The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p>       |

## Add and Edit Smart Tunnel List Dialog Boxes

Use the Add and Edit Smart Tunnel Lists dialog boxes to create, copy, and edit SSL VPN smart tunnel objects.

An SSL VPN smart tunnel list object lists the applications that are eligible for smart tunnel access to a private site. You can configure the clientless settings of an ASA group policy with a smart tunnel list to allow users to access the specified applications through the SSL VPN portal. For an explanation of the types of applications that support smart tunnel access, see [Configuring SSL VPN Smart Tunnels for ASA Devices](#) , on page 1414.

You can include other SSL VPN smart tunnel list objects in an object. Thus, you can create a smaller set of objects that identify your basic list of applications, then create other objects that create the required combination of applications. For example, you might want all three of your ASA group policies to allow smart tunnel access to applications A and B, but the remaining applications are unique for each group. By creating a single object that specifies A and B, you can include that object in each of the SSL VPN smart tunnel list objects for the group policies, and these objects need only specify their unique applications in the applications table.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| App Name | The name of the application to which you are allowing smart tunnel access. The name can be up to 64 characters. Consider including the version number of the application if you are allowing more than one version smart tunnel access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| App Path | <p>The filename and optionally, the path, of the application. This entry can be up to 128 characters. Use one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Filename</b>—For example, <b>outlook.exe</b>. By only specifying the file name, it does not matter where users install the application on their workstations. However, the file name must match exactly.</li> <li>• <b>Full path and filename</b>—For example, <b>C:\Program Files\Microsoft Office\OFFICE11\OUTLOOK.EXE</b>. This allows the application smart tunnel access only if it is installed in the specified directory, which you can use to enforce organizational standards.</li> </ul> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• If you specify the full path, and the smart tunnel application stops working after it had been working for a while, it is likely that a product upgrade changed the installation path. Add a new entry that accounts for the new path.</li> <li>• If you are granting smart tunnel access to an application that is started from the command line, create one entry for <b>cmd.exe</b> (the Windows command line), and another entry for the application.</li> </ul> |
| Platform | <p>Specify the host operating system of the application:</p> <ul style="list-style-type: none"> <li>• Windows</li> <li>• Mac</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hash Value | <p>(Optional) The hash value for the application. By specifying a hash value, you can ensure that the user does not rename another application to use a supported filename and thus start an unsupported and undesired application over the smart tunnel.</p> <p>To obtain the hash value, enter the checksum of the application (that is, the checksum of the executable file) into a utility that calculates a hash using the SHA-1 algorithm. One example of such a utility is the Microsoft File Checksum Integrity Verifier (FCIV), which is available at <a href="http://support.microsoft.com/kb/841290/">http://support.microsoft.com/kb/841290/</a>. Place a temporary copy of the application to be hashed on a path that contains no spaces (for example, c:\temp) and then enter <b>fciv.exe -sha1</b> application at the command line (for example, <b>fciv.exe -sha1 c:\msimn.exe</b>) to display the SHA-1 hash. Copy and paste the value into this field.</p> <p>The SHA-1 hash is always 40 hexadecimal characters. Before authorizing an application for smart tunnel access, clientless SSL VPN calculates the hash of the application matching the App Name. It qualifies the application for smart tunnel access if the result matches the value of hash.</p> <p>Because the checksum varies with each version or patch of an application, the hash you enter can match only one version or patch on the remote host. To specify a hash for more than one version of an application, create a unique smart tunnel entry for each hash value.</p> <p><b>Tip</b> Hash values require maintenance. You must update the smart tunnel list if you want to support future versions or patches of an application for which you supply a hash value. A sudden problem with smart tunnel access might be an indication that the application list containing hash values is not up-to-date with an application upgrade. You can avoid this problem by not entering a hash.</p> |

## Add and Edit Smart Tunnel Network Lists Dialog Boxes

Beginning from Security Manager version 4.7, you can use the Add and Edit Smart Tunnel Network Lists dialog boxes to create and edit a list of hosts that you can use for configuring smart tunnel policies.

### Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Network Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**. Alternatively, you can click the **Add (+)** button to add a new object, or click the **Edit (pencil)** button to edit an object.

| Name                                                  | The smart tunnel network list object name that you use to apply to the tunnel policy. The name can be up to 64 characters. Spaces are not allowed. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.                                                                                                                                                                                                                   |
| Description                                           | An optional description of the network list object.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Smart Tunnel Network List Entries table               | The host mask or IP address of the network to which applications will be allowed smart tunnel access through the SSL VPN. <ul style="list-style-type: none"> <li>To add an entry, click the <b>Add Row</b> button to open the <a href="#">Add and Edit Smart Tunnel List Dialog Boxes</a> , on page 1557.</li> <li>To edit an entry, select it and click the <b>Edit Row</b> button.</li> <li>To delete an entry, select it and click the <b>Delete Row</b> button.</li> </ul>             |
| Include Other Lists                                   | The other SSL VPN smart tunnel network list objects that you want to include in this object, if any. Enter the names of the objects or click <b>Select</b> to select them from a list or to create new objects. Separate multiple entries with commas.                                                                                                                                                                                                                                     |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. or more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add and Edit A Smart Tunnel Network List Entry Dialog Box

Use the Add and Edit A Smart Tunnel Network List Entry dialog box to create a new smart tunnel network list entry or edit an existing entry in the table in the SSL VPN Smart Tunnel Network Lists dialog box.

### Navigation Path

From [Add and Edit Smart Tunnel List Dialog Boxes](#) , on page 1557, click the **Add Row** button beneath the Smart Tunnel Network List Entries table, or select an entry and click the **Edit Row** button.

**Table 472: Add and Edit Smart Tunnel Network List Entry Dialog Boxes**

| Element     | Description                                                                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host        | The host mask that will be part of the smart tunnel network list entry.                                                                                     |
| IP Address  | The IP address of the host that will be part of the smart tunnel network list entry. Beginning with version 4.12, Security Manager supports IPv6 addresses. |
| Subnet Mask | The subnet mask for the specified IP address.                                                                                                               |

# Add and Edit Smart Tunnel Auto Signon List Dialog Boxes

Use the Add and Edit Smart Tunnel Auto Signon Lists dialog boxes to create, copy, and edit SSL VPN smart tunnel auto sign-on objects.

Smart Tunnel Auto Sign-on is a single sign-on method for Clientless SSL VPN users. It passes the login credentials (username and password) to internal servers for authentication using NTLM authentication, HTTP Basic authentication, or both. Smart Tunnel Auto Sign-on is supported on ASA 5500 devices running software version 7.1(1) and later.

An SSL VPN smart tunnel auto sign-on list object identifies the servers for which to automate the submission of login credentials during smart tunnel setup. You can configure the clientless settings of an ASA group policy with a smart tunnel auto sign-on list if you want to reissue the user credentials when the user establishes a smart tunnel connection to a server. For an explanation of the types of applications that support smart tunnel access, see [Configuring SSL VPN Smart Tunnels for ASA Devices](#) , on page 1414.

You can include other SSL VPN smart tunnel auto sign-on list objects in an object. Thus, you can create a set of objects that identify your basic list of servers and include those objects in another object that expands upon that list of servers.

## Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Auto Signon Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                                  | The object name, which can be up to 64 characters. Spaces are not allowed. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.                                                                                                                                                                                                                                                                                                |
| Description                                           | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Smart Tunnel Auto Signon Entries table                | The servers for which to automate the submission of login credentials during smart tunnel setup. <ul style="list-style-type: none"> <li>To add servers, click the <b>Add Row</b> button to open the <a href="#">Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes</a> , on page 1563.</li> <li>To edit an entry, select it and click the <b>Edit Row</b> button.</li> <li>To delete an entry, select it and click the <b>Delete Row</b> button.</li> </ul>                               |
| Include Other Lists                                   | The other smart tunnel auto sign-on list objects that you want to include in this object, if any. Enter the names of the objects or click <b>Select</b> to select them from a list or to create new objects. Separate multiple entries with commas.                                                                                                                                                                                                                                             |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                     |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br><br>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes

Use the Add and Edit Smart Tunnel Auto Signon Entry dialog boxes to create a new smart tunnel entry or edit an existing entry in the table in the SSL VPN Smart Tunnel Auto Signon List dialog box.

### Navigation Path

From [Add and Edit Smart Tunnel Auto Signon List Dialog Boxes](#) , on page 1562, click the **Add Row** button beneath the Smart Tunnel Auto Signon Entries table, or select an entry and click the **Edit Row** button.

**Table 474: Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes**

| Element                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Matching Mode: <ul style="list-style-type: none"> <li>• Host</li> <li>• IPv4/IPv6 Address</li> </ul> | <p>Identifies the server for which to automate the submission of login credentials during smart tunnel setup. Use Host to specify the server by host name or wildcard mask, and use IP Address to specify the server by IP address and netmask:</p> <ul style="list-style-type: none"> <li>• <b>Host</b>—Select Host and then enter the host name or a wildcard mask in the Hostname Mask field that identifies the host for which to automate the submission of login credentials during smart tunnel setup.</li> </ul> <p><b>Note</b> Using this option protects the configuration from dynamic changes to IP addresses.</p> <ul style="list-style-type: none"> <li>• <b>IPv4/IPv6 Address</b>—Select the IP Address and then enter the IP address and netmask of the host or sub-network of hosts for which to automate the submission of login credentials during smart tunnel setup.</li> </ul> <p><b>Note</b> Beginning with version 4.12 Security Manager supports IPv6 addresses. By default, when you select the <b>IPv4/IPv6 Address</b>, Security Manager looks for IPv4/IPv6 address. Enter the Subnet Mask or Prefix Length as required.</p> <p><b>Note</b> Firefox requires the administrator to specify hosts using an exact host name or IP address (instead of a host mask with wild cards, a subnet using IP addresses, or a netmask). For example, within Firefox, you cannot enter *.cisco.com and expect auto sign-on to host email.cisco.com.</p> |
| Port Number                                                                                          | The port that performs auto sign-on. For Firefox, if no port number is specified, auto sign-on is performed on HTTP and HTTPS, accessed by default port numbers 80 and 443 respectively.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Authentication Realm                                                                                 | The realm for the authentication. The Authentication Realm is associated with the protected area of the website and is passed back to the browser either in the authentication prompt or in the HTTP headers during authentication. After auto sign-on is configured and a realm string is specified, users can configure the realm string on a web application (such as Outlook Web Access) and access web applications without signing on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Use Domain                                                                                           | Select this option to add the Windows domain to the username if authentication requires it. If you use this option, be sure to specify the domain name when assigning the smart tunnel list to one or more group policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Add or Edit User Group Dialog Box

Use the Add or Edit User Group dialog box to create or edit a user group object. User group objects are used in Easy VPN topologies, remote access VPNs, and SSL VPNs for IOS devices.

When you configure a remote access VPN, SSL VPN, or Easy VPN server, you can create user groups to which remote clients belong. The remote clients must be configured with the same group name as the user group on the VPN server in order to connect to the server; otherwise, no connection is established. When the

remote client connects to the VPN server successfully, the group policies for that particular user group are pushed to all remote clients belonging to the user group.

For more information about user groups, see:

- [Configuring User Group Policies](#) , on page 1481
- [Configuring a User Group Policy for Easy VPN](#) , on page 1259
- [Configuring an SSL VPN Policy \(IOS\)](#) , on page 1482

**Note** You must select the technology (Easy VPN/Remote Access VPN, or SSL VPN) for which you are creating the user group object. If you are editing an existing user group object, the technology is already selected and you cannot change it. Depending on the selected technology, the appropriate settings are available for configuration.

### Navigation Path

Select **Manage > Policy Objects**, then select **User Groups** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

**Tip** You can also access this dialog box from the **Remote Access VPN > IPSec VPN > User Groups** or the **Remote Access VPN > SSL VPN** policies.

**Table 476: User Group Dialog Box—General Settings**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preshared Key                 | <p>The preshared key that will be used to authenticate the clients associated to the user group.</p> <p><b>Note</b> You do not have to enter a preshared key if you are using digital certificates for group authentication.</p> <p>In regular IPsec VPNs, preshared keys allow for one or more peers to use individual shared secrets to authenticate encrypted tunnels. A preshared key must be configured on each participating peer. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established.</p> <p>In Easy VPN authentication, the same Easy VPN server key is used for the spoke configuration to ensure that the server/client keys match.</p> <p>In remote access IPsec VPN authentication, the same key is used to negotiate a VPN connection between the remote access VPN server and the remote clients.</p> |
| IP Address Pool Subnet/Ranges | <p>The IP address ranges for a local pool that will be used to allocate an internal IP address to a client. Remote clients are assigned IP addresses from this pool. Separate multiple entries with commas. The default is 172.16.0.1-172.16.4.254.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Backup Servers IP Address     | <p>The IP address of the servers to be used as backups for the Easy VPN or remote access IPsec VPN server. The router tries to connect to these servers if the primary connection to the Easy VPN or remote access VPN server fails. Separate multiple entries with commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PIX Only Attributes           | <p>These attributes apply only to PIX 6.3 devices.</p> <ul style="list-style-type: none"> <li>• <b>Idle Time</b>—The timeout period for VPN connections, in seconds. If no communication occurs on the connection during this period, the device terminates the connection. The minimum is 60 seconds, and the maximum time is 35791394 minutes. The default is 30 minutes.</li> <li>• <b>Max Time</b>—The maximum amount of time for VPN connections, in seconds. At the end of the time, the device terminates the connection. The minimum is 60 seconds, and the maximum is 35791394 minutes. There is no default.</li> </ul>                                                                                                                                                                                                                                                   |

## User Group Dialog Box—DNS/WINS Settings

Configure the DNS/WINS settings for your user group to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the user group.

**Note** The DNS/WINS settings you configure for a user group apply in Easy VPN, remote access VPN, and SSL VPN configurations.

**Navigation Path**

Select **DNS/WINS** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

**Field Reference**

*Table 477: User Group Dialog Box—DNS/WINS Settings*

| Element               | Description                                                                                                                                                                                            |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary DNS Server    | The IP address of the primary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.   |
| Secondary DNS Server  | The IP address of the secondary DNS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object. |
| Domain Name           | The domain name of the DNS server you want to configure on the user group.                                                                                                                             |
| Primary WINS Server   | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.  |
| Secondary WINS Server | The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select an object from a list or to create a new object.  |

## User Group Dialog Box—Split Tunneling

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination.

The split tunneling policy is applied to a specific network. When you configure split tunneling, you can transmit both secured and unsecured traffic on the same interface. You must specify which traffic will be secured and what the destination of that traffic is, so that you have a secure tunnel to the central site, while the clear (unsecured) traffic is transmitted across the public network.

---

**Tip** For optimum security, we recommend that you not enable split tunneling.

---

---

**Note** Split tunneling can be applied in Easy VPN, remote access VPN, and SSL VPN configurations. For information about configuring split tunneling for SSL VPN, see [User Group Dialog Box—SSL VPN Split Tunneling](#) , on page 1579.

---

### Navigation Path

Select **Split Tunneling** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564 when configuring Easy VPN/Remote Access IPSec VPN.

### Field Reference

**Table 478: User Group Dialog Box—Split Tunneling**

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Split Tunneling | <p>The networks for which you want to tunnel traffic. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. You can identify the networks using one of these options:</p> <ul style="list-style-type: none"> <li>• <b>Protected Networks</b>—Specify the networks by network addresses. Enter the addresses or network/host objects, or click <b>Select</b> to select the objects from a list or to create new objects. For information on specifying addresses, see <a href="#">Specifying IP Addresses During Policy Definition</a> , on page 316.</li> <li>• <b>ACL</b>—Specify the networks using an extended access control list policy object. Enter the name of the object or click <b>Select</b> to select the object from a list or to create a new object.</li> </ul> |
| Split DNS       | <p>A list of domain names that must be tunneled or resolved to the private network. All other names will be resolved through the public DNS server.</p> <p>You can enter multiple domain names separated by commas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## User Group Dialog Box—IOS Client Settings

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Configure IOS client settings to define Cisco IOS specific options for your user group, including firewall settings for VPN clients.

**Note** These settings apply in Easy VPN and remote access IPSec VPN configurations.

### Navigation Path

Select **Client Settings (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

Table 479: User Group Dialog Box—Client Settings (IOS)

| Element                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Firewall Are-You-There<br><br>(Not available on 7600 series or ASR routers.) | <p>This feature may be used if a VPN client is running the Black Ice or Zone Alarm personal firewall.</p> <p>When selected, it ensures that the personal firewall is running at connection time and throughout the connection. The Firewall-Are-U-There attribute is sent by the Black Ice and Zone Alarm personal firewalls if the server prompts them to do so. If the personal firewall stops running, the connection is terminated. If this feature is enabled and there is no personal firewall running on the server, the connection is never established.</p>                                                                                                                                                                                                                                  |
| Mode                                                                                | <p>A Central Policy Push (CPP) firewall policy on a server allows or denies a tunnel on the basis of whether the remote device has a required firewall for a local AAA server.</p> <p>The Mode option specifies whether the Central Policy Push (CPP) policy is optional or mandatory, as follows:</p> <ul style="list-style-type: none"> <li>• <b>Optional</b>—If the CPP policy is defined as optional, and is included in the Easy VPN server configuration, the tunnel setup is continued even if the client does not confirm the defined policy.</li> <li>• <b>Required</b>—If the CPP policy is defined as mandatory and is included in the Easy VPN server configuration, the tunnel setup is allowed only if the client confirms this policy. Otherwise, the tunnel is terminated.</li> </ul> |
| Firewall Type                                                                       | The type of firewall that you are making required or optional. The list shows all of the supported firewall software, which includes software from Cisco and Zone Labs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Policy Type                                                                         | <p>Specifies the CPP firewall policy type:</p> <ul style="list-style-type: none"> <li>• <b>Check Presence</b>—Instructs the server to check for the presence of the specified firewall type.</li> <li>• <b>Central Policy Push</b>—The actual policy, such as the input and output access lists, that must be applied by the specified client firewall type. Specify the following: <ul style="list-style-type: none"> <li>• The access control list to be used. Enter the name of the extended ACL object or click <b>Select</b> to select it from a list or to create a new object.</li> <li>• The direction of the access control list—Inbound or Outbound.</li> </ul> </li> </ul>                                                                                                                 |
| Include Local LAN                                                                   | Whether to allow a non split-tunneling connection to access the local LAN at the same time as the client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Perfect Forward Secrecy                                                             | Whether to enable Perfect Forward Secrecy (PFS). If PFS is enabled, the server is configured to notify the client of the central-site policy about whether PFS is required for any IPsec SA. The Diffie-Hellman (D-H) group that is proposed for PFS is the same that was negotiated in Phase 1 of the IKE negotiation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## User Group Dialog Box—IOS Xauth Options

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

IOS Xauth options configure IKE Extended Authentication (Xauth) user authentication and connection parameters for the user group, including the banner text.

**Note** These settings apply in Easy VPN and remote access VPN configurations.

### Navigation Path

Select **Xauth Options (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

*Table 480: User Group Dialog Box—IOS Xauth Options*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Banner                  | The banner text that is displayed to Easy VPN remote clients during Xauth and web-based activation the first time the Easy VPN tunnel is brought up. A maximum of 1024 characters is allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Maximum Logins Per User | The maximum number of connections a user can establish simultaneously. The maximum is 10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Maximum Connections     | The maximum number of client connections to the Easy VPN Server from this group. The maximum is 5000 per group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable Group-Lock       | <p>Whether to enable group lock, which requires that the user enter the extended Xauth username in one of the following formats:</p> <ul style="list-style-type: none"> <li>• username/groupname</li> <li>• username\groupname</li> <li>• username@groupname</li> <li>• username%groupname</li> </ul> <p>The group that is specified after the delimiter is then compared to the group identifier that is sent during IKE aggressive mode. The groups must match or the connection is rejected.</p> <p><b>Note</b> Do not select this option if you are using RSA signature authentication mechanisms such as certificates.</p> |

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Save Password | <p>Whether to allow users to save their Xauth password locally on the client. On subsequent authentications, users can activate the password by using the check box on the software client or by adding the username and password to the Cisco IOS hardware client profile. After users activate the password, their username and password are sent to the server automatically during Xauth.</p> <p>This option is useful only if users have static passwords, that is, they are not one-time passwords such as those that are generated by a token.</p> |

## User Group Dialog Box—IOS Client VPN Software Update

**Note** From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Client VPN Software Update (IOS) settings configure, for an IOS VPN client, the platform type, VPN Client revisions, and image URL for each client VPN software package installed, for your user group.

The Client Update feature is supported on IOS routers version 12.4(2)T and later, and Catalyst 6500/7600 devices version 12.2(33)SRA and later.

- To add a client, click the **Add Row** button to open the [Add/Edit Client Update Dialog Box](#) , on page 1573.
- To edit a client, select it and click the **Edit Row** button.
- To delete a client, select it and click the **Delete Row** button.

**Note** These settings apply in Easy VPN and remote access VPN configurations.

### Navigation Path

Select **Client VPN Software Update (IOS)** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

## Add/Edit Client Update Dialog Box

Use the Add or Edit Client Update dialog box to configure the platform type, image URL, and VPN Client revisions for a client VPN software package.

### Navigation Path

Open the [User Group Dialog Box—IOS Client VPN Software Update](#) , on page 1573, then click **Add Row**, or select an item in the table and click **Edit Row**.

| System Type              | The platform on which the IOS VPN client operates. <ul style="list-style-type: none"> <li>• All Windows (Default)—This option includes any Windows platform for which a VPN client is available.</li> <li>• Macintosh OS X</li> </ul> |
| IOS Image URL            | Enter the URL from where the client can be downloaded. The URL must start with http:// or https://.                                                                                                                                   |
| IOS VPN Client Revisions | Enter the revision level of the VPN client. You can specify more than one client revision separated by commas.                                                                                                                        |

## User Group Dialog Box—Advanced PIX Options

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

The Advanced PIX Options are specifically for PIX 6.3 Firewalls in your user group.

**Note** These settings apply in Easy VPN and remote access VPN configurations.

**Navigation Path**

Select **Advanced Options (PIX)** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

**Field Reference***Table 482: User Group Dialog Box—Advanced PIX Options*

| Element                 | Description                                                                                                                 |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| User Idle Timeout (sec) | The length of time that a VPN tunnel can remain open without user activity, in seconds. Values range from 60-86400 seconds. |

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Authentication Server        | The AAA server to which remote devices send user authentication requests. Enter the name of the server group or click <b>Select</b> to select it from a list or to create a new group. See <a href="#">Understanding AAA Server and Server Group Objects</a> , on page 254.                                                                                                                                                                                                                                                                                 |
| Enable Device Pass-Through        | Whether to use Media Access Control (MAC) addresses to bypass authentication for devices, such as Cisco IP phones, that do not support AAA authentication.<br><br>When MAC-based AAA exemption is enabled, the device bypasses the AAA server for traffic that matches both the MAC address of the device and the IP address that was dynamically assigned by a DHCP server. Authorization services are disabled automatically when you bypass authentication. Accounting records continue to be generated (if enabled), but the username is not displayed. |
| Enable Secure Unit Authentication | Whether to provide increased security when allowing access to the device from a remote client.<br><br>With Secure Unit Authentication (SUA), you can use one-time passwords, two-factor authentication, and similar authentication schemes to authenticate the remote device during Extended Authentication (Xauth).<br><br>SUA is specified in the VPN policy on the device and is downloaded to the remote client. This enables SUA and determines the connection behavior of the remote client.                                                          |
| Enable User Authentication        | Whether to enable Individual User Authentication (IUA), which supports individually authenticating clients on the inside network of the remote access VPN, based on the IP address of each inside client. IUA supports both static and OTP authentication mechanisms.                                                                                                                                                                                                                                                                                       |

## User Group Dialog Box—Clientless Settings

Use the Clientless settings to configure the clientless mode of access to the corporate network in an SSL VPN.

In clientless access mode, once a user is authenticated and a session is established, an SSL VPN portal page and toolbar is displayed on the user's web browser. From the portal page, the user can access all available HTTP sites, access web e-mail, and browse Common Internet File System (CIFS) file servers.

### Navigation Path

Select **Clientless** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

| Portal Page Websites                      | The name of the SSL VPN bookmarks policy object that includes the web site URLs to display on the portal page. These web sites help users access desired resources. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Allow Users to Enter Websites             | Whether to allow the remote user to enter web site URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Common Internet File System (CIFS) | In Clientless mode, files and directories created on Microsoft Windows servers can be accessed by the remote client through the web browser. When you enable the Common Internet File System (CIFS), a list of file server and directory links are displayed on the portal page after login.<br><br>The CIFS protocol lets you customize permissions on the SSL VPN gateway to allow shared files to be accessed or modified by the remote client, as follows: <ul style="list-style-type: none"> <li>• <b>Enable File Browsing</b>—Whether to allow the remote user to browse for file shares on the CIFS file servers.</li> <li>• <b>Enable File Entry</b>—Whether to allow the remote user to locate file shares on the CIFS file servers by entering the names of the file shares.</li> </ul> |
| WINS Server List                          | The name of the WINS server list policy object that identifies the WINS/NetBIOS servers to use for resolving file server names. You should supply an object if you enable CIFS. Enter the name of the object or click <b>Select</b> to select if from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Enable Citrix                             | Whether to enable remote clients to run Citrix-enabled applications, such as Microsoft Word or Excel, through the SSL VPN as if the application were locally installed, without the need for client software. The Citrix software must be installed on one or more servers on a network that the router can reach.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## User Group Dialog Box—Thin Client Settings

Use the Thin Client settings to enable the thin client, or port forwarding, mode of access to the corporate network in an SSL VPN. Port forwarding allows users to access applications (such as Telnet, e-mail, VNC, SSH, and Terminal services) inside the enterprise through an SSL VPN session. A port forwarding list object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.

In thin client access mode, the remote user downloads a Java applet that acts as a TCP proxy on the client machine for the services configured on the SSL VPN gateway. The proxy provides the port forwarding services.

### Navigation Path

Select **Thin Client** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Thin Client                              | Whether to allow thin client access to the SSL VPN.                                                                                                                                                                                                                                                                     |
| Port Forward List                               | The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object. |
| Download Port Forwarding Applet on Client Login | Whether the port forwarding Java applet should be automatically downloaded to the client when a user logs into the SSL VPN. If you do not automatically download the applet, users must download it manually after login.                                                                                               |

## User Group Dialog Box—SSL VPN Full Tunnel Settings

Use the SSL VPN Full Tunnel settings to enable the full tunnel client access mode in your SSL VPN. When you enable full tunnel access, you should also define DNS/WINS server settings, browser proxy settings, and split tunneling for the user group.

In full tunnel client access mode, the tunnel connection is determined by the group policy configuration. The full tunnel client software, SSL VPN Client (SVC), must be downloaded to the remote client so that a tunnel connection can be established when the remote user logs in to the SSL VPN gateway.

---

**Tip** For full tunnel client access to work, you must install the client software on the gateway. The user downloads the client when connecting to the gateway.

---

### Navigation Path

Select **Full Tunnel** > **Settings** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

| Element                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Full Tunnel                                      | Whether to enable full tunnel client access to the SSL VPN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use Other Access Modes if SSL VPN Client Download Fails | Whether to allow users to connect to the SSL VPN even if a problem prevents the client from downloading, installing, and starting correctly on the user's system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Full Tunnel Only                                        | If you select <b>Full Tunnel Only</b> , a user cannot connect to the SSL VPN if the download fails, which locks the user out of the network. Select <b>Use Other Access Modes</b> to allow clientless or thin client access if there is a download problem.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Client IP Address Pool                                  | <p>The IP address ranges of the address pool that full tunnel clients will draw from when they log on. The address pool must be in the same subnet as one of the device's interface IP addresses.</p> <p>Enter the address range separating the first and last IP address with a hyphen, for example, <b>10.100.10.2-10.100.10.255</b>. If you enter a single address, the pool has just one address. Do not enter subnet designations.</p> <p>You can also enter the name of a network/host policy object that defines the range, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple ranges with commas.</p> |
| Filter ACL                                              | The name of an extended access control list (ACL) object that restricts access to the SSL VPN. Enter the name of the object or click <b>Select</b> to select it from a list or to create a new object.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Keep SSL VPN Client on Client Computer                  | Whether to leave the full client installed on the user's workstation after the user disconnects. If you do not allow the client to remain on the user's system, the client must be downloaded each time the user establishes a connection to the SSL VPN gateway.                                                                                                                                                                                                                                                                                                                                                                                               |
| Home Page URL                                           | The web address of the login home page for the full client.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Client Dead Peer Detection Timeout                      | The time interval that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the remote user. Enter a value in the range 1-3600 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Gateway Dead Peer Detection Timeout                     | The time interval that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the gateway. Enter a value in the range 1-3600 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Key Renegotiation Method                                | <p>The method by which the tunnel key is refreshed for the remote user group client:</p> <ul style="list-style-type: none"> <li>• <b>Disabled</b>—Disables the tunnel key refresh.</li> <li>• <b>Create New Tunnel</b>—Initiates a new tunnel connection. Enter the time interval (in seconds) between the tunnel refresh cycles in the <b>Interval</b> field.</li> </ul>                                                                                                                                                                                                                                                                                       |

## User Group Dialog Box—SSL VPN Split Tunneling

Use the Split Tunneling settings to configure a secure tunnel to the central site and simultaneous clear text tunnels to the Internet for SSL VPNs.

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination. The split tunneling policy is applied to specific networks.

**Tip** For optimum security, we recommend that you not enable split tunneling.

### Navigation Path

Select **Full Tunnel** > **Split Tunneling** from the table of contents in the [Add or Edit User Group Dialog Box](#), on page 1564.

### Field Reference

*Table 486: User Group Dialog Box—Split Tunneling Settings*

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tunnel Option | <p>Whether to allow split tunneling and if so, which traffic should be secured or transmitted unencrypted across the public network:</p> <ul style="list-style-type: none"> <li>• <b>Disabled—(Default)</b> No traffic goes in the clear or to any other destination than the gateway. Remote users reach networks through the corporate network and do not have access to local networks.</li> <li>• <b>Tunnel Specified Traffic</b>—Tunnel all traffic from or to the addresses listed in the <b>Destinations</b> field. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider.</li> <li>• <b>Exclude Specified Traffic</b>—Traffic goes in the clear from and to the addresses listed in the <b>Destinations</b> field. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel.</li> </ul> |
| Destinations  | <p>The IP addresses for hosts or networks that identify the networks that require traffic to travel across the tunnel and those that do not require tunneling. Whether traffic to these addresses is encrypted and tunneled to the gateway, or sent in the clear, is determined by your selection for <b>Tunnel Option</b>.</p> <p>Enter network addresses such as 10.100.10.0/24 or host addresses such as 10.100.10.12. You can also enter the name of a network/host policy object, or click <b>Select</b> to select the object from a list or to create a new object. Separate multiple addresses with commas.</p>                                                                                                                                                                                                                                                                                                                                                    |

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Exclude Local LANs | <p>Whether to exclude local LANs from the encrypted tunnel. This option is available only if you selected the <b>Exclude Specified Traffic</b> tunnel option. By selecting this option, you do not have to enter local LAN addresses into the destinations field to allow users to communicate with systems (such as printers) that are attached to their LAN.</p> <p>When selected, this attribute disallows a non split-tunneling connection to access the local subnetwork at the same time as the client.</p> |
| Split DNS Names    | <p>A list of domain names to be resolved through the split tunnel to the private network. All other names are resolved using the public DNS server.</p> <p>Enter up to 10 entries in the list of domains, separated by commas. The entire string can be no longer than 255 characters.</p>                                                                                                                                                                                                                        |

## User Group Dialog Box—Browser Proxy Settings

Use the Browser Proxy settings to configure proxy bypass for full tunnel access in an SSL VPN.

A security appliance can terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers, which act as intermediaries between users and the Internet. Proxy bypass is an alternative method of content rewriting that makes minimal changes to the original content. It is useful with custom web applications.

---

**Tip** The browser proxy settings work only for Microsoft Internet Explorer; they do not work for other types of browsers.

---

### Navigation Path

Select **Full Tunnel > Browser Proxy Settings** from the table of contents in the [Add or Edit User Group Dialog Box](#) , on page 1564.

| Proxy Server                                         | The address of the proxy server: <ul style="list-style-type: none"> <li>• IP address—The IP address or the name of a network/host object that specifies the address. Click <b>Select</b> to select the object from a list.</li> <li>• Name—The fully qualified domain name, for example, proxy.example.com.</li> </ul>                                                                                                                                                               |
| Proxy Server Port                                    | The port number on the server that is used for proxy traffic, for example, 80. Enter a value in the range 1-65535.                                                                                                                                                                                                                                                                                                                                                                   |
| Do Not Use Proxy Server for Addresses Beginning With | If you configured a proxy, you can identify specific hosts for which the proxy should be bypassed. If the user opens these hosts in the browser, the proxy is not used in the connection.<br><br>Enter full IP addresses or fully qualified domain names. For example, 10.100.10.14 or www.cisco.com.                                                                                                                                                                                |

## User Group Dialog Box—SSL VPN Connection Settings

Use this SSL VPN Connection Settings page to configure the SSL VPN session connection settings for the user group, including the banner text. An SSL VPN session is disconnected if the client is connected longer than the session timeout or if it is idle longer than the idle timeout.

### Navigation Path

Select **Connection Settings** from the table of contents in the [Add or Edit User Group Dialog Box](#), on page 1564.

## Field Reference

**Table 488: User Group Dialog Box—Connection Settings**

| Element      | Description                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Idle Timeout | The idle timeout period for the SSL VPN session. The session is disconnected if the client is idle longer than the specified idle timeout. Values range from 0-3600 seconds. |

| Element         | Description                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Session Timeout | The timeout period for the SSL VPN session. The session is disconnected when this timeout is reached even if the user is still active. Values range from 1-1209600 seconds.                                                                                              |
| Banner Text     | The banner, for example, a welcome message, that is displayed to remote users when they connect to the SSL VPN.<br><br>You cannot use double quotes or new lines (carriage returns) in the banner text. However, you can include HTML tags to create the desired layout. |

## Add or Edit WINS Server List Dialog Box

Use the WINS Server Lists dialog box to create, copy, and edit WINS server list objects. A WINS Server List object defines a list of Windows Internet Naming Server (WINS) servers, which are used to translate Windows file server names to IP addresses.

### Navigation Path

Select **Manage > Policy Objects**, then select **WINS Server Lists** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Add or Edit WINS Server Dialog Box

Use the Add/Edit WINS Server dialog box to create a new WINS server entry or edit an existing entry in the table in the WINS Server Lists dialog box.

### Navigation Path

From the [Add or Edit WINS Server List Dialog Box](#), on page 1582, click the **Add** button beneath the WINS Server List table, or select a server in the table and click the **Edit** button.

### Related Topics

- [Configuring WINS/NetBIOS Name Service \(NBNS\) Servers To Enable File System Access in SSL VPNs](#), on page 1416

### Field Reference

*Table 490: Add/Edit WINS Server Dialog Box*

| Element                | Description                                                                                                                                                                                                                                                                                  |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server                 | The IP address of the WINS server used to translate Windows file server names to IP addresses. You can also enter the name of a network/host policy object that identifies the server. Click <b>Select</b> to choose a network/hosts object or to create a new object.                       |
| Set as Primary Browser | Whether to set the server as the primary browser. The primary browser maintains the list of computers and shared resources.                                                                                                                                                                  |
| Timeout                | The period of time the security appliance waits for a response to a WINS query before sending the query again to the same server (if it is the only one), or to the next server (if there is more than one).<br><br>The default timeout is 2 seconds. The range is between 1 and 30 seconds. |
| Retries                | The number of times to retry sending WINS queries to the configured servers. The security appliance recycles through the list of servers this number of times before sending an error message.<br><br>The default is 2. The range is between 0 and 10.                                       |

## CHAPTER 35

# Using Map View

---

The following topics describe how to use the Map view:

- [Understanding Maps and Map View](#) , on page 1585
- [Working With Maps](#) , on page 1593
- [Displaying Your Network on the Map](#) , on page 1599
- [Managing VPNs in Map View](#) , on page 1606
- [Managing Device Policies in Map View](#) , on page 1607

## Understanding Maps and Map View

The Security Manager Map view provides a graphical view of your VPN and Layer 3 network topology.

Using the map view, you can investigate details of your VPN configuration graphically. Topological display of tunnels enables you to easily derive the relationship among multiple VPN configurations (for example, a hierarchical VPN). You can group devices to achieve a more complete picture of your VPN configuration. This is useful in situations where a hub failover pair is a peer with hundreds of spokes.

You can represent your Layer 3 network topology graphically, populating it with managed devices (called device nodes). You can make the picture of the topology more complete by adding unmanaged objects (called map objects) such as devices, clouds, and networks. For large networks, you can choose to simplify the topology graph by incorporating only a portion of the overall topology. You can save the topology maps for future use.

You can save multiple topology maps to reflect your network's geographical or functional organization. You can link a saved map to a node on a parent map, so that from the parent map you can drill down to the linked map with more detailed information (for more information, see [Using Linked Maps](#) , on page 1598). Saved maps are shared among all users who have the necessary access privileges.

You can launch other Security Manager features from the map view. In some cases, you can simplify the use of features by selecting nodes from the map before you start another feature. For example, you can select multiple nodes, then create a VPN that includes those nodes as members.

---

**Tip** The network data that is displayed on maps is typically updated as this data changes. However, to be certain that a map displays current network data, you can refresh it manually by selecting **Map > Refresh Map**.

---

This section contains the following topics:

- [Understanding the Map View Main Page](#) , on page 1586
- [Map Toolbar](#) , on page 1588
- [Using the Navigation Window](#) , on page 1589
- [Maps Context Menus](#) , on page 1589
- [Access Permissions for Maps](#) , on page 1593

## Understanding the Map View Main Page

Map view enables you to create customized, visual topology maps of your network, within which you can view connections between your devices and easily configure VPNs and access control settings. The following figure identifies the functional areas of the Map view.

To open the Map view main page, click the **Map View** button in the toolbar.

You can undock the map window, which enables you to use other product features while keeping the map open. To undock the map, select **Map > Undock Map View**. To dock the map window, select **Map > Dock Map View**.

## Map Toolbar

The following table describes the buttons on the map toolbar.

**Table 491: Map Toolbar**

| Toolbar Button                                                                      | Description                                                                                                                                    |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Selects objects on the map. Click the button, then click items on the map.                                                                     |
|    | Pans the map. Click the button, click and hold on the map, then drag the cursor.                                                               |
|    | Zooms in on the map.                                                                                                                           |
|    | Zooms out from the map.                                                                                                                        |
|  | Zooms the map to fill a rectangle that you draw.                                                                                               |
|  | Zooms the map to include the entire map.                                                                                                       |
|  | Zooms the map to actual size.                                                                                                                  |
|  | Creates a new Security Manager-managed node. After you create the new device in the inventory, it is added to the active map as a device node. |
|  | Adds a new map object to the map.                                                                                                              |
|  | Adds a new link to the map.                                                                                                                    |
|  | Creates a new VPN connection between nodes on the map.                                                                                         |
|  | Select devices to show on the map as device nodes.                                                                                             |
|  | Select VPNs to show on the map.                                                                                                                |

## Using the Navigation Window

The navigation window displays a smaller version of the entire active map. The shaded rectangle defines the area of the map that is currently displayed.

Use the navigation window to select the portion of the map to view and to change the map zoom level.

- To toggle the display of the navigation window, select **Map > Show/Hide Navigation Window**.
- To pan the navigation control to select which portion of the map to display, click within the shaded rectangle and drag it to a new location.
- To change the zoom level, click one of the resizing handles in the corners of the shaded rectangle, then drag it to increase or decrease the area of the map to display. The map zooms to display the area covered by the map indicator.

The title bar in the navigation window displays the name of the map. If the map has unsaved changes, an asterisk (\*) appears next to the map name.

For information on other ways to pan and zoom maps, see [Panning, Centering, and Zooming Maps](#), on page 1596.

## Maps Context Menus

The following topics describe the menus that contain maps commands. To open the context menus, right-click map elements.

- [Managed Device Node Context Menu](#), on page 1589
- [Multiple Selected Nodes Context Menu](#), on page 1590
- [VPN Connection Context Menu](#), on page 1591
- [Layer 3 Link Context Menu](#), on page 1591
- [Map Object Context Menu](#), on page 1591
- [Map Background Context Menu](#), on page 1592

## Managed Device Node Context Menu

The Managed Device Node context menu opens when you right-click a map node that represents a managed device. The commands that you see depend on the type of device you select. The following table lists all commands that you might see.

**Table 492: Managed Device Node Context Menu**

| Menu Command           | Description                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------|
| Edit Firewall Policies | Edits firewall policies on the device.<br>Select a firewall policy type from the submenu to edit it. |
| Edit Firewall Settings | Edits firewall settings on the device.<br>Select a setting from the submenu to edit it.              |

| Menu Command                  | Description                                                                                                                                                                                                      |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit VPN Peers                | Edits peers in VPNs in which the device participates.                                                                                                                                                            |
| Edit VPN Policies             | Edits VPN policies on the device.                                                                                                                                                                                |
| Device Properties             | Displays device properties.                                                                                                                                                                                      |
| Clone Device                  | Creates a copy of the device. See <a href="#">Cloning a Device</a> , on page 126.                                                                                                                                |
| Copy Policies Between Devices | Copies policies between the device and other devices. See <a href="#">Copying Policies Between Devices</a> , on page 197.                                                                                        |
| Share Device Policies         | Shares device local policies.                                                                                                                                                                                    |
| Catalyst Summary Info         | Allows you to view high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered. See <a href="#">Viewing Catalyst Summary Information</a> , on page 2648. |
| Show in Device View           | Opens the Device View for the selected device.                                                                                                                                                                   |
| Device Manager                | Launches the Device Manager. See <a href="#">Starting Device Managers</a> , on page 2875.                                                                                                                        |
| Inventory Status              | Displays the Inventory Status window for the device. See <a href="#">Inventory Status Window</a> , on page 2874.                                                                                                 |
| Show VPN Peers                | Shows peers in VPNs in which the device participates.                                                                                                                                                            |
| Preview Configuration         | Previews the device configuration with all committed changes included.                                                                                                                                           |
| Show Containment              | Shows the security contexts and service modules in devices that have them.                                                                                                                                       |
| Node Properties               | Displays node properties.                                                                                                                                                                                        |
| Set Linked Map                | Creates a link from this node to another map.                                                                                                                                                                    |
| Open Linked Map               | Opens the map that is linked to the node.                                                                                                                                                                        |
| Discover Policies on Device   | Discovers policies on the device.                                                                                                                                                                                |
| Move To Center                | Pans the map to display the node in the center.                                                                                                                                                                  |
| Delete Device                 | Deletes the device from the device inventory.                                                                                                                                                                    |
| Remove from Map               | Removes the node from the map.                                                                                                                                                                                   |

## Multiple Selected Nodes Context Menu

The Multiple Selected Device Node context menu opens when you select more than one map node, then right-click on a selected node.

If all of the selected nodes are not VPN-capable, the commands to configure VPNs do not appear.

**Table 493: Multiple Selected Nodes Context Menu**

| Menu Command              | Description                                                                                                                                                             |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Create Point to Point VPN | Creates a point to point VPN between two selected devices.<br>All selected nodes must be managed and VPN-capable.                                                       |
| Create Hub and Spoke VPN  | Creates a hub and spoke VPN that includes the selected nodes.<br>The node that you right-click becomes the VPN hub. All selected nodes must be managed and VPN-capable. |
| Create Meshed VPN         | Creates a full mesh VPN that includes the selected nodes.<br>All selected nodes must be managed and VPN-capable.                                                        |
| Remove Selected Nodes     | Removes all selected device nodes. Appears only if you right-click on a selected device node.                                                                           |
| Delete Map Objects        | Deletes all selected map objects. Appears only if you right-click on a selected map object.                                                                             |

## VPN Connection Context Menu

The VPN Connection context menu opens when you right-click on a VPN connection on the map. For more information, see [Editing VPN Policies or Peers From the Map](#) , on page 1607.

**Table 494: VPN Connection Context Menu**

| Menu Command      | Description                 |
|-------------------|-----------------------------|
| Edit VPN Peers    | Edits the peers in the VPN. |
| Edit VPN Policies | Edits the VPN policies.     |

## Layer 3 Link Context Menu

The Layer 3 Link context menu opens when you right-click on a layer 3 link on the map.

**Table 495: Layer 3 Link Context Menu**

| Menu Command    | Description                    |
|-----------------|--------------------------------|
| Link Properties | Displays the link properties.  |
| Delete Link     | Deletes the link from the map. |

## Map Object Context Menu

The Map Object context menu opens when you right-click a map object that does not represent a managed device.

**Table 496: Map Object Context Menu**

| Menu Command      | Description                                     |
|-------------------|-------------------------------------------------|
| Node Properties   | Displays the node properties.                   |
| Move To Center    | Pans the map to display the node in the center. |
| Set Linked Map    | Links the node to a map.                        |
| Open Linked Map   | Opens the map to which the node is linked.      |
| Delete Map Object | Deletes the map object.                         |

## Map Background Context Menu

The Map Background context menu opens when you right-click in the background area of a map, that is, not on any object or link.

**Table 497: Map Background Context Menu**

| Menu Command                | Description                                                           |
|-----------------------------|-----------------------------------------------------------------------|
| Show Devices on Map         | Selects the managed devices to show on the map.                       |
| Show VPNs on Map            | Selects the VPNs to display on the map.                               |
| Add Map Object              | Adds a map object to the map.                                         |
| Add Link                    | Adds a Layer 3 link to the map.                                       |
| New Device                  | Creates a new managed device and adds it to the map as a device node. |
| New VPN                     | Creates a new VPN and adds it to the map.                             |
| Find Map Node               | Finds nodes on the map.                                               |
| Open Map                    | Opens a saved map.                                                    |
| Save Map                    | Saves the open map.                                                   |
| Show/Hide Navigation Window | Toggles the display of the navigation window on the map.              |
| Map Properties              | Displays the properties of the map.                                   |
| Hierarchical layout         | Arranges the network nodes in a hierarchical layout.                  |
| Radial layout               | Arranges the network nodes in a radial layout.                        |
| Circular layout             | Arranges the network nodes in a circular layout.                      |
| Dock/Undock Map             | Undocks the Map view.                                                 |

## Access Permissions for Maps

Access to maps is controlled based on two systems of user privileges:

- Device privileges—You must have at least read privileges to all the devices in a map to open the map.
- Map privileges—Access to maps is based on your Security Manager user role. There are two levels of map access:
  - Read-only—You can open maps, but you cannot modify them. If you have this map privilege level, the features for modifying maps are not available.
  - Read-write—You can modify maps. All map modification features are available.

## Working With Maps

A map is a representation of a portion of your network. You can create and save multiple maps to address your network management needs. To work with any map, you must be in Map view (select **View > Map View**).

After you create and save a map, the map is available to all users on the system that have at least read privileges to all the devices on the map. Users that do not have read privileges to a device on a map do not see the map in the list of existing maps when they try to open a map. For more information, see [Access Permissions for Maps](#) , on page 1593.

You can only have one map open at a time. If a map is open and you create a new map or open an existing map, you are prompted to save or discard any unsaved changes that you made to the current map.

Multiple users can open and modify a map at the same time. When a user saves changes to a map, any other users who are using the map are notified and have the option to do one of the following:

- Update their map to the version saved by the other user, losing any changes they have made.
- Save their version of the map as a new map, preserving any changes they made.

This section contains the following topics:

- [Creating New or Default Maps](#) , on page 1594
- [Opening Maps](#) , on page 1594
- [Saving Maps](#) , on page 1595
- [Deleting Maps](#) , on page 1595
- [Exporting Maps](#) , on page 1595
- [Arranging Map Elements](#) , on page 1596
- [Panning, Centering, and Zooming Maps](#) , on page 1596
- [Selecting Map Elements](#) , on page 1597
- [Searching for Map Nodes](#) , on page 1597
- [Using Linked Maps](#) , on page 1598

- [Setting the Map Background Properties](#) , on page 1598

## Creating New or Default Maps

You have two options for creating a new map:

- Create an empty map—To create a new empty map, select **Map > New Map**. You must already be in Map view (select **View > Map View**). If you currently have a map open with unsaved changes, you are asked if you want to save it. For information about adding elements to a map, see [Displaying Your Network on the Map](#) , on page 1599.
- Create a new map containing all managed devices and VPNs in the inventory—This is called the default map. Generating the default map is a good way to create a map. After generating the map, save it with a unique name to make it a standard map and modify it as desired.

You can generate the default map whenever you want to, and it contains the inventory as it exists at the time you generate it. You cannot specifically save the default map *as* the default map; it is regenerated every time you select it.

The following procedure explains how to create a new map using the default map.

### Tips

- If you refresh the map (select **Map > Refresh Map**), items that you added to the inventory after generating the default map are not added to the map. You must reopen the default map to see new devices.

---

**Step 1** In Map view, select **Map > Open Map**.

**Step 2** Select **Default Map** from the Available Maps list, then click **OK**.

**Note** If you do not have sufficient access rights to all devices in the inventory, the default map that opens shows only the subset of devices for which you do have access rights. For more information, see [Access Permissions for Maps](#) , on page 1593.

**Step 3** To save the default map as a standard map, select **Map > Save Map** or **Map > Save Map As**, enter a name for the map and click **OK**.

---

## Opening Maps

To open an existing map, select **Map > Open Map**, select the desired map from the list of available maps, and click **OK**. You must already be in Map view (select **View > Map View**). If you currently have a map open with unsaved changes, you are asked if you want to save it.

The list of available maps includes a special map called the **Default Map**. This map contains all of the managed devices and VPNs in the inventory. You are essentially creating a new map each time you open it. For more information about the default map, see [Creating New or Default Maps](#) , on page 1594.

---

**Tip** You can open any map that you have created or the default map. You can also open any map that another user has created provided you have the requisite permission settings with regard to the devices shown on that map (see [Access Permissions for Maps](#) , on page 1593).

---

- [Understanding Map Elements](#) , on page 1599

## Saving Maps

To save the active map, select **Map > Save Map**. Any changes that you made since you last saved it are saved. If you did not save the map previously, the Save Map As dialog box opens, enabling you to assign a name to the map and save it.

To save a map under a new name, select **Map > Save Map As**. The map name can be as long as 256 characters, but cannot be the reserved names “Default Map” or “New Map.”

If you close a map that contains unsaved changes, you are prompted to save the changes.

If your Security Manager session closes automatically because of inactivity when a map is open with unsaved changes, the current version of the map is saved if it has a name. If you have not yet saved the map, the map is discarded. For example, if you generate the default map, or create a new map, and do not save it before your session times out, you cannot retrieve that map.

## Deleting Maps

If you no longer need a map, you can delete it (presuming that you have edit permission). Deleting a map does not delete any devices or VPNs shown on the map, nor does it delete or modify their configurations; only the map is deleted.

When you delete a map, it is permanently deleted from the server. Other users cannot use the deleted map.

To delete a map, select **Map > Delete Map**, select the map you want to delete from the available maps list and click **OK**. You are asked to confirm the deletion.

You must already be in Map view (select **View > Map View**) to delete a map.

## Exporting Maps

When viewing a map, you can export the map to a scalable vector graphics (SVG) image file for use outside of Security Manager.

#### Related Topics

- [Working With Maps](#) , on page 1593
- [Understanding Map Elements](#) , on page 1599

- 
- Step 1** Select **Map > Export Map**. The Export Topology Map to SVG dialog box opens.
- Step 2** Browse to the location in which to save the file.
- Step 3** Enter a filename in the File name field. The correct file extension will be added for you.
- Step 4** Click **Save**.
- 

## Arranging Map Elements

To move a map element, click and hold, then drag it to the desired position. Attached links move automatically, but the other end of the link remains where it is.

You can also automatically arrange the network nodes on the map in several predefined layouts. Only nodes that are already displayed on the map are arranged. Any nodes that you later add do not follow the layout.

To select a map layout, right-click the map background, then select one of the following layouts from the map context menu:

- Hierarchical Layout—Arranges the nodes in a hierarchical layout.
- Radial Layout—Arranges the nodes in a radial layout.
- Circular Layout—Arranges the nodes in a circular layout.

## Panning, Centering, and Zooming Maps

There are many options for navigating maps. You can pan the map (move around in the map without changing the zoom level), pan a map so that a particular map element is centered in your view, or zoom in or out to see a different map extent.

### To pan a map without changing the zoom level:

- Click the Pan Map toolbar button, then click and hold anywhere on the map and drag the cursor.
- Use the vertical and horizontal scroll bars that are available if the entire map does not fit in the visible page.
- Click and drag the shaded rectangle in the navigation window.
- To center the display of the map on a particular map element, right-click the element, then select **Move to Center**.

### To zoom in or out of a map:

To change the zoom level of the map in predefined increments:

- To zoom in on the map, select **Map > Zoom In**, or click the **Zoom In** toolbar button.
- To zoom out from the map, select **Map > Zoom Out**, or click the **Zoom Out** toolbar button.

- To zoom into a specific area of the map, click **Zoom Rectangle** in the map toolbar, then click the map and drag a rectangle around the area. When you release the mouse button, the map zooms to display the area defined by the rectangle.
- Alternatively, to zoom in to or out of a specific area of the map, click and drag the corner of the shaded rectangle in the navigation window.
- To display the entire map, select **Map > Fit to Window**.
- To display the map at actual size, select **Map > Display Actual Size**.

## Selecting Map Elements

The following table describes how to select map elements. If the selected element contains other elements (for example, a Catalyst switch that contains an FWSM), the containment relationship is shown. For more information, see [Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances](#) , on page 1601.

**Table 498: Selecting Network Elements**

| To select...                        | Do the following                                               |
|-------------------------------------|----------------------------------------------------------------|
| A single map element                | Click the element.                                             |
| Multiple noncontiguous map elements | Ctrl+click each element.                                       |
| Multiple contiguous map elements    | Click the map and drag a rectangle that includes the elements. |

## Searching for Map Nodes

To search for a map node to help you find it in the active map, select **Map > Find Map Node**. This command opens the Find Node dialog box.

The Find Node dialog box initially lists all objects on the map. Use the fields above the list to filter it (the list shows only objects that satisfy all filter criteria). When you find the desired node, select it in the list and click **OK** to have the node centered and selected in the map.

To filter the list, you can:

- Select a node type from the **Type** list to show only objects of that type.
- Enter the name, or at least the initial characters of the name, in the **Name** field. The list is filtered as you type. Your search term must be from the start of the object name. You cannot use wildcard characters.
- Enter all or part of the IP address or subnet mask. The list is filtered as you enter information.

## Using Linked Maps

A linked map is a map that you associate with a map element on another map. Because it is not practical to include all the nodes on a large network in a single map, you can use linked maps to create a hierarchical topology of your network.

You cannot link a node to the another node in the same map.

### Before You Begin

You must create the map to link to before you can link to it.

- 
- Step 1** Right-click the map element to which to link a map, then select **Set Linked Map**. The Set Linked Map dialog box opens.
- Step 2** Select a map to associate with the selected map element, then click **OK**.
- Step 3** To open the linked map, right-click the linked node, then select **Open Linked Map**. The current map closes and the linked map opens.
- 

## Setting the Map Background Properties

You can change the background of a map by changing the color or by configuring an image. A suggested use for a background image is to use an image that represents a geographic area. Then you can position map elements according to their geographic locations.

Some background images are included with Security Manager. You can also transfer images to the server to use as background images. You can use background images of the following file formats: JPEG, GIF, PNG, IVL, and SVG. If you want to use a new image, copy the image file to the Security Manager server file system by connecting directly to the server. For security reasons, Security Manager does not provide a method of transferring files to the server.

To configure the map background, in Map view, select **Map > Map Properties** to open the Map Settings dialog box.

- To configure a background image, select it in the file list. (Select **none** to remove the map's background image.)

If the image is not listed, click **Add** and browse to the file you placed on the server using the Import Background Image dialog box. Click **OK** to have Security Manager add it to the list of available background images.

If you no longer need a listed image, select it and click **Delete**.

---

**Tip** You can control the position and scale of the image using the X and Y coordinates and scale settings. The X,Y source point is the upper left corner of the image. You can use positive or negative numbers. You must experiment to get the results you desire. The scale setting is in percentage.

---

- To change the background color, click **Select** next to the background color field and choose the desired color.

# Displaying Your Network on the Map

You use the map view to represent your network topology by creating maps. A map is a visual representation of your network, or a portion of it if it is too large to fit on a single map. Maps consist of map elements that represent devices, links, and other objects in your network. For more information about map, see [Working With Maps](#), on page 1593.

The following topics describe how to create maps:

- [Understanding Map Elements](#), on page 1599
- [Displaying Managed Devices on the Map](#), on page 1601
- [Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances](#), on page 1601
- [Using Map Objects To Represent Network Topology](#), on page 1602
- [Creating and Managing Layer 3 Links on the Map](#), on page 1604

## Understanding Map Elements

All objects that can appear on a map are map elements. You display map elements on a map to create a representation of a portion of your network. For more information about maps, see [Working With Maps](#), on page 1593. To open a map, see [Opening Maps](#), on page 1594.

The following tables describe the elements that can appear on a map:

- [Table 499: Device Node Types](#), on page 1599 describes the device nodes that can appear on a map. These elements are managed by Security Manager.
- [Table 500: Map Object Types](#), on page 1600 describes the map objects that can appear on a map. These elements are not managed by Security Manager.
- [Table 501: Map Element Indicators](#), on page 1600 describes the map element indicators that can appear with a device node.

**Table 499: Device Node Types**

| Node Type                                    | Icon | Description                                                                                                                            |
|----------------------------------------------|------|----------------------------------------------------------------------------------------------------------------------------------------|
| Firewall security context                    |      | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| Adaptive Security Appliance                  |      | When you select a device, its security contexts are highlighted.                                                                       |
| Firewall                                     |      | When you select a device, its security contexts are highlighted.                                                                       |
| Adaptive Security Appliance security context |      | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| Router                                       |      | Router or VPN concentrator.                                                                                                            |

| Node Type                             | Icon | Description                                                                                                                            |
|---------------------------------------|------|----------------------------------------------------------------------------------------------------------------------------------------|
| Catalyst 6500/7600 or Catalyst switch |      | When you select a Catalyst device node, any Firewall Service Modules contained in it are highlighted.                                  |
| Firewall Services Module (FWSM)       |      | When you select a Firewall Services Module, the security contexts it contains are highlighted on the map.                              |
| FWSM security context                 |      | When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context. |
| IPS Sensor or Security Service Module |      | An IPS sensor.                                                                                                                         |
| VPN connection                        |      | Any type of VPN connection.<br>For GET VPNs, a dashed line indicates the connection between group members and key servers.             |

Table 500: Map Object Types

| Node Type          | Icon | Description                                                                             |
|--------------------|------|-----------------------------------------------------------------------------------------|
| Unmanaged firewall |      | Unmanaged firewall device.                                                              |
| Unmanaged router   |      | Unmanaged router.                                                                       |
| Network            |      | Network with a specified address space.                                                 |
| Host               |      | Network host.<br>Examples: CSA, Syslog Server, CA Server, AAA Host                      |
| Cloud              |      | An unspecified group of map objects that provides connectivity between specified nodes. |
| Layer 3 link       | —    | Layer 3 network connection                                                              |

Table 501: Map Element Indicators

| Indicator  | Icon | Description                    |
|------------|------|--------------------------------|
| Linked map |      | Node is linked to another map. |

### Related Topics

- [Using Map Objects To Represent Network Topology](#) , on page 1602
- [Creating and Managing Layer 3 Links on the Map](#) , on page 1604

## Displaying Managed Devices on the Map

A device node represents a device that is managed by Security Manager. You add a device node to a map by selecting the device from the Security Manager inventory.

When you add a device node to a map, its layer 3 connectivity to other nodes on the map is created automatically. For more information, see [Creating and Managing Layer 3 Links on the Map](#), on page 1604.

You can add, remove, or show managed nodes by the following means:

- **To add devices that are already in the Security Manager inventory**—Select **Map > Show Devices on Map** to open a device selector. Select the desired devices from the list of available devices and click **>>** to move them to the selected devices list. You can select device groups to move all devices in the group. Click **OK** when the list of selected devices has the desired nodes. Only those devices in the selected list are shown on the map.

You can remove devices by selecting them in the selected list and clicking **<<**.

- **To add a new device to the map and the device inventory**—Click the **New Device** button in the map toolbar or right-click the map background and select **New Device**. The New Device dialog box opens. Follow the procedures for adding new devices described in [Adding Devices to the Device Inventory](#), on page 75.
- **To remove a managed node**—Right-click the node and select **Remove from Map**.
- **To locate a device on the open map when in Device view**—Right-click the device in the device selector and select **Show in Map view**. If the device is shown on the active map, it is shown centered and highlighted on the undocked map. You are told that the device cannot be found if the device is not shown on the active map.
- **To locate a device in Device view from the map**—Right-click the device and select **Show in Device View**. Device view is opened with the device selected so that you can edit its policies.

### Related Topics

- [Understanding Map Elements](#), on page 1599
- [Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances](#), on page 1601

## Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances

---

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any enhancements.

---

The containment relationship between Catalyst and Adaptive Security Appliance (ASA) devices and their service modules and security contexts, between PIX 7.x+ devices and FWSM and their security contexts, or between IPS devices and their virtual sensors, is displayed in maps as follows:

- When you select a Catalyst device, nodes that represent its Firewall Services Modules (FWSM) are highlighted.

- When you select an ASA, nodes that represent its Security Service Modules are highlighted.
- When you select a service module, the device that contains it is highlighted.
- When you select an IPS device, the nodes that represent virtual sensors defined on the device are highlighted.
- You can view a list of the security contexts contained in an ASA, firewall, or FWSM device, or the virtual sensors contained in an IPS device, by right-clicking the node and selecting **Show Containment**. This command also shows the service modules in a device that has them.
- When you select a security context node, all its ancestor device nodes are highlighted.
- When you select a virtual sensor, the device on which it is defined is highlighted.

## Using Map Objects To Represent Network Topology

You can add map elements to a map that represent objects (such as devices and links) that Security Manager does not manage. These nodes are called map objects. You can use map objects to create a more useful representation of your network topology. (If you want to add a managed device, see [Displaying Managed Devices on the Map](#), on page 1601.)

You can add layer 3 links between any map elements, whether they are device nodes, map nodes, or a combination of both types.

---

**Tip** To delete a map object, right-click the object and select **Delete Map Object**.

---

**Step 1** Select **Map > Add Map Object**. The Add Map Object dialog box appears (see [Add Map Object and Node Properties Dialog Boxes](#), on page 1603).

**Step 2** Do one of the following:

- If you are adding a map object based on the definition of an Security Manager policy object, click **Copy Policy Object** to open the [Select Policy Object Dialog Box](#), on page 1603. Then, select the type of object (AAA server, network/host, PKI enrollment), click **Select** to choose the object, then click **OK** in the Select Policy Object dialog box. Information from the policy object is entered in the Add Map Object dialog box.

The name of the object is used as the map object name, but you can edit this if desired.

- If you are adding a map object that is not based on a policy object, enter a name for the map object in the **Name** field.

**Step 3** Select the type of object that the node represents from the **Type** list. If you selected a policy object, the type is pre-selected, but you can change the selection.

**Step 4** (Optional) Add interfaces to the node by doing the following for each interface:

- Click **Add** to open the [Interface Properties Dialog Box](#), on page 1604. If items already appear in the list, you can select them and click **Edit** to change them.
- Enter an interface name, IP address, and network mask, then click **OK**.

**Step 5** Click **OK**. The map object is added to the center of the map. Move it to the desired location.

## Add Map Object and Node Properties Dialog Boxes

For unmanaged map objects, the Add Map Object and Node Properties dialog boxes are the same. Use the Add Map Object dialog box to add an object to the map. Use the Node Properties dialog box to view or edit map object properties. For more information, see [Using Map Objects To Represent Network Topology](#), on page 1602.

For managed map objects (such as a managed device), the Node Properties dialog box is read-only. It displays the object name, type, and list of interface names and IP addresses (if any are defined in Security Manager for the device). The reference information below does not apply to this version of the Node Properties dialog box.

### Navigation Path

- To open the Add Map Object dialog box, select **Map > Add Map Object**.
- To open the Node Properties dialog box, right-click a map object or managed device and select **Node Properties**.

### Field Reference

*Table 502: Add Map Object and Node Properties Dialog Boxes for Unmanaged Nodes*

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                      | The name of the map object. If you select a policy object, the name of the object is automatically used, but you can change it.                                                                                                                                                                                                                                                                                                                                                        |
| Copy Policy Object button | Click to browse for a policy object to use as the basis for the map object using the <a href="#">Select Policy Object Dialog Box</a> , on page 1603.                                                                                                                                                                                                                                                                                                                                   |
| Type list                 | The type of object you are creating. If you select a policy object, a type is selected for you, but you can change it if necessary.                                                                                                                                                                                                                                                                                                                                                    |
| Interfaces table          | The interfaces on the node. If you select a policy object, information might have been added to this table. <ul style="list-style-type: none"> <li>• To add an interface, click the <b>Add (+)</b> button and fill in the <a href="#">Interface Properties Dialog Box</a>, on page 1604.</li> <li>• To edit an interface, select it and click the <b>Edit (pencil)</b> button.</li> <li>• To delete an interface, select it and click the <b>Delete (trash can)</b> button.</li> </ul> |

## Select Policy Object Dialog Box

Use the Select Policy Object dialog box to add an object to the map that is defined in a policy object.

Select the type of object that defines the node you want to add to the map from the **Select a Policy Object** list, then click **Select** to select the specific policy object. If you know the object's name, you can type it into the text box instead of clicking Select.

For more information, see [Using Map Objects To Represent Network Topology](#), on page 1602.

### Navigation Path

To open this dialog box, click **Copy Policy Object** in the Add Map Object dialog box (see [Add Map Object and Node Properties Dialog Boxes](#), on page 1603).

## Interface Properties Dialog Box

Use the Interface Properties dialog box to add and edit interfaces on map objects. For more information, see [Using Map Objects To Represent Network Topology](#), on page 1602.

### Navigation Path

To open this dialog box, click the **Add** or **Edit** button in the [Add Map Object and Node Properties Dialog Boxes](#), on page 1603.

### Field Reference

*Table 503: Interface Properties Dialog Box*

| Element                | Description                                                                                          |
|------------------------|------------------------------------------------------------------------------------------------------|
| Interface Name         | The interface name.                                                                                  |
| Interface IP Addr/Mask | The interface IP address and network mask, for example, 10.100.10.0/24 or 10.100.10.0/255.255.255.0. |

## Creating and Managing Layer 3 Links on the Map

A layer 3 link is a line on the map that represents a network connection between two device interfaces.

Layer 3 connectivity information is automatically added to the map when you add map elements that have interface information. When you add a map element that has interface information, one of the following happens:

- If the interface is on a network that is not represented on the map as a network map object, a network map object is added to the map with a layer 3 link to the new map element.
- If the interface is on a network that is represented on the map as a network map object, a layer 3 link is added between the new map element and the network map object.

When you remove a node interface that is a layer 3 link endpoint, the link is also removed.

You can add additional layer 3 links between device nodes and map objects to illustrate your network's connectivity. Adding Layer 3 links to a map does not configure any network devices. Layer 3 links are just visual elements on the map.

You create layer 3 links to connect any two interfaces on a map. Depending on the interfaces that you choose, the layer 3 link might include intermediary networks or network clouds. In some cases, you have the option to select which intermediary networks and networks clouds are inserted between the connected interfaces.

The following procedure explains how to manually create a new layer 3 link.

#### Tips

- The automatic addition of network objects and links is called Autolink. You can configure Autolink to not automatically add private or certain reserved network addresses. To configure these settings, select **Tools > Security Manager Administration**, then click **Autolink**.
- To view the properties of a link, right-click the layer 3 link and select **Link Properties**.
- To delete a layer 3 link, right-click the layer 3 link to be removed and select **Delete Link**. Deleting a layer 3 link does not delete any intermediary network or network clouds between map elements.

- 
- Step 1** In Map view, click **Map > Add Link** or the Add Link button in the toolbar.
- Step 2** Click one of the map elements to connect, then click the other map element to connect.
- Step 3** If the map elements contain interfaces, select the source and destination interfaces for the link in the [Select Interfaces and Link Properties Dialog Boxes](#) , on page 1605, then click **OK**.
- The Add Link dialog box might open, depending on which interfaces you select.
- Step 4** If the [Add Link Dialog Box](#) , on page 1605 opens, select which intermediary objects and network clouds to insert, then click **OK**.
- 

## Select Interfaces and Link Properties Dialog Boxes

The Select Interfaces and Link Properties dialog boxes are used with layer 3 links on maps. These dialog boxes show information about the source and destination devices for the link (the source being the first device you clicked when making the link).

If you are creating a link, the Select Interfaces dialog box is used. If there are interfaces defined for the device in Security Manager, select the desired source and destination interfaces for the link you are creating from the **Source/Destination Interface** list.

- 
- Tip** When creating a link, if there are no interfaces defined for either device, the Interface lists are greyed out. If one device has interfaces defined, both fields are active, but empty for the device that does not have interfaces defined for it. You cannot change the interface when viewing link properties.
- 

#### Navigation Path

For information on how to create layer 3 links or view their properties, see [Creating and Managing Layer 3 Links on the Map](#) , on page 1604.

## Add Link Dialog Box

Use the Add Link dialog box to select how to represent the layer 3 link that you are adding to the map.

The contents of the Add Link dialog box vary according to which nodes and interfaces you are connecting. Select the check boxes for each intermediary map object (network or cloud) that you want to insert between the connected nodes. If desired, you can change the names of the map objects.

### Navigation Path

This dialog box might open when you add a link between nodes, depending on which interfaces you select to connect. For the procedure, see [Creating and Managing Layer 3 Links on the Map](#), on page 1604.

## Managing VPNs in Map View

The following topics describe how to manage VPNs in the Map view:

- [Displaying Existing VPNs on the Map](#), on page 1606
- [Creating VPN Topologies in Map View](#), on page 1606
- [Editing VPN Policies or Peers From the Map](#), on page 1607

## Displaying Existing VPNs on the Map

To display an existing VPN on the map, select **Map > Show VPNs on Map**. You are prompted with a list of existing VPNs. Select the ones you want from the available VPNs list and click >> to move them to the selected list.

---

**Tip** You can also remove a VPN using this command. Select the VPNs you want to remove from the selected VPNs list and click <<. When you remove a VPN, only the VPN tunnels are removed. The device nodes remain on the map.

---

When you display a VPN, all of its member devices are added to the map as device nodes, and all of its tunnels are highlighted. However, devices that you removed from the map previously are not added, even if they are members of a VPN that you display. You can add such devices to the map manually, and their VPN connectivity is displayed.

A VPN tunnel is a line on the map that represents a VPN connection between two devices. VPN tunnels are not added to the map automatically when you add a device node that is a member of a VPN. However, if the VPN was already selected to be shown on the map, adding a device in the VPN to the map will also display the tunnel.

For an explanation of the icons used in the map, see [Understanding Map Elements](#), on page 1599.

## Creating VPN Topologies in Map View

You can create VPN connections between VPN-capable managed device nodes that are displayed on the map. You cannot create Extranet VPNs, however.

To create a VPN, do one of the following:

- Click the **New VPN** button in the toolbar and select the type of VPN you want to configure: point-to-point, hub and spoke, or full mesh.

- Select the devices that you want to participate in the VPN (use Ctrl+click to select multiple devices), and either right click and select the command for the desired type of VPN, or click the **New VPN** button and select the VPN type.

Consider the following tips:

- Select only 2 devices to create a point-to-point VPN.
- If you create a hub-and-spoke VPN, the device you right-click is initially defined as the hub, but you can change that in the wizard.
- While in the wizard, you can add or remove devices. You are not restricted to the devices you selected on the map.

Using either technique, the Create VPN wizard opens, where you can create the VPN. For more information, see [Creating or Editing VPN Topologies](#), on page 1101 or click the Help button in the wizard.

The VPN is displayed on the map when you are finished with the wizard.

#### Related Topics

- [Selecting Map Elements](#), on page 1597

## Editing VPN Policies or Peers From the Map

You can edit VPN policies, or the peers that participate in a VPN, from map view. To edit policies or peers, right-click a VPN tunnel or device node and select one of these commands:

- **Edit VPN Policies**—To open the Site-to-Site VPN Manager, where you can edit the policies that define the VPN. For more information, see [Site-to-Site VPN Manager Window](#), on page 1091.
- **Edit VPN Peers**—To open a dialog box that allows you to configure the peers that participate in the VPN. Click the **Help** button in the dialog box for more information.
- **Show VPN Peers**—To see which devices participate in a VPN without editing the list (VPN Peers dialog box).

If the device participates in more than one VPN, you are first prompted to select the desired VPN (with the Select VPN to Configure dialog box) before the appropriate dialog box is opened.

## Managing Device Policies in Map View

You can perform only basic policy management and configure firewall services policies in Map view. You cannot configure other types of policies. The following topics describe how to manage policies from the Map view:

- [Performing Basic Policy Management in Map View](#), on page 1608
- [Managing Firewall Policies in Map View](#), on page 1608
- [Managing Firewall Settings in Map View](#), on page 1609

## Performing Basic Policy Management in Map View

You can perform some basic policy management tasks in Map view. Right click the device and select one of the following commands:

- **Copy Policies Between Devices**—To copy local device policies from one device to another. For more information on copying policies, see [Copying Policies Between Devices](#) , on page 197.
- **Share Device Policies**—To create shared policies from local device policies. For more information on sharing policies, see [Sharing Multiple Policies of a Selected Device](#) , on page 206.
- **Clone Device**—To create a copy of a device, including its policies. For more information on cloning devices, see [Cloning a Device](#) , on page 126.
- **Preview Configuration**—To view the configuration file that will be generated for the device, including the changes from the previous deployment. For more information on previewing configurations, see [Previewing Configurations](#) , on page 422.
- **Discover Policies on Device**—To discover the policies defined on the device and configure them in Security Manager, wiping out whatever policies are defined in Security Manager for the device. For more information device discovery, see [Discovering Policies on Devices Already in Security Manager](#) , on page 179.

### Related Topics

- [Managing Deployment](#), on page 379
- [Managing the Device Inventory](#), on page 69
- [Managing Policies](#), on page 165

## Managing Firewall Policies in Map View

You can configure firewall policies on a device in Map view. These policies are local to the device rather than being shared policies (you must use Policy view to configure shared policies).

---

**Tip** If you want to assign a shared policy to a device, see [Performing Basic Policy Management in Map View](#) , on page 1608.

---

To configure local firewall policies on a device in Map view, right click the device and select one of the following commands:

- **Edit Firewall Policies > AAA Rules**—To configure AAA policies, which control who is allowed access to the device and what services they are allowed to use once they have access. For more information on configuring AAA rules, see [AAA Rules Page](#) , on page 691.
- **Edit Firewall Policies > Access Rules**—To configure Access Rules policies, which control the traffic that flows through a device. For more information on configuring access rules, see [Access Rules Page](#) , on page 724.

- **Edit Firewall Policies > Inspection Rules**—To configure Inspection Rules policies, which analyze traffic at the application layer and track TCP and UDP sessions to perform refined access control. For more information on configuring inspection rules, see [Inspection Rules Page](#) , on page 772.
- **Edit Firewall Policies > Botnet Traffic Filter Rules**—(ASA 8.2 and later only) To configure Botnet Traffic Filter Rules policies, which monitor web traffic. For more information on configuring botnet traffic filter rules, see [Botnet Traffic Filter Rules Page](#) , on page 913.
- **Edit Firewall Policies > Transparent Rules**—To configure Transparent Rules policies, which define EtherType rules for transparent firewalls. For more information on configuring inspection rules, see [Transparent Rules Page](#) , on page 1009.
- **Edit Firewall Policies > Web Filter Rules**—To configure Web Filter Rules policies, which define rules for web access. For more information on configuring web filter rules, see [Web Filter Rules Page \(ASA/PIX/FWSM\)](#) , on page 885 or [Web Filter Rules Page \(IOS\)](#) , on page 894.
- **Edit Firewall Policies > Zone Based Firewall Rules**—(IOS 12.4(6)T and later only) To configure Zone Based Firewall Rules policies, which configure inspection and web filtering using security zones. For more information on configuring zone based firewall rules, see [Zone-based Firewall Rules Page](#) , on page 987.

#### Related Topics

## Managing Firewall Settings in Map View

You can configure firewall settings policies on a device in Map view. These policies are local to the device rather than being shared policies (you must use Policy view to configure shared policies).

---

**Tip** If you want to assign a shared policy to a device, see [Performing Basic Policy Management in Map View](#) , on page 1608.

---

To configure local firewall settings policies on a device in Map view, right click the device and select one of the following commands:

- **Edit Firewall Settings > AAA Firewall**—(ASA/PIX/FWSM only) To configure AAA Firewall settings policies, which configures proxy, authentication challenge, MAC exempt lists, and other general AAA settings. For more information on configuring AAA firewall settings, see [AAA Firewall Settings Page, Advanced Setting Tab](#) , on page 702 and [AAA Firewall Page, MAC-Exempt List Tab](#) , on page 708.
- **Edit Firewall Settings > Access Control**—To configure Access Control settings policies, which configures optimization and other general access control settings. For more information on configuring access control settings, see [Access Control Settings Page](#) , on page 738.
- **Edit Firewall Settings > AuthProxy**—(IOS devices only) To configure AuthProxy settings policies, which configure general settings for authorization proxies. For more information on configuring authorization proxies, see [AAA Page](#) , on page 710.

- **Edit Firewall Settings > Inspection**—(IOS devices only) To configure Inspection settings policies, which configure timeout and session settings for inspection rules. For more information on configuring inspection settings, see [Configuring Settings for Inspection Rules for IOS Devices](#) , on page 880.
- **Edit Firewall Settings > Web Filter**—To configure Web Filter settings policies, which configure the server used for web filtering. For more information on configuring web filter settings, see [Web Filter Settings Page](#) , on page 899.
- **Edit Firewall Settings > Zone Based Firewall**—(IOS 12.4(6)T and later devices) To configure Zone Based Firewall settings policies, which configure zones and Trend web filter server settings.

## CHAPTER 36

# Getting Started with IPS Configuration

Cisco Intrusion Prevention System (IPS) Sensors are network devices that perform real-time monitoring of network traffic for suspicious activities and active network attacks. The IPS sensor analyzes network packets and flows to determine whether their contents appear to indicate an attack against your network.

Using Cisco Security Manager, you can configure and manage sensors, which can be dedicated stand-alone network appliances, Catalyst 6500 switch modules, service modules running in supported ASA devices or routers, and IPS-enabled Cisco IOS Software images running on integrated services routers. For a full list of supported IPS devices and software versions, see the Supported Devices and Software Versions for Cisco Security Manager document for this version of the product.

This chapter contains the following topics:

- [Understanding IPS Network Sensing](#) , on page 1613
- [Overview of IPS Configuration](#) , on page 1617
- [Identifying Allowed Hosts](#) , on page 1620
- [Configuring SNMP](#) , on page 1621
- [Managing User Accounts and Password Requirements](#) , on page 1627
- [Identifying an NTP Server](#) , on page 1636
- [Identifying DNS Servers](#) , on page 1637
- [Identifying an HTTP Proxy Server](#) , on page 1638

- [Configuring IPS SSHv1 Fallback Settings](#) , on page 1639
- [Configuring the External Product Interface](#) , on page 1640
- [Configuring IPS Logging Policies](#) , on page 1643
- [IPS Health Monitor](#) , on page 1644
- [Configuring IPS Security Settings](#) , on page 1646

## Understanding IPS Network Sensing

Network sensing can be accomplished using Cisco IPS sensors (appliances, switch modules, network modules, and SSMS) and Cisco IOS IPS devices (Cisco IOS routers with IPS-enabled images and Cisco ISRs). These sensing platforms are components of the Cisco Intrusion Prevention System and can be managed and configured through Cisco Security Manager. These sensing platforms monitor and analyze network traffic in real time. They do this by looking for anomalies and misuse on the basis of network flow validation, an extensive embedded signature library, and anomaly detection engines. However, these platforms differ in how they can respond to perceived intrusions.

---

**Tip** Cisco IPS sensors and Cisco IOS IPS devices are often referred to collectively as IPS devices or simply sensors. However, Cisco IOS IPS does not run the full dedicated IPS software, and its configuration does not include IPS device-specific policies. Additionally, the amount of sensing that you can perform with Cisco IOS IPS is more limited. The following sections focus on using dedicated IPS devices, including service modules installed in IOS routers, rather than Cisco IOS IPS. For a discussion focused on Cisco IOS IPS, see [Intrusion Prevention System \(IPS\) Cisco IOS Intrusion Prevention System Deployment Guide on Cisco.com](http://www.cisco.com/go/iosips) and [Configuring IOS IPS Routers, on page 1789](http://www.cisco.com/go/iosips)<http://www.cisco.com/go/iosips> .

---

When an IPS device detects unauthorized network activity, it can terminate the connection, permanently block the associated host, and take other actions.

---

**Note** For more overview information on IPS sensors, including a comparison of the available appliances and service modules and details about device interfaces, see *Introducing the Sensor in Installing Cisco Intrusion Prevention System Appliances and Modules* . A list of these documents for each IPS release is available at [http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/prod\\_installation\\_guides\\_list.html](http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/prod_installation_guides_list.html) .

---

This section contains the following topics:

- [Capturing Network Traffic](#) , on page 1614
- [Correctly Deploying the Sensor](#) , on page 1616
- [Tuning the IPS](#) , on page 1616

## Capturing Network Traffic

The sensor can operate in either promiscuous or inline mode. The following illustration shows how you can deploy a combination of sensors operating in both inline (IPS) and promiscuous (IDS) modes to protect your network.

Figure 43: Comprehensive IPS Deployment Solutions

The command and control interface is always Ethernet. This interface has an assigned IP address, which allows it to communicate with the manager workstation or network devices (Cisco switches, routers, and firewalls). Because this interface is visible on the network, you should use encryption to maintain data privacy. SSH is used to protect the CLI and TLS/SSL is used to protect the manager workstation. SSH and TLS/SSL are enabled by default on the manager workstations.

When responding to attacks, the sensor can do the following:

- Insert TCP resets via the sensing interface.

**Note** You should select the TCP reset action only on signatures associated with a TCP-based service. If selected as an action on non-TCP-based services, no action is taken. Additionally, TCP resets are not guaranteed to tear down an offending session because of limitations in the TCP protocol.

- Make ACL changes on switches, routers, and firewalls that the sensor manages.

---

**Note** ACLs may block only future traffic, not current traffic.

---

- Generate IP session logs, session replay, and trigger packets display.

IP session logs are used to gather information about unauthorized use. IP log files are written when events occur that you have configured the appliance to look for.

- Implement multiple packet drop actions to stop worms and viruses.

## Correctly Deploying the Sensor

Before you deploy and configure your sensors, you should understand the following about your network:

- The size and complexity of your network.
- Connections between your network and other networks, including the Internet.
- The amount and type of traffic on your network.

This knowledge will help you determine how many sensors are required, the hardware configuration for each sensor (for example, the size and type of network interface cards), and how many managers are needed.

You should always position the IPS sensor behind a perimeter-filtering device, such as a firewall or adaptive security appliance. The perimeter device filters traffic to match your security policy thus allowing acceptable traffic in to your network. Correct placement significantly reduces the number of alerts, which increases the amount of actionable data you can use to investigate security violations. If you position the IPS sensor on the edge of your network in front of a firewall, your sensor will produce alerts on every single scan and attempted attack even if they have no significance to your network implementation. You will receive hundreds, thousands, or even millions of alerts (in a large enterprise environment) that are not really critical or actionable in your environment. Analyzing this type of data is time consuming and costly.

## Tuning the IPS

Tuning the IPS ensures that the alerts you see reflect true actionable information. Without tuning the IPS, it is difficult to do security research or forensics on your network because you will have thousands of benign events, also known as false positives. False positives are a by-product of all IPS devices, but they occur much less frequently in Cisco IPS devices because Cisco IPS devices are stateful, normalized, and use vulnerability signatures for attack evaluation. Cisco IPS devices also provide risk rating, which identifies high risk events, and policy-based management, which lets you deploy rules to enforce IPS signature actions based on risk rating.

Follow these tips when tuning your IPS sensors:

- Place your sensor on your network behind a perimeter-filtering device.

Proper sensor placement can reduce the number of alerts you need to examine by several thousands a day.

- Deploy the sensor with the default signatures in place.

The default signature set provides you with a very high security protection posture. The Cisco signature team has spent many hours on testing the defaults to give your sensor the highest protection. If you think that you have lost these defaults, you can restore them.

- Make sure that the event action override is set to drop packets with a risk rating greater than 90.

This is the default and ensures that high risk alerts are stopped immediately.

- Filter out known false positives caused by specialized software, such as vulnerability scanner and load balancers by one of the following methods:
  - You can configure the sensor to ignore the alerts from the IP addresses of the scanner and load balancer.
  - You can configure the sensor to allow these alerts and then use Event Viewer to filter out the false positives.
- Filter the Informational alerts.

These low priority events notifications could indicate that another device is doing reconnaissance on a device protected by the IPS. Research the source IP addresses from these Informational alerts to determine what the source is.

- Analyze the remaining actionable alerts:
  - Research the alert.
  - Fix the attack source.
  - Fix the destination host.
  - Modify the IPS policy to provide more information.

## Overview of IPS Configuration

There are a wide variety of devices on which you can configure the Intrusion Prevention System. From a configuration point-of-view, you can separate the devices into two groups: dedicated appliances and service modules (for routers, switches, and ASA devices) that run the full IPS software; and IPS-enabled routers running Cisco IOS Software 12.4(11)T and later (Cisco IOS IPS).

The following procedure is an overview of IPS configuration on dedicated appliances and service modules. For Cisco IOS IPS devices (which does not include IPS service modules installed in a router), see [Overview of Cisco IOS IPS Configuration](#), on page 1792.

---

### Step 1

Install and connect the device to your network. Install the device software and perform basic device configuration. Install the licenses required for all of the services running on the device. The amount of initial configuration that you perform influences what you will need to configure in Security Manager.

Follow the instructions in the [Installing Cisco Intrusion Prevention System Appliances and Modules](#) document for the IPS version you are using.

### Step 2

Add the device to the Security Manager device inventory (see [Adding Devices to the Device Inventory](#), on page 75).

**Tip** You can discover router and Catalyst switch modules when adding the device in which the module is installed. For ASA devices, you must add the service module separately.

**Step 3** Configure the interfaces as described in [Configuring Interfaces](#), on page 1652. You must enable the interfaces connected to your network for the device to function.

For certain types of service module, there are additional policies to configure:

- Router-hosted service modules—Configure the **IPS Module** interface settings policy on the router. For more information, see [IPS Module Interface Settings on Cisco IOS Routers](#), on page 2346.
- IDSM—Configure the **IDSM Settings** Catalyst platform policy. For more information, see [IDSM Settings](#), on page 2692.
- IPS modules on ASA devices—Configure the **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** policy on the host ASA to specify the traffic that should be inspected. For more information, see [About IPS Modules on ASA Devices](#), on page 2294 and [Service Policy Rules Page](#), on page 2283.

**Step 4** Use the **Virtual Sensors** policy to assign interfaces to the virtual sensors, including the base vs0 virtual sensor that exists for all IPS devices. For information about virtual sensor settings and assigning interfaces to a virtual sensor, see [Defining A Virtual Sensor](#), on page 1669.

If the device supports it, and you have a need for it, you can also create user-defined virtual sensors so that a single device acts like multiple sensors. Most of the IPS configuration is done on the parent device, but you can configure unique settings per virtual sensor for signatures, anomaly detection, and event actions. For more information, see [Configuring Virtual Sensors](#), on page 1665.

**Step 5** Configure basic device access platform policies. These policies determine who can log into the device:

- **AAA**—Configure this policy if you want to use a RADIUS server to control access to the device. You can use AAA control in conjunction with local user accounts defined in the User Accounts policy. See [Configuring AAA Access Control for IPS Devices](#), on page 1634.
- **Allowed Hosts**—The addresses of hosts who are allowed access. Ensure that the Security Manager server is included as an allowed host, or you cannot configure the device using Security Manager. See [Identifying Allowed Hosts](#), on page 1620.
- **SNMP**—Configure this policy if you want to use an SNMP application to manage the device. See [Configuring SNMP](#), on page 1621.
- **Password Requirements**—You can define the acceptable characteristics of a user password. See [Configuring User Password Requirements](#), on page 1633.
- **User Accounts**—The user accounts defined on the device. See [Configuring IPS User Accounts](#), on page 1631.

**Step 6** Configure basic server access platform policies. These policies identify the servers to which the device can connect:

- **External Product Interface**—If you use Management Center for Cisco Security Agents, configure this policy to allow the sensor to download host postures from the application. See [Configuring the External Product Interface](#), on page 1640.
- **NTP**—Configure this policy if you want to use a Network Time Protocol server to control the device time. See [Identifying an NTP Server](#), on page 1636.
- **DNS, HTTP Proxy**—The DNS and HTTP Proxy policies are required only if you configure global correlation. They identify a server that can resolve DNS names to IP addresses. Use the HTTP Proxy policy if your network

requires the use of a proxy to make Internet connections; otherwise, use the DNS policy. See [Identifying DNS Servers](#) , on page 1637 or [Identifying an HTTP Proxy Server](#) , on page 1638.

- Step 7** Configure the Logging policy if you want non-default logging. See [Configuring IPS Logging Policies](#) , on page 1643.
- Step 8** Configure IPS signatures and event actions. Event action policies are easier to configure than creating custom signatures, so try to use event action filters and overrides to modify signature behavior before trying to edit specific signatures. For more information, see the following topics:
- [Configuring Event Action Rules](#) , on page 1711
  - [Configuring Signatures](#) , on page 1680
- Step 9** If you use any of the Request Block or Request Rate Limit event actions, configure blocking or rate limiting hosts. See [Configuring IPS Blocking and Rate Limiting](#) , on page 1765.
- Step 10** Configure other desired advanced IPS services. See the following topics:
- [Configuring Global Correlation](#) , on page 1751
  - [Configuring Anomaly Detection](#) , on page 1742
- Step 11** Maintain the device:
- Update and redeploy configurations as necessary.
  - Apply updated signature and engine packages. For information about checking for updates, applying them, and setting up regular automated updates, see [Managing IPS Updates](#) , on page 1780.
  - Manage the device licenses. You can update and redeploy licenses, or automate license updates. For more information, see the following topics:
    - [Updating IPS License Files](#) , on page 1777
    - [Redeploying IPS License Files](#) , on page 1778
    - [Automating IPS License File Updates](#) , on page 1779
  - Manage the certificates required for SSL (HTTPS) communication. These certificates expire, so you need to regenerate them approximately every 2 years. For information on regenerating certificates and ensuring that the certificates defined on the device are synchronized with those stored in the Security Manager certificate store, see [Managing IPS Certificates](#) , on page 1786.
- Step 12** Monitor the device:
- Use the Event Viewer application to view alerts generated from the device. You can open Event Viewer from the Launch menu in Configuration Manager or Report Manager, or from the Windows Start menu.
    - For information on using Event Viewer, see [Viewing Events](#) , on page 2703.
    - For an example of how to filter IPS alerts, see [Removing False Positive IPS Events from the Event Table](#) , on page 2770.
  - Use the Report Manager application to generate reports on IPS usage, including comparisons of inline vs. promiscuous mode, and global correlation vs. traditional inspection. You can also analyze top attackers, victims, signatures, blocked signatures, and perform target analysis. The following topics explain Report Manager and the IPS reports in more detail:

- [Managing Reports, on page 2773](#)
- [Understanding General IPS Reports , on page 2791](#)
- [Understanding IPS Top Reports , on page 2790](#)
- [Opening and Generating Reports , on page 2792](#)

---

## Identifying Allowed Hosts

Use the Allowed Hosts policy to identify which hosts or networks have permission to access the IPS sensor. By default, no hosts are permitted to access a sensor, so you must add hosts or networks to this policy.

Specifically, you must add either the IP address of the Security Manager server, or its network address, or Security Manager cannot configure the device. Also add the addresses of all other management hosts that you use, such as CS-MARS.

---

**Tip** If you add host addresses only, you will be limited to using those workstations to access the device. Instead, you can specify network addresses to allow all hosts connected to specific “safe” networks access.

---

---

**Step 1** Do one of the following to open the Allowed Hosts policy:

- (Device view) Select **Platform > Device Admin > Device Access > Allowed Hosts** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Allowed Hosts**, then select an existing policy or create a new one.

**Step 2** Do one of the following:

- To add an entry, click the **Add Row** button and fill in the Access List dialog box.

You can add up to 512 entries.

- To edit an entry, select it and click the **Edit Row** button.
- To delete an entry, select it and click the **Delete Row** button.

**Step 3** When adding or editing an entry, specify the host or network address in the Add or Modify Access List dialog box, then click **OK**. You can enter addresses using the following formats:

- Host address—A simple IP address, such as 10.100.10.10.
  - Network address—A network address and mask, such as 10.100.10.0/24 or 10.100.10.0/255.255.255.0.
  - A network/host policy object—Click **Select** to select an existing object or to create a new one. To use the object in this policy, it must have a single value, either a single network or a single host.
-

# Configuring SNMP

SNMP is an application layer protocol that facilitates the exchange of management information between network devices. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

SNMP is a simple request/response protocol. The network-management system issues a request, and managed devices return responses. This behavior is implemented by using one of four protocol operations: Get, GetNext, Set, and Trap.

You can configure the sensor for monitoring by SNMP. SNMP defines a standard way for network management stations to monitor the health and status of many types of devices, including switches, routers, and sensors.

You can configure the sensor to send SNMP traps. SNMP traps enable an agent to notify the management station of significant events by way of an unsolicited SNMP message.

Trap-directed notification has the following advantage—if a manager is responsible for a large number of devices, and each device has a large number of objects, it is impractical to poll or request information from every object on every device. The solution is for each agent on the managed device to notify the manager without solicitation. It does this by sending a message known as a trap of the event.

After receiving the event, the manager displays it and can take an action based on the event. For example, the manager can poll the agent directly, or poll other associated device agents to get a better understanding of the event.

---

**Tip** Trap-directed notification results in substantial savings of network and agent resources by eliminating frivolous SNMP requests. However, it is not possible to totally eliminate SNMP polling. SNMP requests are required for discovery and topology changes. In addition, a managed device agent cannot send a trap if the device has had a catastrophic outage.

---

This procedure describes how to configure SNMP on an IPS sensor so that you can manage the sensor with an SNMP management station, including the configuration of traps.

- 
- Step 1** Do one of the following to open the SNMP policy:
- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
  - (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one.
- Step 2** On the **General Configuration** tab, configure at least the following options. For a complete description of all available options, see [General SNMP Configuration Options](#), on page 1623.
- **Enable SNMP Gets/Sets**—Select this option to enable the SNMP management workstation to obtain (get) information, and to modify (set) values on the IPS sensor. If you do not enable this option, the management workstation cannot manage this sensor.
  - **Read-Only Community String**—The community string required for read-only access to the sensor. SNMP get requests from the management station must supply this string to get responses from the sensor. This string gives access to all SNMP get requests.

- **Read-Write Community String**—The community string required for read-write access to the sensor. SNMP set requests from the management station must supply this string to get responses from the sensor; it can also be used on get requests. This string gives access to all SNMP get and set requests.

**Step 3** On the **SNMPv3 Users** tab, add one or more SNMPv3 users to configure SNMPv3 settings on the managed IPS devices. Beginning with version 4.6, Security Manager enables you to configure SNMPv3 settings on the IPS devices it manages. For more information, see [SNMPv3 Users Tab](#), on page 1624.

**Note** SNMPv3 is supported in IPS version 7.2.2 and later, but not in the IPS version 7.3.1. Security Manager can however manage IPS 7.3.1 devices. If you try to use Security Manager to upgrade an IPS device from version 7.2.2, with SNMP policy configured, to version 7.3.1, a mouse-over tooltip displays the message "Selected upgrade is not recommended. Unassign the SNMP policy on the device and deploy it to continue with the upgrade to 7.3.1". For information about managing SNMPv3 policies on IPS devices with version 7.2.2 and later, see the Release Notes for Cisco Intrusion Prevention System 7.2(2).

**Step 4** If you want to configure SNMP traps, click the **SNMP Trap Configuration** tab and configure at least the following options. For a complete description of all available options, see [SNMP Trap Configuration Tab](#), on page 1625.

- **Enable Notifications**—Select this option to allow the sensor to send SNMP traps.
- **Trap Destinations**—Add the SNMP management stations that should be trap destinations. Click the **Add Row (+)** button to add a new destination, or select a destination and click the **Edit Row (pencil)** button to change its configuration.

When adding or editing a trap destination, the trap community string that you enter overrides the default community string entered on the SNMP Trap Configuration tab. The community string appears in the traps sent to this destination and is useful if you are receiving multiple types of traps from multiple agents. For example, a router or sensor could be sending the traps, and if you put something that identifies the router or sensor specifically in your community string, you can filter the traps based on the community string.

To remove a destination, select it and click the **Delete Row (trash can)** button.

**Step 5** If you configure trap destinations, you must also ensure that the desired alerts include the **Request SNMP Trap** action. You have the following options for adding this action:

- (Easy way.) Create an event action override to add the Request SNMP Trap action to all alerts of a specified risk rating (**IPS > Event Actions > Event Action Overrides** policy). For example, you could generate traps for all alerts with a risk rating between 85-100. Event action overrides let you add an action without individually editing each signature. For more information, see [Configuring Event Action Overrides](#), on page 1722.
- (Precise way.) Edit the Signatures policy (**IPS > Signatures > Signatures**) to add the Request SNMP Trap action to the signatures for which you want to send trap notifications. Traps are sent only for signatures that you configure to send traps.

**Note** If the signature has Default for the source, you have to change the source to the Local source before you can change the action. However, if you right-click the Action cell in the signatures table and select **Edit Actions**, then select Request SNMP Trap (along with any other desired action) and click **OK**, the source is automatically changed to Local.

**Step 6** Add the SNMP management stations to the Allowed Hosts policy. The management stations must be allowed hosts to access the sensor. See [Identifying Allowed Hosts](#), on page 1620.

## General SNMP Configuration Options

Use the General Configuration tab on the SNMP page to configure general SNMP parameters and apply them to IPS sensors. For the procedure, see [Configuring SNMP](#), on page 1621.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the General Configuration tab.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one. Select the General Configuration tab.

### Field Reference

*Table 504: General Configuration Tab, SNMP Policy for IPS Sensors*

| Element                     | Description                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable SNMP Gets/Sets       | Whether to enable the SNMP management workstation to obtain (get) information, and modify (set) values on the IPS sensor. If you do not enable this option, the management workstation cannot manage this sensor; the sensor will not respond to SNMP requests.                                                               |
| Read-Only Community String  | The community string required for read-only access to the sensor. SNMP get requests from the management station must supply this string to get responses from the sensor. This string gives access to all SNMP get requests. Use the string to help identify the sensor.                                                      |
| Read-Write Community String | The community string required for read-write access to the sensor. SNMP set requests from the management station must supply this string to get responses from the sensor; it can also be used on get requests. This string gives access to all SNMP get and set requests. Use the string to help identify the sensor.        |
| Sensor Contact              | The network administrator or contact point who is responsible for this sensor.                                                                                                                                                                                                                                                |
| Sensor Location             | The physical location of the sensor, such as building address, name, and room number.                                                                                                                                                                                                                                         |
| Sensor Agent Port           | The port to use for SNMP get/set communication with the sensor. The default is 161. The valid range is 1 to 65535.<br><br>Enter a port number or the name of a port list object, or click <b>Select</b> to select a port list object from a list or to create a new object. The port list object must identify a single port. |
| SNMP Agent Protocol         | The protocol you are using for SNMP, either UDP (the default) or TCP. Select the protocol used by your SNMP management station.                                                                                                                                                                                               |

## SNMPv3 Users Tab

Beginning with version 4.6, Security Manager enables you to configure SNMPv3 settings on the IPS devices it manages. You must add SNMPv3 users to configure SNMPv3 settings on the managed IPS devices.

You can use the SNMPv3 Users tab on the SNMP page to view, add, edit, or delete SNMPv3 users.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMPv3 Users tab.
- (Policy view) Select **IPS > Platform > Device Admin > SNMP**, then select an existing policy or create a new one. Select the SNMPv3 Users tab.

Do one of the following:

- To add an SNMPv3 user, click the **Add Row (+)** button. This opens the Add SNMPv3 User dialog box. Enter the information required to create the user. For detailed information on the settings, see [Add SNMPv3 User Dialog Box](#), on page 1624
- To edit an SNMPv3 user, select it and click the **Edit Row (pencil)** button and make the required changes in the Edit SNMPv3 User dialog box.
- To delete an existing SNMPv3 user, select it and click the **Delete Row (trash can)** button.

### Field Reference

*Table 505: SNMPv3 Users*

| Element                 | Description                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------|
| User Name               | Name of the user on the host that belongs to the SNMP agent.                                           |
| Access Control          | Access privilege for the SNMPv3 user.                                                                  |
| Security Level          | Security level for the SNMPv3 user.                                                                    |
| Authentication Protocol | The authentication protocol keyword is the authentication level used to configure the SNMPv3 user.     |
| Privacy Protocol        | The privacy protocol keyword is the privacy or encryption algorithm used to configure the SNMPv3 user. |

## Add SNMPv3 User Dialog Box

Use the Add SNMPv3 User dialog box to configure a new SNMPv3 user for the managed IPS device.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMPv3 Users tab and click the **Add Row (+)** button.

- (Policy view) Select **IPS > Platform > Device Admin > SNMP**, then select an existing policy or create a new one. Select the SNMPv3 Users tab and click the **Add Row (+)** button.

### Field Reference

*Table 506: Add SNMPv3 Users Dialog Box*

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name                 | Enter a name for the new SNMPv3 user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Access Control            | Select the access privilege for the new SNMPv3 user.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Security Level            | Select one of the following security levels for the SNMPv3 user: <ul style="list-style-type: none"> <li>• <b>NoAuthNoPriv</b>—There is no authentication and no privacy, which means that no security is applied to the messages.</li> <li>• <b>AuthNoPriv</b>—There is authentication but there is no privacy, which means that messages are authenticated.</li> <li>• <b>AuthPriv</b>—Authentication and privacy are configured, which means that messages are authenticated and encrypted.</li> </ul> |
| Authentication Protocol   | Select the authentication protocol keyword that specifies which authentication level should be used. There is no default value.                                                                                                                                                                                                                                                                                                                                                                          |
| Privacy Protocol          | Select the privacy protocol keyword that specifies which privacy or encryption algorithm should be used. For the encryption algorithm, you can specify the AES keyword. There is no default value.                                                                                                                                                                                                                                                                                                       |
| Authentication Passphrase | Enter the authentication passphrase argument that specifies the authentication user password. This password must not be less than eight characters. There is no default value.                                                                                                                                                                                                                                                                                                                           |
| Privacy Passphrase        | Enter the privacy passphrase argument that specifies the encryption user password. This password must not be less than eight characters. There is no default value.                                                                                                                                                                                                                                                                                                                                      |

## SNMP Trap Configuration Tab

Use the SNMP Trap Communication tab on the SNMP page to configure traps and apply them to sensors and to identify recipients that the traps should be sent to. For the procedure, see [Configuring SNMP](#), on page 1621.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMP Trap Configuration tab.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one. Select the SNMP Trap Configuration tab.

## Field Reference

**Table 507: SNMP Trap Configuration Tab, SNMP Policy for IPS Sensors**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Notifications          | <p>Whether to enable the sensor to send trap notifications to the trap destinations whenever a specific type of event occurs in a sensor. If you do not select this option, the sensor does not send traps.</p> <p><b>Tip</b> To have the sensor send SNMP traps, you must also select <b>Request SNMP Trap</b> as the event action when you configure signatures. Traps are sent only for signatures that you configure to send traps.</p>                                                                                                                                                                                                                         |
| Error Filter                  | <p>The type of events that will generate SNMP traps based on the severity of the event: fatal, error, or warning. Select all severities that you want; use Ctrl+click to select multiple values.</p> <p>The sensor sends notifications of events of the selected severities only.</p>                                                                                                                                                                                                                                                                                                                                                                               |
| Enable Detail Traps           | <p>Whether to include the full text of the alert in the trap. If you do not select this option, sparse mode is used. Sparse mode includes less than 484 bytes of text for the alert.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Default Trap Community String | <p>The community string used for the traps if no specific string has been set for the trap destination in the Trap Destinations table.</p> <p><b>Tip</b> All traps carry a community string. By default, all traps that have a community string identical to that of the destination are taken by the destination. All other traps are discarded by the destination. However, you can configure the destination to determine which trap strings to accept.</p>                                                                                                                                                                                                      |
| Trap Destinations table       | <p>The SNMP management stations that will be sent trap notifications. The table shows the IP address of the management station, the community string added to traps from this sensor, and the port to which traps are sent.</p> <ul style="list-style-type: none"> <li>• To add a destination, click the <b>Add Row</b> button and fill in the Add SNMP Trap Communication dialog box (see <a href="#">SNMP Trap Communication Dialog Box</a>, on page 1626).</li> <li>• To edit a destination, select it, click the <b>Edit Row</b> button and make your changes.</li> <li>• To delete a destination, select it and click the <b>Delete Row</b> button.</li> </ul> |

## SNMP Trap Communication Dialog Box

Use the Add or Modify SNMP Trap Communication dialog box to configure SNMP trap destinations. These are the SNMP management stations that should receive traps from the IPS sensor.

### Navigation Path

Go to the **IPS Platform > Device Admin > Device Access > SNMP** policy, select the **SNMP Trap Configuration** tab, and click the **Add Row** button beneath the Trap Destinations table, or select a destination

in the table and click the **Edit Row** button. For more information, see [SNMP Trap Configuration Tab](#), on page 1625.

### Field Reference

*Table 508: SNMP Trap Communication Dialog Box*

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address            | The IP address of the SNMP management station that should receive trap notifications. Enter the IP address or the name of a network/host object, or click <b>Select</b> to select the object from a list or to create a new object. The network/host object must specify a single host IP address.                                                                                                                                                         |
| Trap Community String | The community string of the trap. If you do not enter a trap string, the default trap string defined on the SNMP Trap Communication tab is used for traps sent to this destination.                                                                                                                                                                                                                                                                        |
| Trap Port             | The port used by the SNMP management station to receive traps. Enter the port number or the name of a port list object, or click <b>Select</b> to select the object from a list or to create a new one. The port list object must identify a single port.                                                                                                                                                                                                  |
| SNMPv3 User           | Enter the username of the SNMPv3 user that you configured by using the <a href="#">Add SNMPv3 User Dialog Box</a> , on page 1624. Leave this field blank if you do not want to associate any SNMPv3 user.<br><br><b>Note</b> If you enter a username that is not a configured SNMPv3 user, you will receive an error message while trying to save the SNMP trap communication settings. () Also, note that you can add up to a maximum of 23 SNMPv3 users. |

## Managing User Accounts and Password Requirements

You can configure user accounts and passwords, and general password requirements, for your IPS devices. You can configure local users (defined directly on the device), use a RADIUS AAA server, or use them both in conjunction. The policies used are the **AAA**, **User Accounts**, and **Password Requirements** policies in the **Platform > Device Admin > Device Access** folder.

When you create or edit a local user account in Security Manager, the password you enter must satisfy the requirements defined in the Password Requirements policy. This ensures that new passwords meet your security requirements.

**Tip** If you change the password requirements, and then make changes to any local user account, the new requirements must be met by all user accounts that have passwords managed by Security Manager. This is because Security Manager reconfigures the passwords for all managed accounts if any single account needs to be reconfigured.

The User Accounts policy allows you to centrally manage the local user accounts for your IPS devices. Using a shared policy can help you ensure that all IPS devices contain the same accounts with the same passwords. However, it is important to understand that passwords are encrypted, so Security Manager cannot discover

the actual passwords defined on the device. Security Manager manages the passwords for an account only if you define that password in Security Manager. Security Manager does not manage any user accounts defined in a RADIUS AAA server.

The following topics describe IPS user accounts, and Security Manager discovery and deployment considerations, in more detail:

- [Understanding IPS User Roles](#) , on page 1628
- [Understanding Managed and Unmanaged IPS Passwords](#) , on page 1629
- [Understanding How IPS Passwords are Discovered and Deployed](#) , on page 1629
- [Configuring IPS User Accounts](#) , on page 1631
- [Configuring User Password Requirements](#) , on page 1633
- [Configuring AAA Access Control for IPS Devices](#) , on page 1634

## Understanding IPS User Roles

There are four user roles for IPS user accounts:

- **Viewer**—Users can view the device configuration and events, but they cannot modify any configuration data except their user passwords.
- **Operator**—Users can view everything and they can modify the following options:
  - Signature tuning (priority, disable or enable).
  - Virtual sensor definition.
  - Managed routers.
  - Their user passwords.
- **Administrator**—Users can view everything and they can modify all options that Operators can modify in addition to the following:
  - Sensor addressing configuration.
  - List of hosts allowed to connect as configuration or viewing agents.
  - Assignment of physical sensing interfaces.
  - Enable or disable control of physical interfaces.
  - Add and delete users and passwords.
  - Generate new SSH host keys and server certificates.
- **Service**—Only one user with service privileges can exist on a sensor. The service user cannot log in to IDM or IME. The service user logs in to a bash shell rather than the CLI. The service role is a special role that allows you to bypass the CLI if needed.

---

**Note** The purpose of the Service account is to provide Cisco Technical Support access to troubleshoot unique and unusual problems. It is not needed for normal system configuration and troubleshooting. You should carefully consider whether you want to create a service account. The service account provides shell access to the system, which makes the system vulnerable. However, you can use the service account to create a password if the administrator password is lost. Analyze your situation to decide if you want a service account existing on the system.

---

## Understanding Managed and Unmanaged IPS Passwords

Every IPS local user account has a password, which allows secure user login to the device. These user passwords are encrypted on the IPS device. Thus, when you add an IPS device to the Security Manager inventory, Security Manager cannot read the actual user passwords.

Because Security Manager cannot read the password, it is unable to deploy newly-discovered user account passwords to the device. To avoid putting user accounts into a state where the passwords are unknown and unusable, Security Manager marks discovered user account passwords as **unmanaged**. The status of a password is indicated in the **Is Password Managed?** column of the **Platform > Device Admin > Device Access > User Accounts** policy:

- If **No** is indicated, the password for this account is not configured in Security Manager. When you deploy this policy, Security Manager will not attempt to configure the password for this user account.
- If **Yes** is indicated, the password for this account was configured or updated in Security Manager. When you deploy this policy, Security Manager reconfigures the passwords for all managed accounts, not just the passwords that changed since the last deployment.

Because Security Manager configures even unchanged passwords, all managed passwords must satisfy the password requirements defined in the Password Requirements policy.

Thus, you can have a mix of managed and unmanaged account passwords. For example, you can have a set of shared user accounts that are centrally managed, and manage these account passwords in Security Manager. Other accounts might be unique to individuals; if you never edit these account passwords in Security Manager, the user can manage these passwords individually on the device.

---

**Tip** If you do not want to manage any user accounts in Security Manager, ensure that the User Accounts policy is empty, or simply unassign the policy (right-click the policy and select **Unassign Policy**). Security Manager will not modify user account configurations.

---

## Understanding How IPS Passwords are Discovered and Deployed

Because user passwords are encrypted on IPS devices, Security Manager has to handle them with special care when discovering policies on the device or deploying configurations. When discovering or deploying user accounts on IPS devices, Security Manager does the following:

- **Discovery**—When you add an IPS device to the inventory, or rediscover policies on it, Security Manager determines the current status of each user account, updates the User Account policy with each discovered username and associated role, and marks the user password as unmanaged (as described in [Understanding Managed and Unmanaged IPS Passwords](#), on page 1629).

You cannot view the account status through Security Manager, because it is dynamic and can change. However, the Discovery Status window displays the status at discovery. Accounts can have these statuses:

- **Active**—This state indicates that the account is available for use. Active accounts can be accessed using an authentication token if one has been assigned to the account.
- **Expired**—This state indicates that the account's authentication token has expired and the account can not be accessed using a token until the token has been updated.
- **Locked**—This state indicates that logins to the account have been disabled due to too many failed authentication attempts. You should update the password for these accounts.

**Deployment**—You are warned if any deployed user accounts are in the Expired or Locked state. Any unmanaged passwords are not deployed to the device. Also, keep in mind the following points:

- If you make changes to any user account on the device, all user accounts with managed passwords are reconfigured. If you also changed the Password Requirements policy, all passwords are compared to the new policy and must meet the new requirements.
- If you change the password of the user account you defined in the device's properties for Security Manager to use when configuring the device, after successful deployment, Security Manager updates the password in the device properties to the new password. You do not need to manually update the password. To see device properties, select **Tools > Device Properties**.

This behavior assumes that you selected **Security Manager Device Credentials** for the Connect to Device Using option on the **Tools > Security Manager Administration > Device Communication** page. If you are using the logged-in users credentials for deployment, after successful deployment, the overall deployment is marked as failed, and a message explains how to reestablish connection. See [Device Communication Page](#), on page 530.

- If you use out-of-band change detection, changes to passwords are not detected. However, changes to usernames and roles are detected. For more information about out-of-band change detection, see [Detecting and Analyzing Out of Band Changes](#), on page 424.
- When previewing configurations, you can see changes to the user accounts by selecting to IPS(Delta – User Passwords). However, passwords are masked. For more information, see [Previewing Configurations](#), on page 422.
- If you are rolling back configurations, the user accounts are never rolled back. The current status and configuration of user accounts does not change.

---

**Tip** The IPS sensor can accept public keys for RSA authentication when logging into the device through an SSH client. Each user has an associated list of authorized keys. Users can use these keys instead of passwords. Security Manager ignores these keys during discovery and deployment. Thus, if keys are configured, Security Manager does not remove the configuration.

---

## Configuring IPS User Accounts

Use the User Accounts policy to configure local user accounts for IPS devices. Users can use these accounts to log into the device. You can create new users, modify user privileges and passwords, and delete users.

The user accounts policy should have at least these accounts:

- cisco—An account named “cisco” must exist on the device and you cannot delete it.
- An administrator account that Security Manager can use—Security Manager must be able to log into the device to configure it. Typically, you create an account for this purpose. However, you have the option of having Security Manager use the user account of the person deploying configurations to log into the device. You can configure this using the **Connect to Device Using** option on the **Tools > Security Manager Administration > Device Communication** page. See [Device Communication Page](#) , on page 530.

IPS user account configuration is more complicated than it seems. Before you configure IPS user accounts, read the following topics:

- [Managing User Accounts and Password Requirements](#) , on page 1627
- [Understanding IPS User Roles](#) , on page 1628
- [Understanding Managed and Unmanaged IPS Passwords](#) , on page 1629
- [Understanding How IPS Passwords are Discovered and Deployed](#) , on page 1629
- [Configuring User Password Requirements](#) , on page 1633
- [Configuring AAA Access Control for IPS Devices](#) , on page 1634

### Tips

- Cisco IOS IPS devices use the same user accounts that are defined for the router. This procedure does not apply to Cisco IOS IPS configurations.
- If you change the password for the user defined in the device properties, which Security Manager uses to deploy configurations to the device, Security Manager uses the existing credentials defined in the device properties to log into the device and deploy changes. After successful deployment, the device properties are then changed to use your new settings. For more information on credentials in device properties, see [Device Credentials Page](#) , on page 112.

### Related Topics

- [Filtering Tables](#) , on page 50
- [Table Columns and Column Heading Features](#) , on page 51

---

**Step 1** Do one of the following to open the User Accounts policy:

- (Device view) Select **Platform > Device Admin > Device Access > User Accounts** from the Policy selector.

- (Policy view) Select **IPS > Platform > Device Admin > Device Access > User Accounts**, then select an existing policy or create a new one.

The policy shows existing user accounts, including the username, role, and whether the password is managed by Security Manager (as explained in [Understanding Managed and Unmanaged IPS Passwords](#), on page 1629).

**Step 2** Do one of the following:

- To add a user account, click the **Add Row (+)** button. This opens the Add User dialog box. Enter the information required to define the account. For detailed information on the settings, see [Add User and Edit User Credentials Dialog Boxes](#), on page 1632.
- To edit a user account, select it and click the **Edit Row (pencil)** button and make the required changes in the Edit User dialog box.

You cannot change a user role to or from the Service role.

- To delete a user account, select it and click the **Delete Row (trash can)** button. You cannot delete the account named cisco.

**Tip** All password changes must meet the requirements of the Password Requirements policy. If you change the requirements policy, all new user accounts, or edited accounts, are tested against the new requirements. Although the passwords for existing unedited user accounts are not tested, they too must meet the password requirements if you change any user account defined in this policy, because Security Manager will deploy all of the accounts during the next configuration deployment. Passwords are checked for conformity when you validate policies, which typically happens when you submit changes to the database. For more information, see [Understanding How IPS Passwords are Discovered and Deployed](#), on page 1629.

## Add User and Edit User Credentials Dialog Boxes

Use the Add User or Edit User Credentials dialog boxes to add or edit IPS device user accounts.

### Navigation Path

From the IPS platform User Accounts policy, click the **Add Row (+)** button to create a new account, or select an existing account and click the **Edit Row (pencil)** button. For information on accessing the User Accounts policy, see [Configuring IPS User Accounts](#), on page 1631.

### Field Reference

*Table 509: Add or Edit User Dialog Box*

| Element   | Description                                                                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| User Name | The username for the account. The name can be 1 to 64 characters, including uppercase and lowercase letters and numbers, plus the special characters ( ) + : , _ / - ] + \$.<br>You cannot change the username when editing an account. |

| Element  | Description                                                                                                                                                                                                                                                                                      |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Password | The password for this user account. Enter the password in both fields.                                                                                                                                                                                                                           |
| Confirm  | The password must conform to the Password Requirements policy for IPS devices; see <a href="#">Configuring User Password Requirements</a> , on page 1633.                                                                                                                                        |
| Role     | The role for this user. For an explanation of these roles, see <a href="#">Understanding IPS User Roles</a> , on page 1628.<br><br><b>Tip</b> When editing a user account, you cannot select the Service role. When editing an account assigned to the Service role, you cannot change the role. |

## Configuring User Password Requirements

Use the IPS platform Password Requirements policy to configure the rules for passwords for local IPS device user accounts. All user-created sensor passwords must conform to the requirements defined in this policy. You can configure password requirements for sensor running IPS software version 6.0 or later.

**Tip** The requirements you define here determine what is considered an acceptable password in the User Accounts policy (see [Configuring IPS User Accounts](#) , on page 1631). If you change this policy, it can be applied even to unchanged user accounts. For more information about the implications of deploying changes to this policy, see [Understanding How IPS Passwords are Discovered and Deployed](#) , on page 1629.

To configure IPS password requirements, select one of the following policies:

- (Device view) Select **Platform > Device Admin > Device Access > Password Requirements** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Password Requirements** from the Policy Type selector, then select an existing policy or create a new one.

The following table explains the password requirement options that you can configure.

**Table 510: Password Requirements Policy**

| Element       | Description                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attempt Limit | How many times a user is allowed to try to log into the device before you lock the user account due to excessive failed attempts.<br><br>The default is 0, which indicates unlimited authentication attempts. For security purposes, you should change this number. |

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Size Range                     | <p>The minimum and maximum size allowed for user passwords; separate the minimum and maximum with a hyphen. The range is 6 to 64 characters; the default is 8-64.</p> <p><b>Tip</b> If you configure non-zero values for any of the minimum characters options, the minimum size you enter in the Size Range field must be equal to or greater than the sum of those values. For example, you cannot set a minimum password size of eight and also require that passwords must contain at least five lowercase and five uppercase characters.</p> |
| Minimum Digit Characters       | The minimum number of numeric digits that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Minimum Uppercase Characters   | The minimum number of uppercase alphabet characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Minimum Lowercase Characters   | The minimum number of lowercase alphabet characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Minimum Other Characters       | The minimum number of non-alphanumeric printable characters that must be in a password.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Number of Historical Passwords | The number of historical passwords that you want the sensor to remember for each account. Any attempt to change the password of an account fails if the new password matches any of the remembered passwords. If you specify 0, no previous passwords are remembered.                                                                                                                                                                                                                                                                             |

## Configuring AAA Access Control for IPS Devices

Use the AAA policy to configure AAA access control for your IPS devices. The device must use IPS Software release 7.0(4) or above or 7.1.3 or above to configure AAA; for example, neither 7.1.1 nor 7.1.2 supports AAA.

You can configure the IPS device to use a RADIUS AAA server to authenticate user access to the device. By configuring AAA, you can reduce the number of local users defined on the device and take advantage of your existing RADIUS setup. If you configure a AAA server, you can configure the device to allow local user accounts as a fallback mechanism if the RADIUS servers are unavailable.

When configuring AAA, you identify the RADIUS server using a AAA server policy object. You can create the object while configuring the policy, or you can create it in the Policy Object Manager. When you configure the AAA server object, you must adhere to the following restrictions:

- **Host**—You must specify the IP address; you cannot use a DNS name.
- **Timeout**—If you enter a timeout value, it must be from 1 to 512 seconds. The generic AAA server object allows higher numbers, but IPS has a more limited timeout range. The default is 3.
- **Protocol**—RADIUS is the only supported protocol.
- **Key**— You must specify the shared secret key that is defined on the RADIUS server. Although this field is optional for a generic AAA server object, IPS requires a key.

- **Port**—Ensure that the RADIUS Authentication/Authorization port is correct. Note that the default port in the AAA server object is different from the IPS default, which is 1812. You will need to change the port if you want to use the IPS default.

For more information about configuring AAA server objects, see [Creating AAA Server Objects](#), on page 260.

---

**Tip** You must ensure that the user account configured in the device properties exists in the RADIUS server or as a local user account, depending on the authorization method that you use. If you switch between local and AAA modes, or change AAA servers, you must ensure that the account is defined in whatever user account database you are using. If you are using AAA with local fallback, the account should be defined in all databases. This account must exist, with the same password defined in the Security Manager device properties for the device, or deployment to the device will fail. The user account used for discovery and deployment must have administrator privileges.

---

#### Related Topics

- [Managing User Accounts and Password Requirements](#), on page 1627
- [Configuring IPS User Accounts](#), on page 1631

---

#### Step 1

Do one of the following:

- (Device view) Select **Platform > Device Admin > Device Access > AAA** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > AAA**, then select an existing policy or create a new one.

#### Step 2

Configure the following basic properties:

- **Authentication Mode**—Whether to use Local or AAA mode. Local mode uses user accounts defined on the IPS device only. With AAA mode, the RADIUS servers are the primary means of user authentication, and you can configure local user accounts as a fallback mechanism. The default is Local. You must select AAA to configure any other options in this policy.
- **Primary RADIUS Server, Secondary RADIUS Server**—The main (primary) AAA server and a backup server, if any. Enter the name of the AAA server policy object that identifies the RADIUS server, or click **Select** to select it from a list of objects or to create a new object.

When authenticating users, the IPS device sends the user authentication attempt to the primary server. The secondary server is contacted only if the request to the primary server times out.

#### Step 3

Configure the following optional properties if you want non-default values:

- **Console Authentication**—How you want to authenticate users who access the IPS device through the console:
  - Local—Users connected through the console port are authenticated through local user accounts.
  - Local and RADIUS—Users connected through the console port are authenticated through RADIUS first. If RADIUS fails, local authentication is attempted.
  - RADIUS—Users connected through the console port are authenticated by RADIUS. If you also select Enable Local Fallback, then users can also be authenticated through the local user accounts.

- **RADIUS NAS ID**—The Network Access ID, which identifies the service requesting authentication. The value can be no NAS-ID, cisco-ips, or a NAS-ID already configured on the RADIUS server. The default is cisco-ips.
- **Enable Local Fallback**—Whether you want to fall back to local user account authentication if all RADIUS servers are unavailable. This option is selected by default. Note that local authentication is not attempted if the RADIUS server responds negatively to the logon attempt; local authentication is tried only if no response is received from the RADIUS server.
- **Default User Role**—The role to assign to users who do not have a role assigned in the RADIUS server. You can make Viewer, Operator, or Administrator the default roles, but not Service; select Unspecified to assign no default role (this is the default). For an explanation of user roles, see [Understanding IPS User Roles](#), on page 1628.

**Note** User role configuration is very important. If you do not assign a role to the user, either through the default user role or in the RADIUS server, the sensor prevents user login even if the RADIUS server accepted the username and password.

To assign roles specifically to users on the RADIUS server, you configure the Accept Message for those accounts as either `ips-role=administrator`, `ips-role=operator`, `ips-role=viewer`, or `ips-role=service`. You configure the Accept Message individually for each user account. An example of a Reply attribute for a given user could be configured to return “Hello <user> your ips-role=operator.”

If you configure a service account in the RADIUS server, you must also configure an identical service account locally on the device. For service accounts, both the RADIUS and Local accounts are checked during login.

## Identifying an NTP Server

Use the NTP policy to configure a Network Time Protocol (NTP) server as the time source for the IPS device. Using NTP helps ensure synchronized time among your network devices, which can aid event analysis. NTP is the recommended way to configure time settings on an IPS device.

For detailed information on how to set the time on a sensor, including how to set up a Cisco IOS router as an NTP server, refer to [Configuring Time](#) in *Configuring the Cisco Intrusion Prevention System Sensor Using the Command Line Interface Version 7.0*.

**Tip** Check the time on your IPS sensor if you are having trouble updating your IPS software. If the time on the sensor is ahead of the time on the associated certificate, the certificate is rejected, and the sensor software update fails.

**Step 1** Do one of the following to open the NTP policy:

- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > NTP**, then select an existing policy or create a new one.

**Step 2** In the **NTP Server IP Address** field, enter the IP address of the NTP server. You can also enter the name of a network/host object that identifies the single host address of the server, or click **Select** to select the object from a list or to create a new one.

**Note** Beginning with Cisco Security Manager 4.19, you can configure NTP server with IPV6 address for all ASA 9.12(1) and later devices.

**Step 3** If the NTP server does not require authentication, deselect the **Authenticated NTP** checkbox.

If the NTP server requires authentication, configure the following options:

- **Authenticated NTP**—Select this option to enable authenticated connections.
- **Key, Confirm**—The key value of the NTP server. The key is an MD5 type of key (either numeric or character); it is the key that was used to set up the NTP server.
- **Key ID**—The key ID value of the NTP server, a numeric value between 1 and 65535.

**Tip** The key and key ID are configured on the NTP server; you must obtain them from the NTP server configuration.

## Identifying DNS Servers

If you configure global correlation on an IPS 7.0+ sensor, the sensor must be able to resolve domain names to successfully connect to the update server when downloading global correlation updates. Use the DNS policy to identify the Domain Name System (DNS) servers that the sensor can use to resolve domain names to IP addresses.

**Tip** If your network requires HTTP proxies when making Internet connections, configure the HTTP Proxy policy instead of the DNS policy. See [Identifying an HTTP Proxy Server](#), on page 1638.

**Note** The AIP-SSC-5 service module does not support DNS servers.

**Step 1** Do one of the following to open the HTTP Proxy policy:

- (Device view) Select **Platform > Device Admin > Server Access > DNS** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > DNS**, then select an existing policy or create a new one.

**Step 2** Specify the IP addresses of up to three DNS servers in the **Primary, Secondary, and Tertiary Address** fields. The sensor uses the servers in the order listed; if one server does not respond, the next server is contacted.

You can enter an IP address or the name of a network/host object that contains a server address. Click **Select** to select a network/host object from a list or to create a new one. The network/host object must specify a single host address.

## Identifying an HTTP Proxy Server

If you configure global correlation on an IPS 7.0+ sensor, and your network requires the use of HTTP proxies to connect to the Internet, you need to configure the HTTP Proxy policy to identify a proxy that the IPS sensor can use. When downloading global correlation updates, the IPS sensor connects to the update server using this proxy. The proxy must be able to resolve DNS names.

**Tip** If you do not use HTTP proxies, configure DNS servers so that the IPS sensor can resolve the address of the update server. See [Identifying DNS Servers](#), on page 1637.

**Note** The AIP-SSC-5 service module does not support HTTP proxy servers.

**Step 1** Do one of the following to open the HTTP Proxy policy:

- (Device view) Select **Platform** > **Device Admin** > **Server Access** > **HTTP Proxy** from the Policy selector.
- (Policy view) Select **IPS** > **Platform** > **Device Admin** > **Server Access** > **HTTP Proxy**, then select an existing policy or create a new one.

**Step 2** Configure the following options:

- **Enable Proxy**—Select this option to tell the device to connect through the configured proxy server.
- **IP Address**—Enter the IP address of the proxy server, or the name of the network/host object that contains the server's IP address. Click **Select** to select a network/host object from a list or to create a new one. The network/host object must contain a single host IP address.
- **Port**—Enter the port number used for HTTP connections to the proxy server. The default is 80.

## IPS SSHv2 Known Host Keys

The IPS SSHv2 Known Host Keys policy enables you to configure SSHv2 server host keys (outgoing SSHv2 connections from an IPS sensor to an SSH server). This feature is available on IPS sensors running 7.1(8) and later versions of Cisco IPS.

The host key can be retrieved from an IPS sensor using valid IP addresses; alternatively, it can be entered manually if you know it. The host key retrieval may take few seconds.

**Step 1** Do one of the following to open the IPS SSHv2 Known Host Keys policy:

- (Device view) Select **Platform** > **Device Admin** > **Server Access** > **SSHv2 Known Host Keys** from the Policy selector.

- (Policy view) Select **IPS > Platform > Device Admin > Server Access > SSHv2 Known Host Keys**, then select an existing policy or create a new one.

**Step 2** Click the **Add** button to open the [Add or Edit Known Host RSA Key Dialog Box, on page 1639](#).

**Step 3** Select a row and then click the **Edit** button to open the [Add or Edit Known Host RSA Key Dialog Box, on page 1639](#).

## Add or Edit Known Host RSA Key Dialog Box

Use the Add or Edit Known Host RSA Key dialog box to retrieve an SSHv2 key from an IPS sensor or to enter the key manually if you know it.

### Navigation Path

From the SSHv2 Known Host Keys policy, click the **Add** button beneath the IP Address/Public Key table, or select a row in the table and click the **Edit** button. For information on the SSHv2Known Host Keys policy, see [IPS SSHv2 Known Host Keys, on page 1638](#).

### Field Reference

*Table 511: Add or Edit Known Host RSA Key Dialog Box*

| Element             | Description                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address          | The IP address of the IPS sensor from which you want to retrieve the public key.                                                                                                                                                                                                                                                                                        |
| Retrieve Public Key | Initiates retrieval of the public key from the device identified in the IP Address field.<br><br>The Retrieve Public Key option is available in device view (it is not shown in shared policy view). However, you can enter inline values for the public key in shared policies or retrieve the public key in device view and share it using the "share policy" option. |
| Public Key          | The public key that you know and are able to enter manually.<br><br>For shared policies, you will be able to enter inline values for the host key.                                                                                                                                                                                                                      |

## Configuring IPS SSHv1 Fallback Settings

The IPS SSHv1 Fallback policy is available on IPS sensors running 7.1(8) and later versions of Cisco IPS.

**Step 1** Do one of the following to enable or disable SSHv1 Fallback:

- (Device view) Select **Platform > Device Admin > Server Access >Settings** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > Settings**, then select an existing policy or create a new one.

**Step 2** To enable SSHv1 fallback, click the checkbox.

**Step 3** To disable SSHv1 fallback, clear the checkbox.

---

## Configuring the External Product Interface

Use the External Product Interface policy to configure the way that Security Manager works with Management Center for Cisco Security Agents (CSA MC).

In general, the external product interface is designed to receive and process information from external security and management products. These external security and management products collect information that can be used to automatically enhance the sensor configuration information. Management Center for Cisco Security Agents is the only external product that can be configured to communicate with the IPS. At most two Management Center for Cisco Security Agents servers can be configured per IPS device.

**Tip** Management Center for Cisco Security Agents is no longer an active product. Configure this policy only if you are still using that application. For more information, see [About CSA MC](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 6.0* and <http://www.cisco.com/en/US/products/sw/cscowork/ps5212/index.html>.

---

Management Center for Cisco Security Agents enforces a security policy on network hosts. It has two components:

- Agents that reside on and protect network hosts.
- A management console, which is an application that manages agents. It downloads security policy updates to agents and uploads operational information from agents.

### Before You Begin

Add the external product as an allowed host so that Security Manager allows the sensor to communicate with the external product. For more information, see [Identifying Allowed Hosts](#), on page 1620.

---

**Step 1** Do one of the following to open the External Product Interface policy:

- (Device view) Select **Platform > Device Admin > Server Access > External Product Interface** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > External Product Interface**, then select an existing policy or create a new one.

The **Management Center for Cisco Security Agents** tab shows any existing definitions, including the IP address (or network/host object), URL, and port of the external application, the username and password used to log into it, and whether the connection is enabled. The interface type is always Extended SDEE.

**Step 2** Do one of the following:

- To add a server, click the **Add Row (+)** button. This opens the External Product Interface dialog box. Enter the information required to identify the server and configure the posture ACLs. For detailed information on the settings, see [External Product Interface Dialog Box](#), on page 1641.

You can add at most two servers.

- To edit a server, select it and click the **Edit Row (pencil)** button and make the required changes in the External Product Interface dialog box.
- To delete a server, select it and click the **Delete Row (trash can)** button.

## External Product Interface Dialog Box

Use the Add or Edit External Product Interface dialog box to add or modify interfaces between Management Center for Cisco Security Agents (CSA MC) and the IPS device and the related posture ACLs.

### Navigation Path

From the External Product Interface IPS platform policy, click **Add Row** or select an entry and click **Edit Row**. For information on opening the External Product Interface policy, see [Configuring the External Product Interface](#), on page 1640.

### Field Reference

*Table 512: External Product Interface Dialog Box*

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| External Product's IP Address | The IP address, or the network/host policy object that contains the address, of the external product. Enter the IP address or object name, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                               |
| Interface Type                | Identifies the physical interface type, which is always Extended SDEE.                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable receipt of information | Whether information is allowed to be passed from the external product to the sensor.                                                                                                                                                                                                                                                                                                                                                                    |
| SDEE URL                      | The URL on the CSA MC the IPS uses to retrieve information using SDEE communication. You must configure the URL based on the software version of the CSA MC that the IPS is communicating with as follows: <ul style="list-style-type: none"> <li>• For CSA MC version 5.0—/csamc50/sdee-server.</li> <li>• For CSA MC version 5.1—/csamc51/sdee-server.</li> <li>• For CSA MC version 5.2 and later—/csamc/sdee-server (the default value).</li> </ul> |
| Port                          | The port, or the port list object that identifies the port, being used for communications. Enter the port or port list name, or click <b>Select</b> to select the object from a list or to create a new object.                                                                                                                                                                                                                                         |
| User name<br>Password         | A username and password that can log into the external product.                                                                                                                                                                                                                                                                                                                                                                                         |

| Element                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable receipt of host postures          | Whether to allow the receipt of host posture information from CSA MC. The host posture information received from a CSA MC is deleted if you disable this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Allow unreachable hosts' postures        | Whether to allow the receipt of host posture information for hosts that are not reachable by the CSA MC.<br><br>A host is not reachable if the CSA MC cannot establish a connection with the host on any IP addresses in the host's posture. This option is useful in filtering the postures whose IP addresses may not be visible to the IPS sensor or that might be duplicated across the network. This filter is most applicable in network topologies where hosts that are not reachable by the CSA MC are also not reachable by the IPS, for example if the IPS and CSA MC are on the same network segment.                                                                                                                                                                                                                                                                    |
| Posture ACL table                        | Posture ACLs are network addresses for which host postures are allowed or denied. Use posture ACLs to filter postures that have IP addresses that might not be visible to the IPS or that might be duplicated across the network. <ul style="list-style-type: none"> <li>• To add a posture ACL, click the <b>Add Row (+)</b> button. This opens the Add Posture ACL dialog box. For information on configuring the Posture ACL, see <a href="#">Posture ACL Dialog Box</a> , on page 1642.</li> <li>• To edit a posture ACL, select it and click the <b>Edit Row (pencil)</b> button.</li> <li>• To delete a posture ACL, select it and click the <b>Delete Row (trash can)</b> button.</li> <li>• To change the priority of an ACL, select it and click the Up or Down button. ACLs are processed in order, and the action associated with the first match is applied.</li> </ul> |
| Enable receipt of watch listed addresses | Whether to allow the receipt of the watch list information from CSA MC. The watch list information received from a CSA MC is deleted if you disable this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Manual Watch List RR increase            | The percentage of the manual watch list risk rating (RR). The default is 25, and the valid range is 0 to 35.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Session-based Watch List RR Increase     | The percentage of the session-based watch list risk rating. The default is 25, and the valid range is 0 to 35.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Packed-based Watch List RR Increase      | The percentage of the packet-based watch list risk rating. The default is 10, and the valid range is 0 to 35.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Posture ACL Dialog Box

Use the Add or Modify Posture ACL dialog box to configure posture ACLs for Management Center for Security Agents. Posture ACLs are network addresses for which host postures are allowed or denied. Use posture ACLs to filter postures that have IP addresses that might not be visible to the IPS or that might be duplicated across the network.

Configure the following fields to define a posture ACL:

- **Network Address**—Enter the IP address of a host or network, or the name of a network/host object that specifies one. You can click **Select** to select the object from a list or to create a new object.
- **Action**—Whether host postures will be permitted or denied from the hosts on the network address.

### Navigation Path

From the External Product Interface dialog box (see [External Product Interface Dialog Box](#), on page 1641), click the **Add Row (+)** button underneath the Posture ACL table, or select a posture ACL and click the **Edit Row (pencil)** button.

## Configuring IPS Logging Policies

Use the IPS platform Logging policy to configure traffic flow notifications and Analysis Engine global variables. These settings apply to the general operation of the IPS sensor.

Traffic flow notifications have to do with the flow of traffic across the interface of a sensor. You can configure the sensor to monitor the flow of packets across an interface and send notification if that flow changes (starts and stops) during a specified interval. You can configure the missed packet threshold within a specific notification interval and also configure the interface idle delay before a status event is reported.

The Analysis Engine performs packet analysis and alert detection. It monitors traffic that flows through specified interfaces. For the Analysis Engine, there is only one global variable: Maximum Open IP Log Files.

### Navigation Path

- (Device view) Select **Platform > Logging** from the Policy selector.
- (Policy view) Select **IPS > Platform > Logging**, then select an existing policy or create a new one.

### Field Reference

*Table 513: IPS Logging Page*

| Element                     | Description                                                                                                                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Notifications Tab |                                                                                                                                                                                      |
| Missed Packets Threshold    | The percent of missed packets that has to occur before you want to receive notification. The default is 0, and the range is 0 to 100.                                                |
| Notification Interval       | The length of time, in seconds, that you want to check for the percentage of missed packets. The default is 30, and the range is 5 to 3600.                                          |
| Interface Idle Threshold    | The length of time, in seconds, that you will allow an interface to be idle and not receiving packets before you want to be notified. The default is 30, and the range is 5 to 3600. |
| Analysis Engine Tab         |                                                                                                                                                                                      |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Specify-Flow-Depth        | Lets you specify the inspection depth of the flow. Flow depth is the number of bytes inspected in a flow. The new value applies for new flows only. The valid range is from 0 to 429496296. The default is 0.                                                                                                                                                                            |
| Enable Service Activity   | Service activity lets you gather information about service activities for diagnostic purposes. The details are more granular and have port level details. Enabling service activity impacts system performance. Enable service activity collection temporarily for diagnostic purposes only. You must reboot the sensor after you enable service activity for the change to take effect. |
| Service Activity Limit    | Sets the limit for how many services you want to enable. The valid range is from 10 to 65536. The default is 15.                                                                                                                                                                                                                                                                         |
| <b>Note</b>               | The Specify-Flow-Depth, Enable Service Activity, and Service Activity Limit fields are applicable to IPS devices of version 7.2(2) or later.                                                                                                                                                                                                                                             |
| Maximum Open IP Log Files | The maximum number of open IP log files that you want to allow on the sensor. The default is 20, and the range is 20 to 100.                                                                                                                                                                                                                                                             |

## IPS Health Monitor

Use the IPS Health Monitor page to configure the metrics, or parameters, that are used to determine the health and network security status of your IPS devices. Your IPS devices use these metrics to assign appropriate severity when sending IPS events. The results appear in the Health and Performance Monitor of Security Manager (Launch > Health and Performance Monitor).

IPS Health Monitor is supported in IPS devices beginning with IPS version 6.1 and in Security Manager beginning with version 4.4. Please note the following special cases:

1. For IPS devices running 7.x, all 11 configuration items in the IPS Security Settings Policy are displayed and monitored properly in the Security Manager GUI.
2. For IPS devices running less than 6.1, the Network Participation and Global Correlation entries are hidden in the device view of Security Manager.
3. Some IPS Health Monitor configuration items are protected entries on the device side itself and cannot be edited. Security Manager informs you in such cases.

If you do not select a metric by checking the check box, it does not appear in the Health and Performance Monitor. You can accept the default configuration or edit the values. Items will be disabled and will not be editable if you do not select a metric.

The overall health is set to the most critical settings of any of the metrics. For instance, if all the selected metrics are normal except for one that is critical, the overall health becomes critical. The IPS sensor sends a health and security status event when the overall health status of the IPS sensor changes.

The security status of the IPS sensor is determined for each virtual sensor using the threat ratings of events detected by the virtual sensors. The security status of the virtual sensor is raised when the virtual sensor detects an event with a threat rating that exceeds the threshold for that virtual sensor. After a threshold has been

exceeded, the security status remains at a critical level until the configured amount of time has passed with no more events being detected at the higher level.

To configure the metrics on the IPS Health Monitor page, select one of the following policies:

- (Device view) Select **Platform > Device Admin > Health Monitor** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Health Monitor** from the Policy Type selector, then select an existing policy or create a new one.

**Note** In policy view, no validation is performed if a shared IPS Health Monitor policy is applied to an IPS device running less than 6.1. Security Manager ignores such policies during deployment to device and captures them in deployment logs also.

The following table explains the IPS Health Monitor Metrics that you can configure.

**Table 514: IPS Security Settings Policy**

| Element               | Description                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inspection Load       | Lets you set a threshold for inspection load and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                             |
| Missed Packet         | Lets you set a threshold percentage for missed packets and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                   |
| Memory Usage          | Lets you set a threshold percentage for memory usage and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                     |
| Signature Update      | Lets you set a threshold for when the last signature update was applied and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                  |
| License Expiration    | Lets you set a threshold for when the license expires and whether this metric is applied to the overall sensor health rating.                                                                                                                                                                                                                                    |
| Event Retrieval       | Lets you set a threshold for when the last event was retrieved and whether this metric is applied to the overall sensor health rating.<br><br><b>Note</b> The event retrieval metric keeps track of when the last event was retrieved by an external monitoring application such as IME. Disable Event Retrieval if you are not doing external event monitoring. |
| Network Participation | Lets you choose whether the Network Participation health metrics contribute to the overall sensor health rating.                                                                                                                                                                                                                                                 |
| Global Correlation    | Let you choose whether the Global Correlation health metrics contribute to the overall sensor health rating.                                                                                                                                                                                                                                                     |
| Application Failure   | Lets you choose to have an application failure applied to the overall sensor health rating.                                                                                                                                                                                                                                                                      |

| Element                            | Description                                                                                                                 |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| IPS in Bypass Mode                 | Let you choose to know if bypass mode is active and have that apply to the overall sensor health rating.                    |
| One or More Active Interfaces Down | Lets you choose to know if one or more enabled interfaces are down and have that apply to the overall sensor health rating. |
| Warning                            | Lets you set the lowest threshold in percentage, days, seconds, or failures for the warning threshold.                      |
| Critical                           | Lets you set the lowest threshold in percentage, days, seconds, or failures for the critical threshold.                     |

## Configuring IPS Security Settings

Use the IPS Security Settings policy to configure two items that are important to the security of your IPS devices:

- **Permit packet capture logging**—With this feature, IPS devices can prevent users from arbitrarily executing packet capture/display/iplog commands. In previous versions of Security Manager, such actions leave no trace of who executed the command.
- **Configurable idle timeout**—When configured, this feature terminates the connection to an IPS device after a period of time that you specify. Its purpose is to increase the security of a CLI session.

---

**Note** These settings are available for devices operating with IPS 7.1.3 and later.

---

To configure IPS security settings, select one of the following policies:

- (Device view) Select **Platform > Security > Settings** from the Policy selector.
- (Policy view) Select **IPS > Platform > Security > Settings** from the Policy Type selector, then select an existing policy or create a new one.

The following table explains the IPS security settings that you can configure.

**Table 515: IPS Security Settings Policy**

| Element                             | Description                                                                         |
|-------------------------------------|-------------------------------------------------------------------------------------|
| Permit packet logging               | Whether to enable packet logging; applies to packet capture/display/iplog commands. |
| CLI Inactivity Timeout (In Minutes) | Terminates the connection to an IPS device after the specified period of time.      |

## CHAPTER 37

# Managing IPS Device Interface

Dedicated IPS appliances and service modules have their own interface configuration, whereas Cisco IOS IPS devices are configured using the regular router interface policies. This chapter explains how to configure interfaces for dedicated IPS appliances and service modules only.

This chapter contains the following topics:

- [Understanding Interfaces](#) , on page 1647
- [Understanding Interface Modes](#) , on page 1648
- [Configuring Interfaces](#) , on page 1652

## Understanding Interfaces

**Tip** This topic is an overview of IPS interfaces. For more detailed information, including the specific interface names and locations for each type of appliance and service module, supported roles, configuration restrictions, and hardware considerations, refer to the “Configuring Interfaces” chapter of the [Installing and Using Cisco Intrusion Prevention System Device Manager](#) for the IPS software version you are using on Cisco.com. The information is also in the IME and CLI guides. For general information, see <http://www.cisco.com/go/ips>.

The sensor interfaces are named according to the maximum speed and physical location of the interface. For example, GigabitEthernet2/1 supports a maximum speed of 1 Gigabit and is the second-from-the-right interface in the second-from-the bottom expansion slot.

There are three interface roles:

- **Command and control**—The command and control interface has an IP address and is used for configuring the sensor. It receives security and status events from the sensor and queries the sensor for statistics.

The command and control interface is permanently enabled. It is permanently mapped to a specific physical interface, which depends on the specific model of sensor. You cannot use the command and control interface as either a sensing or alternate TCP reset interface. See the IPS document cited above for a list of command and control interfaces by device type.

- **Sensing**—Sensing interfaces are used by the sensor to analyze traffic for security violations. A sensor has one or more sensing interfaces depending on the sensor. Sensing interfaces can operate individually in promiscuous mode or you can pair them to create inline interfaces. In promiscuous mode, packets do not flow through the sensor; the sensor analyzes a copy of the monitored traffic. In inline mode, the IPS

is in the traffic flow and can directly affect the traffic. For more information about sensing modes, see [Understanding Interface Modes](#) , on page 1648.

---

**Note** On appliances, all sensing interfaces are disabled by default. You must enable them to use them. On modules, the sensing interfaces are permanently enabled. See the IPS document cited above for a list of sensing interfaces by device type.

---

- **Alternate TCP reset**—You can configure sensors to send TCP reset packets to try to reset a network connection between an attacker host and its intended target host. In some installations when the interface is operating in promiscuous mode, the sensor may not be able to send the TCP reset packets over the same sensing interface on which the attack was detected. In such cases, you can associate the sensing interface with an alternate TCP reset interface and any TCP resets that would otherwise be sent on the sensing interface when it is operating in promiscuous mode are instead sent out on the associated alternate TCP reset interface.

If a sensing interface is associated with an alternate TCP reset interface, that association applies when the sensor is configured for promiscuous mode but is ignored when the sensing interface is configured for inline mode (interface or VLAN pair), because TCP resets are always sent on the sensing interfaces in those modes.

---

**Note** With the exception of IDSM-2, any sensing interface can serve as the alternate TCP reset interface for another sensing interface. The alternate TCP reset interface on IDSM-2 is fixed because of hardware limitation. However, there is only one sensing interface on IPS modules (on routers or ASA devices), so you cannot specify an alternate TCP reset interface on them. See the IPS document cited above for a list of eligible alternate TCP reset interfaces by device type, and for more information about the conditions under which you would use one.

---

## Understanding Interface Modes

Sensing interfaces can operate in various modes. The mode configured for an interface determines the traffic it can inspect and how it can respond to events.

This section contains the following topics:

- [Promiscuous Mode](#) , on page 1648
- [Inline Interface Mode](#) , on page 1649
- [Inline VLAN Pair Mode](#) , on page 1649
- [VLAN Group Mode](#) , on page 1650

## Promiscuous Mode

In promiscuous mode, packets do not flow through the sensor. The sensor analyzes a copy of the monitored traffic rather than the actual forwarded packet. The advantage of operating in promiscuous mode is that the sensor does not affect the packet flow with the forwarded traffic. The disadvantage of operating in promiscuous

mode, however, is the sensor cannot stop malicious traffic from reaching its intended target for certain types of attacks, such as atomic attacks (single-packet attacks). The response actions implemented by promiscuous sensor devices are post-event responses and often require assistance from other networking devices, for example, routers and firewalls, to respond to an attack. While such response actions can prevent some classes of attacks, in atomic attacks the single packet has the chance of reaching the target system before the promiscuous-based sensor can apply an ACL modification on a managed device (such as a firewall, switch, or router).

By default, all sensing interfaces are in promiscuous mode. To change an interface from inline interface mode to promiscuous mode, delete any inline interface that contains that interface and delete any inline VLAN pair subinterfaces of that interface from the interface configuration.

- [Understanding Interfaces](#) , on page 1647
- [Configuring Physical Interfaces](#) , on page 1655

## Inline Interface Mode

Operating in inline interface pair mode puts the IPS directly into the traffic flow and affects packet-forwarding rates making them slower by adding latency. This allows the sensor to stop attacks by dropping malicious traffic before it reaches the intended target, thus providing a protective service. Not only is the inline device processing information on Layers 3 and 4, but it is also analyzing the contents and payload of the packets for more sophisticated embedded attacks (Layers 3 to 7). This deeper analysis lets the system identify and stop or block attacks that would normally pass through a traditional firewall device.

In inline interface pair mode, a packet comes in through the first interface of the pair on the sensor and out the second interface of the pair. The packet is sent to the second interface of the pair unless that packet is being denied or modified by a signature.

#### Notes:

- If the paired interfaces are connected to the same switch, you should configure them on the switch as access ports with different access VLANs for the two ports. Otherwise, traffic does not flow through the inline interface.
- You can configure IPS modules for routers and ASA devices to operate inline even though these modules have only one sensing interface.

#### Related Topics

- [Understanding Interfaces](#) , on page 1647
- [Configuring Inline Interface Pairs](#) , on page 1659

## Inline VLAN Pair Mode

You can associate VLANs in pairs on a physical interface. This is known as inline VLAN pair mode. Packets received on one of the paired VLANs are analyzed and then forwarded to the other VLAN in the pair.

Inline VLAN pair mode is an active sensing mode where a sensing interface acts as an 802.1q trunk port, and the sensor performs VLAN bridging between pairs of VLANs on the trunk. The sensor inspects the traffic it receives on each VLAN in each pair, and can either forward the packets on the other VLAN in the pair, or drop the packet if an intrusion attempt is detected. You can configure an IPS sensor to simultaneously bridge up to 255 VLAN pairs on each sensing interface. The sensor replaces the VLAN ID field in the 802.1q header of each received packet with the ID of the egress VLAN on which the sensor forwards the packet. The sensor drops all packets received on any VLANs that are not assigned to inline VLAN pairs.

**Notes:**

- You cannot use the default VLAN as one of the paired VLANs in an inline VLAN pair.
- Inline VLAN pairs are not supported on IPS modules for routers or ASA devices.

**Related Topics**

- [Understanding Interfaces](#) , on page 1647
- [Configuring Inline VLAN Pairs](#) , on page 1660

## VLAN Group Mode

You can divide each physical interface or inline interface into VLAN group subinterfaces, each of which consists of a group of VLANs on that interface. If you configure multiple virtual sensors, each of them can monitor one or more of these interfaces. This lets you apply multiple policies to the same sensor. The advantage is that now you can use a sensor with only a few interfaces as if it had many interfaces.

---

**Note** You cannot divide physical interfaces that are in inline VLAN pairs into VLAN groups.

---

VLAN group subinterfaces associate a set of VLANs with a physical or inline interface. No VLAN can be a member of more than one VLAN group subinterface. Each VLAN group subinterface is identified by a number between 1 and 255. Subinterface 0 is a reserved subinterface number used to represent the entire unvirtualized physical or logical interface. You cannot create, delete, or modify subinterface 0 and no statistics are reported for it.

When you create a VLAN group, it is either promiscuous or inline:

- Promiscuous VLAN group—If you configure a VLAN group on a physical interface, the VLAN group is promiscuous, as described in [Promiscuous Mode](#) , on page 1648.
- Inline VLAN group—If you configure a VLAN group on an inline interface pair (a logical interface), the VLAN group is inline, as described in [Inline Interface Mode](#) , on page 1649.

Thus, VLAN groups augment the operation of promiscuous mode interfaces or inline interfaces by confining their operation to selected VLANs. Once you assign a VLAN group to an interface (physical or inline interface), the interface is no longer a plain promiscuous or inline interface pair and can only be used for inline VLAN groups.

An unassigned VLAN group is maintained that contains all VLANs that are not specifically assigned to another VLAN group. You cannot directly specify the VLANs that are in the unassigned group. When a VLAN is added to or deleted from another VLAN group subinterface, the unassigned group is updated.

Packets in the native VLAN of an 802.1q trunk do not normally have 802.1q encapsulation headers to identify the VLAN number to which the packets belong. A default VLAN variable is associated with each physical interface and you should set this variable to the VLAN number of the native VLAN or to 0. The value 0 indicates that the native VLAN is either unknown or you do not care if it is specified. If the default VLAN setting is 0, the following occurs:

- Any alerts triggered by packets without 802.1q encapsulation have a VLAN value of 0 reported in the alert.
- Non-802.1q encapsulated traffic is associated with the unassigned VLAN group and it is not possible to assign the native VLAN to any other VLAN group.

**Note** You can configure a port on a switch as either an access port or a trunk port. On an access port, all traffic in a single VLAN is called the access VLAN. On a trunk port, multiple VLANs can be carried over the port, and each packet has a special header attached called the 802.1q header that contains the VLAN ID. This header is commonly referred to as the VLAN tag. However, a trunk port has a special VLAN called the native VLAN. Packets in the native VLAN do not have the 802.1q headers attached. IDSM-2 can read the 802.1q headers for all nonnative traffic to determine the VLAN ID for that packet. However, IDSM-2 does not know which VLAN is configured as the native VLAN for the port in the switch configuration, so it does not know what VLAN the native packets are in. Therefore, you must tell IDSM-2 which VLAN is the native VLAN for that port. Then IDSM-2 treats any untagged packets as if they were tagged with the native VLAN ID.

#### Related Topics

- [Deploying VLAN Groups](#) , on page 1651
- [Understanding Interfaces](#) , on page 1647
- [Configuring VLAN Groups](#) , on page 1662

## Deploying VLAN Groups

Because a VLAN group of an inline pair does not translate the VLAN ID, an inline paired interface must exist between two switches to use VLAN groups on a logical interface. For an appliance, you can connect the two pairs to the same switch, make them access ports, and then set the access VLANs for the two ports differently. In this configuration, the sensor connects between two VLANs, because each of the two ports is in access mode and carries only one VLAN. In this case the two ports must be in different VLANs, and the sensor bridges the two VLANs, monitoring any traffic that flows between the two VLANs. IDSM-2 also operates in this manner, because its two data ports are always connected to the same switch.

You can also connect appliances between two switches. There are two variations. In the first variation, the two ports are configured as access ports, so they carry a single VLAN. In this way, the sensor bridges a single VLAN between the two switches.

In the second variation, the two ports are configured as trunk ports, so they can carry multiple VLANs. In this configuration, the sensor bridges multiple VLANs between the two switches. Because multiple VLANs are carried over the inline interface pair, the VLANs can be divided into groups and each group can be assigned to a virtual sensor. The second variation does not apply to IDSM-2 because it cannot be connected in this way.

## Configuring Interfaces

Use the Interfaces policy for IPS appliances and service modules to configure the interface settings for the device. The following topics explain how to configure the various types of settings. These topics do not apply to Cisco IOS IPS devices, which use the standard router interface policies.

- [Understanding the IPS Interfaces Policy](#) , on page 1652
- [Configuring Physical Interfaces](#) , on page 1655
- [Configuring Bypass Mode](#) , on page 1658
- [Configuring CDP Mode](#) , on page 1659
- [Configuring Inline Interface Pairs](#) , on page 1659
- [Configuring Inline VLAN Pairs](#) , on page 1660
- [Configuring VLAN Groups](#) , on page 1662
- [Viewing a Summary of IPS Interface Configuration](#) , on page 1654

## Understanding the IPS Interfaces Policy

Use the Interfaces policy to configure the physical interfaces, inline pairs, VLAN pairs, and VLAN groups on IPS appliances and service modules. This policy does not apply to Cisco IOS IPS devices.

You can configure any single physical interface to run in promiscuous mode, inline pair mode, inline VLAN pair mode, promiscuous VLAN group, or inline VLAN group, but you cannot configure an interface in a combination of these modes.

---

**Tip** The contents of this policy differ depending on the device type and IPS software version. For example, some devices display the physical interfaces tab only; creating the other types of configurations is not supported. If a tab or option described below does not appear on the policy you are configuring, it does not apply to the device.

---

### Navigation Path

(Device view only) Select **IPS > Interfaces** from the Policy selector.

| Summary tab | <p>A summary of how you have configured the sensing interfaces—the interfaces you have configured for promiscuous mode, the interfaces you have configured as inline pairs, and the interfaces you have configured as inline VLAN pairs.</p> <p>For more information, see <a href="#">Viewing a Summary of IPS Interface Configuration</a> , on page 1654.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Bypass Mode | <p>The bypass mode for the device, which determines how the sensor should handle inline mode traffic when the sensor processes are temporarily stopped for upgrades or when the sensor monitoring processes fail. This is a global setting that applies to all inline mode interfaces on the device. Select the desired option; for a detailed explanation of how each of these options affect inline traffic, see <a href="#">Configuring Bypass Mode</a> , on page 1658.</p> <ul style="list-style-type: none"> <li>• <b>Off (Always inspect inline traffic)</b>—Disables bypass mode. Traffic is always inspected, and if the monitoring process of the sensor is down, traffic stops flowing.</li> <li>• <b>On (Never inspect inline traffic)</b>—Traffic bypasses the Analysis Engine and is never inspected.</li> <li>• <b>Auto (Bypass inspection when analysis engine is stopped)</b>—Traffic is inspected unless the monitoring process of the sensor is down, in which case traffic continues to flow through the sensor uninspected. This is the default. Auto mode is useful during sensor upgrades to ensure that traffic is still flowing while the sensor is being upgraded.</li> </ul> |
| CDP Mode    | <p>How to handle Cisco Discovery Protocol (CDP) packets. The CDP configuration applies globally to all interfaces on the device, however, it has an effect only on inline interfaces (both inline interfaces and inline VLAN pairs). For more information, see <a href="#">Configuring CDP Mode</a> , on page 1659. Select the desired option:</p> <ul style="list-style-type: none"> <li>• <b>Forward CDP packets</b>—To allow CDP packets to pass through the sensor.</li> <li>• <b>Drop CDP packets</b>—To have the sensor drop all CDP packets and not allow them to pass through the sensor. This is the default setting.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Viewing a Summary of IPS Interface Configuration

The Summary tab of the Interfaces policy contains a table summarizing how you have configured the sensing interfaces—the interfaces you have configured for promiscuous mode, the interfaces you have configured as inline pairs, the interfaces you have configured as inline VLAN pairs, inline VLAN groups, and promiscuous VLAN groups. The content of this table changes when you change your interface configuration.

You can configure any single physical interface to run in promiscuous mode, inline pair mode, or inline VLAN pair mode, but you cannot configure an interface in a combination of these modes.

**Tip** Not all service modules have a summary tab.

### Navigation Path

(Device view) Select **Interfaces** from the Policy selector. Click the **Summary** tab.

### Field Reference

**Table 517: IPS Interface Summary Tab**

| Element               | Description                                                                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                  | The name of the interface.<br>The names are FastEthernet or GigabitEthernet for promiscuous interfaces. For inline interfaces, the name is whatever you assigned to the pair.                                                            |
| Subinterface Number   | The subinterface number of the inline VLAN pair or VLAN group. Subinterface numbers can be from 1 to 255.                                                                                                                                |
| Inline Interface Name | The name of the inline interface pair.                                                                                                                                                                                                   |
| Mode                  | The mode for the interface: promiscuous, inline, promiscuous VLAN group, or inline VLAN group and whether there are VLAN pairs. For an explanation of interface modes, see <a href="#">Understanding Interface Modes</a> , on page 1648. |
| VLAN A<br>VLAN B      | The VLAN ID for the first and second VLANs for VLAN pairs. VLAN numbers can be from 1 to 4095.                                                                                                                                           |
| VLAN Range            | The range of VLAN IDs belonging to the VLAN group, for example, 100-200.<br>If the VLAN group is configured to apply to all unassigned VLANs, the field is empty.                                                                        |

## Configuring Physical Interfaces

The Physical Interfaces tab of the IPS Interfaces policy lists the existing physical interfaces on your sensor and their associated settings. You cannot add or delete physical interfaces in this policy; instead, you must use policy discovery to obtain the current list of interfaces from the device. Thus, if you add or remove interface cards (available for some appliances), you must rediscover the device as described in [Discovering Policies on Devices Already in Security Manager](#) , on page 179.

To configure the sensor to monitor traffic, you must enable the interface using this procedure. When you initialized the sensor using the **setup** command (using the command line interface on the IPS), you assigned

the interface or the inline pair to a virtual sensor, and enabled the interface or inline pair. If you need to change your interfaces settings, you can do so on the Physical Interfaces tab. To assign an interface to a virtual sensor, select the Virtual Sensors policy and add or edit the virtual sensor, as appropriate.

---

**Tip** Each physical interface can be divided into VLAN group subinterfaces, each of which consists of a group of VLANs on that interface. For more information, see [Configuring VLAN Groups](#), on page 1662.

---

- 
- Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **Physical Interfaces** tab (if necessary).
- Step 2** Select the interface whose configuration you want to change and click the **Edit Row** button. The Modify Physical Interface Map dialog box appears.
- Step 3** Make the desired configuration changes and click **OK**. Following are the settings you are most likely to want to change; for a description of all options, see [Modify Physical Interface Map Dialog Box](#), on page 1656.
- **Enabled**—Whether the interface is enabled (**Yes** or **No**). Select Yes to make the interface functional. The value of this option is shown in the Administrative State column in the Physical Interfaces tab.
  - **Default VLAN**—The VLAN to which the interface is assigned.
  - **Specify Interface for TCP Reset**—If you want to assign an alternate TCP reset interface, as described in [Understanding Interfaces](#), on page 1647, select this option, then select the alternate interface from the **interface-name** list.
- 

## Modify Physical Interface Map Dialog Box

Use the Modify Physical Interface Map dialog box to change the configuration of the physical interfaces of an IPS sensor. For the procedure, see [Configuring Physical Interfaces](#), on page 1655.

#### Navigation Path

(Device view) Select **Interfaces** from the Policy selector. On the **Physical Interfaces** tab, select an interface and click the **Edit Row** button.

## Configuring Bypass Mode

You can use inline bypass as a diagnostic tool and a failover protection mechanism. Normally, the sensor Analysis Engine performs packet analysis. When inline bypass is activated, Analysis Engine is bypassed, allowing traffic to flow through the inline interfaces and inline VLAN pairs without inspection. Inline bypass ensures that packets continue to flow through the sensor when the sensor processes are temporarily stopped for upgrades or when the sensor monitoring processes fail. There are three modes: on, off, and automatic. By default, bypass mode is set to automatic.

Keep the following factors in mind before deciding which bypass mode to use:

- There are security consequences when you put the sensor in bypass mode. When bypass mode is on, the traffic bypasses the sensor and is not inspected; therefore, the sensor cannot prevent malicious attacks.
- The inline bypass functionality is implemented in software, so it functions only when the operating system is running. If the sensor is powered off or shut down, inline bypass does not work—traffic does not flow through the sensor.
- When the sensor applies a signature or global correlation update, it might trigger bypass. Whether bypass is triggered depends on the traffic load of the sensor and the size of the signature or global correlation update. If bypass mode is turned off, an inline sensor stops passing traffic while the update is being applied.

To change the bypass mode setting, follow these steps:

**Step 1** (Device view) Select the **Interfaces** policy from the Policy selector.

**Step 2** In the **Bypass Mode** field at the bottom of the policy, select the desired option:

- **Off (Always inspect inline traffic)**—Disables bypass mode.

Traffic flows through the sensor for inspection. If the monitoring process of the sensor is down, traffic stops flowing. This means that inline traffic is always inspected.

- **On (Never inspect inline traffic)**—Traffic bypasses the Analysis Engine and is not inspected. This means that inline traffic is never inspected.
- **Auto (Bypass inspection when analysis engine is stopped)**—Traffic flows through the sensor for inspection unless the monitoring process of the sensor is down. This is the default.

If the monitoring process of the sensor is down, traffic bypasses the sensor until the sensor is running again. The sensor then inspects the traffic. Auto mode is useful during sensor upgrades to ensure that traffic is still flowing while the sensor

is being upgraded. Auto mode also helps to ensure traffic continues to pass through the sensor if the monitoring process fails.

---

## Configuring CDP Mode

You can configure the IPS sensor to enable or disable the forwarding of Cisco Discovery Protocol (CDP) packets. The CDP configuration applies globally to all interfaces on the device, however, it has an effect only on inline interfaces (both inline interfaces and inline VLAN pairs).

Cisco Discovery Protocol is a media- and protocol-independent device-discovery protocol that runs on all Cisco-manufactured equipment, including routers, access servers, bridges, and switches. Using CDP, a device can advertise its existence to other devices and receive information about other devices on the same LAN or on the remote side of a WAN. CDP runs on all media that support SNAP, including LANs, Frame Relay, and ATM media.

---

**Tip** The CDP Mode setting is not available on all IPS appliances and service modules. If the CDP Mode field does not appear on the Interfaces policy, the setting does not apply to the device you are configuring.

---

To change the CDP mode setting on a device, follow these steps:

---

**Step 1** (Device view) Select the **Interfaces** policy from the Policy selector.

**Step 2** In the **CDP Mode** field at the bottom of the policy, select the desired option:

- **Forward CDP packets**—To allow CDP packets to pass through the sensor.
- **Drop CDP packets**—To have the sensor drop all CDP packets and not allow them to pass through the sensor. This is the default setting.

---

## Configuring Inline Interface Pairs

You can pair interfaces on your sensor if your sensor is capable of inline monitoring. For more information about inline pairs, see [Inline VLAN Pair Mode](#), on page 1649.

---

**Tip** IPS modules for routers and ASA devices do not need an inline pair for monitoring. You only need to add the physical interface to a virtual sensor.

---

### Related Topics

- [Understanding Interfaces](#), on page 1647
- [Configuring Bypass Mode](#), on page 1658
- [Configuring CDP Mode](#), on page 1659

- [Configuring Physical Interfaces](#) , on page 1655
- [Configuring VLAN Groups](#) , on page 1662
- [Defining A Virtual Sensor](#) , on page 1669
- [Editing Policies for a Virtual Sensor](#) , on page 1673
- [Assigning Interfaces to Virtual Sensors](#) , on page 1668

---

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **Inline Pairs** tab.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add Interface Pair dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit Interface Pair dialog box opens.

**Tip** You can also delete a pair by selecting it and clicking the **Delete Row** button. You cannot delete an inline pair if there is an inline VLAN group. First delete the inline VLAN group from the VLAN Groups tab, and then delete the inline pair.

**Step 3** In the Add or Edit Inline Pairs dialog box, configure the following options:

- **Inline Interface Name**—The name you want to give to this inline pair. The name cannot be longer than 32 characters; alphanumeric and underscore characters are allowed. You cannot edit this name after you create the pair.
- **Interface 1 and 2**—Select the two physical interfaces that you want to form a pair. The lists include only those interfaces that are defined on the Physical Interfaces tab and that are not already part of an inline pair, VLAN pair, or VLAN group.
- **Description**—An optional description for the pair.

**Step 4** Click **OK** to save your changes.

---

## Configuring Inline VLAN Pairs

Use the VLAN Pairs tab of the IPS Interfaces policy to configure the VLAN pairs for physical interfaces. The summary table displays the existing VLAN pairs for each physical interface. You can create multiple VLAN pairs on a single physical interface. For more information about inline VLAN pair mode, see [Inline VLAN Pair Mode](#) , on page 1649.

### Tips

- You cannot create a VLAN pair for an interface if it is already part of an inline interface pair; create VLAN groups for inline interface pairs.
- To create an inline VLAN pair for an interface that is in promiscuous mode and assigned to a virtual sensor, you must first remove the interface from the virtual sensor (using the Virtual Sensors policy) and then create the inline VLAN pair.
- You cannot use the default VLAN as one of the paired VLANs in an inline VLAN pair.

- If your sensor does not support inline VLAN pairs, the VLAN Pairs pane is not displayed. IPS modules on routers and ASA devices do not support inline VLAN pairs.
- When using inline VLAN pairs, you should configure UniDirectional Link Detection (UDLD) on the connected switch that is hosting the VLANs. UDLD can help switches prevent spanning-tree forwarding loops and single direction links. For detailed information, see [https://www.cisco.com/c/en/us/td/docs/security/ips/7-0/configuration/guide/idm/idmguid7/idm\\_interfaces.html#wp1169508](https://www.cisco.com/c/en/us/td/docs/security/ips/7-0/configuration/guide/idm/idmguid7/idm_interfaces.html#wp1169508)

### Related Topics

- [Understanding Interfaces](#) , on page 1647

- [Configuring CDP Mode](#) , on page 1659
- [Configuring Physical Interfaces](#) , on page 1655
- [Configuring VLAN Groups](#) , on page 1662

---

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **VLAN Pairs** tab.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add VLAN Pair dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit VLAN Pair dialog box opens.

**Tip** You can also delete a pair by selecting it and clicking the **Delete Row** button. You cannot delete an inline VLAN pair if it is assigned to a virtual sensor. First remove the assignment to the virtual sensor using the Virtual Sensors policy, and then delete the inline VLAN pair.

**Step 3** In the Add or Edit VLAN Pairs dialog box, configure the following options:

- **Physical Interfaces**—Select the physical interface on which you are creating this VLAN pair. The list includes only those interfaces that are defined on the Physical Interfaces tab and that are not already part of an inline interface pair or VLAN group. However, you can create multiple VLAN pairs on a single interface.
- **Subinterface Number**—Enter a number to assign as a subinterface. The number must be unique on the interface, that is, it cannot already be assigned to another VLAN pair on the selected physical interface. Subinterface numbers can be from 1 to 255.
- **Description**—An optional description for the pair.
- **VLAN A, B**—The numbers of the two VLANs that you want to join as a pair. VLAN numbers are from 1 to 4095. You must enter different numbers, and the numbers must not already be part of another VLAN pair on the selected physical interface.

**Step 4** Click **OK** to save your changes.

---

## Configuring VLAN Groups

Use the VLAN Groups tab of the IPS Interfaces policy to configure the VLAN groups for physical interfaces and inline interface pairs (logical interfaces). The summary table displays the existing VLAN groups. You can create multiple VLAN groups on a single physical interface or inline interface pair. For more information about VLAN group mode, see [VLAN Group Mode](#), on page 1650.

A VLAN group consists of a group of VLAN IDs that exist on an interface. Each VLAN group consists of at least one VLAN ID. You can have up to 255 VLAN groups per interface (logical or physical). Each group can contain any number of VLAN IDs.

After you assign the VLAN IDs to the VLAN group, you must assign the VLAN group to a virtual sensor for it to be operational. You can assign a single group to at most one virtual sensor. Use the Virtual Sensors policy to make the assignment.

---

**Note** VLAN groups are supported in IPS 6.0 and later only. Not all IPS appliances or service modules support VLAN groups. If the VLAN Groups tab does not appear in the Interfaces policy, the device you are configuring does not support the feature.

---

### Related Topics

- [Understanding Interfaces](#), on page 1647

- [Configuring Physical Interfaces](#), on page 1655
- [Defining A Virtual Sensor](#), on page 1669
- [Editing Policies for a Virtual Sensor](#), on page 1673
- [Assigning Interfaces to Virtual Sensors](#), on page 1668

---

**Step 1** (Device view) Select **Interfaces** from the Policy selector, then click the **VLAN Groups** tab.

The table shows the existing VLAN groups, including the interface for which the group is defined, the subinterface number, description (if any), and the VLANs assigned to the group. If the VLANs cell is empty, the group is defined for all unassigned VLANs on the interface.

**Step 2** Do one of the following:

- To add a pair, click the **Add Row** button. The Add VLAN Group dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit VLAN Group dialog box opens.

**Tip** You can also delete a group by selecting it and clicking the **Delete Row** button. You cannot delete a VLAN group if it is assigned to a virtual sensor. First remove the assignment to the virtual sensor using the Virtual Sensors policy, and then delete the VLAN group.

**Step 3** In the Add or Edit VLAN Group dialog box, configure the following options:

- **Physical and Logical Interfaces**—Select the physical interface or inline interface pair for which you are creating this VLAN group. The list includes only unpaired physical interfaces (defined on the Physical Interfaces tab) that do not already have inline VLAN pairs defined, or inline interface pairs that are defined on the Inline Pairs tab. You can create multiple VLAN groups on a single interface. Keep the following in mind:
  - If you select a physical interface, you are creating a promiscuous VLAN group.
  - If you select a logical interface, you are creating an inline VLAN group.
- **Subinterface Number**—Enter a number to assign as a subinterface. The number must be unique on the interface, that is, it cannot already be assigned to another VLAN group on the selected interface. Subinterface numbers can be from 1 to 255.
- **Description**—An optional description for the group.
- **VLAN assignment**—Select one of the following options:
  - **All Unassigned VLAN IDs**—The group contains all VLANs that are not assigned to other VLAN groups. This is the default option
  - **Range of free VLAN IDs**—The group contains specific VLANs. In the **Range** box, enter any combination of single VLAN IDs or ranges (separate starting and ending ID with a hyphen), and separate multiple entries with commas. For example, 10, 12-25, 33-49. VLAN numbers are from 1 to 4095.

The VLAN ID cannot already be in another VLAN group for the selected interface. The VLANs also must be configured on the connected switch or there will be no traffic to inspect.

**Step 4** Click **OK** to save your changes.

---

## CHAPTER 38

# Configuring Virtual Sensors

All IPS devices and service modules have a base virtual sensor named vs0. When you configure the IPS appliance or service module, you must configure the base vs0 sensor to assign interfaces to it. This assignment tells the device which interfaces to inspect. There are also other settings that are configured on virtual sensors.

In addition to the base vs0 virtual sensor, many IPS appliances and service modules allow you to create user-defined virtual sensors. You can use these virtual sensors to create separate policies for traffic, so that a single physical sensor can act as if it were multiple sensors. A virtual sensor is a logical grouping of sensing interfaces and the configuration policy for the signature engines and event action filters to apply.

This chapter contains the following topics:

- [Understanding the Virtual Sensor](#) , on page 1665
- [Defining A Virtual Sensor](#) , on page 1669
- [Editing Policies for a Virtual Sensor](#) , on page 1673
- [Deleting A Virtual Sensor](#) , on page 1674

## Understanding the Virtual Sensor

The sensor can receive data inputs from one or many monitored data streams. These monitored data streams can either be physical interface ports or virtual interface ports. For example, a single sensor can monitor traffic from in front of the firewall, from behind the firewall, or from in front of and behind the firewall concurrently. A single sensor can monitor one or more data streams. In this situation a single sensor policy or configuration is applied to all monitored data streams.

With virtual sensors, you can create separate policies to apply to specific traffic feeds. For example, if you want to create a policy for a data center and a second much different policy for the campus network, yet run both policies on the same hardware device, you can configure separate virtual sensors to implement these policies.

You configure the following policies and settings separately for a virtual sensor:

- Signature and signature settings (policies in the IPS > Signatures folder).
- Event action policies (policies in the IPS > Event Actions folder).
- Anomaly detection policies (the IPS > Anomaly Detection policy) and the anomaly detection mode (in the Virtual Sensors policy).
- The promiscuous interfaces, inline interface pairs, inline VLAN pairs, inline VLAN groups, or promiscuous VLAN groups that the virtual sensor monitors.

---

**Note** No packet is processed by more than one virtual sensor; you cannot assign the same physical or logical interface to more than one sensor. Packets from interfaces, inline interface pairs, inline VLAN pairs, and VLAN groups that are not assigned to any virtual sensor are disposed of according to the inline bypass configuration that you define in the **Interfaces** policy.

---

- The inline TCP session tracking and Normalizer modes (in the Virtual Sensors policy).

---

**Note** If you create a policy instance on an IPS device for signatures, event actions, or anomaly detection but do not assign it to any of the virtual sensors on that device (that is, you do not use that policy instance), then that policy instance is deleted by Security Manager during deployment.

---

All other policies and settings are configured on the parent device that hosts the virtual sensor. For example, if you want to use global correlation, you configure it on the parent device and the virtual sensors share that configuration.

You can configure up to four virtual sensors on one appliance, but you can add only three user-defined virtual sensors. The first virtual sensor, vs0, is the base sensor and you cannot delete it. In Security Manager, virtual sensors are presented as follows:

- The device selector in Device view contains the parent device, which doubles as the base virtual sensor, vs0. Select this device to configure all device-level policies and to create virtual sensors in the Virtual Sensors policy.
- Any user-defined virtual sensors are also shown in the device selector in Device view. The display name of the real device is prepended to the beginning of the name of the virtual sensor. In most cases, the result is that the virtual sensors appear next to the parent (real) device that the virtual sensor is on. For example, on the host (real device) named “bob,” the virtual sensor with the name “vs1” will appear in the device list as “bob\_vs1.”

To configure the signature, anomaly detection, and event action policies for a virtual sensor, you must select it in the device selector. You cannot configure these policies by selecting the parent device; those policies on the parent device are for the vs0 base sensor.

The following topics explain more about virtual sensors:

- [Advantages and Restrictions of Virtualization](#) , on page 1667
- [Inline TCP Session Tracking Mode](#) , on page 1668
- [Understanding Normalizer Mode](#) , on page 1668
- [Assigning Interfaces to Virtual Sensors](#) , on page 1668
- [Identifying the Virtual Sensors for a Device](#) , on page 1669
- [Defining A Virtual Sensor](#) , on page 1669
- [Editing Policies for a Virtual Sensor](#) , on page 1673
- [Deleting A Virtual Sensor](#) , on page 1674

## Advantages and Restrictions of Virtualization

An advantage of using virtual sensors is that you can operate more than one virtual sensor on one appliance while configuring each virtual sensor differently with regard to signature behavior and traffic feed. For example, if you want to create a policy for a data center and a second much different policy for the campus network, yet run both policies on the same hardware device, you can configure separate virtual sensors to implement these policies.

Virtualization has the following advantages:

- You can apply different configurations to different sets of traffic.
- You can monitor two networks with overlapping IP spaces with one sensor.
- You can monitor both inside and outside a firewall or NAT device.

Virtualization has the following restrictions:

- You must assign both sides of asymmetric traffic to the same virtual sensor.
- Using VACL capture or SPAN (promiscuous monitoring) is inconsistent with regard to VLAN tagging, which causes problems with VLAN groups.
  - When using Cisco IOS software, a VACL capture port or a SPAN target does not always receive tagged packets even if it is configured for trunking.
  - When using the MSFC, fast path switching of learned routes changes the behavior of VACL captures and SPAN.
- Persistent store is limited.
- Not all IPS sensors support multiple virtual sensors. The Virtual Sensors policy appears for all IPS appliances and service modules, because you must use it to assign interfaces to the base vs0 sensor. If the Add button in the policy is disabled for a device, and you have not configured user-defined virtual sensors, then the device does not support virtualization. Examples of devices that do not support virtualization include the Cisco IPS 4215, NM-CIDS, AIM-IPS, NME-IPS, and AIP-SSC. IDSM2 supports virtualization, but it does not support VLAN groups or inline interface pairs.
- You must use IPS 6.0+ software. Older software versions do not support virtualization.
- Cisco IOS IPS devices do not support virtualization. Use the **IPS > Interface Rules** policy to specify the interfaces that IPS should monitor.

Virtualization has the following traffic capture requirements:

- The virtual sensor must receive traffic that has 802.1q headers (other than traffic on the native VLAN of the capture port).
- The sensor must see both directions of traffic in the same VLAN group in the same virtual sensor for any given sensor.

### Related Topics

- [Understanding the Virtual Sensor](#) , on page 1665
- [Defining A Virtual Sensor](#) , on page 1669

## Inline TCP Session Tracking Mode

When you choose to modify packets inline, if the packets from a stream are seen twice by the Normalizer engine, it cannot properly track the stream state and often the stream is dropped. This situation occurs most often when a stream is routed through multiple VLANs or interfaces that are being monitored by the IPS. A further complication in this situation is the necessity of allowing asymmetric traffic to merge for proper tracking of streams when the traffic for either direction is received from different VLANs or interfaces.

To deal with this situation, you can set the mode so that streams are perceived as unique if they are received on separate interfaces or VLANs (or the subinterface for VLAN pairs).

The following inline TCP session tracking modes apply:

- **Interface and VLAN**—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) and on the same interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.
- **VLAN Only**—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) regardless of the interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.
- **Virtual Sensor**—All packets with the same session key (AaBb) within a virtual sensor belong to the same session. This is the default and almost always the best option to choose.

You configure the inline TCP session tracking mode as a property of the virtual sensor as described in [Defining A Virtual Sensor](#), on page 1669.

## Understanding Normalizer Mode

Normalizer mode applies only when the sensor is operating in inline mode. The default is strict evasion protection, which is full enforcement of TCP state and sequence tracking. The Normalizer enforces duplicate packets, changed packets, out-of-order packets, and so forth, which helps prevent attackers from evading the IPS.

Asymmetric mode disables most of the Normalizer checks. Use Asymmetric mode only when the entire stream cannot be inspected, because in this situation, attackers can now evade the IPS.

You configure the Normalizer mode as a property of the virtual sensor as described in [Defining A Virtual Sensor](#), on page 1669.

## Assigning Interfaces to Virtual Sensors

An IPS sensor monitors traffic that traverses interfaces, interface pairs, or VLAN pairs assigned to a virtual sensor.

You can assign one or more of the following types of interfaces to a virtual sensor:

- **Promiscuous interface**—A physical interface that does not have VLAN groups and which is not part of an inline interface pair.
- **Inline interface pair**—A logical interface composed of two physical interfaces.
- **Inline VLAN pair**—A logical interface composed of two VLANs.
- **Promiscuous VLAN group**—A VLAN group that is assigned to a subinterface on a physical interface.

The physical interface cannot already be used for an inline interface or VLAN pair. There can be many promiscuous VLAN groups on the same promiscuous interface, but the VLANs assigned cannot overlap. Once a VLAN group is assigned to a promiscuous interface, it is no longer a plain promiscuous interface and can only be used for promiscuous VLAN groups.

- **Inline VLAN group**—A VLAN group that is assigned to a subinterface of an inline interface pair.

There can be many inline VLAN groups on the same inline interface pair, but the VLANs assigned cannot overlap. Once a VLAN group is assigned to an inline interface pair it is no longer a plain inline interface pair and can only be used for inline VLAN groups.

VLAN groups cannot be assigned to inline VLAN pairs.

You must configure the interfaces before you can assign them to virtual sensors. For more information about configuring all of these types of interfaces, see [Configuring Interfaces](#), on page 1652. For information on assigning interfaces to virtual sensors, see [Defining A Virtual Sensor](#), on page 1669.

## Identifying the Virtual Sensors for a Device

If you configure user-defined virtual sensors on an IPS appliance or service module, the virtual sensor appears in the device selector in Device view.

Normally, the display name of a virtual sensor is in the form *device-name\_virtual-sensor-name*, where *device-name* is the name of the parent device, and *virtual-sensor-name* is the name of the virtual sensor. For example, the virtual sensor vs1 on device 10.100.10.10 would be 10.100.10.10\_vs1.

Thus, under normal conditions, the virtual sensors for a device should appear immediately after the parent device in the device selector. However, you can change the virtual sensor's display name by editing the device properties. If you alter the default name, the virtual sensors might not appear anywhere near the parent device in the device selector.

You can use the following techniques to identify the virtual sensors defined on a device, or to identify the parent device of a virtual sensor:

- To see a list of virtual sensors defined on an IPS device, select the **Virtual Sensors** policy on the device. The table shows all virtual sensors, including the base vs0 sensor. Note that the vs0 sensor does not appear separately in the device selector; it is represented by the parent device itself.

Unless you radically alter the display names of virtual sensors, the virtual sensor name, along with the parent device's display name, should help you find the virtual sensor in the device selector.

- To determine which IPS device is the host of a virtual sensor, right-click the virtual sensor in the device selector and select **Device Properties**. The Hostname display-only field on the General tab shows the host device display name plus the virtual sensor name as defined on the device.

## Defining A Virtual Sensor

Use the Virtual Sensors policy to configure virtual sensors on your Cisco IPS devices. Even if your IPS device does not support multiple virtual sensors, you must use this policy to assign interfaces to the base sensor, vs0, and configure properties that are associated with the virtual sensor.

---

**Tip** For Cisco IOS IPS devices, you configure the interfaces that the IPS examines in the **IPS > Interface Rules** policy. You cannot configure virtual sensors in an IOS IPS device.

---

### Before You Begin

Configure the interfaces on the sensor, including inline interface pairs, inline VLAN pairs, and promiscuous and inline VLAN groups. The interface configurations must exist before you can assign them to a virtual sensor. For information on interfaces, interface modes, and how to configure them, see [Managing IPS Device Interface, on page 1647](#).

### Related Topics

- [Understanding Interfaces , on page 1647](#)
- [Understanding Interface Modes , on page 1648](#)
- [Advantages and Restrictions of Virtualization , on page 1667](#)
- [Inline TCP Session Tracking Mode , on page 1668](#)
- [Inline TCP Session Tracking Mode , on page 1668](#)

- [Assigning Interfaces to Virtual Sensors , on page 1668](#)
- [Identifying the Virtual Sensors for a Device , on page 1669](#)
- [Editing Policies for a Virtual Sensor , on page 1673](#)

---

**Step 1** (Device view only.) Select **Virtual Sensors** from the Policies selector to open the Virtual Sensors policy.

The policy lists all existing virtual sensors, including the base vs0 sensor, which you cannot delete. The information for each sensor shows the interfaces assigned to the sensor, anomaly detection mode, inline TCP tracking mode, normalizer mode, and a description, if any. If the Assignments cell is empty, no interfaces are assigned to the virtual sensor, which means the virtual sensor cannot analyze any traffic.

**Step 2** Do one of the following:

- To add a virtual sensor, click the **Add Row** button. The Add Virtual Sensor dialog box opens.

You can add at most three sensors. The device supports four virtual sensors, including the base vs0 sensor. If the Add Row button is disabled, you either have configured the maximum number of sensors, or your device does not support multiple virtual sensors.

- To edit a virtual sensor, select it and click the **Edit Row** button. The Edit Virtual Sensor dialog box opens.

**Tip** You can also delete a virtual sensor by selecting it and clicking the **Delete Row** button. You cannot delete the base vs0 sensor. For more information about deleting virtual sensors, see [Deleting A Virtual Sensor , on page 1674](#).

**Step 3** In the Add or Edit Virtual Sensor dialog box, configure at least the following options. The defaults for the other options are appropriate in most cases. For detailed information on all available options, see [Virtual Sensor Dialog Box , on page 1671](#).

- **Virtual Sensor Name**—The name of the virtual sensor. The virtual sensor name can be up to 64 characters and it cannot contain spaces.
- **Interface assignments (Available, Assigned lists)**—The promiscuous interfaces, inline interface pairs, inline VLAN pairs, promiscuous VLAN groups, or inline VLAN groups that you want this virtual sensor to use. The list of available interfaces shows only those interfaces that are configured in the Interfaces policy and that are not yet assigned to another virtual sensor.
  - To assign interfaces, select them in the available list and click >>.
  - To remove an assignment, select the interface in the assigned list and click <<. You must remove an assignment before you can assign an interface to a different virtual sensor.

**Tip:** If you are not sure about the content of a specific interface, for example, its mode or assigned VLANs, close the dialog box, go to the Interfaces policy, and examine the various tabs.

**Step 4** Click **OK** to save your changes and add them to the Virtual Sensors policy.

**Step 5** Click **Save** to save the Virtual Sensors policy.

**Step 6** If you created a new virtual sensor, you must submit your changes to the database for the new virtual sensor to appear in the device selector in Device view.

- **Non-Workflow mode**—Select **File > Submit**.
- **Workflow mode**—Select **Activities > Approve Activity**, or if you are operating with an activity approver, **Activities > Submit Activity**. The activity must be approved before the virtual sensor appears in the device selector.

**Note** In the device selector, the display name of the real device is prepended to the beginning of the name of the virtual sensor. In most cases, the result is that the virtual sensors appear next to the parent (real) device that the virtual sensor is on. For example, on the host (real device) named “bob,” the virtual sensor with the name “vs1” will appear in the device list as “bob\_vs1.”

**Step 7** To configure the policies associated with a virtual sensor, select it in the device selector in Device view. You can then configure the associated policies. See the following topics:

- [Defining IPS Signatures, on page 1677](#)
- [Configuring Event Action Rules, on page 1711](#)
- [Configuring Anomaly Detection Signatures , on page 1740](#)

---

## Virtual Sensor Dialog Box

Use the Add or Edit Virtual Sensor dialog box to configure the properties for a virtual sensor.

### Navigation Path

(Device view only.) Select **Virtual Sensors** from the Policy selector. Click the **Add Row** button, or select an existing virtual sensor and click the **Edit Row** button.

## Field Reference

**Table 519: Add or Edit Virtual Sensor Dialog Box**

| Element                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Virtual Sensor Name                            | <p>The name of the virtual sensor. The virtual sensor name can be up to 64 characters and it cannot contain spaces. The name of the default virtual sensor is <b>vs0</b>.</p> <p>You cannot change the name after you create the virtual sensor. To change a virtual sensor name, delete the sensor and create a new sensor with the desired name. If you already configured local policies for the sensor (that is, signature, event action, and anomaly detection policies), first save the policies as shared policies, delete the sensor, create the new sensor, then assign the shared policies to the new virtual sensor. For more information about creating shared policies from local policies, see <a href="#">Sharing a Local Policy</a> , on page 205.</p>                                                                                                                 |
| Interface Assignments<br>(Available, Assigned) | <p>The promiscuous interfaces, inline interface pairs, inline VLAN pairs, promiscuous VLAN groups, or inline VLAN groups that you want this virtual sensor to use. The list of available interfaces shows only those interfaces that are configured in the Interfaces policy and that are not yet assigned to another virtual sensor.</p> <ul style="list-style-type: none"> <li>• To assign interfaces, select them in the available list and click &gt;&gt;.</li> <li>• To remove an assignment, select the interface in the assigned list and click &lt;&lt;. You must remove an assignment before you can assign an interface to a different virtual sensor.</li> </ul> <p><b>Tip</b> If you are not sure about the content of a specific interface, for example, its mode or assigned VLANs, close the dialog box, go to the Interfaces policy, and examine the various tabs.</p> |
| Anomaly Detection Mode                         | <p>The mode that you want the anomaly detection policy to operate in for this virtual sensor: Detect, Inactive, Learn. The default and normal operational mode is Detect. However, if you are using asymmetric normalizer mode, you might want to set the anomaly detection mode to Inactive. For detailed information about these modes, see <a href="#">Anomaly Detection Modes</a> , on page 1738.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Element                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inline TCP Session Tracking Mode | <p>The mode used to segregate multiple views of the same stream if the same stream passes through the sensor more than once. The default mode is Virtual Sensor. For more information, see <a href="#">Inline TCP Session Tracking Mode</a> , on page 1668. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Interface and VLAN</b>—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) and on the same interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.</li> <li>• <b>VLAN Only</b>—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) regardless of the interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.</li> <li>• <b>Virtual Sensor</b>—All packets with the same session key (AaBb) within a virtual sensor belong to the same session.</li> </ul>                                                                                                                                                |
| Normalizer Mode                  | <p>The type of Normalizer mode you need for traffic inspection. For more information, see <a href="#">Understanding Normalizer Mode</a> , on page 1668.</p> <ul style="list-style-type: none"> <li>• <b>Strict Evasion Protection</b>—(Default) If a packet is missed for any reason, all packets after the missed packet are not processed. Strict evasion protection provides full enforcement of TCP state and sequence tracking.</li> </ul> <p>Any out-of-order packets or missed packets can produce Normalizer engine signatures 1300 or 1330 firings, which try to correct the situation, but can result in denied connections.</p> <ul style="list-style-type: none"> <li>• <b>Asymmetric Mode Protection</b>—Can only see one direction of bidirectional traffic flow. Asymmetric mode protection relaxes the evasion protection at the TCP layer.</li> </ul> <p>Asymmetric mode lets the sensor synchronize state with the flow and maintain inspection for those engines that do not require both directions. Asymmetric mode lowers security because full protection requires both sides of traffic to be seen.</p> |
| Description                      | The description of the virtual sensor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Editing Policies for a Virtual Sensor

Virtual sensors have two types of policies: the virtual sensor's properties, and policies assigned to the virtual sensor. You use a different approach to edit these items.

- To edit the properties of a virtual sensor, select the virtual sensor's parent device in the device selector in Device view. Then, select the **Virtual Sensors** policy. You can then select the virtual sensor in the table and click the **Edit Row** button.

Using the Virtual Sensors policy, you can change the interfaces assigned to a sensor, the anomaly detection mode, inline TCP session tracking mode, and Normalizer mode. For more information, see the following topics:

- [Defining A Virtual Sensor](#) , on page 1669

- [Virtual Sensor Dialog Box](#) , on page 1671
- To edit the policies assigned to a virtual sensor, select the virtual sensor in the device selector in Device view. A virtual sensor's name is in the form *device-name\_virtual-sensor-name* , where *device-name* is the name of the parent device, and *virtual-sensor-name* is the name of the virtual sensor. For example, the virtual sensor vs1 on device 10.100.10.10 would be 10.100.10.10\_vs1.

---

**Note** The base virtual sensor, vs0, is integrated with the parent device and does not appear separately in the device selector. To configure the base virtual sensor, select the parent device.

---

You can then select the policies in the Policies selector and configure them. For more information, see the following topics:

- [Defining IPS Signatures](#), on page 1677
- [Configuring Event Action Rules](#), on page 1711
- [Configuring Anomaly Detection](#) , on page 1742

All other policies are configured on the parent device, and the configurations apply to all virtual sensors configured on the device.

## Deleting A Virtual Sensor

Virtual sensors appear in the device selector in Device view. However, you cannot delete them from the selector using the same command used for other devices. Instead, you must delete the virtual sensor from the Virtual Sensors policy of the parent device, that is, the device on which the virtual sensor is defined. The following procedure explains how to delete a user-defined virtual sensor.

---

**Tip** The base virtual sensor, vs0, does not appear in the device selector. Instead, it is represented by the parent IPS sensor; it is considered to be the base IPS device. To delete the base vs0 sensor, you delete the entire device from the inventory. For information on deleting devices from the inventory, see [Deleting Devices from the Security Manager Inventory](#) , on page 128.

---

### Before You Begin

When you delete a virtual sensor, you also delete the policies defined for the sensor, such as signature, event action, and anomaly detection policies. If you configured non-default local policies, and you want to preserve them for use on other virtual sensors, you must first convert the local policies to shared policies. Then, after you delete the virtual sensor, the policies continue to exist as unassigned shared policies. You can then assign them to another virtual sensor. For more information on creating a shared policy from a local policy, see [Sharing a Local Policy](#) , on page 205.

Using this technique is ideal if you are deleting a virtual sensor simply as a means to change the virtual sensor's name. Because you cannot change a virtual sensor's name, you must delete it and create a new virtual sensor with the desired name. If you created shared policies, you could then assign those shared policies to your new sensor, and it will have the same configuration as the sensor had under the old name.

- 
- Step 1** (Device view only.) Select **Virtual Sensors** from the Policies selector to open the Virtual Sensors policy.
- Step 2** Select the user-defined virtual sensor that you want to delete and click the **Delete Row** button.
- Step 3** You are asked for a two-step confirmation. First, you are warned that you must save the policy to keep the policy and device synchronized. Click **OK** to continue, and you are also asked to confirm that you want to delete the node.
- If you confirm, the virtual sensor is removed from both the policy and the device selector. It will take a few moments before the device view is updated and the virtual sensor disappears from the list of devices.
-

## CHAPTER 39

# Defining IPS Signatures

**Note** From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see EOL notice.

You can use Security Manager to configure IPS signatures for dedicated IPS appliances and service modules or Cisco IOS IPS devices. When configuring signatures for Cisco IOS IPS, keep in mind that the router cannot use as many signatures as a dedicated appliance or service module.

This chapter contains the following topics:

- [Understanding Signatures](#) , on page 1677
- [Configuring Signatures](#) , on page 1680
- [Configuring Signature Settings](#) , on page 1707

## Understanding Signatures

Network intrusions are attacks on, or other misuses of, network resources. Cisco IPS sensors and Cisco IOS IPS devices use a signature-based technology to detect network intrusions. A signature specifies the types of network intrusions that you want the sensor to detect and report. As sensors scan network packets, they use signatures to detect known types of attacks, such as denial of service (DoS) attacks, and respond with actions that you define.

On a basic level, signature-based intrusion detection technology can be compared to virus-checking programs. Cisco IPS contains a set of signatures that the sensor compares with network activity. When a match is found, the sensor takes some action, such as logging the event or sending an alarm to the Security Manager Event Viewer.

Signatures can produce false positives, because certain normal network activity can be construed as malicious. For example, some network applications or operating systems may send out numerous ICMP messages, which a signature-based detection system might interpret as an attempt by an attacker to map out a network segment. You can minimize false positives by editing your signature parameters (tuning your signatures).

To configure a sensor to monitor network traffic for a particular signature, you must enable the signature. By default, the most critical signatures are enabled when you install the signature update. When an attack is detected that matches an enabled signature, the sensor generates an alert, which is stored in the event store of the sensor. The alerts, as well as other events, may be retrieved from the event store by web-based clients such as Event Viewer. By default the sensor logs all Informational alerts or higher.

Some signatures have subsignatures, that is, the signature is divided into subcategories. When you configure a subsignature, changes made to the parameters of one subsignature apply only to that subsignature. For example, if you edit signature 3050 subsignature 1 and change the severity, the severity change applies to only subsignature 1 and not to 3050 2, 3050 3, and 3050 4.

Cisco IPS contains over 10,000 built-in default signatures. You cannot rename or delete signatures from the list of built-in signatures, but you can retire signatures to remove them from the sensing engine. You can later activate retired signatures; however, this process requires the sensing engines to rebuild their configuration, which takes time and could delay the processing of traffic. You can tune built-in signatures by adjusting several signature parameters. Built-in signatures that have been modified are called tuned signatures.

---

**Note** We recommend that you retire any signatures that you are not using. This improves sensor performance.

---

You can create signatures, which are called custom signatures. Custom signature IDs begin at 60000. You can configure them for several things, such as matching of strings on UDP connections, tracking of network floods, and scans. Each signature is created using a signature engine specifically designed for the type of traffic being monitored.

For more about signatures, see:

- [Obtaining Detailed Information About a Signature](#) , on page 1678
- [Understanding Signature Inheritance](#) , on page 1679

#### Related Topics

- [Configuring Global Correlation](#), on page 1751

## Obtaining Detailed Information About a Signature

You can find detailed information about each signature from the [Cisco Security Intelligence Operations](#) web site. The web site includes a wealth of information and best practice recommendations for network security, and you can set up IntelliShield alerts. There is education on advanced security topics to help you protect your network, prioritize remediation, and structure your systems to reduce organizational risk.

When you edit the Signatures policy in Security Manager (see [Signatures Page](#) , on page 1680), the signature ID is linked directly into the Cisco Security Intelligence Operations database of IPS signatures. Clicking a signature ID opens a page containing information about the signature, including a description, the vulnerabilities on which the signature is based, when the signature was created, and so forth. You can search this database yourself at <http://tools.cisco.com/security/center/search.x?search=Signature> . (The database was formerly called the Cisco Network Security Database or NSDB.)

If you do not have access to Cisco.com, then the signature ID is linked to a local copy of the signature database information. Security Manager detects whether you have access to Cisco.com and makes the appropriate link for you without your having to set a preference.

The database includes information only for built-in, default signatures. You cannot find information about custom (user-defined) signatures.

Beginning with Security Manager 4.4, the Signatures Page (IPS > Signatures > Signatures) contains an Explanation tab and a Related Threats tab for each signature. These tabs display detailed information in a separate window on the Signatures page. For example, the Explanation tab displays Description, Signature ID, and so forth; the Related Threats tab displays vulnerabilities for other software that you may be using, and so forth.

**Tip** If this window is not visible to you, expand it with the up arrow button in the bottom-left corner of the Signatures page. To hide this window, collapse it with the corresponding down arrow, also in the bottom-left corner of the Signatures page. You can resize this window with standard controls.

## Understanding Signature Inheritance

Signature inheritance for IPS devices is different than for any other Security Manager rules-based policy. Inheritance refers to the capability of Security Manager to enforce hierarchical lists of first-match, rule-based policies such as access rules. Signature inheritance is different because for IPS devices, Security Manager allows inheritance on a per-signature basis.

This example shows what is meant by inheritance on a per-signature basis:

- 
- Step 1** In Policy View, select **IPS > Signatures > Signatures**.
  - Step 2** Create a policy named test1.
  - Step 3** Create a second policy, named test2.
  - Step 4** Right-click **test 2** and select **Inherit Signatures**. The Inherit Rules—test 2 dialog box appears.
  - Step 5** Select **test1** and click the **OK** button.
  - Step 6** Select **test1** and edit a signature. Note the edit that you made and save your change.
  - Step 7** Select **test2** and select the signature that you just edited. Observe that test2 inherited the editing that you did on test1.
- 

## IPS Signature Purge

Beginning with Security Manager 4.1, old signature versions (defined as being older than the lowest signature level deployed) are purged during a periodic purge operation, the purpose of which is to optimize the database.

**Note** As a result of the purge operation, you may notice the deletion of some of your unused tuning contexts.

Some of the purged signatures may be restored during your next download of IPS signature packages from Cisco.com.

IPS signature purge is disabled by default. To enable IPS signature purge,

- 
- Step 1** Stop the Cisco Security Manager Daemon Manager: At the command prompt, enter **net stop crmdmgtd**.
  - Step 2** Navigate to *NMSROOT*\MDC\ips\etc\sensorupdate.properties file, where *NMSROOT* is the path to the Security Manager installation directory. The default is C:\Program Files\CSCOPx.

- Step 3** In `sensorupdate.properties`, change `purgeUnusedSignaturesEntriesinDB:false` to `purgeUnusedSignaturesEntriesinDB:true`.
- Step 4** Re-start the Cisco Security Manager Daemon Manager: At the command prompt, enter **net start crmdmgtd**.  
IPS signature purge now runs at midnight every day.
- 

## Configuring Signatures

The Signatures policy is where you configure signatures for Cisco IPS sensors and Cisco IOS IPS devices.

This section contains the following topics:

## Signatures Page

Use the Signatures page to display the signature summary table, in which you can add, edit, and delete IPS signatures. From this page you can tune the active signature set in a policy by enabling or disabling signatures. You can also use this page to unload signatures from the engine.

Beginning with Version 4.6, Security Manager enables you to apply a signature threat profile to one or more signature policies, starting from IPS device version 7.3(1). A signature threat profile is a predefined signature template that includes customized tunings. These tunings adjust the signature coverage and response actions to enable the sensor to make better choices in various deployment and threat scenarios. This Signatures page displays the threat profile and its version, that has been applied to the policy. Click the **To Change** button to select a threat profile to apply to the policy. For more information, see [Apply Signature Threat Profiles](#) , on page 1685. To see the signatures that belong to a threat profile, filter the Source column to contain the text **Threat Profile**. For information about how to filter tables, see [Filtering Tables](#) , on page 50.

If you download a particular signature package that does not contain one or more of the threat profiles already created in shared signature policy, Security Manager displays the warning message "**Currently applied threat profile is not applicable to this signature version**" on the shared signature Policy View. Similarly on the Device View, Security Manager displays the same warning message if you try to apply the shared signature policy to an unsupported device.

Since threat profile updates cannot be performed separately, you must update the current signature version of the device if you want to update its threat profile version. Note that any update made to a threat profile version modifies the signatures associated with the threat profiles, but retains any user-defined signature tuning already performed by the user.

---

**Note** Threat profiles are not supported in IOS-IPS.

---

### Tips

- Enabled and disabled signatures are indicated by the "Enabled" checkbox for a particular signature. In previous releases of Security Manager, disabled signatures were indicated by hash marks covering the table row. When you deploy the configuration, disabled signatures are removed from the device. For more information, see [Enabling and Disabling Signatures](#) , on page 1690.
- For many columns, you can right-click the column and edit the property directly. Your edits apply to all rows that you have selected. If you select more than one row, the options that you can select are limited to those that are valid for all selected rows. The contents of the right-click menu differ on the basis of the cell that you right-click. For more information on the available commands, see [Signature Shortcut Menu](#) , on page 1686.
- To show or hide a column, right-click the table heading row on the signature summary table and then click **Show Columns**. By default, all columns are shown.

---

**Note** Beginning with Version 4.5, Security Manager has a Notes column for each signature; this feature enables you to add a note so that you can revisit particular signatures later to see what you or other users have added for a signature or an event. This feature is helpful for network administrators in monitoring noisy signatures or signatures that need particular attention. However, the Notes column may not appear by default after you restore a Security Manager database. To show the Notes column, right-click the table heading row on the signature summary table, then click **Show Columns**, and finally click **Notes**. You may discover this situation during installation of Security Manager if you back up and restore the database; however, this situation will not occur during inline upgrades.

---

### Navigation Path

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

## Field Reference

*Table 520: Signature Policy*

| Element  | Description                                                                                                                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID       | The signature ID, which is the unique numerical value assigned to this signature. This value lets the sensor identify a particular signature. Click the ID number to open a page in your web browser with detailed information about the signature, as explained in <a href="#">Obtaining Detailed Information About a Signature</a> , on page 1678. |
| Sub      | The subsignature ID, which is the unique numerical value assigned to this subsignature. A Subsignature ID identifies a more granular version of a broad signature.                                                                                                                                                                                   |
| Name     | The name assigned to the signature.                                                                                                                                                                                                                                                                                                                  |
| Enabled  | A checkbox indicating whether the signature is enabled or disabled in this policy. A signature must be enabled for the sensor to protect against the traffic specified by the signature.                                                                                                                                                             |
| Severity | The severity level that the signature reports: High, Medium, Low, or Informational.                                                                                                                                                                                                                                                                  |
| Fidelity | The weight associated with how well this signature might perform in the absence of specific knowledge of the target.                                                                                                                                                                                                                                 |

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes   | <p>Enables you to add a note so that you can revisit particular signatures later to see what you or other users have added for a signature or an event. This feature is helpful for network administrators in monitoring noisy signatures or signatures that need particular attention.</p> <p>Notes are not saved to the device during deployment to the device. Notes as described here are a Security Manager GUI feature only and are disregarded during deployment to the device, as they are not part of any IPS policy in Security Manager.</p> <p>Notes are not part of any IPS policy, so assignment or inheritance of a shared signature policy will have no effect on Notes.</p> <p>Right-clicking a signature and adding notes will not prompt for activity/ticket creation. However, adding notes by double-clicking a signature or clicking the Edit button will prompt for activity/ticket creation because this involves signature policy modification.</p> <p>Notes cannot be added to signatures as part of a signature update operation. Other parameters can be edited, though.</p> <p>Notes cannot be searched by the Global Search feature.</p> <p>The Notes column will not display the Notes text. Only an icon will be displayed. You must double-click the icon to display the Notes text.</p> <p>If you use the "Export to File" button, then in the resultant .csv file, the Notes column will display only Y or N, and in this way signifies that those signatures were annotated. The actual text will not be exported.</p> <p>Notes cannot be edited. All added notes are appended to the existing notes as a new note entry. You can of course delete the note and add the updated note afresh.</p> <p>To add a note, right-click the row for a particular signature and then click <b>Add Note</b>. After you add the note, click <b>Save</b> and then close the Notes dialog box. After you close the Notes dialog box, the row for a particular signature will display a "Note" icon.</p> <p>To add a note to more than one signature, select the signatures you want (Shift-click or Ctrl-click in Windows) and proceed as you would for one particular signature.</p> <p>Notes can be local or shared. If you add a note to a device with only local policies, you can add, edit, and delete only local notes. If you add a note to a device with a shared policy assigned, you can add, edit, and delete both local and shared notes—check the <b>Share this Note</b> option. However, you can add notes only to <i>that particular device</i> (i.e., local override of notes) even if a shared policy is assigned.</p> <p><b>Tip</b> If you have a shared policy assigned to a device and want to add the notes only to that device for a particular signature without affecting the shared policy, then you need to add the notes without choosing the <b>Share this Note</b> option in Device View.</p> <p><b>Tip</b> You can also work with notes in the Edit Signature dialog box. Refer to Edit Button later in this table.</p> |
| Base RR | The base risk rating value of the signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Actions | The actions the sensor takes when this signature fires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Source                                          | <p>The lowest policy in the inheritance hierarchy that overrides the settings for a signature. Values can be:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—The signature uses the default Cisco-defined settings.</li> <li>• <b>Local</b>—The signature is defined specifically for the selected device (Device view only.)</li> <li>• <b>Policy name</b>—The lowest shared policy in the inheritance hierarchy. You can see policy names in Policy view, or in Device view if you assign a shared signature policy to the device.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Retired                                         | <p>The conditions under which the signature is retired, if any. A retired signature is removed from the signature engine. You can activate a retired signature to place it back in the signature engine.</p> <p><b>Timesaver</b>) Use the retired field to unload disabled signatures on your IOS-IPS device to achieve the most favorable memory consumption of that device.</p> <p>If the engine level of a signature policy is less than E-4, the Retired field has two possible values: false and true. False means that the signature is not retired; true means that the signature is retired.</p> <p>If the engine level of a signature policy is equal to E-4, the Retired field has four possible values:</p> <ul style="list-style-type: none"> <li>• <b>false</b>—The signature is not retired.</li> <li>• <b>low-mem-retired</b>—The signature should be retired on low-memory platforms. A low-memory device is one that has 2 GB RAM or less.</li> <li>• <b>med-mem-retired</b>—The signature should be retired on both low-end and medium platforms. A medium-memory device is one that has 4 GB RAM or less, but more than 2 GB RAM. (Any device with more than 4 GB RAM is considered a high-memory platform.)</li> <li>• <b>true</b>—The signature is retired on all platforms.</li> </ul> <p>When you select low-mem-retired or med-mem-retired, Security Manager configures the device with those signatures. Whether the signature is actually retired on the device depends on amount of memory installed on the device; the device makes the decision on which signatures are actually retired.</p> <p><b>Tip</b>           The term <i>engine level</i> used here is not the same as the term <i>engine</i> in the row above.</p> |
| Engine                                          | The engine that parses and inspects the traffic specified by this signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| View Update Level button<br>(Device view only.) | Click this button view the signature update level for this device. For more information, see <a href="#">Viewing Signature Update Levels</a> , on page 1689.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Element               | Description                                                                                                                                                                                                                                                                                                                                 |

| Export to File button | Click this button to export the signature summary for the current device to a comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name.                                                                                                                           |
| Add button            | Click this button to add a custom signature. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Adding Custom Signatures</a> , on page 1695</li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes</a> , on page 1692</li> </ul>                                      |
| Edit button           | Click this button to edit the selected signature. You can edit one signature at a time. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Editing Signatures</a> , on page 1691</li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes</a> , on page 1692</li> </ul> |
| Delete button         | Click this button to delete the selected custom signatures.<br><br>You cannot delete Cisco-defined signatures. If you do not want to deploy a Cisco-defined signature, you can retire it or disable it.                                                                                                                                     |

## Apply Signature Threat Profiles

Use the Apply Threat Profile dialog box to select a signature threat profile from the available profiles and apply to the policy. Applying a threat profile modifies only the **Enabled** and **Retired** fields on the [Signatures Page](#) , on page 1680. After you have applied a particular threat profile to a policy, the corresponding signature tunings are merged with the existing signatures on the Signatures page. To see the signatures that belong to a threat profile, on the Signatures page, filter the Source column to contain the text **Threat Profile**. For information about how to filter tables, see [Filtering Tables](#) , on page 50.

Select any of the following threat profiles that are currently provided by Cisco:

- **SCADA**—Select this threat profile template if you are using the Cisco IPS device primarily to protect industrial control systems. In addition to signatures in the default set, SCADA signature template includes specialized signatures for general SCADA protocol detections and specific identifiers that address tools and environments common to most device controlled environments.
- **Edge**—Select this threat profile template if you are using the Cisco IPS device primarily for securing an internet connection. In addition to signatures in the default set, Edge signature template includes additional signatures that provide broader protection for desktop operating systems, web browsers, web technologies, and common desktop applications.
- **Web\_Applications**—Select this threat profile template if you are using the Cisco IPS device primarily for protecting web server farms. In addition to signatures in the default set, Web\_Applications signature template includes additional signatures that provide broader protection for web servers, web development tools and frameworks, content management systems, load balancers, and databases.
- **Data Center**—Select this threat profile template if you are using the Cisco IPS device primarily for protecting data centers. In addition to signatures in the default set, Data Center signature template includes additional signatures that provide broader protection for server operating systems, web servers, application servers, databases, content management systems, messaging servers and virtualization systems.

**Note** Any signature tuning performed by the user on Local signatures (signatures defined for a selected device and for which the source policy is Local) will be preserved over the threat profile. For Default signatures, the threat profile tunings will be preserved.

### Navigation Path

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS devices) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.

### Field Reference

*Table 521: Threat Profile Details*

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Signature ID     | The signature ID, which is the unique numerical value assigned to this signature. This value lets the sensor identify a particular signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Sub Signature ID | The sub signature ID, which is the unique numerical value assigned to this sub signature. A sub signature ID identifies a more granular version of a broad signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enabled          | Indicates whether the signature is enabled or disabled in this threat profile. A signature must be enabled for the sensor to protect against the traffic specified by the signature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Retired          | Indicates whether the signature is retired or active in this threat profile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Has Conflict     | Indicates whether a signature with tunings from the applied threat profile also has tunings performed by the user. Signatures that are tuned by the user and by the applied threat profile are flagged as True in the Has Conflict column. If there is no conflict between the applied threat profile and user tunings for a signature, the Has Conflict column for that signature shows False.<br><br><b>Note</b> Any signature tuning performed by the user on Local signatures (signatures defined for a selected device and for which the source policy is Local) will be preserved over the threat profile. For Default signatures, the threat profile tunings will be preserved. |

## Signature Shortcut Menu

Right-clicking inside the signature summary table in the Signatures policy displays a shortcut menu for performing various functions on the selected signatures. Some commands appear only if you select a single signature, while some commands can be used on more than one signature at a time; your changes apply to all selected signatures. For more information about the Signatures policy, see [Signatures Page](#), on page 1680.

Additionally, the available commands differ depending on which cell you right click. Some commands are available when right-clicking any cell, while others are specific to a single cell.

**Tip** When you use a right-click command to change the value in a cell of a Default signature, the signature is converted to a Local signature in Device view or a shared-policy-specific signature in Policy view.

The following table explains the available commands.

**Table 522: Signature Shortcut Menu**

| Menu Command                     | Description                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Commands Available for All Cells |                                                                                                                                                                                                                                                                                                                                       |
| Add Row                          | Adds a custom signature. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Adding Custom Signatures , on page 1695</a></li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes , on page 1692</a></li> </ul>                                                    |
| Edit Row                         | Edits the selected signature. You can edit one signature at a time. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Editing Signatures , on page 1691</a></li> <li>• <a href="#">Edit Signature or Add Custom Signature Dialog Boxes , on page 1692</a></li> </ul>               |
| Delete Row                       | Deletes the selected custom signatures.<br>You cannot delete Cisco-defined signatures. If you do not want to deploy a Cisco-defined signature, you can retire it or disable it.                                                                                                                                                       |
| Clone                            | Creates a new custom signature that contains the same properties as the selected signature. For more information, see <a href="#">Cloning Signatures , on page 1699</a> .                                                                                                                                                             |
| Enable, Disable                  | Places the signature in the enabled or disabled state, respectively. Disabled signatures appear with crosshatching over them. For more information, see <a href="#">Enabling and Disabling Signatures , on page 1690</a> .                                                                                                            |
| Show Events<br>Show MARS Events  | Enables navigation to the Event Viewer or Cisco Security MARS application to view the realtime or historical events detected by the selected signature. For more information, see <a href="#">Viewing Events for an IPS Signature , on page 2760</a> and <a href="#">Viewing CS-MARS Events for an IPS Signature , on page 2908</a> . |
| Action Cell Commands             |                                                                                                                                                                                                                                                                                                                                       |
| Add to Actions                   | Adds an action to the current list of actions for the selected signature.                                                                                                                                                                                                                                                             |
| Delete from Actions              | Deletes an action from the current list of actions for the selected signature.                                                                                                                                                                                                                                                        |
| Replace Actions With             | Replace the current set of actions for the selected signature with the single action selected. If you want to select more than one action, select <b>More</b> from the submenu, then use Ctrl+click to select the desired actions.                                                                                                    |

| Menu Command                                                                                                                                      | Description                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Edit Actions                                                                                                                                      | Opens the Edit Actions dialog box, where you can select the desired actions for the signature. Your selection replaces the current list of actions for the signature. For more information, see <a href="#">Edit, Add, Replace Action Dialog Boxes</a> , on page 1688. |
| Severity Cell Commands                                                                                                                            |                                                                                                                                                                                                                                                                        |
| <ul style="list-style-type: none"> <li>• High</li> <li>• Medium</li> <li>• Low</li> <li>• Informational</li> </ul>                                | Changes the severity level of the signature to the level you select.                                                                                                                                                                                                   |
| Fidelity Cell Commands                                                                                                                            |                                                                                                                                                                                                                                                                        |
| Edit Fidelity                                                                                                                                     | Changes the fidelity rating of the signature, which is the weight associated with how well this signature might perform in the absence of specific knowledge of the target.                                                                                            |
| Retired Cell Commands                                                                                                                             |                                                                                                                                                                                                                                                                        |
| <ul style="list-style-type: none"> <li>• Retire</li> <li>• Activate</li> <li>• Retire on Low Memory</li> <li>• Retire on Medium Memory</li> </ul> | Changes the retired status of the signature to the selected status. For more information about the retired status categories, see <a href="#">Edit Signature or Add Custom Signature Dialog Boxes</a> , on page 1692.                                                  |

## Edit, Add, Replace Action Dialog Boxes

Use the Edit, Add, or Replace Action dialog boxes to change the actions defined for a signature. These dialog boxes are available only when you edit the Action cell using the right click menu as explained in [Signature Shortcut Menu](#) , on page 1686. The behavior differs depending on the dialog box name:

- Add Actions—The actions that you select are added to those already defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Add to Actions > More**.
- Replace Actions—The actions that you select completely replace those defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Replace Actions With > More**.
- Edit Actions—The actions that you select completely replace those defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Edit Actions**.

For an explanation of the available actions, see [Understanding IPS Event Actions](#) , on page 1712. You can select multiple actions using Ctrl+click.

**Note** When you open dialog box, the list of actions that you see varies. The list of actions depends upon whether you right-click in only one signature row in the Actions column or select more than one signature row before right-clicking in the Actions column. If you right-click in only one signature row in the Actions column, the list of actions is that of the engine for that signature. If you select more than one signature row before right-clicking in the Actions column, the list of actions is that which is available for each affected engine. (It is the list of common actions, not the union of actions.)

## Edit Fidelity Dialog Box

Use the Edit Fidelity dialog box to make changes in the Fidelity Rating for a particular signature. The Fidelity Rating, or Signature Fidelity Rating (SFR), identifies the weight associated with how well this signature might perform in the absence of specific knowledge of the target. This rating can be any number from 0 to 100, with 100 indicating the most confidence in the signature.

### Navigation Path

In the Signatures policy, right-click the Fidelity cell in a signature and select Edit Fidelity. For information on opening the Signatures policy, see [Signatures Page](#), on page 1680. For more information on the signature shortcut menu, see [Signature Shortcut Menu](#), on page 1686.

## Viewing Signature Update Levels

In Device view, you can determine the current signature update packages applied to the device in Security Manager and compare it to the one deployed on the device.

Differences between the applied and deployed update levels can occur when:

- The device is updated outside of Security Manager.
- An update is applied to the policy in Security Manager but not yet published to the device.
- During initial Security Manager deployment before the devices are under Security Manager control.

To view the signature update level, select the **IPS > Signatures > Signatures** policy for an IPS device in Device view. Then, click the **View Update Level** button to open the Update Level dialog box.

The following table describes the information displayed in the dialog box.

**Table 523: Update Level Dialog Box**

| Element        | Description                                                                              |
|----------------|------------------------------------------------------------------------------------------|
| Applied Level  | This column displays the patch level that is applied to this device in Security Manager. |
| Deployed Level | This column displays the patch level that is currently running on the selected device.   |
| Major Update   | Identifies the major update level.                                                       |
| Minor Update   | Identifies the minor update level.                                                       |
| Service Pack   | Identifies the service pack level.                                                       |

| Element          | Description                                                                                                                                                                                                                                                                                    |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Patch            | Identifies the patch level.                                                                                                                                                                                                                                                                    |
| Engine           | Identifies the engine level.                                                                                                                                                                                                                                                                   |
| Signature Update | Identifies the signature update level.<br><b>Note</b> This field is the only field on this page that applies to the IOS IPS devices; all of the other fields are exclusive to IPS devices.                                                                                                     |
| Revert button    | If you mistakenly modify Applied Level, allows you to discard that new Applied Level; clicking <b>Revert</b> syncs the Applied Level to the Deployed Level.<br><b>Tip</b> A warning dialog appears before performing Revert. Also, a warning dialog appears asking you to submit the activity. |

## Enabling and Disabling Signatures

You can enable and disable individual signatures. Your change takes effect when you redeploy the configuration to the device.

If a signature is disabled, it appears in the table overlain with hash marks. When you deploy the configuration, disabled signatures are removed from the device.

Disabling signatures is useful when you want to reduce the number of signatures used by a device, or if you want to temporarily stop using a custom signature without deleting it. You can later reenable a signature that you disabled.

---

**Note** You can enable a signature that is retired, but it then is not used to scan traffic, because it is not in the signature micro-engine. If you want a sensor to scan network traffic for a particular signature, you must enable it and not retire it. The AIP-SSC-5 does not support enabling a signature that is retired.

---

**Step 1** Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page](#), on page 1680.

**Step 2** Right-click the signature whose enabled status you want to change and select **Enable** or **Disable**, as appropriate.

---

## Editing Signatures

You can edit signatures to change their behavior. For example, you can change the action that should be taken when a signature fires, or the severity and fidelity ratings used to calculate the risk rating of the signature.

Some signatures have special requirements. For example, to configure a sensor to detect ACL violation signatures, you must first configure one or more Cisco IOS routers to log ACL violations. Then, you must configure those routers to communicate with the sensor. Finally, you must configure the sensor to accept syslog traffic from those routers.

---

**Tip** This procedure describes how to edit an entire signature. You can also selectively edit individual properties of a signature using the right-click menu in the Signatures policy. For information on the available commands, see [Signature Shortcut Menu](#) , on page 1686.

---

### Related Topics

- [Cloning Signatures](#) , on page 1699
- [Configuring Event Action Filters](#) , on page 1714
- [Configuring Event Action Rules](#) , on page 1711

---

### Step 1

Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page](#) , on page 1680.

### Step 2

Right-click the signature you want to edit and select **Edit Row**. You can also select the signature and click the Edit Row (pencil) button beneath the signatures table. The Edit Signature dialog box opens.

**Tip** Use the filter fields above the table to help you find the desired signature. For information on filtering tables, see [Filtering Tables](#) , on page 50.

### Step 3

Make the desired changes to the signature. For specific details about each option, see x [Edit Signature or Add Custom Signature Dialog Boxes](#) , on page 1692.

When editing signatures, keep the following in mind:

- You cannot edit a Default signature. Default signatures are the Cisco-defined version of a signature. Before you can edit a Default signature, you must convert it either to a Local signature (one defined specifically on the selected

device) or a shared-policy-specific signature (one defined in a shared policy). You must select either Local or the shared policy name from the Source Policy field before you can change any field on the Edit Signature dialog box.

- You cannot change every characteristic of a signature. For example, you cannot change the signature or subsignature IDs. These fields are read-only.
- If you want to change the detailed parameters of a signature, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), on page 1700.

**Step 4** Click **OK** to save your changes.

---

## Edit Signature or Add Custom Signature Dialog Boxes

The Edit Signature and Add Custom Signature dialog boxes are essentially the same. Most of the fields are identical, although there are some layout differences. Use these dialog boxes as follows:

- Use the Edit Signature dialog box to edit the characteristics of a non-default signature (you can only view the characteristics of a default signature in read-only mode).

You cannot edit default signatures. To make any changes to a signature, you must select something other than Default in the Source Policy field at the top of the dialog box.

- Use the Add Custom Signature dialog box to create a custom signature. In the Add Custom Signature dialog box, you enter a name and then select an existing engine from a drop-down list. The signature ID and subsignature ID are assigned by Security Manager. After you finish selecting the remaining parameters, the new signature is added to the Signatures page in the appropriate numerical location, and it is selected.

---

**Note** Beginning with Security Manager 4.4, you can specify a signature ID and a subsignature ID while adding a custom signature. If you specify a signatureID/subsignature ID combination that already exists, you will receive an error message.

---

### Navigation Path

From the Signatures page:

- To edit a signature, right-click the policy you want to edit and select **Edit Row**.
- To add a custom signature, click the **Add Row (+)** button beneath the table, or right-click any row and select **Add Row**.

For information on opening the Signature page, see [Signatures Page](#), on page 1680.

## Field Reference

Table 524: Edit Signature or Add Custom Signature Dialog Boxes

| Element                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source Policy<br>(Edit signature only.)         | <p>The policy in which you are editing the signature:</p> <ul style="list-style-type: none"> <li>• Default—The default Cisco-defined signature, which you cannot edit. You must select something other than Default to edit the signature.</li> <li>• Local—The signature is a local signature defined specifically for the selected device. This option is not available in Policy view.</li> <li>• Policy name (variable)—The name of a shared policy. In Device view, a policy name is available only if you assign a shared policy to the device. In Policy view, this is the name of the policy you are editing. Select the policy name to edit the signature and to have your edits reflected on all devices that are assigned the shared policy.</li> </ul> |
| Name<br>(Add only.)                             | <p>The name of the signature.</p> <p>You cannot change the name after you create the signature. If you want to change the name, you must create a clone of the signature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SigID<br>(Add only.)                            | <p>The signature ID that you specify while adding a custom signature.</p> <p>The allowed range of values is 60000 - 65000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SubSigID<br>(Add only.)                         | <p>The subsignature ID that you specify while adding a custom signature.</p> <p>The allowed range of values is 0 - 255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Inheritance Mandatory<br>(Edit signature only.) | <p>When selected, forces any policy that inherits from this policy to use the signature settings defined.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enabled                                         | <p>Whether the signature is enabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Severity                                        | <p>The severity level that the signature will report: High, Medium, Low, or Informational.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Fidelity Rating                                 | <p>The weight associated with how well this signature might perform in the absence of specific knowledge of the target.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Actions                                         | <p>The actions that the sensor will take when this signature fires. For a complete list of actions, see the <a href="#">Understanding IPS Event Actions</a>, on page 1712.</p> <p>Use Ctrl+click to select multiple actions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Element                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Base Risk Rating<br/>Risk Rating<br/>(Fields have slightly different names when adding or editing signatures.)</p> | <p>The base risk rating value of the signature, which is calculated by multiplying the fidelity rating and the severity factor and dividing them by 100 (Fidelity Rating x Severity Factor /100). This value is read only; you cannot directly change it. To change the value, alter the Severity and Fidelity fields.</p> <p>The Severity Factor has the following values based on what you select in the Severity field:</p> <ul style="list-style-type: none"> <li>• High = 100</li> <li>• Medium = 75</li> <li>• Low = 50</li> <li>• Informational = 25</li> </ul>                                                                                      |
| <p>Engine<br/>(Read-only when editing; read-write when adding custom signatures.)</p>                                 | <p>The engine that parses and inspects the traffic specified by this signature. For a description of the engines, see <a href="#">Engine Options</a> , on page 1697.</p> <p>When adding a custom signature, you must select the appropriate engine. For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the <a href="#">Installing and Using Cisco Intrusion Prevention System Device Manager</a> document for the IPS Software release you are using.</p> <p><b>Tip</b>           The term <i>engine</i> used here is not the same as the term <i>engine level</i> used in the row below.</p> |

| Element                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retired                                                                       | <p>The conditions under which the signature is retired, if any. A retired signature is removed from the signature engine. You can activate a retired signature to place it back in the signature engine.</p> <p><b>Timesaver</b>—Use the retired field to unload disabled signatures on your IOS-IPS device to achieve the most favorable memory consumption of that device.</p> <p>If the engine level of a signature policy is less than E-4, the Retired field has two possible values: false and true. False means that the signature is not retired; true means that the signature is retired.</p> <p>If the engine level of a signature policy is equal to E-4, the Retired field has four possible values:</p> <ul style="list-style-type: none"> <li>• <b>false</b>—The signature is not retired.</li> <li>• <b>low-mem-retired</b>—The signature should be retired on low-memory platforms. A low-memory device is one that has 2 MB RAM or less.</li> <li>• <b>med-mem-retired</b>—The signature should be retired on both low-end and medium platforms. A medium-memory device is one that has 4 MB RAM or less, but more than 2 MB RAM. (Any device with more than 4 MB RAM is considered a high-memory platform.)</li> <li>• <b>true</b>—The signature is retired on all platforms.</li> </ul> <p>When you select low-mem-retired or med-mem-retired, Security Manager configures the device with those signatures. Whether the signature is actually retired on the device depends on amount of memory installed on the device; the device makes the decision on which signatures are actually retired.</p> <p><b>Tip</b>           The term <i>engine level</i> used here is not the same as the term <i>engine</i> in the row above.</p> |
| Obsolete<br>(Edit signature only.)                                            | Identifies whether the signature is obsolete. An obsolete signature is removed from the signature engine. It cannot be re-activated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Restore Defaults button<br>(Non-custom signatures only. Edit signature only.) | Click this button to revert to default values for this signature as defined by Cisco.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Edit Parameters button                                                        | Click this button to edit the detailed parameters for this signature using the Edit Signature Parameters dialog box. For more information, see the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Edit Signature Parameters Dialog Box</a> , on page 1702</li> <li>• <a href="#">Editing Signature Parameters (Tuning Signatures)</a> , on page 1700</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Adding Custom Signatures

If you want to look for traffic patterns that are not identified by the built-in signatures, you can create your own custom signatures to define the traffic patterns.

Even if a built-in signature covers the traffic pattern, you might want to create a custom signature to edit the detailed signature parameters without altering the default signature. If you are creating a custom signature that is similar to an existing signature, the easiest way to do it is to clone the signature as described in [Cloning Signatures](#), on page 1699.

When adding a custom signature to some IPS devices, you can use regular expressions. For more information on the importance of proper syntax when using regular expressions, refer to [Regular Expressions in Custom Signatures](#), on page 1699

---

**Note** The AIP-SSC-5 does not support custom signatures.

---

**Step 1** Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page](#), on page 1680.

**Step 2** Click the **Add Row (+)** button beneath the signature table to open the Add Custom Signature dialog box.

**Step 3** Configure the desired settings. For specific details about each option, see [Edit Signature or Add Custom Signature Dialog Boxes](#), on page 1692.

When creating signatures, keep the following in mind:

- You cannot change the signature name after you define the signature. If you later want to change the name, you must clone the signature and change it while creating the clone.
- Select the appropriate signature engine for the signature. For a description of the signature engines, see [Engine Options](#), on page 1697. You cannot change the engine after you create the signature; if you select the wrong engine and click OK to save the signature, you must start over and create an entirely new signature.
- The default is to create an enabled signature, but you can deselect the Enabled check box to initially create a disabled signature. You might want to disable the signature if you have not finished editing its parameters.
- Follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), on page 1700 to define the detailed signature parameters. You must select the desired engine before you edit the parameters, because many of the parameters are determined by the signature engine.

Whether you can save the signature before configuring parameters differs based on the engine that you select. At minimum, you must click **Edit Parameters** to open the Edit Signature Parameters dialog box, and then click **OK** in the Edit Signature Parameters dialog box, before you can save the signature definition. However, to create a meaningful signature, you will need to configure the parameters to identify the desired traffic pattern.

**Step 4** Click **OK** to save your changes.

The custom signature is added to the end of the table and given the next available signature ID starting at 60000.

**Note** Beginning with Security Manager 4.4, you can specify a signature ID and a subsignature ID while adding a custom signature. If you specify a signatureID/subsignature ID combination that already exists, you will receive an error message.

---

## Engine Options

The following list identifies the options you can specify in the Engine field of the Edit Signature Parameters dialog box. For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the [Installing and Using Cisco Intrusion Prevention System Device Manager](#) document for the IPS Software release you are using.

- AIC FTP—Inspects FTP traffic and lets you control the commands being issued.
- AIC HTTP—Provides granular control over HTTP sessions to prevent abuse of the HTTP protocol.
- Atomic ARP—Inspects Layer-2 ARP protocol. The Atomic ARP engine is different because most engines are based on Layer-3-IP.
- atomic-ip—Inspects IP protocol packets and associated Layer-4 transport protocols.
- Atomic IPv6—Detects IOS vulnerabilities that are stimulated by malformed IPv6 traffic.
- Flood Host—Detects ICMP and UDP floods directed at hosts.
- Flood Net—Detects ICMP and UDP floods directed at networks.
- Meta—Defines events that occur in a related manner within a sliding time interval. This engine processes events rather than packets.
- multi-string—Defines signatures that inspect Layer 4 transport protocol (ICMP, TCP, and UDP) payloads using multiple string matches for one signature. You can specify a series of regular expression patterns that must be matched to fire the signature.
- normalizer—Configures how the IP and TCP normalizer functions and provides configuration for signature events related to the IP and TCP normalizer. Allows you to enforce RFC compliance.
- service-dns—Inspects DNS (TCP and UDP) traffic.
- service-ftp—Inspects FTP traffic.
- Service Generic—Decodes custom service and payload.

The Service Generic engine allows programmatic signatures to be issued in a config-file-only signature update. It has a simple machine and assembly language that is defined in the configuration file. It runs the machine code (distilled from the assembly language) through its virtual machine, which processes the instructions and pulls the important pieces of information out of the packet and runs them through the comparisons and operations specified in the machine code. It is intended as a rapid signature response engine to supplement the String and State engines.

You cannot use the Service Generic engine to create custom signatures.

---

**Note** Due to the proprietary nature of this complex language, we do not recommend that you edit the Service Generic engine signature parameters. Change only the severity and event action for these signatures.

---

- Service Generic Advanced—Generically analyzes network protocols.
- Service H225—Inspects VoIP traffic.
- service-http—Inspects HTTP traffic. The WEBPORTS variable defines inspection port for HTTP traffic.
- Service IDENT—Inspects IDENT (client and server) traffic.
- Service MSRPC—Inspects MSRPC traffic.
- Service MSSQL—Inspects Microsoft SQL traffic.
- Service NTP—Inspects NTP traffic.
- service-rpc—Inspects RPC traffic.
- Service SMB—Inspects SMB traffic.
- Service SMB Advanced—Processes Microsoft SMB and Microsoft RPC over SMB packets.
- Service SNMP—Inspects SNMP traffic.
- Service SSH—Inspects SSH traffic.
- Service TNS—Inspects TNS traffic.
- state—Stateful searches of strings in protocols such as SMTP.
- string-icmp—Searches on Regex strings based on ICMP protocol.
- string-tcp—Searches on Regex strings based on TCP protocol.
- string-udp—Searches on Regex strings based on UDP protocol.
- Sweep—Analyzes sweeps of ports, hosts, and services, from a single host (ICMP and TCP), from destination ports (TCP and UDP), and multiple ports with RPC requests between two nodes.
- Sweep Other TCP—Analyzes TCP flag combinations from reconnaissance scans that are trying to get information about a single host. The signatures look for flags A, B, and C. When all three are seen, an alert is fired.
- Traffic ICMP—Analyzes nonstandard protocols, such as TFN2K, LOKI, and DDOS. There are only two signatures with configurable parameters.
- Traffic Anomaly—Analyzes TCP, UDP, and other traffic for worm-infested hosts.
- Trojan Bo2k—Analyzes traffic from the nonstandard protocol BO2K. There are no user-configurable parameters in this engine.
- Trojan Tfn2k—Analyzes traffic from the nonstandard protocol TFN2K. There are no user-configurable parameters in this engine.
- Trojan UDP—Analyzes traffic from the UDP protocol. There are no user-configurable parameters in this engine.

## Cloning Signatures

If you want to create a custom signature that is similar to an existing signature, you can create a clone, or copy, of the signature. You can then edit the parameters to make the clone perform according to your requirements.

For example, you might want to create a clone of a Cisco-defined signature to customize it to your needs. You might find this preferable to converting the Cisco signature to a Local or shared policy signature and directly editing its parameters.

To clone a signature, follow these steps:

- 
- Step 1** Do one of the following:
- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
  - (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
  - (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page , on page 1680](#).

- Step 2** Right-click the signature that you want to clone and select **Clone**.
- Security Manager takes some time to make the copy, and might warn you that some attributes are read-only and cannot be copied. If you receive a warning, click **OK**. The Add Custom Signature dialog box then appears.

- Step 3** Edit the properties of the cloned signature, as described in [Adding Custom Signatures , on page 1695](#).

- Step 4** Click **OK**. The clone appears in the summary table on the Signatures page as the last signature.

Cloned signatures are enabled and active by default.

---

## Regular Expressions in Custom Signatures

You can use regular expressions when adding a custom signature to some IPS devices.

Regardless of the type of IPS device or the particular characteristics of the custom signature, incorrect syntax in a regular expression will cause device deployment to fail after adding the custom signature.

Regular expressions may contain many control characters or regex notations which are used to describe the regex pattern itself. If you intend to use them as literal characters in the regular expression itself, they should be escaped with the "\" escape character. If you intend to use them for their real meaning, on the other hand, you should be careful to conform to proper regular expression syntax.

Example of regular expression that will cause deployment failure: `!@#%&^&*( )_+{|:"<>?`

Example of regular expression that will be deployed successfully: `!@#%&^&*\\( )_+\\{|}|:"<>\\?`

Using regular expressions in custom IPS signatures is described in this example:

- 
- Step 1** Add a Cisco ASA 5500 Series IPS Security Services Processor (e.g., 5525-X).
- Step 2** Add a custom signature with a string-XL engine (e.g., string-xl-tcp) to the IPS device.
- Step 3** Click Edit Parameter and create a regular expression for the custom signature.
- Step 4** Deploy the IPS device.
- Step 5** Deployment will fail if incorrect syntax for regular expressions used, but deployment will succeed if correct syntax is used.
- 

## Editing Signature Parameters (Tuning Signatures)

If you cannot alter the behavior of a signature to fit your needs using the Event Action Filters and Overrides policies, or by changing the actions associated with a signature, you might need to fine-tune the signature parameters. You should consider editing parameters to be your last option, however, because these parameters can be complex and frequently require that you have a deep understanding of packet characteristics.

The reason you would want to edit parameters is to reduce false positives and false negatives:

- A *false positive* occurs when legitimate network activity, such as virus scanning, is interpreted and reported as an attack. This happens when network activity meets criteria that were specified to identify an attack before the attack occurred. You can decrease the number of false positives by tuning your sensor configurations.
- A *false negative* occurs when an attack was not detected. Tuning your sensor configurations will help you decrease the number of false negatives.

---

**Tip** You cannot edit the parameters of a default signature. Before editing the parameters of a default signature, you must convert the signature to a local- or shared-policy signature. In some cases, such as regular expression editing, you must clone the signature and convert it to a custom signature.

---

This procedure describes how to edit signature parameters to tune a signature.

  - [Understanding Signatures](#) , on page 1677
  - [Configuring Event Action Filters](#) , on page 1714
  - [Configuring Event Action Overrides](#) , on page 1722
- 

- Step 1** Do one of the following:
- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
  - (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.

- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see [Signatures Page , on page 1680](#).

**Step 2** Right-click the signature whose parameters you want to edit and select **Edit Row**. The Edit Signature dialog box appears (see [Edit Signature or Add Custom Signature Dialog Boxes , on page 1692](#)).

**Step 3** If the Source Policy field shows Default, you must change it to Local or to the name of a shared policy before you can edit the parameters. The Local option is available in Device view only, and makes your changes apply to the device you are editing and to no other devices. If you select the name of a shared policy, your changes apply to all devices that are assigned the policy.

**Step 4** Click **Edit Parameters**. The Edit Signature Parameters dialog box appears.

The Edit Signature Parameters dialog box contains a folder tree structure, with the parameter names in the left side tree, and the values of the parameters shown on the right side.

Values that you can change contain a little box in the name; this is a check box. An empty check box indicates that the default value is being used for the parameter. Check the check box to configure that parameter. Click the value field to change the parameter. A green check indicates that a user-defined value is being used. Click the green check to change the value back to the default. (Editing the field typically adds a check mark to the box.)

To change a parameter, click in the associated field in the right side. The behavior of clicking on a parameter differs based on the parameter type:

- Read-only parameters—Many parameters are read-only and cannot be changed, such as signature ID. Clicking these parameters typically has no effect, although parameter lists will open a dialog box (such as the Obsoletes list).
- Text or Numeric parameters—When you click a parameter that requires that you type in a value, whether alphanumeric or numeric, the field becomes an edit box. Type in the desired value and either press enter or click outside the edit box.
- Predefined value parameters—Many parameters have a small set of possible values, such as Yes/No. When you click these parameters, you activate a drop-down list. Select the desired option and click outside the field.
- List parameters—Some parameters contain a list of items. These parameters are represented by a pencil icon in the parameter value along with a word, such as Set or List. When you click in the field, a dialog box opens where you can configure the list associated with the item. The Meta engine component list is an example; for more information, see [Editing the Component List for Meta Engine Signatures , on page 1706](#).
- Variable parameters—Some parameters allow you to select policy objects to identify the contents of the parameters. For example, you can select port list objects to identify ports in some signature engines. When you click these parameters, an edit box with a Select button appears. You can type the items directly into the edit box, including the name of the policy object, or click **Select** to select the policy object from a list or to create a new object.

For more information about the Edit Signature Parameters dialog box, see [Edit Signature Parameters Dialog Box , on page 1702](#).

**Step 5** Change the settings as desired, then click **OK** to save your changes. You are returned to the Edit Signature dialog box.

**Step 6** Click **OK** in the Edit Signature dialog box to save your changes to the signature.

**Tip** If you decide that your edits did not have the desired effect, or you suspect that you made a mistake, you can click the **Restore Defaults** button in the Edit Signature dialog box to erase your changes. You can then start over.

## Edit Signature Parameters Dialog Box

Use the Edit Signature Parameters dialog box to edit (also called tune) the built-in micro-engine parameters for a particular signature. Different engines have different parameters, so the appearance of the Edit Signature Parameters dialog box varies. For more information about editing signature parameters, see [Editing Signature Parameters \(Tuning Signatures\)](#), on page 1700.

The Edit Signature Parameters dialog box contains a folder tree structure, with the parameter names in the left side tree, and the values of the parameters shown on the right side.

Values that you can change contain a little box in the name; this is a check box. An empty check box indicates that the default value is being used for the parameter. Check the check box to configure that parameter. Click the value field to change the parameter. A green check indicates that a user-defined value is being used. Click the green check to change the value back to the default. (Editing the field typically adds a check mark to the box.)

To change a parameter, click in the associated field in the right side. The behavior of clicking on a parameter differs based on the parameter type:

- Read-only parameters—Many parameters are read-only and cannot be changed, such as signature ID. Clicking these parameters typically has no effect, although parameter lists will open a dialog box (such as the Obsoletes list).
- Text or Numeric parameters—When you click a parameter that requires that you type in a value, whether alphanumeric or numeric, the field becomes an edit box. Type in the desired value and either press enter or click outside the edit box.
- Predefined value parameters—Many parameters have a small set of possible values, such as Yes/No. When you click these parameters, you activate a drop-down list. Select the desired option and click outside the field.
- List parameters—Some parameters contain a list of items. These parameters are represented by a pencil icon in the parameter value along with a word, such as Set or List. When you click in the field, a dialog box opens where you can configure the list associated with the item. The Meta engine component list is an example; for more information, see [Editing the Component List for Meta Engine Signatures](#), on page 1706.
- Variable parameters—Some parameters allow you to select policy objects to identify the contents of the parameters. For example, you can select port list objects to identify ports in some signature engines. When you click these parameters, an edit box with a Select button appears. You can type the items directly into the edit box, including the name of the policy object, or click **Select** to select the policy object from a list or to create a new object.

### Navigation Path

From the Edit Signature or Add Custom Signature dialog boxes, click the **Edit Parameters** button. For information on opening these dialog boxes, see [Edit Signature or Add Custom Signature Dialog Boxes](#), on page 1692.

---

**Tip** If the button is not active, you must first select Local or the name of a shared policy from the Source Policy field, or clone the signature to create a custom policy. The Local option is available in Device view only, and makes your changes apply to the device you are editing and to no other devices. If you select the name of a shared policy, your changes apply to all devices that are assigned the policy.

## Field Reference

Table 525: Edit Signature Parameters Dialog Box

| Elements                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tuning Context<br>(Policy view only) | <p>Displays the information needed by Security Manager to uniquely describe how the signature parameters were edited (tuned) for a particular signature policy. The Tuning Context field is a character string that contains the following items:</p> <ul style="list-style-type: none"> <li>• <b>Context</b>—The identification given by the Security Manager server for the unique definition of this micro-engine.</li> <li>• <b>SigLevel (IPS) or Version (IOS IPS)</b>—For IPS policies, the range of signature update levels to which this definition of the signature micro-engine applies. For IOS IPS, this is the IOS IPS version.</li> <li>• <b>Engine</b>—The name of the IPS engine.</li> </ul> <p><b>Tip</b> As an example, the Tuning Context field could contain the following character string: Context:9, SigLevel:302-449, Engine:atomic-ip.</p> <p>For any particular signature policy, the Tuning Context field can contain one or many tuning contexts:</p> <ul style="list-style-type: none"> <li>• The tuning context with the highest signature level is pre-pended with "Reference context."</li> <li>• If you modify the shared policy that is pre-pended with "Reference context," Security Manager may ask you if you want to copy the policy to other applicable contexts. (A particular device may appear in more than one context.)</li> <li>• If you choose to copy the policy to other applicable contexts, an error message informs you if some parameters cannot be copied.</li> </ul> <p><b>Note</b> Beginning with Security Manager 4.1, old signature versions (defined as being older than the lowest signature level deployed) are purged during a periodic purge operation, the purpose of which is to optimize the database. As a result, you may notice the deletion of some of your unused tuning contexts.</p> |
| Signature ID                         | <p>The unique numerical value assigned to this signature. This value lets the sensor identify a particular signature.</p> <p>The value is 1000 to 65000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SubSignature ID                      | <p>The unique numerical value assigned to this subsignature. The subsignature ID identifies a more granular version of a broad signature.</p> <p>The value is 0 to 255.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Promiscuous Delta                    | <p>Modifies the seriousness of an alert when operating in promiscuous mode. The value is subtracted from an alert's overall risk rating. The promiscuous delta is ignored when operating in inline mode. The value can be 0 to 30.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Elements        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sig Description | <p>A description of the signature to help you distinguish this signature from other signatures:</p> <ul style="list-style-type: none"> <li>• Alert Notes—Additional information about this signature that will be included in the alert message.</li> <li>• User Comments—Your comments about the signature.</li> <li>• Alarm Traits—Traits you want to document about this signature. The value is 0 to 65535. The default is 0.</li> <li>• Release—The release in which the signature was most recently updated.</li> <li>• Signature Creation Date—The date on which the signature was created.</li> <li>• Signature Type—The type of signature: Anomaly, Component, Exploit, Vulnerability, or Other.</li> </ul>                                                                                                                                                     |
| Engine          | <p>The engine that parses and inspects the traffic specified by this signature. The engine determines which parameters are available in the Engines folder. For a description of the engines, see <a href="#">Engine Options</a>, on page 1697.</p> <p>For detailed information about each engine, and the parameters available, see the “Signature Engines” section in the <a href="#">Installing and Using Cisco Intrusion Prevention System Device Manager</a> document for the IPS Software release you are using.</p> <p><b>Tip</b> Many engines include the Fragment Status parameter, which lets you identify whether packet fragments should be inspected. You can elect to not inspect fragments, to inspect fragments, or to apply the signature to any packet status.</p>                                                                                     |
| Event Counter   | <p>How the sensor counts events. For example, you can specify that you want the sensor to send an alert only if the same signature fires 5 times for the same address set. Configure the following values:</p> <ul style="list-style-type: none"> <li>• Event Count—The number of times an event must occur before an alert is generated. The value is 1 to 65535. The default is 1.</li> <li>• Event Count Key—The storage type used to count events for this signature. Choose attacker address, attacker address and victim port, attacker and victim addresses, attacker and victim addresses and ports, or victim address. The default is attacker address.</li> <li>• Specify Alert Interval—Whether you want to specify the time between alerts for resetting the event count, Yes or No. If you select Yes, enter the time in seconds from 2 to 1000.</li> </ul> |

| Elements                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alert Frequency                                           | <p>How often the sensor alerts you when this signature is firing. Specify the following parameters for this signature. These parameters are explained below.</p> <ul style="list-style-type: none"> <li>• Summary Mode</li> <li>• Summary Interval</li> <li>• Summary Key</li> <li>• Specify Global Summary Threshold</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Summary Mode<br>(Alert Frequency group)                   | <p>The mode of alert summarization. There are four modes: Fire All, Fire Once, Summarize, and Global Summarize. The summary mode is changed dynamically to adapt to the current alert volume. For example, you can configure the signature to Fire All, but after a certain threshold is reached, it starts summarizing. Your selection of summary mode controls which other parameters are available in the Summary Mode group.</p> <ul style="list-style-type: none"> <li>• Fire All—Fires an alert on all events.</li> <li>• Fire Once—Fires an alert only once.</li> <li>• Summarize—Summarizes alerts.</li> <li>• Global Summarize—Summarizes an alert so that it only fires once regardless of how many attackers or victims.</li> </ul> <p><b>Note</b> When multiple contexts from an ASA device are contained in one virtual sensor, the summary alerts contain the context name of the last context that was summarized. Thus, the summary is the result of all alerts of this type from all contexts that are being summarized.</p> |
| Specify Summary Threshold<br>(Summary Mode group.)        | <p>When you select Fire All, you can select whether you want to configure the summary threshold settings that will be used if the device dynamically changes to summary mode. If you select Yes, you can configure the summary interval, key, or global summary thresholds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Summary Interval<br>(Summary Mode group.)                 | <p>The time in seconds used in each summary alert. The value is 1 to 65535. The default is 15.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Summary Key<br>(Summary Mode group.)                      | <p>The storage type used to summarize alerts. Choose Attacker address, Attacker address and victim port, Attacker and victim addresses, Attacker and victim addresses and ports, or Victim address. The default is Attacker address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Specify Global Summary Threshold<br>(Summary Mode group.) | <p>Whether to specify the threshold number of events to take the alert into global summary, Yes or No. If you select Yes, enter the threshold number of events, from 1 to 65535. The default is 240.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Elements            | Description                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status              | The status of the signature.<br><br>The Obsoletes list shows the signatures that are obsoleted by this signature; click the pencil icon to open the list. In many cases, this information is read-only. If you can modify the list, click Set in the parameter field to open the list, where you can add the obsoleted signature IDs. |
| Vulnerable OS List  | The list of operating systems that this attack targets.                                                                                                                                                                                                                                                                               |
| MARS Category       | The category in Cisco Security MARS to which this signature belongs. This metadata is used to color the events generated in such a way as to provide MARS with the data that it needs to process this signature relative to the event categories that it studies.                                                                     |
| Expand All button   | Expands all categories and subcategories.                                                                                                                                                                                                                                                                                             |
| Collapse All button | Collapses all fields to the category.                                                                                                                                                                                                                                                                                                 |

## Editing the Component List for Meta Engine Signatures

Use the Edit Signature Parameter—Component List dialog box to edit the component list for a meta engine signature.

The Meta engine defines events that occur in a related manner within a sliding time interval. This engine processes events rather than packets. As signature events are generated, the Meta engine inspects them to determine if they match any or several Meta definitions. The Meta engine generates a signature event after all requirements for the event are met.

All signature events are handed off to the Meta engine by the Signature Event Action Processor. The Signature Event Action Processor hands off the event after processing the minimum hits option. Summarization and event action are processed after the Meta engine has processed the component events.

The Meta engine is different from other engines in that it takes alerts as input where most engines take packets as input. Thus, in a Meta engine signature, you must identify the signatures that the Meta signature should be looking for. This list of signatures is contained in the Component list.

The Component list is part of the signature parameters. To edit the parameters, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), on page 1700. When you open the Edit Signature Parameters dialog box for a signature that uses the Meta engine, look for the **Engine > Component List** parameter. The parameter value contains a pencil icon and the word List. Click **List** to open the Edit Signature Parameter—Component List dialog box.

The dialog box is divided into two lists, an Inactive list (on the left) and an active list (on the right). The active list defines the signatures that the Meta engine signature is looking for.

To modify the components list:

- **Add new components**—Click the **Add Entry (+)** button to the left of the inactive list. The Add Signature Parameter—List Entry dialog box opens. Configure the following values:
  - **Entry Key**—A name for the component.
  - **Component Sig ID**—The signature ID of the signature you are looking for.
  - **Component SubSig ID**—The subsignature ID; enter 0 if there are no subsignatures.

- **Component Count**—The number of times this signature must fire before the Meta signature is triggered.
- **Is a Not Component**—This field lets you create negative entries; thus, you can identify a list where some signatures must fire, and some signatures must not fire. Select **No** for signatures that must fire, and **Yes** for signatures that must not fire.

When you click **OK** in the Add Signature Parameter—List Entry dialog box, the new component is added to the inactive list. Select it and click the >> button to move it to the active list. Then, use the Up and Down arrow buttons to position the component in the active component list; a third button is available to reset the order to the previously saved order.

- **Edit an existing component**—Select the component (in either list) and click the **Edit Entry (pencil)** button that is between the lists. The Edit Signature Parameter—List Entry dialog box opens. The parameters are the same as for adding a new entry, except that you cannot change the component name.
- **Delete a component**—Select the component in the inactive list and click the **Delete Entry (trash can)** button that is to the left of the inactive list. If you want to delete an active component, you must first select it in the active list and click the << button to move it to the inactive list.
- **Restore defaults**—If you want to restore the default values of a component, select it and click **Restore**.

## Obsoletes Dialog Box

Use the Obsoletes dialog box to identify obsolete signatures associated with a particular signature. In many cases, this information is read-only. In some cases, it is read-write; for example, you can edit the list for IOS IPS signature policies for Local or shared-policy-specific signatures.

If you can edit the list:

- Click the **Add Entry (+)** button to add the signature and subsignature ID of a signature that is made obsolete by the signature you are editing.
- Select an entry and click the **Delete Entry (trash can)** button to remove it from the list of obsoleted signatures.

### Navigation Path

The Obsoletes list is part of the signature parameters. To edit the parameters, follow the procedure described in [Editing Signature Parameters \(Tuning Signatures\)](#), on page 1700. When you open the Edit Signature Parameters dialog box, look for the **Status > Obsoletes** parameter. The parameter value contains a pencil icon and the word Set (when the parameter is not read-only). Click the pencil or word to open the Obsoletes dialog box.

## Configuring Signature Settings

Use the Signature Settings page to define settings for IPS appliances and service modules (but not Cisco IOS IPS devices). These settings define the following policies:

- **Application policy**—Enable or disable HTTP, determine and specify the maximum number of HTTP requests, specify AIC web ports, and enable or disable FTP.

- **Fragment reassembly policy**—Configure the sensor to reassemble a datagram that has been fragmented over more than one packet by selecting the IP reassembly mode.
- **Stream reassembly policy**—Configure the sensor to monitor only TCP sessions that have been established by a complete three-way handshake by specifying whether a TCP handshake is required and by selecting the TCP reassembly mode.
- **IP logging policy**—Configure the sensor to generate an IP session log when the sensor detects an attack by determining and selecting the maximum allowable number of log packets, the IP log time and the maximum allowable size of the IP log.

**Tip** All of these settings have default values, so configure this policy only if you need to use a non-default value.

To configure the Signature Settings policy, do one of the following:

- (Device view) Select **IPS > Signatures > Settings** from the Policy selector.
- (Policy view) Select **IPS > Signatures > Settings**, then select an existing policy or create a new one.

You can then configure the options that are explained in the following table.

**Table 526: Signature Settings Page**

| Element                | Description                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable HTTP            | Enables protection for web services. Select <b>Yes</b> to require the sensor to inspect HTTP traffic for compliance with the RFC.                                                                                                    |
| Max HTTP Requests      | The maximum number of outstanding HTTP requests per connection.                                                                                                                                                                      |
| AIC Web Ports          | The ports on which to look for AIC traffic. Enter a comma-separated list of port numbers or port list objects that define the ports. You can click <b>Select</b> to select a port list object from a list or to create a new object. |
| Enable FTP             | Enables protection for FTP services. Select <b>Yes</b> to require the sensor to inspect FTP traffic.                                                                                                                                 |
| IP Reassembly Mode     | The method the sensor uses to reassemble the fragments, based on the operating system.                                                                                                                                               |
| TCP Handshake Required | Whether the sensor should only track sessions for which the three-way handshake is completed.                                                                                                                                        |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TCP Reassembly Mode | <p>The mode the sensor should use to reassemble TCP sessions with the following options:</p> <ul style="list-style-type: none"><li>• Asymmetric—May only be seeing one direction of bidirectional traffic flow.</li></ul> <p><b>Note</b> Asymmetric mode lets the sensor synchronize state with the flow and maintain inspection for those engines that do not require both directions. Asymmetric mode lowers security because full protection requires both sides of traffic to be seen.</p> <ul style="list-style-type: none"><li>• Loose—Use in environments where packets might be dropped.</li><li>• Strict—If a packet is missed for any reason, all packets after the missed packet are not processed.</li></ul> |
| Max IP Log Packets  | The number of packets you want logged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IP Log Time         | The duration you want the sensor to log, from 1 to 60 minutes. The default is 30 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Max IP Log Bytes    | The maximum number of bytes you want logged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## CHAPTER 40

# Configuring Event Action Rules

---

**Note** From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see EOL notice.

---

An IPS event is an IPS message that contains an alert, a block request, a status message, or an error message. An event action is the sensor's response to an event. An event action happens only if the event is not filtered. Possible event actions are TCP reset, block host, block connection, IP logging, and capturing the alert trigger packet. Event actions were known as alarms in Cisco IPS versions earlier than 5.x.

The IPS Event Actions folder is where you configure settings for the event action processing component of the sensor. These settings define the actions for the sensor to take when an event is detected.

---

**Note** You cannot use IPv6 addresses in Event Action policies in Security Manager. For more information on IPv6 Support in Security Manager, see [IPv6 Support in Security Manager](#) , on page 8.

---

This chapter contains the following topics:

- [Understanding the IPS Event Action Process](#) , on page 1711
- [Understanding IPS Event Actions](#) , on page 1712
- [Configuring Event Action Filters](#) , on page 1714
- [Configuring Event Action Overrides](#) , on page 1722
- [Configuring IPS Event Action Network Information](#) , on page 1727
- [Configuring Settings for Event Actions](#) , on page 1733

## Understanding the IPS Event Action Process

The IPS event action rules dictate the actions that the sensor performs when an event occurs. Although each signature is configured with specific actions that should be taken, the actual actions performed also depend on other factors.

Following is the general process that occurs when inspection identifies a signature event:

1. A signature alert occurs with actions specified by the signature. A risk rating for the alert is calculated.

For a detailed explanation of how risk rating is calculated, see [Calculating the Risk Rating](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 7.0* on Cisco.com.

You can influence risk ratings by configuring target value ratings and OS mappings; see [Configuring IPS Event Action Network Information](#), on page 1727.

2. The **Event Action Overrides** policy is processed. If the risk rating of the event matches an override rule, the actions identified in the override rule are **added** to the actions defined in the signature. The overrides do not replace the actions specified in the signature.

For information on configuring overrides, see [Configuring Event Action Overrides](#), on page 1722.

3. The **Event Action Filters** policy is processed. If rules apply to the event, the rules **subtract** actions from the event. Thus, an action you added in a signature policy or override rule might be removed by one of your filter rules.

For information on creating filter rules, see [Configuring Event Action Filters](#), on page 1714.

4. Event summarization occurs, unless you turn off the summarization feature as described in [Configuring Settings for Event Actions](#), on page 1733.

5. The actions are performed. For an explanation of possible actions, see [Edit, Add, Replace Action Dialog Boxes](#), on page 1688.

6. A list of denied attackers is maintained, and subsequent access prevented, based on configurable settings. To change the default settings, see [Configuring Settings for Event Actions](#), on page 1733.

## Understanding IPS Event Actions

When you configure an event action filter or override, or a signature, you specify an action for events that meet the rule. For signatures and overrides, you are specifying an action to add to the event; for filters, you are specifying an action to remove from the event.

The most common action is Produce Alert, which generates an alert that you can view in your network management system, such as the Security Manager Event Viewer or CS MARS. However, there are a wide variety of actions that you can assign to an event. When looking over the possible actions, keep the following in mind:

- Many actions produce alerts in addition to the other action performed. The description for each action explains whether an alert is also produced.
- Cisco IOS IPS supports fewer actions for event action override or filter rules. The actions supported are Deny Attacker Inline, Deny Connection Inline, Deny Packet Inline, Product Alert, and Reset TCP Connection.
- Not all actions are necessarily available on all combinations of IPS software version and device type. Whenever you need to select an action, only those actions that are valid are available for selection.
- For deny and block actions, use the event actions settings policy to set the period of time for which addresses or packets are denied. For more information, see [Configuring Settings for Event Actions](#), on page 1733.

The following table explains the possible actions.

Table 527: IPS Event Actions

| Menu Command                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Deny Attacker Inline              | <p>Terminates the current packet and future packets from this attacker address for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p> <p>For Cisco IOS IPS devices, no connection can be established from the attacker to the router until the shun time expires.</p> <p><b>Tip</b> This is the most severe of the deny actions. It denies current and future packets from a single attacker address. For IPS appliances and service modules, you can use the IPS Device Manager to see a list of denied attackers and clear the list if necessary.</p> |
| Deny Attacker/Service Pair Inline | <p>Does not transmit this packet and future packets on the attacker address victim port pair for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                     |
| Deny Attacker/Victim Pair Inline  | <p>Does not transmit this packet and future packets on the attacker/victim address pair for a specified period of time.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| Deny Connection Inline            | <p>Terminates the current packet and future packets on this TCP flow. Other connections from the attacker can be established.</p> <p>The IPS must be operating in inline mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| Deny Packet Inline                | <p>Terminates the packet.</p> <p>The IPS must be operating in inline mode.</p> <p>For Cisco IOS IPS devices, this action discards the packet without sending a reset. Cisco recommends using “drop and reset” in conjunction with alarm.</p> <p><b>Tip</b> For IPS appliances and service modules, there is an event action override that adds this action to high risk events. You cannot delete the override. If you do not want to use it, disable the override. For more information, see <a href="#">Configuring Event Action Overrides</a>, on page 1722.</p>                   |
| Log Attacker Packets              | <p>Starts IP logging on packets that contain the attacker address and sends an alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                        |
| Log Pair Packets                  | <p>Starts IP Logging on packets that contain the attacker/victim address pair. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                               |
| Log Victim Packets                | <p>Starts IP Logging on packets that contain the victim address and sends an alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.</p>                                                                                                                                                                                                                                                                                                                                                                                          |

| Menu Command             | Description                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Modify Packet Inline     | <p>Modifies packet data to remove ambiguity about what the endpoint might do with the packet.</p> <p><b>Tip</b> This option is not available for event action override or filter rules. It is available in signatures.</p>                                                                                                                                     |
| Product Alert            | <p>Writes the event to the Event Store as an alert. For Cisco IOS IPS devices, the notification is sent through syslog or SDEE.</p> <p><b>Note</b> A Produce Alert event action is added for an event when global correlation has increased the risk rating of an event, and has added either the Deny Packet Inline or Deny Attacker Inline event action.</p> |
| Produce Verbose Alert    | Includes an encoded dump of the offending packet in the alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.                                                                                                                                                                                            |
| Request Block Connection | Sends a request to block this connection. You must have blocking devices configured to implement this action. For more information, see <a href="#">Configuring IPS Blocking and Rate Limiting</a> , on page 1765.                                                                                                                                             |
| Request Block Host       | Sends a request to block this attacker host. You must have blocking devices configured to implement this action.                                                                                                                                                                                                                                               |
| Request Rate Limit       | Sends a rate limit request to perform rate limiting. You must have rate limiting devices configured to implement this action.                                                                                                                                                                                                                                  |
| Request SNMP Trap        | Requests that the sensor send an SNMP trap notification to the configured trap destinations. This action causes an alert to be written even if Produce Alert is not selected. You must have SNMP configured on the sensor for traps to actually be sent. For more information, see <a href="#">Configuring SNMP</a> , on page 1621.                            |
| Reset TCP Connection     | Sends TCP resets to hijack and terminate the TCP flow, sending a reset to both the source and destination addresses. Reset TCP Connection works only on TCP signatures that analyze a single connection, for example, half-open SYN attacks. It does not work for sweeps or floods.                                                                            |

## Configuring Event Action Filters

You can configure event action filters to remove specific actions from an event or to discard an entire event and prevent further processing by the sensor.

Filters let the sensor perform certain actions in response to the event without requiring the sensor to perform all actions or remove the entire event. Filters work by removing actions from an event. A filter that removes

all actions from an event effectively consumes the event. Before configuring filter rules, read [Tips for Managing Event Action Filter Rules](#) , on page 1716.

**Note** When filtering sweep signatures, we recommend that you do not filter the destination addresses. If there are multiple destination addresses, only the last address is used for matching the filter.

#### Related Topics

- [Understanding IPS Event Actions](#) , on page 1712

**Step 1** Do one of the following to open the Event Action Filters policy:

- (Device view) Select **IPS > Event Actions > Event Action Filters** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Filters**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Filters**, then select an existing policy or create a new one.

The table shows the existing filter rules organized into sections. The Local section is for rules defined specifically for a selected device (in Device view). For shared or inherited policies, there are also sections for mandatory and default rules. For more information about the contents of this policy, see [Event Action Filters Page](#) , on page 1717.

**Step 2** Select the row after which you want to create the filter rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add Filter Item dialog box. For detailed information about the options in this dialog box, see [Filter Item Dialog Box](#) , on page 1719.

#### Tips

- If you do not select a row, the new rule is added at the end of the local scope.
- You can also select an existing row and edit either the entire row (by clicking the **Edit Row** button) or specific cells. To edit a specific cell, right-click the cell and select the **Edit** command related to the cell from the top of the context menu.
- You can delete a rule by selecting it and clicking the **Delete Row** button.
- You can export the entire list of filter rules to a comma-separated values (CSV) file. Click **Export to File**, navigate to an appropriate folder on the Security Manager server, change the file name if you do not like the default name, and click **Save**.

**Step 3** Configure the filter rule. Following are the highlights of what you typically need to configure. For specific information on configuring the fields, and for information on fields not mentioned here, see [Filter Item Dialog Box](#) , on page 1719.

- Name—You must enter a name for the rule. Use a name that is meaningful to you.
- Signature, Subsignature ID—If the filter should apply to all signatures, use the default values. If you are targeting a specific signature, enter its signature and subsignature identifiers. You can obtain these values by finding the signature in the Signatures policy (see [Signatures Page](#) , on page 1680).

- **Attacker and Victim Addresses and Ports**—If the filter should apply no matter who is attacking, or who is the victim, use the default values. If you are creating a filter specific to an attacker or victim, update these fields to match the appropriate address and port.
- **Risk Rating**—You are most likely to want to change this value. The filter is applied to events that are within the minimum-maximum range you configure here. The default value, 0-100, will apply the filter rule to all events. If you configure a specific signature ID, the rating applies only to events for that signature (in which case the default risk rating might be acceptable).

For example, you might want to target only high-risk events, such as 90-100.

- **Actions to Subtract**—Select the actions that you want to subtract from the event. Use Ctrl+click to select more than one action. If you select an action that is not actually assigned to an event, the filter rule essentially has no effect on the event. For more information about the actions, see [Edit, Add, Replace Action Dialog Boxes](#), on page 1688.
- **Stop on Match**—Whether to define this filter rule as a stop rule. This setting determines how the remaining rules in the event action filter rules table are processed:
  - If you select this option, and an event meets the conditions of the rule, this rule is the final rule tested for the event. The actions identified by this rule are removed from the event, and the device moves on to perform all remaining actions assigned to the event.
  - If you do not select this option, then events that meet the conditions of this filter rule are also compared to subsequent rules in the event actions filters table. Subsequent rules are tested until either all rules are tested, or the event matches a stop rule.

Click **OK** when you are finished defining your filter rule.

- Step 4** If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. Ensure that stop rules are placed after other rules that you want applied prior to the stop.

## Tips for Managing Event Action Filter Rules

Following are some tips that might help you effectively manage your event action filter rules:

- Disabled rules are shown with hash marks covering the table row. To change the enabled/disabled status of a rule, right click the rule and select **Enable** or **Disable** as appropriate. You can also change the status when editing the rule.

Disabling a rule is useful if you want to stop using the rule, but you might want to start using it again in the future. Disabled rules remain in the table so that you do not need to recreate them.

- For existing rules, you can edit most of the fields directly from the event actions filter rules table by right-clicking the cell and selecting the appropriate Edit command from the top portion of the context menu. For example, you can right click the Attacker Ports cell and select **Edit Attacker Ports**.

Many of these right-click commands open a version of the Edit Filter Item dialog box that contains only the selected property. Other commands simply change a value, or open a sub-menu from which you can select a value to add or remove. For example, right-clicking the Action cell provides four commands:

- **Add to Actions**—Select from a list of actions to add to those already defined in the rule.
- **Delete from Actions**—Select from a list of actions defined in the rule to remove from the rule.

- **Replace Actions With**—Select from a list the action that you want to completely replace those defined in the rule.
- **Edit Actions**—Opens a dialog box where you can select all actions for the rule. Your selection replaces the cell contents.
- Although filter rules are configured as an ordered list, the rules are not processed as a “first match wins” list, even though they are processed and applied top to bottom. Instead, each rule has a Stop property: the rule is either a stop rule or it is not a stop rule. Processing ends only if an event matches a stop rule. If an event matches a non-stop rule, the event is compared to subsequent filter rules. Thus, more than one filter rule can apply to an event. If you decide to create stop rules, ensure that you place them below all other rules that you want processed for an event.

If you define no stop rules, each event is compared to all filter rules, and all matching rules are applied to the event in top-to-bottom order.

- You can inherit event action filter rules policies. Thus, you could configure a shared policy in Policy view that includes filter rules that you want to share among all of your devices, inherit that rule for each device (in Device view), and in Device view configure local filter rules that are unique to each device. For more information on inheriting policies, see:
  - [Creating a New Shared Policy](#) , on page 219
  - [Inheritance vs. Assignment](#) , on page 170
  - [Inheriting or Uninheriting Rules](#) , on page 211

## Event Action Filters Page

Use the Event Actions Filters page to configure event action filter rules. Filter rules can remove specific actions from an event or they can discard an entire event and prevent further processing by the sensor.

Event action filters are processed as an ordered list and you can move filters up or down in the list. Filters let the sensor perform certain actions in response to the event without requiring the sensor to perform all actions or remove the entire event. Filters work by removing actions from an event. A filter that removes all actions from an event effectively consumes the event.

Before configuring event action filter rules, read the following topics:

- [Configuring Event Action Filters](#) , on page 1714
- [Tips for Managing Event Action Filter Rules](#) , on page 1716
- [Understanding IPS Event Actions](#) , on page 1712

**Tip** Disabled rules are shown with hash marks covering the table row. To change the enabled/disabled status of a rule, right click the rule and select **Enable** or **Disable** as appropriate. You can also change the status when editing the rule.

### Navigation Path

- (Device view) Select **IPS > Event Actions > Event Action Filters** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Filters**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Filters**, then select an existing policy or create a new one.

### Field Reference

**Table 528: Event Action Filters Page**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name         | The name of the filter rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Active       | Whether the signature is active.<br>This cell is not available for Cisco IOS IPS policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| IDs          | The signature identifiers to which this rule applies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Subs         | The subsignature identifiers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Attackers    | The IP address of the attacker that triggers the filter rule, which can be a host address, an address range (such as 0.0.0.0-255.255.255.255 in the case of IPv4 or ::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF in the case of IPv6), or a network/host policy object.<br><b>Tip</b> If you use a network/host object, you can see the contents of the object by right-clicking it and selecting <b>Show Contents</b> .<br><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure. |
| Attack Ports | The port used by the attacker host that triggers the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Victims      | The IP address of the victim that triggers the filter rule, which can be a host address, an address range (such as 0.0.0.0-255.255.255.255 in the case of IPv4 or ::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF in the case of IPv6), or a network/host policy object.<br><b>Tip</b> If you use a network/host object, you can see the contents of the object by right-clicking it and selecting <b>Show Contents</b> .<br><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.   |

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Victim Ports                              | The port targeted by the attacker host that triggers the filter.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Actions                                   | The actions that should be removed from the event when the filter is triggered.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| RR                                        | The risk rating range that triggers this event action filter.<br><br>For a detailed explanation of how risk rating is calculated, see <a href="#">Calculating the Risk Rating</a> in <i>Installing and Using Cisco Intrusion Prevention System Device Manager 7.0</i> on Cisco.com.                                                                                                                                                                                                                           |
| Stop                                      | Whether this is a stop rule. If Yes, then when an event meets the conditions of this rule, the filter is applied to the event but the event is not tested against the remaining rules in the event action filter rules policy.                                                                                                                                                                                                                                                                                |
| Export to File button                     | Click this button to export the event action filters summary to a comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name.                                                                                                                                                                                                                                                                                                         |
| Up Row and Down Row buttons (arrow icons) | Click these buttons to move the selected rules up or down within a scope.<br><br>Filter rules are processed in order top to bottom for each event. If the conditions of an event match those defined for a filter, and the filter has the Stop field set to Yes, that filter is applied and no additional filters are considered. Ensure that stop rules are placed after the other rules you want applied to an event.<br><br>You should order the more restrictive rules before general rules in the table. |
| Add Row button                            | Click this button to add a filter rule to the table after the selected row using the Add Filter Item dialog box (see <a href="#">Filter Item Dialog Box</a> , on page 1719). If you do not select a row, the rule is added at the end of the local scope.                                                                                                                                                                                                                                                     |
| Edit Row button                           | Click this button to edit the selected rule. You can also edit individual cells by right-clicking the cell and selecting the appropriate Edit command.                                                                                                                                                                                                                                                                                                                                                        |
| Delete Row button                         | Click this button to delete the selected rule.<br><br><b>Tip</b> Instead of removing the rule, you can right-click the rule and select <b>Disable</b> . This prevents the rule from being used, but leaves it in the table in case you want to use it again at a later time.                                                                                                                                                                                                                                  |

## Filter Item Dialog Box

Use the Add or Edit Filter Item dialog box to configure an event action filter rule.

**Tip** For existing rules, you can edit most of these fields directly from the event actions filter rules table by right-clicking the cell and selecting the appropriate command from the top portion of the context menu. For example, you can right click the Attacker Ports cell and select **Edit Attacker Ports**. Many of these right-click commands open a version of the Edit Filter Item dialog box that contains only the selected property. When seeking help for these context-editing dialog boxes, look for the property description in the table below.

### Navigation Path

From the Event Action Filters page (see [Event Action Filters Page](#), on page 1717), click the **Add Row** button, or select a filter rule and click the **Edit Row** button.

### Field Reference

*Table 529: Filter Item Dialog Box*

| Element                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active Enabled<br>(Active does not apply to Cisco IOS IPS devices.) | Whether the filter rule is active and enabled. Active means that the filter has been put into the filter list and will take effect on filtering events. The default is that the rule is both active and enabled, which means that the rule is used when events are processed.<br><br><b>Tips</b> <ul style="list-style-type: none"> <li>• If a filter is active but not enabled, it will still be included in the ordering list; it will be processed, but it will not be used.</li> <li>• If a filter is not active, then it will not be included at all in the ordering of the filters; it will not be processed at all.</li> <li>• Disabled rules are shown in the event action filters table with cross-hatching.</li> </ul> |
| Name                                                                | The name of the filter rule. The following characters are allowed in filter names: a-z, A-Z, 0-9, -, . (dot or period), : (colon), and _ (underscore).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Signature IDs                                                       | The numerical signature IDs to which the filter rule applies. You can enter a single signature ID, a comma-separated list, or a range of IDs. The default is to apply the rule to signatures in the range 900-65535.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SubSignature ID                                                     | The subsignature ID for the specified signature to which the filter rule applies. The subsignature ID identifies a more granular version of a broad signature, but it is not used for all signatures.<br><br>Enter a subsignature ID appropriate for the signature ID you specified, or enter a range of subsignature IDs. The default value is the range of 0-255.                                                                                                                                                                                                                                                                                                                                                              |
| Attacker IPv4 Address                                               | The IP address of the host that sent the offending packet. You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.<br><br><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.<br><br>The default value is a range of all IPv4 addresses (0.0.0.0-255.255.255.255).                                                                                                                                                                                                |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Attacker IPv6 Address     | <p>The IP address of the host that sent the offending packet. You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv6 addresses (::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF).</p>                         |
| Attacker Port             | <p>The port used by the attacker host. This is the port from which the offending packet originated. You can also enter a range of ports.</p> <p>The default value is a range of all ports (0-65535).</p>                                                                                                                                                                                                                                                                                                                                                                             |
| Victim IPv4 Address       | <p>The IP address of the host being attacked (the recipient of the offending packet). You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv4 addresses (0.0.0.0-255.255.255.255).</p>                     |
| Victim IPv6 Address       | <p>The IP address of the host being attacked (the recipient of the offending packet). You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click <b>Select</b> to select a network/host object from a list or to create a new object.</p> <p><b>Note</b> Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.</p> <p>The default value is a range of all IPv6 addresses (::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF).</p> |
| Victim Port               | <p>The port of the host being attacked (the recipient of the offending packet). This is the port to which the offending packet was sent. You can also enter a range of ports.</p> <p>The default value is a range of all ports (0-65535).</p>                                                                                                                                                                                                                                                                                                                                        |
| Risk Rating Min. and Max. | <p>The risk rating range, between 0 and 100, that should be used to trigger this event action filter. The default value is the complete range (0-100).</p> <p>If an event occurs with a risk rating that falls within the minimum-maximum range you configure here, the event is processed against the rules of this event filter.</p>                                                                                                                                                                                                                                               |
| OS Relevance              | <p>Indicates whether the alert is relevant to the OS that has been identified for the victim. Possible values include one or more of the following: Not Relevant, Relevant, Unknown. Use Ctrl+click to select multiple values. The default is all values selected.</p> <p><b>Note</b> OS Relevance is applicable only to appliances and service modules running IPS 6.x+ software. For Cisco IOS IPS devices, this field is read-only and cannot be edited, and for IPS 5.x devices, this field is blank.</p>                                                                        |

| Comments            | The user comments associated with this filter, such as an explanation of the purpose of the rule.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Actions to Subtract | <p>The actions that should be removed from the event, should the conditions of the event meet the criteria of the event action filter. You can select one or more actions in this list box. All selected actions are removed from the event. Use Ctrl+click to select multiple values. For more information about the possible actions, see <a href="#">Edit, Add, Replace Action Dialog Boxes</a>, on page 1688.</p> <p>For IOS IPS devices, the possible values are restricted to the following:</p> <ul style="list-style-type: none"> <li>• <i>Deny Attacker Inline</i> blocks the attacker's source IP address completely. No connection can be established from the attacker to the router until the shun time expires. You can configure this time in the Event Actions Settings policy as described in <a href="#">Configuring Settings for Event Actions</a>, on page 1733.</li> <li>• <i>Deny Connection Inline</i> blocks the appropriate TCP flow from the attacker. Other connections from the attacker can be established to the router.</li> <li>• <i>Deny Packet Inline</i> discards the packet without sending a reset. Cisco recommends using “drop and reset” in conjunction with alarm.</li> <li>• <i>Produce Alert</i> sends a notification about the attack through syslog or SDEE.</li> <li>• <i>Reset TCP Connection</i> is effective for TCP-based connections and sends a reset to both the source and destination addresses. For example, in case of a half-open SYN attack, Cisco IOS IPS can reset the TCP connections.</li> </ul> |
| % to Deny           | <p>The percentage of packets to deny for deny attacker features. The range is 0 to 100. The default is 100 percent.</p> <p><b>Note</b> For IOS IPS devices, this field is read only and cannot be edited.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Stop on Match       | <p>Whether to define this filter rule as a stop rule. This setting determines how the remaining rules in the event action filter rules table are processed:</p> <ul style="list-style-type: none"> <li>• If you select this option, and an event meets the conditions of the rule, this rule is the final rule tested for the event. The actions identified by this rule are removed from the event, and the device moves on to perform all remaining actions assigned to the event.</li> <li>• If you do not select this option, then events that meet the conditions of this filter rule are also compared to subsequent rules in the event actions filters table. Subsequent rules are tested until either all rules are tested, or the event matches a stop rule.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring Event Action Overrides

You can add an event action override to change the actions associated with an event based on the risk rating of that event. Event action overrides are a way to add event actions globally without having to configure each signature individually.

Each event action has an associated risk rating range. If a signature event occurs and the risk rating for that event falls within the range for an event action, that action is added to the event. For example, if you want any event with a risk rating of 85 or more to generate an SNMP trap, you can create an event action override for Request SNMP Trap with the risk rating 85-100.

**Tip** If you want to prevent the use of action overrides, you can disable the entire event action override component as described in [Configuring Settings for Event Actions](#) , on page 1733.

#### Related Topics

- [Understanding IPS Event Actions](#) , on page 1712

### Step 1

Do one of the following to open the Event Action Overrides policy:

- (Device view) Select **IPS > Event Actions > Event Action Overrides** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Overrides**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Overrides**, then select an existing policy or create a new one.

The table shows the existing overrides, including the action, the risk rating of the alerts the action will be added to, and whether the rule is enabled. The order of the rules does not matter: all overrides that apply to an alert add the associated actions.

The table can have at most a single entry for each possible action.

### Step 2

Configure the desired overrides:

- To add a new override, click the **Add Row (+)** button beneath the table and fill in the Add Event Action Rule dialog box. In the dialog box, select the action you want to add, enter the rating range of the alerts to which you are adding the action (for example, 90-100), and click **OK**. For more information, see [Add or Edit Event Action Rule Dialog Box](#), on page 1724.

The risk rating range must be between 0 and 100. Separate the low and high of the range with a hyphen, for example, 80-90.

When adding a new override, you can define your own risk rating, or you can use a pre-defined Risk Rating policy object; beginning with Version 4.5, Security Manager has several pre-defined Risk Rating policy objects:

- Extreme Risk (90-100)
- High Risk (76-90)
- Medium-High Risk (61-75)
- Medium Risk (46-60)
- Medium-Low Risk (30-45)
- Low Risk (16-30)
- Very Low Risk (1-15)

For more information on these pre-defined policy objects, refer to [Configuring Risk Rating Policy Objects, on page 1725](#).

These pre-defined policy objects cannot be edited, but you can add and edit any of your own policy objects that you have defined.

- To edit an override, to disable it or to change the risk rating, select the override and click the **Edit Row (pencil)** button. You cannot change the event action.

**Note** Re-discovery of an IPS device will replace the Risk Rating policy object's value with its inline value. For example, if you assign the High Risk policy object (80-89) to any of the event actions and deploy it to the device, then after re-discovery that policy object's value will be replaced with its inline value of 80-89.

- To remove an override, select it and click the **Delete Row** button.

**Note** Policies for IPS appliances and service modules include a default override for Deny Packet Inline, which you cannot delete. If you do not want to use that override, disable it.

- To export the entire list of overrides to a comma-separated values (CSV) file, click **Export to File**, navigate to an appropriate folder on the Security Manager server, change the file name if you do not like the default name, and click **Save**.

---

## Add or Edit Event Action Rule Dialog Box

Use the Add or Edit Event Action Rule dialog box to add an event action rule based on one of the pre-defined Risk Rating policy objects that are available in Security Manager beginning with Version 4.5.

### Navigation Path

From the Event Action Overrides policy, click the **Add Row** button beneath the overrides table, or select a row in the table and click the **Edit Row** button. For information on opening the Event Action Overrides policy, see [Configuring Event Action Overrides , on page 1722](#).

| Assigned    | Whether a particular action is assigned to at least one of the Risk Rating policy objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Action Name | The action to be taken for a particular Risk Rating when assigned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enabled     | Whether a particular action is enabled. Deselect this option to temporarily disable an action without deleting it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Configuring Risk Rating Policy Objects

Use the Risk Rating Policy Object Dialog Box to configure policy objects for IPS. Seven pre-defined policy objects are available for risk rating; you can also define your own.

### Navigation Path

Select **Manage > Policy Objects > All Object Types**, then select **Risk Rating** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**. You cannot edit the pre-defined policy objects, however.

Depending upon whether you selected **New Object** or **Edit Object**, the Add Risk Rating or Edit Risk Rating dialog box appears: refer to [Add or Edit Event Action Rule Dialog Box](#), on page 1724

The remainder of this topic describes the fields that you see in the Risk Rating Policy Object dialog box.

## Field Reference

**Table 531: Risk Rating Policy Object Dialog Box**

| Element            | Description                                                                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | The name of a pre-defined policy object, such as "High Risk," or the name of a policy object that you have defined.                                                                                              |
| Range              | The Risk Rating of a particular policy object, expressed as a numerical range.                                                                                                                                   |
| Category           | Allows you to select Cat-A through Cat-G.<br>This is the category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239. |
| Overrides          | Whether any IPS event action overrides have been configured for this policy object                                                                                                                               |
| Description        | A text description that you can provide; applies to policy objects that you have defined, not to pre-defined policy objects.                                                                                     |
| Last Ticket(s)     | The last ticket used for this policy object.                                                                                                                                                                     |
| Last Modified Date | The last date on which this policy object was modified.                                                                                                                                                          |

## Add or Edit Risk Rating Dialog Box

Use the Add or Edit Risk Rating dialog box to define policy objects for IPS Risk Rating.

### Navigation Path

Select **Manage > Policy Objects > All Object Types**, then select **Risk Rating** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**. You cannot edit the pre-defined policy objects, however.

The <b>Overrides</b> field indicates the number of devices that have overrides for this object. |

## Configuring IPS Event Action Network Information

Use the Event Actions Network Information policy to configure these features:

- **Target value ratings (IPv4 Target Value Ratings tab and IPv6 Target Value Ratings tab)**—You can configure the target value ratings of your network assets. The sensor uses these ratings when calculating the overall risk rating of an alert. By identifying your mission-critical assets, you can trigger more severe signature event actions. As the names indicate, you can use IPv4 or IPv6 by selecting the appropriate tab.

Target value rating is available on IPS appliances, service modules, and Cisco IOS IPS devices.

For more information, see [Configuring Target Value Ratings](#) , on page 1728.

- **Passive OS fingerprinting and OS mappings (OS Identification tab)**—You can enable the sensor to use information about the operating system running on a device to determine the attack relevance rating, which is a component of the overall risk rating.

Passive OS fingerprinting and OS mappings are available on devices running IPS 6.x+ software only, and are not available on Cisco IOS IPS devices.

For more information, see:

- [Understanding Passive OS Fingerprinting](#) , on page 1730
- [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#) , on page 1731

To open the Network Information policy, do one of the following:

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Network Information**, then select an existing policy or create a new one.

## Configuring Target Value Ratings

You can assign target value ratings to your network assets. The target value rating is one of the factors used to calculate the risk rating value for each alert. It identifies the perceived importance of a network asset, which you identify by its IP address.

You can develop a security policy that is more stringent for valuable corporate resources and looser for less important resources. For example, you could assign a target value rating to the company web server that is higher than the target value rating you assign to a desktop node. In this example, attacks against the company web server have a higher risk rating than attacks against the desktop node. Events with a higher risk rating trigger more severe signature event actions.

You can configure four value ratings. From highest value to lowest: Mission Critical, High, Medium, Low, No Value (zero value).

For a detailed explanation of how risk rating is calculated, see [Calculating the Risk Rating](#) in *Installing and Using Cisco Intrusion Prevention System Device Manager 7.0* on Cisco.com.

---

**Tip** If you are configuring target value ratings on a device that uses IPS 6.0 software lower than 6.0(5), you might also want to update the OS Identification tab of the Network Information policy to get around a software bug, even if you do not need to create OS maps. For detailed information, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#), on page 1731.

---

### Related Topics

- [Configuring IPS Event Action Network Information](#), on page 1727
- [Understanding the IPS Event Action Process](#), on page 1711

---

**Step 1** Do one of the following to open the Network Information policy:

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector, then click the **IPv4 Target Value Ratings** tab or the **IPv6 Target Value Ratings** tab.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **IPv4 Target Value Ratings** tab or the **IPv6 Target Value Ratings** tab.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **IPv4 Target Value Ratings** tab.

**Note** Cisco IOS IPS devices do not support IPv6.

The tab shows the target value ratings that are already configured, showing the IP addresses associated with each configured ratings category. The table can have at most five entries, one per rating category.

**Step 2** Configure the desired target value ratings categories:

- To add a new ratings category, click the **Add Row (+)** button beneath the table and fill in the Add Target Value Rating dialog box. In the dialog box, select the rating you want to add, enter the host, network, and address ranges to associate with the category, and click **OK**. For more information, see [Target Value Rating Dialog Box](#), on page 1729.

For IPv4 addresses, you can specify a single network/host object, or a comma-separated list of host, network, or address ranges, such as 10.10.10.10, 10.10.10.0/24, or 10.10.10.2-10.10.10.254. Addresses that you enter in the network format are converted to address ranges. For IPv6 addresses, use IPv6 addressing conventions.

- To edit the IP addresses in an existing ratings category, select the category and click the **Edit Row (pencil)** button. You cannot change the value rating.
- To remove a rating, select it and click the **Delete Row** button.

## Target Value Rating Dialog Box

Use the Add or Edit Target Value Rating dialog box to associate the IP addresses of your assets to a ratings category. IP addresses are IPv4 when you open the Target Value Rating dialog box from the IPv4 Target Value Ratings tab; they are IPv6 from the IPv6 tab.

### Navigation Path

From the IPv4 Target Value Rating tab or the IPv6 Target Value Rating tab of the IPS Event Actions Network Information policy, click the **Add Row** button beneath the Target Value Ratings table, or select a row in the table and click the **Edit Row** button. For information on opening the IPv4 Target Value Rating tab or the IPv6 Target Value Rating tab, see [Configuring Target Value Ratings](#), on page 1728.

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Value          | <p>The target value rating to associate with the specified addresses. From highest to lowest importance: Mission Critical, High, Medium, Low, No Value.</p> <p>This list includes only those value ratings that you have not already configured in the target value ratings table.</p> <p>You change this option when editing a ratings category.</p>                                                                                                                                                                                                                                                                                                                                                                |
| target-address | <p>The IP addresses of the network assets assigned to this value rating. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>• Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>• A comma-separated list of host or network addresses or address ranges. For example, using IPv4, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254. Addresses that you enter in the network format are converted to address ranges; for example, 10.10.10.0/24 is converted to 10.10.10.0-10.10.10.255.</li> </ul> |

## Understanding Passive OS Fingerprinting

Passive operating system (OS) fingerprinting is enabled by default on IPS 6.0+ sensors and the IPS contains a default vulnerable OS list for each signature.

Passive OS fingerprinting lets the sensor determine the OS that hosts are running. The sensor analyzes network traffic between hosts and stores the OS of these hosts with their IP addresses. The sensor inspects TCP SYN and SYNACK packets exchanged on the network to determine the OS type.

The sensor then uses the OS of the target host OS to determine the relevance of the attack to the victim by computing the attack relevance rating component of the risk rating. Based on the relevance of the attack, the sensor may alter the risk rating of the alert for the attack or the sensor may filter the alert for the attack. You can then use the risk rating to reduce the number of false positive alerts (a benefit in IDS mode) or definitively drop suspicious packets (a benefit in IPS mode). Passive OS fingerprinting also enhances the alert output by reporting the victim OS, the source of the OS identification, and the relevance to the victim OS in the alert.

Passive OS fingerprinting consists of three components:

- Passive OS learning.

Passive OS learning occurs as the sensor observes traffic on the network. Based on the characteristics of TCP SYN and SYNACK packets, the sensor makes a determination of the OS running on the host of the source IP address.

- User-configurable OS identification.

You can configure OS host mappings, which take precedence over learned OS mappings.

- Computation of attack relevance rating and risk rating.

The sensor uses OS information to determine the relevance of the attack signature to the targeted host. The attack relevance is the attack relevance rating component of the risk rating value for the attack alert.

There are three sources of OS information. The sensor ranks the sources of OS information in the following order:

1. Configured OS mappings—OS mappings that you enter on the OS Identification tab of the Event Actions Network Information policy. You can configure different mappings for each virtual sensor. For more information, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#), on page 1731.

We recommend configuring OS mappings to define the identity of the OS running on critical systems. It is best to configure OS mappings when the OS and IP address of the critical systems are unlikely to change.

2. Imported OS mappings—OS mappings imported from Management Center for Cisco Security Agents (CSA MC).

Imported OS mappings are global and apply to all virtual sensors. For information on configuring the sensor to use CSA MC, see [Configuring the External Product Interface](#), on page 1640.

3. Learned OS mappings—OS mappings observed by the sensor through the fingerprinting of TCP packets with the SYN control bit set.

Learned OS mappings are local to the virtual sensor that sees the traffic.

When the sensor needs to determine the OS for a target IP address, it consults the configured OS mappings. If the target IP address is not in the configured OS mappings, the sensor looks in the imported OS mappings.

If the target IP address is not in the imported OS mappings, the sensor looks in the learned OS mappings. If it cannot find it there, the sensor treats the OS of the target IP address as unknown.

**Tip** You can configure Event Action Filter rules to use the OS relevancy value of the target, and configure signatures to identify the OSes vulnerable to a signature.

## Configuring OS Identification (Cisco IPS 6.x and Later Sensors Only)

Use the OS Identification tab on the Event Actions Network Information policy to configure operating system (OS) host mappings, which take precedence over learned OS mappings. On the OS Identifications tab you can add, edit, and delete configured OS maps. You can move them up and down in the list to change the order in which the sensor computes the attack relevance rating and risk rating for that particular IP address and OS type combination.

**Note** OS Identification applies to IPS 6.0+ sensors only and does not apply to Cisco IOS IPS devices.

You can also move them up and down in the list to change the order in which the sensor resolves the OS associated with a particular IP address. Configured OS mappings allow for ranges, so for network 192.168.1.0/24 you might define the following:

| IP Address Range Set                  | OS      |
|---------------------------------------|---------|
| 192.168.1.1                           | IOS     |
| 192.168.1.2-192.168.1.10,192.168.1.25 | UNIX    |
| 192.168.1.1-192.168.1.255             | Windows |

More specific mappings should be at the beginning of the list. Overlap in the IP address range sets is allowed, but the entry closest to the beginning of the list takes precedence.

**Tip** There is a bug in IPS 6.0 versions lower than 6.0(5) related to the Network Information policy. Even if you change nothing on the OS Identification tab, but you make configuration changes to the Threat Value Ratings tab, Security Manager configures the device to use the **any** variable for restricting OS mappings to addresses. This can result in your monitoring application showing “any” as the event locality for all events. The solution is to upgrade the IPS version on your sensor. The workaround is to enter a non-default value in the **Restrict to these IP Addresses** field on the OS Identification tab, even if you are not configuring specific OS mappings. For example, enter 0.0.0.1-255.255.255.255 instead of “any” or 0.0.0.0-255.255.255.255.

### Navigation Path

- (Device view) Select **IPS > Event Actions > Network Information** from the Policy selector, then click the **OS Identification** tab.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Network Information**, then select an existing policy or create a new one. Click the **OS Identification** tab.

| Enable Passive OS Fingerprinting | <p>When selected, lets the sensor perform passive OS analysis. You must enable this option for any of the maps configured on this page to be used.</p> <p>Passive OS fingerprinting functions as part of the sensor. As the sensor analyzes network traffic between hosts, the sensor stores the identity of the OS running on the hosts alongside the IP addresses of the hosts. The sensor determines the identity of the OSes on the hosts by inspecting characteristics of the packets exchanged on the network. The sensor then uses the target system's OS information to compute the ARR (Attack Relevance Rating) component for the RR (Risk Rating). The RR can then be used to drop suspicious packets.</p> <p>For more information about passive OS fingerprinting, see <a href="#">Understanding Passive OS Fingerprinting</a> , on page 1730.</p> |
| Restricted to these IP Addresses | <p>Restricts attack relevance rating calculation to the specified addresses. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>• Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>• A comma-separated list of host or network addresses or address ranges. For example, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254.</li> </ul>                                                                                                                                                                                                                                                                                                       |
| OS Maps table                    | <p>The list of OS mappings, showing the IP addresses of the hosts and the operating systems to which they are mapped. When looking for a match, the sensor goes from top to bottom and selects the first rule that matches the IP address.</p> <ul style="list-style-type: none"> <li>• To add a mapping, click the <b>Add Row</b> button and fill in the Add OS Map dialog box (see <a href="#">OS Map Dialog Box</a> , on page 1732).</li> <li>• To edit a mapping, select the rule and click the <b>Edit Row</b> button.</li> <li>• To delete a map, select it and click the <b>Delete Row</b> button.</li> <li>• To change the priority of a rule, select it and click the <b>Up</b> or <b>Down</b> arrow buttons until the rule is positioned correctly.</li> </ul>                                                                                       |

## OS Map Dialog Box

Use the Add or Edit OS Map dialog box to map a host through its IP address to an OS type. Create mappings only if you want to statically assign an OS type to an IP address. Because the sensor uses passive OS

fingerprinting to discover the OS associated with an IP address, you might not want to create any mappings, or create mappings only for mission-critical devices that have static IP addresses. Update any mappings that you create if you install devices with different operating systems on the address.

### Navigation Path

From the OS Identification tab of the IPS Event Actions Network Information policy, click the **Add Row** button beneath the OS Maps table, or select a row in the table and click the **Edit Row** button. For information on opening the OS Identification tab, see [Configuring OS Identification \(Cisco IPS 6.x and Later Sensors Only\)](#), on page 1731.

### Field Reference

**Table 535: OS Map Dialog Box**

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Addresses | <p>The IP addresses for this mapping. You can specify addresses using the following techniques:</p> <ul style="list-style-type: none"> <li>• Enter the name of a single network/host object, or click <b>Select</b> to select an object from a list or to create a new one. The object can contain a group of networks, hosts, and address ranges.</li> <li>• A comma-separated list of host or network addresses or address ranges. For example, 10.10.10.0/24, 10.10.10.10, 10.10.10.2-10.10.10.254.</li> </ul>                                                                                    |
| OS Type      | <p>The operating system running on the identified hosts. Select the most appropriate option from the list. You can select multiple options (using Ctrl+click) to indicate that there is more than one possible OS.</p> <p><b>Tip</b> Because these mappings take precedence over learned mappings, you probably are better off not assigning General OS, Other, or Unknown OS. The sensor might be able to learn the actual OS through passive OS fingerprinting and provide a better matching. For more information, see <a href="#">Understanding Passive OS Fingerprinting</a>, on page 1730.</p> |

## Configuring Settings for Event Actions

Use the Event Actions Settings policy to configure general settings that apply globally to event action rules. The defaults for these options are appropriate for most situations, so change them only if you are certain that your situation requires non-default behavior.

To configure the Event Actions Settings policy, do one of the following:

- (Device view) Select **IPS > Event Actions > Settings** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Settings**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Settings**, then select an existing policy or create a new one.

The following table describes the options you can configure. Note that the options available for Cisco IOS IPS devices are more limited than those available for IPS appliances and service modules.

**Tip** Do not disable the Summarizer except for troubleshooting purposes. If you disable the Summarizer, every signature is set to Fire All with no summarization. Note that you do not need to change the state of the Meta Event Generator. Cisco has discontinued the use of Meta signatures, and they have all been retired.

**Table 536: Event Actions Settings Policy**

| Element                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Event Action Override<br>(All device types.)                          | When selected, enables override rules as defined on the Event Action Overrides page. You can add an event action override to add actions to an event based on specific details about that event. For configuring override rules, see <a href="#">Configuring Event Action Overrides</a> , on page 1722.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable Event Action Filters<br>(All device types.)                           | When selected, enables the filter rules as defined on the Event Action Filters page. You can configure event action filters to remove specific actions from an event or to discard an entire event and prevent further processing by the sensor. For configuring event action filters rules, see <a href="#">Configuring Event Action Filters</a> , on page 1714.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Enable Event Action Summarizer<br>(IPS appliances and service modules only.) | <p>When selected, enables the Summarizer component. The Summarizer groups events into a single alert, thus decreasing the number of alerts the sensor sends out.</p> <p>By default, the Summarizer is enabled. If you disable it, all signatures are set to Fire All with no summarization. If you configure individual signatures to summarize, this configuration is ignored when the Summarizer is not enabled.</p> <p>The Report Manager component of Cisco Security Manager reports events individually. The Event Viewer component of Cisco Security Manager displays alerts. As stated above, the Summarizer groups events into a single alert, thus decreasing the number of alerts the sensor sends out.</p> <p><b>Tip</b> Cisco IPS Manager Express (IME) and Cisco Security Manager do not summarize events in precisely the same way.</p> |
| Enable Meta Event Generator<br>(IPS appliances and service modules only.)    | Cisco recommends that you do not change the state of the Meta Event Generator. Cisco has discontinued the use of Meta signatures, and they have all been retired.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Threat Rating Adjustment<br>(IPS appliances and service modules only.)    | <p>When selected, enables threat rating adjustment, which adjusts the risk rating. If disabled, risk rating is equal to threat rating. Available in sensors running IPS 6.0+ software only.</p> <p>The Threat Rating feature provides a single view of the threat environment of the network. Threat Rating minimizes alarms and events through a customized view that shows only events with a high Threat Rating value. The Threat Rating value is derived as follows:</p> <ul style="list-style-type: none"> <li>• Dynamic adjustment of event Risk Rating based on success of response action</li> <li>• If response action was applied, Risk Rating is deprecated (Threat Rating &lt; Risk Rating)</li> <li>• If response action was not applied, Risk Rating remains unchanged (Threat Rating = Risk Rating)</li> </ul> <p>The result is a single value by which the threat risk is determined.</p> |
| Deny Attacker Duration in seconds<br>(All device types.)                         | <p>The number of seconds to deny the attacker inline.</p> <p>The range is 0 to 518400. The default is 3600.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Block Attack Duration in minutes<br>(IPS appliances and service modules only.)   | <p>The number of minutes to block a host or connection.</p> <p>The range is 0 to 10000000. The default is 30.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Maximum Number of Denied Attackers<br>(IPS appliances and service modules only.) | <p>Limits the number of denied attackers possible in the system at any one time.</p> <p>The range is 0 to 100000000. The default is 10000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable One Way TCP Reset<br>(IPS appliances and service modules only.)           | <p>When selected, enables a one-way TCP reset for deny packet inline actions for TCP-based alerts. Available only for sensors running IPS 6.1+ software.</p> <p>The one-way TCP reset operates for inline mode only and is an automatic addition to the deny packet inline actions. It sends a TCP reset to the victim of the alert, thus creating a black hole for the attacker and clearing the TCP resources of the victim.</p> <p><b>Tips</b></p> <ul style="list-style-type: none"> <li>• In inline mode, all packets entering or leaving the network must pass through the sensor.</li> <li>• An inline sensor denies packets for any alert with a risk rating of greater than or equal to 90. It also issues a one-way TCP reset on TCP alerts with a risk rating of greater than or equal to 90.</li> </ul>                                                                                       |

## CHAPTER 41

# Managing IPS Anomaly Detection

---

**Note** From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

---

Anomaly detection is designed to recognize network congestion caused by worm traffic that exhibits scanning behavior. Anomaly detection also will identify infected hosts on the network that are scanning for other vulnerable hosts.

Anomaly detection is enabled by default, but there are some configuration settings you should adjust to use it effectively.

---

**Note** The sensor must use IPS software version 6.x or later to configure anomaly detection. In addition, Cisco IOS IPS and the AIP-SSC-5 do not support anomaly detection.

---

This chapter contains the following topics:

- [Understanding Anomaly Detection](#) , on page 1737
- [Configuring Anomaly Detection](#) , on page 1742

## Understanding Anomaly Detection

The anomaly detection component of the sensor detects worm-infected hosts. This enables the sensor to be less dependent on signature updates for protection against worms and scanners, such as Code Red and SQL Slammer and so forth. The anomaly detection component lets the sensor learn normal activity and send alerts or take dynamic response actions for behavior that deviates from what it has learned as normal behavior.

---

**Note** Anomaly detection does not detect email-based worms, such as Nimda.

---

Anomaly detection detects the following two situations:

- When the network starts on the path of becoming congested by worm traffic.
- When a single worm-infected source enters the network and starts scanning for other vulnerable hosts.

The following topics explain anomaly detection in more detail:

- [Worm Viruses](#) , on page 1738
- [Anomaly Detection Modes](#) , on page 1738
- [Anomaly Detection Zones](#) , on page 1739
- [Knowing When to Turn Off Anomaly Detection](#) , on page 1740
- [Configuring Anomaly Detection Signatures](#) , on page 1740
- [Configuring Anomaly Detection](#) , on page 1742

## Worm Viruses

Worm viruses are automated, self-propagating, intrusion agents that make copies of themselves and then facilitate their spread. Worm viruses attack a vulnerable host, infect it, and then use it as a base to attack other vulnerable hosts. They search for other hosts by using a form of network inspection, typically a scan, and then propagate to the next target. A scanning worm virus locates vulnerable hosts by generating a list of IP addresses to probe, and then contacts the hosts. Code Red worm, Sasser worm, Blaster worm, and the Slammer worm are examples of worms that spread in this manner.

Anomaly detection identifies worm-infected hosts by their behavior as a scanner. To spread, a worm virus must find new hosts. It finds them by scanning the Internet using TCP, UDP, and other protocols to generate unsuccessful attempts to access different destination IP addresses. A scanner is defined as a source IP address that generates events on the same destination port (in TCP and UDP) for too many destination IP addresses.

The events that are important for TCP are non-established connections, such as a SYN packet that does not have its SYN-ACK response for a given amount of time. A worm-infected host that scans using TCP generates non-established connections on the same destination port for an anomalous number of IP addresses.

The events that are important for UDP are unidirectional connections, such as a UDP connection where all packets are going in only one direction. A worm-infected host that scans using UDP generates UDP packets but does not receive UDP packets on the same IP address within a time-out period on the same destination port for multiple destination IP addresses.

The events that are important for other protocols, such as ICMP (protocol number 1), are from a source IP address to many different destination IP addresses, that is, packets that are received in only one direction.

---

**Caution** If a worm virus has a list of IP addresses it should infect and does not have to use scanning to spread itself (for example, it uses passive mapping—listening to the network as opposed to active scanning), it will not be detected by anomaly detection worm policies. Worm viruses that receive a mailing list from probing files within the infected host and email this list will not be detected, because no Layer 3 or Layer 4 anomaly is generated.

---

## Anomaly Detection Modes

Anomaly detection initially conducts a “peacetime” learning process when the most normal state of the network is reflected. Anomaly detection then derives a set of policy thresholds that best fit the normal network. This is done in two phases: an initial learning mode phase, followed by the ongoing operational detect mode phase.

Anomaly detection has the following modes:

- Learning accept mode (initial setup)

Although anomaly detection is in detect mode by default, it conducts an initial learning accept mode for the default period of 24 hours. We assume that during this phase no attack is being carried out. Anomaly detection creates an initial baseline, known as a knowledge base, of the network traffic. The default interval value for periodic schedules is 24 hours and the default action is rotate, meaning that a new knowledge base is saved and loaded, and then replaces the initial knowledge base after 24 hours.

Keep the following in mind:

- Anomaly detection does not detect attacks when working with the initial knowledge base, which is empty. After the default of 24 hours, a knowledge base is saved and loaded and now anomaly detection also detects attacks.
- Depending on your network complexity, you may want to have anomaly detection in learning accept mode for longer than the default 24 hours. You configure the mode in the Virtual Sensors policy; see [Defining A Virtual Sensor](#), on page 1669. After your learning period has finished, edit the virtual sensor and change the mode to Detect.
- Detect mode

For ongoing operation, the sensor should remain in detect mode. This is for 24 hours a day, 7 days a week. Once a knowledge base is created and replaces the initial knowledge base, anomaly detection detects attacks based on it. It looks at the network traffic flows that violate thresholds in the knowledge base and sends alerts. As anomaly detection looks for anomalies, it also records gradual changes to the knowledge base that do not violate the thresholds and thus creates a new knowledge base. The new knowledge base is periodically saved and takes the place of the old one thus maintaining an up-to-date knowledge base.

- Inactive mode

You can turn anomaly detection off by putting it in inactive mode. Under certain circumstances, anomaly detection should be in inactive mode, for example, if the sensor is running in an asymmetric environment. Because anomaly detection assumes it gets traffic from both directions, if the sensor is configured to see only one direction of traffic, anomaly detection identifies all traffic as having incomplete connections, that is, as scanners, and sends alerts for all traffic flows.

The following example summarizes the default anomaly detection configuration. If you add a virtual sensor at 11:00 pm and do not change the default anomaly detection configuration, anomaly detection begins working with the initial knowledge base and only performs learning. Although it is in detect mode, it cannot detect attacks until it has gathered information for 24 hours and replaced the initial knowledge base. At the first start time (10:00 am by default), and the first interval (24 hours by default), the learning results are saved to a new knowledge base and this knowledge base is loaded and replaces the initial knowledge base. Because the anomaly detection is in detect mode by default, now that anomaly detection has a new knowledge base, the anomaly detection begins to detect attacks.

## Anomaly Detection Zones

By subdividing the network into zones, you can achieve a lower false negative rate. A zone is a set of destination IP addresses. There are three zones, each with its own thresholds: internal, illegal, and external.

The external zone is the default zone with the default Internet range of 0.0.0.0-255.255.255.255. By default, the internal and illegal zones contain no IP addresses. Packets that do not match the set of IP addresses in the internal or illegal zone are handled by the external zone.

We recommend that you configure the internal zone with the IP address range of your internal network. If you configure it in this way, the internal zone is all the traffic that comes to your IP address range, and the external zone is all the traffic that goes to the Internet.

You can configure the illegal zone with IP address ranges that should never be seen in normal traffic, for example, unallocated IP addresses or part of your internal IP address range that is unoccupied. An illegal zone can be very helpful for accurate detection, because we do not expect any legal traffic to reach this zone. This allows very low thresholds, which in turn can lead to very quick worm virus detection.

## Knowing When to Turn Off Anomaly Detection

Anomaly detection assumes that it gets traffic from both directions. If the sensor is configured to see only one direction of traffic, you should turn off anomaly detection. Otherwise, when anomaly detection is running in an asymmetric environment, it identifies all traffic as having incomplete connections, that is, as scanners, and sends alerts for all traffic flows.

You turn off anomaly detection in the Virtual Sensors policy. Edit the virtual sensor for which you are disabling anomaly detection, and change the Anomaly Detection Mode to Inactive. For information on editing virtual sensors, see [Editing Policies for a Virtual Sensor](#), on page 1673.

## Configuring Anomaly Detection Signatures

The Traffic Anomaly engine contains nine anomaly detection signatures covering three protocols (TCP, UDP, and other). Each signature has two subsignatures, one for the scanner and the other for the worm-infected host (or a scanner under worm attack). When anomaly detection discovers an anomaly, it triggers an alert for these signatures. All anomaly detection signatures are enabled by default and the alert severity for each one is set to high.

When a scanner is detected but no histogram anomaly occurred, the scanner signature fires for that attacker (scanner) IP address. If the histogram signature is triggered, the attacker addresses that are doing the scanning each trigger the worm signature (instead of the scanner signature). The alert details state which threshold is being used for the worm detection now that the histogram has been triggered. From that point on, all scanners are detected as worm-infected hosts.

The following anomaly detection event actions are possible:

- Produce alert—Writes the event to the Event Store.
- Deny attacker inline—(Inline only) Does not transmit this packet and future packets originating from the attacker address for a specified period of time.
- Log attacker packets—Starts IP logging for packets that contain the attacker address.
- Deny attacker service pair inline—Blocks the source IP address and the destination port.
- Request SNMP trap—Sends a trap notification to an SNMP trap destination. To use this action, you must configure SNMP trap hosts as described in [Configuring SNMP](#), on page 1621.
- Request block host—Sends a request to ARC to block this host (the attacker). To use this action, you must configure blocking devices as described in [Configuring IPS Blocking and Rate Limiting](#), on page 1765.

You can add actions to the signatures either directly, in the Signatures policy, or to events generated by the signatures based on risk rating in the Event Actions Overrides policy.

The following table lists the anomaly detection worm signatures.

**Table 537: Anomaly Detection Worm Signatures**

| Signature ID | Subsignature ID | Name                   | Description                                                                                                                                                          |
|--------------|-----------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 13000        | 0               | Internal TCP Scanner   | Identified a single scanner over a TCP protocol in the internal zone.                                                                                                |
| 13000        | 1               | Internal TCP Scanner   | Identified a worm attack over a TCP protocol in the internal zone; the TCP histogram threshold was crossed and a scanner over a TCP protocol was identified.         |
| 13001        | 0               | Internal UDP Scanner   | Identified a single scanner over a UDP protocol in the internal zone.                                                                                                |
| 13001        | 1               | Internal UDP Scanner   | Identified a worm attack over a UDP protocol in the internal zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13002        | 0               | Internal Other Scanner | Identified a single scanner over an Other protocol in the internal zone.                                                                                             |
| 13002        | 1               | Internal Other Scanner | Identified a worm attack over an Other protocol in the internal zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |
| 13003        | 0               | External TCP Scanner   | Identified a single scanner over a TCP protocol in the external zone.                                                                                                |
| 13003        | 1               | External TCP Scanner   | Identified a worm attack over a TCP protocol in the external zone; the TCP histogram threshold was crossed and a scanner over a TCP protocol was identified.         |
| 13004        | 0               | External UDP Scanner   | Identified a single scanner over a UDP protocol in the external zone.                                                                                                |
| 13004        | 1               | External UDP Scanner   | Identified a worm attack over a UDP protocol in the external zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13005        | 0               | External Other Scanner | Identified a single scanner over an Other protocol in the external zone.                                                                                             |
| 13005        | 1               | External Other Scanner | Identified a worm attack over an Other protocol in the external zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |
| 13006        | 0               | Illegal TCP Scanner    | Identified a single scanner over a TCP protocol in the illegal zone.                                                                                                 |

| Signature ID | Subsignature ID | Name                  | Description                                                                                                                                                         |

| 13006        | 1               | Illegal TCP Scanner   | Identified a worm attack over a TCP protocol in the illegal zone; the TCP histogram threshold was crossed and a scanner over a TCP protocol was identified.         |
| 13007        | 0               | Illegal UDP Scanner   | Identified a single scanner over a UDP protocol in the illegal zone.                                                                                                |
| 13007        | 1               | Illegal UDP Scanner   | Identified a worm attack over a UDP protocol in the illegal zone; the UDP histogram threshold was crossed and a scanner over a UDP protocol was identified.         |
| 13008        | 0               | Illegal Other Scanner | Identified a single scanner over an Other protocol in the illegal zone.                                                                                             |
| 13008        | 1               | Illegal Other Scanner | Identified a worm attack over an Other protocol in the illegal zone; the Other histogram threshold was crossed and a scanner over an Other protocol was identified. |

## Configuring Anomaly Detection

Use the Anomaly Detection policy to configure anomaly detection settings. The Virtual Sensors policy also contains a setting important for anomaly detection.

This procedure explains the overall configuration of anomaly detection. Before configuring these settings, read the following topics:

- [Understanding Anomaly Detection](#) , on page 1737
- [Worm Viruses](#) , on page 1738
- [Anomaly Detection Modes](#) , on page 1738
- [Anomaly Detection Zones](#) , on page 1739
- [Knowing When to Turn Off Anomaly Detection](#) , on page 1740
- [Configuring Anomaly Detection Signatures](#) , on page 1740

**Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:

- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
- (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.

The Anomaly detection policy includes these tabs:

- **Operation Settings**—Defines the worm timeout and identifies any IP addresses that should be ignored by anomaly detection.
- **Learning Accept Mode**—The configuration for learning mode, including how the knowledge base is handled.

- **Internal Zone, Illegal Zone, External Zone**—The zones of your network that you define. You can configure unique settings for each zone. For an explanation of the zones, see [Anomaly Detection Zones](#) , on page 1739.

**Step 2** Click the **Operation Settings** tab, if necessary, and configure the following:

- **Worm Timeout**—The time in seconds for the worm termination timeout. The range is 120 to 10,000,000 seconds. The default is 600 seconds. For an explanation of how this timeout is used, see [Understanding Anomaly Detection Thresholds and Histograms](#) , on page 1746.
- **Enable Ignored Addresses** and **Source/Destination Addresses to Ignore**—Whether you are configuring a list of addresses that should be ignored while anomaly detection is processing. You can specify a list of source addresses (those that initiate a scan) or destination addresses (the hosts that are scanned).

The addresses can be single host (such as 10.100.10.1), a range of addresses (such as 10.100.10.0-10.100.10.255), or network/host objects that contain single hosts, address ranges, or a combination of hosts and ranges. Click **Select** to select objects from a list or to create new objects.

**Step 3** Click the **Learning Accept Mode** tab and define how the knowledge base will be generated and used. For detailed information, see [Configuring Anomaly Detection Learning Accept Mode](#) , on page 1744.

**Step 4** Configure the internal, illegal, and external zones:

- Define the internal and illegal zones—The internal zones are the IP addresses of your internal network, the network that you manage. The illegal zone should represent IP address ranges that should never be seen in normal traffic, for example, unallocated IP addresses or part of your internal IP address range that is unoccupied.

Click the **Internal Zone** and **Illegal Zone** tabs in turn and configure the following on the **General** tab:

- **Enable this zone**—Whether the zone will be processed by anomaly detection.
- **Service Subnets**—The IP addresses that comprise the zone. The default (0.0.0.0) is that no address is included in the zone. Replace 0.0.0.0 to define addresses for the zone.

The addresses can be single host (such as 10.100.10.1), a range of addresses (such as 10.100.10.0-10.100.10.255), or network/host objects that contain single hosts, address ranges, or a combination of hosts and ranges. Click **Select** to select objects from a list or to create new objects.

- Decide whether to enable the external zone—The external zone comprises all IP addresses that are not configured for the internal or illegal zones. You do not explicitly assign addresses to this zone. On the **External Zone** tab, **General** sub-tab, you can enable or disable the zone using the **Enable this zone** checkbox. The external zone is enabled by default.
- Configure scanner thresholds and histograms—Each zone has sub-tabs for **TCP Protocol**, **UDP Protocol**, and **Other Protocols**. On these tabs, you can configure non-default settings for specific services that override the learned histograms. For detailed information about configuring these settings, see [Configuring Anomaly Detection Thresholds and Histograms](#) , on page 1747.

At this point, you have finished configuring the basic anomaly detection settings.

**Step 5** (Device view only.) Configure the anomaly detection mode. This setting is defined in the **Virtual Sensors** policy. Consider the following tips to select the correct policy:

- If you configured the anomaly detection policy on a virtual sensor (other than vs0, which is represented by the parent IPS device), you must select the parent IPS device, then select the Virtual Sensors policy.

- If you configured the Anomaly Detection policy as a shared policy in Policy view, select the IPS device to which the policy is assigned, or that hosts a virtual sensor to which the policy is assigned.

Then, complete the following steps in the Virtual Sensors policy:

- Select the desired virtual sensor in the table and click the **Edit Row** button.
- In the Modify Virtual Sensors dialog box, select the appropriate option for the Anomaly Detection Mode setting: Detect, Inactive, Learn. The default and normal operational mode is Detect. However, if you are using asymmetric normalizer mode, you might want to set the anomaly detection mode to Inactive. For detailed information about these modes, see [Anomaly Detection Modes , on page 1738](#). For information about the other settings in this dialog box, see [Virtual Sensor Dialog Box , on page 1671](#).
- If you placed anomaly detection in Learning mode, remember to change the mode to Detect after the desired learning period has completed.

**Step 6** Add additional actions to the anomaly detection signatures, if desired. For example, you might want to add a deny action so that attacks are dropped. You can alternatively configure event action overrides to add actions based on risk rating. For more information, see [Configuring Anomaly Detection Signatures , on page 1740](#).

**Step 7** Manage the knowledge base, if necessary.

If you configured the knowledge base to automatically rotate (on the Learning Accept Mode tab), then the knowledge base is refreshed automatically and manual intervention is not necessary.

If you configured anomaly detection to only save new databases, and not use them, then you need to manually load updated knowledge bases periodically. You cannot do this in Security Manager; use the IPS Device Manager (IDM) instead.

Using IDM (or IME), you can load, delete, and rename knowledge bases, and upload them to or download them from an external server. For more information about what you can do, see the online help for IDM or IME.

## Configuring Anomaly Detection Learning Accept Mode

Use the Learning Accept Mode tab of the Anomaly Detection policy to configure whether you want the sensor to create a new knowledge base every so many hours. You can configure whether the knowledge base is created and loaded (Rotate) or saved (Save Only). You can schedule how often and when the knowledge base is loaded or saved.

The default generated filename is YYYY-Mon-dd-hh\_mm\_ss (that is, year-month-day-hour\_minute\_second), where Mon is a three-letter abbreviation of the current month.

The knowledge base has a tree structure and contains the following information:

- Knowledge base name
- Zone name
- Protocol
- Service

The knowledge base holds a scanner threshold and a histogram for each service. If you have learning accept mode set to automatic and the action set to rotate, a new knowledge base is created every 24 hours and used in the next 24 hours. If you have learning accept mode set to automatic and the action is set to save only, a

new knowledge base is created but not loaded, and the current knowledge base is used. If you do not have learning accept mode set to automatic, no knowledge base is created.

**Tip** Although you can use Security Manager to configure how knowledge bases are generated, you cannot manage the knowledge bases themselves. Use the IPS Device Manager (IDM), or IPS Manager Express (IME) instead. Using IDM (or IME), you can load, delete, and rename knowledge bases, and upload them to or download them from an external server. For more information about what you can do, see the online help for IDM or IME.

#### Related Topics

- [Anomaly Detection Modes](#) , on page 1738
- [Configuring Anomaly Detection](#) , on page 1742
- [Understanding Anomaly Detection Thresholds and Histograms](#) , on page 1746

- 
- Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:
- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
  - (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.
- Step 2** Click the **Learning Accept Mode** tab and configure the following options:
- **Automatically accept learning knowledge base**—Whether to have the sensor automatically update the knowledge base. If you do not select this option, anomaly detection does not automatically create a new knowledge base, and you cannot configure the other options on this tab.
  - **Action**—Whether to rotate or save the knowledge base when it is created.
- If you choose **Rotate** (the default), the new knowledge base is created and loaded according to the schedule you define. If you choose **Save Only**, the new knowledge base is created but not loaded. You can examine it and decide whether to load it into anomaly detection using IDM or IME.
- Step 3** In the **Schedule** field, select the schedule for generating a new knowledge base. The default schedule is periodic starting at 10 AM and running for 24 hours. Options are:
- **Periodic**—Base the schedule on a recurring period. Configure the following options:
    - **Start Time**—The starting time for the learning window in hh:mm:ss format (24-hour clock).
    - **Learning Interval in hours**—How long you want anomaly detection to learn from the network before creating a new knowledge base.
  - **Calendar Schedule**—Base the schedule on specific times of day and days of the week. The dialog box changes to show Time of Day and Days of the Week tables. These times apply to every day selected; you cannot specify different times for different days.
    - To add a time or day, click the **Add Row (+)** button beneath the appropriate table. The time is in hh:mm:ss format (24-hour clock). For day, select the day from the list.

- To edit an existing time or day, select it and click the **Edit Row (pencil)** button.
- To delete a time or day, select it and click the **Delete Row (trash can)** button. Ensure that you have at least one time and one day configured.

## Understanding Anomaly Detection Thresholds and Histograms

Anomaly detection uses thresholds and histograms to determine if scanning behavior is an attack.

During learning mode, anomaly detection develops histograms for each TCP and UDP port, and for other protocols, to create a baseline of the normal behavior of your network (see [Anomaly Detection Modes](#), on page 1738). For example, the histogram for a TCP port lists the “normal” number of source addresses that make incomplete connections to a certain number of destination addresses during a minute. The histograms contain three buckets: low number of destination addresses (5), medium number (20), and high number (100). (The destination buckets are a fixed number.) Separate histograms are kept for each service and zone (see [Anomaly Detection Zones](#), on page 1739).

For example, learning mode might develop the following histogram for TCP port 80:

| Number of Destination Addresses | Number of Source Addresses |
|---------------------------------|----------------------------|
| Low (5)                         | 18                         |
| Medium (20)                     | 6                          |
| High (100)                      | 2                          |

In addition to these learned histograms, the anomaly detection scanner has a threshold setting that you configure. You configure a general scanner threshold, and you can override the threshold (configuring a different value) for any specific service (TCP port, UDP port, or other protocol). Each zone has its own thresholds.

When anomaly detection moves to detect mode, where it is actively scanning for worms, the thresholds and histograms are used as follows:

- Histograms are ignored until the threshold for the service is exceeded. For example, consider the above table for TCP/80 traffic. If the threshold is set at 200 (the default), a scanner must scan 200 hosts in a minute to trigger a scanner alert. If 7 source addresses scanned 50 hosts (which is an anomaly in the histogram, which expects no more than 6 hosts scanning 20-99 destinations), but a single scanner scanned only 100 addresses, no alert is generated, and no anomaly is detected.
- When the scanner threshold is exceeded, anomaly detection uses the histogram to determine if the service is under worm attack. In this example, if a source scans more than 200 destinations, anomaly detection evaluates the collected activity in the network. Because 7 hosts have scanned 50 hosts, a worm alert is generated.

When under worm attack, anomaly detection stops learning and clears the current learning information. It also temporarily lowers the thresholds.

- When a worm attack is detected, the worm timeout counter is started. When the timeout is reached, the scanner is reset. If the worm attack continues, new alerts are generated. You configure the worm timeout on the Operation Settings tab of the Anomaly Detection policy.

If you leave the defaults in place, anomaly detection generates histograms based on what it learns about your network from the network's actual behavior. However, if you understand your network you can fine-tune these histograms to reduce false positives, creating your own definition of expected (or desired or tolerated) behavior for each TCP/UDP port or other protocol, for each zone. You can create your own histograms for only those services that interest you, and leave the defaults for all other ports. Additionally, you can configure the general scanner threshold for each zone, and configure different thresholds for specific services.

For information on configuring thresholds and histograms, see [Configuring Anomaly Detection Thresholds and Histograms](#), on page 1747.

## Configuring Anomaly Detection Thresholds and Histograms

Anomaly detection uses thresholds and histograms to determine if scanning behavior is an attack. In most cases, you can use the default thresholds and the histograms that anomaly detection generates during learning mode (see [Anomaly Detection Modes](#), on page 1738). However, you might want to fine-tune these settings. Changing the thresholds is a more likely change than creating your own histograms.

Before you configure these settings, read [Understanding Anomaly Detection Thresholds and Histograms](#), on page 1746. You must understand how thresholds and histograms are used together to configure them.

- 
- Step 1** Do one of the following to open the Anomaly Detection policy you want to modify:
- (Device view) Select **IPS > Anomaly Detection** from the Policy selector.
  - (Policy view) Select **IPS > Anomaly Detection** from the Policy selector. Select an existing policy or create a new one.
- Step 2** Click the tab for the zone whose thresholds or histograms you want to change. You configure separate values for each zone: **Internal Zone**, **Illegal Zone**, **External Zone**. For an explanation of the zones, see [Anomaly Detection Zones](#), on page 1739.
- The tabs for each zone contain four sub-tabs: General, TCP Protocol, UDP Protocol, and Other Protocols. The General tab defines the IP addresses for the zone and whether the zone is enabled (the External zone includes all IP addresses not specified for the other zones, you do not configure specific addresses for the External zone).
- The other tabs are where you define thresholds and histograms.
- Step 3** Select the tab for the protocol for which you want to modify thresholds or histograms: **TCP Protocol**, **UDP Protocol**, **Other Protocol**.
- On each tab, configure the following options:
- **Enabled**—Whether anomaly detection is enabled for the protocol. You can turn off detection for all of TCP, UDP, or for all non-TCP/UDP protocols with this option. If you deselect the option, any other settings configured on the tab are ignored.
  - **Destination Port Map** or **Protocol Number Map** table—This table lists the TCP/UDP ports, or other protocols, for which you are configuring non-default mappings. By default, all ports and protocols are enabled and use the default scanner threshold.
- Add items to this table only if you want to: disable detection for a port or protocol; set a different threshold value for a port or protocol; or configure an explicit histogram for a port or protocol, which will be used instead of the learned histogram.

- To add a mapping, click the **Add Row (+)** button and fill in the Add Dest or Protocol Map dialog box. For detailed information, see [Dest Port or Protocol Map Dialog Box , on page 1748](#).
- To edit a mapping, select it and click the **Edit Row (pencil)** button.
- To delete a mapping, select it and click the **Delete Row (trash can)** button. Deleting a mapping returns the service to the default settings.
- **Scanner Threshold**—The threshold for all TCP, UDP, or other protocols. This threshold is used for all services except those for which you configured a scanner override in the mapping table. The range is 5 to 1000. The default is 200.
- **Threshold Histogram**—The default histogram for all TCP, UDP, or other protocols. This histogram is used for all services except those for which you configured a scanner override in the mapping table.

The content of this table is fixed; you cannot add or delete items. However, you can select a row and click **Edit Row (pencil)** to change the number of source addresses configured for a threshold setting. See [Histogram Dialog Box , on page 1749](#).

**Step 4** Repeat the process for each combination of zone and protocol for which you are defining non-default settings.

## Dest Port or Protocol Map Dialog Box

Use the Add or Modify Dest Port Map dialog box to add or modify destination port scanner settings for TCP or UDP, and the Add or Modify Protocol Map dialog box to add or modify scanner settings for other protocols.

Before you configure these settings, read the following topics:

- [Understanding Anomaly Detection Thresholds and Histograms , on page 1746](#)
- [Configuring Anomaly Detection Thresholds and Histograms , on page 1747](#)

**Tip** You do not need to add a port or protocol to have anomaly detection look for worm attacks against it. By default, all ports and protocols are processed. You need to configure specific settings only if you want to turn off detection on a specific port or protocol, or if you want non-default thresholds or histograms.

### Navigation Path

In the Anomaly Detection policy, on the **TCP Protocol**, **UDP Protocol**, or **Other Protocol** sub tabs on the Internal Zone, Illegal Zone, or External Zone tabs, click the **Add Row** button beneath the Destination Port Map or Protocol Number Map tables, or select a row and click the **Edit Row** button. For more information on the steps required to get here, see [Configuring Anomaly Detection Thresholds and Histograms , on page 1747](#).

Click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Protocol Number<br>(Protocol Map dialog box only.)          | The protocol number for non-TCP/UDP protocols. For a list of protocol numbers, see RFC 1700 at <a href="http://www.ietf.org/rfc/rfc1700.txt">http://www.ietf.org/rfc/rfc1700.txt</a> and search for “Protocol Numbers.” Look for a heading (at the time of this writing, the second search hit). The range is 0 to 255.<br><br>For example, ICMP is protocol 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Enabled                                                     | Whether to enable this service. If you do not enable the service, the associated port or protocol is not processed by anomaly detection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Override Scanner Settings                                   | Whether to override the scanner settings for this service or protocol. You must select this option to enable the remaining fields on the dialog box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Scanner Threshold                                           | The scanner threshold for this port or protocol. The range is 5 to 1000. The default is 200.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Threshold Histogram table                                   | The histograms for this port or protocol. If you leave the table empty, the default histograms are used. You can have up to three rows, for low, medium, and high numbers of destination addresses, with different threshold levels (source addresses) for each. <ul style="list-style-type: none"> <li>• To add a threshold, click the <b>Add Row</b> button and fill in the <a href="#">Histogram Dialog Box</a>, on page 1749. The Add button is disabled if you already have three rows.</li> <li>• To edit a threshold, select it and click the <b>Edit Row</b> button. You cannot change the destination bucket to one that is already defined in the table.</li> <li>• To delete a threshold, select it and click the <b>Delete Row</b> button. Any buckets not included in the table use the default histogram for the bucket.</li> </ul> |

## Histogram Dialog Box

Use the Histogram dialog box to create or modify entries in a histogram. The histograms you create or modify override the default histograms that anomaly detection generates. For detailed information about how these histograms are used, see:

- [Understanding Anomaly Detection Thresholds and Histograms](#), on page 1746
- [Configuring Anomaly Detection Thresholds and Histograms](#), on page 1747

### Navigation Path

Do one of the following from the Anomaly Detection policy (see [Configuring Anomaly Detection](#), on page 1742):

- On the TCP Protocol, UDP Protocol, or Other Protocol sub tabs on the Internal Zone, Illegal Zone, or External Zone tabs, select a row in the Threshold Histogram table and click the **Edit Row** button.
- On the Add or Modify Dest or Protocol Map dialog boxes, click the **Add Row** button, or select a row and click the **Edit Row** button. For information on opening the map dialog boxes, see [Dest Port or Protocol Map Dialog Box](#), on page 1748.

### Field Reference

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of Destination IP Addresses | <p>The histogram bucket you are defining. The buckets have a fixed number of destination addresses: Low (5 addresses); Medium (20); High (100).</p> <p><b>Tip</b> A histogram can have a single entry for each destination bucket (low, medium, high). Thus, you cannot change this value to one that is already defined in the histogram you are editing.</p> |
| Number of Source IP Addresses      | <p>The number of source addresses that are allowed to simultaneously scan the associated number of destination addresses. Enter the desired number.</p> <p>The range is 0 to 4096. If you are editing a histogram, the current value is shown.</p>                                                                                                             |

## CHAPTER 42

# Configuring Global Correlation

**Note** From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see [EOL notice](#).

You can configure global correlation so that your sensors are aware of network devices with a reputation for malicious activity and can take action against them. Global correlation allows you to dynamically use information about malicious activity collected from networks around the globe to change the risk rating of events that have known bad devices as their source.

To configure global correlation, your sensor must be running IPS 7.0+ software. Global correlation is not available on Cisco IOS IPS devices.

This chapter contains the following topics:

- [Understanding Global Correlation](#) , on page 1751
- [Understanding Reputation](#) , on page 1752
- [Understanding Network Participation](#) , on page 1753
- [Global Correlation Requirements and Limitations](#) , on page 1754
- [Configuring Global Correlation Inspection and Reputation](#) , on page 1755
- [Configuring Network Participation](#) , on page 1757

## Understanding Global Correlation

You can configure global correlation so that your sensors are aware of network devices with a reputation for malicious activity and can take action against them. Participating IPS devices in a centralized Cisco threat database, the SensorBase, receive and absorb global correlation updates. The reputation data contained in the global correlation updates is factored into the analysis of network traffic, which increases IPS efficacy, because traffic is denied or allowed based on the reputation of the source IP address. The participating IPS devices send data back to the Cisco SensorBase Network, which results in a feedback loop that keeps the updates current and global.

---

**Tip** The Botnet Traffic Filter feature of adaptive security appliances (ASA) is another dynamic feature you can deploy in your network to defend against malicious activity. Configuring global correlation on IPS devices, and Botnet Traffic Filtering on ASA firewalls, can be an effective combined security implementation. For more information about Botnet Traffic Filtering, see [Managing Firewall Botnet Traffic Filter Rules, on page 905](#).

---

There are three main features of global correlation:

- Global Correlation Inspection—The IPS uses the global correlation reputation knowledge of attackers to influence alert handling and to deny actions when attackers with a bad score are seen on the sensor. For more information about reputation, see [Understanding Reputation , on page 1752](#).
- Reputation Filtering—Applies automatic deny actions to packets from known malicious sites.
- Network Participation—The sensor sends alert and TCP fingerprint data to the SensorBase Network so that other users can share in the community knowledge. For more information, see [Understanding Network Participation , on page 1753](#).

Global correlation has the following goals:

- Dealing intelligently with alerts thus improving efficacy.
- Improving protection against known malicious sites.
- Sharing telemetry data with the SensorBase Network to improve visibility of alerts and sensor actions on a global scale.
- Simplifying configuration settings.
- Automatic handling of the uploads and downloads of the information.

---

**Tip** You can use Report Manager to generate reports comparing the number of alerts generated by global correlation to those generated by traditional IPS inspection. For information on the Inspection/Global Correlation report, see [Understanding General IPS Reports , on page 2791](#). For information on generating reports, see [Opening and Generating Reports , on page 2792](#).

---

For information on how to configure global correlation, see the following topics:

- [Global Correlation Requirements and Limitations , on page 1754](#)
- [Configuring Global Correlation Inspection and Reputation , on page 1755](#)
- [Configuring Network Participation , on page 1757](#)

## Understanding Reputation

Similar to human social interaction, reputation is an opinion toward a device on the Internet. Reputation indicates the probability that a particular attacker IP address will initiate malicious behavior based on its known past activity. Reputation enables the installed base of IPS sensors to collaborate using the existing network infrastructure and identify network devices that are likely to be malicious or infected.

By collecting data about devices and assigning reputation scores to them, the global correlation database provides important data that the IPS sensor can use to adjust the risk rating of an attack. Risk rating is the probability that a network event is malicious. Each signature has an associated risk rating. If you enable global correlation, the IPS sensor computes a score based on the reputation of an attacker and adds this score to the risk rating of the event. The updated risk rating is then used by your event action override and filter policies to help determine what actions to take for the event.

Thus, you might have an event that is initially configured to simply produce an alert. But, if the attacker has a bad reputation, the IPS might increase the risk rating to a number high enough that it triggers an event action override rule that adds the Deny Packet Inline action. Thus, for some source devices, the event simply produces an alert, but for others, the event drops the packet in addition to producing the alert.

---

**Tip** The Produce Alert action is added to an event whenever global correlation raises the risk rating of the event, or when global correlation adds the Deny Packet Inline or Deny Attacker Inline actions.

---

Because the global correlation database changes rapidly, the sensor must periodically download global correlation updates from the global correlation servers.

Using reputation scores to adjust the risk rating of an event improves the efficacy of the sensor by improving the following metrics:

- False positives as a percentage of actionable events.
- False negatives as a percentage of threats that do not result in actionable events.
- Actionable events as a percentage of all events.

## Understanding Network Participation

Network participation lets Cisco collect nearly real-time data from sensors around the world. Sensors installed at customer sites can send data to the SensorBase Network. These data feed in to the global correlation database to increase reputation fidelity. Communication between sensors and the SensorBase Network involves an HTTPS request and response over TCP/IP.

There are three modes for Network Participation:

- **Off**—The Network Participation server does not collect data, track statistics, or try to contact the Cisco SensorBase network.
- **Partial Participation**—The Network Participation server collects data, tracks statistics, and communicates with the SensorBase network. Data considered to be potentially sensitive is filtered out and never sent.

**Note** Configuring the sensor for partial network participation limits a third party from extracting reconnaissance information about your internal network from the global correlation database.

- **Full Participation**—The Network Participation server collects data, tracks statistics, and communicates with the SensorBase network. All data collected is sent.

If you select partial or full participation, you are prompted to accept a participation agreement. You must accept the agreement to participate or you cannot change the participation mode.

The following table explains the data collected and the purpose of collecting it.

**Table 540: Network Participation Data Sharing and Usage**

| Participation Level | Type of Data                                                                                                 | Purpose                                                                 |
|---------------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Partial             | Protocol attributes (TCP maximum segment size and options string, for example).                              | Tracks potential threats and helps Cisco to understand threat exposure. |
|                     | Attack type (signature fired, including signature ID and version, risk rating, and reputation, for example). | Used to understand current attacks and attack severity.                 |
|                     | Connecting IP address and port.                                                                              | Identifies attack source.                                               |
|                     | Summary IPS performance (CPU utilization, memory usage, inline vs promiscuous, for example).                 | Tracks product efficacy.                                                |
| Full                | Victim IP address and port.                                                                                  | Detects threat behavioral pattern.                                      |

To configure network participation, the IPS device requires at least 100 MB of available memory, a network connection to the sensor, and a network connection to the Internet. For information on configuring network participation, see [Configuring Network Participation](#), on page 1757.

## Global Correlation Requirements and Limitations

The following list explains the requirements that you must meet to configure and successfully use global correlation on IPS devices. It also explains some limitations.

- **Valid license**—You must have a valid sensor license for global correlation features to function. You can still configure and display statistics for the global correlation features, but the global correlation databases are cleared and no updates are attempted. Once you install a valid license, the global correlation features are reactivated. For information on configuring licenses, see [Updating IPS License Files](#), on page 1777.
- **Agree to Network Participation disclaimer**—If you decide to configure network participation, you must accept the disclaimer. For more information, see [Understanding Network Participation](#), on page 1753 and [Configuring Network Participation](#), on page 1757.
- **External connectivity for sensor and a DNS server or HTTP proxy**—Global correlation requires the sensor to connect to the Cisco SensorBase Network. Domain name resolution is also required for these features to function. You can either configure the sensor to connect through an HTTP proxy server that

has a DNS client running on it, or you can assign an Internet routeable address to the management interface of the sensor and configure the sensor to use a DNS server. For more information, see [Identifying DNS Servers](#) , on page 1637 and [Identifying an HTTP Proxy Server](#) , on page 1638.

- **Sensor in inline mode**—The sensor must operate in inline mode so that the global correlation features can increase efficacy by being able to use the inline deny actions.
- **Sensor and IPS version that supports the global correlation features**—The sensor must run IPS 7.0+ software. You cannot configure global correlation on Cisco IOS IPS devices.
- **Sufficient available memory**—To configure network participation, the IPS device requires at least 100 MB of available memory.
- **Firewall access for port 80, 443 traffic**—Because global correlation updates occur through the sensor management interface, any firewall that lies between the sensor and the internet must allow traffic on ports 80 and 443. You can also use an HTTP proxy (see [Identifying an HTTP Proxy Server](#) , on page 1638).
- **Exposure to external traffic**—The global correlation database contains external IP addresses only, so if you position a sensor in an internal lab that has no interaction with outside networks, you might never receive global correlation information. The feature will have no effect.
- **Bypass mode might be triggered during global correlation updates**— As with signature updates, when the sensor applies a global correlation update, it might trigger bypass. Whether bypass is triggered depends on the traffic load of the sensor and the size of the signature or global correlation update. If bypass mode is turned off, an inline sensor stops passing traffic while the update is being applied.
- **No IPv6 address support**—Global correlation inspection and the reputation filtering deny features do not support IPv6 addresses. For global correlation inspection, the sensor does not receive or process reputation data for IPv6 addresses. The risk rating for IPv6 addresses is not modified for global correlation inspection. Similarly, network participation does not include event data for attacks from IPv6 addresses. And finally, IPv6 addresses do not appear in the deny list.

## Configuring Global Correlation Inspection and Reputation

Use the Inspection/Reputation policy to configure the sensor to use updates from the SensorBase Network to adjust the risk rating of events. The global correlation client on the sensor determines which updates are available and applicable to the sensor by communicating with the global correlation update server and a file server. The global correlation update server provides the server manifest document to the sensor, which identifies which updates are available and how to obtain them from a file server. The sensor downloads the update files from the file server using the information in the server manifest.

When you configure global correlation, updates are automatic and happen at regular intervals, approximately every five minutes by default, but this interval can be modified by the global correlation server. The sensor initially gets a full update and then applies an incremental update periodically.

If you turn on global correlation, you can choose how aggressively you want the deny actions to be enforced against malicious hosts. You can then enable reputation filtering to deny access to known malicious hosts. If you only want a report of what could have happened, you can enable Test Global Correlation. This puts the sensor in Audit mode, and actions the sensor would have performed are generated in the events.

**Tip** When you view IPS events in Event Viewer, there are several columns specific to global correlation that you can add to the event table; these columns are not shown by default, so you must add them to your view. To monitor global correlation in general, use the IPS device manager (IDM) and look at the Sensor Health gadget. Use either the full IDM or open a read-only copy from Security Manager by right-clicking the device in Device view and selecting **Device Manager**.

### Before You Begin

- You must also configure a DNS server or HTTP proxy for global correlation to function. For details, see [Identifying DNS Servers](#), on page 1637 or [Identifying an HTTP Proxy Server](#), on page 1638.
- There are several configuration requirements and limitations that you should be aware of before configuring global configuration. For details, see [Global Correlation Requirements and Limitations](#), on page 1754.

### Related Topics

- [Understanding Global Correlation](#), on page 1751
- [Understanding Reputation](#), on page 1752
- [Configuring Network Participation](#), on page 1757

**Step 1** Do one of the following to open the Inspection/Reputation policy:

- (Device view) Select **IPS > Global Correlation > Inspection/Reputation** from the Policy selector.
- (Policy view) Select **IPS > Global Correlation > Inspection/Reputation** from the Policy Type selector. Select an existing policy or create a new one.

**Step 2** Configure the following settings:

- **Global Correlation Inspection**—Whether to enable global correlation inspection. When turned on, the sensor uses updates from the SensorBase Network to adjust the risk rating. Deselect this option to disable inspection.
- **Global Correlation Influence**—How aggressively the sensor uses global correlation information to initiate deny actions. Select one of the following:
  - **Permissive**—Has the least aggressive effect on deny actions.
  - **Standard**—(The default.) Has a moderately aggressive effect on deny actions.
  - **Aggressive**—Has a very aggressive effect on deny actions.

- **Reputation Filtering**—Select whether you want reputation filtering **on** or **off**. When turned on, the sensor denies access to malicious hosts that are listed in the global correlation database.
- **Test Global Correlation**—Whether to place global correlation in audit mode. In audit mode, reputation filtering does not deny access to known malicious hosts; only a report of what could have happened is generated.

Audit mode allows you to test the global correlation features without actually denying any hosts. If you decide the effects are desirable, you can deselect this option to activate reputation filtering.

---

## Configuring Network Participation

Use the Network Participation policy to configure the sensor to send data to the SensorBase Network. You can configure the sensor to fully participate and send all data to the SensorBase Network, or you can configure the sensor to collect the data but to omit potentially sensitive data, such as the destination IP address of trigger packets. For detailed information about network participation and the data that is collected, see [Understanding Network Participation](#), on page 1753.

### Related Topics

- [Understanding Global Correlation](#), on page 1751
- [Understanding Reputation](#), on page 1752
- [Global Correlation Requirements and Limitations](#), on page 1754
- [Configuring Global Correlation Inspection and Reputation](#), on page 1755

- 
- Step 1** Do one of the following to open the Network Participation policy:
- (Device view) Select **IPS > Global Correlation > Network Participation** from the Policy selector.
  - (Policy view) Select **IPS > Global Correlation > Network Participation** from the Policy Type selector. Select an existing policy or create a new one.
- Step 2** Select the level of participation from the **Network Participation** list:
- **Off**—No data is contributed to the SensorBase network.
  - **Partial**—Data is contributed to the SensorBase network but potentially sensitive information is withheld.
- Note** Configuring the sensor for partial network participation limits a third party from extracting reconnaissance information about your internal network from the Global Correlation database.
- **Full**—All data is contributed to the SensorBase network.
- Step 3** If you select Full or Partial, when you click Save, the Network Participation Disclaimer dialog box opens, prompting you to read and accept a disclaimer. Carefully read the disclaimer. Click **Agree** if you agree to it.
- If you click **Disagree**, you cannot enable network participation. Change the setting to Off and save the policy.
-

## CHAPTER 43

# Configuring Attack Response Controller for Blocking and Rate Limiting

---

You can configure an IPS device to implement blocks or rate limits to control attacks. Blocking and rate limiting are primarily of use when operating in promiscuous mode. When operating in inline mode, it is much more efficient to have the IPS drop traffic itself. Blocking and rate limiting are actions that other devices implement at the request of the IPS; thus, configuring blocking and rate limiting is a more complex configuration than simple inline denies.

To configure blocking or rate limiting, you must identify the network device that performs the blocking. A network device that performs blocking is called a blocking device. Many network devices can be used to support blocking: Cisco IOS routers and Catalyst 6500 switches, Cisco security appliances (ASA, PIX, and FWSM), and Catalyst 6500/7600 devices running the Catalyst operating system. You can also configure another IPS device to act as a main blocking sensor.

- [Understanding IPS Blocking](#) , on page 1759
- [Configuring IPS Blocking and Rate Limiting](#) , on page 1765
- [Blocking Page](#) , on page 1766

## Understanding IPS Blocking

The Attack Response Controller (ARC) component of the IPS is responsible for managing network devices in response to suspicious events by blocking access from attacking hosts and networks. ARC blocks the IP address on the devices it is managing. It sends the same block to all the devices it is managing, including any other main blocking sensors. ARC monitors the time for the block and removes the block after the time has expired.

---

**Note** ARC is formerly known as Network Access Controller. Although the name has been changed, the IPS documentation and configuration interfaces contain references to Network Access Controller, nac, and network-access.

---

ARC completes the action response for a new block in no more than 7 seconds. In most cases, it completes the action response in less time. To meet this performance goal, you should not configure the sensor to perform blocks at too high a rate or to manage too many blocking devices and interfaces. We recommend that the maximum number of blocks not exceed 250 and the maximum number of blocking items not exceed 10. To calculate the maximum number of blocking items, a security appliance counts as one blocking item per

blocking context. A router counts as one blocking item per blocking interface/direction. A switch running Catalyst software counts as one blocking item per blocking VLAN. If the recommended limits are exceeded, ARC might not apply blocks in a timely manner or might not be able to apply blocks at all.

For security appliances configured in multiple-context mode, Cisco IPS does not include VLAN information in the block request. Therefore you must make sure the IP addresses being blocked are correct for each security appliance. For example, the sensor is monitoring packets on a security appliance customer context that is configured for VLAN A, but is blocking on a different security appliance customer context that is configured for VLAN B. Addresses that trigger blocks on VLAN A might refer to a different host on VLAN B.

---

**Note** Blocking is not supported on the FWSM on the admin context in multiple-context mode.

---

There are three types of blocks:

- Host block—Blocks all traffic from a given IP address.

To configure the IPS to initiate automatic host blocks when a signature is triggered, add the **Request Block Host** event action to a signature, or add it to events based on risk rating using the event action override policy. See [Configuring Event Action Overrides](#), on page 1722 and [Configuring Signatures](#), on page 1680.

- Connection block—Blocks traffic from a given source IP address to a given destination IP address and destination port. Multiple connection blocks from the same source IP address to either a different destination IP address or destination port automatically switch the block from a connection block to a host block.

To configure the IPS to initiate automatic connection blocks when a signature is triggered, add the **Request Block Connection** event action to a signature, or add it to events based on risk rating using the event action override policy.

- Network block—Blocks all traffic from a given network.

You can initiate host and connection blocks manually or automatically when a signature is triggered. You can only initiate network blocks manually. You cannot initiate network blocks from within Security Manager; use the IPS Device Manager instead.

---

**Tip** Connection blocks and network blocks are not supported on security appliances (firewalls). Security appliances only support host blocks with additional connection information.

---

---

**Note** Do not confuse blocking with the ability of the sensor to drop packets. The sensor can drop packets when the following actions are configured for a sensor in inline mode: deny packet inline, deny connection inline, and deny attacker inline.

---

On Cisco IOS Software devices (routers and Catalyst 6500 series switches), ARC creates blocks by applying ACLs; on Catalyst 6500/7600 devices that run the Catalyst operating system, ARC creates blocks by applying VACLs. ACLs and VACLs permit or deny passage of data packets through interface directions or VLANs. Each ACL or VACL contains permit and deny conditions that apply to IP addresses. The security appliances use the **shun** command instead of ACLs.

**Tip** For a list of the specific devices and operating system versions that you can configure as blocking devices, see the supported device information in the chapter “Configuring Attack Response Controller for Blocking and Rate Limiting” in the *Installing and Using Cisco Intrusion Prevention System Device Manager* publication for your IPS software version. These publications are available on Cisco.com at [http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/products\\_installation\\_and\\_configuration\\_guides\\_list.html](http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/products_installation_and_configuration_guides_list.html)

The following topics explain more about IPS blocking:

- [Strategies for Applying Blocks](#) , on page 1761
- [Understanding Rate Limiting](#) , on page 1762
- [Understanding Router and Switch Blocking Devices](#) , on page 1762
- [Understanding the Main Blocking Sensor](#) , on page 1764
- [Configuring IPS Blocking and Rate Limiting](#) , on page 1765
- [Blocking Page](#) , on page 1766

## Strategies for Applying Blocks

Blocking is performed only when an event occurs and the event includes the Request Block Connection or Request Block Host event actions. These event actions are not typically needed when you operate the IPS in inline mode, where you use Deny actions to drop undesired traffic.

The following are situations in which you might want to implement blocking actions:

- Promiscuous mode—When running in promiscuous mode, the IPS cannot implement Deny actions. Thus, if you want to prevent traffic from a host, you must implement blocking.
- Inline mode—In inline mode, you can implement Deny actions to immediately drop undesired traffic. However, you might want to add blocking actions to protect other segments of your network.

For example, suppose that your network consists of five subnets, A, B, C, D, and E, and that each of these segments has an inline IPS device monitoring it. If the IPS for subnet A identifies an attack, the IPS can use Deny actions to protect subnet A, but also use Request Block actions to configure the firewalls that protect B, C, D, and E to shun the attacker before the attack can target those other subnets. In this example, you would want to designate a single IPS as the main blocking sensor and have the other four IPS sensors perform blocking through the main blocking sensor.

Use the following techniques to add the request block actions to an event:

- Event Action Override policy—Configure an event action override rule to add the action to all events based on the event’s risk rating. This is a simple approach. You could add the request block action for the same risk ratings used for adding Deny actions. For more information, see [Configuring Event Action Overrides](#) , on page 1722.
- Signatures policy—You can add the request block actions to individual signatures. This requires editing each signature to add the action. This can be a time-consuming approach, but it allows you to configure blocking for just the types of events that concern you most. For more information, see [Configuring Signatures](#) , on page 1680.

- [Understanding IPS Blocking](#) , on page 1759
- [Understanding the Main Blocking Sensor](#) , on page 1764
- [Understanding Interface Modes](#) , on page 1648
- [Configuring IPS Blocking and Rate Limiting](#) , on page 1765
- [Blocking Page](#) , on page 1766

## Understanding Rate Limiting

Attack Response Controller (ARC) is responsible for rate limiting traffic in protected networks. Rate limiting lets sensors restrict the rate of specified traffic classes on network devices. Rate limit responses are supported for the Host Flood and Net Flood engines, and the TCP half-open SYN signature. ARC can configure rate limits on network devices running Cisco IOS 12.3 or later. Main blocking sensors can also forward rate limit requests to blocking forwarding sensors.

To add a rate limit to a signature, you must add the Request Rate Limit action. You can then edit the signature parameters to set the percentage for these signatures in the Event Actions Settings folder.

---

**Tip** You can also manually implement rate limits, but you cannot do so using Security Manager; use the IPS Device Manager instead.

---

On the blocking device, you must not apply a service policy to an interface/direction that is configured for rate limiting. If you do so, the rate limit action will fail. Before configuring rate limits, confirm that there is no service policy on the interface/direction, and remove it if one exists. ARC does not remove the existing rate limit unless it is one that ARC had previously added.

Rate limits use ACLs, but not in the same way as blocks. Rate limits use ACLs and class-map entries to identify traffic, and policy-map and service-policy entries to police the traffic.

## Understanding Router and Switch Blocking Devices

You can use routers or Catalyst 6500/7600 devices running Cisco IOS Software, or Catalyst 6500/7600 devices running the Catalyst operating system, to implement IPS blocking in your network. When you use routers or switches, Attack Response Controller (ARC) configures extended ACLs (on IOS devices) or VLAN ACLs (on Catalyst OS devices) to implement the blocks. These ACLs and VACLs are created and managed in the same way.

Rate limits also use ACLs, but not in the same way as blocks. Rate limits use ACLs and class-map entries to identify traffic, and policy-map and service-policy entries to police the traffic.

---

**Tip** IPS considers Catalyst 6500/7600 devices that run Cisco IOS Software to be equivalent to routers. When you add these devices as blocking devices, add them as routers.

---

When you configure a router interface or switch VLAN as a blocking interface, you can optionally specify the names of pre- and post-ACLs or VACLs. Although specifying ACL or VACL names is optional, if you

have configured ACLs or VACLs on the interface or VLAN, you must identify them to the IPS or ARC will remove them from your device configuration.

The pre- and post-ACL/VACL have the following uses:

- The Pre-Block ACL/VACL is mainly used for permitting what you do not want the sensor to ever block. When a packet is checked against the ACL/VACL, the first line that gets matched determines the action. If the first line matched is a permit line from the Pre-Block ACL/VACL, the packet is permitted even though there may be a deny line (from an automatic block) listed later in the ACL/VACL. The Pre-Block ACL/VACL can override the deny lines resulting from the blocks.
- The Post-Block ACL/VACL is best used for additional blocking or permitting that you want to occur on the same interface or direction. If you have an existing ACL on the interface or direction that the sensor will manage, that existing ACL can be used as a Post-Block ACL/VACL. If you do not have a Post-Block ACL/VACL, the sensor inserts permit ip any any at the end of the new ACL/VACL.

If you are managing the IOS Software blocking device in Security Manager, you can identify the ACL name by selecting the blocking device, then selecting **Tools > Preview Config**. Look for the **ip access-group** command in the interface configuration, and check the direction. For example, the following lines show that there is an ACL named CSM\_FW\_ACL\_GigabitEthernet0/1 in the In direction attached to the GigabitEthernet0/1 interface.

```
interface GigabitEthernet0/1
 ip access-group CSM_FW_ACL_GigabitEthernet0/1 in
```

In this example, if you configure GigabitEthernet0/1 in the In direction as a blocking interface, ensure that you specify CSM\_FW\_ACL\_GigabitEthernet0/1 as a pre- or post-ACL. In most cases, you should specify the ACL as the post-ACL, so that the relatively short IPS blocking ACL first filters out undesirable traffic before the blocking device implements your other access rules.

Because Security Manager does not manage Catalyst OS devices, you must examine a Catalyst OS device configuration outside of Security Manager to determine VACL names. Keep in mind that a Catalyst 6500/7600 device that runs IOS Software can also have VACLs, but the IPS does not do VLAN blocking on Catalyst 6500/7600 VLANs when the device is running IOS Software.

When the sensor starts up, it reads the contents of the two ACL/VACLs. It creates a third ACL/VACL with the following entries in this order, and this combined ACL/VACL is applied to the interface or VLAN:

1. A **permit** line with the sensor IP address or, if specified, the NAT address of the sensor.

If you select the Allow Sensor IP address to be Blocked option on the General tab of the Blocking policy, this permit entry is not added. For more information, see [General Tab, IPS Blocking Policy , on page 1768](#).

1. Pre-Block ACL/VACL, if specified.
2. Any active blocks generated by the IPS (deny statements).
3. The Post-Block ACL/VACL, if specified.

If you do not specify a Post-Block ACL/VACL, a **permit ip any any** entry is added to allow all unfiltered traffic. Note that this negates the normal implicit deny any that ends interface ACLs.

When using Catalyst OS, IDSM-2 inserts **permit ip any any capture** at the end of the new VACL.

If ARC is managing a device and you need to configure the ACL/VACLs on that device, you should disable blocking first. You want to avoid a situation in which both you and ARC could be making a change at the

same time on the same device. This could cause the device or ARC to fail. If you need to modify the Pre-Block or Post-Block ACL/VACL, do the following:

1. Disable blocking on the sensor.

Because you are making a temporary change, you can disable and then reenabling blocking by using the IPS Device Manager (IDM) on the device. Alternatively, you can deselect the Enable Blocking option on the General tab of the Blocking policy in Security Manager, then deploy the configuration to the IPS sensor. To reenabling blocking, select the Enable Blocking option again and deploy the configuration to the IPS sensor.

1. Make the changes to the configuration of the device. For example, if you manage the blocking device in Security Manager, deploy the updated configuration and wait for the device to reload.
2. Reenable blocking on the sensor.

## Understanding the Main Blocking Sensor

Multiple sensors (blocking forwarding sensors) can forward blocking requests to a specified main blocking sensor, which controls one or more devices. The main blocking sensor is the ARC running on a sensor that controls blocking on one or more devices on behalf of one or more other sensors. When a signature fires that has blocking or rate limit requests configured as event actions, the sensor forwards the block or rate limit request to the main blocking sensor, which then performs the block or rate limit.

When you add a main blocking sensor, you reduce the number of blocking devices per sensor. For example, if you want to block on 10 firewalls and 10 routers with one blocking interface/direction each, you can assign 10 to the sensor and assign the other 10 to a main blocking sensor.

You configure main blocking sensors on the Primary Blocking Sensors tab of the Blocking policy, as described in [Blocking Page](#), on page 1766.

When configuring main blocking sensors, keep the following tips in mind:

- Two sensors cannot control blocking or rate limiting on the same device. If this situation is needed, configure one sensor as the main blocking sensor to manage the devices and the other sensors can forward their requests to the main blocking sensor.
- On the blocking forwarding sensor, identify which remote host serves as the main blocking sensor; on the main blocking sensor you must add the blocking forwarding sensors to its access list using the Allowed Hosts policy. See [Identifying Allowed Hosts](#), on page 1620.
- If the main blocking sensor requires TLS for web connections, you must configure the ARC of the blocking forwarding sensor to accept the X.509 certificate of the main blocking sensor remote host. Sensors by default have TLS enabled, but you can change this option. For more information, see [Primary Blocking Sensor Dialog Box](#), on page 1771.
- Typically the main blocking sensor is configured to manage the network devices. Blocking forwarding sensors are not normally configured to manage other network devices, although doing so is permissible.
- Only one sensor should control all blocking interfaces on a device.

# Configuring IPS Blocking and Rate Limiting

If you use the Request Block Host, Request Block Connection, or Request Rate Limit actions on any signatures, or add them to events using the event action override policy, you must configure blocking devices. If you do not use these actions, there is no need to configure blocking devices.

Before you configure blocking, read the following topics:

- [Understanding IPS Blocking](#) , on page 1759
- [Strategies for Applying Blocks](#) , on page 1761
- [Understanding Rate Limiting](#) , on page 1762
- [Understanding Router and Switch Blocking Devices](#) , on page 1762
- [Understanding the Main Blocking Sensor](#) , on page 1764

---

## Step 1

Do one of the following:

- (Device view) Select **Platform** > **Security** > **Blocking** from the Policy selector.
- (Policy view) Select **IPS** > **Platform** > **Security** > **Blocking**, then select an existing policy or create a new one.

For an overview of the blocking policy, see [Blocking Page](#) , on page 1766.

## Step 2

On the General tab, change any settings where you want non-default values. However, the default values are appropriate for most networks. For detailed information about the settings, see [General Tab, IPS Blocking Policy](#) , on page 1768.

## Step 3

Click the **User Profiles** tab and create the user profiles that are required to log into the blocking devices.

- To add a profile, click the **Add Row** button and fill in the Add User Profile dialog box (see [User Profile Dialog Box](#) , on page 1770).
- To edit a profile, select it and click the **Edit Row** button.
- To delete a profile, select it and click the **Delete Row** button. Before you delete a profile, ensure that it is not currently being used by a blocking device.

## Step 4

If you need to use a main blocking sensor, as described in [Understanding the Main Blocking Sensor](#) , on page 1764, click the **Primary Blocking Sensors** tab and do the following:

- To add a main blocking sensor, click the **Add Row** button and fill in the Add Main Blocking Sensor dialog box (see [Primary Blocking Sensor Dialog Box](#) , on page 1771).
- To edit a main blocking sensor, select it and click the **Edit Row** button.
- To delete a main blocking sensor, select it and click the **Delete Row** button.

## Step 5

Identify the blocking devices (unless you will use main blocking sensors only). You must add the devices to the correct tab:

- **Routers** tab—For all Cisco IOS Software devices, including Catalyst 6500 switches that are running IOS Software.
- **Firewalls** tab—For ASA, PIX, and FWSM.

- **Catalyst 6K** tab—For Catalyst 6500/7600 devices that are running the Catalyst operating system.

On each tab, the configuration steps are the same:

- To add a device, click the **Add Row** button and fill in the Add Router, Firewall, or Cat6K Device dialog box (see [Router, Firewall, Cat6K Device Dialog Box](#), on page 1771).
- To edit a device, select it and click the **Edit Row** button.
- To delete a device, select it and click the **Delete Row** button.

**Step 6** Click the **Never Block Hosts and Networks** tab and identify the hosts and networks that should never be blocked. These lists affect blocking actions, but they do not affect limiting actions. Identify your trusted networks and hosts:

- To add a host or network, click the **Add Row** button beneath the appropriate table and fill in the Add Never Block Host or Network dialog box (see [Never Block Host or Network Dialog Boxes](#), on page 1775).
- To edit a host or network, select it and click the **Edit Row** button.
- To delete a host or network, select it and click the **Delete Row** button.

## Blocking Page

Use the Blocking page to configure IPS sensor blocking properties. Configure the blocking policy only if you use the Request Block Connection, Request Block Host, or Request Rate Limit event actions in your signatures or event actions policies. Blocking hosts are used only for events to which these actions are assigned.

**Tip** The list of hosts and networks to never block applies only to the Request Block Connection and Request Block Host event actions. The list does not affect rate limiting, nor does it affect any of the Deny actions such as Deny Packet Inline. To exempt hosts and networks from Deny or rate limiting actions, use event action filter rules, specify the hosts and networks as Attackers, and remove the actions from events. For more information, see [Configuring Event Action Filters](#), on page 1714.

### Navigation Path

- (Device view) Select **Platform > Security > Blocking** from the Policy selector.
- (Policy view) Select **IPS > Platform > Security > Blocking**, then select an existing policy or create a new one.

## Field Reference

**Table 541: IPS Blocking Policy**

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General tab                  | The basic settings required to enable blocking and rate limiting. For information about the options on the General tab, see <a href="#">General Tab, IPS Blocking Policy</a> , on page 1768.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| User Profiles tab            | The connection credential information profiles for logging into the blocking devices. Before you define a blocking device, create the user profile required to log into the device. The table shows the profile name, username, and the passwords, which are masked with a fixed number of asterisks. <ul style="list-style-type: none"> <li>• To add a profile, click the <b>Add Row</b> button and fill in the Add User Profile dialog box (see <a href="#">User Profile Dialog Box</a> , on page 1770).</li> <li>• To edit a profile, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a profile, select it and click the <b>Delete Row</b> button. Before you delete a profile, ensure that it is not currently being used by a blocking device.</li> </ul>                                                                    |
| Primary Blocking Sensors tab | The main blocking IPS sensors (see <a href="#">Understanding the Main Blocking Sensor</a> , on page 1764). A main blocking sensor manages blocks for other IPS devices. The table shows the IP address (or network/host object) of the main blocking sensor, the username and password for logging into it, the port used for connections, and whether TLS is used for login. <ul style="list-style-type: none"> <li>• To add a main blocking sensor, click the <b>Add Row</b> button and fill in the Add Primary Blocking Sensor dialog box (see <a href="#">Understanding the Main Blocking Sensor</a> , on page 1764).</li> <li>• To edit a main blocking sensor, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a main blocking sensor, select it and click the <b>Delete Row</b> button.</li> </ul>                         |
| Router tab                   | The IOS routers and Catalyst 6500/7600 devices (that are running IOS Software) to be used as blocking or rate limiting devices. The table shows the IP address (or network/host object) of the device, the communication method used to log into it, the NAT address of the sensor (0.0.0.0 if NAT is not used), the name of the profile that is used for logging into the device, and the device's response capabilities (blocking, rate limiting, or both). <ul style="list-style-type: none"> <li>• To add a router, click the <b>Add Row</b> button and fill in the Add Router Device dialog box (see <a href="#">Primary Blocking Sensor Dialog Box</a> , on page 1771).</li> <li>• To edit a router, select it and click the <b>Edit Row</b> button.</li> <li>• To delete a router, select it and click the <b>Delete Row</b> button.</li> </ul> |

| Element                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Firewall tab                   | <p>The ASA, PIX, and FWSM devices to be used as blocking devices. The table shows the IP address (or network/host object) of the device, the communication method used to log into it, the NAT address of the sensor (0.0.0.0 if NAT is not used), and the name of the profile that is used for logging into the device.</p> <ul style="list-style-type: none"> <li>To add a firewall, click the <b>Add Row</b> button and fill in the Add Firewall Device dialog box (see <a href="#">Router, Firewall, Cat6K Device Dialog Box</a>, on page 1771).</li> <li>To edit a firewall, select it and click the <b>Edit Row</b> button.</li> <li>To delete a firewall, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                                                            |
| Catalyst 6K tab                | <p>The Catalyst 6500/7600 devices that are using Catalyst software to be used as blocking devices. The table shows the IP address (or network/host object) of the device, the communication method used to log into it, the NAT address of the sensor (0.0.0.0 if NAT is not used), and the name of the profile that is used for logging into the device.</p> <p><b>Tip</b> Do not use this tab for Catalyst 6500/7600 devices that run Cisco IOS Software. Instead, use the Router tab.</p> <ul style="list-style-type: none"> <li>To add a Catalyst OS device, click the <b>Add Row</b> button and fill in the Add Cat6K Device dialog box (see <a href="#">Router, Firewall, Cat6K Device Dialog Box</a>, on page 1771).</li> <li>To edit a Catalyst OS device, select it and click the <b>Edit Row</b> button.</li> <li>To delete a Catalyst OS device, select it and click the <b>Delete Row</b> button.</li> </ul> |
| Never Block Hosts and Networks | <p>The hosts and networks that should never be blocked. Hosts and networks are shown in separate tables. The tables show the IP address or network/host object for the host or network. These lists do not affect rate limiting actions, nor do they apply to Deny actions.</p> <ul style="list-style-type: none"> <li>To add a host or network, click the <b>Add Row</b> button beneath the appropriate table and fill in the Add Never Block Host or Network dialog box (see <a href="#">Never Block Host or Network Dialog Boxes</a>, on page 1775).</li> <li>To edit a host or network, select it and click the <b>Edit Row</b> button.</li> <li>To delete a host or network, select it and click the <b>Delete Row</b> button.</li> </ul>                                                                                                                                                                           |

## General Tab, IPS Blocking Policy

Use the General tab of the Blocking policy to configure the basic settings required to enable blocking and rate limiting.

### Navigation Path

- (Device view) Select **Platform > Security > Blocking** from the Policy selector. If necessary, select the **General** tab.
- (Policy view) Select **IPS > Platform > Security > Blocking**, then select an existing policy or create a new one. If necessary, select the **General** tab.

**Field Reference****Table 542: General Tab, IPS Blocking Policy**

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Log All Block Events and Errors       | <p>Whether to log events that follow blocks from start to finish and any error messages that occur. When a block is added to or removed from a device, an event is logged. You may not want all these events and errors to be logged. Disabling this option suppresses new events and errors. The default is enabled.</p> <p><b>Note</b> Log all block events and errors also applies to rate limiting.</p>                                                                                                                                                                                                                                                   |
| Enable NVRAM Write                    | <p>Whether to have the router write to non-volatile RAM (NVRAM) when Attack Response Controller (ARC) first connects. If enabled, NVRAM is written each time the ACLs are updated. The default is disabled.</p> <p>Enabling NVRAM writing ensures that all changes for blocking and rate limiting are written to NVRAM. If the router is rebooted, the correct blocks and rate limits will still be active. If NVRAM writing is disabled, a short time without blocking or rate limiting occurs after a router reboot. Not enabling NVRAM writing increases the life of the NVRAM and decreases the time for new blocks and rate limits to be configured.</p> |
| Enable ACL Logging                    | <p>Whether to have ARC append the log parameter to block entries in the access control list (ACL) or VLAN ACL (VACL). This causes the device to generate syslog events when packets are filtered. This option applies to routers and switches only. The default is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                              |
| Allow Sensor IP address to be Blocked | <p>Whether the sensor IP address can be blocked. The default is disabled.</p> <p><b>Tip</b> If you allow the sensor address to be blocked, the IPS does not add an explicit permit entry to the interface ACL to allow the IPS address. You must ensure that the IPS address is permitted by the device ACL or the IPS cannot implement blocking on the device.</p>                                                                                                                                                                                                                                                                                           |
| Enable Blocking                       | <p>Whether to enable the blocking and rate limiting of hosts. The default is enabled.</p> <p><b>Note</b> When you enable blocking, you also enable rate limiting. When you disable blocking, you also disable rate limiting. This means that ARC cannot add new or remove existing blocks or rate limits.</p>                                                                                                                                                                                                                                                                                                                                                 |
| Max Blocks                            | <p>The maximum number of entries to block. The range is 1 to 65535. The default is 250.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Interfaces  | <p>The maximum number of interfaces for performing blocks. For example, a PIX 500 series security appliance counts as one interface. A router with one interface counts as one, but a router with two interfaces counts as two. The maximum number of interfaces is 250 per device. The default is 250.</p> <p>You use Max Interfaces to set an upper limit on the number of devices and interfaces that ARC can manage. The total number of blocking devices (not including main blocking sensors) cannot exceed this value. The total number of blocking items also cannot exceed this value, where a blocking item is one security appliance context, one router blocking interface/direction, or one Catalyst Software switch blocking VLAN.</p> <p><b>Note</b> In addition, the following maximum limits are fixed and you cannot change them: 100 interfaces per device, 250 security appliances, 250 routers, 250 Catalyst Software switches, and 100 main blocking sensors.</p> |
| Max Rate Limits | The maximum number of rate limit entries. The maximum rate limit must be equal to or less than the maximum blocking entries. The range is 1 to 32767. The default value is 250.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## User Profile Dialog Box

Use the Add or Modify User Profile dialog box to add or modify a user profile for an IPS blocking device. The profile defines a username and passwords that the IPS device can use to log into and configure the router, switch, or firewall that will implement IPS blocking.

Although you can save a profile that has a profile name only, the requirements for username, password, and enable password are determined by the device. You must specify the items required by the device to enter configuration mode, or the IPS cannot configure blocking on the device.

### Navigation Path

From the IPS Blocking policy, select the User Profiles tab and click the **Add Row** button or select an existing sensor and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page](#), on page 1766.

### Field Reference

*Table 543: User Profile Dialog Box*

| Element         | Description                                                                       |
|-----------------|-----------------------------------------------------------------------------------|
| Profile Name    | The name of the profile, up to 64 alphanumeric characters.                        |
| Username        | The username to use when logging into the blocking device.                        |
| Password        | The login password for the username, if required.                                 |
| Enable Password | The enable password for entering Privileged EXEC Mode (enable mode), if required. |

## Primary Blocking Sensor Dialog Box

Use the Add or Modify Primary Blocking Sensor dialog box to configure a main blocking sensor. For more information about main blocking sensors, see [Understanding the Main Blocking Sensor](#), on page 1764.

### Navigation Path

From the IPS Blocking policy, select the Primary Blocking Sensors tab and click the **Add Row** button or select an existing sensor and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page](#), on page 1766.

*Table 544: Primary Blocking Sensor Dialog Box*

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | The IP address of the main blocking sensor. Enter the IP address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Username   | The username to use to log in to the main blocking sensor. The user account must be an active account configured on the main blocking sensor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Password   | The login password for the username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Port       | The port on which to connect on the main blocking sensor. The default is 443.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TLS        | Whether to use TLS.<br><br>If you select the TLS option, you must configure the ARC of the blocking forwarding sensor to accept the TLS/SSL X.509 certificate of the main blocking sensor remote host. (The blocking forwarding sensor is any device to which you are assigning this blocking policy.)<br><br>The easiest way to configure the blocking forwarding sensor to accept the X.509 certificate is to use the IPS Device Manager (IDM) to log into the sensor, choose <b>Configuration &gt; Sensor Management &gt; Certificates &gt; Trusted Hosts &gt; Add Trusted Host</b> , and add the main blocking sensor as a trusted host. Alternatively, you can log into the sensor CLI, enter configuration mode, and use the <code>tls trusted-host ip-address</code> command. |

## Router, Firewall, Cat6K Device Dialog Box

Use the Add or Modify Router, Firewall, or Cat6K Device dialog box to configure a device as a blocking device for an IPS sensor. The name of the dialog box indicates the type of device you are adding:

- Router—IOS Software routers and Catalyst 6500/7600 devices. These devices can do rate limiting as well as blocking. See [Understanding Router and Switch Blocking Devices](#), on page 1762.
- Firewall—ASA and PIX appliances.
- Cat6K—Catalyst 6500/7600 devices that are running Catalyst OS software.

**Tip** If the Catalyst 6500/7600 runs Cisco IOS Software, add the device as a router on the Router tab. Do not add the device to the Cat6K tab.

### Navigation Path

From the IPS Blocking policy, select the Router, Firewall, or Catalyst 6K tab and click the **Add Row** button or select an existing row and click the **Edit Row** button. For information on opening the Blocking policy, see [Blocking Page](#), on page 1766.

### Field Reference

*Table 545: Router, Firewall, Cat6K Device Dialog Boxes*

| Element            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address         | The IP address of the device. Enter the IP address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one.                                                                                                                                                                                                                                                                                                                                                                                    |
| Communication Type | The communication mechanism used to log in to the blocking device (SSH 3DES, SSH DES, Telnet). The default is SSH 3DES.<br><br>If you choose SSH 3DES or SSH DES, you must add the device to the known hosts list. The easiest way to add the device to the known hosts list is to use the IPS Device Manager (IDM) to log into the sensor, choose <b>Configuration &gt; Sensor Management &gt; SSH &gt; Known Host Keys &gt; Add Known Host Key</b> , and add the device address. Alternatively, you can log into the sensor CLI, enter configuration mode, and use the <b>ssh host-key</b> command. |
| NAT Address        | The NAT address of the sensor, if any is used between the sensor and the blocking device. Enter the NAT address or the name of a network/host policy object that contains a single host address, or click <b>Select</b> to select an object from a list or to create a new one. Leave the default 0.0.0.0 if NAT is not used.                                                                                                                                                                                                                                                                         |
| Profile Name       | The login profile used to log in to the blocking device. You must create this profile on the User Profiles tab of the blocking policy or the IPS cannot successfully use this blocking device.                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Router Block Interface Dialog Box

Use the Add or Modify Router Block Interface dialog box to configure a blocking interface on a router or IOS Software Catalyst 6500/7600 device that is configured as an IPS blocking device. The IPS sensor uses the interface for blocking actions.

### Navigation Path

From the Add or Modify Router Device dialog box, click the **Add Row** button beneath the interfaces table, or select a row in the table and click the **Edit Row** button. For information on opening the Router Device dialog box, see [Router, Firewall, Cat6K Device Dialog Box](#) , on page 1771.

## Field Reference

**Table 546: Router Block Interface Dialog Box**

| Element                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name                | The name of the interface on the router that the IPS should use for blocking. Enter the name exactly as it is configured on the router (for example, GigabitEthernet0/1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Direction                     | The direction to apply the blocking ACL, In or Out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Pre ACL Name<br>Post ACL Name | <p>The ACLs to combine with the blocking entries that the IPS creates to implement blocking actions. The Pre ACL is added before the blocking ACL, and the Post ACL is added after the blocking ACL. For more information, see <a href="#">Understanding Router and Switch Blocking Devices</a>, on page 1762.</p> <p><b>Tip</b> If you have configured an ACL on the interface in the specified direction, you must specify the name of the ACL in the Pre or Post ACL Name field or the ACL will be removed from the interface. When you identify an interface and direction as a blocking interface, the IPS takes control of the ACL on that interface/direction.</p> <p>If you are managing the blocking device in Security Manager, you can identify the ACL name by selecting the blocking device, then selecting <b>Tools &gt; Preview Config</b>. Look for the <b>ip access-group</b> command in the interface configuration, and check the direction. For example, the following lines show that there is an ACL named CSM_FW_ACL_GigabitEthernet0/1 in the In direction attached to the GigabitEthernet0/1 interface.</p> <pre>interface GigabitEthernet0/1  ip access-group CSM_FW_ACL_GigabitEthernet0/1 in</pre> <p>In this example, if you configure GigabitEthernet0/1 in the In direction as a blocking interface, ensure that you specify CSM_FW_ACL_GigabitEthernet0/1 as a pre- or post-ACL. In most cases, you should specify the ACL as the post-ACL, so that the relatively short IPS blocking ACL first filters out undesirable traffic before the blocking device implements your other access rules.</p> |

## Cat6k Block VLAN Dialog Box

Use the Add or Modify Cat6k Block VLAN dialog box to configure a blocking VLAN on a Catalyst 6500/7600 device that runs the Catalyst operating system and that is configured as an IPS blocking device. The IPS sensor uses the VLAN for blocking actions.

**Tip** If the Catalyst 6500/7600 runs Cisco IOS Software, add the device as a router, not a Cat6K.

### Navigation Path

From the Add or Modify Cat6K Device dialog box, click the **Add Row** button beneath the VLANs table, or select a row in the table and click the **Edit Row** button. For information on opening the Cat6K Device dialog box, see [Router, Firewall, Cat6K Device Dialog Box](#), on page 1771.

## Field Reference

**Table 547: Cat6k Block VLAN Dialog Box**

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN                            | The number of the VLAN on the Catalyst 6500/7600 device that the IPS should use for blocking. The number can be 1 to 4094 and must be defined on the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Pre VACL Name<br>Post VACL Name | <p>The VLAN ACLs to combine with the blocking entries that the IPS creates to implement blocking actions. The Pre VACL is added before the blocking VACL, and the Post VACL is added after the blocking VACL. For more information, see <a href="#">Understanding Router and Switch Blocking Devices</a>, on page 1762.</p> <p><b>Tip</b> If you have configured a VACL on the VLAN, you must specify the name of the VACL in the Pre or Post VACL Name field or the VACL will be removed from the VLAN. When you identify a VLAN as a blocking interface, the IPS takes control of the VACL on that VLAN. Typically, you would specify the VACL name as the post-VACL.</p> |

## Never Block Host or Network Dialog Boxes

Use the Add or Modify Never Block Host or Network dialog boxes to specify a host or network that should never be subject to blocking. The name of the dialog box indicates whether you are adding a host or network address.

Enter the IP address or the name of a network/host policy object that specifies the address. You can also click **Select** to select an object from a list or to create a new object. When selecting objects, the object can contain a single entry of the appropriate type. Host addresses do not have subnet masks (for example, 10.100.10.1), whereas network addresses have masks (for example, 10.100.10.0/24).

### Navigation Path

From the IPS Blocking policy, select the Never Block Hosts or Networks tab and click the **Add Row** button or select an existing row and click the **Edit Row** button. Hosts and networks are listed in separate tables, so ensure that you click the buttons associated with the desired table. For information on opening the Blocking policy, see [Blocking Page](#), on page 1766.

## CHAPTER 44

# Managing IPS Sensors

To perform day-to-day sensor management, you typically need to use a device manager such as the IPS Device Manager (IDM). Security Manager is focused on policy and event management.

However, the following topics describe some management activities that you can perform using Security Manager:

- [Managing IPS Licenses](#) , on page 1777
- [Managing IPS Updates](#) , on page 1780
- [Managing IPS Certificates](#) , on page 1786
- [Rebooting IPS Sensors](#) , on page 1788

## Managing IPS Licenses

The following topics explain how to manage licenses for IPS devices:

[Updating IPS License Files](#) , on page 1777

[Managing IPS Updates](#) , on page 1780

[Managing IPS Certificates](#) , on page 1786

## Updating IPS License Files

You can use Security Manager to update the licenses for IPS devices. This procedure explains how to update the licenses manually by retrieving them from Cisco.com or from a license file on the Security Manager server. For information about setting up automatic license updates, see [Automating IPS License File Updates](#) , on page 1779.

### Before You Begin

If you use Cisco.com, you must first configure the IPS Update server to be Cisco.com, so that you can specify the username and password. You must use Cisco.com for licensing if you are using a device that requires it; for example, an IPS 4270 or an AIP SSM-40 in an ASA device requires a Cisco.com account. For information on configuring Cisco.com as the IPS Update server, see [Configuring the IPS Update Server](#) , on page 1780.

If you use local licenses, you must download them directly to the Security Manager server file system. You cannot do this through Security Manager; you must log into Windows on the server to download the licenses.

### Related Topics

- [Redeploying IPS License Files , on page 1778](#)

---

**Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

**Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page , on page 569](#)).

The table lists all IPS devices in the device inventory and displays the status of their licenses. The status can be valid, invalid, expired, no license, or trial license. The expiration date for the license is also shown. Click **Refresh License** to update the table with the latest license information from the devices (you can select one or more devices to limit the scope of the refresh).

To update licenses, do one of the following:

- To update devices with licenses obtained directly from Cisco.com—Select the devices you want to update and click **Update Selected via CCO**. A dialog box opens that lists the devices that can be updated from Cisco.com, which might not be all of the devices you selected. Review the list and click **OK**. The status of the update task is shown in the License Update Status Details dialog box (see [License Update Status Details Dialog Box , on page 573](#)).

To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices.

**Tip** The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.

- To update devices with licenses that you have copied to the Security Manager server—Click **Update from License File**. A dialog box opens where you can select the license files. Click **Browse** to select them from the Security Manager local file system. You can select more than one license file. When you have selected the desired files, click **OK** to have them applied to the devices.

---

## Redeploying IPS License Files

If an attempt to apply an IPS license update to a device fails, you can redeploy the update. Redeployment works only if you have already attempted to apply an update and a license file is associated with the IPS device.

### Related Topics

- [Updating IPS License Files , on page 1777](#)
- [Automating IPS License File Updates , on page 1779](#)

---

**Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

**Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page , on page 569](#)).

**Step 3** Select the devices to which you want to redeploy licenses and click **Redeploy Selected Licenses**. A dialog box opens listing devices whose licenses you are redeploying. Click **OK** to perform the update.

The status of the update task is shown in the License Update Status Details dialog box (see [License Update Status Details Dialog Box](#) , on page 573).

---

## Automating IPS License File Updates

Security Manager can automatically apply IPS license updates to your IPS devices on a regular schedule. To successfully configure automatic updates, you must have a Cisco.com support contract that includes the serial numbers of your IPS devices.

---

**Tip** Security Manager applies new licenses only if the downloaded license has an expiration date further into the future than the one replaced or if the license information is different.

---

### Before You Begin

You must first configure the IPS Update server to be Cisco.com, so that you can specify the Cisco.com username and password. For information on configuring Cisco.com as the IPS Update server, see [Configuring the IPS Update Server](#) , on page 1780.

### Related Topics

- [Updating IPS License Files](#) , on page 1777
- [Redeploying IPS License Files](#) , on page 1778

- 
- Step 1** Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.
- Step 2** Click the **IPS** tab (see [IPS Tab, Licensing Page](#) , on page 569).
- Step 3** Select **Download and apply licenses** and configure the following settings:
- **Days before the expiration date**—Select the number of days before a license expires that Security Manager should download an updated license. The default is 1 day.
  - **Discover devices daily at**—Select the time of day when Security Manager should download licenses. At this time, Security Manager will check the license status on the devices, and contact Cisco.com for new licenses for devices that have no license, have expired licenses, or that have licenses that will expire within the number of days you selected.
  - **Email License Update Results**—Select whether Security Manager should send e-mail notification of license update results. E-mails are sent with license expiration status and for license update job results. If you select this option, enter one or more e-mail addresses in the **Email Notification** field. Separate multiple addresses with commas.

For the e-mails to be sent, you must configure an SMTP server as described in [Configuring an SMTP Server and Default Addresses for E-Mail Notifications](#) , on page 27.

- Step 4** Click **Save** to save your changes.
-

# Managing IPS Updates

You can use Security Manager to apply sensor and signature updates to your IPS devices and shared policies. Through Security Manager, you can download updates and either set up automatic updates or apply them manually.

Signature updates are available only for IPS 5.1(4) and later.

---

**Tip** If you have problems applying patches, service packs, or signature updates, check the time on your IPS sensor. If the time on the sensor is ahead of the time on the associated certificate, the certificate is rejected and the update may fail. Use the Network Time Protocol (NTP) to maintain accurate time on an IPS sensor. For information on configuring NTP on the sensor, see [Identifying an NTP Server](#), on page 1636.

---

The IPS packages included with Security Manager do not include the package files that are required for updating IPS devices. You must download IPS packages from Cisco.com or your local update server before you can apply any updates. The downloaded versions include all required package files and replace the partial files that are included in the Security Manager initial installation.

The following topics describe how to use Security Manager to manage IPS updates:

- [Configuring the IPS Update Server](#), on page 1780
- [Checking for IPS Updates and Downloading Them](#), on page 1781
- [Automating IPS Updates](#), on page 1782
- [Manually Applying IPS Updates](#), on page 1783

## Configuring the IPS Update Server

To apply IPS sensor and signature updates, Security Manager must download the updates to the Security Manager server from an identified IPS Update server.

You can use Cisco.com as the IPS Update server. Using Cisco.com ensures that the latest updates are available to you at their earliest availability. However, if you cannot use Cisco.com for some reason, you can set up your own local IPS Update web server, manually download updates to it, and configure Security Manager to obtain the updates from your local server.

---

**Tip** If you are using a device that requires a Cisco.com login for updating licenses, such as an IPS 4270 or an AIP SSM-40 in an ASA device, you must configure the IPS Update server as Cisco.com. You cannot use a local server.

---

### Related Topics

- [Automating IPS Updates](#), on page 1782
- [Manually Applying IPS Updates](#), on page 1783

- 
- Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page](#) , on page 557).
- Step 2** In the Update Server area, click **Edit Settings** to open the Edit Update Server Settings dialog box (see [Edit Update Server Settings Dialog Box](#) , on page 562).
- Step 3** Enter the identifying information for your server. Based on the server type selected in the Update From field:
- Cisco.com—Enter a Cisco.com username and password. The user account you specify must have applied for eligibility to download strong encryption software. To verify the account has the appropriate permissions, go to Cisco.com and try to download an IPS update package. You will be prompted to accept the appropriate agreements if the account is not already qualified.
  - Local server—Enter the IP address or DNS host name of your server, a username and password if you require a log in before allowing access, and the path to the folder that contains the files. For the path, do not enter the entire URL; enter only the path portion of the URL (for example, the path in http://servername/IPSPATH is IPSPATH). Also add IIS configuration settings:
    - Home Directory should have listing enabled.
    - Documents should have Default Content Page disabled.

Enter certificate information. Before you can download an IPS package, you must accept the Cisco.com certificate. You must accept the certificate from both the "Image Meta-data locator" site and the download site of the IPS packages to start downloading images successfully (see [Edit Update Server Settings Dialog Box](#) , on page 562).

If your network requires a proxy server to get from the Security Manager server to the IPS Update server, select **Enable Proxy Server** and enter the information for the proxy server.

Click **OK** to save your changes.

- Step 4** Click **Save** on the IPS Updates page. Your changes are not completely saved unless you click **Save**.
- Step 5** Test the connectivity to the IPS Update server by clicking **Download Latest Updates**. A dialog box opens. Click **Start** to have Security Manager log into the update server, check for new updates, and download them. The dialog box displays the results of the operation.

If you are using Cisco.com and experience a download failure, double-check the user account to ensure it has the required permissions for downloading strong encryption software.

---

## Checking for IPS Updates and Downloading Them

You can use Security Manager to check for IPS sensor and signature updates and download them to the Security Manager server, where you can apply them to your IPS devices and policies.

You can manually download IPS updates, automate IPS update downloads, or download them when you try to manually apply them to a device. The following procedure explains how to manually check for updates and download them. For information on configuring automatic downloads, see [Automating IPS Updates](#) , on page 1782. For information on downloading updates while manually applying them to devices or policies, see [Manually Applying IPS Updates](#) , on page 1783.

### Before You Begin

You must configure the IPS Update server as described in [Configuring the IPS Update Server](#) , on page 1780.

**Related Topics**

- [Automating IPS Updates](#) , on page 1782
- [Manually Applying IPS Updates](#) , on page 1783

**Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page](#) , on page 557).

**Step 2** Review the status information in the Update Status group, and do any of the following:

- Click **Check for Updates**. A dialog box opens to display the results of the operation. Click **Start** to have Security Manager log into the IPS Update server and check for updates.
- Click **Download Latest Updates**. A dialog box opens to display the results of the operation. Click **Start** to have Security Manager log into the IPS Update server, check for updates, and download them to the Security Manager server.

**Tip** If a Cisco.com download fails, ensure that the account you are using has applied for eligibility to download strong encryption software. For details, see the description of User Name in [Edit Update Server Settings Dialog Box](#) , on page 562.

## Automating IPS Updates

You can automatically apply sensor image and signature updates to compatible IPS devices to ensure that they are up to date. If desired, you can partially automate the updates to maintain the desired level of control over the process.

**Tip** If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

**Tip** If you do not manage IPS devices, consider taking the following performance tuning step. In `$NMSROOT\MDC\ips\etc\sensorupdate.properties`, change the value of `packageMonitorInterval` from its initial default value of 30,000 milliseconds to a less-frequent value of 600,000 milliseconds. Taking this step will improve performance somewhat. [`$NMSROOT` is the full pathname of the Common Services installation directory (the default is `C:\Program Files\CSCOPx`).]

**Before You Begin**

You must configure the IPS Update server as described in [Configuring the IPS Update Server](#) , on page 1780.

**Related Topics**

- [Checking for IPS Updates and Downloading Them](#) , on page 1781
- [Manually Applying IPS Updates](#) , on page 1783

- [Understanding IPS Network Sensing , on page 1613](#)
- [Deploying Configurations in Non-Workflow Mode , on page 406](#)
- [Deploying Configurations in Workflow Mode , on page 412](#)

- 
- Step 1** Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents to open the IPS Updates page (see [IPS Updates Page , on page 557](#)).
- Step 2** In the Auto Update Settings group in the lower portion of the page, select an auto update mode to establish the extent of automation. Choices include:
- **Download, Apply, and Deploy Updates**—Security Manager checks for updates according to your schedule, downloads them to the Security Manager server, applies them to the selected devices and policies, and starts a deployment job to update the affected devices. This choice ensures that your devices are running the latest updates with minimal effort for your operations staff.
  - **Disable Auto Update**—Security Manager does not perform any automatic actions for IPS updates.
  - **Check for Updates**—Security Manager checks for updates according to your schedule and updates the information in the Update Status group. No devices or policies are updated.
  - **Download Updates**—Security Manager checks for updates according to your schedule and downloads any new updates to the Security Manager server.
  - **Download and Apply Updates**—Security Manager checks for updates according to your schedule, downloads them, and applies them to the selected devices and policies. You must separately create a deployment job to deploy the changes to the affected devices.
- Step 3** Click **Edit Update Schedule** to open a dialog box where you can specify the schedule for the operation. Select the starting date, enter the starting time in 24-hour format (hh:mm), and select whether the schedule should be by the hour, day, week, month, or a one-time event. Click **OK** to save the schedule.
- Step 4** (Optional) Enter an e-mail address in the Notify Email field. Security Manager will notify this user when a package is available for download or has been downloaded, applied, or deployed. You can enter more than one address by separating the addresses with commas.
- Step 5** Select the devices and shared policies you want to automatically update in the Apply Update To selector. Use the Type field to toggle between local policies (for devices) and shared policies.
- To select a device or policy, click it in the selector and click the **Edit Row** button (the pencil icon below the selector). This action opens the Edit Auto Update Settings dialog box. Select the types of updates you want to apply: minor sensor updates and service packs or service packs only, and the signature update level. Click **OK** to save your changes. The devices to which the policy apply are added to the Devices to be Auto Updated list. A message will indicate if you need to submit your changes for the change to take effect.
- Step 6** Click **Save**.
- 

## Manually Applying IPS Updates

You can manually apply image and signature updates to compatible IPS devices using the Apply IPS Update wizard. Use this procedure with policies and devices that you did not configure for automatic updates (as described in [Automating IPS Updates , on page 1782](#)).

When applying signature updates, the wizard displays those signatures in the update that are not configured on the target IPS devices. You can configure the new signatures before they are applied.

When applying image and signature updates, only those devices to which the updates can be applied are available for selection. Inapplicable devices are grayed out. If you hover the mouse pointer over a grayed out device, a tooltip displays the reason for graying out the device. A device can be grayed out even if a signature update applies to it but if the required engine upgrade or generic packages are not available. Following are some of the instances when devices might be grayed out and the corresponding tooltip labels:

- If the version of the selected signature or sensor package is lower than the version of the target IPS device, Security Manager grays out the device and a mouse-over tooltip displays the message "Selected package is inapplicable".
- If you try to use Security Manager to upgrade an IPS device from version 7.2.2, with SNMP policy configured, to version 7.3.1, a mouse-over tooltip displays the message "Selected upgrade is not recommended. Unassign the SNMP policy on the device and deploy it to continue with the upgrade to 7.3.1". This is because SNMPv3 is not supported in IPS version 7.3.1.
- If you try to use Security Manager to perform a signature update that does not contain one or more threat profiles applied to the device, Security Manager grays out the device and a mouse-over tooltip displays the message "Currently applied threat profile is not applicable to this signature version". It does not allow the signature update to be successfully applied. You must remove the existing threat profile and then proceed with the signature update.

---

**Tip** If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

---

### Before You Begin

Configure the IPS Update server as described in [Configuring the IPS Update Server](#) , on page 1780.

### Related Topics

- [Checking for IPS Updates and Downloading Them](#) , on page 1781
- [Selecting a Signature Category for Cisco IOS IPS](#) , on page 1794

---

**Note** This note describes a difference between the update packages for IPS 7.1.3 and those used for earlier versions. When you open the Apply IPS Update wizard (Tools > Apply IPS Update), the first page of the wizard lists the sensor and signature update packages that are available. Beginning with IPS 7.1.3, a single update package is used for all supported platforms, such as IPS-4270 and ASA-SSE-AIP-85; example: IPS-CSM-K9-7.1.3.zip. Prior to IPS 7.1.3, a separate package was used for each supported platform; example: IPS-CS-MGR-SSC\_5-K9-6.2-4-E4.zip.

---

**Step 1** Select **Tools > Apply IPS Update** to open the Apply IPS Update wizard.

**Step 2** On the first page of the wizard, select the update that you want to apply. This page lists the sensor and signature updates that are available. Do the following on this page:

- To update the list of packages, click **Download Latest Updates**. Security Manager logs into the IPS Update server and downloads the updates that have become available since the last download. This works only if you have configured an update server as described in [Configuring the IPS Update Server](#), on page 1780. You can also update the list of packages by doing the following:
  - Configure automatic downloads on the IPS Updates page (select **Tools > Security Manager Administration > IPS Updates**). For more information, see [IPS Updates Page](#), on page 557.
  - Manually download the updates to the CSCOpX\MDC\ips\updates folder in the product installation folder (typically Program Files) on the Security Manager server.

You can also check for updates without downloading them by clicking **Check for Updates**. The Update Status information is the same as described in [IPS Updates Page](#), on page 557.

- Select the signature or sensor update you want to apply to your IPS devices in the Updates Downloaded table. Use the **Type** field to toggle between the types of updates (you can select only one update to apply):
  - **Sensor Updates**—Displays the filename, the major, minor, service pack, and patch versions, as well as the supported engine release. You must apply all major sensor updates, however, minor updates are cumulative.
  - **Signature Updates**—Displays the filename, the signature number, and the supported engine release. Signature updates are cumulative; however, applying them as separate packages allows you to separate your work into more manageable units if you intend to tune the updates to match the specific needs of your network.

**Note** The engine package is not listed on the update page, but Security Manager implicitly pushes the engine package automatically in the case of a signature update that requires a higher engine version. (This occurs only when updating a device with the particular version that the engine package requires.)

Click **Next** to continue.

### Step 3

On the second page of the wizard, select the local signature policies (representing devices not assigned to any shared signature policy) and shared signature policies you want to update from the Apply Updates To list. Use the **Type** field to toggle between the types of policies. You can select any combination of local and shared policies. When you select a policy, the devices that use the policy are selected for update.

To select all applicable devices or shared policies, click **Select All**. To erase your selection and start over, click **Deselect All**. These buttons apply only to the displayed list.

IPS devices to which the update does not apply are grayed out in the Apply Updates To list, and you cannot select them. When you select a device that can be updated, it is listed in the Devices Assigned to Selected Policies list; these are the only devices that will be updated. If you select a shared policy, all devices that are using the policy appear in the selected policies list, but the devices to which the update does not apply are grayed out.

**Tip** The engine release controls which devices you can select for sensor updates; you can apply the update only to devices that use the same engine version, regardless of the release version. For example, if your device is running 6.0(5) E3, you can update to 6.1(1) E3 but not to 6.1(1) E2. You also cannot apply a 6.1(1) E3 update to a device running 6.1(1) E2. If you want to update the engine version, select a signature update with the higher engine version, and Security Manager will update the engine level automatically while updating the signatures. For example, if the device has the 6.1(1) E2 version and needs to have the E3 engine package applied, choose the signature package that requires the E3 engine and apply it to the device; doing so applies the engine package automatically to the device while updating the signatures. Thus, if the device you want to update is grayed out, click **Back** and change your update selection.

If you are applying a signature update, and you want to edit the signatures before applying them, click **Next** to continue. Otherwise, click **Finish** to apply your update to the policies.

**Step 4** (Optional) On the third page of the wizard, modify the signatures as desired.

The signatures list displays the new and modified signatures between the signature level of the selected update and the lowest signature level among the selected devices. If the selected devices include both IPS sensors and Cisco IOS IPS devices, the signatures for these devices appear on separate tabs.

Click the link in the ID number to read the description for the signature on Cisco.com. The Status column indicates whether the signature is new or modified (see the visual description of the icons on the wizard page).

To edit a signature, select it in the table and click the Edit button below the table (the pencil icon). For help in understanding the signature, click **Help** in the dialog box that the Edit button opens.

For details on available signature information, see [Signatures Page](#), on page 1680. In the Signature Summary Table, you can also add custom signatures and delete signatures, but you cannot do that on this page of the Apply IPS Update Wizard.

Click **Finish** to apply your update to the policies and to save your edits.

**Step 5** Submit your changes and deploy them to the devices. For information on creating deployment jobs, see these topics:

- [Deploying Configurations in Non-Workflow Mode](#), on page 406
- [Deploying Configurations in Workflow Mode](#), on page 412

---

## Managing IPS Certificates

When you configure Security Manager to use SSL (HTTPS) to communicate with your IPS devices, the certificate configured on the device must match the certificate stored in Security Manager's certificate store. Mismatched certificates will result in communication failures during policy discovery or deployment.

IPS devices use self-signed certificates that have a fixed validity period of about 2 years. When the certificate expires, you need to regenerate the certificate and update the certificate store with the new certificate.

Security Manager includes a utility that you can use to synchronize the certificate store with the certificate defined on the device, to regenerate expired certificates, and to view the status of certificates (including expiration dates) on the IPS devices that you manage.

---

**Tip** If you are using HTTP for communication with the IPS devices, certificates are not used and you cannot manage them. IPS device communication settings are configured in the Security Manager Administration Device Communication page (see [Device Communication Page](#), on page 530).

---

The following procedure explains how to manage your IPS certificates with Security Manager.

### Related Topics

- [Table Columns and Column Heading Features](#), on page 51
- [Filtering Tables](#), on page 50
- [Manually Adding SSL Certificates for Devices that Use HTTPS Communications](#), on page 459
- [Security Certificate Rejected When Discovering Device](#), on page 460
- [Invalid Certificate Error During Device Discovery](#), on page 461

**Step 1**

Select **Manage > IPS > IPS Certificates** to open the IPS Certificates dialog box.

**Tip** The list shown in this dialog box is not automatically refreshed. Click **Refresh** whenever you open the dialog box to ensure that you are looking at the most current certificate expiration information.

The dialog box lists all IPS sensors that are in the inventory according to their Security Manager display name. Not all columns are displayed (right-click any cell heading to select additional columns). The main columns of interest are the following:

- **Certificate Mismatch?**—Whether the certificate defined on the device is the same as that in Security Manager. This field is blank if the certificate is unavailable or non-retrievable; otherwise, it can have these values:
  - **No**—The device and Security Manager have the same certificate. No action is required.
  - **Yes**—The device and Security Manager have different certificates. If the certificate has not expired, select the device and click **Sync Certificates** to replace the certificate in the Security Manager certificate store with the certificate from the device.
- **Valid Until on Device, Valid From on Device**—These two separate columns show the date range within which the certificate is valid. The certificate expires after the Valid Until date is reached. Consider regenerating the certificate as this date approaches.
- **Certificate Status on Device**—Shows the current status of the certificate as it exists on the device:
  - **Valid Certificate**—The certificate is good and within the validity date range.
  - **Expired Certificate**—The certificate has passed its Valid Until date and is now expired. Select the device and click **Regenerate Certificate** to create a new valid certificate on the device and to have the certificate loaded into the Security Manager certificate store.
  - **Certificate Not Yet Valid**—The certificate has not yet reached its Valid From date and cannot be used yet. This might indicate a mismatch between the time settings on the device and on the Security Manager server. Ensure that the time settings are the same (consider using an NTP server). Consider regenerating the certificate.
  - **Unavailable – Refresh to get Cert Info**—The certificate is not currently in the Security Manager certificate store. Click **Refresh** to have Security Manager retrieve the certificate from the device and load it into the certificate store.
  - **Nonretrievable – Cert Info not available**—Security Manager was not able to log into the device and retrieve the certificate, or you are using HTTP for communications. Select the device and click **Refresh**.

If refresh does not resolve the problem, ensure that the device is operating normally (that it is not down), and then check the device properties to ensure that correct credentials are configured for access (see [Viewing or Changing Device Properties](#), on page 107). If credentials are not the problem, also check the Allowed Hosts policy configured on the device and ensure that the Security Manager server is included as an allowed host (see [Identifying Allowed Hosts](#), on page 1620). You can also log into Windows on the Security Manager server and use ping to see if there is a route between the server and the IPS device.

- **Thumbprint on CSM, Thumbprint on Device**—These separate columns show the thumbprint for the certificate in the certificate store and on the device.

**Step 2**

Use any of the following buttons to perform the indicated actions. Except where indicated, if you do not select one or more devices before clicking the button, the action is performed on all listed devices, which can be time-consuming if

there are a lot of IPS devices. You are warned before an operation is performed on all devices and given the option to stop it.

- **Sync Certificate**—Synchronize the certificate information in the Security Manager certificate store with the certificate on the device. The device certificate replaces the one in the certificate store.
- **Regenerate Certificate**—Generate a new certificate on the device and then load the new certificate into the certificate store.
- **Refresh**—Refresh the status information by having Security Manager contact the devices and retrieve certificate information, such as validity dates, and compare the certificate with the one in the certificate store. This action updates the Certificate Status on Device column and also determines whether there is a certificate mismatch.
- **Export**—Exports the entire certificates table to a comma-separated values (CSV) file. You cannot export less than the entire table. You are prompted for a file name and folder on the Security Manager server.

---

## Rebooting IPS Sensors

You can reboot an IPS sensor from Security Manager.

To reboot the sensor, select it in Device view, right-click and select **Reboot Device**. You are asked to confirm that you want to reboot.

Security Manager does not provide status information on the reboot process.

## CHAPTER 45

# Configuring IOS IPS Routers

Some Cisco IOS routers, such as integrated services routers (ISRs), include native IPS capabilities based on IPS 5.1 software. You can configure some basic IPS inspection on these devices to supplement IPS sensor inspection or to support small networks.

This chapter contains the following topics:

- [Understanding Cisco IOS IPS](#) , on page 1789
- [Overview of Cisco IOS IPS Configuration](#) , on page 1792

## Understanding Cisco IOS IPS

You can use Cisco Security Manager with the Cisco IOS Intrusion Prevention System (IOS IPS) to manage intrusion prevention on Cisco routers that use supported Cisco IOS Software releases 12.4(11)T2 and later.

The Cisco IOS IPS acts as an in-line intrusion prevention sensor, watching packets and sessions as they flow through the router and scanning each packet to match any of the Cisco IOS IPS signatures. When it detects suspicious activity, it responds before network security can be compromised and logs the event through Cisco IOS syslog messages or Security Device Event Exchange (SDEE).

You can configure Cisco IOS IPS to choose the appropriate response to various threats. The Signature Event Action Processor (SEAP) can dynamically control actions that are to be taken by a signature event on the basis of parameters such as fidelity, severity, or target value rating. You can configure these actions in Security Manager through the Signatures and Event Actions policies.

When packets in a session match a signature, Cisco IOS IPS can take any of the following actions, as appropriate:

- Send an alarm to a syslog server or a centralized management interface.
- Drop the packet.
- Reset the connection.
- Deny traffic from the source IP address of the attacker for a specified amount of time.
- Deny traffic on the connection for which the signature was seen for a specified amount of time.

Cisco developed its Cisco IOS software-based intrusion-prevention capabilities and Cisco IOS Firewall with flexibility in mind, so that individual signatures could be disabled in case of false positives. Generally, it is preferable to enable both the firewall and Cisco IOS IPS to support network security policies. However, each of these features can be enabled independently and on different router interfaces.

For an overall understanding of the Cisco IOS IPS configuration process, see [. Overview of Cisco IOS IPS Configuration , on page 1792](#)

This section contains the following topics:

- [Understanding IPS Subsystems and Support of IOS IPS Revisions , on page 1790](#)
- [Cisco IOS IPS Signature Scanning with Lightweight Signatures , on page 1790](#)
- [Router Configuration Files and Signature Event Action Processor \(SEAP\) , on page 1791](#)
- [Cisco IOS IPS Limitations and Restrictions , on page 1791](#)

## Understanding IPS Subsystems and Support of IOS IPS Revisions

Cisco Security Manager automatically supports minor revisions of IOS IPS. To identify minor revisions that are supported, the IPS subsystem version is needed.

The IPS subsystem version is a version number used to keep track of Cisco IOS IPS feature changes. The subsystem number is show in the device properties (right-click the device and select **Device Properties**). You can also use the command **show subsys name ips** at a command line on the router that is running Cisco IOS IPS to show the detailed Cisco IOS IPS subsystem version. The 3.x subsystems are equivalent to IPS 5.x. For a list of the supported subsystems by Cisco IOS Software release, see the *Supported Devices and Software Versions for Cisco Security Manager* on Cisco.com for this release of Security Manager.

An IPS subsystem version is minor if the version difference is limited at postfix. For example, a revision from 3.0.1 to 3.0.2 is considered minor. For another example, 3.0.1 to 3.1.1 is also considered a minor version change. However, minor revisions that include new features are not automatically supported by Cisco Security Manager.

## Cisco IOS IPS Signature Scanning with Lightweight Signatures

The addition of Cisco IOS IPS signature scanning with lightweight signatures in Cisco IOS Release 15.0(1)M is an enhancement to Cisco IOS IPS that allows loading of larger signatures sets, without consuming significant additional memory or reducing the memory consumed by an existing signature set, by loading equivalent lighter-weight signatures. These signatures are referred to as lightweight signatures.

Security Manager can discover and tune custom signatures with LWEs on ISRs and modular access routers. Security Manager supports the following features for signatures with LWEs on ISRs and modular access routers:

- New signature types
- Signature categories
- New default signature category recognition
- New engine update levels
- Licensing status—bypassed, expired, or not installed

## Router Configuration Files and Signature Event Action Processor (SEAP)

As of Cisco IOS Release 12.4(11)T, signature definition files (SDFs) are no longer used by Cisco IOS IPS. Thus, you cannot use the deprecated built-in signature sets, 128.sdf, 256.sdf, and attack-drop.sdf, with Security Manager.

Instead, routers access signature definition information through a directory that contains three configuration files—the default configuration, the delta configuration, and the SEAP configuration. You configure the location using the **IPS > General Settings** policy.

SEAP is the control unit responsible for coordinating the data flow of a signature event. It allows for advanced filtering and signature overrides on the basis of the Event Risk Rating (ERR) feedback. ERR is used to control the level in which a user chooses to take actions in an effort to minimize false positives.

Signatures once stored in NVRAM are now stored in the delta configuration file.

## Cisco IOS IPS Limitations and Restrictions

Cisco IOS IPS routers do not support all the features that are supported by dedicated IPS sensor appliances and service modules. In addition, routers that support IOS IPS might not allocate as much memory to IPS functionality as an IPS sensor does. The following limitations and restrictions are important:

- When configuring an IOS IPS device, select only the signatures that you need. If you select all signatures that are available in Security Manager, you might exceed the memory available on the IOS IPS router and deployment can fail, the device might fail to load all of the signatures, or performance might be significantly degraded. If you encounter deployment failures, select a reduced set of signatures and then redeploy the configuration to the device.
- Security Manager-managed routers being configured to use IOS-IPS for the first time cannot use the auto-update process for signature updates. You must first update the router before you use the auto-update process. Follow these steps:
  1. Push an E3 signature, for example, S317.
  2. Push an intermediate signature, for example, S470.
  3. Push the first E4 signature, for example, S485.
  4. Push subsequent E4 signatures until you reach the desired level. Note that each delta should be less than 10 MB in size.

After you have updated the router, you can use the auto-update process to update the signatures. The auto-update process will be successful as each incremental change will not exceed the memory available on the router. For information on configuring automatic updates, see [Automating IPS Updates](#), on page 1782.

- Virtual sensors are not supported by IOS IPS.
- When using event action filters with an IOS IPS router, only a subset of IPS actions are available for removal from an event that meets the criteria of the event action filter. For more information on available event actions, see [Filter Item Dialog Box](#), on page 1719 and [Understanding IPS Event Actions](#), on page 1712.
- IOS IPS is based on IPS Software 5.1. Therefore, features introduced in later versions of IPS Software are typically not available in IOS IPS. For example, you cannot configure the following features:
  - Global correlation.

- Anomaly detection.
- OS identification in the event action network identification policy.

## Overview of Cisco IOS IPS Configuration

There are a wide variety of devices on which you can configure the Intrusion Prevention System. From a configuration point-of-view, you can separate the devices into two groups: dedicated appliances and service modules (for routers, switches, and ASA devices) that run the full IPS software; and IPS-enabled routers running Cisco IOS Software 12.4(11)T and later (Cisco IOS IPS).

The following procedure is an overview of IPS configuration on a Cisco IOS IPS router. For dedicated IPS devices, including IPS service modules installed in a router, see [Overview of IPS Configuration](#) , on page 1617.

Cisco IOS IPS is a more limited feature meant for branch offices and small to medium sized networks, or to distribute IPS throughout a network. You typically cannot employ as many signatures in a Cisco IOS IPS router compared to a dedicated appliance. You also cannot configure advanced features such as global correlation, because Cisco IOS IPS is based on IPS Software version 5.1. When configuring Cisco IOS IPS devices, you are mostly configuring standard router policies, because the device is a router that is running a few IPS features. In comparison, the platform policies for IPS appliances and service modules are specific to IPS software.

---

**Tip** Before configuring Cisco IOS IPS, read *Cisco IOS Intrusion Prevention System Deployment Guide* on Cisco.com.

---

- 
- Step 1** Install and connect the device to your network. Install the device software and perform basic device configuration. Install the licenses required for all of the services running on the device. The amount of initial configuration that you perform influences what you will need to configure in Security Manager. For information about required basic settings, see:
- [Setting Up SSL on Cisco IOS Routers](#) , on page 58
  - [Setting Up SSH](#) , on page 60
  - [Configuring Licenses on Cisco IOS Devices](#) , on page 66
  - [Initial Preparation of a Cisco IOS IPS Router](#), on page 1793
  - [Selecting a Signature Category for Cisco IOS IPS](#) , on page 1794
- Step 2** Add the device to the Security Manager device inventory (see [Adding Devices to the Device Inventory](#) , on page 75). When you add the device be sure to make the following selections:
- When adding from Network or Export File, ensure that you select **IPS Policies** for policy discovery.
  - When adding from Configuration File or by Manual Definition, ensure that you select **IPS** from the **Options** list, or the device will not be IPS-capable from Security Manager's point of view.
- Step 3** Configure the IPS general settings to specify the location of the IPS files on the router. For more information, see [Configuring General Settings for Cisco IOS IPS](#) , on page 1795.

- Step 4** Configure the IPS interface rules to enable IPS and to identify the interfaces on which traffic will be subject to IPS inspection. For more information, see [Configuring IOS IPS Interface Rules , on page 1797](#).
- Step 5** Configure IPS signatures and event actions. Event action policies are easier to configure than creating custom signatures, so try to use event action filters and overrides to modify signature behavior before trying to edit specific signatures. For more information, see the following topics:
- [Configuring Event Action Rules, on page 1711](#)
  - [Configuring Signatures , on page 1680](#)
- Step 6** Maintain the device:
- Update and redeploy configurations as necessary.
  - Apply updated signature and engine packages. For information about checking for updates, applying them, and setting up regular automated updates, see [Managing IPS Updates , on page 1780](#).

---

## Initial Preparation of a Cisco IOS IPS Router

Before you add a Cisco IOS IPS router to the Security Manager inventory, you need to perform some preparatory steps. The white paper *Getting Started with Cisco IOS IPS with 5.x Format Signatures* provides a step-by-step explanation of a basic configuration. Although you could do some of the steps after adding the router to Security Manager, such as configuring interface rules, you should do at least the basic steps.

The following procedure explains the steps you are required to complete in the CLI. These steps are required because Security Manager either cannot complete them, or it is simply easier to do it in the CLI (as a one-time configuration). The white paper includes additional steps that you can complete in the CLI, and Security Manager can discover your configuration when you add the device to the inventory. The more you do in CLI, the less you will have to configure in Security Manager.

---

**Tip** You also must complete the basic router configuration steps as explained in [Setting Up SSL on Cisco IOS Routers , on page 58](#), [Setting Up SSH , on page 60](#), and [Configuring Licenses on Cisco IOS Devices , on page 66](#). The following steps apply to the IPS configuration only.

---

- Step 1** Create a directory for IPS files on flash. For example, the following command creates a directory named ips:

**Example:**

```
router# mkdir ips
Create directory filename [ips]?
Created dir flash:ips
```

At this point, you can optionally configure the router to use this directory for IPS, or you can do it later in Security Manager (in the IPS > General Settings policy). Use the following commands to configure it in CLI:

**Example:**

```
router# configure terminal
router(config)# ip ips config location flash:ips
```

**Step 2** Configure the Cisco IOS IPS crypto key. The crypto key is used to verify the digital signature for the main signature file (sigdef-default.xml) whose contents are signed by a Cisco private key to guarantee its authenticity and integrity at every release.

You can obtain the CLI required for the key from

<http://download-sj.cisco.com/cisco/ciscosecure/ids/sigup/5.0/ios/realms-cisco.pub.key.txt> (login to Cisco.com is required).

**Tip** Configuring the key through the CLI is probably the easiest way to do it. Alternatively, you can configure it in Security Manager by assigning the IOS\_IPS\_PUBLIC\_KEY pre-defined FlexConfig object to the router's FlexConfig policy. For more information about FlexConfigs, see [Managing Flexconfigs, on page 339](#).

- a) Open the text file and copy its contents to the clipboard (select all text then press Ctrl+C).
- b) If necessary, enter **configure terminal** at the router CLI prompt.
- c) Paste the copied text file at the router prompt.
- d) Exit configuration mode.
- e) Enter the **show run** command to confirm that the key was correctly configured.

**Step 3** Syslog is configured for IPS notifications by default. If you want to use SDEE for notifications, enable SDEE:

**Example:**

```
router# configure terminal
router(config)# ip ips notify sdee
```

**Step 4** Select a signature category to compile. For detailed information, see [Selecting a Signature Category for Cisco IOS IPS](#), on page 1794.

## Selecting a Signature Category for Cisco IOS IPS

Cisco IPS appliances and Cisco IOS IPS with IPS 5.x format signatures operate with signature categories. All signatures are grouped into categories; the categories are hierarchical. An individual signature can belong to more than one category. Top-level categories help to define general types of signatures. Subcategories exist beneath each top-level signature category. (For a list of supported top-level categories, use your router CLI help (?) with the **category** command.)

Router memory and resource constraints prevent a router from loading all Cisco IOS IPS signatures. Thus, it is recommended that you load only a selected set of signatures that are defined by the categories. Because the categories are applied in a “top-down” order, you should first retire all signatures, followed by “unretiring” specific categories. Retiring signatures enables the router to load information for all signatures, but the router does not build the parallel scanning data structure.

Retired signatures are not scanned by Cisco IOS IPS, so they do not fire alarms. If a signature is irrelevant to your network or if you want to save router memory, you should retire signatures, as appropriate.

Security Manager does not manage the signature category command. You cannot configure it directly with a policy. However, you can configure the FlexConfig policy to include a FlexConfig object that configures the command. There is a pre-defined object, IOS\_IPS\_SIGNATURE\_CATEGORY, that you can use. If you want to configure a different category than basic, make a copy of the object and edit it. For information on how to use FlexConfigs, see [Managing Flexconfigs, on page 339](#).

**Tip** If you do not use the **category** command to select a subset of IPS signatures that the device will attempt to compile, Security Manager will configure the category command to enable the IOS IPS Basic category to prevent the device resources from being overloaded. You can change the category manually on the device to select another set of signatures to compile. We recommend that you configure the category before adding the device to Security Manager; however, this is not possible if you add the device through manual definition.

The following example shows how to first retire all signatures, then to configure the basic category and unretire the basic signatures:

```
Router> enable
Router# configure terminal
Router(config)# ip ips signature-category
Router(config-ips-category)# category all
Router(config-ips-category-action)# retired true
Router(config-ips-category-action)# exit
Router(config-ips-category)# category ios_ips basic
Router(config-ips-category-action)# retired false
Router(config-ips-category-action)# exit
```

## Configuring General Settings for Cisco IOS IPS

Use the General Settings page to specify the global settings used for Cisco IOS IPS properties defined for a particular router. The default settings are appropriate for most situations; however, you must specify an IPS configuration file location. If storing the configuration file on the router, you must first create the directory as described in [Initial Preparation of a Cisco IOS IPS Router, on page 1793](#).

### Navigation Path

- (Device view) Select **IPS > General Settings** from the Policy selector.
- (Policy view) Select **IPS (Router) > General Settings**, then select an existing policy or create a new one.

| IPS Config Location Properties |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IPS Config Location            | <p>The location where the router will save IOS IPS specific configuration files. These configuration files are automatically updated every time the IOS IPS configuration is changed or updated from Security Manager. When the router reboots, the IOS IPS configuration is retrieved and restored from these configuration files.</p> <p>To specify a location on the router, enter the name of the directory. The directory must already exist; Security Manager does not create it. For example, flash:ips.</p> <p><b>Note</b> If the router has a LEFS-based file system, you will be unable to create a directory in router memory. In this case, flash: is used as the config location.</p> <p>To specify a location on a remote system, specify the protocol and path of the URL needed to reach the location. For example, if you want to save the config files to an HTTP server, then enter http://172.27.108.5/ips-cfg.</p> <p>Supported servers for saving the IOS IPS configuration files are: http://, https://, ftp://, rcp://, scp://, and tftp://.</p> |
| Max retries                    | <p>When storing configuration files on a remote system, how many times the router is to attempt to contact the remote system.</p> <p>The default is 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Configuring IOS IPS Interface Rules

**Note** From version 4.17, though Cisco Security Manager continues to support IOS and IPS features/functionality, it does not support any bug fixes or enhancements.

Use the IPS Interface Rules policy to enable IPS inspection on Cisco IOS IPS routers and to specify the interfaces that will be subject to IPS inspection. You can identify a subset of the traffic on the interface that is subject to inspection by configuring an ACL and by specifying the traffic direction relative to the interface.

### Related Topics

- [Overview of Cisco IOS IPS Configuration](#) , on page 1792
- [Understanding Cisco IOS IPS](#) , on page 1789

**Step 1** Do one of the following to open the Interface Rules policy you want to modify:

- (Device view) Select **IPS > Interface Rules** from the Policy selector.
- (Policy view) Select **IPS (Router) > Interface Rules** from the Policy selector. Select an existing policy or create a new one.

The policy shows any existing interface rules, including the rule name, the name of the ACL that defines which traffic is inspected (if any), and the interface and traffic direction that is inspected. If no ACL is specified, all traffic on the interface in the specified direction is inspected.

Although the rules are numbered, the sequence of rules has no effect on IPS processing.

**Step 2** Select **Enable IPS** to enable the deployment of IOS IPS configuration to the device.

If Enable IPS is unchecked, IPS rules are removed from all the router interfaces, which disables IPS. Also, no signature or event action policy will be deployed.

**Step 3** Configure the interface rules. The rules identify the interfaces, and traffic direction on the interface, that will be inspected by IPS. The rules can optionally include an ACL to identify a subset of traffic for inspection.

- To add a rule, click the **Add Row (+)** button and fill in the Add IPS Rule dialog box. For detailed information, see [IPS Rule Dialog Box](#) , on page 1798.
- To edit a rule, select it and click the **Edit Row (pencil)** button.
- To delete a rule, select it and click the **Delete Row (trash can)** button.

## IPS Rule Dialog Box

**Note** From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any bug fixes or enhancements.

Use the Add or Edit IPS Rule dialog box to identify the traffic flows to be inspected using the active signature policy.

### Navigation Path

From the Interface Rules policy, click the **Add Row** button to add a new rule, or select a rule and click the **Edit Row** button. For information on opening the Interface Rules policy, see [Configuring IOS IPS Interface Rules](#), on page 1797.

| Rule Name             | The unique name for this IPS rule.<br><br>IPS rule names are not case sensitive. You cannot use a rule name that contains the same characters as another one previously defined but using a different case. For example MYRULE and MyRule are the same.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| ACL Name              | The name of the ACL policy object that defines which traffic should be subject to IPS inspection. If you do not specify an ACL, all traffic on the interface/direction pairs listed in the Interface Pairs table is subject to inspection.<br><br><b>Tip</b> If you create an ACL, permit entries identify traffic that is subject to inspection, whereas deny entries identify traffic that is exempt from inspection. Remember that there is an implicit deny any any rule at the end of the ACL, so if your intention is simply to identify exempt traffic, be sure to add a permit any any rule at the end of the ACL.<br><br>Enter the name of the ACL policy object, or click <b>Select</b> to select it from a list or to create a new object. |
| Interface Pairs table | The interfaces and traffic direction pairs that are subject to IPS inspection. <ul style="list-style-type: none"> <li>• To add a pair, click the <b>Add Row (+)</b> button and fill in the Adding Pair dialog box. See <a href="#">Pair Dialog Box</a>, on page 1799.</li> <li>• To edit a pair, select it and click the <b>Edit Row (pencil)</b> button.</li> <li>• To delete a pair, select it and click the <b>Delete Row (trash can)</b> button.</li> </ul>                                                                                                                                                                                                                                                                                       |

## Pair Dialog Box

Use the Adding or Editing Pair dialog box to identify the interface and traffic direction pair to add to a Cisco IOS IPS interface rule. For information on configuring interface rules, see [Configuring IOS IPS Interface Rules](#), on page 1797.

### Navigation Path

From the Add or Edit IPS Rule dialog box, click the **Add Row** button to add a new pair, or select a pair and click the **Edit Row** button. For information on opening the Add or Edit IPS Rule dialog box, see [IPS Rule Dialog Box](#), on page 1798.

### Field Reference

*Table 550: Adding or Editing Pair Dialog Box*

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Direction  | <p>The traffic direction, with respect to the interface, on which IPS inspection should be performed. Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>In</b> (default)—The IPS rule should be applied to inbound traffic.</li> <li>• <b>Out</b>—The IPS rule should be applied to outbound traffic.</li> <li>• <b>Both</b>—The IPS rule should be applied to both inbound and outbound traffic.</li> </ul>                                                               |
| Interfaces | <p>The interface on which to apply this IPS rule. Enter the name of an interface or interface role object, or click <b>Select</b> to select the interface or interface role from a list or to create a new interface role.</p> <p>If you use interface roles, the rule is applied to all interfaces on the device that are defined by the role. The interfaces that match the role cannot conflict with an existing rule. You cannot specify the same interface for more than one interface rule.</p> |

## CHAPTER 46

# Managing Firewall Devices

---

**Note** From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM, IOS devices, and IPS, it does not support any bug fixes or enhancements.

---

The following topics describe configuration and management of security services and policies on Cisco security devices: Adaptive Security Appliances (ASAs), PIX Firewalls, and the Catalyst 6500 series switch Services Modules—that is, Firewall Services Modules (FWSMs) and ASA-SMs.

This chapter contains the following topics:

- [Firewall Device Types](#) , on page 1803
- [Default Firewall Configurations](#) , on page 1806
- [Configuring Firewall Device Interfaces](#) , on page 1807
- [VXLAN](#) , on page 1891

## Firewall Device Types

Security Manager can discover and manage a variety of Cisco security appliances or firewall devices, most notably the following:

- PIX 500 Series firewall devices
- ASA 5500 Series security appliances including the Cisco Virtual Security Appliance (ASA-V)
- Secure Firewall 3100 series firewall devices
- Secure Firewall 4200 series devices
- Security-specific Catalyst Services Modules

### PIX 500 Series

The Private Internet eXchange (PIX) 500 Series firewall appliances are no longer sold, however they are still supported and a great many are still in use world-wide.

### ASA 5500 Series

The Adaptive Security Appliance (ASA) 5500 Series devices provide comprehensive security services, including context-aware firewall capabilities and real-time threat defense. The ASA 5500 has replaced the PIX 500 as Cisco's primary security appliance. Visit the [Cisco ASA 5500 Series Adaptive Security Appliance](#) page on cisco.com for more information.

The Cisco ASAv Virtual Appliance, introduced in ASA 9.2(1), brings full firewall functionality to virtualized environments to secure data center traffic and multi-tenant environments. The ASAv runs on VMware vSphere. Although the ASAv is a virtual device, it is managed like other ASA devices in Security Manager. For more information about the ASAv, see <http://www.cisco.com/c/en/us/support/security/virtual-adaptive-security-appliance-firewall/tsd-products-support-series-home.html>

---

**Note** The ASAv does not support the following ASA features: Clustering, Multiple context mode, Active/Active failover, Ether channels, and Shared Secure Client Premium Licenses.

---

### Secure Firewall 3100 Series

Firepower 3100 series firewall devices support is introduced for ASA 9.17(1) devices in CSM 4.24.

**Note** Secure Firewall 3105 device support is introduced for ASA 9.19(1) and above devices in CSM.

**New Device - Device Information (Step 2 of 4)**

### Secure Firewall 4200 Series

Secure Firewall 4200 series devices support is introduced for ASA 9.20(1) devices in CSM 4.27.

The following models are supported:

- FPR-4215
- FPR-4225
- FPR-4245

### Catalyst Services Modules

A variety of Services Modules (SMs) are available for the Catalyst 6500 switch, including two that provide firewall and security services. These are blade-type modules that are installed directly into the switch chassis.

The Firewall Services module (FWSM) allows any port on the switch to operate as a firewall port, integrating firewall security inside the network structure.

The Adaptive Security Appliance service module (ASA-SM) provides high-speed security services across Layers 2 through 7, and you can install up to four ASA-SM blades in a single switch, providing scalability to 64 Gbps.

**Note** While the ASA-SM is a blade installed in a Catalyst 6500 switch—much like the FWSM physically—it is an ASA device, and it is documented as such. That is, refer to ASA-related topics for information about the ASA-SM. Where necessary, caveats and differences between the Service Module and the ASA appliance are noted.

## Default Firewall Configurations

Firewall devices are shipped with certain settings already configured. When you manually add a newly installed firewall device to Cisco Security Manager, you should discover (import) the pre-set or default policies for that device. Importing these policies into Security Manager prevents them being unintentionally removed the

first time you deploy a configuration to that device. For more information about importing policies, see [Discovering Policies](#) , on page 176.

Cisco Security Manager provides a set of configuration files that contain default policies for a number of device types and versions. These configuration files are located in the directory: `<install_dir>\CSCOpX\MDC\fwtools\pixplatform\` (for example, `C:\Program Files\CSCOpX\MDC\fwtools\pixplatform\`).

The file name indicates device type, operating system version, context support, and operation type. For example, “FactoryDefault\_FWSM2\_2\_MR.cfg” is the configuration file for an FWSM, version 2.2, with support for Multiple contexts, operating in Routed mode. Similarly, “FactoryDefault\_ASA7\_0\_1\_ST.cfg” is the configuration file for an ASA, version 7.0.1, in Single-context, Transparent mode.

Refer to [Interfaces in Single and Multiple Contexts](#) , on page 1809 for more about security contexts, and [Interfaces in Routed and Transparent Modes](#) , on page 1809 for more about routed and transparent operation.

See [Adding Devices from Configuration Files](#) , on page 89 for information about adding new devices from the supplied configuration files.

## Configuring Firewall Device Interfaces

The Interfaces page displays configured physical interfaces, logical interfaces, and redundant interfaces, as well as hardware ports and bridge groups, for the selected device. From this page, you can add, edit and delete interfaces; enable communication between interfaces on the same security level; and manage VPDN groups and PPPoE users.

---

**Note** The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: Hardware Ports and Interfaces. Similarly, the Interfaces page displayed for the Catalyst 6500 services modules (ASA-SMs and FWSMs) operating in transparent mode also presents two tabbed panels: Interfaces and Bridge Groups.

---

### Navigation Path

To access the Interfaces page, select a security device in Device View and then select **Interfaces** from the Device Policy selector.

This section contains the following topics:

- [Understanding Device Interfaces](#) , on page 1807
- [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#) , on page 1837
- [Advanced Interface Settings \(PIX/ASA/FWSM\)](#) , on page 1886

## Understanding Device Interfaces

An interface is a point of connection between a security device and some other network device. Interfaces are initially disabled; thus, as an essential part of firewall configuration, interfaces must be enabled and configured to allow appropriate packet inspection and forwarding.

There are two types of interface: physical and logical, where a physical interface is the actual slot on the device into which a network cable is plugged, and a logical interface is a virtual port assigned to a specific physical

port. Generally, physical ports are referred to as interfaces, while logical ports are referred to as subinterfaces, virtual interfaces, VLANs, or EtherChannels, depending on their function. The number and type of interfaces you can define varies with appliance model and type of license purchased.

---

**Note** On devices running version 6.3 of the PIX operating system, the labels “physical” and “logical” are used, rather than “interface” and “subinterface.” Also, transparent mode and multiple contexts are not supported on these devices.

---

Subinterfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN IDs. Because VLANs keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or security appliances. This feature is particularly useful in multiple-context mode, allowing you to assign unique interfaces to each context.

As a general rule, interfaces attach to router-based networks, and subinterfaces attach to switch-based networks. All subinterfaces must be associated with a physical interface that is responsible for routing allowed traffic correctly.

If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. The physical interface must be enabled for the subinterface to pass traffic, but do not name the physical interface to ensure it does not pass traffic. However, if you do want to let the physical interface pass untagged packets, you can name the interface as usual. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#) , on page 1837 for information about naming an interface.

---

**Note** The ASA 5505, combining switch and security appliance features, is a special case in that you configure both physical switch ports and logical VLAN interfaces. See [Understanding ASA 5505 Ports and Interfaces](#) , on page 1811 for more information.

---

The Catalyst 6500 services modules (ASA-SMs and FWSMs) do not include any external physical interfaces—instead, they use internal VLAN interfaces. For example, assume you assign VLAN 201 to an FWSM inside interface, and VLAN 200 to the outside interface. You assign these VLANs to physical switch ports, and hosts connect to those ports. When communication occurs between VLANs 201 and 200, the FWSM is the only available path between the VLANs, forcing traffic to be statefully inspected.

See the following sections for additional information about device interfaces:

- [Interfaces in Routed and Transparent Modes](#) , on page 1809
- [Interfaces in Single and Multiple Contexts](#) , on page 1809
- [Understanding ASA 5505 Ports and Interfaces](#) , on page 1811
- [Configuring Subinterfaces \(PIX/ASA\)](#) , on page 1811
- [Configuring Redundant Interfaces](#) , on page 1813
- [Configuring EtherChannels](#) , on page 1814
- [Configuring VNI Interfaces](#) , on page 1819
- [Configuring Tunnel Interface](#), on page 1827

## Security Appliance Configurations

Firewall devices allow a variety of configurations, and the configuration determines how to define the interfaces associated with a specific device. The following table outlines the various configurations.

**Table 551: Security Appliance Configurations**

| Device Type                                                   | Operational Mode (Router or Transparent) | Context Support (Single or Multiple)                                                               |
|---------------------------------------------------------------|------------------------------------------|----------------------------------------------------------------------------------------------------|
| PIX 6.3.x                                                     | N/A                                      | N/A                                                                                                |
| PIX 7.0+/ASA                                                  | Router or Transparent                    | Single                                                                                             |
| PIX 7.0+/ASA, or security context of unmanaged PIX 7.0+/ASA   | Router or Transparent                    | Multiple (see <a href="#">Checklist for Configuring Multiple Security Contexts</a> , on page 2308) |
| FWSM, or security context of unmanaged switch (multiple mode) | Router or Transparent                    | Single or Multiple                                                                                 |

## Interfaces in Routed and Transparent Modes

Beginning with ASA/PIX 7.0 and FWSM 2.2.1, you can configure a security device to operate in one of two modes: *routed* or *transparent* . (The PIX 6.3 operates only in routed mode.)

In routed mode, the security appliance acts as a gateway or router for connected networks: it maintains IP addresses for its interfaces, and inspects and filters traffic traversing these interfaces based on IP address (Layer 3) information. In this mode, each device interface is connected to a different IP subnet, and has its own IP address on that subnet. Routed mode supports up to 256 interfaces in single mode or per context, with a maximum of 1000 interfaces divided between all contexts.

In transparent mode, the security appliance operates as a Layer 2 (data link) device, or transparent bridge, and is often referred to as a “bump in the wire,” or a “stealth firewall.” In this mode, you can define only two interfaces: inside and outside. The interfaces do not require IP addresses; they use VLAN IDs to forward inspected traffic. However, if the device includes a dedicated management interface, you can use it—either the physical interface or a subinterface—as a third interface for device-management traffic.

**Note** Cisco Security Manager does not populate the interface information for FWSM 2.x devices during discovery.

### Bridge Groups

Beginning with the ASA 8.4.1 and FWSM 3.1, in transparent mode, you can increase the number of interfaces available to a device or context through use of bridge groups. You can configure up to eight bridge groups; on an FWSM each group can contain two interfaces; on an ASA 9.7.1 (Cisco Security Manager 4.13) each group can contain up to 64 interfaces. See [Add/Edit Bridge Group Dialog Box](#) , on page 1881 for more information.

## Interfaces in Single and Multiple Contexts

Security “contexts” allow a single physical device to operate as multiple, independent firewalls. In multiple-context mode, each context defines a single virtual firewall, complete with its own configuration.

Each context acts as a unique virtual firewall that inspects and filters traffic traversing the interfaces allocated to that context. Each context is “unaware” of other contexts defined on the same security appliance.

As with a single-context, routed-mode device, interfaces on a multiple-context device connect to router-based networks, subinterfaces connect to switch-based networks, and each subinterface must be associated with an interface that routes allowed traffic correctly.

However, you cannot define IP addresses, the routed-mode portion of the configuration, or identify the management interface until you have defined and deployed the contexts. But you cannot define a security context until you have defined the necessary interfaces and subinterfaces.

In other words, you must enable and configure the interfaces and subinterfaces on a device that will provide multiple security contexts (in either routed or transparent mode) before you can define and configure the security contexts themselves.

## About Asymmetric Routing Groups

In some situations, return traffic for a session may be routed through a different interface than the one from which it originated. Similarly, in failover configurations, return traffic for a connection that originated on one unit may return through the peer unit. This most commonly occurs when two interfaces on a single FWSM, or two FWSMs in a failover pair, are connected to different service providers and the outbound connection does not use a NAT address. By default, the FWSM drops the return traffic because there is no connection information for that traffic.

You can prevent return traffic being dropped by assigning the VLAN interfaces on which this is likely to occur to an asymmetric routing (ASR) group. When a member interface receives a packet for which it has no session information, it checks the session information for other interfaces that are members of the same group.

If a match is not found, the packet is dropped. If a match is found, one of the following actions occurs:

- If the incoming traffic originated on a different interface on the same FWSM, some or all of the Layer 2 header is rewritten and the packet is re-injected into the stream.
- If the incoming traffic originated on a peer unit in a failover configuration, some or all of the Layer 2 header is rewritten and the packet is redirected to the other unit. This redirection continues as long as the session is active.

---

**Note** In failover configurations, you must enable Stateful Failover for session information to be passed from the standby unit or failover group to the active unit or failover group.

---

To assign an FWSM virtual interface to an asymmetric routing group, simply specify an ASR Group ID in the [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), on page 1853. If the group does not exist, it is created and the interface assigned to it.

You must repeat the assignment for each interface that will participate in this ASR group. You can create up to 32 ASR groups and assign a maximum of eight interfaces to each group.

---

**Note** The upstream and downstream routers must use one MAC address per VLAN, and have different MAC addresses for different VLANs, to allow the redirection of packets from a standby unit to an active unit in failover configurations.

---

## Understanding ASA 5505 Ports and Interfaces

The ASA 5505 is unique in that it includes a built-in switch, and there are two kinds of ports and interfaces that you need to configure:

- Physical switch ports – The ASA 5505 has eight Fast Ethernet switch ports that forward traffic at Layer 2, using the switching function in hardware. Two of these ports are power-over-Ethernet (PoE) ports. You can connect these ports directly to user equipment such as PCs, IP phones, or DSL modems. Or you can connect to another switch.
- Logical VLAN interfaces – In routed mode, these interfaces forward traffic between VLAN networks at Layer 3, using the configured security policy to apply firewall and VPN services. In transparent mode, these interfaces forward traffic between the VLANs on the same network at Layer 2, using the configured security policy to apply firewall services.

To segregate the switch ports into separate VLANs, you assign each switch port to a VLAN interface. Switch ports on the same VLAN can communicate with each other using hardware switching. But when a switch port on one VLAN attempts to communicate with a switch port on another VLAN, the ASA 5505 applies the security policy to the traffic, and routes or bridges between the two VLANs.

---

**Note** Subinterfaces and redundant interfaces are not available on the ASA 5505.

---

### Navigation Path

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: *Hardware Ports* and *Interfaces*. To access these panels, select an ASA 5505 in Device View and then select **Interfaces** from the Device Policy selector.

### Configuring ASA 5505 Switch Ports and Interfaces

Refer to [Configuring Hardware Ports on an ASA 5505](#), on page 1879 for information about configuring the switch ports.

Refer to [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842 for information about configuring the interfaces.

### Related Topics

- [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837

## Configuring Subinterfaces (PIX/ASA)

---

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

---

Subinterfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN IDs. Because VLANs keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or security appliances.

This feature is particularly useful in multiple-context mode, letting you assign unique interfaces to each context.

---

**Note** If you use subinterfaces, you typically do not also want the physical interface to pass traffic, as the physical interface passes untagged packets. Because the physical interface must be enabled for the subinterface to pass traffic, do not name the physical interface to ensure it does not pass traffic. However, if you do want to let the physical interface pass untagged packets, you can name the interface as usual.

---

---

**Note** This option is available only on PIX 7.0+ and non-5505 ASA devices.

---

### Defining Subinterfaces

Follow these steps to configure a subinterface in the Add/Edit Interface (ASA/PIX 7.0+) dialog box, which is accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837).

1. Choose **Subinterface** as the interface **Type** in the Add/Edit Interface dialog box.

The VLAN ID and Subinterface ID fields appear below the Hardware Port, Name and Security Level fields.

1. Choose the desired **Hardware Port** from the list of previously defined interface ports. If you do not see a desired interface ID, be sure that Interface is defined and enabled.
2. **VLAN ID** – Provide a VLAN ID for this subinterface: enter a value between 1 and 4094. The specified VLAN ID must not be in use on any connected device.

Some VLAN IDs might be reserved on connected switches; see the switch documentation for more information. In multiple-context mode, you can only set the VLAN ID in the system configuration.

1. **Secondary VLAN ID** – Provide a secondary VLAN ID value for this subinterface; this enables the ASA to map the packets that arrive on the ASA on the secondary VLAN to a primary VLAN. configure: Enter a value between 1 and 4090. The secondary VLAN ID must be unique and not be the same as a VLAN ID. A secondary VLAN is supported on devices running ASA 9.5.2 or later in single context, in routed or firewall mode or as an L2 cluster.

---

**Note** You can add multiple VLAN IDs, separated by a space or a comma. You can also specify a range of VLAN IDs for e.g. 56-78.

---

1. **Subinterface ID** – Provide an integer between 1 and 4294967293 as the Subinterface ID. The number of subinterfaces allowed depends on your platform.

For subinterface port identification, this ID is appended to the chosen Hardware Port. For example, *GigabitEthernet0.4* represents the subinterface assigned an ID of 4, operating on the port GigabitEthernet0.

---

**Note** You cannot change the Subinterface ID after you set it.

---

1. Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842.

## Configuring Redundant Interfaces

Beginning with Security Manager 3.2.2, you can define logical “redundant” interfaces to increase security appliance reliability. A redundant interface is a specific pair of physical interfaces, with one designated as active (or primary) and the other as standby (or secondary). If the active interface fails, the standby interface becomes active and starts passing traffic. This feature is separate from device-level failover, but you can configure redundant interfaces as well as failover, if desired. You can configure up to eight redundant interface pairs.

A redundant interface functions as a single interface (inside, outside, etc.), with only one of the member pair active at any one time. This redundant interface is configured normally, with a unique interface name, security level and IP address. Note that each member interface must be of the same type (e.g., GigabitEthernet), and cannot have a name, security level, or IP address assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.

The redundant interface uses the MAC address of the first physical interface that you specify. If you change the order of the member interfaces in the configuration, then the MAC address changes to match the MAC address of the interface that is now listed first. Alternatively, you can explicitly assign a MAC address to the redundant interface; this address is then used regardless of the member interface MAC addresses. In either case, when the active interface fails over to the standby, the same MAC address is maintained so that traffic is not disrupted.

---

**Note** This option is available only on PIX 8.0+ and non-5505 ASA devices.

---

### Defining Redundant Interfaces

Follow these steps to configure two physical interfaces as a single logical “redundant interface” in the Add/Edit Interface (ASA/PIX 7.0+) dialog box, which is accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837).

1. Choose **Redundant** as the interface **Type** in the Add/Edit Interface dialog box.

The Redundant ID, Primary Interface and Secondary Interface options appear.

1. Provide an identifier for this redundant interface in the **Redundant ID** field; valid IDs are the integers from 1 to 8.
2. **Primary Interface** – Choose the primary member of the redundant interface pair from this list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.
3. **Secondary Interface** – Choose the secondary member of the redundant interface pair from this list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.

---

**Note** Member interfaces must be enabled and of the same type (e.g., GigabitEthernet), and cannot have a Name, IP Address, or Security Level assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.

---

1. Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842.

## Configuring EtherChannels

Beginning with ASA 8.4.1, you can define logical EtherChannel interfaces. An EtherChannel, also called a port-channel interface, is a logical interface consisting of a bundle of individual Ethernet links (a channel group). This provides increased bandwidth and fault tolerance compared to the individual links.

An EtherChannel interface is configured and used in the same manner as a single physical interface. You can configure up to 48 EtherChannels, each of which consists of between one and eight active Fast Ethernet, Gigabit Ethernet, or Ten-Gigabit Ethernet ports. For ASA 9.2(1), the number of active interfaces increased to 16.

---

**Note** You cannot use a redundant interface as part of an EtherChannel, nor can you use an EtherChannel as part of a redundant interface. You cannot use the same physical interfaces in a redundant interface and an EtherChannel interface. You can, however, configure both types on the ASA if they do not use the same physical interfaces.

---

### EtherChannel MAC Addressing

All interfaces that are part of a channel group share the same MAC address. This makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. By default, the EtherChannel uses the MAC address of the lowest-numbered member interface as its MAC address.

Alternatively, you can manually configure a MAC address for the port-channel interface. We recommend doing so in case the channel interface membership changes. For example, if you remove the interface that provides the port-channel MAC address, the port-channel is assigned the MAC address of the next lowest numbered interface, causing traffic disruption. Manually assigning a unique MAC address to the EtherChannel interface prevents this disruption. (Note that in multiple-context mode, you can assign unique MAC addresses to interfaces assigned to an individual context, including EtherChannel interfaces.)

### About Management Only EtherChannel Interfaces

You can specify an EtherChannel group as a management-only interface, but note the following caveats:

- Routed mode – You must explicitly configure the EtherChannel to be Management Only in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842. Any non-management interface added to the management-only port-channel is treated as a management port. If you add an interface already defined as management-only to the management-only group, that attribute is ignored on the physical interface. Similarly, you cannot designate an interface as management-only if it is already a member of a management-only port-channel.
- Transparent mode – In this mode, members of a management-only EtherChannel can themselves only be management-only ports. Thus, when a management-only member is added to a transparent-mode EtherChannel, the channel inherits the management-only designation, while the designation is removed

from the member interface. Conversely, when such an interface is removed from the EtherChannel, the designation is restored on the individual interface.

### Using an EtherChannel Interface as a Failover Link

If an EtherChannel interface is specified as a failover link, all state-sync traffic for that link will travel over a single physical interface. Should that physical interface fail, the state-sync traffic will then traverse another physical interface that is part of the EtherChannel aggregated link. If there are no remaining available physical interfaces in the EtherChannel link specified for failover, the ASA falls back to the redundant interface, if one is specified.

While an EtherChannel interface is being used as an active failover link, changes to that EtherChannel configuration are not allowed. You can change the EtherChannel configuration of that link only by disabling either the link or failover, as follows:

- Disable the EtherChannel link while the configuration changes are being made, and then reactivate it (failover will not occur while the link is disabled).
- Disable failover while the configuration changes are being made, and then re-enable it (failover will not occur in the interim).

---

**Note** As with any other type of interface assigned as a failover link, the EtherChannel interface cannot be named. Further, none of the EtherChannel's member interfaces can be named.

---

### Defining EtherChannels on an ASA

Follow these steps to configure multiple physical interfaces as a single logical EtherChannel interface in the ASA Add Interface or Edit Interface dialog boxes, which are accessed from the device Interfaces page (see [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837).

---

**Step 1** Choose **EtherChannel** as the interface Type.

The EtherChannel ID and interface-selection options appear on the General panel of the dialog box; the Load Balancing, LACP Mode, and Active Physical Interfaces: Minimum and Maximum fields appear on the Advanced panel.

**Step 2** Provide an identifier for this EtherChannel in the EtherChannel ID field; valid IDs are the integers from 1 to 48. This number is appended to "Port-channel" to identify the EtherChannel in the Interface column of the table on the device's Interfaces page.

**Step 3** **Available Interfaces** – Specify the members of this port-channel group by select one or more interfaces in this list of available interfaces, and then click the >> button to add them to the member list on the right.

**Note** All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

You can assign up to 16 interfaces to a channel group. For ASA 9.2(1) and later, each channel group can have up to 16 active interfaces. For switches that support only 8 active interfaces and ASA versions earlier than 9.2(1), only eight interfaces can be active, the remaining interfaces can act as standby links in case of interface failure. Alternatively, you can create a static EtherChannel by setting LACP Mode to On (on the Advanced panel, as described below), which means all interfaces in the group can pass traffic.

**Note** After assigning interfaces to this EtherChannel group, you can edit the LACP Port parameters for each member interface, as described in [Editing LACP Parameters for an Interface Assigned to an EtherChannel](#), on page 1816.

**Step 4** Click the **Advanced** tab to display that panel.

**Step 5** Choose a **Load Balancing** option in the EtherChannel section. See [About EtherChannel Load Balancing](#), on page 1818, for more information about this option.

**Step 6** Select the desired **LACP Mode**; the default is Active, which means up to eight interfaces are active, while up to eight are in stand-by mode, as determined by the Minimum and Maximum values under Active Physical Interfaces.

If you select On, a static port-channel is created in which all member interfaces are all “on,” meaning you can have up to 16 ports passing traffic, with no stand-by ports. When you select this option, the Mode for all interfaces assigned to this EtherChannel group is switched to On (if the Mode for each is not already On). See [Editing LACP Parameters for an Interface Assigned to an EtherChannel](#), on page 1816, for more information about this mode.

**Step 7** Specify the Minimum and Maximum number of Active Physical Interfaces for this EtherChannel.

As mentioned, an EtherChannel can consist of between 1 and 8 active links for ASA devices earlier than 9.2(1) or between 1 and 16 active links for ASA 9.2(1)+. Use these fields to indicate the minimum and maximum number of interfaces that can be active in this channel group at any given time. If your switch does not support 16 active interfaces, be sure to set the maximum to 8 or fewer.

**Step 8** Continue configuring this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842.

**Note** The EtherChannel **LACP System Priority** for this device is specified in the [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), on page 1886 dialog box.

---

## Editing LACP Parameters for an Interface Assigned to an EtherChannel

After assigning interfaces to an EtherChannel (port-channel) group, you can edit the LACP Port parameters for each member interface, as described here.

---

**Note** This feature is available only on ASA 8.4.1+ devices.

---

The Link Aggregation Control Protocol (LACP) directs aggregation of physical Fast Ethernet, Gigabit Ethernet, or Ten-Gigabit Ethernet interfaces into an EtherChannel group, and updating the remote partner device with current information after it finds a compatible set of ports and assigns a unique value called an “operational key” to the group. Note that operational key assignment is automatic; you cannot configure it.

---

**Caution** These LACP parameters are not available when the EtherChannel is assigned as a failover link.

---

### LACP System Priority

Every LACP-enabled device has a unique system ID that is formed by combining a System Priority identifier and the system’s MAC address. In certain situations, two EtherChannel-linked systems may need to change the operational key assigned to a set of ports to allow optimal aggregation. In such a situation, the system with higher priority is allowed to dynamically modify the operational key value assigned to the ports to achieve better aggregation. The system with the lower priority is not allowed to change the operational keys. The

System Priority identifier is user-configurable, as described in [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), on page 1886.

### LACP Port Parameters

Port identification is provided by a unique number assigned to every group interface; this identifier is formed by combining a configurable Port Priority number and the port number assigned to the interface.

The port identifier provides port aggregation priority. Ports are considered for active use in an aggregation starting with the port that has highest aggregation priority in the system, and working down through an ordered list of port identifiers. The use of this port aggregation priority makes aggregation predictable and reproducible by selecting the links for aggregation in the same manner when all links are running LACP concurrently.

In addition, you can configure the priority of each port to administratively control the set of stand-by ports. For example, the port with the lowest priority will be considered last for group aggregation and will become a stand-by port (assuming enough members are assigned to the group to allow stand-by ports).

### Related Topics

- [Configuring EtherChannels](#), on page 1814

### Editing LACP Port Parameters for an Existing EtherChannel Interface

Follow these steps to edit an existing EtherChannel-assigned interface:

- 
- Step 1** In the table on the device's Interfaces page, select an interface that is a Member of a Port-channel group. (See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837 for information about accessing and using this table.)
- Step 2** Click **Edit Row** to open the Edit Interface dialog box for that interface.
- Only the Enable Interface check box, the LACP Port parameters, and the Description field can be altered.
- Step 3** Edit the **LACP Port** parameters as necessary:
- **Priority** – This number is combined with the port number assigned to the interface to produce a unique port identification number. This value can be 1 to 65535, with higher numbers signifying lower priorities. The default is 32768. This parameter applies only when the port is in Active or Passive mode.
  - **Mode** – Choose one of these LACP modes:
    - **Active** – In Active mode, a port initiates LACP exchanges with the partner device and periodically sends updates to the partner. Active LACP reflects the port's preference to participate in the protocol regardless of the partner's control mode.
    - **Passive** – A Passive-mode port does not initiate LACP exchanges, but upon receiving a request from the partner, the port will start exchanging LACP information with the partner. Passive mode is useful when it is not clear if the remote port supports LACP.

Some devices may show undesired behavior when they do not have LACP enabled and they receive periodic LACP updates. However, for channeling to operate correctly, at least one port must be configured in Active mode.

- **On** – Use this mode to configure a static port-channel in which all member interfaces are “on,” with no stand-by ports. No negotiation takes place and most restrictions associated with the other two modes do not apply; for example, the speed and duplex settings do not have to be the same for all member ports, and all member ports remain Active. Note that the remote ports also must be On. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

- **VSS or vPC Switch ID** – Identifies the Virtual Switching System (VSS) or Virtual Port Channel (vPC) switch ID to which the interface is connected.

**Step 4** Continue editing this interface, as described in [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842.

## About EtherChannel Load Balancing

Traffic in an EtherChannel is distributed across the individual bundled links in a deterministic fashion; however, the load is not necessarily balanced equally across all the links. Instead, frames are forwarded on a specific link as a result of a hashing algorithm. This algorithm uses a specific field or combination of fields in the packet header to produce a fixed Result Bundle Hash (RBH) value that indicates which link to use.

The algorithm can use one or a combination of the following packet-header fields to determine link assignment: source IP address, destination IP address, source MAC address, destination MAC address, TCP/UDP port numbers, or VLAN IDs. The field combination used by the algorithm is chosen from the **Load Balancing** list (on the Advanced tab of the ASA's Add Interface and Edit Interface dialog boxes); these options are described in the following section. For additional information, see [Configuring EtherChannels](#), on page 1814.

For example, suppose source MAC address (*src-mac*) is the chosen field: when packets are forwarded to an EtherChannel, they are distributed across the ports in the channel based on the source MAC address of each incoming packet. Therefore, to provide load balancing, packets from different hosts use different ports in the channel, but packets from the same host use the same port in the channel (and the MAC addresses learned by the device do not change).

Similarly, with destination MAC address forwarding, when packets are forwarded to an EtherChannel, each packet is distributed across the ports in the channel based on the packet's destination host MAC address. Thus, packets to the same destination are forwarded over the same port, and packets to a different destination are sent on a different port in the channel.

Therefore, when choosing a load-balancing option, use the option that provides the greatest variety in your configuration. For example, if most of the traffic on a channel is going only to a single MAC address, choosing the destination MAC address results in most of the traffic always using the same link in the channel. Alternatively, using source addresses or IP addresses might result in better load balancing, while a method that uses the source and destination addresses along with UDP or TCP port numbers can distribute traffic much differently.

---

**Note** This option is available only on ASA 8.4.1+ devices.

---

### Load Balancing Options

When defining a single logical EtherChannel interface in the ASA Add/Edit Interface dialog box, choose one of the following **Load Balancing** options (on the [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), on page 1853) to specify the basis of load distribution:

- **dst-ip** – Load distribution is based on the destination-host IP address only; the source of the packets is not considered. Each packet with the same destination IP address is forwarded over the same link.
- **dst-ip-port** – Load distribution is based on the destination-host IP address and TCP/UDP port. This option offers more granularity and a little more complexity than destination IP address alone.

- **dst-mac** – Load distribution is based on the destination host MAC address of incoming packets.
- **dst-port** – Distribution is based on the destination port; that is, a TCP or UDP port and not a physical interface.
- **src-dst-ip** – Distribution is based on source and destination IP addresses—source and destination IP addresses are paired for hash calculations. This method provides more granularity than destination IP address, for example: packets to the same destination can be forwarded over different links in a port-channel if they are coming from a different IP source.
- **src-dst-ip-port** – Distribution calculation considers source and destination IP addresses, and TCP/UDP ports. Provides even greater granularity and distribution.
- **src-dst-mac** – Calculation is based on source and destination MAC address pairing.
- **src-dst-port** – Load distribution is based on source and destination TCP/UDP port.
- **src-ip** – Based on source host IP address only.
- **src-ip-port** – Source IP address and TCP/UDP port.
- **src-mac** – Source MAC address only.
- **src-port** – Source TCP/UDP port only.
- **vlan-dst-ip** – Destination IP address and VLAN ID pairing.
- **vlan-dst-ip-port** – Combination of destination IP address, TCP/UDP port, and VLAN ID.
- **vlan-only** – VLAN ID only.
- **vlan-src-dst-ip** – Source and destination IP address, and VLAN ID.
- **vlan-src-dst-ip-port** – Source and destination IP address, TCP/UDP port, and VLAN ID.
- **vlan-src-ip** – Source IP address and VLAN ID.
- **vlan-src-ip-port** – Source IP address, TCP/UDP port, and VLAN ID.

## Configuring VNI Interfaces

VNI interfaces are similar to VLAN interfaces: they are virtual interfaces that keep network traffic separated on a given physical interface by using tagging. You apply your security policy directly to each VNI interface. All VNI interfaces are associated with the same VTEP interface.

To configure VXLAN, you must first [Configure VXLAN Policy](#), on page 1891 and then create a VNI interface and associate the configured VXLAN policy to the VNI interface.

When VNI Interface is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The following sections describe how to configure VNI interfaces using the three tabbed panels:

- [VXLAN](#), on page 1891
- [VNI Interfaces—General Tab](#), on page 1820
- [VNI Interfaces—Advanced Tab](#), on page 1822
- [VNI Interfaces—IPv6 Tab](#), on page 1823

## VNI Interfaces—General Tab

When VNI Interface is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **General** panel are described in this section.

### Navigation Path

You can access the General panel in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837.

### Field Reference

*Table 552: General tab: Add/Edit Interface Dialog Box (ASA)*

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface             | Check this box to enable the VNI interface if not already enabled.                                                                                                                                                                                                                                                                                                                               |
| Name                         | Enter the Interface Name. The name is a text string up to 48 characters, and is not case-sensitive. You can change the name by reentering this command with a new value.                                                                                                                                                                                                                         |
| Security Level               | Enter the Security Level, between 0 (lowest) and 100 (highest).                                                                                                                                                                                                                                                                                                                                  |
| VXLAN                        |                                                                                                                                                                                                                                                                                                                                                                                                  |
| VNI ID                       | Enter the VNI ID, between 1 and 10000. This ID is just an internal interface identifier.                                                                                                                                                                                                                                                                                                         |
| VNI Segment ID               | Enter the VNI Segment ID, between 1 and 16777215. The segment ID is used for VXLAN tagging.                                                                                                                                                                                                                                                                                                      |
| Multicast Group IP Address   | (Single Mode) Enter the Multicast Group IP Address.<br><br>If you do not set the multicast group for the VNI interface, the default group from the VTEP source interface configuration is used, if available. If you manually set a VTEP peer IP for the VTEP source interface, you cannot specify a multicast group for the VNI interface. Multicast is not supported in multiple context mode. |
| NVE Mapped to VTEP Interface | Check the NVE Mapped to VTEP Interface check box. This setting associates the VNI interface with the VTEP source interface.                                                                                                                                                                                                                                                                      |
| IP Type                      | Select the IP Type from the available options.                                                                                                                                                                                                                                                                                                                                                   |

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static IP   | <p>IP Address—(Routed Mode) In the IP Address area, configure an IPv4 address. To configure IPv6, click the IPv6 tab.</p> <p>Subnet Mask—Specify the Subnet Mask.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use DHCP    | <p>DHCP Learned Route Metric—(Required) To assign an administrative distance to the learned route, enter a value between 1 and 255 in the DHCP Learned Route Metric field. If this field is left blank, the administrative distance for the learned routes is 1.</p> <p>Obtain Default Route using DHCP—(Optional) Select this option to obtain a default route from the DHCP server so that you do not need to configure a default static route.</p> <p>Enable Tracking for DHCP Learned Route—(Optional) If Obtain Default Route using DHCP is selected, you can select this option to enable route tracking via a specific Service Level Agreement (SLA) monitor. The following option becomes available:</p> <p>Tracked SLA Monitor—Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface.</p> |
| Description | (Optional) Specify a description for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 553: General tab: Add/Edit Interface Dialog Box (ASAv)

| Element          | Description                                                                                                                                                                                                                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | Check this box to enable the VNI interface if not already enabled.                                                                                                                                                                                                                                            |
| Name             | Enter the Interface Name. The name is a text string up to 48 characters, and is not case-sensitive. You can change the name by reentering this command with a new value.                                                                                                                                      |
| Security Level   | Enter the Security Level, between 0 (lowest) and 100 (highest).                                                                                                                                                                                                                                               |
| VXLAN            |                                                                                                                                                                                                                                                                                                               |
| Proxy Single-Arm | <p>Select the proxy single arm to support the AWS GWLB for ASAv devices.</p> <p><b>Important</b> You must enable AWS in ASAv device with hypervisors XENAWS or KVMASWS to view and configure Proxy Single-Arm in CSM UI. ASAv30 is the minimum supported platform for the Proxy Single-Arm configuration.</p> |
| VNI ID           | Enter the VNI ID, between 1 and 10000. This ID is just an internal interface identifier.                                                                                                                                                                                                                      |
| VNI Segment ID   | Enter the VNI Segment ID, between 1 and 16777215. The segment ID is used for VXLAN tagging.                                                                                                                                                                                                                   |

| Element                      | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Multicast Group IP Address   | (Single Mode) Enter the Multicast Group IP Address.<br><br>If you do not set the multicast group for the VNI interface, the default group from the VTEP source interface configuration is used, if available. If you manually set a VTEP peer IP for the VTEP source interface, you cannot specify a multicast group for the VNI interface. Multicast is not supported in multiple context mode. |
| NVE Mapped to VTEP Interface | Check the NVE Mapped to VTEP Interface check box. This setting associates the VNI interface with the VTEP source interface.                                                                                                                                                                                                                                                                      |
| IP Type                      | Select the IP Type from the available options.                                                                                                                                                                                                                                                                                                                                                   |
| Static IP                    | IP Address—(Routed Mode) In the IP Address area, configure an IPv4 address. To configure IPv6, click the IPv6 tab.<br><br>Subnet Mask—Specify the Subnet Mask.                                                                                                                                                                                                                                   |

## VNI Interfaces—Advanced Tab

When VNI Interface is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **Advanced** panel are described in this section.

### Navigation Path

You can access the Advanced tab in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837.

| Element             | Description                                                                                                |
|---------------------|------------------------------------------------------------------------------------------------------------|
| Active MAC Address  | Use the Active MAC Address field to manually assign a private MAC address to the interface                 |
| Standby MAC Address | The Standby MAC Address field can be used to set a standby MAC address for use with device-level failover. |

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Roles                             | All interface roles assigned to this interface are listed in this field. Role assignments are based on pattern matching between the Name given to this interface and all currently defined Interface Role objects in Cisco Security Manager. Interface role objects are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces. |
| DHCP Relay Servers                | Enter the IP address or select a Networks/Hosts object representing the interface-specific DHCP server to which DHCP requests on this interface are relayed. Use a comma to separate multiple values. You can configure a maximum of 4 interface-specific DHCP relay servers and a maximum of 10 global and interface-specific DHCP relay servers combined.                                                                                                     |
| DHCP Relay Trust Info (Option 82) | Specifies that you want to trust this DHCP client interface. You can configure interfaces as trusted interfaces to preserve DHCP Option 82.                                                                                                                                                                                                                                                                                                                     |

### VNI Interfaces—IPv6 Tab

When VNI Interface is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **IPv6** panel are described in this section.

#### Navigation Path

You can access the IPv6 panel in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837.

#### Field Reference

*Table 555: IPv6 tab: Add/Edit Interface Dialog Box (ASA)*

| Element     | Description                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable IPv6 | Check this box to enable IPv6 and configure IPv6 addresses on this interface. You can deselect this option to disable IPv6 on the interface, but retain the configuration information. |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enforce EUI-64 | <p>When selected, use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link is enforced.</p> <p>When this option is enabled on an interface, the source addresses of IPv6 packets received on the interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the interface identifier in an IPv6 packet is not in the Modified EUI-64 format, the packet is dropped and the following system log message is generated:</p> <pre>%PIX ASA-3-325003: EUI-64 source address check failed.</pre> <p>Address format verification is performed only when a flow is created. Packets from an existing flow are not checked. Additionally, address verification can be performed only for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.</p> <p>The Modified EUI-64 format interface identifier is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link-layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64-bit interface ID of 02E0:B6FF:FE01:3B7A.</p>                                                                                                                                                                            |
| DAD Attempts   | <p>To specify the number of consecutive neighbor solicitation messages that are sent on an interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection on the interface. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre>%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval    | <p>The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reachable Time      | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Managed Config Flag | Whether or not to set the flag "managed-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Other Config Flag   | Whether or not to set the flag "other-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable RA           | <p>When checked, IPv6 router advertisement transmissions are enabled on the interface. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• <b>RA Lifetime</b> – The “router lifetime” value specifies how long nodes on the local link should consider the security appliance as the default router on the link. Valid values range from 0 to 9000 seconds; the default is 1800 seconds. Entering 0 indicates that the security appliance should not be considered a default router on the selected interface.</li> </ul> <p>Any non-zero value should not be less than the following RA Interval value.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval</b> – The interval between IPv6 router advertisement transmissions on this interface. Valid values range from 3 to 1800 seconds, (or from 500 to 1800000 milliseconds if the following RA Interval in Milliseconds option is checked); the default is 200 seconds.</li> </ul> <p>The interval between transmissions should be less than or equal to the RA Lifetime value if it is non-zero. To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the desired value.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval in Milliseconds</b> – Checking this option indicates that the provided RA Interval value is in milliseconds, rather than seconds.</li> </ul> |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface IPv6 Addresses | <p>The IPv6 addresses assigned to the interface are specified in this section of the dialog box.</p> <ul style="list-style-type: none"> <li>• <b>Link-Local Address</b> – To override the link-local address that is automatically generated for the interface, enter the desired IPv6 link-local address in this field.</li> </ul> <p>The link-local address is composed of the link-local prefix FE80::/64 and the interface ID in Modified EUI-64 format. For example, an interface with a MAC address of 00E0.B601.3B7A would have a link-local address of FE80::2E0:B6FF:FE01:3B7A. An error will occur if another host is using the specified address.</p> <ul style="list-style-type: none"> <li>• <b>Enable Address Auto-Configuration</b> – Select this option to enable automatic configuration of IPv6 addresses on the interface using stateless autoconfiguration. The addresses are configured based on the prefixes received in Router Advertisement (RA) messages. If a link-local address has not been configured, then one is automatically generated for this interface. An error occurs if another host is already using the generated link-local address.</li> <li>• <b>Trust the DHCP Servers for default gateway</b>– Select this radio button to install a default route from Router Advertisements that come from a trusted source - the directly-connected network.</li> <li>• <b>Ignore trust and accept router advertisements</b> – Select this radio button to install a default route from Router Advertisements that come from another network.</li> </ul> <ul style="list-style-type: none"> <li>• The table in this section displays the IPv6 addresses assigned to this interface. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables , on page 50.</a>)</li> </ul> <p>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box , on page 1869.</a></p> |
| Interface IPv6 Prefixes  | <p>Use the table in this section to configure which IPv6 prefixes (that is, the network portion of the IPv6 addresses) are included in IPv6 router advertisements. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables , on page 50.</a>)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Prefix Editor Dialog Box , on page 1871.</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Configuring Loopback Interface

When a WAN link goes out of service or unreachable then the corresponding S2S VPN link also becomes unreachable. To overcome this challenge, ASA 9.19.1 is enhanced to support the configuration of loopback interface which will keep the VPN links intact.

VTI loopback interface is supported only for Regular IPsec VTI with hub and spoke, and point-to-point VPN topologies. VTI loopback interface is not supported for other topologies like full mesh, extranet VPN, and RAVPN Policies.

The following section describes how to configure the tunnel interface:

- [Loopback—General Tab](#)

## Loopback—General Tab

In the Add Interface or Edit Interface dialog box, when you select Loopback from the Type drop-down, the dialog box displays three tabs: General, Advanced, and IPv6. This section describes the options provided by the **General** panel.

### Navigation Path

You can access the General panel from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#).

**Table 556: General tab: Add/Edit Interface Dialog Box (ASA)**

| Element          | Description                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | Check this box to enable the tunnel interface if not already enabled.                                                                                                                                                                                    |
| Name             | Enter the interface name. The name is a text string up to 48 characters, and is not case-sensitive. You can change the name by re-entering this command with a new value.                                                                                |
| Loopback ID      | Enter the unique tunnel ID, between 0 and 10413. This ID is an internal interface identifier. The specified ID is mapped with the interface name.                                                                                                        |
| IP Type          | From the drop-down, select Static IP. <ul style="list-style-type: none"> <li>IP Address—(Routed Mode) In the IP Address area, configure an IPv4 address. To configure IPv6, click the IPv6 tab.</li> <li>Subnet Mask—Specify the subnet mask.</li> </ul> |
| Description      | (Optional) Specify a description for the interface.                                                                                                                                                                                                      |

## Configuring Tunnel Interface

Cisco Security Manager 4.13 supports route based VPN method for the Site-to-Site VPN. This support requires configuration of the static crypto map access list and mapping it to an interface. Due to this requirement, Large Enterprises and Virtual Private Clouds need to track all remote subnets and include them in the crypto map access list. To overcome this challenge, ASA 9.7.1 is enhanced to support the route based VPN method using the VTI (Virtual Tunnel Interface). Thus, beginning with Cisco Security Manager 4.13, you can define tunnel interface for the VPN and its associated IPsec policy.

VTI is supported only for Regular IPsec with Hub and Spoke, and Point to Point VPN topologies. VTI is not supported for other topologies like Full Mesh Topology, Extranet VPN Topology and RAVPN Policies.

In a multi- hub and multi- spoke scenario, for the tunnel interface to establish connectivity from one peer to another peer, ensure interface roles are applied to the hubs and spokes.

You can now configure IPv6 addresses in the Virtual tunnel interfaces (VTI) and enable the IPsec tunnel mode for IPv6. You can also configure IPv6 tunnel source or destination interfaces. If you configure tunnel interface for Regular IPsec VTI with both IPv4 and IPv6 addresses, IPv4 is used by default. From Cisco Security Manager version 4.23 onwards, the IPv6 address is supported only for Regular IPsec VTI under Point-to-Point and Hub-and-Spoke topologies.

You can now configure up to 1024 named VTIs for a device. Based on the platform model used, there might be discrepancies with the number of VTIs that can be configured. In such cases, you can configure the maximum number of VTIs in Cisco Security Manager with the limit set on ASA.

**Note** The BGPv6 address is supported in the IPv6 Family for Regular IPsec VTI under Point-to-Point and Hub-and-Spoke topologies for ASA 9.16(1) and higher version devices. The configured BGPv6 address should match with the tunnel IP address, else it triggers a validation error.

**Note** Ensure you add the pre-shared key manually after the discovery of IPv6 Regular IPsec VTI topology.

The following sections describe how to configure tunnel interface:

- [Tunnel—General Tab, on page 1828](#)
- [Configuring IPsec Policy for Tunnel Interface, on page 1831](#)

## Tunnel—General Tab

In the Add Interface or Edit Interface dialog box, when you select Tunnel from the Type drop-down, the dialog box displays three tabs: General, Advanced, and IPv6. This section describes the options provided by the **General** panel.

### Navigation Path

You can access the General panel from the ASA Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837.

| IP Type         | <p>From the drop-down, select Static IP.</p> <ul style="list-style-type: none"> <li>• IP Address—(Routed Mode) In the IP Address area, configure an IPv4 address. To configure IPv6, click the IPv6 tab.</li> <li>• Subnet Mask—Specify the Subnet Mask.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Description     | (Optional) Specify a description for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Establishing Regular IPSec VPN Tunnel

The following checkpoints (while configuring the Tunnel - [Configuring Tunnel Interface, on page 1827](#)) help you to successfully establish the Regular IPSec VPN Tunnel connectivity:

1. You must enter Tunnel ID value.
2. Source interface must be configured and must be reachable to its peer through ISP or routing.
3. You must enter the peer source interface IP address in the Destination IP field.
4. For the IPSec Profile field:
  - a. Select the same IKEV1 transform set for both the peer devices.
  - b. In Point-to-Point topology, either one of the peers must be the responder.
  - c. In Hub and Spoke topology, select the Hub as the responder; select all spokes as initiators.
5. IPV4 mode must be configured for enabling the interesting traffic.

6. You must enter IP address to establish the VPN, dynamic IP address is not supported.
7. Select Static or BGP routing for enabling the interesting traffic. In case of firewall policy, VTI is supported only in static routing.

**Note** Cisco Security Manager displays error message if BGP/Static route is not configured properly for Point-to-Point topology, and Hub and Spoke topology with one hub and one spoke. For Multi hub/spoke scenario, the error message is not displayed.

## Configuring IPsec Policy for Tunnel Interface

Use the IPsec Policy page to configure the IPsec policy used during IKE Phase 1 and IKE Phase 2 negotiations for Regular IPsec with Hub and Spoke and Point to Point VPN topologies.

You can now enable BGPv6 for Regular IPsec VTI under Point-to-Point and Hub-and-Spoke topologies. You can also configure IPv6 ip addresses on the Family tab of BGP page.

### Navigation Path

- Choose **Manage > Policy Objects** to open the Policy Object Manager. Under All Object Types, click **IPsec Profile**. To add a profile, click the Add button.

### Field Reference

*Table 558: IPsec Profile*

| Element     | Description                                                                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | Name of the IPsec policy.                                                                                                                                                                   |
| Description | Description for the policy.                                                                                                                                                                 |
| IKE Version | Choose the relevant IKE version— IKEv1 or IKEv2.<br><br><b>Note</b> Beginning with 4.14, Cisco Security Manager supports IKEv2. However, at a time, you can choose only one version of IKE. |

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IKEv1 Transform Sets                      | <p>The IKEv1 transform sets to be used for your tunnel policy. Transform sets specify which authentication and encryption algorithms are used to secure the traffic in the tunnel. You can select up to 11 transform sets. For more information, see <a href="#">Understanding Transform Sets</a> , on page 1168.</p> <p>Transform sets may use only tunnel mode IPsec operation.</p> <p>You can associate more than one IKEv1 Transform Sets. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security is used.</p> <p><b>Note</b> For the tunnel to be functional, IKEv1 transform set on both peers should be the same.</p> <p>Click <b>Select</b> to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the <b>Create (+)</b> button beneath the available objects list in the selection dialog box to create a new one. For more information, see <a href="#">Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects</a> , on page 1175.</p> <p>This field is not available for IKEv2.</p> |
| IKEv2 IPsec Proposal (ASA 9.8(1) Onwards) | <p>Click <b>Select</b> to select the IPsec proposals to be used for your tunnel policy. Cisco Security Manager allows you to select more than one proposals. If the required object is not yet defined, you can click the <b>Create (+)</b> button beneath the available objects list in the selection dialog box to create a new one. For more information, see <a href="#">Configuring IPsec IKEv1 or IKEv2 Transform Set Policy Objects</a> , on page 1175.</p> <p><b>Note</b> Beginning with Cisco Security Manager 4.23, DH group 31 is supported for IPsec profile and IKEv2 on ASA 9.16(1) and later devices.</p> <p>This field is not available for IKEv1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Trustpoint (ASA 9.8(1) Onwards)           | <p>Click <b>Select</b> to select the CA servers for issuing certificates to the participating IPsec network devices. The peers that are configured with this policy obtains digital certificates from the selected CA server. You can specify only one trustpoint.</p> <p>For IKEv1, when trustpoint is used for authentication, the initiator should have the trustpoint specified under IPsec profile's trustpoint configuration; and for responder, the trustpoint should be specified under tunnel-group CLI (similar to non-VTI configuration).</p> <p><b>Note</b> When trustpoint configuration is used as authentication in Site-to-site VPN, IKE profile should be in certificate. For the tunnel to be up, activity validation is required between IKE profile CLI and tunnel group CLI in site-to-site VPN manager for VTI VPN.</p> <p>For IKEv2, when trustpoint is used for authentication, the trustpoint CLI is specified under tunnel-group CLI for both initiator and responder.</p>                                                                                                                                                        |
| Certificate Chain (ASA 9.8(1) Onwards)    | <p>Select the check box to enable sending of the certificate chain for authorization.</p> <p>A certificate chain includes the root CA certificate, identity certificate, and key pair.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Responder Only                                        | Check this check box to set the peer that is associated with this policy acts as the responder. Ensure only one of the peer is configured with the responder only settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable Perfect Forward Secrecy (PFS)<br>Modulus Group | <p>Whether to enable the use of Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. In IPsec negotiations, PFS ensures that each new cryptographic key is unrelated to any previous key.</p> <p>If you select this option, also select the Diffie-Hellman key derivation algorithm to use when generating the PFS session key in the <b>Modulus Group</b> list. For an explanation of the options, see <a href="#">Deciding Which Diffie-Hellman Modulus Group to Use</a> , on page 1154.</p> <p>The following Modulus Groups are not supported for IKEv1. Ensure you do not select them for IKEv1:</p> <ul style="list-style-type: none"> <li>• group19</li> <li>• group20</li> <li>• group21</li> <li>• group24</li> <li>• group1</li> </ul> <p><b>Note</b> Beginning with Cisco Security Manager 4.23, DH group 31 is supported for IPsec profile and IKEv2 on ASA 9.16(1) and later devices.</p> <p><b>Note</b> Beginning with Cisco Security Manager 4.19, DH group 1 option is not supported for ASA 9.12(1) and later devices.</p> |
| Lifetime (Seconds)<br>Lifetime (Kilobytes)            | <p>The global lifetime settings for the Crypto IPsec security association (SA). You can specify the IPsec lifetime in seconds, in kilobytes, or both.</p> <ul style="list-style-type: none"> <li>• Seconds—The number of seconds an SA will exist before expiring. Enter a value within the range 120-2147483647 seconds.</li> <li>• Kilobytes—The volume of traffic (in kilobytes) that can pass between IPsec peers using a given SA before it expires. Valid values depend on the device type. Enter a value within the range 10-2147483647.</li> </ul> <p>To allow unlimited you can select Enable Unlimited Lifetime (Kilobytes) check box.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Category                                              | The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Allow Value Override per Device                       | <p>Select to allow the properties of this object to be redefined on individual devices.</p> <p>If you allow device overrides, you can click the Edit button to create, edit, and view the overrides. The Overrides field indicates the number of devices that have overrides for this object.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

---

**Note** DH groups 2, 5, and 24 will not be supported for ASA 9.14(1) and later devices.

---

## Configuring VLAN Interface

Beginning with version 4.20, Cisco Security Manager supports L2 hardware switching on Cisco FPR-1010 Adaptive Security Appliance. To avail the L2 switching support, you need to configure the respective VLAN interface.

### VLAN Interface—General Tab

In the Add Interface or Edit Interface dialog box, when you select VLAN Interface from the Type drop-down list, the dialog box displays five tabs: General, Advanced, IPv6, Switch Port, and Power Over Ethernet.

---

**Note** You cannot configure Switch Port and Power Over Ethernet for VLAN Interface.

---

### Navigation Path

Select **Interfaces > Add Interface** from the Device Policy selector and choose VLAN Interface from the Type drop-down list.

### Field Reference

*Table 559: General tab: Add/Edit Interface Dialog Box*

| Element                      | Description                                                                                                                                                                                                                    |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface             | Check this box to enable the VLAN interface if not already enabled.                                                                                                                                                            |
| Management Only              | Check this box to enable the Management Only feature. This reserves the interface for device administration where traffic for only this device is accepted; pass-through traffic for other interfaces and devices is rejected. |
| Name                         | Enter the Interface Name. The name is a text string up to 48 characters, and is not case-sensitive. You can change the name by reentering this command with a new value.                                                       |
| Security Level               | Enter the Security Level, between 0 (lowest) and 100 (highest).                                                                                                                                                                |
| L2 VLAN ID                   | Enter the L2 VLAN ID, between 0 (lowest) and 4090 (highest). This is a mandatory field.                                                                                                                                        |
| No Forward Interface VLAN ID | Enter the No Forward Interface VLAN ID, between 0 (lowest) and 4090 (highest).                                                                                                                                                 |

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Map | Select the Route Map from the Route Map Object Selector dialog box. Choose a desired filter to be applied, from the Filter drop-down list or create a new filter using the Create Filter option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IP Type   | Select the IP Type from the available options: Static IP, Use DHCP, and PPPoE (PIX and ASA 7.2+).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Static IP | <p>IP Address—(Routed Mode) In the IP Address area, configure an IPv4 address. To configure IPv6, click the IPv6 tab.</p> <p>Subnet Mask—Specify the Subnet Mask.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Use DHCP  | <p>DHCP Learned Route Metric—(Required) To assign an administrative distance to the learned route, enter a value between 1 and 255 in the DHCP Learned Route Metric field. If this field is left blank, the administrative distance for the learned routes is 1.</p> <p>Obtain Default Route using DHCP—(Optional) Select this option to obtain a default route from the DHCP server so that you do not need to configure a default static route.</p> <p>Enable Tracking for DHCP Learned Route—(Optional) If Obtain Default Route using DHCP is selected, you can select this option to enable route tracking via a specific Service Level Agreement (SLA) monitor. The following option becomes available:</p> <p>Tracked SLA Monitor—Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface.</p> |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PPPoE (PIX and ASA 7.2+) | <p>This enables Point-to-Point Protocol over Ethernet (PPPoE) for automatic assignment of an IP address from a PPPoE server on the connected network; this option is not supported with failover. On selecting PPPoE (PIX and ASA 7.2+) from the IP Type drop-down, the following options become available:</p> <p>VPDN Group Name (required)—Choose the Virtual Private Dialup Network (VPDN) group that contains the authentication method and user name/password to use for network connection, negotiation, and authentication. See <a href="#">Managing VPDN Groups</a>, on page 1890 for more information.</p> <p>IP Address—If provided, this static IP address is used for connection and authentication, instead of a negotiated address.</p> <p>Subnet Mask—The subnet mask to be used in conjunction with the provided IP Address.</p> <p>PPPoE Learned Route Metric (required)—Assign an administrative distance to the learned route. Valid values are 1 to 255; defaults to 1.</p> <p>All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.</p> <p>Obtain Default Routing Using PPPoE—Select this option to obtain a default route from the PPPoE server. This sets the default routes when the PPPoE client has not yet established a connection. When using this option, you cannot have a statically defined route in the configuration.</p> <p>Enable Tracking for PPPoE Learned Route—If Obtain Default Route using PPPoE is selected, you can select this option to enable route tracking for PPPoE-learned routes. When selected, the following options become available.</p> <p>Dual ISP Interface—If you are defining interfaces for dual ISP support, choose Primary or Secondary to indicate which connection you are configuring.</p> <p>Tracked SLA Monitor—Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface.</p> |

| Description | (Optional) Specify a description for the interface. |

## Managing Device Interfaces, Hardware Ports, and Bridge Groups

The Interfaces page displays the interfaces, subinterfaces, redundant interfaces, virtual interfaces (VLANs), and EtherChannel interfaces, as well as the hardware ports and bridge groups, configured on the selected device, and lets you add, edit and delete them.

The types of interface available depend on device type, operating system version, and mode (routed or transparent). For example, EtherChannel interfaces are available only on ASA 8.4.1 and later devices, in both routed and transparent mode. See [Understanding Device Interfaces](#), on page 1807 for more information.

**Note** The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: Interfaces and **Hardware Ports**. Similarly, the Interfaces page displayed for both Firewall Services Modules (FWSMs), version 3.1 and later, and ASAs version 8.4.1 and later, operating in transparent mode also present two tabbed panels: Interfaces and **Bridge Groups**. Links to configuration information for these features are included in the following procedure.

Each security device must be configured, and each active interface must be enabled. Inactive interfaces can be disabled. When disabled, the interface does not transmit or receive data, but its configuration information is retained.

If you bootstrapped a new security device, the set-up feature configures only the addresses and names associated with the inside interface. You must define the remaining interfaces on that device before you can specify access and translation rules for traffic traversing that security device.

Transparent firewall mode allows only two interfaces to pass traffic; however, if your platform includes a dedicated management interface, you can use it (either the physical interface or a subinterface) as a third interface for management traffic.

Follow these general steps to manage security-device interfaces and related options. You can add, edit and delete configured interfaces, subinterfaces, redundant interfaces, virtual interfaces (VLANs), EtherChannel interfaces, hardware ports, and bridge groups, according to the type of device selected.

**Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.

**Note** For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager](#), on page 194.

**Step 2** Select the security device you want to configure.

**Step 3** Select **Interfaces** in the Device Policy selector.

The Interfaces page is displayed. The information displayed, and the page itself, varies based on the selected device type and version, the operational mode (routed versus transparent), and whether the device hosts single or multiple contexts.

Note that the Interfaces page for ASA 5505 devices presents two tabbed panels: Hardware Ports and Interfaces. Similarly, the Interfaces page displayed for both FWSMs (version 3.1 and later) and ASAs (version 8.4.1 and later), operating in transparent mode also presents two tabbed panels: Interfaces and Bridge Groups.

**Step 4** Add, edit and delete interfaces and related options, as necessary.

The Interfaces pages/panels and the Bridge Groups and Hardware Ports panels present standard Security Manager tables, with Add Row, Edit Row and Delete Row buttons, which are described in [Using Tables](#), on page 50.

The actual dialog box presented when you click the Add Row or Edit Row button depends on the type of device (and panel) you have selected. Refer to the following topics for device-specific dialog box information:

- [Add/Edit Interface Dialog Box \(PIX 6.3\)](#), on page 1838
- [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842
- [Configuring Hardware Ports on an ASA 5505](#), on page 1879
- [Add/Edit Bridge Group Dialog Box](#), on page 1881

**Step 5** To manage Advanced Interface settings, including enabling communication between interfaces with the same security level, click the Advanced button at the bottom of the Interfaces page to open the Advanced Interface Settings dialog box. See [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), on page 1886 for more information.

**Step 6** When you are finished adding, editing and deleting interfaces, click **Save** at the bottom of the window to save your interface definitions to the Cisco Security Manager server.

## Add/Edit Interface Dialog Box (PIX 6.3)

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

**Table 560: Add/Edit Interface Dialog Box (PIX 6.3)**

| Element          | Description                                                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | Enables this interface to pass traffic. In addition to this setting, you must specify an IP Type and a Name before traffic can pass according to your security policy.<br><br>You must enable a physical interface before traffic can pass through any enabled subinterfaces. |
| Type             | Choose the type of interface: <ul style="list-style-type: none"> <li>• <b>Physical</b> – VLAN is on the same network as its underlying hardware interface.</li> <li>• <b>Logical</b> – VLAN is associated with a logical interface.</li> </ul>                                |

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name          | <p>Provide an interface name up to 48 characters in length. The Name should be a memorable name for the interface that relates to its use. Supported interface names are:</p> <ul style="list-style-type: none"> <li>• Inside—Connects to your internal network. Must be most secure interface.</li> <li>• DMZ—Demilitarized zone (Intermediate interface). Also known as a perimeter network.</li> <li>• Outside—Connects to an external network or the Internet. Must be least secure interface.</li> </ul>                                                                                                      |
| Hardware Port | <p>When defining a physical network interface, this value represents the name identifies the interface type and its slot or port in the device.</p> <p>When you add a logical network interface, you can choose any enabled physical interface to which you want to add a logical interface. If you do not see the desired hardware port, verify that the interface is enabled.</p> <p>Valid values are:</p> <ul style="list-style-type: none"> <li>• ethernet0 to ethernet<i>n</i> .</li> <li>• gb-ethernet<i>n</i> .</li> </ul> <p>where <i>n</i> represents the number of network interfaces in the device.</p> |
| IP Type       | <p>The IP Type defines the type of IP addressing used for the interface; choose <b>Static IP</b> or <b>Use DHCP</b>, as described in <a href="#">Device Interface: IP Type (PIX 6.3)</a>, on page 1841. (The PPPoE option is not applicable to PIX 6.3 devices.)</p> <p><b>Note</b> You can configure DHCP only on the outside interface of a security appliance.</p>                                                                                                                                                                                                                                              |

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed and Duplex | <p>Lists the speed options for a physical interface; not applicable to logical interfaces. Choose one of the following options:</p> <ul style="list-style-type: none"> <li>• auto – Sets Ethernet speed automatically. The auto keyword can be used only with the Intel 10/100 automatic speed-sensing network interface card.</li> <li>• 10baset – 10-Mbps Ethernet half-duplex.</li> <li>• 10full – 10-Mbps Ethernet full-duplex.</li> <li>• 100basetx – 100-Mbps Ethernet half-duplex.</li> <li>• 100full – 100-Mbps Ethernet full-duplex.</li> <li>• 1000auto – 1000-Mbps Ethernet to auto-negotiate full- or half -duplex.</li> </ul> <p><b>Tip</b> We recommend that you do not use this option to maintain compatibility with switches and other devices in your network.</p> <ul style="list-style-type: none"> <li>• 1000full – Auto-negotiate, advertising 1000-Mbps Ethernet full-duplex.</li> <li>• 1000full nonnegotiate – 1000-Mbps Ethernet full-duplex.</li> <li>• aui – 10-Mbps Ethernet half-duplex communication with an AUI cable interface.</li> <li>• bnc – 10-Mbps Ethernet half-duplex communication with a BNC cable interface.</li> </ul> <p><b>Note</b> We recommend that you specify the speed of the network interfaces in case your network environment includes switches or other devices that do not handle autosensing correctly.</p> |
| MTU              | Specify the maximum packet size in bytes; that is, the maximum transmission unit (MTU). The value depends on the type of network connected to the interface. Valid values are 300 to 65535 bytes. Default is 1500.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Physical VLAN ID | For a physical interface, enter the VLAN ID, between 1 and 4094. This VLAN ID must not be in use on connected devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Logical VLAN ID  | Provide the alias, a value between 1 and 4094, for the VLAN associated with this logical interface. This value is required if the logical interface Type is selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Security Level   | Specify the security level of the interface: enter a value between 0 (least secure) and 100 (most secure). The security appliance lets traffic flow freely from an inside network to an outside network (lower security level). Many other security features are affected by the relative security level of two interfaces. <ul style="list-style-type: none"> <li>• The <i>outside</i> interface is always 0.</li> <li>• The <i>inside</i> interface is always 100.</li> <li>• DMZ interfaces are between 1 and 99.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Roles   | <p>For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects</a> , on page 301.</p> <p>All interface roles assigned to this interface are listed in this field. Role assignments are based on pattern matching between the Name given to this interface and all currently defined Interface Role objects in Cisco Security Manager.</p> <p>Interface role objects are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces.</p> <p>For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects</a> , on page 301.</p> |

### Device Interface: IP Type (PIX 6.3)

A PIX 6.3 security device requires IP addressing for its interfaces; however, firewall interfaces do not have IP addresses until you assign them.

The Add/Edit Interface dialog box presented for a PIX 6.3 security device includes the section **IP Type**, where you specify the type of IP addressing for the interface and provide related parameters, as described here. See [Add/Edit Interface Dialog Box \(PIX 6.3\)](#) , on page 1838 for information about the other sections of the dialog box.

**Note** The IP Type options presented for other security appliances are described in [Device Interface: IP Type \(PIX/ASA 7.0+\)](#) , on page 1875.

In the Add/Edit Interface dialog box, choose a method for address assignment from the **IP Type** list, and then provide related parameters, as follows:

- **Static IP** – Provide a static **IP Address** and **Subnet Mask** that represents the security device on this interface’s connected network. The IP address must be unique for each interface.

The Subnet mask can be expressed in dotted decimal format (for example, 255.255.255.0), or by entering the number of bits in the network mask (for example, 24). Beginning from Version 4.13, Cisco Security Manager allows 255.255.255.254 for a point to point interface. Do not use 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface. If you omit the Subnet Mask value, a “classful” network is assumed, as follows:

- The Class A netmask (255.0.0.0) is assumed if the first octet of the IP Address is 1 through 126 (i.e., addresses 1.0.0.0 through 126.255.255.255).
- The Class B netmask (255.255.0.0) is assumed if the first octet of the IP Address is 128 through 191 (i.e., addresses 128.0.0.0 through 191.255.255.255).
- The Class C netmask (255.255.255.0) is assumed if the first octet of the IP Address is 192 through 223 (i.e., addresses 192.0.0.0 through 223.255.255.255).

**Note** Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.

- **Use DHCP** – Enables Dynamic Host Configuration Protocol (DHCP) for automatic assignment of an IP address from a DHCP server on the connected network. The following options become available:
  - **Obtain Default Route using DHCP** – Check this box to obtain a default route from the DHCP server so that you do not need to configure a default static route.
  - **Retry Count** – The number of times the PIX will resend the DHCP request. Valid values are 4 to 16; the default is 2
- **PPPoE (PIX and ASA 7.2+)** – This option does not apply to PIX 6.3 devices.

**Note** You can configure DHCP only on the outside interface of a firewall device.

---

## Add/Edit Interface Dialog Box (PIX 7.0+/ASA/FPR/FWSM)

---

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

---

These Add Interface and Edit Interface dialog boxes are used to define and configure interfaces, subinterfaces, redundant, and EtherChannel interfaces on PIX 7.0+, ASA, FPR, and FWSM devices. You can access the Add/Edit Interface dialog boxes from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837 for more information.

---

**Note** From version 4.24, Cisco Security Manager supports FPR-3100 series devices for ASA 9.17(1) and above devices.

---

---

**Note** For Secure Firewall 4200 devices:

- Support added for devices running ASA 9.20(1) and above in CSM 4.27
  - On devices running ASA 9.20(1) or above, you can now view and configure dual management interface (Management1/1 and Management1/2). This feature is supported for single context and multi-context devices in router and transparent modes, but not for EtherChannel interfaces. You can also create sub-interfaces for these management interfaces.
  - The new 100G/200G netmod CLIs and the breakout of the 40G/100G netmod CLIs are not supported by Cisco Security Manager. To reflect the new interface creation modifications in CSM, you must manually configure these CLIs in the device and re-discover the device in the CSM device inventory.
-

---

**Note** The ASA 5505, combining switch and security appliance features, is a special case in that you configure both physical switch ports and logical VLAN interfaces. Thus, the Interfaces page displayed for ASA 5505 devices presents two tabbed panels: **Hardware Ports** and **Interfaces**. See [Understanding ASA 5505 Ports and Interfaces , on page 1811](#) for more information. ASA 8.4.1+ and FWSM 3.1+ devices operating in transparent mode also present two tabbed panels: **Interfaces** and **Bridge Groups**. See [Add/Edit Bridge Group Dialog Box , on page 1881](#) for information about configuring bridge groups.

---

Many of the parameters presented in these dialog boxes vary according to device type and version, operational mode (routed versus transparent), and whether the device hosts a single or multiple contexts.

---

**Note** If you intend to use an interface for failover, you can define that interface in the Add Interface dialog box but do not configure it; instead, use the Failover page. In particular, do not specify an interface Name, as this parameter disqualifies the interface from being used as the failover link.

---

### Using the Add Interface and Edit Interface Dialog Boxes

The following steps outline the general use of these dialog boxes:

1. An interface Type drop-down list appears at the top of the Add Interface and Edit Interface dialog boxes.

---

**Note** Catalyst 6500 services modules (ASA-SMs and FWSMs) and the ASA 5505 do not present the Type list.

---

Depending on device type, operating-system version and operating mode (router or transparent), the Type options presented will be two, three or all of the following:

- **Physical Interface** – Choose this option to configure a physical interface on the device.
- **Sub-Interface** – Choose this option to configure a logical interface (or VLAN connection) associated with a previously defined physical interface. Refer to [Configuring Subinterfaces \(PIX/ASA\) , on page 1811](#) for more information.
- **Redundant** – Choose this option to configure two physical interfaces as a single logical “redundant interface.” Refer to [Configuring Redundant Interfaces , on page 1813](#) for more information.
- **EtherChannel** – Choose this option to configure a logical interface consisting of a bundle of up to eight individual Ethernet links; this bundle is known as an EtherChannel, or a port-channel interface. (This option is available only on ASA 8.4+ devices.) Refer to [Configuring EtherChannels , on page 1814](#), for more information.
- **VNI Interface** – Choose this option to configure a VNI interface. They are virtual interfaces that keep network traffic separated on a given physical interface by using tagging. You apply your security policy directly to each VNI interface. All VNI interfaces are associated with the same VTEP interface. Refer to [Configuring VNI Interfaces , on page 1819](#), for more information.
- **Loopback** – Choose this option to configure the VTI loopback interface to support the configuration of site-to-site VPN topologies. VTI loopback interface, when enabled, helps in overcoming the path

failures when the VPN tunnels are unreachable. Refer to [Configuring Loopback Interface](#), for more information.

- Tunnel— Choose this option to configure a logical interface -VTI, to support route based VPN method for the Site-to-Site VPN topologies. Refer to [Configuring Tunnel Interface, on page 1827](#), for more information.
- Below the Type option, the dialog boxes present up to three tabbed panels. Again, this depends on device type, operating-system version and operating mode.

The PIX 7.0+ Add Interface and Edit Interface dialog boxes present two tabbed panels: General and Advanced. The ASA 7.0+ Add Interface and Edit Interface dialog boxes present three tabbed panels: General, Advanced and IPv6.

The FPR-3100 Add Interface and Edit Interface dialog boxes present three tabbed panels: General, Advanced and IPv6.

The Secure Firewall 4200 series devices Add Interface and Edit Interface dialog boxes present three tabbed panels: General, Advanced and IPv6.

- Configure the General options, as appropriate. This panel is described in [Add/Edit Interface Dialog Box: General Tab \(PIX 7.0+/ASA/FWSM\)](#), on page 1844.
- Configure the Advanced-panel options, as appropriate. This panel is described in [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), on page 1853.
- Configure the IPv6 options, as appropriate. This panel is described in [Configuring IPv6 Interfaces \(ASA/FWSM\)](#), on page 1865.
- Configure the Switch Port options, as appropriate. For more information on the options, see [Add/Edit Interface Dialog Box: Switch Port Tab, on page 1878](#).
- Configure the Power Over Ethernet options, as appropriate. For more information on the options, see [Add/Edit Interface Dialog Box: Power Over Ethernet Tab, on page 1878](#).
- When you have finished configuring this interface, click **OK** to close the dialog box and return to the device Interfaces page.

### Add/Edit Interface Dialog Box: General Tab (PIX 7.0+/ASA/FWSM)

The [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842, is used to define and configure interfaces, subinterfaces, VLAN interfaces, and redundant, and EtherChannel interfaces on firewall devices. You can access the Add/Edit Interface dialog box from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837 for more information.

---

**Note** In the following descriptions, the term “interface” may be used generically to refer to any of these types of interface.

---

The General panel of this dialog box is used to configure general interface settings, including Name, Security Level and IP Type parameters. Note that many of the parameters presented in this panel vary according to device type and version, operational mode (routed versus transparent), and whether the device hosts a single or multiple contexts. Thus, some of the options in the following table may not appear for the device you are configuring.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | <p>Enables this interface to pass traffic.</p> <p>By default, all physical interfaces are shut down. Traffic cannot traverse an interface of any type if the interface is not enabled. If you are defining a logical interface such as a subinterface, enable the physical interface it will be associated with before defining the subinterface. If you are defining a redundant interface or an EtherChannel interface, enable the member interfaces before defining the group interface.</p> <p>When you check this option, you must also specify a Name and, in routed mode, an IP Type (or IP Address and Subnet Mask on an FWSM or ASA-SM) before traffic can pass according to your security policy.</p> <p>In multiple-context mode, if you allocate a physical or logical interface to a context, the interface is enabled by default in the context. However, before traffic can pass through the context interface, you must also enable the interface in the system configuration. If you shut down an interface in the system execution space, that interface is shut down in all contexts in which it shared.</p> |
| Management Only  | <p>Reserves this interface for device administration. Only traffic for management of this device is accepted; pass-through traffic for other interfaces and devices is rejected.</p> <p>You cannot set a Primary or Secondary ISP interface to be Management Only.</p> <p>Defining a management-only EtherChannel interface has certain member-interface restrictions. See <a href="#">Configuring EtherChannels , on page 1814</a>, for more information.</p> <p><b>Note</b> This is not available on devices in transparent mode. If an interface is assigned as Management Only, then Route Map cannot be assigned to that interface. In other words, either Management Only or Route Map can be assigned to an interface but not both.</p>                                                                                                                                                                                                                                                                                                                                                                                  |

| Element   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | <p>On the ASA 5505, the Hardware Port is specified on the Hardware Ports panel (see <a href="#">Configuring Hardware Ports on an ASA 5505</a>, on page 1879). Also, this option is not part of Catalyst 6500 services module (ASA-SM and FWSM) configuration.</p> <p>For a physical interface, provide the specific hardware port assigned to the interface: enter a physical port ID, which includes network type, slot and port number, in the form: <i>type[slot/]port</i>. This is also the name by which subinterfaces can be associated with the interface.</p> <p>The network type specified for the physical interface can be either Ethernet or GigabitEthernet; on the ASA 5580, TenGigabitEthernet is also available. This field provides automatic pattern matching: if you begin typing with the letter e, “Ethernet” is inserted into the field. Similarly, typing the letter g produces “GigabitEthernet.” Therefore, valid values are:</p> <ul style="list-style-type: none"> <li>• Ethernet0 to Ethernet<i>n</i></li> <li>• GigabitEthernet0 to GigabitEthernet<i>n</i></li> <li>• GigabitEthernets /<i>n</i></li> <li>• TenGigabitEthernets /<i>n</i> (ASA 5580 only)</li> </ul> <p>where <i>s</i> represents a slot number, and <i>n</i> represents a port number, up to the maximum number of network ports in the slot or device.</p> <p>For an ASA 5500 series appliance, enter the type and a slot/port pair; for example, <i>gigabitethernet0/1</i>. Ports that are built into the chassis are assigned to slot 0, while ports on the 4-Port Gigabit Ethernet Security Services Module (4GE SSM) are assigned to slot 1. When you enter a slot/port pair, the Media Type options are enabled.</p> <p>The ASA 5500 series appliances also include a <b>management</b> interface type. The management interface is a Fast Ethernet interface designed for device-management traffic only, and is specified as <i>management0/0</i>. You can, however, use this physical interface for through traffic if desired (be sure the Management Only option is not selected). Thus, in transparent firewall mode, you can use the management interface in addition to the two interfaces allowed for through traffic. You can also add subinterfaces to the management interface to provide management in each security context in multiple-context mode.</p> <p>If you are defining a subinterface, you can simply choose the desired Hardware Port from a list of previously defined ports (you must also supply a VLAN ID). If you do not see a desired interface ID, be sure that Interface is defined and enabled.</p> |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name           | <p>Provide an identifier for this interface of up to 48 characters in length. The name should be a memorable name for the interface that relates to its use. However, if you are using failover, do not name interfaces that you are reserving for failover communications; this includes an EtherChannel intended for failover, as well as its member interfaces. Also, do not name interfaces intended for use as a member of a redundant-interface pair.</p> <p>Certain names are reserved for specific interfaces, in accordance with the interface naming conventions of the security appliance. As such, these reserved names enforce default, reserved security levels, as follows:</p> <ul style="list-style-type: none"> <li>• Inside – Connects to your internal network. Must be the most secure interface.</li> <li>• DMZ – “Demilitarized zone” attached to an intermediate interface. DMZ is also known as a perimeter network. You can name a DMZ interface any name you choose. Typically, DMZ interfaces are prefixed with “DMZ” to identify the interface type.</li> <li>• Outside – Connects to an external network or the Internet. Must be the least secure interface.</li> </ul> <p>Similarly, a subinterface name typically identifies its associated interface, in addition to its own unique identifier. For example, <i>DMZoobmgmt</i> could represent an out-of-band management network attached to the DMZ interface.</p> <p><b>Note</b> Again, <b>do not name the interface if you intend to use it for failover, or as a member of a redundant interface</b>. See <a href="#">Configuring Redundant Interfaces</a> , on page 1813 for more information.</p> |
| Security Level | <p>Specify the security level of the interface: enter a value between 0 (least secure) and 100 (most secure). The security appliance lets traffic flow freely from an inside network to an outside network (lower security level). Many other security features are affected by the relative security level of two interfaces.</p> <ul style="list-style-type: none"> <li>• The <i>outside</i> interface is always 0.</li> <li>• The <i>inside</i> interface is always 100.</li> <li>• DMZ interfaces are between 1 and 99.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Media Type      | <p>When Interface is the chosen Type and you enter a hardware port ID with slot/port numbers in the Hardware Port field, these options are enabled. (These options apply to ASA slot/port interfaces only.)</p> <p>For all ASA 5500 series appliances, except the 5505, ports that are built into the chassis are assigned to slot 0, while ports on the 4GE SSM are assigned to slot 1. By default, all connectors used on an ASA are RJ-45 connectors. However, the ports on the 4GE SSM can include fiber SFP connectors. As part of the interface configuration for one of these fiber-based connections, you must change the Media Type setting from the default (RJ45) to the fiber-connector setting (SFP).</p> <p>Fiber-based interfaces do not support duplexing and have a fixed speed, so the Duplex option is disabled, and the Speed options are limited to auto and nonegotiate.</p> <p>Select the connector type used by this slot-1 interface:</p> <ul style="list-style-type: none"> <li>• <b>RJ45</b> – The port uses RJ-45 (copper) connectors.</li> <li>• <b>SFP</b> – The port uses fiber SFP connectors. Required for 10-Gigabit Ethernet cards.</li> </ul> |
| VLAN ID         | <p>When Subinterface is the chosen interface Type, or when you are defining a logical interface on a device operating in transparent mode, on an ASA 5505, or on a Catalyst 6500 services module (ASA-SM or FWSM), provide a VLAN ID for this interface.</p> <p>For PIX/ASA devices running operating system 7.2(2)18 or earlier, valid VLAN IDs are 1 to 1001; with version 7.2(2)19 or later, valid IDs are 1 to 4090. For Catalyst 6500 services modules, valid IDs are 1 to 4096. The specified VLAN ID must not be in use on any connected device.</p> <p>Some VLAN IDs might be reserved on connected switches; see the switch documentation for more information. In multiple-context mode, you can only set the VLAN ID in the system configuration.</p> <p>See <a href="#">Configuring Subinterfaces (PIX/ASA)</a>, on page 1811 for more information.</p>                                                                                                                                                                                                                                                                                                               |
| Subinterface ID | <p>When Subinterface is the chosen interface Type, or when defining an interface on a device operating in transparent mode, provide an integer between 1 and 4294967293 as the Subinterface ID.</p> <p>For subinterface port identification, this ID is appended to the chosen Hardware Port. For example, <i>GigabitEthernet0.4</i> represents the subinterface assigned an ID of 4, operating on the port GigabitEthernet0.</p> <p><b>Note</b> You cannot change the Subinterface ID after you set it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Route Map       | <p>Select the Route Map from the Route Map Object Selector dialog box.</p> <p><b>Note</b> Except VNI Interface, all other interface types support Policy Based Routing for ASA devices running the software version 9.4(1) or later. VNI Interface supports Policy Based Routing for ASA devices running the software version 9.5(1) or later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Path Monitoring   | <p>Select the value from the drop-down list. Following are the values available:</p> <ul style="list-style-type: none"> <li>• <b>peer-ipv4</b></li> <li>• <b>peer-ipv6</b></li> <li>• <b>auto</b></li> <li>• <b>None</b></li> </ul> <p><b>Note</b> Enter the ip address if you select <b>peer-ipv4</b> and <b>peer-ipv6</b>.</p> <p>Path monitoring, when configured on interfaces, derive metrics such as round trip time (RTT), jitter, mean opinion score (MOS), and packet loss per interface. These metrics are used to determine the best path for routing PBR traffic.</p> |
| Policy Route Cost | Enter value between 1-65535. The default value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| IP Type           | <p><b>PIX 7.0+ and ASA (except the 5505 in transparent mode) only.</b></p> <p>The IP Type defines the type of IP addressing used for the interface; choose <b>Static IP</b>, <b>Use DHCP</b>, or <b>PPPoE</b> (as described in <a href="#">Device Interface: IP Type (PIX/ASA 7.0+)</a>, on page 1875).</p> <p><b>Note</b> You can configure DHCP and PPPoE only on the outside interface of a security appliance.</p>                                                                                                                                                            |

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| IP Address<br>Subnet Mask | <p><b>Catalyst 6500 services modules (ASA-SMs and FWSMs) in routed mode only.</b></p> <p>Use these two fields to assign an IP address and subnet mask to the VLAN interface. The IP address must be unique for each interface.</p> <p>The Subnet Mask can be expressed in dotted decimal format (for example, 255.255.255.0), or by entering the number of bits in the network mask (for example, 24).</p> <p>Till Version 4.12, 255.255.255.254 and 255.255.255.255 were not to be used for an interface connected to the network because it would stop traffic on that interface.</p> <p>Beginning from Version 4.13, /31 subnet mask (or 255.255.255.254) is supported for a point to point interface connected to the network. Cisco Security Manager displays a warning message on saving the interface record.</p> <p>If you omit the Subnet Mask value, a “classful” network is assumed, as follows:</p> <ul style="list-style-type: none"> <li>• The Class A netmask (255.0.0.0) is assumed if the first octet of the IP Address is 1 through 126 (that is, addresses 1.0.0.0 through 126.255.255.255).</li> <li>• Subnet Mask</li> </ul> <p>The Class B netmask (255.255.0.0) is assumed if the first octet of the IP Address is 128 through 191 (that is, addresses 128.0.0.0 through 191.255.255.255).</p> <ul style="list-style-type: none"> <li>• The Class C netmask (255.255.255.0) is assumed if the first octet of the IP Address is 192 through 223 (that is, addresses 192.0.0.0 through 223.255.255.255).</li> </ul> <p><b>Note</b> Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.</p> |
| Description               | <p>You can enter an optional description of up to 240 characters on a single line, without carriage returns. In multiple-context mode, the system description is independent of the context description.</p> <p>For a failover or state link, the description is fixed as “LAN Failover Interface,” “STATE Failover Interface,” or “LAN/STATE Failover Interface,” for example. You cannot edit this description. The fixed description overwrites any description you enter here if you make this interface a failover or state link.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                           | <p>Redundant Interface; these options not available on ASA 5505 devices or Catalyst 6500 services modules (ASA-SMs and FWSMs).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Redundant ID              | <p>When Redundant Interface is the chosen interface Type, provide an identifier for this redundant interface; valid IDs are the integers from 1 to 8.</p> <p>See <a href="#">Configuring Redundant Interfaces</a> , on page 1813 for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Primary Interface<br>Secondary Interface                              | <p>When Redundant Interface is the chosen interface Type, choose the primary member of the redundant interface pair from the Primary Interface list of available interfaces. Available interfaces are presented by Hardware Port IDs, as named interfaces cannot be used for a redundant interface pair.</p> <p>Similarly, choose the secondary member of the redundant interface pair from the Secondary Interface list of available interfaces.</p> <p><b>Note</b> Member interfaces must be enabled and of the same type (e.g., GigabitEthernet), and cannot have a Name, IP Address, or Security Level assigned. In fact, do not configure any options other than Duplex and Speed on the member interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| These options available on ASA 5505 devices only.                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Block Traffic To                                                      | Restricts this VLAN interface from initiating contact with the VLAN chosen here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Backup Interface                                                      | Choose a VLAN interface as a backup interface, for example, to an ISP. The backup interface does not pass traffic unless the default route through the primary interface fails. To ensure that traffic can pass over the backup interface, be sure to configure default routes on both the primary and backup interfaces so that the backup interface can be used when the primary fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Active MAC Address<br>Standby MAC Address                             | <p>Use the Active MAC Address field to manually assign a private MAC address to the interface; the Standby MAC Address field can be used to set a standby MAC address for use with device-level failover.</p> <p>Refer to <a href="#">Device Interface: MAC Address</a>, on page 1877 for more information about these fields.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| EtherChannel Interface options; available on ASA 8.4.1+ devices only. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| EtherChannel ID                                                       | When EtherChannel is the chosen interface Type, enter an identifier for this EtherChannel (also referred to as a “port-channel”). Valid values are 1 to 48—you can define up to 48 port-channel groups. See <a href="#">Configuring EtherChannels</a> , on page 1814, for more information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Available Interfaces/Members in Group                                 | <p>When EtherChannel is the chosen interface Type, you can assign interfaces to this EtherChannel group by selecting them in the Available Interfaces list and then clicking the &gt;&gt; button to add them to the members list to the right.</p> <p>You can assign up to 16 interfaces to a channel group. For ASA 9.2(1) and later, each channel group can have up to 16 active interfaces. For switches that support only eight active interfaces and for ASA versions earlier than 9.2(1), only eight interfaces can be active, the remaining interfaces can act as standby links in case of interface failure. Alternatively, you can create a static EtherChannel by setting LACP Mode to On (on the Advanced tab, see <a href="#">Add/Edit Interface Dialog Box: Advanced Tab (ASA/PIX 7.0+)</a>, on page 1853), which means all interfaces in the group can pass traffic.</p> <p><b>Note</b> All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the type and speed for the group.</p> <p>See <a href="#">Configuring EtherChannels</a>, on page 1814, for more information.</p> |

## Add/Edit Interface Dialog Box: Cisco Firepower 9000 (General and Advanced tabs)

For the elements supported in Cisco Firepower 9000 devices for the General and Advanced tabs, see the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842. In addition, the following changes are applicable only to Cisco Firepower 9000 devices.

**Table 562: Add/Edit Interface Dialog Box Cisco Firepower 9000**

| Element                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type                                                                             | Choose the type of interface. Redundant Interfaces are not supported in Cisco Firepower 9000 devices.                                                                                                                                                                                                                                                                                                                                                                                 |
| Management Only Individual                                                       | Applicable only in Cisco Firepower 9000 devices and only if the device is in cluster mode.<br><br><b>Note</b> You cannot enable both Management Only and Management Only Individual check boxes at the same time. You can configure Cluster pool only when Management Only Individual check box is selected.                                                                                                                                                                          |
| Name                                                                             | Provide an interface name up to 48 characters in length. The Name should be a memorable name for the interface that relates to its use.<br><br>The Interface name must begin with “Ethernet” and must have the following format:<br><br>Ethernet[slot]/[port]/sub-port, where, <ul style="list-style-type: none"> <li>• slot is between 1 and 3</li> <li>• port is between 1 and 8</li> <li>• sub-port is between 1 and 4</li> <li>• sub-port is not applicable for slot 1</li> </ul> |
| <b>The following elements are not supported in Cisco Firepower 9000 devices:</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Media Type (General Tab)                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Add/Edit Interface Dialog Box: Advanced Tab (ASA/PIX 7.0+)

The [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842, is used to define and configure interfaces, subinterfaces, redundant, and EtherChannel interfaces on ASA and PIX 7.0+ devices. You can access the Add/Edit Interface dialog box from the Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837 for more information.

The Advanced panel of this dialog box is used to configure basic interface settings, including Duplex, Speed, and maximum transmission unit (MTU) parameters, as described in the following table.

| Enable Flow Control                       | <p>If you choose <b>Physical Interface</b>, you can configure the <b>Enable Flow Control</b> option to control the packet flow.</p> <p><b>Enable Flow Control</b> send configuration is supported in the following Secure Firewall devices:</p> <ul style="list-style-type: none"> <li>• FPR-3110</li> <li>• FPR-3120</li> <li>• FPR-3130</li> <li>• FPR-3140</li> <li>• FPR-4215</li> <li>• FPR-4225</li> <li>• FPR-4245</li> </ul> <p><b>Note</b>      <b>Enable Flow Control</b> configuration is applicable to ASA 9.18(1) and higher devices only.</p>                                                               |
| MTU                                       | Specify the maximum packet size in bytes; that is, the maximum transmission unit (MTU). The value depends on the type of network connected to the interface. Valid values are 64 to 9198 bytes. Default is 1500 for all types except PPPoE, for which the default is 1492. In multiple-context mode, set the MTU in the context configuration.                                                                                                                                                                                                                                                                            |
| Active MAC Address<br>Standby MAC Address | <p><b>Available only on PIX 7.2+ and ASA 7.2+ devices.</b></p> <p>Use the Active MAC Address field to manually assign a private MAC address to the interface; the Standby MAC Address field can be used to set a standby MAC address for use with device-level failover.</p> <p>Refer to <a href="#">Device Interface: MAC Address</a>, on page 1877 for more information about these fields.</p>                                                                                                                                                                                                                         |
| Roles                                     | <p>All interface roles assigned to this interface are listed in this field. Role assignments are based on pattern matching between the Name given to this interface and all currently defined Interface Role objects in Cisco Security Manager.</p> <p>Interface role objects are replaced with the actual interface IP addresses when the configuration is generated for each device. They allow you to define generic rules—ones that can apply to multiple interfaces.</p> <p>For more information on roles and how to define and use them, see <a href="#">Understanding Interface Role Objects</a>, on page 301.</p> |
| MAC Address                               | Site specific MAC address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Site ID                                   | Site ID to specify the site the current unit belongs to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                                                              | Beginning with Security Manager version 4.9 for ASA devices running the software version 9.5(1) or later, you can use inter-site clustering for Spanned EtherChannels in routed mode. To avoid MAC address flapping, configure a site ID for each cluster member so that a site-specific MAC address for each interface can be shared among a site's units.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>EtherChannel Interface options; available on ASA 8.4.1+ devices only.</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Load Balancing                                                               | When EtherChannel is the chosen interface Type (on the General panel), choose a load-balancing method for the channel links. See <a href="#">About EtherChannel Load Balancing</a> , on page 1818, for more information about this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| LACP Mode                                                                    | <p>Select the desired <b>LACP Mode</b>; the default is Active, which means up to eight interfaces are active, while up to eight are in stand-by mode, as determined by the Minimum and Maximum values under Active Physical Interfaces.</p> <p>If you select On, a static port-channel is created in which all member interfaces are all “on,” meaning you can have up to 16 ports passing traffic, with no stand-by ports. When you select this option, the Mode for all interfaces assigned to this EtherChannel group is switched to On (if the Mode for each is not already On). See <a href="#">Editing LACP Parameters for an Interface Assigned to an EtherChannel</a>, on page 1816, for more information about this mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Active Physical Interfaces                                                   | <p>When EtherChannel is the chosen interface Type (on the General panel), specify the minimum and maximum number of interfaces that can be active for this EtherChannel group:</p> <ul style="list-style-type: none"> <li>• <b>Minimum</b> – Specify the minimum number of active interfaces for this group. For ASA 9.2(1)+, you can specify a value from 1 to 16; for earlier versions, enter a value from 1 to 8.</li> </ul> <p>If the active interfaces in the channel group falls below this value, then the port-channel interface goes down, and could trigger a device-level failover.</p> <ul style="list-style-type: none"> <li>• <b>Maximum</b> – Specify the maximum number of interfaces that can be active. For ASA 9.2(1)+, you can specify a value from 1 to 16; for earlier versions, enter a value from 1 to 8.</li> </ul> <p>For 16 active interfaces, be sure that your switch supports the feature (for example, the Cisco Nexus 7000 with F2-Series 10 Gigabit Ethernet Module). If your switch does not support 16 active interfaces, be sure to set this command to 8 or fewer.</p> <p>Interfaces available to the channel are selected on the General tab of this dialog box ( <a href="#">Add/Edit Interface Dialog Box: General Tab (PIX 7.0+/ASA/FWSM)</a>, on page 1844).</p> <p>Specifying 3, 5, 6, or 7 active ports in an EtherChannel bundle provides poor load balancing, because some ports get up to twice the load of others. We recommend specifying 2, 4, or 8 active ports per EtherChannel to achieve effective load balancing. (A value of 1 provides no load balancing at all.)</p> |

| Element                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Use a comma to separate multiple values. You can configure a maximum of 4 interface-specific DHCP relay servers and a maximum of 10 global and interface-specific DHCP relay servers combined.</p> <p><b>Note</b> IPv6 is not supported for interface-specific servers.</p> <p>When a DHCP request enters an interface, the DHCP servers to which the ASA relays the request depends on your configuration. You can configure the following types of servers:</p> <ul style="list-style-type: none"> <li>• Interface-specific DHCP servers—When a DHCP request enters a particular interface, then the ASA relays the request only to the interface-specific servers.</li> <li>• Global DHCP servers—When a DHCP request enters an interface that does not have interface-specific servers configured, the ASA relays the request to all global servers. If the interface has interface-specific servers, then the global servers are not used. For more information, see <a href="#">DHCP Relay Page</a> , on page 2010.</li> </ul> |
| DHCP Relay Trust Info (Option 82)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Specifies that you want to trust this DHCP client interface. You can configure interfaces as trusted interfaces to preserve DHCP Option 82.</p> <p><b>Note</b> You can also trust all DHCP client interfaces. For more information, see <a href="#">DHCP Relay Page</a> , on page 2010.</p> <p>DHCP Option 82 is used by downstream switches and routers for DHCP snooping and IP Source Guard. Normally, if the ASA DHCP relay agent receives a DHCP packet with Option 82 already set, but the giaddr field (which specifies the DHCP relay agent address that is set by the relay agent before it forwards the packet to the server) is set to 0, then the ASA will drop that packet by default. You can now preserve Option 82 and forward the packet by identifying an interface as a trusted interface.</p>                                                                                                                                                                                                                                                                                                                                                                                 |

| <p>SGT plus Ethernet Tagging, also called Layer 2 SGT Imposition, enables the ASA to send and receive security group tags on Ethernet interfaces using Cisco proprietary Ethernet framing (EtherType 0x8909), which allows the insertion of source security group tags into plain-text Ethernet frames. The ASA inserts security group tags on the outgoing packet and processes security group tags on the incoming packet, based on a manual per-interface configuration. This feature allows inline hop-by-hop propagation of endpoint identity across network devices and provides seamless Layer 2 SGT Imposition between each hop.</p> <p><b>Note</b> Supported only on physical interfaces, VLAN interfaces, port channel interfaces, and redundant interfaces. Not supported on logical interfaces or virtual interfaces, such as BVI, TVI, and VNI. Does not support failover links or cluster control links.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Tag egress packets with secure group tags                                                                                                     | Enables propagation of a security group tag (called sgt) on an interface.                                                                                                                                                                                                                                                                                                                 |
| Assign a static secure group tag to all ingress packets                                                                                       | Applies a static security group tag to incoming traffic from the peer. If enabled, you must specify the SGT number to use in the Secure Group Tag field.                                                                                                                                                                                                                                  |
| Secure Group Tag                                                                                                                              | Specifies the SGT number to apply to incoming traffic from the peer. Valid values are from 2-65519.                                                                                                                                                                                                                                                                                       |
| Trusted Interface                                                                                                                             | Indicates that ingress traffic on the interface should not have its existing SGT overwritten with the static SGT specified.                                                                                                                                                                                                                                                               |
| <b>ASA Cluster (Layer 3); available on ASA 5580 and 5585 devices in cluster mode only.</b>                                                    |                                                                                                                                                                                                                                                                                                                                                                                           |
| Supported by all interfaces when ASA cluster is in Router mode and supported by management interface when ASA cluster is in Transparent mode. |                                                                                                                                                                                                                                                                                                                                                                                           |
| IPv4 Address Pool                                                                                                                             | Enter or select the IPv4 Pool object that represents the pool of addresses to use.                                                                                                                                                                                                                                                                                                        |
| MAC Address Pool                                                                                                                              | Enter or select the MAC Pool object that represents the pool of MAC addresses to use.                                                                                                                                                                                                                                                                                                     |
| <b>ASA Cluster (Layer 2); available on ASA 5580 and 5585 devices in cluster mode only.</b>                                                    |                                                                                                                                                                                                                                                                                                                                                                                           |
| Supported on EtherChannel interfaces for ASA clusters. Not supported on Management interface when ASA cluster is in Transparent mode.         |                                                                                                                                                                                                                                                                                                                                                                                           |
| Span EtherChannel across the ASA Cluster                                                                                                      | Select to configure an EtherChannel that spans all ASAs in the cluster, and provides load balancing as part of the EtherChannel operation.                                                                                                                                                                                                                                                |
| Enable load balancing between switch pairs in VSS or vPC mode                                                                                 | (Optional) If you are connecting the ASA to two switches in a Virtual Switching System (VSS) or Virtual Port Channel (vPC), then you should enable load balancing by checking the <b>Enable load balancing between switch pairs in VSS or vPC mode</b> check box. This feature ensures that the physical link connections between the ASAs to the VSS (or vPC) pair are balanced.         |
| Member Interface Configuration                                                                                                                | Identifies the LACP mode for the interface and the Virtual Switching System (VSS) or Virtual Port Channel (vPC) switch to which a given interface is connected, 1 or 2.                                                                                                                                                                                                                   |
| Advanced tab options specific to ASA 5505 devices (routed mode only)                                                                          |                                                                                                                                                                                                                                                                                                                                                                                           |
| Block Traffic To                                                                                                                              | Restricts this VLAN interface from initiating contact with the VLAN chosen here.                                                                                                                                                                                                                                                                                                          |
| Backup Interface                                                                                                                              | Choose a VLAN interface as a backup interface, for example, to an ISP. The backup interface does not pass traffic unless the default route through the primary interface fails. To ensure that traffic can pass over the backup interface, be sure to configure default routes on both the primary and backup interfaces so that the backup interface can be used when the primary fails. |

| Element                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

See <a href="#">Add/Edit Bridge Group Dialog Box</a> , on page 1881 for more information.                                                                                                                                                                                                                                                                                             |
| ASR Group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | To add this interface to an asymmetric routing group, enter the ASR group number in this field. Stateful failover must be enabled for asymmetric routing support to function properly between units in failover configurations. Valid values for ASR group range from 1 to 32. See <a href="#">About Asymmetric Routing Groups</a> , on page 1810 for more information.                                                                                                                                                    |
| <p><b>Pause Frame for Flow Control options</b></p> <p>When a network interface gets over loaded, flow control allows it to send PAUSE requests to the devices sending it data to allow the over loaded condition to clear. If flow control is not enabled and an over loaded condition occurs, the device will drop packets.</p> <p>When the receiving part of the interface reaches the high water mark, the transmitting part of the interface starts to generate pause frames. The remote device is expected to stop / reduce the transmission of packets for the pause time mentioned in the pause frame. If the receiving part of the interface is able to clear its queue or reaches the low water mark within the pause time, the transmitting part of the interface sends out a special pause frame that mentions the pause time as zero. This enables the remote device to start to transmit packets. If the receiving part of the interface still works on the queue, once the pause time expires, the transmitting part of the interface sends a new pause frame again with a new pause time.</p> <p><b>Note</b> Pause Frame for flow control is supported only on physical interfaces on ASA 8.2 and above, in the single and multi-context mode. It is not supported on logical interfaces or virtual interfaces, such as BVI, TVI, and VNI.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

After the interface sends a pause frame, when the buffer usage is reduced below the low-water mark, the interface sends an "transmission on" frame. The remote device can resume transmitting data.                                                                                                                                                                                                                                                                                  |
| High Watermark (in Kilobytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Enter a value for the high-water mark. When the buffer usage exceeds the high-water mark, the interface sends a pause frame.                                                                                                                                                                                                                                                                                                                                                                                               |
| Pause Time                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Enter a value for the pause refresh threshold value, between 0 and 65535 slots. Each slot is the amount of time to transmit 64 bytes, so the time per unit depends on your link speed. The remote device can resume traffic after receiving an transmission on frame, or after the transmission off frame expires, as controlled by this timer value in the pause frame. If the buffer usage is consistently above the high-water mark, pause frames are sent repeatedly, controlled by the pause refresh threshold value. |

Table 564: Device specific Pause Frame Flow Control values

| Device Type   | Low Watermark Range (in Kb)                                        | Default Low Watermark (in Kb) | High Watermark Range(in Kb) | Default High Watermark(in Kb) | Range of Pause Time | Default Pause Time |
|---------------|--------------------------------------------------------------------|-------------------------------|-----------------------------|-------------------------------|---------------------|--------------------|

### Configuring IPv6 Interfaces (ASA/FWSM)

When Interface, Subinterface, Redundant, or EtherChannel is the chosen Type in the Add Interface or Edit Interface dialog box, the dialog box presents three tabbed panels of options: General, Advanced and IPv6. The options provided by the **IPv6** panel are described in this section.

**Note** These options are available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

#### Navigation Path

You can access the IPv6 panel in the Add Interface and Edit Interface dialog boxes, which are accessed from the ASA or FWSM Interfaces page, as described in [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837.

| Enable IPv6    | Check this box to enable IPv6 and configure IPv6 addresses on this interface. You can deselect this option to disable IPv6 on the interface, but retain the configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enforce EUI-64 | <p>When selected, use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link is enforced.</p> <p>When this option is enabled on an interface, the source addresses of IPv6 packets received on the interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the interface identifier in an IPv6 packet is not in the Modified EUI-64 format, the packet is dropped and the following system log message is generated:</p> <pre>%PIX ASA-3-325003: EUI-64 source address check failed.</pre> <p>Address format verification is performed only when a flow is created. Packets from an existing flow are not checked. Additionally, address verification can be performed only for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.</p> <p>The Modified EUI-64 format interface identifier is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link-layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64-bit interface ID of 02E0:B6FF:FE01:3B7A.</p> |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| DAD Attempts        | <p>To specify the number of consecutive neighbor solicitation messages that are sent on an interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection on the interface. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre>%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval         | <p>The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Reachable Time      | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Managed Config Flag | Whether or not to set the flag "managed-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Other Config Flag   | Whether or not to set the flag "other-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable RA                | <p>When checked, IPv6 router advertisement transmissions are enabled on the interface. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• <b>RA Lifetime</b> – The “router lifetime” value specifies how long nodes on the local link should consider the security appliance as the default router on the link. Valid values range from 0 to 9000 seconds; the default is 1800 seconds. Entering 0 indicates that the security appliance should not be considered a default router on the selected interface.</li> </ul> <p>Any non-zero value should not be less than the following RA Interval value.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval</b> – The interval between IPv6 router advertisement transmissions on this interface. Valid values range from 3 to 1800 seconds, (or from 500 to 1800000 milliseconds if the following RA Interval in Milliseconds option is checked); the default is 200 seconds.</li> </ul> <p>The interval between transmissions should be less than or equal to the RA Lifetime value if it is non-zero. To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the desired value.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval in Milliseconds</b> – Checking this option indicates that the provided RA Interval value is in milliseconds, rather than seconds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Interface IPv6 Addresses | <p>The IPv6 addresses assigned to the interface are specified in this section of the dialog box.</p> <ul style="list-style-type: none"> <li>• <b>Link-Local Address</b> – To override the link-local address that is automatically generated for the interface, enter the desired IPv6 link-local address in this field.</li> </ul> <p>The link-local address is composed of the link-local prefix FE80::/64 and the interface ID in Modified EUI-64 format. For example, an interface with a MAC address of 00E0.B601.3B7A would have a link-local address of FE80::2E0:B6FF:FE01:3B7A. An error will occur if another host is using the specified address.</p> <ul style="list-style-type: none"> <li>• <b>Enable Address Auto-Configuration</b> – Select this option to enable automatic configuration of IPv6 addresses on the interface using stateless autoconfiguration. The addresses are configured based on the prefixes received in Router Advertisement (RA) messages. If a link-local address has not been configured, then one is automatically generated for this interface. An error occurs if another host is already using the generated link-local address.</li> <li>• <b>Trust the DHCP Servers for default gateway</b>– Select this radio button to install a default route from Router Advertisements that come from a trusted source - the directly-connected network.</li> <li>• <b>Ignore trust and accept router advertisements</b> – Select this radio button to install a default route from Router Advertisements that come from another network.</li> <li>• The table in this section displays the IPv6 addresses assigned to this interface. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables</a> , on page 50.)</li> </ul> <p>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box</a> , on page 1869.</p> |

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Interface IPv6 Prefixes | <p>Use the table in this section to configure which IPv6 prefixes (that is, the network portion of the IPv6 addresses) are included in IPv6 router advertisements. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables , on page 50.</a>)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Prefix Editor Dialog Box , on page 1871.</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Interface IPv6 DHCP     | <p>Use this section to enable the DHCPv6 Prefix Delegation client on one or more interfaces. The ASA obtains one or more IPv6 prefixes that it can subnet and assign to inside networks. Typically, the interface on which you enable the prefix delegation client obtains its IP address using the DHCPv6 address client; only other ASA interfaces use addresses derived from the delegated prefix.</p> <p>Select one of the following:</p> <ul style="list-style-type: none"> <li>• Server Pool – Select this to configure the IPv6 DHCP pool that contains the information you want the DHCPv6 server to provide. You can configure separate pools for each interface if you want, or you can use the same pool on multiple interfaces. Use the Add Row and Edit Row buttons in the DHCP Pool Selector dialog to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables , on page 50.</a>) Add Row and Edit Row open the <a href="#">Add or Edit DHCPv6 Pool Dialog Box , on page 1873.</a></li> </ul> <p>OR</p> <ul style="list-style-type: none"> <li>• Client Prefix Delegation Name – Enable the DHCPv6 Prefix Delegation client by entering a name for the prefix(es) obtained on this interface. Valid values are a string not exceeding 200 characters. <ul style="list-style-type: none"> <li>• DHCPv6 Prefix Hint – Use the Add Row button to provide one or more hints about the delegated prefix that you want to receive. Typically you want to request a particular prefix length, such as <code>::/60</code>, or if you have received a particular prefix before and want to ensure you get it again when the lease expires, you can enter the whole prefix as the hint. If you enter multiple hints (different prefixes or lengths), then it is up to the DHCP server which hint to honor, or whether to honor the hint at all.</li> </ul> </li> </ul> <p><b>Note</b> If the prefix suggested as the hint is a valid prefix in the associated local prefix pool and is not assigned elsewhere, the server delegates the client-suggested prefix. Otherwise, the hint is ignored and a prefix is delegated from the free list in the pool.</p> <ul style="list-style-type: none"> <li>• Enable DHCP – Select this to obtain an address using DHCPv6. Optionally, select Enable Default Route to obtain a default route from Router Advertisements.</li> </ul> |
| <b>Note</b>             | If a DHCPv6 client or Server Pool is configured on an IPv6 Interface, the same interface cannot be used to configure DHCPv6 Relay.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### IPv6 Address for Interface Dialog Box

This dialog box is used to add or edit an IPv6 address assigned to an ASA or FWSM interface. Multiple IPv6 addresses can be assigned to the interface in the IPv6 panel of the Add Interface or Edit Interface dialog box.

**Note** This dialog box is available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

### Navigation Path

You can access the IPv6 Address for Interface dialog box:

- From the IPv6 panel of the ASA or FWSM Add Interface and Edit Interface dialog boxes.
- From the Management IPv6 page of an ASA 5505 in transparent firewall mode (version 8.2 and 8.3 devices only).

Click the Add Row or Edit Row buttons beneath the table in the Interfaces IPv6 Addresses section to open the dialog box.

**Table 566: IPv6 Address for Interface Dialog Box**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prefix Name | <p>(Optional) Enter a prefix name to use a delegated prefix. Valid values are a string not exceeding 200 characters.</p> <p><b>Tip</b> 'DHCP' is a reserved word; Cisco Security Manager will not accept it as Prefix Name.</p> <p><b>Note</b> Make sure that the DHCPv6 Prefix Delegation Client is enabled on this ASA Interface. For more information, see the Interface IPv6 DHCP element in the <a href="#">Table 565: IPv6 tab: Add/Edit Interface Dialog Box (ASA/FWSM)</a> , on page 1866.</p> |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address/Prefix Length | <p>Enter an IPv6 network address to be assigned to the interface, with its Prefix Length appended, where the Prefix Length integer indicates how many of the high-order, contiguous bits of the address comprise network portion of the address. A slash (/) must precede the Prefix Length. For example, 3FFE:C00:0:1::/64.</p> <p>Typically, the delegated prefix will be /60 or smaller so you can subnet to multiple /64 networks. /64 is the supported subnet length if you want to support SLAAC for connected clients. You should specify an address that completes the /60 subnet, for example ::1:0:0:0:1.</p> <p>Enter :: before the address in case the prefix is smaller than /60. For example, if the delegated prefix is 2001:DB8:1234:5670::/60, then the global IP address assigned to this interface is 2001:DB8:1234:5671::1/64. The prefix that is advertised in router advertisements is 2001:DB8:1234:5671::/64. In this example, if the prefix is smaller than /60, the remaining bits of the prefix will be 0's as indicated by the leading ::. For example, if the prefix is 2001:DB8:1234::/48, then the IPv6 address will be 2001:DB8:1234::1:0:0:0:1/64.</p> |
| EUI-64                | <p>If this box is checked, the EUI-64 interface ID will be used in the low-order 64 bits of the IPv6 address. If the value specified for the Prefix Length is greater than 64 bits, the prefix bits have precedence over the interface ID. An error occurs if another host is using the specified address.</p> <p>The Modified EUI-64 format interface ID is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64 bit interface ID of 02E0:B6FF:FE01:3B7A.</p>                                                                                                                                                                                                                                                                                       |
| IPv6 Address Pool     | Enter or select the IPv6 Pool object that represents the pool of addresses to use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### IPv6 Prefix Editor Dialog Box

This dialog box is used to add or edit an IPv6 prefix (that is, the network portion of an IPv6 address), providing control over individual parameters, including whether the prefix should be included in IPv6 router advertisements. Multiple prefixes can be configured in the IPv6 panel of the ASA or FWSM Add Interface or Edit Interface dialog box.

**Note** This dialog box is available only on ASA 7.0+ devices in routed mode; ASA 8.2+ devices in transparent mode; and FWSM 3.1+ devices in routed mode.

By default, prefixes configured as addresses on an interface are advertised in router advertisements. If you configure specific prefixes for advertisement, then only those prefixes are advertised. The valid and preferred lifetimes are counted down in real time. Alternately, a date can be set to specify the expiration of a prefix. When the expiration is reached, the prefix is no longer advertised.

## Navigation Path

You can access the IPv6 Prefix Editor dialog box from the IPv6 panel of the Add Interface and Edit Interface dialog boxes: click the Add Row or Edit Row buttons beneath the table in the Interfaces IPv6 Prefixes section in either of those dialog boxes.

## Field Reference

*Table 567: IPv6 Prefix Editor Dialog Box*

| Element               | Description                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Address/Prefix Length | Enter an IPv6 network address, with its Prefix Length appended, where the Prefix Length integer indicates how many of the high-order, contiguous bits of the address represent the network portion of the address. A slash (/) must precede the Prefix Length. For example, 3FFE:C00:0:1::/64.                    |
| Default               | If this box is checked, the settings in this dialog box will apply to all prefixes, rather than a single address. (When checked, the Address/Prefix Length field is disabled.)                                                                                                                                    |
| No Advertisements     | When checked, hosts on the local link cannot use the specified prefix in advertisements.                                                                                                                                                                                                                          |
| Off Link              | When checked, the specified prefix is “off-link”; that is, not locally reachable on the link.<br><br>When on-link (the default), the specified prefix is assigned to the link. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be locally reachable on the link. |
| No Auto-Configuration | When checked, hosts on the local link cannot use the specified prefix for IPv6 autoconfiguration.<br><br>When auto-configuration is on (the default), hosts on the local link can use the specified prefix for IPv6 autoconfiguration.                                                                            |

| Element         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Prefix Lifetime | <p>You can expand this section of the dialog box to display the following expiration options:</p> <ul style="list-style-type: none"> <li>• <b>Lifetime Duration</b> – Select this option to define prefix expiration as a length of time; the following options are enabled: <ul style="list-style-type: none"> <li>• <b>Valid Lifetime</b> – The amount of time (in seconds) that the specified IPv6 prefix is advertised as being valid. Enter a value from 0 to 4294967295 seconds. The maximum value represents infinity (that is, the lifetime does not expire), which can also be specified by the checking the <b>Infinite</b> box. The default is 2592000 (30 days).</li> <li>• <b>Preferred Lifetime</b> – The amount of time (in seconds) that the specified IPv6 prefix is advertised as being preferred. Enter a value from 0 to 4294967295 seconds. The maximum value represents infinity (that is, the lifetime does not expire), which can also be specified by the checking the <b>Infinite</b> box. The default is 604800 (7 days). The Preferred Lifetime must be less than or equal to the Valid Lifetime.</li> </ul> </li> <li>• <b>Lifetime Expiration Date</b> – Select this option to define prefix expiration as a specific date. Note that acceptable values for this date can range from today’s date to one year from today’s date. The following options are enabled: <ul style="list-style-type: none"> <li>• <b>Valid</b> – The prefix is advertised as being valid until this date and time are reached. Enter a date in the form Mmm dd yyyy (that is, three-letter month abbreviation, two-digit date, and four-digit year), or click the calendar icon to select a date from a scrolling calendar. Also, enter the time of expiration on the specified date, in the form hh:mm , based on a 24-hour clock.</li> <li>• <b>Preferred</b> – The prefix is advertised as being preferred until this date and time are reached. Enter a date in the form Mmm dd yyyy (that is, three-letter month abbreviation, two-digit date, and four-digit year), or click the calendar icon to select a date from a scrolling calendar. Also, enter the time of expiration on the specified date, in the form hh:mm , based on a 24-hour clock. The Preferred date and time must be earlier than or equal to the Valid date and time.</li> </ul> </li> </ul> |

### Add or Edit DHCPv6 Pool Dialog Box

This dialog box is used to add or edit the DHCPv6 Server Pool. For clients that use StateLess Address Auto Configuration (SLAAC) in conjunction with the Prefix Delegation feature, you can configure the ASA to provide information such as the DNS server or domain name when they send Information Request (IR) packets to the ASA. The ASA only accepts IR packets, and does not assign addresses to the clients.

#### Navigation Path

- Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Pool Objects > DHCPv6 Pool Object** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

OR

- You can access the Add DHCPv6 Pool dialog box from DHCPv6 Pool Selector dialog box: click the Add Row or Edit Row buttons beneath the Available DHCPv6 Pool table. The DHCPv6 Pool Selector dialog box can be accessed from the Server Pool radio button in the Interface IPv6 DHCP section of the IPv6 panel of the Add Interface and Edit Interface dialog box.

| Allow Value Override per Device Overrides Edit button | <p>Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a>, on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a>, on page 244.</p> <p>If you allow device overrides, you can click the <b>Edit</b> button to create, edit, and view the overrides. The <b>Overrides</b> field indicates the number of devices that have overrides for this object.</p> |

### Device Interface: IP Type (PIX/ASA 7.0+)

A security device operating in single-context, routed mode requires IP addressing for its interfaces; however, firewall interfaces do not have IP addresses until you assign them. Note that in transparent mode, the device acts as an access-control bridge (a “bump in the wire”)—you assign different VLANs to each interface, but IP addressing is not necessary.

The Add/Edit Interface dialog box presented for an independent ASA or PIX 7.0+ device in single-context, routed mode includes the section **IP Type**, where you specify the type of IP addressing for the interface and provide related parameters, as described here. (The IP Type section of the Add/Edit Interface dialog box for PIX 6.3 devices is described in [Device Interface: IP Type \(PIX 6.3\)](#), on page 1841.)

In multiple-context mode, interface IP addresses are set in the context configuration.

**Note** Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry. Also, do not specify IP Type information for an interface you intend to use as a redundant interface.

### Step 1

In the Add/Edit Interface dialog box, choose a method for address assignment (**Static IP**, **Use DHCP**, or **PPPoE (PIX and ASA 7.2+)**) from the **IP Type** list, and then provide related parameters, as follows:

- **Static IP** – Provide a static **IP Address** and **Subnet Mask** that represents the security device on this interface’s connected network. The IP address must be unique for each interface.

The Subnet mask can be expressed in dotted decimal format (for example, 255.255.255.0), or by entering the number of bits in the network mask (for example, 24). Beginning from Version 4.13, Cisco Security Manager allows you to use 255.255.255.254 for point to point interface. Do not use 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface. If you omit the Subnet Mask value, a “classful” network is assumed, as follows:

- The Class A netmask (255.0.0.0) is assumed if the first octet of the IP Address is 1 through 126 (i.e., addresses 1.0.0.0 through 126.255.255.255).
- The Class B netmask (255.255.0.0) is assumed if the first octet of the IP Address is 128 through 191 (i.e., addresses 128.0.0.0 through 191.255.255.255).
- The Class C netmask (255.255.255.0) is assumed if the first octet of the IP Address is 192 through 223 (i.e., addresses 192.0.0.0 through 223.255.255.255).

**Note** Do not use addresses previously used for routers, hosts, or any other firewall device commands, such as an IP address in the global pool or a static NAT entry.

- **Use DHCP** – Enables Dynamic Host Configuration Protocol (DHCP) for automatic assignment of an IP address from a DHCP server on the connected network. The following options become available:
  - **DHCP Learned Route Metric** (required) – Assign an administrative distance to the learned route. Valid values are 1 to 255. The administrative distance for learned routes defaults to 1.

All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.

- **Obtain Default Route using DHCP** – Select this option to obtain a default route from the DHCP server so that you do not need to configure a default static route. See also [Configuring Static Routes](#), on page 2244.
- **Enable Tracking for DHCP Learned Route** – If Obtain Default Route using DHCP is selected, you can select this option to enable route tracking via a specific Service Level Agreement (SLA) monitor. The following option becomes available:
  - **Tracked SLA Monitor** – Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface. See [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity](#), on page 2002 for more information.
- **PPPoE (PIX and ASA 7.2+)** – Enables Point-to-Point Protocol over Ethernet (PPPoE) for automatic assignment of an IP address from a PPPoE server on the connected network; this option is not supported with failover. The following options become available:
  - **VPDN Group Name** (required) – Choose the Virtual Private Dialup Network (VPDN) group that contains the authentication method and user name/password to use for network connection, negotiation and authentication. See [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity](#), on page 2002 for more information.
  - **IP Address** – If provided, this static IP address is used for connection and authentication, instead of a negotiated address.
  - **Subnet Mask** – The subnet mask to be used in conjunction with the provided IP Address.
  - **PPPoE Learned Route Metric** (required) – Assign an administrative distance to the learned route. Valid values are 1 to 255; defaults to 1.

All routes have a value or “metric” that represents its priority of use. (This metric is also referred to as “administrative distance.”) When two or more routes to the same destination are available, devices use administrative distance to decide which route to use.

- **Obtain Default Route using PPPoE** – Select this option to obtain a default route from the PPPoE server; sets the default routes when the PPPoE client has not yet established a connection. When using this option, you cannot have a statically defined route in the configuration.
- **Enable Tracking for PPPoE Learned Route** – If Obtain Default Route using PPPoE is selected, you can select this option to enable route tracking for PPPoE-learned routes. The following options become available:
  - **Dual ISP Interface** – If you are defining interfaces for dual ISP support, choose Primary or Secondary to indicate which connection you are configuring.

- **Tracked SLA Monitor** – Required if Enable Tracking for DHCP Learned Route is selected. Enter or Select the name of the SLA monitor object that defines the route tracking (connectivity monitoring) to be applied to this interface. See [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity](#), on page 2002 for more information.

**Note** You can configure DHCP and PPPoE only on the outside interface of a firewall device. If you have already configured PPPoE on the outside interface, it is no longer available as an option.

**Step 2** Continue configuring the device interface in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842.

---

### Device Interface: MAC Address

By default, a physical interface uses its “burned-in” MAC address, and all subinterfaces of a physical interface use the same burned-in MAC address.

A redundant interface uses the MAC address of the first physical interface that you add. If you change the order of the member interfaces in the configuration, then its MAC address changes to match the MAC address of the interface that is now listed first. If you manually assign a MAC address to the redundant interface, that is used regardless of the physical-interface MAC addresses.

Similarly, all interfaces assigned to an EtherChannel group share the same MAC address. By default, the EtherChannel uses the MAC address of the lowest-numbered member interface. However, you can manually configure a MAC address for the EtherChannel to prevent traffic disruption should the low-numbered interface be removed from the group.

You also might want to assign unique MAC addresses to subinterfaces. For example, your service provider might control access based on MAC addresses.

Further, if you use failover, you can provide a standby MAC address. If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

---

**Note** The following options appear only on the Advanced tab of the Add Interface and Edit Interface dialog boxes presented by PIX 7.2+ and ASA 7.2+ devices.

---

(Optional) To manually assign a private MAC address to the current interface:

---

**Step 1** In the Add/Edit Interface dialog box, provide the desired MAC address in the **Active MAC Address** field.

MAC addresses are provided in *H.H.H* format, where *H* is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE.

**Note** In some cases, you may have to press the Tab key after entering the Active MAC Address to activate the Standby MAC Address field.

**Step 2** If desired, provide a **Standby MAC Address** for use with device-level failover.

If the active unit fails over and the standby unit becomes active, the new active unit begins using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

**Step 3** Continue configuring the device interface in the [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842.

### Add/Edit Interface Dialog Box: Switch Port Tab

The Switch Port panel in the Add/Edit Interface dialog box is used to configure settings such as Mode, Access VLAN ID, Trunk Type, and VLAN ID on Firepower 1010 devices.

#### Navigation Path

You can access the Add/Edit Interface dialog box from the Interfaces page. Select the Enable Switchport check box to configure these settings.

#### Field Reference

*Table 569: Switch Port Tab: Add/Edit Interface Dialog Box*

| Element           | Description                                                                                                                                                               |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Switchport | Check this box to enable switchport on the selected interface. Unchecking this option disables the switchport on the interface but retains the configuration information. |
| Mode              | Select one of the two modes available: Access or Trunk                                                                                                                    |
| Access VLAN ID    | This dialog box gets enabled only when Access mode is selected. Enter a value between 0 and 4190. The VLAN ID configured in the interface is entered here.                |
| Trunk Type        | Select one of the two trunk types available: Allowed or Native.                                                                                                           |
| VLAN ID           | Enter the VLAN ID(s) for this port, according to the chosen mode.                                                                                                         |
| Enable Protected  | Select this option to prevent this port from communicating with other switch ports on the same VLAN.                                                                      |

### Add/Edit Interface Dialog Box: Power Over Ethernet Tab

The Power Over Ethernet (POE) in the Add/Edit Interface dialog box is used to configure power consumption mode and wattage. Beginning with ASA 9.13(1), this feature is supported on Firepower 1010 devices and is a part of physical interface for ports Ethernet1/7 and Ethernet1/8.

The POE feature allows you to configure the physical interface such that the power is delivered automatically to the connected device, in accordance to the class limiting wattage; the power is cut off from the specified port, Ethernet1/7 or Ethernet1/8; and the wattage required for the specified port is preset in milliwatts, without LLDP negotiation.

| Element             | Description                                                                                                                                                                                                                                                                                                                                              |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dsiable POE         | Check this box to cut off the power to the specified port (Ethernet 1/7 or Ethernet 1/9)                                                                                                                                                                                                                                                                 |
| Cosumption Mode     | Select the power consumption mode: <ul style="list-style-type: none"> <li>• <b>Auto</b> (default) - Select this to deliver the power automatically to the connected devices as per the class limiting wattage.</li> <li>• <b>Configure</b> - Select this to specify the consumption wattage manually, that is required for the selected port.</li> </ul> |
| Consumption Wattage | Specify the consumption wattage (in milliwatts) required for the selected port.                                                                                                                                                                                                                                                                          |

## Configuring Hardware Ports on an ASA 5505

The Interfaces page displayed for ASA 5505 devices presents two tabbed panels: *Hardware Ports* and *Interfaces*. The table on the Hardware Ports panel displays currently configured switch ports for the selected ASA 5505.

Use the Configure Hardware Ports dialog box to configure the switch ports on an ASA 5505, including setting the mode, assigning a switch port to a VLAN, and setting the Protected option. (The following dialog-box parameter descriptions also describe the fields in the Hardware Ports table.)

---

**Caution** The ASA 5505 does not support Spanning Tree Protocol for loop detection in the network. Therefore, you must ensure that any connection with the appliance does not end up in a network loop.

---

### Navigation Path

You can access the Configure Hardware Ports dialog box by clicking Add Row or Edit Row on the Hardware Ports panel of the ASA 5505 Interfaces page. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837 for more information.

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Interface | Select this option to enable this switch port. You can deselect this option to disable the port, but retain its configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Isolated         | Select this option to prevent this port from communicating with other isolated or “protected” switch ports on the same VLAN.<br><br>You might want to prevent switch ports from communicating with each other if the devices on those ports are primarily accessed from other VLANs, if you do not need to allow intra-VLAN access, and you want to isolate the devices from each other in case of infection or other security breach. For example, if you have a DMZ that hosts three Web servers, you can isolate the Web servers from each other if you apply the Isolated option to each switch port. The inside and outside networks can both communicate with all three Web servers, and vice versa, but the Web servers cannot communicate with each other. |
| Hardware Port    | Choose the switch port that you are configuring; all device ports are listed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Mode             | Choose a mode for this port: <ul style="list-style-type: none"> <li>• <b>Access Port</b> – Sets the port to access mode. Each access port can be assigned to one VLAN.</li> <li>• <b>Trunk Port</b> – Sets the port to trunk mode using 802.1Q tagging. Trunk ports can carry multiple VLANs using 802.1Q tagging.</li> </ul> <p>Trunk mode is available only with the Security Plus license. Trunk ports do not support untagged packets, there is no native VLAN support, and the appliance drops all packets that do not contain a tag.</p>                                                                                                                                                                                                                     |
| VLAN ID          | Enter VLAN ID(s) for this port, according to the chosen Mode: <ul style="list-style-type: none"> <li>• For Access Port mode, enter the ID of the VLAN to which this switch port is to be assigned.</li> <li>• For Trunk Port mode, you can enter multiple VLAN IDs, and multiple ID ranges (such as 4-8), separated by commas.</li> </ul> <p><b>Note</b> For devices running operating system 7.2(2)18 or earlier, valid VLAN IDs are 1 to 1001; with version 7.2(2)19 or later, valid IDs are 1 to 4090.</p>                                                                                                                                                                                                                                                      |
| Duplex           | Choose a duplex option for the port: <b>Full</b> , <b>Half</b> , or <b>Auto</b> . The Auto setting is recommended, and the default.<br><br>If you set Duplex to anything other than Auto for PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.                                                                                                                                                                                                                                                                                                                                                                                                   |

| Element | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed   | <p>Choose a speed for the port: <b>10</b>, <b>100</b>, or <b>Auto</b>. The Auto setting is recommended, and the default.</p> <p>If you set Speed to anything other than Auto for PoE ports Ethernet 0/6 or 0/7, then Cisco IP phones and Cisco wireless access points that do not support IEEE 802.3af will not be detected and supplied with power.</p> <p>The default Auto setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either Speed or Duplex must be set to Auto to enable Auto-MDI/MDIX for the interface. If you explicitly set both Speed and Duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled.</p> |

## Add/Edit Bridge Group Dialog Box

A transparent firewall connects the same network on its inside and outside interfaces, and supports only the two interfaces per context. However, you can increase the number of interfaces available to a context through use of bridge groups. You can configure up to eight bridge groups; on an FWSM each group can contain two interfaces; on an ASA 9.6.1 each group can contain 64 interfaces.

Each bridge group connects to a separate network. Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the security appliance—traffic must exit the security appliance to be routed by an external router back to another bridge group in the security appliance.

You might want to use more than one bridge group if you do not want the overhead of security contexts, or want to maximize your use of security contexts. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration. For complete security policy separation, use security contexts with one bridge group in each context.

Starting from Cisco Security Manager 4.13, the Bridge-group Virtual Interface (BVI) feature is extended to the routed firewall mode. Routed firewalls are implemented by means of configuring bridge-groups. A user can configure up to eight bridge groups and on an ASA 9.7.1 (Cisco Security Manager 4.13) each group can contain upto 64 interfaces. On versions prior to Cisco Security Manager 4.13, a user can configure a maximum of two bridge groups; with each group containing a maximum limit of four interfaces. In addition to the BVI features supported in the transparent mode, the routed firewall mode includes support for the following additional communication modes:

- Inter BVI communication
- BVI to Data Port communication (Layer 2 to Layer 3) and vice versa

For FWSM 3.1+ and ASA 8.4.1+ devices in transparent mode, the Interfaces page displays two tabbed panels: Interfaces and Bridge Groups. The following information applies to the Bridge Groups panel and the Add/Edit Bridge Group dialog box; refer to [Add/Edit Interface Dialog Box \(PIX 7.0+/ASA/FPR/FWSM\)](#), on page 1842 for information about the Interfaces panel.

### Navigation Path

You can access the Add/Edit Bridge Group dialog box from the Bridge Groups panel of the Interfaces page.

| General Tab          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Bridge Group         | Enter a name for this bridge group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Name                 | <p>Provide an identifier for this interface of up to 48 characters in length. The name should be a memorable name for the interface that relates to its use. However, if you are using failover, do not name interfaces that you are reserving for failover communications; this includes an EtherChannel intended for failover, as well as its member interfaces. Also, do not name interfaces intended for use as a member of a redundant-interface pair.</p> <p>Certain names are reserved for specific interfaces, in accordance with the interface naming conventions of the security appliance. As such, these reserved names enforce default, reserved security levels, as follows:</p> <ul style="list-style-type: none"> <li>• Inside – Connects to your internal network. Must be the most secure interface.</li> <li>• DMZ – “Demilitarized zone” attached to an intermediate interface. DMZ is also known as a perimeter network. You can name a DMZ interface any name you choose. Typically, DMZ interfaces are prefixed with “DMZ” to identify the interface type.</li> <li>• Outside – Connects to an external network or the Internet. Must be the least secure interface.</li> </ul> <p>Similarly, a subinterface name typically identifies its associated interface, in addition to its own unique identifier. For example, <i>DMZoobmgmt</i> could represent an out-of-band management network attached to the DMZ interface.</p> <p><b>Note</b> Again, <b>do not name the interface if you intend to use it for failover, or as a member of a redundant interface</b>. See <a href="#">Configuring Redundant Interfaces</a> , on page 1813 for more information.</p> |
| ID                   | Enter an identifier for this bridge group; can be an integer between 1 and 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Security Level       | Assign a security level to the VLAN interface. Valid values are from 0-100; 100 is the most secure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Available Interfaces | <p>Choose from a list of available interfaces or VLANs to assign to this bridge group; all available interfaces are listed.</p> <p><b>Note</b> Starting from ASA 9.7.1(Cisco Security Manager 4.13), a maximum of 64 interfaces are supported per bridge group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Members in Group | Displays the number of interfaces in the current bridge group                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| IP Type          | <p>Select the IP type for the interface.</p> <ul style="list-style-type: none"> <li>• Static IP - Assign an IP address and subnet mask for the bridge-group interface.</li> <li>• DHCP - Use DHCP to obtain an IP address for the interface. <ul style="list-style-type: none"> <li>• Obtain Default Route using DHCP - When selected, Cisco Security Manager uses the default route supplied by the DHCP server.</li> </ul> </li> </ul>                                                                        |
| IP Address       | <p>Enter or Select a management IP address for the bridge group. A transparent firewall does not participate in IP routing. Thus, the only IP configuration required for a bridge group is this management IP address. This address is the source address for traffic originating on the security appliance, such as system messages or communications with AAA servers. You can also use this address for remote management access.</p> <p><b>Note</b> IPv6 addresses are not supported for bridge groups.</p> |
| Netmask          | <p>Network mask for the specified IP address. You can express the value in dotted decimal format (for example, 255.255.255.0) or by entering the number of bits in the network mask (for example, 24).</p> <p><b>Note</b> Do not use 255.255.255.255 for an interface connected to the network because this will stop traffic on that interface.</p>                                                                                                                                                            |
| Description      | You can enter an optional description for this bridge group.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IPv6 Tab         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable IPv6      | Check this box to enable IPv6 and configure IPv6 addresses on this bridge group. You can deselect this option to disable IPv6 on the bridge group, but retain the configuration information.                                                                                                                                                                                                                                                                                                                    |

| Element        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enforce EUI-64 | <p>When selected, use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link is enforced.</p> <p>When this option is enabled on a bridge group, the source addresses of IPv6 packets received on the bridge group interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64 format. If the interface identifier in an IPv6 packet is not in the Modified EUI-64 format, the packet is dropped and the following system log message is generated:</p> <pre>%PIX ASA-3-325003: EUI-64 source address check failed.</pre> <p>Address format verification is performed only when a flow is created. Packets from an existing flow are not checked. Additionally, address verification can be performed only for hosts on the local link. Packets received from hosts behind a router will fail the address format verification, and be dropped, because their source MAC address will be the router MAC address and not the host MAC address.</p> <p>The Modified EUI-64 format interface identifier is derived from the 48-bit link-layer (MAC) address by inserting the hex number FFFE between the upper three bytes (OUI field) and the lower 3 bytes (serial number) of the link-layer address. To ensure the chosen address is from a unique Ethernet MAC address, the next-to-lowest order bit in the high-order byte is inverted (universal/local bit) to indicate the uniqueness of the 48-bit address. For example, an interface with a MAC address of 00E0.B601.3B7A would have a 64-bit interface ID of 02E0:B6FF:FE01:3B7A.</p>                                                                                                                                                                         |
| DAD Attempts   | <p>To specify the number of consecutive neighbor solicitation messages that are sent on a bridge group interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection on the interface. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre>%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| NS Interval         | <p>The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Reachable Time      | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Managed Config Flag | Whether or not to set the flag "managed-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Other Config Flag   | Whether or not to set the flag "other-config-flag" in the IPv6 router advertisement packet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Enable RA           | <p>When checked, IPv6 router advertisement transmissions are enabled on the interface. The following options are enabled:</p> <ul style="list-style-type: none"> <li>• <b>RA Lifetime</b> – The “router lifetime” value specifies how long nodes on the local link should consider the security appliance as the default router on the link. Valid values range from 0 to 9000 seconds; the default is 1800 seconds. Entering 0 indicates that the security appliance should not be considered a default router on the selected interface.</li> </ul> <p>Any non-zero value should not be less than the following RA Interval value.</p> <p><b>Note</b> This value is included in all IPv6 router advertisements sent out on this interface.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval</b> – The interval between IPv6 router advertisement transmissions on this interface. Valid values range from 3 to 1800 seconds, (or from 500 to 1800000 milliseconds if the following RA Interval in Milliseconds option is checked); the default is 200 seconds.</li> </ul> <p>The interval between transmissions should be less than or equal to the RA Lifetime value if it is non-zero. To prevent synchronization with other IPv6 nodes, randomly adjust the actual value used to within 20 percent of the desired value.</p> <ul style="list-style-type: none"> <li>• <b>RA Interval in Milliseconds</b> – Checking this option indicates that the provided RA Interval value is in milliseconds, rather than seconds.</li> </ul> |

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface IPv6 Addresses | <p>The IPv6 addresses assigned to the bridge group interface are specified in this section of the dialog box.</p> <ul style="list-style-type: none"> <li>• <b>Link-Local Address</b> – To override the link-local address that is automatically generated for the interface, enter the desired IPv6 link-local address in this field.</li> </ul> <p>The link-local address is composed of the link-local prefix FE80::/64 and the interface ID in Modified EUI-64 format. For example, an interface with a MAC address of 00E0.B601.3B7A would have a link-local address of FE80::2E0:B6FF:FE01:3B7A. An error will occur if another host is using the specified address.</p> <ul style="list-style-type: none"> <li>• <b>Enable Address Auto-Configuration</b> – Select this option to enable automatic configuration of IPv6 addresses on the interface using stateless autoconfiguration. The addresses are configured based on the prefixes received in Router Advertisement (RA) messages. If a link-local address has not been configured, then one is automatically generated for this interface. An error occurs if another host is already using the generated link-local address.</li> <li>• <b>Trust the DHCP Servers for default gateway</b>– Select this radio button to install a default route from Router Advertisements that come from a trusted source - the directly-connected network.</li> <li>• <b>Ignore trust and accept router advertisements</b> – Select this radio button to install a default route from Router Advertisements that come from another network.</li> </ul> <ul style="list-style-type: none"> <li>• The table in this section displays the IPv6 addresses assigned to this interface. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables</a> , on page 50.)</li> </ul> <p>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box</a> , on page 1869.</p> |
| Interface IPv6 Prefixes  | <p>Use the table in this section to configure which IPv6 prefixes (that is, the network portion of the IPv6 addresses) are included in IPv6 router advertisements. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables</a> , on page 50.)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Prefix Editor Dialog Box</a> , on page 1871.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Advanced Interface Settings (PIX/ASA/FWSM)

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Advanced configuration options are available for interfaces on FWSMs and ASA/PIX 7.0+ devices operating in single-context mode and for ASA 9.0+ devices operating in single-context mode or multi-context mode.

These are general device-related settings; that is, they are not applied to individual interfaces.

---

**Note** The information in this section does not apply to PIX 6.3 devices, nor to security devices in multiple-context mode.

---

The Advanced Interface Settings dialog box includes the following elements:

- **MAC Address Auto** - Enable this option to automatically assign private MAC addresses to each shared context interface. You can also, optionally, set a user-defined prefix as part of the MAC address. The prefix is a decimal value between 0 and 65535. If you do not enter a prefix, then the ASA generates a default prefix. This prefix is converted to a 4-digit hexadecimal number. The prefix ensures that each ASA uses unique MAC addresses (using different prefix values), so you can have multiple ASAs on a network segment, for example,
- **Traffic between interfaces with same security levels** – This parameter controls communication between interfaces and subinterfaces on the same security level. If you enable same security interface communication, you can still configure interfaces at different security levels as usual. Refer to [Enabling Traffic between Interfaces with the Same Security Level](#), on page 1888 for more information.
- **PPPoE Users button** – Click this button to open the PPPoE Users dialog box, where you can add, edit and delete PPPoE users, as described in [Managing the PPPoE Users List](#), on page 1889. This option is available only for ASA and PIX 7.0+ devices.
- **VPDN Groups (PIX and ASA 7.2+)** – This table lists currently defined VPDN Groups. The buttons below the table are used to add, edit and delete VPDN group entries, as described in [Managing VPDN Groups](#), on page 1890.
- **LACP System Priority (ASA 8.4.1+)** – All systems participating in EtherChannel link aggregation require a Link Aggregation Control Protocol (LACP) System Priority. The value can be 1 to 65535, with the higher number signifying lower priority. The default is 32768.

This value is combined with the system MAC address to form the system's LACP identifier, and thus is applicable only for EtherChannel interfaces. See [Configuring EtherChannels](#), on page 1814, for more information.

---

**Note** Additional LACP parameters are available in the Edit Interface dialog box for individual interfaces assigned to an EtherChannel; see [Editing LACP Parameters for an Interface Assigned to an EtherChannel](#), on page 1816, for more information.

---

---

**Note** LACP System Priority is not supported in Cisco Firepower 9000 devices.

---

- **Static Port Priority (ASA 9.2.1+ Cluster in Spanned mode)** – Disables dynamic port priority in LACP. Some switches do not support dynamic port priority, so this parameter improves switch compatibility. Enabling static port priority enables support of 16 active spanned EtherChannel members. Without this parameter, only 8 active members and 8 standby members are supported. If you enable this parameter, then you cannot use any standby members; all members are active. This parameter is not part of the bootstrap configuration, and is replicated from the control unit to the member units.

---

**Note** If you enable Static Port Priority, 16 nodes can be part of a cluster instead of 8 nodes.

---

- **Director-Localization** – In Geo clustering where, multiple Data Center sites are supported, the inter-cluster round-trip time (RTT) latency is higher than intra-DC. This delay impacts the performance of applications like the VoIP media stream. Beginning with 4.13, the director localization is used to minimize the RTT latency and the delays in performance lookup messages. Enabling this option makes the flow owner and director to be in the same DC site, so that the flow owner lookup is done in local DC site, and the traffic is contended within the same site.

---

**Note** Director-localization is not supported in Cisco Firepower 2100 Series, Firepower 4000 Series, and Firepower 9000 Series devices.

---

- **Enable Site Redundancy**—Beginning with 4.16, you can enable site redundancy to protect flows from a failed site. The site redundancy can be enabled only on the Control unit and will be replicated to the member units in the cluster group. If the connection backup owner is at the same site as the owner, then an additional backup owner will be chosen from another site to protect flows from a failed site. Director localization and site redundancy are separate features; you can configure one or the other, or configure both.

---

**Note** Site redundancy is not supported in Cisco Firepower 2100 Series, Firepower 4000 Series, and Firepower 9000 Series devices.

---

### Navigation Path

You can open the Advanced Interface Settings dialog box by clicking the Advanced button at the bottom of the Interfaces page (for non-5505 ASAs, PIX 7.0+ devices, and FWSMs), or at the bottom of the Interfaces tab on the ASA 5505 Ports and Interfaces page.

- [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#) , on page 1837

## Enabling Traffic between Interfaces with the Same Security Level

The [Advanced Interface Settings \(PIX/ASA/FWSM\)](#) , on page 1886 dialog box presented for a single-context security device includes the “Traffic between interfaces with the same security level” drop-down list, as described in this section.

By default, interfaces or subinterfaces on the same security level cannot communicate with each other. Allowing communication between same-security interfaces provides the following benefits:

- You can configure more than 101 communicating interfaces.

If you use different levels for each interface and do not assign any interfaces to the same security level, you can configure only one interface per level (0 to 100).

- You can allow traffic to flow freely between all same-security interfaces without access lists.

---

**Note** If you enable NAT control, you do not need to configure NAT between same-security-level interfaces.

---

### Step 1

In the Advanced Interface Settings dialog box, choose the option that identifies how you want this device to handle **Traffic between interfaces with the same security levels**:

- **Disabled**—Communication between interfaces on the same security level is not allowed.
- **Inter-interface**—Enables traffic flows between interfaces with the same security level setting. When this option is enabled, you are not required to define translation rules to enable traffic flow between interfaces in the firewall device.
- **Intra-interface**—Enables traffic flows between subinterfaces with the same security level setting. When this option is enabled, you are not required to define translation rules to enable traffic flow between subinterfaces assigned to an interface.
- **Both**—Allows both intra- and inter-interface communications among interfaces and subinterfaces with the same security level.

### Step 2

Continue with [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), on page 1886 configuration, or click OK to close the Advanced Interface Settings dialog box.

## Managing the PPPoE Users List

Point-to-Point Protocol over Ethernet (PPPoE) allows standard PPP communication between a security device and an external ISP, via an Ethernet interface on the device. To establish a communication link, the device must provide authentication credentials and obtain network parameters. This is accomplished using a Virtual Private Dialup Network (VPDN) group, which basically consists of established PPPoE user credentials (i.e., a user name and password) and an authentication protocol. See [Managing VPDN Groups](#), on page 1890 for more information about VPDN groups.

The PPPoE user credentials available for use with VPDN groups are maintained in the PPPoE Users dialog box, which you can access from the [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), on page 1886 dialog box, and from the Add/Edit VPDN Group dialog boxes.

### Adding and Editing PPPoE Users

The PPPoE Users dialog box presents a table of currently defined PPPoE users, along with standard Add Row, Edit Row, and Delete Row buttons. The Add Row button opens the Add PPPoE User dialog box; the Edit Row button opens the virtually identical Edit PPPoE User dialog box.

Enter or edit the following PPPoE user parameters, and then click OK to close the Add (Edit) PPPoE User dialog box and return to the Advanced Interface Settings dialog box.

---

**Note** PPPoE user options are not available on Firewall Service Modules (FWSMs).

---

*Table 573: Add and Edit PPPoE User Dialog Boxes*

| Element                                    | Description                                                                                                                                 |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Username                                   | The name assigned to this user account; generally provided by the external ISP.                                                             |
| Password                                   | The password assigned to this user account; also generally provided by the external ISP.                                                    |
| Confirm                                    | Re-enter the password.                                                                                                                      |
| Store Username and Password in Local Flash | If checked, this PPPoE user information will be stored in the device's local flash memory, ensuring it cannot be inadvertently overwritten. |

## Managing VPDN Groups

A Virtual Private Dialup Network (VPDN) group—basically an established PPPoE user and an authentication protocol—is used by a security device to contact an external ISP and authenticate itself, in order to establish a PPPoE communications link and obtain network parameters. (See [Managing the PPPoE Users List](#), on page 1889 for information about establishing PPPoE users.)

Available VPDN groups are maintained in the Advanced Interface Settings dialog box, which opens when you click the Advanced button at the bottom of the Interfaces page, as described in [Advanced Interface Settings \(PIX/ASA/FWSM\)](#), on page 1886.

### Adding and Editing VPDN Groups

The Advanced Interface Settings dialog box includes a table of currently defined VPDN groups, and standard Add Row, Edit Row, and Delete Row buttons. The Add Row button opens the Add VPDN Group dialog box; the Edit Row button opens the virtually identical Edit VPDN Group dialog box.

Enter or edit the following VPDN group parameters, and then click OK to close the Add (Edit) VPDN Group dialog box and return to the Advanced Interface Settings dialog box.

---

**Note** VPDN group options are not available on Firewall Service Modules (FWSMs).

---

| PPP Authentication | <p>Select the PPP Authentication method:</p> <ul style="list-style-type: none"> <li>• <b>PAP</b> – Password Authentication Protocol, with exchange of credentials in clear text.</li> <li>• <b>CHAP</b> – Challenge Handshake Authentication Protocol, with encrypted credential exchange.</li> <li>• <b>MSCHAP</b> – Microsoft’s CHAP, version 1 only.</li> </ul>                                                   |

## VXLAN

Virtual eXtensible LANs (VXLAN) act as Layer 2 virtual networks over Layer 3 physical networks to stretch Layer 2 networks. VXLAN provides the same Ethernet Layer 2 network services as VLAN does, but with greater extensibility and flexibility. Compared to VLAN, VXLAN offers the following benefits:

- Flexible placement of multitenant segments throughout the data center.
- Higher scalability to address more Layer 2 segments—up to 16 million VXLAN segments.

Beginning with version 4.9, Security Manager supports VXLAN for ASA, ASA v, and ASASM devices on version 9.4(1) and later.

---

**Note** VxLAN is not supported on FWSM devices.

---

You can now specify an IPv6 address for the VXLAN VTEP interface. IPv6 is not supported for the ASA virtual cluster or for Geneve encapsulation. For IPv6 VXLAN, both unicast and multicast IP will be supported. When configuring peer VTEP, either IPv4 or IPv6 can be specified, but not both at the same time.

To configure VXLAN, follow these steps:

1. [Configuring VXLAN Policy](#), on page 1891
2. Create a [Configuring VNI Interfaces](#), on page 1819 and associate the configured VXLAN policy to the VNI interface.

## Configuring VXLAN Policy

To configure VXLAN you must first configure VXLAN policy and then create a VNI interface and associate the configured VXLAN policy to the VNI interface. This section describes how to configure VXLAN policy.

### Navigation Path

To access the VXLAN page, go to **Device View**, select an ASA, ASAy, or ASASM device and then click **VxLAN** from **Policies**.

| Enable VTEP IP Address Or Multicast Traffic Address | <p>Select one of the following:</p> <ul style="list-style-type: none"> <li>• Peer VTEP IP Address—Manually specify the peer VTEP IP address. If you specify the peer IP address, you cannot use multicast group discovery. Multicast is not supported in multiple context mode. You can only specify one peer for the VTEP. Note that the peer VTEP IP address must be reachable from the VTEP Tunnel Interface, else deployment will fail. If you have used peer IP address in VXLAN policy, you cannot configure multicast IP address on the Interface page, including the VNI interface.</li> <li>• Default Multicast IP Address—Specify a default multicast group for all associated VNI interfaces. The range of IP addresses is from 224.0.0.0 to 239.255.255.255. If you do not configure the multicast group per VNI interface, then this group is used. If you configure a group at the VNI interface level, then that group overrides this setting.</li> <li>• Enable Geneve Port Number—Check this box to change the Geneve Destination Port value. The default value is 6081. Enter a numeric value between 1024 and 65535.</li> </ul> <p><b>Note</b> For the default port number 6081, CSM does not build the delta configuration.</p> |
| Save                                                | Click Save to save the VXLAN settings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## CHAPTER 47

# Configuring Bridging Policies on Firewall Devices

---

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 device that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. The security appliance connects the same network on its inside and outside ports, acting as an access-control bridge; you assign different VLANs to each interface, and IP addressing is not used

## About Bridging on Firewall Devices

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 device that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. The security appliance connects the same network on its inside and outside ports, acting as an access-control bridge; you assign different VLANs to each interface, and IP addressing is not used.

Thus, you can easily introduce a transparent firewall into an existing network—IP re-addressing is unnecessary—and maintenance is facilitated because there are no complicated routing patterns to troubleshoot and no NAT configuration.

Although the transparent-mode device acts as a bridge, Layer 3 traffic, such as IP traffic, cannot pass through the security appliance unless you explicitly permit it with specific access rules. The only traffic allowed through a firewall without an access list is ARP traffic, which you can control using ARP inspection, and IPv6 neighbor discovery.

When the security appliance runs in transparent mode, the outgoing interface of a packet is determined by performing a MAC address lookup instead of a route lookup. Route statements can still be configured, but

they apply only to security appliance-originated traffic. For example, if your syslog server is located on a remote network, you must use a static route so the security appliance can reach that subnet.

Starting from Cisco Security Manager 4.13, the Bridge-group Virtual Interface (BVI) feature is extended to the routed firewall mode. Routed firewalls are implemented by means of configuring bridge-groups. A user can configure up to eight bridge groups and on an ASA 9.7.1 (Cisco Security Manager 4.13) each group can contain up to 64 interfaces. On versions prior to Cisco Security Manager 4.13, a user can configure a maximum of two bridge groups; with each group containing a maximum limit of four interfaces. In addition to the BVI features supported in the transparent mode, the routed firewall mode includes support for the following additional communication modes:

- Inter BVI communication
- BVI to Data Port communication (Layer 2 to Layer 3) and vice versa

To configure a transparent firewall, use the following policies. When configuring an ASA/PIX/FWSM device in multiple-context mode, configure these policies on each transparent security context.

- **Firewall > Access Rules**—Access rules control layer 3 and higher traffic using extended access control lists. In routed mode, some types of traffic cannot pass through the security appliance even if you allow it in an access list. For example, you can establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on access rules. Likewise, protocols like HSRP or VRRP can pass through the security appliance. However, the transparent-mode security appliance does not pass CDP packets.

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can provide those functions. For example, by using access rules, you can allow DHCP traffic to pass (instead of the unsupported DHCP relay feature), or multicast traffic such as that created by IP/TV.

For more information, see [Understanding Access Rules](#), on page 715 and [Configuring Access Rules](#), on page 721.

- **Firewall > Transparent Rules**—Transparent rules control non-IP layer 2 traffic using Ethertype access control lists. For example, you can configure rules to allow AppleTalk, IPX, BPDUs, and MPLS to pass through the device. For more information, see [Configuring Transparent Firewall Rules](#), on page 1007.
- **Platform > Bridging > ARP Table, ARP Inspection and IPv6 Neighbor Cache**—Use these policies to control the types of ARP and IPv6 traffic allowed through the bridge. If desired, you can configure static ARP and IPv6 neighbor cache entries and drop any traffic not defined by those static rules. Enable ARP inspection so that if a mismatch between the MAC address, the IP address, or the interface occurs, the security appliance drops the packet. This helps prevent ARP spoofing. For more information, see [ARP Table Page](#), on page 1898 and [ARP Inspection Page](#), on page 1900.

---

**Note** The ARP Table and IPv6 Neighbor Cache are the only bridging policies available for non-transparent ASA/PIX/FWSM devices.

---

- **Platform > Bridging > MAC Address Table and MAC Learning**—Use these policies to configure static MAC-IP address mappings and to enable or disable MAC learning. MAC learning is enabled by default, which allows the appliance to add MAC-IP address mappings as traffic passes through the interface. If you want to prevent all traffic except from static entries, you can disable MAC learning. For more information, see [MAC Address Table Page](#), on page 1902 and [MAC Learning Page](#), on page 1903.

- **Platform > Bridging > Management IP**
- and **Platform > Bridging > Management IPv6**—Use these policies to configure a management IP address that Security Manager can use to communicate with the device.

---

**Note** The Management IP and Management IPv6 pages are not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

---

If you change the management IP address, you also need to update the device properties for the device or security context. Follow these steps:

- Change the management IP address, save and submit your changes.
- Deploy your changes to the device.
- In Device view, select the device or security context, then select **Tools > Device Properties**. On the General page, enter the new management IP address in the IP Address field. On the Credentials tab, update the username and password fields with account credentials that can log into the management interface. Security Manager will now use this address and user account for subsequent deployments and device communication.

For more information, see [Management IP Page](#) , on page 1905.

## Bridging Support for FWSM 3.1

---

**Note** From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

---

Although FWSM 3.1 can support multiple L2 interface pairs, Security Manager lets you specify no more than two L2 interfaces (a single interface pair), and one associated management IP address. That means only one bridge group with two named interfaces associated is provisioned with a management IP address. If the device configuration contains a maximum of one bridge group and two named interfaces, it is valid for discovery. All other scenarios result in an error message and the commands are ignored during discovery. Furthermore, discovery will not show any bridge-group information in Security Manager, although the bridge-group commands will be generated during deployment. Bridge group 1 will be deployed and used in transparent rule policies if no bridge group exists in the device configuration.

# ARP Table Page

Use the ARP Table page to add static ARP entries that map a MAC address to an IP address and identifies the interface through which the host is reached.

## Navigation Path

- (Device view) Select **Platform > Bridging > ARP Table** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > ARP Table** from the Policy Type selector. Right-click **ARP Table** to create a policy, or select an existing policy from the Shared Policy selector.

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout (seconds) | <p>The amount of time, between 60 and 4294967 seconds, before the security appliance rebuilds the ARP table. The default is 14400 seconds.</p> <p>Rebuilding the ARP table automatically updates new host information and removes old host information. You might want to reduce the timeout because the host information changes frequently.</p> <p><b>Note</b> The timeout applies to the <i>dynamic</i> ARP table, and not the static entries contained in the ARP table.</p> |
| ARP Table         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Interface         | The interface to which the host is attached.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| IP Address        | The IP address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| MAC Address       | The MAC address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alias Enabled | <p>Indicates whether the security appliance performs proxy ARP for this mapping. If this setting is enabled and the security appliance receives an ARP request for the specified IP address, it responds with the security appliance MAC address. When the security appliance receives traffic destined for the host belonging to the IP address, the security appliance forwards the traffic to the host MAC address that you specify in this command. This feature is useful if you have devices that do not perform ARP, for example.</p> <p><b>Note</b> In transparent firewall mode, this setting is ignored and the security appliance does not perform proxy ARP.</p> |

## Add/Edit ARP Configuration Dialog Box

Use the Add/Edit ARP Configuration dialog box to add a static ARP entry that maps a MAC address to an IP address and identifies the interface through which the host is reached.

### Navigation Path

You can access the Add/Edit ARP Configuration dialog box from the ARP Table page. For more information about the ARP Table page, see .

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface    | The name of the interface to which the host network is attached.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| IP Address   | The IP address of the host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| MAC Address  | The MAC address of the host; for example, 00e0.1e4e.3d8b.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Enable Alias | <p>When selected, enables proxy ARP for this mapping. If the security appliance receives an ARP request for the specified IP address, it responds with the security appliance MAC address. When the security appliance receives traffic destined for the host belonging to the IP address, the security appliance forwards the traffic to the host MAC address that you specify in this command. This feature is useful if you have devices that do not perform ARP, for example.</p> <p><b>Note</b> In transparent firewall mode, this setting is ignored and the security appliance does not perform proxy ARP.</p> |

# ARP Inspection Page

Use the ARP Inspection page to configure ARP inspection for a transparent firewall. ARP inspection is used to prevent ARP spoofing.

## Navigation Path

- (Device view) Select **Platform > Bridging > ARP Inspection** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > ARP Inspection** from the Policy Type selector. Right-click **ARP Inspection** to create a policy, or select an existing policy from the Shared Policy selector.

| Interface              | The name of the interface to which the ARP inspection setting applies.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ARP Inspection Enabled | Indicates whether ARP inspection is enabled on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Flood Enabled          | Indicates whether packets that do not match any element of a static ARP entry should be flooded out all interfaces except the originating interface. If there is a mismatch between the MAC address, the IP address, or the interface, the security appliance drops the packet. If you do not select this check box, all non-matching packets are dropped.<br><br><b>Note</b> The dedicated management interface, if present, never floods packets even if this parameter is set to flood. |

## Add/Edit ARP Inspection Dialog Box

Use the Add/Edit ARP Inspection dialog box to enable or disable ARP inspection for a transparent firewall interface.

### Navigation Path

You can access the Add/Edit ARP Inspection dialog box from the ARP Inspection page. For more information about the ARP Inspection page, see [ARP Inspection Page , on page 1900](#).

| Interface                               | The name of the interface for which you are enabling or disabling ARP inspection.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Enable ARP Inspection on this interface | When selected, enables ARP inspection on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Flood ARP packets                       | When selected, packets that do not match any element of a static ARP entry are flooded out all interfaces except the originating interface. If there is a mismatch between the MAC address, the IP address, or the interface, the security appliance drops the packet. If you do not select this check box, all non-matching packets are dropped.<br><br><b>Note</b> The dedicated management interface, if present, never floods packets even if this parameter is set to flood. |

## Managing the IPv6 Neighbor Cache

Use the IPv6 Neighbor Cache page to manage static IPv6 neighbor entries that map a MAC address to an IPv6 address, and identify the interface through which the neighbor host is reached, to provide address-resolution functions for IPv6. This is available on ASA 7.0+ devices only.

**Note** The IPv6 Neighbor Cache entries are the IPv6 equivalent of the static ARP entries, managed on the [ARP Table Page , on page 1898](#).

If an entry for a specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry. Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process.

The IPv6 Neighbor Cache page is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons. (These are standard buttons, as described in [Using Tables , on page 50](#).) The Add Row button opens the Add IPv6 Neighbor Cache Configuration dialog box, and Edit Row opens the Edit IPv6 Neighbor Cache Configuration dialog box. Other than the titles, the two dialog boxes are identical.

**Note** Ensure that IPv6 is enabled on at least one interface before trying to add a neighbor.

| Element     | Description                                                                                                                                                                                                                                                                     |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface   | Enter or Select the name of the interface on which to add the neighbor.                                                                                                                                                                                                         |
| IP Address  | Enter the IPv6 address that corresponds to the local data-link address. (If an entry for the specified IPv6 address already exists in the neighbor discovery cache—learned through the IPv6 neighbor discovery process—the entry is automatically converted to a static entry.) |
| MAC Address | Enter the local data-line (hardware) MAC address of the host; for example, 00e0.1e4e.3d8b.                                                                                                                                                                                      |

## MAC Address Table Page

Use the MAC Address Table page to add static MAC address entries to the MAC Address table. The table associates the MAC address with the source interface so that the security appliance knows to send any packets addressed to the device out the correct interface.

### Navigation Path

- (Device view) Select **Platform > Bridging > MAC Address Table** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > MAC Address Table** from the Policy Type selector. Right-click **MAC Address Table** to create a policy, or select an existing policy from the Shared Policy selector.

| Element     | Description                                           |
|-------------|-------------------------------------------------------|
| Interface   | The interface to which the MAC address is associated. |
| MAC Address | The MAC address; for example, 00e0.1e4e.3d8b.         |

## MAC Learning Page

Use the MAC Learning page to enable or disable MAC address learning on an interface. By default, each interface learns the MAC addresses of entering traffic, and the security appliance adds corresponding entries to the MAC address table. You can disable MAC address learning if desired; however, unless you statically add MAC addresses to the table, no traffic can pass through the security appliance.

**Navigation Path**

- (Device view) Select **Platform > Bridging > MAC Learning** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > MAC Learning** from the Policy Type selector. Right-click **MAC Learning** to create a policy, or select an existing policy from the Shared Policy selector.

| MAC Learning Enabled | When selected, the security appliance learns MAC addresses from traffic entering the interface. |

# Management IP Page

A transparent firewall does not participate in IP routing. The only IP configuration required for the device is specification of a management IP address, which is used as the source address for traffic originating on the device, such as system messages or communications with AAA servers. You can also use this address for remote-management access.

For IPv4 traffic, the management IP address is required to pass any traffic.

**Note** In addition to the management IP address for the device, you can configure an IP address for the Management 0/0 or 0/1 management-only interface. This IP address can be on a separate subnet from the main management IP address.

Use the Management IP page to set the management IP address for a security device, or for a context in transparent firewall mode.

## Navigation Path

- (Device view) Select **Platform** > **Bridging** > **Management IP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform** > **Bridging** > **Management IP** from the Policy Type selector. Right-click **Management IP** to create a policy, or select an existing policy from the Shared Policy selector.

|-----------------------|----------------------------------------------------------------|
| Management IP Address | The management IP address.                                     |
| Subnet Mask           | The subnet mask that corresponds to the management IP address. |

## Management IPv6 Page (ASA 5505)

A transparent firewall does not participate in IP routing. The only IP configuration required for the device is specification of a management IP address, which is used as the source address for traffic originating on the device, such as system messages or communications with AAA servers. You can also use this address for remote-management access.

For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global management address is recommended for full functionality, including remote management and other management operations. If you configure the global address, a link-local address is automatically configured on each interface, so you do not also need to specifically configure a link-local address. However, if you do not configure a global management address, you need to configure interface link-local addresses, as described in [Configuring IPv6 Interfaces \(ASA/FWSM\)](#), on page 1865. Note that you can configure both IPv6 and IPv4 management addresses on a device.

On an ASA 5505 in transparent mode, use the Management IPv6 page to enable IPv6, configure neighbor solicitation, and manage IPv6 interface addresses.

---

**Note** This page is available only on ASA 5505 version 8.2 and 8.3 devices in transparent mode.

---

### Navigation Path

- (Device view) Select **Platform > Bridging > Management IPv6** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Bridging > Management IPv6** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Enable IPv6              | Check this box to enable IPv6 and configure IPv6 management-interface addresses. You can deselect this option to disable IPv6, but retain the configuration information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| DAD Attempts             | <p>To specify the number of consecutive neighbor solicitation messages that are sent on an interface during duplicate address detection (DAD), enter a number from 0 to 600 in this field. Entering 0 disables duplicate address detection. Entering 1 configures a single transmission without follow-up transmissions; this is the default.</p> <p>Duplicate address detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces (the new addresses remain in a tentative state while duplicate address detection is performed). Duplicate address detection uses neighbor solicitation messages to verify the uniqueness of unicast IPv6 addresses.</p> <p>When duplicate address detection identifies a duplicate address, the state of the address is set to DUPLICATE and the address is not used. If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface and an error message similar to the following is issued:</p> <pre>%PIX-4-DUPLICATE: Duplicate address FE80::1 on outside</pre> <p>If the duplicate address is a global address of the interface, the address is not used and an error message is issued, similar to that shown previously for a duplicate link-local address.</p> <p>All configuration commands associated with the duplicate address remain as-configured while the state of the address is set to DUPLICATE. If the link-local address for an interface changes, duplicate address detection is performed on the new link-local address, and all other IPv6 address associated with the interface are regenerated (that is, duplicate address detection is performed only on the new link-local address).</p> |
| NS Interval              | The interval between IPv6 neighbor solicitation retransmissions, in milliseconds. Valid values range from 1000 to 3600000 milliseconds; the default value is 1000 milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Reachable Time           | <p>The amount of time, in milliseconds, within which a remote IPv6 node is considered still reachable, after initial reachability was confirmed. Valid values range from 0 to 3600000 milliseconds, the default value is 0. When 0 is used for the value, the reachable time is set as undetermined—it is up to the receiving devices to set and track reachable time.</p> <p>A configured time enables detection of unavailable neighbors. A shorter time allows detecting unavailable neighbors more quickly; however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Interface IPv6 Addresses | <p>The IPv6 address(es) assigned to the management interface are listed in this table. Use the Add Row, Edit Row, and Delete Row buttons below this table to manage these entries. (These are standard buttons, as described in <a href="#">Using Tables</a>, on page 50.)</p> <p>Add Row and Edit Row open the <a href="#">IPv6 Address for Interface Dialog Box</a>, on page 1869.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## CHAPTER 48

# Configuring Device Administration Policies on Firewall Devices

---

The Device Admin section contains pages for configuring device administration policies for firewall devices.

This chapter contains the following topics:

- [About AAA on Security Devices](#) , on page 1909
- [Configuring Banners](#) , on page 1918
- [Configuring Boot Image/Configuration Settings](#) , on page 1919
- [Configuring CLI Prompt](#) , on page 1921
- [Setting the Device Clock](#) , on page 1922
- [Enabling/Disabling FIPS](#), on page 1924
- [Enabling Customer Success Network](#), on page 1925
- [Configuring Umbrella Global Policy](#), on page 1926
- [Configuring Device Credentials](#) , on page 1927
- [Managing Mount Points](#) , on page 1928
- [IP Client](#), on page 1930
- [App Agent](#), on page 1931

## About AAA on Security Devices

Authentication-Authorization-Accounting (AAA) enables the security appliance to determine who a user is (authentication), what the user can do (authorization), and what the user did (accounting). You can use authentication alone, or with authorization and accounting. Authorization always requires a user to be authenticated first. You also can use accounting alone, or with authentication and authorization.

Authentication-Authorization-Accounting provides an extra level of protection and control for user access beyond access lists alone. For example, you can create an ACL that allows all outside users to access Telnet on a server on the DMZ network. If you want to limit user access to the server when you may not always know the IP addresses of these users, you can enable AAA to allow only authenticated and/or authorized users to make it through the security appliance. (The Telnet server enforces authentication, too; the security appliance prevents unauthorized users from attempting to access the server.)

- **Authentication**—Authentication grants access based on user identity. Authentication establishes user identity by requiring valid user credentials, which are typically a user name and password. You can configure the security appliance to authenticate the following items:

- Administrative connections to the security appliance using Telnet, SSH, HTTPS/ASDM, or serial console.
- The **enable** command.
- **Authorization**—Authorization controls user capabilities after users are authenticated. Authorization controls the services and commands available to each authenticated user. If you do not enable authorization, authentication alone would provide the same access to services for all authenticated users.

If you need the control that authorization provides, you can configure a broad authentication rule, and then have a detailed authorization configuration. For example, you might authenticate inside users who attempt to access any server on the outside network, and then use authorization to limit the outside servers that a particular user can access.

The security appliance caches the first 16 authorization requests per user, so if the user accesses the same services during the current authentication session, the security appliance does not resend the request to the authorization server.

- **Accounting**—Accounting tracks traffic that passes through the security appliance, providing a record of user activity. If you enable authentication for that traffic, you can account for traffic per user. If you do not authenticate the traffic, you can account for traffic per IP address. Accounting information includes when sessions start and stop, user name, the number of bytes that pass through the security appliance for the session, the service used, and the duration of each session.

## Preparing for AAA

AAA services depend upon the use of the Local database or at least one AAA server. You can also use the Local database as a fallback for most services provided by an AAA server. Before you implement AAA, you should configure the Local database and configure AAA server groups and servers.

Configuration of the Local database and AAA servers depends upon the AAA services you want the security appliance to support. Regardless of whether you use AAA servers, you should configure the Local database with user accounts that support administrative access, to prevent accidental lock-outs and, if so desired, to provide a fallback method when AAA servers are unreachable. For more information, see [Configuring User Accounts](#), on page 2001.

The following table provides a summary of AAA service support by each AAA server type and by the Local database. You manage the Local database by configuring user accounts on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts](#), on page 2001). You establish AAA server groups and add individual AAA servers to the server groups using the **Platform > Device Admin > AAA** page.

*Table 587: Summary of AAA Support*

| AAA Service          | Database Type |        |         |     |     |          |      |           |
|----------------------|---------------|--------|---------|-----|-----|----------|------|-----------|
|                      | Local         | RADIUS | TACACS+ | SDI | NT  | Kerberos | LDAP | HTTP Form |
| Authentication of... |               |        |         |     |     |          |      |           |
| VPN users            | Yes           | Yes    | Yes     | Yes | Yes | Yes      | Yes  | Yes 1     |
| Firewall sessions    | Yes           | Yes    | Yes     | No  | No  | No       | No   | No        |

| AAA Service         | Database Type |        |         |     |    |          |      |           |
|---------------------|---------------|--------|---------|-----|----|----------|------|-----------|
|                     | Local         | RADIUS | TACACS+ | SDI | NT | Kerberos | LDAP | HTTP Form |
| Administrators      | Yes           | Yes    | Yes     | No  | No | No       | No   | No        |
| Authorization of... |               |        |         |     |    |          |      |           |
| VPN users           | Yes           | Yes    | No      | No  | No | No       | Yes  | No        |
| Firewall sessions   | No            | Yes 2  | Yes     | No  | No | No       | No   | No        |
| Administrators      | Yes 3         | No     | Yes     | No  | No | No       | No   | No        |

1 HTTP Form protocol supports single sign-on authentication for WebVPN users only.

2 For firewall sessions, RADIUS authorization is supported with user-specific ACLs only, which are received or specified in a RADIUS authentication response.

3 Local command authorization is supported by privilege level only.

## Local Database

The security appliance maintains a Local database that you can populate with user accounts, which contain, at a minimum, a user name. Typically, you assign a password and a privilege level to each user name, although passwords are optional. You can manage Local user accounts on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts](#), on page 2001).

If you enable command authorization using the Local database, the security appliance refers to the assigned user privilege level to determine what commands are available. By default, all commands are assigned either privilege level 0 or level 15.

**Note** If you add users to the Local database with access to the CLI and whom you do not want to enter privileged mode, you should enable command authorization. Without command authorization, users can access privileged mode (and all commands) at the CLI using their own password if their privilege level is 2 or greater (2 is the default). Alternatively, you can use RADIUS or TACACS+ authentication for console access so the user will not be able to use the login command, or you can set all local users to level 1 so you can control who can use the system enable password to access privileged mode.

You cannot use the local database for network access authorization.

The user accounts in the Local database can provide fallback support for console and enable-password authentication, for command authorization, and for VPN authentication and authorization. This behavior is designed to help you prevent accidental lock-out from the security appliance.

For users who need fallback support, we recommend that their user names and passwords in the Local database match their user names and passwords on the AAA servers. This provides transparent fallback support. Because the user cannot determine whether a AAA server or the local database is providing the service, using user names and passwords on AAA servers that are different than the user names and passwords in the Local database means that the user cannot be certain which user name and password should be given.

For multiple-context mode, you can configure user names in the system execution space to provide individual logins at the CLI using the **login** command; however, you cannot configure any **aaa** commands that use the local database in the system execution space.

---

**Note** VPN functions are not supported in multiple mode.

---

## AAA for Device Administration

You can authenticate all administrative connections to the security appliance, including:

- Telnet
- SSH
- Serial console
- ASDM
- VPN management access

You can also authenticate administrators who attempt to enter enable mode. You can authorize administrative commands. You can have accounting data for administrative sessions and for commands issued during a session sent to an accounting server.

You can configure AAA for device administration using the **Platform > Device Admin > AAA** page (see [About AAA on Security Devices](#), on page 1909).

## AAA for Network Access

You can configure rules for authenticating, authorizing, and accounting for traffic passing through the firewall by using the **Firewall > AAA Rules** page (see [Managing Firewall AAA Rules](#), on page 683). The rules you create are similar to access rules, except that they specify whether to authenticate, authorize, or perform accounting for the traffic defined; and which AAA server group the security appliance is to use to process the AAA service request.

## AAA for VPN Access

AAA services for VPN access include the following:

- User account settings for assigning users to VPN groups, configured on the **Platform > Device Admin > User Accounts** page (see [Configuring User Accounts](#), on page 2001).

- VPN group policies that can be referenced by many user accounts or tunnel groups, configured on the **Remote Access VPN > RA VPN Policies > User Group Policy** or **Site to Site VPN > User Group Policy** page.
- Tunnel group policies, configured on the **Remote Access VPN > RA VPN Policies > PIX7.0/ASA Tunnel Group Policy** or **Site to Site VPN > PIX7.0/ASA Tunnel Group Policy** page.

## Configuring AAA - Authentication Tab

The AAA page presents three tabbed panels; the **Authentication** panel is presented when you navigate to the AAA page. Use these options to control privileged access to the device console, to restrict access by connection type, and to define access messages.

Use the [Authorization Tab](#) , on page 1915 to control the services and commands available to authenticated users.

Use the [Accounting Tab](#) , on page 1916 to activate tracking of console traffic, providing a record of user activity.

### Navigation Path

- (Device view) Select **Platform > Device Admin > AAA** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > AAA** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Using the Authentication Tab

Use the Authentication tab to enable authentication for administrator access to the security appliance. The Authentication tab also lets you configure the prompts and messages a user sees when authenticated by an AAA server.

The device will prompt for a user name and password before you can enter commands. If the authentication server is offline, wait until the console login request times out. You can then access the console with the firewall username and the enable password.

| Maximum Local Authentication Failed Attempts | Specify the number of times the device will try to authenticate a user in the LOCAL database before that account is locked; valid values are 1 through 16.<br><br>Available only on ASA/PIX 7.01+ and FWSM 3.11+ devices.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Login History                                | Check this to enable the login history reporting feature. When enabled, information about all the administrative login attempts is collected and displayed on the ASA, immediately after a successful login. This includes the following information: <ul style="list-style-type: none"> <li>• Date and time of the last login</li> <li>• Location of last login (terminal or IP address)</li> <li>• Number of unsuccessful login attempts since the last successful login.</li> <li>• Number of successful login attempts occurring during an organization-defined time period.</li> </ul> <p><b>Note</b> This feature is enabled by default.</p> |
| Duration (Optional)                          | Enter the number of days for which login events will be saved. When no value is specified here, the login history is unbounded.<br><br><b>Note</b> The default value is 90 days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Authorization Tab

The Authorization tab allows you to configure authorization for accessing firewall commands.

### Navigation Path

You can access the Authorization tab from the AAA page; see [Configuring AAA - Authentication Tab](#) , on page 1913.

| Enable Authorization for Command Access<br>Server Group<br>Use LOCAL when server group fails                        | Requires authorization for accessing firewall commands.<br>Specify the server group to use for authorization.<br>Uses the LOCAL server group if the selected server group fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Enable Authorization for exec shell access<br>(ASA 8.0(2)+ only)                                                    | When selected, enables management authorization.<br>After enabling management authorization, specify whether to use the remote server or the local database for authorization: <ul style="list-style-type: none"> <li>• <b>Local Server</b>—the local user database is the source for the username entered and the Service-Type and Privilege-Level attributes assigned.</li> <li>• <b>Remote Server</b>—the same server is used for both authentication and authorization.</li> </ul>                                                                                                                                                                                                   |
| Auto Enable Authorization for exec shell access<br>(ASA 9.1(5)+ only)                                               | Allows users with sufficient privileges from the login authentication server to be placed directly in privileged EXEC mode. Otherwise, users are placed in user EXEC mode. These privileges are determined by the Service-Type and Privilege-Level attributes that are required to enter each EXEC mode. To enter privileged EXEC mode, users must have a Service-Type attribute of Administrative and a Privilege Level attribute of greater than 1 assigned to them.<br>This option is not supported in the system context. However, if you configure Telnet or serial authentication in the admin context, then authentication also applies to sessions from the switch to the ASASM. |
| Enable Authorization for HTTP Connection<br>Server Group<br>Use LOCAL when server group fails<br>(ASA 9.4(1)+ only) | When selected, authorization via HTTP is enabled. Authorization of username is disabled by default.<br>Select the server group to use for authorization.<br>Uses the LOCAL server group if the selected server group fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Accounting Tab

Use the Accounting tab to enable accounting for access to the firewall device and for access to commands on the device.

### Navigation Path

You can access the Accounting tab from the AAA page; see [Configuring AAA - Authentication Tab](#) , on page 1913.

|                 | Require AAA Accounting for privileged commands                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Enable          | When selected, enables the generation of accounting records to mark the entry to and exit from privileged mode for administrative access via the console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Server Group    | Specify the server or group of RADIUS or TACACS+ servers to which accounting records are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                 | Require AAA Accounting for the following types of connections                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Connection type | Specify the connection types that will generate accounting records: <ul style="list-style-type: none"> <li>• <b>HTTP</b>—Enable or disable the generation of accounting records to mark the establishment and termination of admin sessions created over HTTP. Valid server group protocols are RADIUS and TACACS+.</li> <li>• <b>Serial</b>—Enable or disable the generation of accounting records to mark the establishment and termination of admin sessions that are established via the serial interface to the console. Valid server group protocols are RADIUS and TACACS+.</li> <li>• <b>SSH</b>—Enable or disable the generation of accounting records to mark the establishment and termination of admin sessions created over SSH. Valid server group protocols are RADIUS and TACACS+.</li> <li>• <b>Telnet</b>—Enable or disable the generation of accounting records to mark the establishment and termination of admin sessions created over Telnet. Valid server group protocols are RADIUS and TACACS+.</li> </ul> |
| Server Group    | Specify the server or group of RADIUS or TACACS+ servers to which accounting records are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                 | Require Accounting for command access                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable          | When selected, enables the generation of accounting records for commands entered by an administrator/user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Element         | Description                                                                                                                                |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Server Group    | Provides a drop-down menu from which you can choose the server or group of RADIUS or TACACS+ servers to which accounting records are sent. |
| Privilege Level | Minimum privilege level that must be associated with a command for an accounting record to be generated. The default privilege level is 0. |

## Configuring Banners

You can use the Banner page to specify Session (exec), Login, Message-of-the-Day (motd), and ASDM banners for a security appliance or shared policy.

**Note** In Cisco Security Manager 4.22, the Banner page is updated to support a new **ASDM Banner** that can be configured, in addition to the existing banners.

**Note** If you use the token \$(hostname) or \$(domain) in a banner, it is replaced with the host name or domain name of the security appliance. When you enter the \$(system) token in a context configuration, the context uses the banner configured in the system configuration.

Spaces in banner text are preserved; however, tabs cannot be entered. Multiple lines in a banner are created by entering a separate line of text for each line you wish to add. Each line is then appended to the end of the existing banner. If the line is empty, a carriage return (CR) is added to the banner.

There is no limit on the length of a banner other than RAM and flash-memory limits. You can only use ASCII characters, including new-line (press the Enter key), which counts as two characters. When accessing the security appliance through Telnet or SSH, the session closes if there is not enough system memory available to process the banner messages, or if a TCP write error occurs when attempting to display the banner messages.

- 
- Step 1** To configure banners, access the Banner page:
- (Device view) Select **Platform > Device Admin > Banner** from the Device Policy selector.
  - (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Banner** from the Policy Types selector. Select an existing policy from the Policies selector, or create a new one.
- Step 2** In the **Session (exec) Banner** field, enter the text you want the system to display as a banner before displaying the enable prompt.
- Step 3** In the **Login Banner** field, enter the text you want the system to display as a banner before the password login prompt when accessing the security appliance using Telnet.
- Step 4** In the **Message-of-the-Day (motd) Banner** field, enter the text you want the system to display as a message-of-the-day banner.
- Step 5** In the **ASDM Banner** field, specify the text you need the system to shown you as an ASDM banner after logging in. This banner does not support or allow question marks in the text. Security Manager will present an activity validation error even if one of your shared policies contains a question mark.

**Step 6** To replace a banner, change the contents of the appropriate box.

**Step 7** To remove a banner, clear the contents of the appropriate box.

## Configuring Boot Image/Configuration Settings

Use the Boot Image/Configuration page to specify which configuration file the security appliance will use at start-up. You can also specify the path to an Adaptive Security Device Manager (ASDM) configuration file.

If you do not specify a boot-image location, the first valid image on internal flash memory will be chosen to launch the system.

**Note** This page is available only on ASA and PIX 7.0+ devices

### Navigation Path

- (Device view) Select **Platform > Device Admin > Boot Image/Configuration** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Boot Image/Configuration** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Boot Config Location | <p>Enter the path to and name of the configuration file to be used when the system is loaded. On an ASA, you can use any of the following syntactical constructs:</p> <ul style="list-style-type: none"> <li>• <b>disk0:</b><i>[/path/ ]filename</i></li> </ul> <p>The value “disk0” represents the internal flash card. You can also use “<b>flash</b>” instead of “<b>disk0</b>,” as they are aliased:</p> <ul style="list-style-type: none"> <li>• <b>flash:</b><i>[/path/ ]filename</i></li> <li>• <b>disk1:</b><i>[/path/ ]filename</i></li> </ul> <p>The value “disk1” represents the external flash card.</p> <p>On a PIX device, you can use only the “flash” syntax; that is:</p> <ul style="list-style-type: none"> <li>• <b>flash:</b><i>[/path/ ]filename</i></li> </ul> |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASDM Image Location | <p>The location and name of the ASDM software image to be used when ASDM sessions are initiated. (You can use ASDM to monitor both ASA and PIX devices.)</p> <p>On a PIX device, as with the Boot Config Location, you are restricted to only the “flash” syntax.</p> <p>On an ASA, as with the Boot Config Location, you can use the “disk0,” “flash,” or “disk1” constructs. In addition, you can specify an image file on a TFTP server, as follows</p> <ul style="list-style-type: none"> <li>• <code>tftp://[user [:password ]@]server [:port ]/[path/ ]filename</code></li> </ul>                                                                                                                                                                                                                                                                                                                   |
| Boot Images Table   | <p>This table lists any alternate configuration files you have defined; you can specify up to four. The first available image in this list is used if you did not specify a primary file in the Boot Config Location field, or if that file is unavailable.</p> <p>This is a standard Security Manager table; use the up-arrow, down-arrow, Add Row, Edit Row, and Delete Row buttons below the table to manage these entries, as described in <a href="#">Using Tables , on page 50</a>.</p> <p>The Add Row and Edit Row open the <a href="#">Images Dialog Box , on page 1920</a>, used to add and edit the paths to alternate configuration files.</p> <p><b>Note</b> On an ASA, the first (and only the first) entry in this table can refer to an ASDM configuration file on a TFTP server. If the device cannot reach the TFTP server, it will attempt to load the next image file in the list.</p> |

## Images Dialog Box

Use the Images dialog box to add or edit a configuration file entry in the Boot Images table on the Boot Image/Configuration page.

### Navigation Path

You can access the Images dialog box from the Boot Image/Configuration page. For more information, see [Configuring Boot Image/Configuration Settings , on page 1919](#).

### Field Reference

The Images dialog box contains one field, used to define the path to a boot image or configuration file, as follows:

Table 592: Images Dialog Box

| Element    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Image File | <p>Enter the path to and name of the configuration file to add to the ordered Boot Images list.</p> <p>On a PIX device, you can use only the “flash” syntax; that is:</p> <ul style="list-style-type: none"> <li>• <b>flash:</b><i>[/path/ ]filename</i></li> </ul> <p>On an ASA, you can use any of the following syntactical constructs:</p> <ul style="list-style-type: none"> <li>• <b>disk0:</b><i>[/path/ ]filename</i></li> </ul> <p>The value “disk0” represents the internal flash card. You can also use “<b>flash</b>” instead of “<b>disk0</b>,” as they are aliased:</p> <ul style="list-style-type: none"> <li>• <b>flash:</b><i>[/path/ ]filename</i></li> <li>• <b>disk1:</b><i>[/path/ ]filename</i></li> </ul> <p>The value “disk1” represents the external flash card.</p> <p>In addition, on an ASA, you can specify an ASDM image file on a TFTP server, as follows</p> <ul style="list-style-type: none"> <li>• <b>tftp:</b><i>[/user [:password ]@]server [:port ]/[/path/ ]filename</i></li> </ul> <p>Note that you can specify only one TFTP location, and it must be listed first in the Boot Images table on the Boot Image/Configuration page.</p> |

## Configuring CLI Prompt

You can use the CLI Prompt page to customize the prompt used by ASA 7.2(1)+ devices during CLI sessions. By default, the prompt shows the hostname of the ASA. In multiple context mode, the prompt also displays the context name. You can display the following items in the CLI prompt:

**Note** The attributes that are available differ by ASA version:

|                                             |                                                                                |
|---------------------------------------------|--------------------------------------------------------------------------------|
| <b>cluster-unit</b><br>(ASA 9.1.1+ only)    | Displays the cluster unit name. Each unit in a cluster can have a unique name. |
| context                                     | (Multiple mode only) Displays the name of the current context.                 |
| domain                                      | Displays the domain name.                                                      |
| hostname                                    | Displays the hostname.                                                         |
| <b>management-mode</b><br>(ASA 9.2.1+ only) | Displays the management mode.                                                  |
| priority                                    | Displays the failover priority as pri (primary) or sec (secondary).            |

|       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| state | <p>Displays the traffic-passing state or role of the unit.</p> <p>For failover, the following values appear for the state:</p> <ul style="list-style-type: none"> <li>• act—Failover is enabled, and the unit is actively passing traffic.</li> <li>• stby— Failover is enabled, and the unit is not passing traffic and is in a standby, failed, or another inactive state.</li> <li>• actNoFailover—Failover is not enabled, and the unit is actively passing traffic.</li> <li>• stbyNoFailover—Failover is not enabled, and the unit is not passing traffic. This condition might occur when there is an interface failure above the threshold on the standby unit.</li> </ul> <p>For grouping, the following values are displayed for state:</p> <ul style="list-style-type: none"> <li>• control</li> <li>• data</li> </ul> <p>For example, in the prompt <code>ciscoasa/cl2/slave</code>, the hostname is <code>ciscoasa</code>, the unit name is <code>cl2</code>, and the state is <code>data</code>.</p> |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Step 1** Access the CLI Prompt page by doing one of the following:

- (Device view) Select **Platform > Device Admin > CLI Prompt** from the Device Policy selector.

**Note** For devices in multiple context mode, the CLI Prompt page is only available in the system context. In the admin context, the CLI Prompt page is not available.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > CLI Prompt** from the Policy Types selector. Select an existing policy from the Policies selector, or create a new one.

**Step 2** Customize the CLI prompt by doing the following:

- To add an attribute to the prompt, select the attribute in the Available Members list and then click >>. The attribute is moved from the Available Members list to the Selected Members list.

You can add multiple attributes to the prompt. The order in which the attributes are added to the Selected Members list will dictate the order in which they are shown in the CLI prompt.

**Note** For ASA 9.1.1+, you can configure up to six attributes for the CLI prompt. For earlier ASA versions, you can only configure up to five attributes.

- To remove an attribute from the prompt, select the attribute in the Selected Members list and then click <<. The attribute is moved from the Selected Members list to the Available Members list.

## Setting the Device Clock

Use the Clock page to set the date and time on the selected device.

**Note** This page is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

To dynamically set the time using an NTP server, see [NTP Page](#), on page 2027; time derived from an NTP server overrides any time set manually on the Clock page.

**Note** In multiple-context mode, set the time in the system context only.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Clock** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Clock** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

**Table 593: Clock Page**

| Element                                                                                                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Hour                                                                                                                                               | Choose the hour, from 00 to 23, in which daylight savings time begins or ends.                                                                                                                                                                                                                                                    |
| Minute                                                                                                                                             | Choose the minute, from 00 to 59, at which daylight savings time begins or ends.                                                                                                                                                                                                                                                  |
| Set by Day                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                   |
| Specify Recurring Time                                                                                                                             | Check this box to enable the Start and End parameters, which are used to set a recurring start and end for daylight savings time that you do not need to alter yearly.                                                                                                                                                            |
| The following five parameters appear in a Start section and an End section. Use the two sets to define when daylight savings time starts and ends. |                                                                                                                                                                                                                                                                                                                                   |
| Month                                                                                                                                              | Choose the month in which daylight savings time begins or ends.                                                                                                                                                                                                                                                                   |
| Week                                                                                                                                               | Choose the week of the month in which daylight savings time begins or ends. You can select a numerical value that corresponds to the week—1 through 4—or you can specify the first or last week in the month by choosing <b>first</b> or <b>last</b> . For example, if the day might fall in the partial fifth week, choose last. |
| Weekday                                                                                                                                            | Choose the day of the week on which daylight savings time begins or ends.                                                                                                                                                                                                                                                         |
| Hour                                                                                                                                               | Choose the hour, from 0 to 23, in which daylight savings time begins or ends.                                                                                                                                                                                                                                                     |
| Minute                                                                                                                                             | Choose the minute, from 00 to 59, at which daylight savings time begins or ends.                                                                                                                                                                                                                                                  |

## Enabling/Disabling FIPS

Beginning with 4.15, Cisco Security Manager provides an option to enable or disable the Federal Information Processing Standards (FIPS) mode on the ASA devices. When you enable FIPS mode with FOM, instead of legacy methods implemented in Cisco SSL versions, the FIPS 140-2 standard compliant cryptographic methods implemented in the FOM is used for signature and verification purposes. This feature is supported only on ASA 9.8.2 or later devices.

---

**Note** To configure FIPS mode on a device, you must reboot the device manually.

---

Before you enable FIPS, ensure the following are configured on ASA:

1. DH group is set to 14 or ECDH group is set to 19, 20, or 21.
2. The Device Identity Certificate key type is set to RSA and the key size is 2048 or above.

### Navigation Path

- (Device view) Select **Platform > Device Admin > FIPS** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > FIPS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

*Table 594: FIPS Page*

| Element | Description                                                                                                   |
|---------|---------------------------------------------------------------------------------------------------------------|
| FIPS    | Select the check box to enable FIPS on the device. This option is available only for ASA 9.8.2 or above.      |
|         | <b>Note</b> You must reboot the device after enabling or disabling FIPS for the configuration to take effect. |

## Enabling Customer Success Network

Beginning with version 4.20, Cisco Security Manager provides an option to enable Customer Success Network, which helps avail the features enabled on ASA devices and leverage the same mechanism of Smart Call Home (SCH). Because the data SCH collects are mostly outdated and the features added since the release of SCH do not report the exact status, Customer Success Network is being introduced. This feature is supported on ASA 9.13.1 and later devices.

---

**Note** A feature must be considered “enabled” only when it is configured and ready to use. If a feature is configured but does not work, it must not be considered “enabled”.

---

### Navigation Path

- (Device view) Select **Platform > Device Admin > Customer Success Network** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Customer Success Network Policy** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

*Table 595: Customer Success Network Page*

| Element                  | Description                                                                                                                                             |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Customer Success Network | Select the <b>Enable Customer Success Network</b> check box to enable it on the device. This option is available only for ASA 9.13.1 and later devices. |

# Configuring Umbrella Global Policy

Beginning with version 4.18, Cisco Security Manager supports configuring Umbrella global policy. Cisco Umbrella Branch is a cloud based security service, which first inspects the DNS traffic, and then examines suspicious HTTP/(S) traffic. The Umbrella connector intercepts DNS packets and redirects the interesting DNS queries to the Umbrella resolver for resolution. Once the DNS response is received, it forwards the response to the host. This feature is supported only on ASA 9.10.1 or later devices.

After configuring Umbrella service, ensure that the Umbrella DNS policy-map is also configured.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Umbrella** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Umbrella** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

*Table 596: Umbrella Page*

| Element                  | Description                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Umbrella                 | Select the check box to apply the global Umbrella configuration for the selected device (ASA 9.10.1 or later).                                                                                                    |
| Token                    | The token value of the ASA device on registering with the Umbrella server. Cisco Security Manager throws an error message if this value is less than 64 characters.                                               |
| Public Key               | The public key value of the ASA device on registering with the Umbrella server. This value must be 64 hexa-decimal digits and less than 80 characters, else Cisco Security Manager will display an error message. |
| EDNS Flow Timeout        | The configured EDNS timeout value. The Umbrella time-out for edns-flow must be between <0:0:0> and <1193:0:0>, else Cisco Security Manager will display error message.                                            |
| IPv4 Resolver            | The IPv4 address of the non-default Cisco Umbrella DNS servers that you want to use to resolve DNS requests. Ensure a valid IPv4, else Cisco Security Manager will display an error message.                      |
| IPv6 Resolver            | The IPv6 address of the non-default Cisco Umbrella DNS servers that you want to use to resolve DNS requests. Ensure a valid IPv6, else Cisco Security Manager will display an error message.                      |
| Regular Expression Class | Use regular expression class to match the local domain bypass for which Umbrella should be bypassed.                                                                                                              |
| Regular Expression       | Use regular expression to match the local domain bypass for which Umbrella should be bypassed.                                                                                                                    |

# Configuring Device Credentials

Use the Credentials page to specify the user credentials Security Manager will use when contacting this device. You can also change the Enable password and the Telnet/SSH password on the device.

This user name-password combination lets you log into the device (in EXEC mode) if you connect to the security appliance using an HTTP, HTTPS, Telnet, or SSH session. You also can specify a separate password specifically for Telnet and SSH sessions. (Further, you can define separate credentials for HTTP/HTTPS connections on the [Device Credentials Page](#), on page 112 in the Device Properties window.)

The Enable password lets you access privileged EXEC mode after you log in.

**Tip** The Username, Password, and Enable Password on this page are linked to the Credentials settings in the Device Properties window. When you update these parameters and then deploy the changes to the device, Security Manager uses the existing credentials defined in the Device Properties to log into the device and deploy changes. After successful deployment, the Device Properties credentials are updated to match these settings. For more information about Credentials in Device Properties, see [Device Credentials Page](#), on page 112.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Credentials** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Credentials** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Danger** Since several user accounts may exist on each device, applying a shared Credentials policy to multiple devices will update only the Enable Password on each device; the Username and Password provided in the shared policy are not applied (nor is the Telnet/SSH password). The Enable Password is sufficient for subsequent access to PIX/ASA/FWSM devices, unless external authentication such as AAA or TACACS+ is configured, in which case the Enable Password alone is not sufficient. In this situation, you must manually update the Username, Password and Enable Password on each device that uses external authentication.

| Password<br>Confirm            | <p>Provide a password for logging into the device (EXEC mode) with the specified Username. This password must be at least three characters; the maximum is 32 characters. Entries are case-sensitive.</p> <p>Re-enter the user password in the Confirm field.</p> <p><b>Note</b> We recommend a password length of at least 8 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Privilege Level                | <p>Choose a privilege level for this user; available values are 1 through 15. Level 1 allows EXEC-mode access only, the default level for log-in; level 15 allows Privileged EXEC-mode access; that is, access to the Enable mode. Other levels must be explicitly defined on the device.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Enable password                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Password as encrypted          | Select Plain Text or Encrypted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Password encrypt type          | Select MD5 or PBKDF2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Enable Password<br>Confirm     | <p>You can specify an Enable password that lets this user access Privileged EXEC mode after logging in. Entries are case-sensitive.</p> <p>Re-enter the Enable password in the Confirm field.</p> <p><b>Note</b> For Plain Text passwords:</p> <ul style="list-style-type: none"> <li>• The length of MD5 password should be three to 32 characters.</li> <li>• The length of PBKDF2 password should be 33 to 127 characters. Ensure PBKDF2 password has correct <code>sha</code> key values to avoid deployment failure.</li> </ul> <p><b>Note</b> If you configure user authentication for Enable access, each user has their own password and this password is not used. See <a href="#">Configuring AAA - Authentication Tab</a>, on page 1913 for more information.</p> |
| Telnet/SSH Password<br>Confirm | <p>You can specify a password that provides access to EXEC mode when connecting to the device via a Telnet or SSH session. This password must be at least three characters; the maximum is 32 characters. Entries are case-sensitive.</p> <p>Re-enter the Telnet/SSH password in the Confirm field.</p> <p><b>Note</b> If you configure user authentication for Telnet or SSH access, each user has their own password and this password is not used. See <a href="#">Configuring AAA - Authentication Tab</a>, on page 1913 for more information.</p>                                                                                                                                                                                                                       |

## Managing Mount Points

Use the Mount Points page to make a Common Internet File System (CIFS) or a File Transfer Protocol (FTP) file system accessible to the security appliance.

**Note** When you create an FTP-type mount point, the FTP server must have a UNIX directory listing style. Microsoft FTP servers have the MS-DOS directory listing style as their default.

The File Mount Point Configuration table lists the configured mount points. The File Mount Point Configuration table is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons. (These are standard buttons, as described in [Using Tables , on page 50.](#)) The Add Row button opens the Add Mount Point Configuration dialog box, and Edit Row opens the Edit Mount Point Configuration dialog box. Other than the titles, the two dialog boxes are identical. For more information, see [Add/Edit Mount Point Configuration Dialog Box , on page 1929.](#)

**Note** This feature is available only on ASA 8.0(2)+ devices. Mount points are supported in router mode only. For ASA versions between 8.0(2) and 9.x, mount points are not supported in multiple-context mode. Mount points are supported in the Admin context on ASA 9.x+ devices in multiple-context, routed mode.

#### Navigation Path

- (Device view) Select **Platform > Device Admin > Mount Points** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Mount Points** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit Mount Point Configuration Dialog Box

Use the Add/Edit Mount Point Configuration dialog box to add or edit a mount point entry in the File Mount Point Configuration table on the Mount Points page. You use mount points to make a Common Internet File System (CIFS) or a File Transfer Protocol (FTP) file system accessible to the security appliance.

#### Navigation Path

You can access the Add/Edit Mount Point Configuration dialog box from the Mount Points page. For more information, see [Managing Mount Points , on page 1928.](#)

| Element            | Description                                                                 |
|--------------------|-----------------------------------------------------------------------------|
| Enable Mount Point | Whether the file system is mounted or unmounted (available or unavailable). |

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Type            | <p>Select the type of file system to mount:</p> <ul style="list-style-type: none"> <li>• <b>cifs</b>—Specifies that the file system being mounted is CIFS, a file system that provides volume-mounting capabilities for CIFS-shared directories.</li> <li>• <b>ftp</b>—Specifies that the file system being mounted is FTP, a Linux kernel module, enhancing the Virtual File System (VFS) with FTP volume-mounting capabilities that allow you to mount FTP-shared directories.</li> </ul> <p><b>Note</b> When you create an FTP-type mount point, the FTP server must have a UNIX directory listing style. Microsoft FTP servers have the MS-DOS directory listing style as their default.</p> |
| Mount Point Name           | Specifies the name of the mount point. The mount point name is used when other CLI commands refer to the filesystem already mounted on the security appliance. A maximum of 31 characters are allowed for the mount point name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Server Name/IP Address     | Specifies the predefined name (or the IP address in dotted decimal notation) of the CIFS or FTP file-system server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Username                   | Specifies the authorized username for file-system mounting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Password<br>Confirm        | Identifies the authorized password for file-system mounting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Encrypt Password           | Select to indicate that the password supplied is in encrypted format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Share Name<br>(CIFS only)  | Explicitly identifies a specific server share (a folder) by name to access file data within a server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Domain Name<br>(CIFS only) | For CIFS file systems only, this argument specifies the Windows NT domain name. A maximum of 63 characters is permitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Mode<br>(FTP only)         | Identifies the FTP transfer mode as either active or passive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Path<br>(FTP only)         | Specifies the directory pathname to the specified FTP file-system server. Question marks and spaces are not allowed in the pathname and will be suppressed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## IP Client

The IP Client page lists the interface name and the IP version. You can use the configured IP Client for integrated routing and bridging support on Firepower 2100 Series devices. The IP Client page has the standard options to Add, Edit and Delete the entries.

---

**Note** This feature is available only on ASA 9.8.2+ Firepower 2100 Series single context devices. No multi context support for IP-Client.

---

#### Navigation Path

- (Device view) Select **Platform > Device Admin > IP Client** from the Device Policy selector.

---

**Note** The menu appears only for a Firepower 2100 Series device.

---

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > IP Client** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit IP Client Dialog Box

Use the Add/Edit IP Client dialog box to add or edit a IP Client entry in the IP Client table on the IP Client page. You use IP Client settings to support integrated routing and bridging on Firepower 2100 Series devices.

#### Navigation Path

You can access the Add/Edit IP Client dialog box from the IP Client page. For more information, see [IP Client, on page 1930](#).

#### Field Reference

*Table 599: Add/Edit IP Client Dialog Box*

| Element    | Description                                                          |
|------------|----------------------------------------------------------------------|
| IP Version | The IP address of the device. It can be an IPv4 or an IPv6 address.  |
| Interface  | Select the interface pertaining to the Firepower 2100 Series device. |

The preview configuration page displays the IP Client configuration with IPv6 suffixed for IPv6 interfaces. For IPv4 interfaces, only the interface name is displayed.

## App Agent

Use the App Agent page to configure the App Agent settings. You can specify the heartbeat interval and retry count.

**Note** App-Agent is available only on Firepower 2100 Series, Firepower 4000 Series, and Firepower 9000 Series devices. In Cisco Security Manager, App-Agent in Firepower 2100 Series device is supported from 9.8.2+; App-Agent in Firepower 4000 Series, and Firepower 9000 Series device is supported from 9.6.2+.

### Navigation Path

- (Device view) Select **Platform > Device Admin > App Agent** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > App Agent** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

| Element     | Description                                                                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interval    | Enter the app agent heartbeat interval. From ASA 9.6.2 to ASA 9.8.1, App-Agent heartbeat value can be between 300 to 6000 ms.<br>For ASA 9.8.2+ devices, App-Agent heartbeat interval value can be between 100 to 6000 ms.<br><b>Note</b> Cisco Security Manager will display an error message if you do not enter values in multiples of 100. |
| Retry Count | Enter the retry count between 3 to 10.                                                                                                                                                                                                                                                                                                         |
| Save        | Click to save the configuration.                                                                                                                                                                                                                                                                                                               |

## CHAPTER 49

# Configuring Device Access Settings on Firewall Devices

---

The Device Access section, located under the Device Admin folder in the Policy selector, contains pages for defining access to firewall devices.

This chapter contains the following topics:

- [Configuring Console Timeout](#) , on page 1933
- [HTTP Page](#) , on page 1934
- [Configuring ICMP](#) , on page 1936
- [Configuring Management Access](#) , on page 1938
- [Configuring Management Session Quota Limits](#) , on page 1939
- [Configuring Secure Shell Access](#) , on page 1940
- [Configuring SSL - Basic and Advanced tabs](#) , on page 1941
- [Reference Identities](#) , on page 1947
- [Configuring SNMP](#) , on page 1948
- [Telnet Page](#) , on page 1963

## Configuring Console Timeout

Use the Console page to specify a timeout value for inactive console sessions. When the time limit you specify is reached, the console session is closed.

In the **Console Timeout** field, enter the number of minutes a console session can remain idle before the device closes it. Valid values are 0 to 60 minutes. To prevent a console session from timing out, enter 0.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Console** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Console** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

# HTTP Page

Use the table on the HTTP page to manage the interfaces configured to access the HTTP server on a device, as well as HTTP redirect to HTTPS on those interfaces. You also can enable or disable the HTTP server on the device from this page. Administrative access by the specific device manager requires HTTPS access.

**Note** To redirect HTTP, the interface requires an access list that permits HTTP. Otherwise, the interface cannot listen to port 80, or to any other port that you configure for HTTP.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > HTTP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > HTTP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

*Table 601: HTTP Page*

| Element                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP Interface table                      | Use the Add Row, Edit Row, and Delete Row buttons below this table to manage device interfaces on which HTTP-to-HTTPS redirect is configured. Add Row and Edit Row open the <a href="#">HTTP Configuration Dialog Box</a> , on page 1935.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Fetch user name from certificate settings | <p>Select this option to set the rules for extracting a username from the certificate. Enter the following:</p> <ul style="list-style-type: none"> <li>• Enable HTTP username from certificate—Check this box to get the HTTP username from the certificate for authentication.</li> <li>• Pre-fill user name—Check the Pre-fill Username checkbox to enable the use of this name for authentication. When enabled, this username, along with the password entered by the user, are used for authentication.</li> </ul> <p>Choose one of the following options:</p> <p><b>Note</b> This feature is supported only in devices running ASA software version 9.4(1) or later.</p> <ul style="list-style-type: none"> <li>• Use the Entire DN as the username—Select this option if you want to use the entire DN as the username. This option is disabled by default.</li> </ul> |

| Element                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fetch user name from certificate settings (contd..) | <ul style="list-style-type: none"> <li>• Specify individual DN fields as the username—Choose from the Primary DN Field and Secondary DN Field drop-down values to specify which attributes and additional attributes to use to derive the username. This option is enabled by default.               <ul style="list-style-type: none"> <li>• C—Country: the two-letter country abbreviation which conforms to the ISO 3166 country abbreviations.</li> <li>• CN—Common Name: the name of a person, system, or other entity. Not available as a secondary attribute.</li> <li>• DNQ—Domain Name Qualifier.</li> <li>• EA—Email address.</li> <li>• GENQ—Generational qualifier.</li> <li>• GN—Given name.</li> <li>• I—Initials.</li> <li>• L—Locality: the city or town where the organization is located.</li> <li>• N—Name.</li> <li>• O—Organization: the name of the company, institution, agency, association, or other entity.</li> <li>• OU—Organizational Unit: the subgroup within the organization (O).</li> <li>• SER—Serial number.</li> <li>• SN—Surname.</li> <li>• SP—State/Province: the state or province where the organization is located.</li> <li>• T—Title.</li> <li>• UID—User Identifier.</li> <li>• UPN—User Principal Name.</li> </ul> </li> <li>• Use LUA Script generated by ASDM—Choose this option if you want to use the LUA script that is generated by ASDM. This option is disabled by default.</li> </ul> |
| Enable HTTP Server                                  | Enables or disables the HTTP server on the device. When enabled, you can specify a communications <b>Port</b> for the server. The Port range is 1 to 65535; the default is 443.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## HTTP Configuration Dialog Box

Use the HTTP Configuration dialog box to add or edit a host or network that will be allowed to access the HTTP server on the device via a specific interface; you also can enable and disable HTTP redirect.

**Navigation Path**

You can access the HTTP Configuration dialog box from the [HTTP Page](#) , on page 1934.

**Field Reference***Table 602: HTTP Configuration Dialog Box*

| Element                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name                    | Enter or Select the interface on which access to the HTTP server on the device is allowed.<br><br><b>Note</b> Beginning with Cisco Security Manager version 4.17, you can configure BVI interface for HTTP on ASA 9.9.2 devices and above. However, in multi-context, “Transparent” mode security context only supports BVI interface.                                                                                                                          |
| IP Address/Netmask                | Enter the IP address and netmask, separated by a forward slash (“/”) of the host or network that is permitted to establish an HTTP connection with the device. Alternately, you can click Select to select a Networks/Hosts object.<br><br><b>Note</b> Beginning with version 4.13, Cisco Security Manager supports policies—Groups, Hosts, Address Range, and Network for IPv6 devices.                                                                        |
| Enable Authentication Certificate | Select this option to require user certificate authentication in order to establish an HTTP connection. On ASA and PIX 8.0(2)+ devices, you can specify the authentication <b>Port</b> .                                                                                                                                                                                                                                                                        |
| Certificate Maps                  | Select the Certificate Map name that you configured in Remote Access VPN > certificate to Connection Profile Maps > Rules. For more information, see <a href="#">Map Rule Dialog Box (Upper Table)</a> , on page 1365. None is selected by default.<br><br>This feature is available beginning with Security Manager version 4.12 for ASA 9.6(2) or later devices. This option is supported for single, multi, routed and transparent contexts for ASA devices. |
| Redirect port                     | The port on which the security appliance listens for HTTP requests, which it then redirects to HTTPS. To disable HTTP redirect, ensure that this field is blank.                                                                                                                                                                                                                                                                                                |

## Configuring ICMP

Use the table on the ICMP page to manage Internet Control Message Protocol (ICMP) rules, which specify the addresses of all hosts or networks that are allowed or denied ICMP access to specific interfaces on the security device.

---

**Note** Starting from ASA 8.2(1) ICMP IPv6 was supported in the transparent firewall mode.

---

The ICMP rules control ICMP traffic that terminates on any device interface. If no ICMP control list is configured, the device accepts all ICMP traffic that terminates at any interface, including the outside interface. However, by default, the device does not respond to ICMP echo requests directed to a broadcast address.

It is recommended that permission is always granted for the ICMP Unreachable message (type 3). Denying ICMP Unreachable messages disables ICMP Path MTU discovery, which can halt IPsec and PPTP traffic. See RFC 1195 and RFC 1435 for details about Path MTU Discovery.

If an ICMP control list is configured, the device uses a first match to the ICMP traffic, followed by an implicit deny all. That is, if the first matched entry is a permit entry, the processing of the ICMP packet continues. If the first matched entry is a deny entry, or an entry is not matched, the device discards the ICMP packet and generates a syslog message. If an ICMP control list is not configured, a permit rule is assumed in all cases.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > ICMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > ICMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Note** ICMP IPv6 support is not available for PIX and FWSM devices.

| Element                     | Description                                                                                                                                                                                                                                                                                |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ICMP Rules Table            | Use the Add Row, Edit Row, and Delete Row buttons below this table to manage ICMP rules. Add Row opens the Add ICMP dialog box, while Edit Row opens the Edit ICMP dialog box. See <a href="#">Add and Edit ICMP Dialog Boxes</a> , on page 1937 for information about these dialog boxes. |
| ICMP Unreachable Parameters |                                                                                                                                                                                                                                                                                            |
| Rate Limit                  | For ICMP traffic that terminates at an interface on this device, the maximum number of ICMP Unreachable messages the device can transmit per second. This value can be between 1 and 100 messages per second; the default is 1 message per second.                                         |
| Burst Size                  | The burst size for ICMP Unreachable messages; this can be a value between 1 and 10.<br><b>Note</b> This parameter is not currently used by the system, so you can choose any value.                                                                                                        |

## Add and Edit ICMP Dialog Boxes

Use the Add ICMP dialog box to add an ICMP rule, which specifies a host/network that is allowed or denied the specified ICMP access on the specified device interface.

---

**Note** The Edit ICMP dialog box is virtually identical to the Add ICMP dialog box, and is used to modify existing ICMP rules. The following descriptions apply to both dialog boxes.

---

### Navigation Path

You can access the Add or Edit ICMP dialog boxes from the [Configuring ICMP](#) , on page 1936.

---

**Note** While adding an ICMP policy, make sure that the network and service is of the same type i.e. IPv6 networks support IPv6 services.

---

### Field Reference

*Table 604: Add and ICMP Dialog Boxes*

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Action       | Whether this rule permits or denies the selected ICMP Service message from the specified Network on the specified Interface. Choose: <ul style="list-style-type: none"> <li>• <b>Permit</b> – ICMP messages from the specified networks/hosts are allowed to the specified interface.</li> <li>• <b>Deny</b> – ICMP messages from the specified networks/hosts to the specified interface are dropped.</li> </ul> |
| ICMP Service | Enter or Select the specific ICMP service message to which the rule applies.                                                                                                                                                                                                                                                                                                                                      |
| Interface    | Enter or Select the device interface to which these ICMP messages are directed.                                                                                                                                                                                                                                                                                                                                   |
| Network      | Enter a host name, IPv4 or IPv6 address, or Select a Networks/Hosts object, to define the specified ICMP message source.                                                                                                                                                                                                                                                                                          |

## Configuring Management Access

Use the Management Access page to enable or disable access on a high-security interface so you can perform management functions on the device. You can enable this feature on an internal interface to allow management functions to be performed on the interface over an IPsec VPN tunnel. You can enable the Management Access feature on only one interface at a time.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Management Access** from the Device Policy selector.

- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Management Access** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Enabling and Disabling Management Access

In the **Management Access Interface** field, enter the name of the device interface that is to permit management access connections. You can click Select to select the interface from a list of interface objects.

You can enable the Management Access feature on only one interface at a time.

Clear the Management Access Interface field to disable management access.

## Configuring Management Session Quota Limits

Beginning with 4.19, Cisco Security Manager allows you to configure enforcement of limits for the maximum number of admin sessions across all connection types and usernames, and for maximum number of concurrent sessions per username as well as per protocol limits on ASA 9.12(1) devices or later. The configured session concurrence limits is enforced prior to authenticating the incoming administrative session.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Management Session Quota** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Management Session Quota** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

---

**Note** The sequence of enforcement on the session limits would be—user limit followed by aggregate limit, and then by protocol limit.

---

### Field Reference

*Table 605: Add and ICMP Dialog Boxes*

| Element   | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| Aggregate | The maximum number of admin sessions across all connection types. The default is 15. You can configure the limit between 1 and 15. |
| HTTP      | Enter management session quota limit for HTTP between 1 and 5. The default value is 5.                                             |
| SSH       | Enter management session quota limit for SSH between 1 and 5. The default value is 5.                                              |
| Telnet    | Enter management session quota limit for Telnet between 1 and 5. The default value is 5.                                           |
| User      | Enter management session quota limit for the user between 1 and 5. There is no default value specified for user limit.             |

# Configuring Secure Shell Access

Use the Secure Shell page to configure rules that permit administrative access to a security device using the SSH protocol. The rules restrict SSH access to a specific IP address and netmask. Any SSH connection attempts that comply with these rules must then be authenticated by an AAA server or Telnet password.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > Secure Shell** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > Secure Shell** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

*Table 606: Secure Shell Page*

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SSH Version         | Specify the SSH version(s) accepted by the device: choose <b>1</b> , <b>2</b> , or <b>1 and 2</b> . By default, SSH Version 1 and SSH Version 2 connections are accepted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Timeout             | Enter the number of minutes, 1 to 60, the Secure Shell session can remain idle before the device closes it. The default value is 5 minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Allowed Hosts table | Use the Add Row, Edit Row, and Delete Row buttons below this table to manage the hosts allowed to connect to the security device via SSH. Add Row opens the Add Host dialog box, while Edit Row opens the Edit Host dialog box. See <a href="#">Add and Edit SSH Host Dialog Boxes</a> , on page 1941 for information about these dialog boxes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Enable Secure Copy  | <p>Check this box to enable the secure copy (SCP) server on the security appliance. This allows the appliance to function as an SCP server for transferring files from/to the device. Only clients that are allowed to access the security appliance using SSH can establish a secure copy connection.</p> <p>This implementation of the secure copy server has the following limitations:</p> <ul style="list-style-type: none"> <li>• The server can accept and terminate connections for secure copy, but cannot initiate them.</li> <li>• The server does not have directory support. The lack of directory support limits remote client access to the security appliance internal files.</li> <li>• The server does not support banners.</li> <li>• The server does not support wildcards.</li> <li>• The security appliance license must have the VPN-3DES-AES feature to support SSH version 2 connections.</li> </ul> |

## Add and Edit SSH Host Dialog Boxes

Use the Add Host dialog box to add an SSH access rule.

**Note** The Edit Host dialog box is virtually identical to the Add Host dialog box, and is used to modify existing SSH access rules. The following descriptions apply to both dialog boxes.

### Navigation Path

You can access the Add and Edit Host dialog boxes from the [Configuring Secure Shell Access](#), on page 1940.

### Field Reference

*Table 607: Add and Edit Host Dialog Boxes*

| Element      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface    | Enter or Select the name of the device interface on which SSH connections are permitted.<br><br><b>Note</b> Beginning with Cisco Security Manager version 4.17, you can configure BVI interface for SSH connections on ASA 9.9.2 devices and above. However, in multi-context, “Transparent” mode security context only supports BVI interface.                                                                                   |
| IP Addresses | Enter the name or IP address for each host or network that is permitted to establish an SSH connection with the security device on the specified interface; use commas to separate multiple entries. You also can click Select to select Networks/Hosts objects from a list.<br><br><b>Note</b> Beginning with version 4.13, Cisco Security Manager supports policies—Groups, Hosts, Address Range, and Network for IPv6 devices. |

## Configuring SSL - Basic and Advanced tabs

Beginning from version 4.8, Security Manager provides enhanced security features using Secure Sockets Layer (SSL).

To configure SSL under device access, ensure you enable SSL under **CSM Admin > Policy Management**

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SSL** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > SSL** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

**Table 608: SSL Page Basic Tab**

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Certificate Authentication                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| FCA Timeout                                   | <p>Enter a value in the range of 1 to 120.</p> <p><b>Note</b> FCA Timeout is applicable for devices running the ASA software version 9.1(2) or later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Interface                                     | <p>Use the Add Row, Edit Row, and Delete Row buttons below the Interface table to manage the interfaces and their port numbers allowed to connect to the security device via SSL. Add Row opens the Add Interface and Port dialog box, while Edit Row opens the Edit Interface and Port dialog box. You can select the interface from the available entries in the Interface Selector dialog box. Enter a value in the range of 1 to 65535 for the port number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Client Version<br>SSL/TLS<br>Protocol Version | <p>The Client Version is the SSL/TLS protocol version to use when the device acts as a client. Select any one of the following:</p> <ul style="list-style-type: none"> <li>• Any—Select this keyword to transmit SSLV3 ClientHellos and negotiate SSLV3 or greater. This is the default keyword.</li> <li>• SSLV3—Enter this keyword to transmit SSLv3 ClientHellos and negotiate SSLV3 or greater.</li> <li>• TLSV1—Enter this keyword to transmit TLSv1 ClientHellos and negotiate TLSV1 or greater.</li> <li>• TLSV1.1—Enter this keyword to transmit TLSV1.1 ClientHellos and negotiate TLSV1.1 or greater.</li> <li>• TLSV1.2—Enter this keyword to transmit TLSV1.2 ClientHellos and negotiate TLSV1.2 or greater.</li> <li>• TLSV1.3—Enter this keyword to transmit TLSV1.3 ClientHellos and negotiate TLSV1.3 or greater.</li> </ul> <p><b>Note</b></p> <ul style="list-style-type: none"> <li>• TLSV1.1 and TLSV1.2 protocol versions are applicable for devices running the ASA software version 9.3(2) or later.</li> <li>• TLSV1.3 protocol version is applicable for devices running the ASA software version 9.19(1) or later.</li> </ul> |

| Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version | <p>Select one of the following versions:</p> <ul style="list-style-type: none"> <li>• DEFAULT</li> <li>• DTLSV1</li> <li>• DTLSV1.2</li> <li>• SSLV3</li> <li>• TLSV1</li> <li>• TLSV1.1</li> <li>• TLSV1.2</li> <li>• TLSV1.3</li> </ul> <p><b>Note</b> The DEFAULT keyword is used to configure outbound connections when the device is acting as a client and establishing a connection to a server. All the other keywords are used when the device is acting as a server and accepting connections from a client.</p> <p><b>Note</b> The SSLV3 version has been deprecated from ASA version 9.4(1). Therefore, beginning with version 4.9, Security Manager performs a validation to check if SSLV3 option has been configured for any ASA devices running the version 9.4(1) or later.</p> |
| Level   | <p>Select one of the following versions:</p> <ul style="list-style-type: none"> <li>• ALL - It includes all ciphers including NULL-SHA.</li> <li>• LOW - It includes all ciphers except NULL-SHA.</li> <li>• MEDIUM - It includes all ciphers except NULL-SHA:DES-CBC-SHA:RC4-SHA:RC4-MD5.</li> <li>• FIPS - It includes all FIPS-compliant ciphers (that is, not NULL-SHA:DES-CBC-SHA:RC4-MD5:RC4-SHA:DES-CBC3-SHA)</li> <li>• HIGH - It includes only AES-256 with SHA-2 ciphers, so it only applies to TLSV1.2 and TLSV1.3.</li> </ul>                                                                                                                                                                                                                                                        |

| Element                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Custom String              | <p>Use the CUSTOM keyword for Security Manager to exercise full control over the cipher suite using OpenSSL cipher definition strings.</p> <p><b>Note</b> Beginning with version 4.9, Security Manager provides support for the following new TLSV1.2 ciphers for devices running the ASA software version 9.4(1) or later.</p> <ul style="list-style-type: none"> <li>• ECDHE_RSA_AES128_SHA256</li> <li>• ECDHE_RSA_AES256_SHA384</li> <li>• ECDHE_ECDSA_AES128_SHA256</li> <li>• ECDHE_ECDSA_AES256_SHA384</li> </ul> <p><b>Note</b> Beginning with version 4.16, Security Manager provides support for the following new TLSV1.2 ciphers in addition to the above mentioned ciphers for devices running the ASA software version 9.4(1) or later.</p> <ul style="list-style-type: none"> <li>• ECDHE-ECDSA-AES256-GCM-SHA384</li> <li>• ECDHE-RSA-AES256-GCM-SHA384</li> <li>• DHE-RSA-AES256-GCM-SHA384</li> <li>• AES256-GCM-SHA384</li> <li>• ECDHE-ECDSA-AES128-GCM-SHA256</li> <li>• ECDHE-RSA-AES128-GCM-SHA256</li> <li>• DHE-RSA-AES128-GCM-SHA256</li> <li>• AES128-GCM-SHA256</li> </ul> |
| ECDH Configuration         | Select from one of the options (19,20,21,none) in the ECDH Group. This feature is available from Security Manager version 4.9 onwards for ASA devices version 9.4(1) or later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| SSL DH Group Configuration | <p>Select from one of the options (2, 5, 14, 15 and 24) in the SSL DH Group, DH group 14 is used by default. You can now use DH group 15 in SSL DH Group, for ASA 9.16(1) and later devices.</p> <p><b>Note</b> Beginning with Cisco Security Manager 4.23, DH groups 2, 5, and 24 is unsupported in the SSL DH Group on ASA 9.16(1) and later devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Note** Due to import regulations in some countries the Oracle implementation provides a default cryptographic jurisdiction policy file that limits the strength of cryptographic algorithms. If stronger algorithms need to be configured or are already configured on the device (for example, AES with 256-bit keys, DH group with 5,14,24), follow these steps:

1. Download the Java 7 unlimited strength cryptography policy .jar files from <http://www.oracle.com>. Cisco recommends to search for the following on the Oracle website:

Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files Java 7

(Click the download button to download the files by accepting the license agreement.)

1. Replace local\_policy.jar and US\_export\_policy.jar on your Security Manager server in the folder CSCOpX\MDC\vmS\jre\lib\security.
2. Restart your Security Manager server.

## Reference Identities

Beginning with version 4.12, Security Manager enables you to configure Reference Identity policy objects for Secure Syslog Server connections on devices running the ASA software version 9.6(2) or later. This object enables support for Common Criteria requirements.

Reference identities are configured as one or more identifiers to be compared to the presented identifiers in the server certificate. Identifiers are specific instances of the four identifier types specified in RFC 6125.

## Add/Edit Reference Identity Dialog Box

Use the Add/Edit Reference Identity Dialog Box to create a new Reference Identity policy object or to edit existing policy objects.

### Navigation Path

Select **Manage > Policy Objects**, then select **Reference Identity** from the Object Type Selector. Right-click inside the work area, then select **New Object** or click the + button to add a new object, or right-click a row, then select **Edit Object**.

### Field Reference

**Table 610: Add/Edit Reference Identity Dialog Box**

| Element         | Description                                                                                                                                                                                                                                                                                                                                      |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | Name of the Reference Identity policy object. Note that each Reference Identifier can have multi line values.                                                                                                                                                                                                                                    |
| Description     | Description of the Reference Identity policy object.                                                                                                                                                                                                                                                                                             |
| Common Name ID  | A Relative Distinguished Name (RDN) in a certificate subject field that contains only one attribute-type-and-value pair of type Common Name (CN), where the value matches the overall form of a domain name. The CN value can be free text. A CN-ID reference identifier does not identify an application service.                               |
| Domain Name ID  | A subjectAltName entry of type dNSName. This is a DNS domain name. A DNS-ID reference identifier does not identify an application service.                                                                                                                                                                                                       |
| Service Name ID | A subjectAltName entry of type otherName whose name form is SRVName as defined in RFC 4985. A SRV-ID identifier may contain both a domain name and an application service type. For example, a SRV-ID of “_imaps.example.net” would be split into a DNS domain name portion of “example.net” and an application service type portion of “imaps.” |

| Element                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Uniform Resource Identifier ID                        | A subjectAltName entry of type uniformResourceIdentifier whose value includes both (i) a “scheme” and (ii) a “host” component (or its equivalent) that matches the “reg-name” rule specified in RFC 3986. A URI-ID identifier must contain the DNS domain name, not the IP address, and not just the hostname. For example, a URI-ID of “sip:voice.example.edu” would be split into a DNS domain name portion of “voice.example.edu” and an application service type of “sip.” |
| Category                                              | (Optional) Select a category between CAT-A and CAT-J.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Allow Value Override per Device Overrides Edit button | Whether to allow the object definition to be changed at the device level. For more information, see <a href="#">Allowing a Policy Object to Be Overridden</a> , on page 245 and <a href="#">Understanding Policy Object Overrides for Individual Devices</a> , on page 244.<br>If you allow device overrides, you can click the Edit button to create, edit, and view the overrides. The Overrides field indicates the number of devices that have overrides for this object.  |

**Note** A reference identity is created when configuring one with a previously unused name. Once a reference identity has been created, the four identifier types and their associated values can be added or deleted from the reference identity. The reference identifiers MAY contain information identifying the application service and MUST contain information identifying the DNS domain name.

## Configuring SNMP

Simple Network Management Protocol (SNMP) defines a standard way for network management stations running on PCs or workstations to monitor the health and status of many types of devices, including switches, routers, and security appliances. You can use the SNMP page to configure a firewall device for monitoring by SNMP management stations.

The Simple Network Management Protocol (SNMP) enables monitoring of network devices from a central location. Cisco security appliances support network monitoring using SNMP versions 1, 2c, and 3, as well as traps and SNMP read access; SNMP write access is not supported.

You can configure a security appliance to send “traps” (event notifications) to a network management station (NMS), or you can use the NMS to browse the management information bases (MIBs) on the security appliance. Use CiscoWorks for Windows or any other SNMP MIB-II-compliant browser to receive SNMP traps and browse a MIB.

The security appliance has an SNMP agent that notifies designated management stations if specified events occur, for example, when a link in the network goes up or down. The notification includes an SNMP system object ID (OID), identifying the device to the management stations. The security appliance SNMP agent also replies when a management station asks for information.

### SNMP MIBs and OIDs

An SNMP trap reports significant events occurring on a network device, most often errors or failures. SNMP traps are defined in Management Information Bases (MIBs), which can be either standard or enterprise-specific.

Standard traps and MIBs are created by the Internet Engineering Task Force (IETF) and documented in various RFCs. Standard traps are compiled into the security appliance software. If needed, you can also download RFCs, standard MIBs, and standard traps from the IETF website: <http://www.ietf.org/>.

For Cisco MIB files and OIDs, refer to: <http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>. OIDs may be downloaded from this FTP site: <ftp://ftp.cisco.com/pub/mibs/oid/oid.tar.gz>.

This section contains the following topics:

- [SNMP Terminology](#), on page 1949
- [SNMP Version 3](#), on page 1949
- [SNMP Page](#), on page 1951

## SNMP Terminology

Here are definitions for some common SNMP terms:

- **Agent** – The SNMP server running on the security appliance. The agent responds to requests for information and action from the management station. The agent also controls access to its management information base (MIB), the collection of data objects that can be viewed or changed by the SNMP manager.
- **Management stations** – The PCs or workstations set up to monitor SNMP events and manage devices such as the security appliance. Management stations can also receive messages about events which require attention, such as hardware failures.
- **MIBs** – The agent maintains standardized data structures called Management Information Bases (MIBs), used to collect information, such as packet, connection and error counters, and buffer usage and failover status. A number of MIBs are defined for specific products, and for the common protocols and hardware standards used by most network devices. SNMP management stations can browse MIBs, or request only specific fields. In some applications, MIB data can be modified for administrative purposes.
- **OID** – The SNMP standard assigns a system object ID (OID) so that a management station can uniquely identify network devices with SNMP agents, and indicate to users the source of information monitored and displayed.
- **Traps** – Specified events that generate a message from the SNMP agent to the management station. Events include alarm conditions such as linkup, linkdown, coldstart, warmstart, authentication, or syslog events.

## SNMP Version 3

SNMP Version 3 provides security enhancements that are not available in SNMP Version 1 or SNMP Version 2c. SNMP Versions 1 and 2c transmit data between the SNMP server and SNMP agent in clear text. SNMP Version 3 adds authentication and privacy options to secure protocol operations. In addition, this version controls access to the SNMP agent and MIB objects through the User-based Security Model (USM) and View-based Access Control Model (VACM). The ASA and ASASM also support the creation of SNMP groups and users, as well as hosts, which is required to enable transport authentication and encryption for secure SNMP communications.

---

**Note** SNMP Version 3 is supported on ASA devices running 8.2(1) or later and on ASASM devices running 8.5(1) or later.

---

### Security Models

For configuration purposes, the authentication and privacy options are grouped together into security models. Security models apply to users and groups, which are divided into the following three types:

- NoAuth—No Authentication and No Privacy, which means that no security is applied to messages.
- Auth—Authentication but No Privacy, which means that messages are authenticated.
- Priv—Authentication and Privacy, which means that messages are authenticated and encrypted.

### SNMP Groups

An SNMP group is an access control policy to which users can be added. Each SNMP group is configured with a security model, and is associated with an SNMP view. A user within an SNMP group must match the security model of the SNMP group. These parameters specify what type of authentication and privacy a user within an SNMP group uses. Each SNMP group name and security model pair must be unique.

### SNMP Users

SNMP users have a specified username, a group to which the user belongs, authentication password, encryption password, and authentication and encryption algorithms to use. The authentication algorithm options are MD5 and SHA. The encryption algorithm options are DES, 3DES, and AES (which is available in 128, 192, and 256 versions). When you create a user, you must associate it with an SNMP group. The user then inherits the security model of the group.

### SNMP Hosts

An SNMP host is an IP address to which SNMP notifications and traps are sent. To configure SNMP Version 3 hosts, along with the target IP address, you must configure a username, because traps are only sent to a configured user. SNMP target IP addresses and target parameter names must be unique on the ASA and ASA Services Module. Each SNMP host can have only one username associated with it. To receive SNMP traps, configure the SNMP NMS, and make sure that you configure the user credentials on the NMS to match the credentials for the ASA and ASASM.

### Implementation Differences Between the ASA, ASA Services Module, and the Cisco IOS Software

The SNMP Version 3 implementation in the ASA and ASASM differs from the SNMP Version 3 implementation in the Cisco IOS software in the following ways:

- The local-engine and remote-engine IDs are not configurable. The local engine ID is generated when the ASA or ASASM starts or when a context is created.
- No support exists for view-based access control, which results in unrestricted MIB browsing.
- Support is restricted to the following MIBs: USM, VACM, FRAMEWORK, and TARGET.
- You must create users and groups with the correct security model.

- You must remove users, groups, and hosts in the correct sequence.
- Use of the **snmp-server host** command creates an ASA or ASASM rule to allow incoming SNMP traffic.

## SNMP Page

Use the SNMP page to configure the security appliance for monitoring by Simple Network Management Protocol (SNMP) management stations.

---

**Note** For SNMP Version 3, configuration must occur in the following order: group, user, host.

---

### Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Device Access > SNMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element             | Description                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable SNMP Servers | When this option is selected, the security device provides SNMP information on the specified interface(s). You can deselect this option to disable SNMP monitoring while retaining the configuration information. |

| Element                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Read Community String<br>Confirm      | Enter the password used by a SNMP management station when sending requests to this device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. The security device uses the password to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces are not permitted.<br><br>Repeat the password in the <b>Confirm</b> field to ensure it was entered correctly.                                                                                                              |
| System Administrator Name             | Enter the name of the device administrator or other contact person. This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.                                                                                                                                                                                                                                                                                                                                                                                                             |
| Location                              | Describe the location of this security device (for example, <b>Building 42, Sector 54</b> ). This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.                                                                                                                                                                                                                                                                                                                                                                                    |
| Port (PIX 7.x, ASA and FWSM 3.x only) | Specify the port on which incoming requests will be accepted. The default is 161.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Configure SNMP Traps                  | Click this button to configure SNMP traps in the <a href="#">SNMP Trap Configuration Dialog Box</a> , on page 1953.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SNMP Engine ID                        | Shows the ID of the SNMP engine configured on the device. Click <b>Get SNMP Engine ID</b> to retrieve the engine ID from the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| SNMP Hosts table                      | This table lists the SNMP management stations that can access the security appliance. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, as described in <a href="#">Using Tables</a> , on page 50.<br><br>The Add Row and Edit Row buttons open the <a href="#">Add/Edit SNMP Host Access Entry Dialog Box</a> , on page 1956, used to add and edit management station host entries.<br><br><b>Note</b> For ASA devices running 9.1(5) or later, you can configure up to 129 SNMP hosts. For other devices and earlier ASA versions, you can only configure up to 32 SNMP hosts. |
| SNMP Host Group table                 | Beginning with version 4.12, Security Manager enables you to add and edit the Host Group entries for SNMP Users. See <a href="#">Add/Edit SNMP Host Group Entry Dialog Box</a> , on page 1957 for more information.                                                                                                                                                                                                                                                                                                                                                                                                      |
| SNMPv3 Configuration                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SNMP Group tab                        | Lists the SNMP groups that have been configured. | Element            | Description                                                                                                                                                                                                                                                                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNMP User tab      | Lists the SNMP users that have been configured. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, as described in <a href="#">Using Tables</a> , on page 50.<br><br>The Add Row and Edit Row buttons open the <a href="#">Add/Edit SNMP User Entry Dialog Box</a> , on page 1960, used to add and edit SNMP users. |
| SNMP User List tab | Beginning with version 4.12, Security Manager enables you to add a user list containing multiple SNMP users. See <a href="#">Add/Edit SNMP User List Entry Dialog Box</a> , on page 1962 for more information.                                                                                                                                             |

## SNMP Trap Configuration Dialog Box

Use the SNMP Trap Configuration dialog box to configure SNMP traps (event notifications) for the selected security device.

Traps are different than browsing; they are unsolicited “comments” from the managed device to the management station for certain events, such as **linkup**, **linkdown**, and **syslog event generated**.

An SNMP object ID (OID) for the device appears in SNMP event traps sent from the device. The SNMP service running on a security device performs two functions:

- Replies to SNMP requests from management stations.
- Sends traps to management stations or other devices that are registered to receive them from the security appliance.

Cisco security devices support three types of traps:

- firewall
- generic
- syslog

In the SNMP Trap Configuration dialog box, available traps are presented on four tabbed panels: Standard, Entity MIB, Resource, and Other.

### Navigation Path

You can access the SNMP Trap Configuration dialog box from the [SNMP Page](#) , on page 1951.

| Other    | <ul style="list-style-type: none"> <li>• <b>IKEv2 Start</b> – Internet Key Exchange version 2 (IKEv2) exchange initiated.</li> <li>• <b>IKEv2 Stop</b> – Internet Key Exchange version 2 (IKEv2) exchange terminated.</li> <li>• <b>Memory Threshold</b> – Available free memory has fallen below configured threshold, as indicated in the notification.</li> <li>• <b>ASA CPU Rising Threshold</b> – This notification is triggered when utilization of CPU resources exceeds the specified Percentage for a specified Period of time:<br/><br/> <b>Percentage</b> – Enter the desired upper limit of CPU resource usage as a percentage of total available. Valid values range from 10 to 94; default is 70%.<br/> <b>Period</b> – Specify the length of time, in minutes, that the specified Percentage can be exceeded before notification is triggered. Valid values range from 1 to 60.</li> <li>• <b>Interface Threshold</b> – This notification is triggered when utilization of a physical interface exceeds the specified Percentage of total bandwidth:<br/><br/> <b>Percentage</b> – Enter the desired upper limit on interface usage as a percentage of total available bandwidth. Valid values range from 30 to 99; default is 70%.</li> <li>• <b>IPSec Start</b> – IPsec has started, as indicated in the notification.</li> <li>• <b>IPSec Stop</b> – IPsec has stopped, as indicated in the notification.</li> <li>• <b>Remote Access Session Threshold Exceeded</b> – The number of remote access sessions has reach the defined limit, as indicated in the notification.</li> <li>• <b>NAT Packet Discard</b> – This notification is generated when IP packets are discarded by the NAT function. Available Network Address Translation addresses or ports have fallen below configured threshold.</li> <li>• <b>CPU Rising Threshold</b> – This notification is triggered when utilization of CPU resources exceeds the specified Percentage for a specified Period of time:<br/><br/> <b>Percentage</b> – Enter the desired upper limit of CPU resource usage as a percentage of total available. Valid values range from 10 to 100; default is 70%.<br/> <b>Period</b> – Specify the length of time, in seconds, that the specified Percentage can be exceeded before notification is triggered. Valid values range from 60 to 3600.</li> </ul> |

## Add/Edit SNMP Host Access Entry Dialog Box

Use the Add/Edit SNMP Host Access Entry dialog box to add and edit entries in the SNMP Hosts table on the SNMP page. These entries represent SNMP management stations allowed to access the security device.

For ASA devices running any software version between 9.1(5) and 9.3(2), you can configure 129 SNMP hosts. For ASA devices running the software version lower than 9.1(5) you can configure only 32 SNMP hosts.

Beginning with version 4.9, Security Manager enables you to configure up to 4096 SNMP hosts for ASA devices running the software version 9.4(1) or later. However, only 129 of this number can be for traps. You cannot configure more than 129 trap configured SNMP hosts.

### Navigation Path

You can access the Add/Edit SNMP Host Access Entry dialog box from the [SNMP Page](#) , on page 1951.

### Field Reference

*Table 613: Add/Edit SNMP Host Access Entry Dialog Box*

| Element                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name              | Enter or Select the interface on which this SNMP management station contacts the device.                                                                                                                                                                                                                                                                                                                                                                                |
| IP Address                  | Enter the IP address, or Select a Networks/Hosts object, representing the SNMP management station.<br><br><b>Note</b> Beginning with Cisco Security Manager version 4.17, IPv6 Address for SNMP policy is supported on ASA 9.9.2 devices and above.<br><br><b>Note</b> You can now configure network or range of the IPv6 address.                                                                                                                                      |
| UDP Port                    | (Optional) Enter a UDP port for requests from the SNMP host. You can use this field to override the global value specified on the SNMP page.                                                                                                                                                                                                                                                                                                                            |
| Community String<br>Confirm | Enter the password used by the SNMP management station when sending requests to the security device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. Thus, the password is used to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces are not permitted.<br><br>Repeat the password in the <b>Confirm</b> field. |

| Element                        | Description                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SNMP Version                   | Choose the version of SNMP used by this management station: <b>1</b> , <b>2c</b> , or <b>3</b> .                                                                                                                                                                                                                                              |
| SNMP User Name                 | If SNMP version 3 is selected, select the SNMP user. For information on SNMP users, see <a href="#">Add/Edit SNMP User Entry Dialog Box</a> , on page 1960.                                                                                                                                                                                   |
| Server Poll/Trap Specification | Specify the type(s) of communication with this management station: poll only, trap only, or both trap and poll. Check either or both: <ul style="list-style-type: none"> <li>• Poll – The security device waits for periodic requests from the management station.</li> <li>• Trap – The device sends trap events when they occur.</li> </ul> |

## Add/Edit SNMP Host Group Entry Dialog Box

Beginning with Security Manager version 4.12, you can use the Add/Edit SNMP Host Group Entry dialog box to add and edit entries in the SNMP Host Group table on the SNMP page. These entries represent SNMP management stations allowed to access the security device.

For ASA devices running any software version between 9.1(5) and 9.4, you can configure 129 SNMP hosts. For ASA devices running the software version lower than 9.1(5) you can configure only 32 SNMP hosts.

Beginning with version 4.9, Security Manager enables you to configure up to 4096 SNMP hosts for ASA devices running the software version 9.4(1) or later. However, only 129 of this number can be for traps. You cannot configure more than 129 trap configured SNMP hosts.

---

**Note** If you edit a used Address Range or Network object in the Networks/Host Policy Object Manager after adding or editing SNMP Host or Host Group entries in the Add/ Edit SNMP Host Group entry page, Cisco Security Manager will not validate for the total number of SNMP traps. Thus, if the trap entries exceed 129, it will result in a deployment failure.

---

### Navigation Path

You can access the Add/Edit SNMP Host Access Entry dialog box from the [SNMP Page](#) , on page 1951.

| IP Address                        | Enter the IP address, or Select a Networks/Hosts object, representing the SNMP management station.<br><br><b>Note</b> SNMP Host Group Entry supports IPV6 grouping for the ASA 9.17(1) and above devices. You can configure the IPV6 network or range in the <a href="#">Add/Edit SNMP Host Access Entry Dialog Box</a> .                                                                                                                                                                                                                                       |
| UDP Port                          | (Optional) Enter a UDP port for requests from the SNMP host. You can use this field to override the global value specified on the SNMP page.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Community String<br>Confirm       | Enter the password used by the SNMP management station when sending requests to the security device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. Thus, the password is used to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces are not permitted.<br><br>Repeat the password in the <b>Confirm</b> field.                                                                                         |
| SNMP Version                      | Choose the version of SNMP used by this management station: <b>1</b> , <b>2c</b> , or <b>3</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Server Poll/Trap<br>Specification | Specify the type(s) of communication with this management station: poll only, trap only, or both trap and poll. Check either or both: <ul style="list-style-type: none"> <li>• Poll – The security device waits for periodic requests from the management station.</li> <li>• Trap – The device sends trap events when they occur.</li> </ul><br><b>Note</b> You cannot enable both traps and polling for the same SNMP Host Group. If you need to enable this, Cisco recommends that you use the <code>snmp-server host</code> command for the relevant hosts. |

## Add/Edit SNMP Group Entry Dialog Box

Use the Add/Edit SNMP Group Entry dialog box to add and edit entries in the SNMP Groups table on the SNMP page. An SNMP group is an access control policy to which users can be added. Each SNMP group is configured with a security model, and is associated with an SNMP view. A user within an SNMP group must match the security model of the SNMP group. These parameters specify what type of authentication and privacy a user within an SNMP group uses. Each SNMP group name and security model pair must be unique.

For configuration purposes, the authentication and privacy options are grouped together into security models. Security models apply to users and groups, which are divided into the following three types:

- NoAuth—No Authentication and No Privacy, which means that no security is applied to messages.

- Auth—Authentication but No Privacy, which means that messages are authenticated.
- Priv—Authentication and Privacy, which means that messages are authenticated and encrypted.

### Notes

- Before a group can be deleted, you must ensure that all users associated with that group are deleted. If any hosts are associated with a user that needs to be deleted, you must delete those hosts before you can delete the user.
- If users have been configured to belong to a particular group with a certain security model, you must do the following to change the security level of that group:
  1. Remove all host entries associated with any users belonging to the group.
  2. Remove the users from the group.
  3. Deploy the changes to the device.
  4. Change the group security level.
  5. Add users that belong to the group.
  6. Add hosts belonging to the users that were added for the group.
  7. Deploy the changes to the device.

### Navigation Path

You can access the Add/Edit SNMP Group Entry dialog box from the [SNMP Page](#) , on page 1951.

## Add/Edit SNMP User Entry Dialog Box

Use the Add/Edit SNMP User Entry dialog box to add a user to an SNMP group or to edit entries in the SNMP User table on the SNMP page. SNMP users inherit the security model of the group to which they are assigned.

### Notes

- After a user has been created, you cannot change the group to which the user belongs.
- Before a user can be deleted, you must ensure that no hosts are configured that are associated with that username.

### Navigation Path

You can access the Add/Edit SNMP User Entry dialog box from the [SNMP Page](#), on page 1951.

| Security Level                      | Shows the security level for the selected group: <ul style="list-style-type: none"> <li>• NoAuth—No Authentication and No Privacy, which means that no security is applied to messages.</li> <li>• Auth—Authentication but No Privacy, which means that messages are authenticated.</li> <li>• Priv—Authentication and Privacy, which means that messages are authenticated and encrypted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| User Name                           | Enter the name of the SNMP user. Usernames must be 32 characters or less and must be unique for the SNMP server group selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Engine ID<br>(SNMP version v3 only) | The SNMP EngineID identifier used for authentication in v3.<br>You can enter comma separated multiple Engine IDs. The Engine ID identifier must be valid, and each Engine ID must be within the range of 1 to 257 characters. <ul style="list-style-type: none"> <li>• If you configure EngineID for an SNMP user with MD5 algorithm, the EngineID must be a valid one. If the EngineID is not valid, the preview config would fail with an error "failed to generate raw config". For example, the preview config fails if the EngineID entered is 111.</li> <li>• For an SNMP group with a security level of NoAuth, do not provide an EngineID identifier because on deployment, the ASA will ignore this engine ID and take the default local engine ID.</li> <li>• The following dynamic behaviors of the device cannot be handled in Security Manager: <ul style="list-style-type: none"> <li>• If you upgrade a failover ASA device from version 8.x or 9.x to version 9.6(2), the device will automatically create multiple SNMP User commands for multiple SNMP Engine IDs. You must copy the Engine ID by retrieving it from the device into this Engine ID text box. For information about retrieving Engine ID from the device see <a href="#">SNMP Page , on page 1951</a>.</li> <li>• If you add or remove an ASA device to or from a failover configuration, you must manually enter the Engine ID because the ASA device automatically removes or creates new SNMP User commands for the existing Engine IDs.</li> </ul> </li> </ul> |
| Encrypt Password Type               | Specify the type of password you want to use: Clear Text or Encrypted.<br>If the password type is Clear Text, Security Manager will encrypt the password when deploying to the device. If the password type is Encrypted, Security Manager will directly deploy the encrypted password. Security Manager will never directly deploy the clear text password to device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Auth Algorithm Type                 | Specify the type of authentication you want to use: MD5, SHA, or SHA256.<br><b>Note</b> Beginning with version 4.21, Cisco Security Manager supports SHA256 authentication type for ASA 9.14(1) and higher devices. The MD5 authentication type will be deprecated in the upcoming ASA versions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Element                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Add/Edit SNMP User List Entry Dialog Box

Beginning with version 4.12, Security Manager enables you to use the Add/Edit SNMP User List Entry dialog box to add a user list containing multiple SNMP users.

### Notes

- You cannot delete a user list if the list is used by a particular host group.
- You cannot delete an SNMP user if that user is referred to in a particular user list.

### Navigation Path

You can access the Add/Edit SNMP User List Entry dialog box from the [SNMP Page](#), on page 1951.

## Field Reference

*Table 617: Add/Edit SNMP User List Entry Dialog Box*

| Element        | Description                                                                         |
|----------------|-------------------------------------------------------------------------------------|
| User List Name | Enter the name of the User List. User List names must be 1-33 characters in length. |
| User Names     | Select the user names from the drop-down list.                                      |

# Telnet Page

Use the Telnet page to configure rules that permit only specific hosts or networks to connect to the firewall device using the Telnet protocol.

The rules restrict administrative Telnet access through a firewall device interface to a specific IP address and netmask. Connection attempts that comply with the rules must then be authenticated by a preconfigured AAA server or the Telnet password. You can monitor Telnet sessions using Monitoring > Telnet Sessions.

---

**Note** Only five Telnet sessions can be active at the same time in single-context mode. In multiple-context mode on ASAs, there can be only five Telnet sessions active per context, 100 Telnet sessions active per blade. With resource class, the administrator can further tune this parameter.

---

## Navigation Path

- (Device view) Select **Platform** > **Device Admin** > **Device Access** > **Telnet** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform** > **Device Admin** > **Device Access** > **Telnet** from the Policy Type selector. Right-click **Telnet** to create a policy, or select an existing policy from the Shared Policy selector.

Do not use the subnetwork mask of the internal network.<br><br><b>Note</b> Beginning with version 4.13, Cisco Security Manager supports policies—Groups, Hosts, Address Range, and Network for IPv6 devices. |

## CHAPTER 50

# Configuring Failover

The Failover page provides access to failover settings for the selected security appliance. The available settings and the overall appearance of the Failover page may change slightly, depending upon the type of device selected, its mode of operation (routed or transparent), and its context mode (single or multiple).

In other words, how you configure failover depends upon both the operating mode and the security context of the security appliance.

Please note the following caveats when assigning an interface as a failover link:

- You can define the interface in the Add/Edit Interface dialog box, but do not configure it. In particular, do not specify an interface Name, as this parameter disqualifies the interface from being used as the failover link. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#), on page 1837 for more information.
- IPv6 addresses are not supported for failover links.
- On an ASA 5505, an interface assigned as the backup for another interface cannot be used as a failover link (although no checking is performed to prevent this).
- Do not assign a PPPoE-enabled interface as a failover link. PPPoE and Failover should not be configured on the same device interface (although no checking is performed to prevent this).
- A failover interface cannot use the same IP address as another interface, especially the Management IP address (although no checking is performed to prevent this).

Note also that after you assign an interface as a failover link, the interface is listed on the Interfaces page, but you cannot edit or delete the interface from that page. The only exception is if you set a physical interface to be the stateful failover link—you can configure its speed and duplex.

This chapter contains the following topics:

- [Understanding Failover](#), on page 1966
- [Basic Failover Configuration](#), on page 1969
- [Additional Steps for an Active/Standby Failover Configuration](#), on page 1973
- [Failover Policies](#), on page 1974

# Understanding Failover

Failover lets you configure two identical security appliances such that one will take over firewall operations if the other fails. Using a pair of security appliances, you can provide high system availability without operator intervention.

The linked security appliances communicate failover information over a dedicated link. This failover link can be either a LAN-based connection or, on PIX security appliances, a dedicated serial failover cable. The following information is communicated over the failover link:

- Current failover state (active or standby)
- “Hello” messages (also called “keep-alives”)
- Network link status
- MAC address exchange
- Configuration replication
- Per-connection state information, in the case of Stateful failover

---

**Caution**

All information sent over the failover link is sent in clear text unless you secure the communication with a failover key. If the security appliance is used to terminate VPN tunnels, this information includes any user names, passwords, and preshared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing failover communications with a failover key, particularly if you are using the security appliance to terminate VPN tunnels.

---

Cisco security appliances support two types of failover:

- **Active/Standby** – The *active* security appliance inspects all network traffic, while the *standby* security appliance remains idle until a failure occurs on the active appliance. Changes to the configuration of the active security appliance are transmitted over the failover link to the standby security appliance.

When failover occurs, the standby security appliance becomes the active unit, and it assumes the IP and MAC addresses of the previously active unit. Because other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time-out anywhere on the network.

Active/Standby failover is available to security appliances operating in single- or multiple-context mode. In single-context mode, only Active/Standby failover is available, and all failover configuration is by means of the Failover page.

---

**Note**

When using Active/Standby failover, you must make all configuration changes on the active unit. The active unit automatically replicates the changes to the standby unit. The standby unit should not be imported or added to the Security Manager device list. Also, you must manually copy the authentication certificate from the active device to the standby device. See [Additional Steps for an Active/Standby Failover Configuration, on page 1973](#) for additional information.

---

- **Active/Active** – Both security appliances inspect network traffic by alternating their roles—such that one is active and one is standby—on a per context basis. This means Active/Active failover is available only on security appliances operating in multiple-context mode.

However, Active/Active failover is not required in multiple-context mode. That is, on a device operating in multiple-context mode, you can configure Active/Standby or Active/Active failover. In either case, you provide system-level failover settings in the system context, and context-level failover settings in the individual security contexts.

See [Active/Active Failover](#) , on page 1967 for additional information about this topic.

In addition, failover can be stateless or stateful:

- **Stateless** – Also referred to as “regular” failover. With stateless failover, all active connections are dropped when failover occurs. Clients need to re-establish connections when the new active unit takes over.
- **Stateful** – The active unit in the failover pair continually passes per-connection state information to the standby unit. When failover occurs, the same connection information is available on the new active unit. Supported end-user applications are not required to reconnect to maintain the current communication session.

See [Stateful Failover](#) , on page 1969 for more information.

#### Related Topics

- [Basic Failover Configuration](#) , on page 1969
- [Failover Policies](#) , on page 1974

## Active/Active Failover

Active/Active failover is available only on security appliances operating in multiple-context mode. In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.

The active and standby roles are assigned over the complete set of security contexts, more or less arbitrarily.

To enable Active/Active failover on the security appliance, you must assign the security contexts to one of two failover groups. A failover group is simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default.

As in Active/Standby failover, each unit in an Active/Active failover pair is given a primary or secondary designation. Unlike Active/Standby failover, this designation does not indicate which unit is active when both units start simultaneously. Each failover group in the configuration is given a primary or secondary role preference. This preference determines the unit on which the contexts in the failover group appear in the active state when both units start simultaneously. You can have both failover groups be in the active state on a single unit in the pair, with the other unit containing the failover groups in the standby state. However, a more typical configuration is to assign each failover group a different role preference to make each one active on a different unit, balancing the traffic across the devices.

---

**Note** To reliably manage security contexts in Active/Active failover mode, Cisco Security Manager requires an IP address for the management interface of each context so that it can communicate directly with the active security context of a failover pair.

---

Initial configuration synchronization occurs when one or both units start. This synchronization occurs as follows:

- When both units start simultaneously, the configuration is synchronized from the primary unit to the secondary unit.
- When one unit starts while the other unit is already active, the unit that is starting up receives the configuration from the already active unit.

After both units are running, commands are replicated from one unit to the other as follows:

- Commands entered within a security context are replicated from the unit on which the security context is in the active state to the peer unit.

---

**Note** A context is considered in the active state on a unit if the failover group to which it belongs is in the active state on that unit.

---

- Commands entered in the system execution space are replicated from the unit on which failover group 1 is in the active state to the unit on which failover group 1 is in the standby state.
- Commands entered in the admin context are replicated from the unit on which failover group 1 is in the active state to the unit on which failover group 1 is in the standby state.

Failure to enter the commands on the appropriate unit for command replication to occur will cause the configurations to be out of synchronization. Those changes may be lost the next time the initial configuration synchronization occurs.

---

**Note** When bootstrapping the peer devices in an Active/Active Failover configuration, the bootstrap configurations are only applied to the system contexts of the respective failover peer devices.

---

In an Active/Active failover configuration, failover occurs on a failover group basis, not a system basis. For example, if you designate both failover groups as active on the primary unit, and failover group 1 fails, failover group 2 remains active on the primary unit, while failover group 1 becomes active on the secondary unit.

---

**Note** When configuring Active/Active failover, make sure that the combined traffic for both units is within the capacity of each unit.

---

## Stateful Failover

---

**Note** Stateful failover is not supported on the ASA 5505 appliance.

---

When stateful failover is enabled, the active unit in the failover pair continually updates the current connection-state information on the standby unit. When failover occurs, supported end-user applications are not required to reconnect to maintain the current communication session.

---

**Note** The IP and MAC addresses for the state and LAN failover links do not change at failover.

---

To employ stateful failover, you must configure a link to pass all state information to the standby unit. If you are using a LAN failover connection rather than the serial failover interface (which is available only on the PIX platform), you can use the same interface for the state link and the failover link. However, we recommend that you use a dedicated interface for passing state information to the standby unit.

The following information is passed to the standby unit when stateful failover is enabled:

- NAT translation table
- TCP connection table (except for HTTP), including the timeout connection
- HTTP connection states (if HTTP replication is enabled)
- H.323, SIP and MGCP UDP media connections
- The system clock
- The ISAKMP and IPsec SA table

The following information is not copied to the standby unit when stateful failover is enabled:

- HTTP connection table (unless HTTP replication is enabled)
- The user authentication (UAUTH) table
- The ARP table
- Routing tables

## Basic Failover Configuration

The following steps describe basic failover configuration. Please note the following caveats when assigning an interface as a failover link:

- You can define the interface in the Add/Edit Interface dialog box, but do not configure it. In particular, **do not specify an interface Name**, as this parameter disqualifies the interface from being used as the failover link.
- On an ASA 5505, an interface assigned as the backup for another interface cannot be used as a failover link (although no checking is performed to prevent this).

- Do not assign a PPPoE-enabled interface as a failover link. PPPoE and Failover should not be configured on the same device interface (although no checking is performed to prevent this).
- A Failover interface cannot use the same IP address as another interface, especially the Management IP address (although no checking is performed to prevent this).

---

**Note** When you save a failover configuration, it is applied to both the security appliance and the failover peer.

---

### Before You Begin

Licenses installed on the device must allow failover configurations. On ASA 5505 and 5510 devices, this failover license is an optional license. You must install the failover license outside of Security Manager, using ASDM or the device CLI, and ensure that the **License Supports Failover** option is selected in the General page of the device properties (right-click the device and select **Device Properties**). If the license is installed when you add the device to the inventory, or you install the license and then rediscover device policies, Security Manager can identify the license and set this option appropriately.

If the option is selected and the license is not in fact installed, you will see deployment failures. If the option is not selected, Security Manager will not deploy the failover policy to the device even if you configure the policy.

### Related Topics

- [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#) , on page 1837
- [Understanding Failover](#) , on page 1966
- [Additional Steps for an Active/Standby Failover Configuration](#), on page 1973
- [Failover Policies](#) , on page 1974

---

**Step 1** Ensure Device View is your present application view; if necessary, click the **Device View** button on the toolbar.

**Note** For more information on using the Device View to configure device policies, see [Managing Policies in Device View and the Site-to-Site VPN Manager](#) , on page 194.

**Step 2** Select the appliance you want to configure.

**Step 3** Expand the **Platform** entry in the Device Policy selector, then expand **Device Admin** and select **Failover**.

The Failover page is displayed.

**Step 4** (PIX only) Choose the **Failover Method: Serial Cable** or **LAN Based**. If you choose Serial Cable, the LAN Failover settings are disabled; be sure the cable connecting the two devices is in place.

**Step 5** Select **Enable Failover** to enable failover on this appliance.

**Step 6** (Optional) Click the Settings button to open the Settings dialog box for the selected device. The contents of the Settings dialog box depend on the type of device, and whether it is operating in single or multiple mode—some options may not be available. Refer to the following sections:

- [Settings Dialog Box](#) , on page 1986 (ASA/PIX 7+)
- [Advanced Settings Dialog Box](#) , on page 1980 (FWSM)

- Step 7** Click the **Bootstrap** button to open the Bootstrap configuration for LAN failover dialog box, which provides bootstrap configurations that can be applied to the primary and secondary devices in a LAN failover configuration. See [Bootstrap Configuration for LAN Failover Dialog Box](#), on page 1992 for more information.
- Step 8** (Multiple-context devices only) In the Configuration section, select the failover mode: **Active/Active** or **Active/Standby**.
- Step 9** (Optional) Follow these steps to configure an interface for **LAN Failover** communications between the two devices:
- Assign a device **Interface** for LAN-based communications, and then press the Tab key on your keyboard to update the page.  
 On PIX and ASA devices, this drop-down list displays the interfaces defined on the device. You can type in a port ID (e.g., *gigabitethernet1*), or you can choose the port if you have already defined the interface.  
 On an FWSM, the Interface list is not populated with VLAN IDs; you must enter the numeric ID of the VLAN you wish to use.  
**Note** In both cases, this cannot be a Named interface, nor can the interface be configured for PPPoE.
  - Provide a **Logical Name** for this failover interface.
  - Enter the **Active IP** address for failover communications.
  - Enter a **Standby IP** address for failover communications. The Standby IP address is used on the security appliance that is currently the standby unit.
  - Enter the **Subnet Mask** for both IP addresses. Both must be on the same subnet.
- Step 10** (Optional) Follow these steps to enable and configure an interface for **Stateful Failover** communications between the two devices:
- Assign a device **Interface** for update communications, and then press the Tab key on your keyboard to update the page.  
 You can type in a port ID (e.g., *gigabitethernet1*), or you can choose the port if you have already defined the interface; note that this cannot be a Named interface.  
**Note** On an FWSM, this is a **VLAN** interface.
  - Provide a **Logical Name** for this interface.
  - Enter the **Active IP** address for connection updates.
  - Enter a **Standby IP** address for update communications.
  - Enter the **Subnet Mask** for both IP addresses. Both must be on the same subnet.
  - Select **Enable HTTP Replication** to preserve HTTP connection information.  
 Connection information is communicated to the standby unit for all TCP protocols except HTTP, because HTTP connections are generally short-lived. Select this option to maintain HTTP connections during failover.
- Step 11** Provide a communications-encryption key: enter a **Shared Key** and then repeat it in the **Confirm** field. Be sure to enter the same key on both devices. (Not available on FWSM versions prior to 3.1)  
 The Shared Key can be any arbitrary string of up to 63 alphanumeric characters. If **HEX** is checked, the Shared Key is an arbitrary string of exactly 32 hexadecimal characters. (The HEX option is available only on PIX/ASA version 7.0.5 and later, and FWSM versions 3.1.3 and later.)  
**Note** This step is optional, but we strongly recommend encrypting failover communications.
- Step 12** To specify a failover reconnect timeout value for asymmetrically routed sessions, enter a length of time in the **Timeout** field, in the form hh:mm:ss (the minutes and seconds values are optional). If the field is blank (the default), or contains a zero, reconnections are prevented. Setting this value to -1 disables the timeout, allowing connections to reconnect after any amount of time.

**Step 13** (Optional) You can configure Bidirectional Forwarding Detection (BFD), to communicate with a failover pair and this can be used to monitor the health of the failover unit. Create or select a BFD template from the Health-Check Monitoring section.

**Note** This is applicable only for Firepower failover devices running ASA 9.7.1 and above.

**Tip** BFD failover commands are supported only in the Active/Standby mode. In a multi-context device, BFD failover commands are supported only in the system context. BFD Failover commands are not supported in the transparent mode.

**Step 14** (FWSM only) – Configured interfaces are listed in the Interface Configuration table. To edit the failover configuration for a listed interface, select it and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box](#) , on page 1989.

## Adding A Security Context to Failover Group 2

To add a new security context to an existing failover group 2, you must save the new context configuration to a deployment file and then manually add it to the appropriate device. Otherwise, until the first successful deployment, Security Manager will attempt to communicate with the new context through the device's Admin context. This will fail since group 2 cannot be reached through the Admin context (unless both group 1 and 2 are active on the same device).

The following steps outline creating a new security context and adding it to failover group 2.

**1.** Create the new security context.

Be sure to define: context Name, Configuration URL, assign an Interface, choose Failover Group 2, and provide a Management IP Address. See [Managing Security Contexts](#) , on page 2310 for more information.

**2.** Save and submit these changes.

**3.** Provide the following context-configuration information, saving each change as you go:

- On the Credentials page of the Device Properties window for the new context, provide Username and Password. See [Viewing or Changing Device Properties](#) , on page 107 for additional information.
- On the context's Interfaces page, edit the assigned interface, providing a Name, IP address and Subnet Mask. See [Managing Device Interfaces, Hardware Ports, and Bridge Groups](#) , on page 1837 for additional information.
- On the context's [Failover Page \(ASA/PIX 7.0+\)](#) , on page 1982, edit the interface configuration to provide a Standby IP Address.
- On the [HTTP Page](#) , on page 1934, check Enable HTTP Server and then define HTTP access.
- On the Credentials page, provide the Username and Password to be used when contacting the context. See [Configuring Device Credentials](#) , on page 1927 for additional information.

**4.** Choose **Deploy** from the Configuration Manager's File menu. Submit your changes, and then in the Deploy Saved Changes dialog box, be sure only this new context is selected, and then click Edit Deploy method. In the Edit Deploy Method dialog box, change the Method to File and then specify the Destination and a file name. Click OK to close the Edit Deploy Method dialog box, and then click Deploy the Deploy Saved Changes dialog box.

5. After uploading the configuration file to the device, use the CLI to enable HTTP access for the context. For example:
6. The context configuration is saved to the specified file. See [Deploying to a File](#), on page 389 for more information about this step.

```
ciscoasa/group2(config-if)# int g3/0
ciscoasa/group2(config-if)# nameif man
ciscoasa/group2(config-if)# security-level 100
ciscoasa/group2(config-if)# ip add 203.0.113.176 255.255.254.0 st 203.0.113.177
ciscoasa/group2(config-if)# exit
ciscoasa/group2(config)# http serv ena
ciscoasa/group2(config)# http 0.0.0.0 0.0.0.0 man
ciscoasa/group2(config)# username cisco pass cisco
ciscoasa/group2(config)#wr
```

Following this process, any new changes to the context can be successfully deployed to the context with Security Manager (attempts to reach the context will not go through the Admin context's management IP address).

### Alternative

Another approach to this issue is to add the new context to failover group 1 first, and then perform the configuration via Security Manager. However, in order to then move this context to failover group 2, both groups (1 and 2) must be active on the same device. Otherwise, this error will be reported:

```
"join-failover-group 2
ERROR: Command requires failover-group 2 and 1 to be in the same state or no nameif comand
for all interfaces in this context"
```

## Additional Steps for an Active/Standby Failover Configuration

Cisco Security Manager lets you authenticate a PIX/ASA/FWSM device by validating the certificate installed on the device. When configuring firewalls in an active/standby failover configuration, you must manually copy the certificate from the active device to the standby device so that Security Manager can communicate with the standby device after a failover occurs.

The following procedures describe how to export or display the identity certificate, CA certificate, and keys for a security appliances in your network using ASDM, and then import that information onto a standby device using ASDM.

- [Exporting the Certificate to a File or PKCS12 data](#), on page 1973
- [Importing the Certificate onto the Standby Device](#), on page 1974

## Exporting the Certificate to a File or PKCS12 data

To export a trustpoint configuration, follow these steps using ASDM:

- 
- Step 1** Go to **Configuration > Features > Device Administration > Certificate > Trustpoint > Export**.
  - Step 2** Fill in the Trustpoint Name, Encryption Passphrase, and Confirm Passphrase fields. For information on these fields, click Help.

- Step 3** Select a method for exporting the trustpoint configuration.
- Export to a File—Type the filename or browse for the file.
  - Display the trustpoint configuration in PKCS12 format—Display the entire trustpoint configuration in a text box and then copy it for importing. For more information, click Help.
- Step 4** Click **Export**.
- 

## Importing the Certificate onto the Standby Device

To import a trustpoint configuration, follow these steps using ASDM:

---

- Step 1** Go to **Configuration > Features > Device Administration > Certificate > Trustpoint > Import**.
- Step 2** Fill in the Trustpoint Name, Decryption Passphrase, and Confirm Passphrase fields. For information on these fields, click Help. The decryption passphrase is the same as the encryption passphrase used when the trustpoint configuration was exported.
- Step 3** Select a method for importing the trustpoint configuration.
- Import from a File—Type the filename or browse for the file.
  - Enter the trustpoint configuration in PKCS12 format—Paste the entire trustpoint configuration from the exported source into a text box. For more information, click Help.
- 

## Failover Policies

This section lists the pages that describe configuring failover on various types of security appliances; the pages are organized by device type.

### PIX 6.x Firewalls

## Failover Page (PIX 6.3)

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Use the Failover page to configure failover settings for a PIX 6.3.x Firewall.

### Navigation Path

Select a PIX 6.3.x device in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

| Failover Poll Time                                                                                                                                                                                                                                                                               | Specify the amount of time between hello messages among units. Values can range from 3 to 15 seconds; default is 15.                                                                                                                 |
| <b>LAN-Based Failover</b>                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                      |
| These fields are available when LAN Based is the chosen Failover Method.                                                                                                                                                                                                                         |                                                                                                                                                                                                                                      |
| Interface                                                                                                                                                                                                                                                                                        | Choose the interface to be used for LAN-based failover. If “Not Selected” is chosen, LAN-based failover is disabled.                                                                                                                 |
| Shared Key<br>Confirm                                                                                                                                                                                                                                                                            | Used to encrypt communications between the primary and standby devices. Value can be any alphanumeric string.<br>Re-enter the Shared Key in the Confirm field.                                                                       |
| <b>Stateful Failover</b>                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                      |
| (Optional) To configure <a href="#">Stateful Failover</a> , on page 1969, provide the following parameters.                                                                                                                                                                                      |                                                                                                                                                                                                                                      |
| Interface                                                                                                                                                                                                                                                                                        | Choose the interface to be used for Stateful Failover. If “Not Selected” is chosen, Stateful Failover is disabled.<br><br><b>Note</b> You must choose a fast LAN link from the list (for example, 100full, 1000full, or 1000sxfull). |
| Enable HTTP Replication                                                                                                                                                                                                                                                                          | When selected, active HTTP sessions are copied to the standby firewall. Otherwise, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link.                        |
| <b>Interface Configuration</b>                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                      |
| The table lists all available named interfaces. To define a Standby IP address and Active and Standby MAC addresses for an interface, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Interface Configuration Dialog Box (PIX 6.3)</a> , on page 1976. |                                                                                                                                                                                                                                      |

## Edit Failover Interface Configuration Dialog Box (PIX 6.3)

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

Use the Edit Failover Interface Configuration dialog box to configure failover interfaces for the selected PIX 6.3.x device.

**Note** The failover interface cannot be configured for PPPoE.

### Navigation Path

You can access the Edit Failover Interface Configuration dialog box from the Interface Configuration table on the [Failover Page \(PIX 6.3\)](#), on page 1975.

| <b>Failover MAC Addresses</b>                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| These parameters let you define virtual MAC addresses for a physical interface that is configured for failover; these addresses are optional. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Active MAC Address                                                                                                                            | Specify a MAC address for the active interface in hexadecimal format (for example, 0123.4567.89ab).                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Standby MAC Address                                                                                                                           | Specify a MAC address for the standby interface in hexadecimal format (for example, 0123.4567.89ab).                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Failover Page (FWSM)

**Note** From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

Use the Failover page to configure basic failover settings for the selected Firewall Services Module (FWSM).

### Navigation Path

To access this feature, select a FWSM in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

| Active/Active                                                                              | In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.<br><br>To enable Active/Active failover on the device, you must assign the security contexts to one of two failover groups. A failover group is a simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default. See <a href="#">Add/Edit Security Context Dialog Box (FWSM)</a> , on page 2311 for information about assigning a context to a failover group. |

| Active/Standby                                                                                              | <p>In an Active/Standby configuration, the active security appliance handles all network traffic passing through the failover pair. The standby security appliance does not handle network traffic until a failure occurs on the active security appliance. Whenever the configuration of the active security appliance changes, it sends configuration information over the failover link to the standby security appliance.</p> <p>When a failover occurs, the standby security appliance becomes the active unit. It assumes the IP and MAC addresses of the previously active unit. Because the other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time out.</p> |
| <b>LAN Failover</b>                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Standby IP Address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Specify a standby IP address for this interface.<br><br>To receive packets from both units in a failover pair, standby IP addresses need to be configured on all interfaces. The Standby IP address is used on the security appliance that is currently the standby unit, and it must be in the same subnet as the active IP address. |
| Subnet Mask                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Enter the Subnet Netmask for the Active and Standby IP addresses.                                                                                                                                                                                                                                                                     |
| Enable HTTP Replication                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | When selected, allows stateful failover to copy active HTTP sessions to the standby firewall. Otherwise, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link.                                                                                                   |
| <p><b>Shared Key (FWSM 3.1.1+ only)</b></p> <p>The options in this section let you encrypt the communications between the active and standby devices by providing a shared encryption key.</p> <p><b>Caution</b> All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If this device is used to terminate VPN tunnels, this information includes any user names, passwords and shared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communications with a shared key.</p> |                                                                                                                                                                                                                                                                                                                                       |
| Shared Key<br>Confirm                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Enter any string of characters up to 63 numbers, letters and punctuation characters. This string is used to generate the encryption key.<br><br>Re-enter this string the <b>Confirm</b> field.<br><br>If you select <b>HEX</b> , the entry in the Shared Key and Confirm fields must be exactly 32 hexadecimal characters (0-9, a-f). |
| <p><b>Interface Configuration</b></p> <p>This table is presented on the Failover page for devices operating in single-context mode, or for individual security contexts only.</p> <p>The table lists all available named interfaces. To enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Interface Configuration Dialog Box</a>, on page 1989. Select or deselect <b>Monitor this interface for failure</b>.</p>                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                       |

## Advanced Settings Dialog Box

The Advanced Settings dialog box lets you configure additional failover settings for the selected FWSM.

**Note** The following reference table describes all fields that can be presented in the Advanced Settings dialog box. The fields actually presented depend on operating mode (routed or transparent) and whether the device is hosting single or multiple contexts.

### Navigation Path

You can access the Advanced Settings dialog box by clicking the Settings button on the [Failover Page \(FWSM\)](#), on page 1978.

| Select a failed-interfaces option and provide an appropriate value.                                                                                                                                                                          |                                                                                                                                                                                                                                     |
| Number of failed interfaces                                                                                                                                                                                                                  | When the number of failed monitored interfaces exceeds this value, the security appliance fails over. Valid values range from 1 to 250.                                                                                             |
| Percentage of failed interfaces                                                                                                                                                                                                              | When the number of failed monitored interfaces exceeds this percentage, the security appliance fails over.                                                                                                                          |
| <b>Failover Poll Time</b>                                                                                                                                                                                                                    |                                                                                                                                                                                                                                     |
| These fields define how often hello messages are sent on the failover link, and how long to wait before testing the peer for failure if no hello messages are received.                                                                      |                                                                                                                                                                                                                                     |
| Unit Failover                                                                                                                                                                                                                                | The amount of time between hello messages between failover units. Enter a value between 1 and 15 seconds, or if <b>msec</b> is checked, between 500 and 999 milliseconds.                                                           |
| Unit Hold Time                                                                                                                                                                                                                               | The amount of time to wait for a hello message on the failover link, after which the unit begins testing for peer failure. Enter a value between 3 and 45 seconds. This value must be at least three times the Unit Failover value. |
| Monitored Interface                                                                                                                                                                                                                          | The amount of time between polls among interfaces. Enter a value between 3 and 15 seconds.                                                                                                                                          |
| <b>MAC Address Mapping</b>                                                                                                                                                                                                                   |                                                                                                                                                                                                                                     |
| In Active/Standby mode, this table lists interface-virtual MAC address mappings. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, which are described in <a href="#">Using Tables</a> , on page 50. |                                                                                                                                                                                                                                     |
| To add or edit interface mappings, click the Add Row or Edit Row button to open the <a href="#">Add/Edit Interface MAC Address Dialog Box</a> , on page 1988.                                                                                |                                                                                                                                                                                                                                     |
| <b>Failover Groups</b>                                                                                                                                                                                                                       |                                                                                                                                                                                                                                     |
| In Active/Active mode, this table lists both failover groups. To edit failover parameters for either group, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Group Dialog Box</a> , on page 1990.   |                                                                                                                                                                                                                                     |

| Element                                                                                                                                                                                                                                                                                                                                                                                         | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| <b>Bridge Group Configuration</b>                                                                                                                                                                                                                                                                                                                                                               |             |
| In single-context transparent mode, this table lists all currently defined bridge groups (see <a href="#">Managing Device Interfaces, Hardware Ports, and Bridge Groups</a> , on page 1837). To add a standby IP address to a bridge group, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Bridge Group Configuration Dialog Box</a> , on page 1982. |             |

### Edit Failover Bridge Group Configuration Dialog Box

Use this dialog box to add a standby IP address to a failover bridge group.

#### Navigation Path

You can access the Edit Failover Bridge Group Configuration dialog box as follows:

- On the Failover page presented for an individual security context in transparent mode on an ASA.
- From the Bridge Group Configuration table in the [Advanced Settings Dialog Box](#) , on page 1980 presented by an FWSM in transparent mode.

#### Field Reference

**Table 624: Edit Failover Bridge Group Configuration Dialog Box**

| Element         | Description                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------|
| Name            | Identifies the bridge group; not editable.                                                                        |
| IP Address      | Identifies the IP address assigned to the bridge group; not editable.                                             |
| Network Mask    | Identifies the subnet mask for the IP Address; not editable.                                                      |
| Standby Address | Enter the IP address of the standby bridge group; this address must be on the same subnet as the primary address. |

## Failover Page (ASA/PIX 7.0+)

---

**Note** From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any bug fixes or enhancements.

---

Use the Failover page to configure basic failover settings for ASA and PIX 7.0+ security devices

**Note** The features and options presented on the Failover page vary according to type of device selected, operating system version, firewall mode (routed or transparent), and security contexts (single or multiple). Thus, some of the elements described in the following table may not appear on the Failover page for your currently selected device.

### Navigation Path

Select an ASA or PIX 7.0+ in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

*Table 625: Failover Page (ASA/PIX 7.0+)*

| Element          | Description                                                                                                                                                                                                                                                                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Failover Method  | Choose the type of failover link: <b>Serial Cable</b> or <b>LAN Based</b> . If you choose Serial Cable, ensure the physical cable is connected to both devices.<br><b>Note</b> This option is available only on PIX devices.                                                                                                                         |
| Enable Failover  | Check this box to enable failover on this device. Ensure that both devices have the same software version, activation key type, flash memory, and RAM.<br>On PIX devices with LAN Based chosen as the Failover Method, and on all ASAs, you must next configure the logical LAN Failover interface and, optionally, the stateful failover interface. |
| Bootstrap button | Click to display the Bootstrap Configuration for LAN Failover dialog box. See <a href="#">Bootstrap Configuration for LAN Failover Dialog Box , on page 1992</a> for more information.                                                                                                                                                               |
| Settings button  | Click to display the <a href="#">Settings Dialog Box , on page 1986</a> , used to define when failover should occur.                                                                                                                                                                                                                                 |

| Element                                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout                                                                                                           | <p>The failover Timeout specifies the amount of time after a system boots or becomes active that “nailed” sessions are accepted; used in conjunction with static translation rules (see <a href="#">Static Rules Tab</a> , on page 1042 for more information).</p> <p>Enter a value in this field to specify the failover reconnect timeout value for asymmetrically routed sessions. The value is in the form hh:mm:ss (hours:minutes:seconds); both minutes and seconds are optional.</p> <p>Valid values for the number of hours are -1 to 1193; the default value is 0, which means connections cannot be re-established. Setting this value to -1 disables the timeout, allowing reconnections after any amount of time.</p>                                                                                                                                             |
| <p><b>Configuration</b></p> <p>This section is presented only for devices operating in multiple-context mode.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Active/Active                                                                                                     | <p>In an Active/Active failover configuration, both security appliances inspect network traffic, on a per-context basis. That is, for each context, one of the appliances is the active device, while the other is the standby device.</p> <p>To enable Active/Active failover on the security appliance, you must assign the security contexts to one of two failover groups. A failover group is a simply a logical group of one or more security contexts. You should specify failover group assignments on the unit that will have failover group 1 in the active state. The admin context is always a member of failover group 1. Any unassigned security contexts are also members of failover group 1 by default. See <a href="#">Add/Edit Security Context Dialog Box (PIX/ASA)</a> , on page 2313 for information about assigning a context to a failover group.</p> |
| Active/Standby                                                                                                    | <p>In an Active/Standby configuration, the active security appliance handles all network traffic passing through the failover pair. The standby security appliance does not handle network traffic until a failure occurs on the active security appliance. Whenever the configuration of the active security appliance changes, it sends configuration information over the failover link to the standby security appliance.</p> <p>When a failover occurs, the standby security appliance becomes the active unit. It assumes the IP and MAC addresses of the previously active unit. Because the other devices on the network do not see any changes in the IP or MAC addresses, ARP entries do not change or time out.</p>                                                                                                                                                |
| LAN Failover                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable HTTP Replication                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | When selected, active HTTP sessions are copied to the standby firewall. Otherwise, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link.                                                                                                                                                                                  |
| <p><b>Key</b></p> <p>The options in this section let you encrypt the communications between the active and standby devices. Select the type and provide a string of characters to produce the shared encryption key.</p> <p><b>Caution</b> All information sent over the failover and Stateful Failover links is sent in clear text unless you secure the communication with a failover key. If this device is used to terminate VPN tunnels, this information includes any user names, passwords and shared keys used for establishing the tunnels. Transmitting this sensitive data in clear text could pose a significant security risk. We recommend securing the failover communications with a shared key.</p> |                                                                                                                                                                                                                                                                                                                                                                                                |
| Any string<br>HEX                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>If you select <b>Any string</b>, the entry in the Shared Key field can be any combination of up to 63 numbers, letters and punctuation characters. This string is used to generate the encryption key.</p> <p>If you select <b>HEX</b>, the entry in the Shared Key and Confirm fields must be exactly 32 hexadecimal characters (0-9, a-f). This string is used as the encryption key.</p> |
| Shared Key<br>Confirm                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Enter any string of characters appropriate to the selected key type: Any string or HEX.</p> <p>Re-enter the string the <b>Confirm</b> field.</p>                                                                                                                                                                                                                                            |
| <p><b>Interface Configuration</b>(in some instances, labeled Monitor Interface Configuration)</p> <p>This table is presented on the Failover page for ASA 8.4.1+ devices operating in single-context, transparent mode, and for individual contexts on PIX/ASA devices. Otherwise, it appears in the <a href="#">Settings Dialog Box , on page 1986</a>.</p> <p>The table lists all available named interfaces. To enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Interface Configuration Dialog Box , on page 1989</a>. Select or deselect <b>Monitor this interface for failure</b>.</p>                                  |                                                                                                                                                                                                                                                                                                                                                                                                |

## Settings Dialog Box

The Settings dialog box lets you define criteria for when failover should occur on the selected ASA or PIX 7.x appliance.

### Navigation Path

You can access the Settings dialog box by clicking the Settings button on the [Failover Page \(ASA/PIX 7.0+\)](#) , on page 1982.

**Note** The following reference table presents all fields that can be presented in the Settings dialog box. The fields actually presented depend on operating mode (routed or transparent) and whether the device is hosting single or multiple contexts.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Policy                |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Number of failed interfaces     | When the number of failed monitored interfaces exceeds this value, the security appliance fails over. The range is between 1 and 250 failures.                                                                                                                                                                                                                                                                                                   |
| Percentage of failed interfaces | When the number of failed monitored interfaces exceeds this percentage, the security appliance fails over.                                                                                                                                                                                                                                                                                                                                       |
| Failover Poll Time              |                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Unit Failover                   | The amount of time between hello messages among units. The range is between 1 and 15 seconds, or between 200 and 999 milliseconds if the <b>Change units to msec</b> option is checked.                                                                                                                                                                                                                                                          |
| Unit Hold Time                  | Sets the time during which a unit must receive a hello message on the failover link, or the unit begins the testing process for peer failure. The range is between 3 and 45 seconds, or between 800 and 999 milliseconds if the <b>msec</b> option is checked. You cannot enter a value that is less than three times the Unit Failover value.                                                                                                   |
| Monitored Interface             | The amount of time between polls among interfaces. The range is between 3 and 15 seconds, or between 500 and 999 milliseconds if the msec option is checked.                                                                                                                                                                                                                                                                                     |
| Interface Hold Time             | Sets the time during which a data interface must receive a hello message, after which the peer is declared failed. Valid values are from 5 to 75 seconds. This value must be at least five times the Unit Failover value.                                                                                                                                                                                                                        |
| Link State Interval             | Sets the interval after which each ASA in a failover pair checks the link state of its interfaces. By default the link state interval value is 500msec. You can customize the polltime; for example, if you set the polltime to 300 msec, the ASA can detect an interface failure and trigger failover faster. Valid range is between 300 and 799 milliseconds.<br><br><b>Note</b> The Link State Interval is available for ASA 9.7.1 and later. |

| Element                                | Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Failover Groups</b>                 | In Active/Active mode, this table lists both failover groups. To edit failover parameters for either group, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Group Dialog Box</a> , on page 1990.                                                                                                                                                                        |
| <b>MAC Address Mapping</b>             | In Active/Standby mode, this table lists interface-virtual MAC address mappings. This is a standard Security Manager table, with Add Row, Edit Row and Delete Row buttons, which are described in <a href="#">Using Tables</a> , on page 50.<br><br>To add or edit interface mappings, click the Add Row or Edit Row button to open the <a href="#">Add/Edit Interface MAC Address Dialog Box</a> , on page 1988. |
| <b>Monitor Interface Configuration</b> | In single-context mode, this table lists all available named interfaces. To define a Standby IP address for, and enable or disable monitoring of an interface, select it in the list and click the Edit Row button to open the <a href="#">Edit Failover Interface Configuration Dialog Box</a> , on page 1989.                                                                                                   |
| <b>Management IP Address</b>           | In single-context transparent mode, this section presents the management IP address and netmask defined for the device (on the <a href="#">Management IP Page</a> , on page 1905); you cannot change these values.                                                                                                                                                                                                |
| Standby                                | Enter the management IP address of the standby unit; this address must be on the same subnet as the primary address.                                                                                                                                                                                                                                                                                              |

### Add/Edit Interface MAC Address Dialog Box

The Add/Edit Interface MAC Address dialog box lets you define virtual MAC addresses for a physical interface on ASA, FWSM 3.x and PIX 7.x security appliances that are configured for failover (not available on ASA 5505 devices).

In Active/Standby failover, the MAC addresses for the primary unit are always associated with the active IP addresses. If the secondary unit boots first and becomes active, it uses the burned-in MAC address for its interfaces. When the primary unit comes online, the secondary unit obtains the MAC addresses from the primary unit. This change can disrupt network traffic. You can configure virtual MAC addresses for each interface to ensure that the secondary unit uses the correct MAC addresses when it is the active unit, even if it comes online before the primary unit. If you do not specify virtual MAC addresses, the failover pair uses the burned-in MAC addresses.

---

**Note** You cannot configure a virtual MAC address for the failover or Stateful Failover links. The MAC and IP addresses for those links do not change during failover.

---

### Navigation Path

You can open the Add/Edit Interface MAC Address dialog box from the [Settings Dialog Box](#) , on page 1986.

**Field Reference***Table 627: Add/Edit Interface MAC Address Dialog Box*

| Element            | Description                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------|
| Physical Interface | Choose the physical interface on which failover virtual MAC addresses are to be configured.                |
| MAC Address        |                                                                                                            |
| Active Interface   | Enter a virtual MAC address for the active interface in hexadecimal format (for example, 0023.4567.89ab).  |
| Standby Interface  | Enter a virtual MAC address for the standby interface in hexadecimal format (for example, 0023.4567.89ab). |

**Edit Failover Interface Configuration Dialog Box**

Use the Edit Failover Interface Configuration dialog box to define a standby IP address for an interface, and to specify whether the status of the interface should be monitored.

---

**Note** A failover interface cannot be configured for PPPoE.

---

**Navigation Path**

You can access the Edit Failover Interface Configuration dialog box from the [Settings Dialog Box](#) , on page 1986 (ASA/PIX 7.0+), [Advanced Settings Dialog Box](#) , on page 1980 (FWSM), and from the Failover page itself for ASA 8.4.1+ devices operating in single-context transparent mode, and for individual ASA/PIX security contexts.

| Interface Name                     | The name of the interface; read-only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Active IP Address                  | The active IP address of this interface; read-only. This field is blank if an IP address has not been assigned to the interface; for example if DHCP is enabled on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Mask                               | The subnet mask for the active IP address; read-only. This field is blank if an IP address has not been assigned to the interface; for example, if DHCP is enabled on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Standby IP Address                 | Specify the IP address of the corresponding interface on the standby failover unit. This field does not appear if an IP address has not been assigned to the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Monitor this interface for failure | <p>Specifies whether this interface is monitored for failure: check this box to enable monitoring. The number of interfaces that can be monitored for the security appliance is 250.</p> <p>Hello messages are exchanged between the security appliance failover pair during every interface poll time period. The failover interface poll time is 3 to 15 seconds. For example, if the poll time is set to 5 seconds, testing begins on an interface if 5 consecutive hellos are not heard on that interface (25 seconds). Monitored failover interfaces can have the following status:</p> <ul style="list-style-type: none"> <li>• Unknown—Initial status. This status can also mean the status cannot be determined.</li> <li>• Normal—The interface is receiving traffic.</li> <li>• Testing—Hello messages are not heard on the interface for five poll times.</li> <li>• Link Down—The interface is administratively down.</li> <li>• No Link—The physical link for the interface is down.</li> <li>• Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.</li> </ul> |
| ASR Group Number                   | <p>If this interface is part of an asymmetric routing group, provide its ASR group number. Valid values for ASR group numbers are 1 through 32.</p> <p>Stateful failover must be enabled for asymmetric routing support to function properly between units in failover configurations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Edit Failover Group Dialog Box

Use the Edit Failover Group dialog box to configure failover parameters for groups of security contexts in an Active/Active failover configuration. See [Add/Edit Security Context Dialog Box \(PIX/ASA\)](#), on page 2313, or [Add/Edit Security Context Dialog Box \(FWSM\)](#), on page 2311, for information about assigning a context to a failover group.

### Navigation Path

You can access the Add Failover Group dialog box from the PIX/ASA [Settings Dialog Box](#) , on page 1986, or the FWSM [Advanced Settings Dialog Box](#) , on page 1980.

### Field Reference

**Table 629: Edit Failover Group Dialog Box**

| Element                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preferred Role                              | Specifies the unit in the failover pair, primary or secondary, on which this failover group appears in the active state when both units start up simultaneously, or when the Preempt option is selected. Choose <b>Primary</b> or <b>Secondary</b> .<br><br>You can have both failover groups in the active state on a single unit in the pair; however, a more typical configuration is to assign each failover group a different role to make each one active on a different unit, balancing the traffic across the devices. |
| Poll time interval for monitored interfaces | Specify the amount of time between polling of monitored interfaces. Valid values are from 3 to 15 seconds (or 500 to 999 milliseconds if <b>msec</b> is checked).                                                                                                                                                                                                                                                                                                                                                              |
| Hold Time                                   | Specify the time period within which the group must receive a hello message, after which the other group is declared failed. Valid values are from 5 to 75 seconds.                                                                                                                                                                                                                                                                                                                                                            |
| Preempt after Reboot                        | Specifies the number of seconds that the preferred failover device should wait after rebooting before taking over as the active unit for this failover group. Valid values are from 0 to 1200 seconds.                                                                                                                                                                                                                                                                                                                         |
| Enable HTTP Replication                     | Indicates whether active HTTP sessions are copied to the standby device for this failover group as part of Stateful failover. If you do not allow HTTP replication, HTTP connections are disconnected at failover. Disabling HTTP replication reduces the amount of traffic on the state link. This setting overrides the HTTP replication setting on the Failover page.                                                                                                                                                       |
| Failover Criteria                           | Select a failed-interfaces criterion for this group and specify the appropriate value: <ul style="list-style-type: none"> <li>• <b>Number of failed interfaces</b> – When this number of interfaces have failed, failover is triggered. Valid values are 1 to 250.</li> <li>• <b>Percentage of failed interfaces</b> – When this percentage of the total number of interfaces have failed, failover is triggered. Valid values are 1 to 100.</li> </ul>                                                                        |

| Element                                                                              | Description |
|--------------------------------------------------------------------------------------|-------------|
| <b>MAC Address Mapping</b>                                                           |             |
| This table displays interfaces to which active and standby MAC addresses are mapped. |             |

## Failover Page (Security Context)

The Failover page for individual ASA and PIX 7.0+ security contexts presents the **Interface Configuration** table, which lists all available named interfaces.

You can select an interface in the table and click the Edit Row button to open the [Edit Failover Interface Configuration Dialog Box](#), on page 1989, where you can specify a standby IP address and an ASR group number, and enable or disable monitoring of the interface.

For individual transparent-mode contexts on ASA 8.4.1+ devices, the Failover page also presents the **Bridge Group Configuration** table, which lists all currently defined failover bridge groups.

You can select an entry in the table and click the Edit Row button to open the [Edit Failover Bridge Group Configuration Dialog Box](#), on page 1982, where you can specify a standby IP address for the selected bridge group.

### Navigation Path

Select a security context in Device View and then select **Platform > Device Admin > Failover** from the Device Policy selector.

## Bootstrap Configuration for LAN Failover Dialog Box

The Bootstrap Configuration for LAN Failover dialog box provides you with bootstrap configuration that can be applied to the primary and secondary devices in a LAN failover configuration.

### Navigation Path

You can access the Bootstrap Configuration for LAN Failover dialog box from the Failover page. For more information about the Failover page, see:

- [Failover Page \(PIX 6.3\)](#), on page 1975
- [Failover Page \(FWSM\)](#), on page 1978

### Field Reference

*Table 630: Bootstrap Configuration for LAN Failover Dialog Box*

| Element   | Description                                                                                                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary   | Contains the bootstrap configuration for the primary device. Open a console connection to the primary device and then paste this configuration to activate failover on the device.                                              |
| Secondary | Contains the bootstrap configuration for the secondary device. After the primary device becomes active, open a console connection to the secondary device and then paste this configuration to activate failover on the device. |

---

**Note** For Active/Active Failover, the bootstrap configurations are only applied to the system contexts of the respective failover peer devices.

---

## CHAPTER 51

# Configuring Hostname, Resources, User Accounts, and SLAs

---

The following topics describe configuring the host name on a security appliance, defining and managing Resource classes on Firewall Services Modules (FWSMs) in multiple-context mode, managing user accounts in the Local user database, and monitoring service level agreements (SLAs) to perform route tracking.

This chapter contains the following topics:

- [Hostname Page](#) , on page 1995
- [Resource Management on Multi-context FWSMs](#) , on page 1996
- [Configuring User Accounts](#) , on page 2001
- [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity](#) , on page 2002

## Hostname Page

You can use the Hostname page to specify a host name for your security device, and to specify a default domain. After the configuration file is deployed, the device uses this domain name when you do not enter a fully-qualified domain name in other commands. It also uses this domain name in RSA key generation.

The device appends this domain name to unqualified names. For example, if you set the domain name to “example.com,” and specify a syslog server by the unqualified name “jupiter,” the security appliance completes the name to “jupiter.example.com.”

When you set a host name for the security appliance, that name appears in the command line prompt. If you establish sessions to multiple devices, the host name helps you keep track of where you enter commands. The default host name depends on your platform.

In multiple-context mode, you can specify a domain name for each context, as well as the system execution space. The host name you specify in the system execution space appears in the command line prompt for all contexts. The host name that you optionally set within a context does not appear in the command line, but can be used by the banner command \$(hostname) token.

### Navigation Path

In Device View, select a security device and then select **Platform > Device Admin > Hostname** from the Device Policy selector.

## Field Reference

**Table 631: Hostname Page**

| Element     | Description                                                                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Name   | Enter a unique device name to help you differentiate among devices; for example, <i>PIX-510-A</i> .<br><br><b>Note</b> We recommend that you use a unique host name for each device you manage. The device name can be up to 63 alphanumeric (U.S. English) characters and can include any of the following special characters: ` ( ) + - , . / : =. |
| Domain Name | Optionally, enter a valid Domain Name System (DNS) domain name for the device; for example, <i>cisco.com</i> .                                                                                                                                                                                                                                       |

# Resource Management on Multi-context FWSMs

**Note** From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any bug fixes or enhancements.

By default, all security contexts on a multiple-context Firewall Services Module (FWSM) have unlimited access to the resources of the FWSM, except where maximum limits per context are enforced. However, if you find that one or more contexts use too many resources, and they cause other contexts to be denied connections, for example, then you can configure resource management to limit the use of resources per context.

**Note** The FWSM does not limit the bandwidth per context; however, the switch containing the FWSM can limit bandwidth per VLAN. See the switch documentation for more information.

The FWSM manages resources by assigning contexts to resource classes. Each context uses the resource limits set by its class. When you create a class, the FWSM does not set aside a portion of the resources for each context assigned to the class; rather, the FWSM sets the maximum limit for a context. If you oversubscribe resources, or allow some resources to be unlimited, a few contexts can “use up” those resources, potentially affecting service to other contexts.

You can set the limit for all resources together as a percentage of the total available for the device. Also, you can set the limit for individual resources as a percentage or as an absolute value.

You can oversubscribe the FWSM by assigning more than 100 percent of the resources across all contexts. For example, you can set up a class to limit connections to 20 percent per context, and then assign 10 contexts to the class for a total of 200 percent. If contexts concurrently use more than the system limit, then each context gets less than the 20 percent you intended.

The FWSM also lets you assign unlimited access to one or more resources in a class, instead of a percentage or absolute number. When a resource is unlimited, contexts can use as much of the resource as the system has available. For example, contexts A, B, and C are assigned to class “Onepercent,” which limits each class member to one percent of the system inspections per second, for a total of three percent; but the three contexts

are currently only using two percent combined. On the other hand, class “Nolimit” has unlimited access to inspections. The contexts in Nolimit can use more than the 97 percent of “unassigned” inspections; they can also use the one percent of inspections not currently in use by contexts A, B, and C, even if that means that contexts A, B, and C are unable to reach their three percent combined limit. Setting unlimited access is similar to oversubscribing the FWSM, except that you have less control over how much you oversubscribe the system.

### Default Class

All contexts belong to the default class if they are not assigned to another class; you do not have to actively assign a context to the default class.

If a context belongs to a class other than the default class, those class settings always override the default class settings. However, if the other class has any settings that are not defined, then the member context uses the default class for those limits. For example, if you create a class with a two percent limit for all concurrent connections, but no other limits, then all other limits are inherited from the default class. Conversely, if you create a class with a two percent limit for all resources, the class uses no settings from the default class.

As initially configured, the default class provides unlimited access to resources for all contexts, except for the following limits, which are by default set to the maximum allowed per context:

- Telnet sessions – 5 sessions
- SSH sessions – 5 sessions
- IPSec sessions – 5 sessions
- MAC addresses – 65,535 entries

Note that you can edit the default class.

## Resources Page

Use the Resources page to configure and manage resource-management classes.

The table on this page lists all currently defined resource classes. Use the buttons below the table to manage this list:

- Add Row – Opens the Add Resource dialog box, where you can define a new class, and assign it to security contexts. See [Add and Edit Resource Dialog Boxes](#) , on page 1998 for more information.
- Edit Row – For the currently selected row, opens the Edit Resource dialog box, so you can edit that class and its context assignments. See [Add and Edit Resource Dialog Boxes](#) , on page 1998 for more information.
- Delete Row – Deletes the currently selected row(s); confirmation may be required.

### Navigation Path

In Device View, select the system context of an ASA or FWSM in multiple-context mode, and then select **Platform > Device Admin > Resources** from the Device Policy selector.

**Related Topics**

- [Resource Management on Multi-context FWSMs](#) , on page 1996

**Add and Edit Resource Dialog Boxes**

Use the Add Resource and Edit Resource dialog boxes to add or edit resource classes and assignments for FWSM and ASA security contexts.

Except for their titles, both dialog boxes are identical; the following descriptions apply to both.

**Navigation Path**

You can access the Add Resource and Edit Resource dialog boxes from the [Resources Page](#) , on page 1997.

|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Class Name             | Enter a name for this class; can be a string of up to 20 alphanumeric characters, and may include any of the following special characters: ` ( ) + - , . / : =.                                                                                                                                                                                                                                                       |
| Limits Tab             |                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Note</b>            | For the following Limits, if you do not specify a value for a particular limit, the limit is inherited from the default class. If the default class does not set that limit, the limit inherits the system limit. Also, any value you enter is considered to be that rate <i>per second</i> , unless you also check the related <b>percent</b> box, in which case the value is that percentage of the total resource. |
| TCP or UDP Connections | Sets a Rate Limit for TCP or UDP connections between any two hosts, including connections between one host and multiple other hosts. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 102400, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                          |
| Inspections (Fixups)   | Sets a Rate Limit for application inspections. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 10000 per second, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                      |
| Syslog Messages        | Sets a Rate Limit for system log messages. You can set the limit as an absolute value, or you can assign more than 100 percent if you want to oversubscribe the device.<br><br>The FWSM can support 30,000 messages per second for messages sent to the FWSM terminal or buffer. If you send messages to a syslog server, the FWSM supports 25,000 per second.                                                        |

| Element          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connections      | <p>Sets the Absolute Limit for concurrent TCP or UDP connections. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 999900, or you can assign more than 100 percent if you want to oversubscribe the device.</p> <p><b>Note</b> For concurrent connections, the FWSM allocates half of the limit to each of two network processors (NPs) that accept connections. Typically, the connections are divided evenly between the NPs. However, in some circumstances, the connections are not evenly divided, and the maximum connection limit could be reached on one NP before reaching the maximum on the other. In this case, the maximum connections allowed is less than the limit you set. The NP distribution is controlled by the switch, based on a distribution algorithm. You can adjust this algorithm on the switch, or you can adjust the connection limit upward to account for the inequity.</p> |
| Hosts            | Sets the limit for concurrent hosts that can connect through the FWSM. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 262144, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| IPsec Sessions   | Sets the limit for IPsec sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 10 concurrent sessions divided between all contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SSH Sessions     | Sets the limit for SSH sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 100 concurrent sessions divided between all contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Telnet Sessions  | Sets the limit for concurrent Telnet sessions. You can set the limit as an absolute value by entering an integer between 1 and 5, or you can assign more than 100 percent if you want to oversubscribe the device. The system allows a maximum of 100 concurrent sessions divided between all contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| NAT Translations | Sets the limit for concurrent address translations. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 266144, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| MAC Address      | (Transparent mode only) Sets the limit for concurrent MAC address entries allowed in the MAC address table. You can set the limit as an absolute value by entering an integer between 0 (system limit) and 65535, or you can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Element              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ASDM                 | <p>Sets the limit for ASDM management sessions (the default is 5). You can set the limit as an absolute value by entering an integer between 1 and 5, or you can enter a percentage between 3.0 and 15.0. The system allows a maximum of 80 concurrent sessions divided between all contexts.</p> <p>ASDM sessions use two HTTPS connections: one for monitoring that is always present, and one for making configuration changes that is present only when you make changes. For example, the system limit of 80 ASDM sessions represents a limit of 160 HTTPS sessions, divided between all contexts.</p> |
| Other VPN            | Sets the limit for Site-to-site VPN sessions. You cannot oversubscribe this resource; all context assignments combined cannot exceed the model limit. The sessions you assign for this resource are guaranteed to the context.                                                                                                                                                                                                                                                                                                                                                                              |
| Other VPN Burst      | Sets the limit for the number of site-to-site VPN sessions allowed beyond the amount assigned to a context with <code>vpn other</code> . For example, if your model supports 5000 sessions, and you assign 4000 sessions across all contexts with <code>vpn other</code> , then the remaining 1000 sessions are available for other <code>vpn burst</code> . Unlike other <code>vpn</code> , which guarantees the sessions to the context, other <code>vpn burst</code> can be oversubscribed; the burst pool is available to all contexts on a first-come, first-served basis.                             |
| <b>Note</b>          | The maximum value for Anyconnect VPN and Anyconnect VPN Burst depends on ASA licenses. Cisco Security Manager cannot validate the values entered for Anyconnect VPN and Anyconnect VPN Burst. Therefore, the user should make sure that the values for Anyconnect VPN and Anyconnect VPN Burst are within the maximum values; else it results in a deployment error. To find the maximum value, telnet into ASA and execute the <code>show version</code> command. The Total VPN Peers value corresponds to the maximum value.                                                                              |
| Anyconnect VPN       | Secure Client peers. You cannot oversubscribe this resource; all context assignments combined cannot exceed the model limit. The peers you assign for this resource are guaranteed to the context.                                                                                                                                                                                                                                                                                                                                                                                                          |
| Anyconnect VPN Burst | The number of Secure Client sessions allowed beyond the amount assigned to a context with Secure Client. For example, if your model supports 5000 peers, and you assign 4000 peers across all contexts with Secure Client, then the remaining 1000 sessions are available for AnyConnect Burst. Unlike Secure Client, which guarantees the sessions to the context, AnyConnect Burst can be oversubscribed; the burst pool is available to all contexts on a first-come, first-served basis.                                                                                                                |
| Storage              | Beginning with version 4.12, Security Manager enables you to enter the storage size or select Default. This feature is available for ASA version 9.6(2) or later. The limit is set in MB. The default limit is 100% of the disk configured since this storage cannot span multiple disks.                                                                                                                                                                                                                                                                                                                   |
| All Resources Limit  | Sets a limit for all resources. If you also set the limit for a specific resource, then that limit overrides the limit you set here for all resources. You can set the limit as a percentage, or as unlimited by setting the value to <b>0</b> (when <b>percent</b> is not checked). You cannot set any other absolute value. You can assign more than 100 percent if you want to oversubscribe the device.                                                                                                                                                                                                 |

| Element            | Description                                                                                                                                                                                                                        |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Contexts Tab       |                                                                                                                                                                                                                                    |
| Available Contexts | Lists all contexts available for class assignments; contexts which already have class assignments are not displayed.<br><br>Select one or more contexts and click the >> button to add the contexts to the Selected Contexts list. |
| Selected Contexts  | Lists all contexts assigned to this class.<br><br>Select one or more contexts and click the << button to return the contexts to the Available Contexts list.                                                                       |

## Configuring User Accounts

The User Accounts page lets you manage the Local user database. User accounts in the Local database can be used in conjunction with the Authentication, Authorization, Accounting (AAA) functions to determine “who is allowed to do what” on a device. Refer to [About AAA on Security Devices , on page 1909](#) for more information.

The table on this page lists all currently defined Local user accounts, showing for each, the name of the user and the assigned privilege level. For a detailed explanation of these fields, see [Add/Edit User Account Dialog Boxes , on page 2002](#).

---

**Important** For a Cisco Security Manager-managed device, when you intend to change the password in the **Device Properties** page, make sure you update the same in the **User Accounts** page also. When you fail to do so, although the initial phase of communication between Security Manager and the device is successful and even the **Test Connectivity** gets verified successfully, the deployment still fails, because the password configured in the **User Accounts** page gets updated in the **Device Properties** page. It is therefore recommended to ensure that credential updates are made *parallelly* in **Device Properties** and the **User Accounts** pages.

---

- To add a user account, click the Add Row button.
- To edit the settings for an account, select it and click the Edit Row button.
- To delete a user account, select it and click the Delete Row button.

### Navigation Path

- (Device view) Select **Platform > Device Admin > User Accounts** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > User Accounts** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Add/Edit User Account Dialog Boxes

Use the Add and Edit User Account dialog boxes to add a local user account or to modify an existing user account.

### Navigation Path

You can access the Add and Edit User Account dialog boxes from the User Accounts page, as described in [Configuring User Accounts](#), on page 2001.

### Field Reference

*Table 633: Add/Edit User Account Dialog Boxes*

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Username              | Enter a name for this user account: must be at least four characters; the maximum is 64 characters. Entries are case-sensitive.                                                                                                                                                                                                                                                                                                                                                                                       |
| Password              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Password as encrypted | Select Plain Text or Encrypted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Password encrypt type | Select MD5 or PBKDF2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Password              | <p>Enter a unique password for this user account. Entries are case-sensitive.</p> <p><b>Note</b> To protect security, we recommend a password length of at least 8 characters.</p> <p><b>Note</b> For Plain Text passwords:</p> <ul style="list-style-type: none"> <li>• The length of MD5 password should be three to 32 characters.</li> <li>• The length of PBKDF2 password should be 33 to 127 characters. Ensure PBKDF2 password has correct <code>sha</code> key values to avoid deployment failure.</li> </ul> |
| Confirm               | Re-enter the user password to confirm it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Privilege Level       | Choose a privilege level for this user; defines local command authorization. The range is 0 (lowest) to 15 (highest). The default privilege level is 2.                                                                                                                                                                                                                                                                                                                                                               |

## Monitoring Service Level Agreements (SLAs) To Maintain Connectivity

You can configure ASA or PIX devices that run version 7.2 or later to perform route tracking by monitoring service level agreements. By monitoring the connectivity to a device on another network, you can track the availability of a primary route and install a backup route if the primary route fails. For example, you can define a default route to an Internet service provider (ISP) gateway and a backup default route to a secondary ISP in case the primary ISP becomes unavailable. This technique, called Dual ISP, provides security appliances

with a form of high availability, which is a vital part of providing customers with the services to which they are entitled.

Without route tracking, there is no inherent mechanism for determining if the route is up or down. A static route remains in the routing table even if the next hop gateway becomes unavailable, and is removed only if the associated interface on the security appliance goes down.

The security appliance performs route tracking by associating a route with a monitoring target that you define in an SLA monitor policy object. It monitors the target using ICMP echo requests, according to the parameters configured in the object. If an echo reply is not received within a specified time period, the SLA monitor is considered down and the associated route is removed from the routing table. A previously configured backup route is used in place of the removed route.

SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out).

This section contains the following topics:

- [Creating Service Level Agreements](#) , on page 2003

## Creating Service Level Agreements

The following procedure explains how to configure SLA monitor objects and associate them with routes and interfaces in an ASA or PIX configuration.

### Related Topics

- [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity](#) , on page 2002
- [Configuring Static Routes](#) , on page 2244
- [Configuring Firewall Device Interfaces](#) , on page 1807
- [Creating Policy Objects](#) , on page 235

---

### Step 1

Create the SLA monitor policy object:

- a) Select **Manage > Policy Objects** to open the Policy Object Manager (see [Policy Object Manager](#) , on page 230) and select **SLA Monitors** from the table of contents.

**Tip** You can also create SLA monitor objects when defining policies that use this object type. For more information, see [Selecting Objects for Policies](#) , on page 228.

- b) Right-click in the work area and select **New Object** to open the Add SLA Monitor dialog box. For more information, see [Configuring SLA Monitor Objects](#) , on page 2004.
- c) The monitoring options are appropriate for most connections, so you need only configure the following:
  - Name—The name of the object.

- **SLA Monitor ID**—An identifying number for the monitoring process. The number must be unique within a device configuration.
- **Monitored Address**—The address that you are monitoring. When you select a monitoring target, make sure that it can respond to ICMP echo requests (pings). The target can be any network address that you choose, but consider the use of:
  - The ISP gateway address.
  - The next hop gateway address (if you are concerned about the availability of the ISP gateway).
  - A server on the target network, such as an AAA server, with which the security appliance needs to communicate.
  - A persistent network device on the destination network. (A desktop or notebook computer that gets shut down at night is not a good choice.)
- **Interface**—The interface name, or interface role that identifies an interface, that will be the source of the ICMP messages. The device pings the monitored address from this interface's IP address.

d) Click **OK** to save the object.

**Step 2** Configure ASA/PIX policies to use the object to monitor routes. You can configure the following policies to monitor SLAs:

- **Platform > Routing > Static Route**—When you define a static route, you can select an SLA monitor object to do route tracking for the route. For more information, see [Configuring Static Routes](#) , on page 2244 and [Add/Edit Static Route Dialog Box](#) , on page 2245.
- **Interfaces**—When you define an interface that uses DHCP or PPPoE, you can configure the DHCP or PPPoE learned default routes to be tracked. For more information, see [Device Interface: IP Type \(PIX/ASA 7.0+\)](#) , on page 1875.

---

## Configuring SLA Monitor Objects

Use the Add or Edit SLA (Service Level Agreement) Monitor dialog box to create, edit, and copy SLA monitor objects. Each SLA monitor defines a connectivity policy to a monitored address and tracks the availability of a route to the address. The route is periodically checked for availability by sending ICMP echo requests and waiting for the response. If the requests time out, the route is removed from the routing table and replaced with a backup route.

You can configure SLA monitors only for security appliances running PIX/ASA version 7.2 or later. SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out).

For more information about configuring and using SLA monitor objects, see [Monitoring Service Level Agreements \(SLAs\) To Maintain Connectivity](#) , on page 2002.

### Navigation Path

Select **Manage > Policy Objects**, then select **SLA Monitors** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

## Field Reference

**Table 634: SLA Monitor Dialog Box**

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name              | The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see <a href="#">Creating Policy Objects</a> , on page 235.                                                                                                                                                                                                                                                                                                                                                                              |
| Description       | An optional description of the object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SLA Monitor ID    | The ID number of the SLA operation. Values range from 1 to 2147483647. You can create a maximum of 2000 SLA operations on a device. Each ID number must be unique to the policy and the device configuration.                                                                                                                                                                                                                                                                                                                                          |
| Monitored Address | The IP address that is being monitored for availability by the SLA operation. For recommendations on selecting an address to monitor, see <a href="#">Monitoring Service Level Agreements (SLAs) To Maintain Connectivity</a> , on page 2002.                                                                                                                                                                                                                                                                                                          |
| Interface         | The source interface for all ICMP echo requests sent to the monitored address to test its availability. Enter the name of an interface or interface role, or click <b>Select</b> to select an it from a list or to create a new interface role.                                                                                                                                                                                                                                                                                                        |
| Frequency         | The frequency of ICMP echo request transmissions, in seconds. Values range from 1 to 604800 seconds (7 days). The default is 60 seconds.<br><br><b>Note</b> The frequency cannot be less than the timeout value; you must convert frequency to milliseconds to compare the values.                                                                                                                                                                                                                                                                     |
| Threshold         | The amount of time that must pass after an ICMP echo request before a rising threshold is declared, in milliseconds. Values range from 0 to 2147483647 milliseconds. The default is 5000 milliseconds.<br><br>The threshold value is used only to indicate events that exceed the defined value. You can use these events to evaluate the proper timeout value. It is not a direct indicator of the reachability of the monitored address.<br><br><b>Note</b> The threshold value should not exceed the timeout value.                                 |
| Time out          | The amount of time that the SLA operation waits for a response to the ICMP echo requests, in milliseconds. Values range from 0 to 604800000 milliseconds (7 days). The default is 5000 milliseconds.<br><br>If a response is not received from the monitored address within the amount of time defined in this field, the static route is removed from the routing table and replaced by the backup route.<br><br><b>Note</b> The timeout value cannot exceed the frequency value (adjust the frequency value to milliseconds to compare the numbers). |

| Element           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request Data Size | <p>The size of the ICMP request packet payload, in bytes. Values range from 0 to 16384 bytes. The default is 28 bytes, which creates a total ICMP packet of 64 bytes. Do not set this value higher than the maximum allowed by the protocol or the Path Maximum Transmission Unit (PMTU).</p> <p>For purposes of reachability, you might need to increase the default data size to detect PMTU changes between the source and the target. A low PMTU can affect session performance and, if detected, might indicate that the secondary path should be used.</p> |
| ToS               | <p>The type of service (ToS) defined in the IP header of the ICMP request packet. Values range from 0 to 255. The default is 0.</p> <p>This field contains information such as delay, precedence, reliability, and so on. It can be used by other devices on the network for policy routing and features such as committed access rate.</p>                                                                                                                                                                                                                      |
| Number of Packets | <p>The number of packets that are sent. Values range from 1 to 100. The default is 1 packet.</p> <p><b>Tip</b>            Increase the default number of packets if you are concerned that packet loss might falsely cause the security appliance to believe that the monitored address cannot be reached.</p>                                                                                                                                                                                                                                                   |
| Category          | <p>The category assigned to the object. Categories help you organize and identify rules and objects. See <a href="#">Using Category Objects</a> , on page 239.</p>                                                                                                                                                                                                                                                                                                                                                                                               |

## CHAPTER 52

# Configuring Server Access Settings on Firewall Devices

---

The Server Access section contains pages for configuring server access on firewall devices; Server Access is under Device Admin in the Device or Policy selector.

This chapter contains the following topics:

- [AUS Page](#) , on page 2007
- [DHCP Relay Page](#) , on page 2010
- [DHCP Relay IPv6 Page](#) , on page 2013
- [Configuring DHCP Servers](#) , on page 2016
- [DNS Page](#) , on page 2020
- [Configuring DDNS](#) , on page 2024
- [NTP Page](#) , on page 2027
- [SMTP Server Page](#) , on page 2029
- [TFTP Server Page](#) , on page 2030

## AUS Page

The AUS page lets you configure remote updating of a security appliance from a server that supports the Auto Update specification. Auto Update applies configuration changes and software updates to the appliance automatically from the remote server.

---

**Note** The server you identify on this page must be the same server you identify in the Auto Update section of the Device Properties (from the Tools menu, choose Device Properties). The Device Properties information identifies the AUS server to which Security Manager sends configuration updates, whereas the information on this page defines for the server the device will contact for updates. Also, the Device Identity you provide in the Device Properties must match the Device ID on this page.

---

If you change AUS servers, note that the device will continue to use the AUS server defined in its current configuration until it receives a new configuration. Thus, you should change the AUS policy but deploy the configuration using the previous AUS server. After deployment is successful, change the Device Properties to point to the new server. For more information on deploying to AUS, see [Deploying Configurations Using an Auto Update Server or CNS Configuration Engine](#) , on page 420.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > AUS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > AUS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

- [Add and Edit Auto Update Server Dialog Boxes , on page 2009](#)

### Field Reference

*Table 635: AUS Page*

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Update Servers table | <p>This table lists currently configured Auto Update servers. Use the buttons below the table to manage these entries.</p> <p>The entries are listed in order of precedence for contacting AUS servers. Use the Up and Down arrow buttons to change the ordering of the list by moving the selected entry up or down.</p> <p>Use the Add Row, Edit Row, and Delete Row buttons to add, edit or delete entries. Add Row opens the Add Auto Update Server dialog box, while Edit Row opens the Edit Auto Update Server dialog box for the selected row. See <a href="#">Add and Edit Auto Update Server Dialog Boxes , on page 2009</a> for information about these dialog boxes.</p> <p><b>Note</b> The URL for contacting this AUS server is produced by concatenating the <i>Protocol ://Username :Password @IP IP Address (:Port )/Path</i> provided in the Add/Edit Auto Update Server dialog boxes. The Port is included only if you entered a port number other than the default 443.</p>           |
| Device ID Type            | <p>Choose the method used for identifying this device to the AUS server:</p> <ul style="list-style-type: none"> <li>• <b>Host Name</b> – The host name of this device, as provided in the Device Properties window (Tools &gt; Device Properties).</li> <li>• <b>Serial Number</b> – The serial number of this device.</li> <li>• <b>IP Address</b> – The IP address of the specified interface. When you choose this option, an Interface field appears; enter or Select the desired device interface.</li> <li>• <b>MAC Address</b> – The MAC address of the specified interface. When you choose this option, an Interface field appears; enter or Select the desired device interface.</li> <li>• <b>User Defined</b> – A unique user-specified ID is used. When you choose this option, a User Defined field appears; enter any alphanumeric string. Note that this string must also appear in the Device Identity field in the Device Properties window (Tools &gt; Device Properties).</li> </ul> |

| Element               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Poll Type             | <p>Choose the method defining how often the AUS server is polled for updates:</p> <ul style="list-style-type: none"> <li>• <b>At Specified Frequency</b> – If you choose this option, the Poll Period field is displayed: <ul style="list-style-type: none"> <li>• <b>Poll Period</b> – Specify the number of minutes the device waits between polls of the AUS server; valid values are 1 to 35791.</li> </ul> </li> <li>• <b>At Scheduled Time</b> – If you choose this option, the following fields are displayed (available only on ASA/PIX devices running version 7.2 or later): <ul style="list-style-type: none"> <li>• <b>Days of the week</b> – Select one or more days on which the device is to poll the AUS server.</li> <li>• <b>Polling Start Time in Hours</b> – The hour at which polling is to begin on the selected days; based on a 24-hour clock.</li> <li>• <b>Polling Start Time in Mins</b> – The minute within the chosen hour when polling is to begin.</li> <li>• <b>Enable Randomization of the Start Time</b> – Select this option to specify a random polling window; the Randomization Window field is enabled.</li> </ul> </li> </ul> <p><b>Randomization Window</b> – The maximum number of minutes the device can use to randomize the specified polling time; valid values are 1 to 1439.</p> |
| Retry Count           | The number of times the device will try to poll the AUS server for new information. Optional; if you enter zero or leave this field blank, the device will not retry after a failed poll attempt.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Retry Period          | If Retry Count is not zero or blank, the number of minutes the device will wait to re-poll the AUS server if the previous attempt failed; valid values are 1 to 35791. If Retry Count is not zero or blank and you leave this field blank, the value defaults to five minutes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Disable Device After: | <p>Selecting this option ensures that if no response is received from the AUS server within the specified Timeout period, the security appliance will stop passing traffic.</p> <ul style="list-style-type: none"> <li>• <b>Timeout</b> – The number of minutes the firewall device will wait to timeout if no response is received from the AUS server.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Add and Edit Auto Update Server Dialog Boxes

Use the Add Auto Update Server dialog box to configure a new AUS server definition. The security appliance will automatically poll this server for image and configuration updates.

The Auto Update specification allows the Auto Update server to either push configuration information and send requests for information to the security appliance, or to pull configuration information by causing the security appliance to periodically poll the Auto Update server. The Auto Update server can also send a command to the security appliance to send an immediate polling request at any time. Communication between the Auto Update server and the security appliance requires a communications path and local CLI configuration on each security appliance.

**Note** The URL for contacting this AUS server is produced by concatenating the *Protocol* ://*Username* :*Password* @*IP IP Address* (:*Port* )/*Path* provided in these dialog boxes. The Port is included only if you entered a port number other than the default 443.

With the exception of the title, the Edit Auto Update Server dialog box is identical to the Add Auto Update Server dialog box. The following descriptions apply to both.

### Navigation Path

You can access the Add and Edit Auto Update Server dialog boxes from the [AUS Page](#) , on page 2007.

### Field Reference

**Table 636: Add and Edit Auto Update Server Dialog Boxes**

| Element            | Description                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol           | The protocol used to communicate with the AUS server; choose <b>http</b> or <b>https</b> .<br><br><b>Note</b> If https is selected as the protocol to communicate with the Auto Update server, the security appliance will use SSL. This requires the security appliance to have a DES, 3DES, or AES license. |
| IP Address         | Enter the IP address or Select a Networks/Hosts object representing this AUS server.                                                                                                                                                                                                                          |
| Port               | Enter the number of the port on which communications with the AUS server take place. Defaults to 80 if http is chosen as the Protocol, and to 443 if https is chosen. If you enter an arbitrary port number, be sure the AUS server is configured to use the same port.                                       |
| Path               | The path to AUS services on the server. The standard path is autoupdate/AutoUpdateServlet ; change this to admin/auto-update only if the AUS server host is an ASA.                                                                                                                                           |
| AUS Interface      | Enter or Select the interface to use when polling the Auto Update server.                                                                                                                                                                                                                                     |
| Verify Certificate | Select this option to require SSL verification from the AUS server. The certificate returned by the server will be checked against Certification Authority (CA) root certificates. This requires that the AUS Server and this device use the same Certification Authority.                                    |
| Username           | Enter a user name to be used for AUS authentication (optional).                                                                                                                                                                                                                                               |
| Password           | Enter the password to be used for AUS authentication (optional).                                                                                                                                                                                                                                              |
| Confirm            | Re-enter the password (optional).                                                                                                                                                                                                                                                                             |

## DHCP Relay Page

Use the DHCP Relay page to configure DHCP relay services for security devices. Dynamic Host Configuration Protocol (DHCP) relay passes DHCP requests received on one interface to an external DHCP server located behind a different interface. To configure DHCP relay, you need to specify at least one DHCP relay server and then enable a DHCP relay agent on the interface receiving DHCP requests.

**Note** You cannot enable a DHCP relay agent on an interface where a DHCP relay server is configured. The DHCP relay agent works only with external DHCP servers; it will not forward DHCP requests to a security appliance interface configured as a DHCP server.

Beginning with Security Manager version 4.9, DHCP Relay IPv4 is supported for ASA cluster devices running the software version 9.4.0 or later.

For ASA-SM 9.1.2+ devices, you can configure DHCP relay servers per-interface, so requests that enter a given interface are relayed only to servers specified for that interface. When a DHCP request enters an interface that does not have interface-specific servers configured, the ASA relays the request to all global servers. If the interface has interface-specific servers, then the global servers are not used. IPv6 is not supported for per-interface DHCP relay. For more information, see [Add/Edit Interface Dialog Box: Advanced Tab \(ASA/PIX 7.0+\)](#), on page 1853.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Relay** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Relay** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Trust Info (Option 82) | <p>Specifies that you want to trust all DHCP client interfaces. You can configure interfaces as trusted interfaces to preserve DHCP Option 82.</p> <p><b>Note</b> You can also specify interfaces to trust individually. For more information, see <a href="#">Add/Edit Interface Dialog Box: Advanced Tab (ASA/PIX 7.0+)</a>, on page 1853.</p> <p>DHCP Option 82 is used by downstream switches and routers for DHCP snooping and IP Source Guard. Normally, if the ASA DHCP relay agent receives a DHCP packet with Option 82 already set, but the giaddr field (which specifies the DHCP relay agent address that is set by the relay agent before it forwards the packet to the server) is set to 0, then the ASA will drop that packet by default. You can now preserve Option 82 and forward the packet by identifying an interface as a trusted interface.</p> |

## Add and Edit DHCP Relay Agent Configuration Dialog Boxes

Use the Add DHCP Relay Agent Configuration dialog box to configure and enable a DHCP relay agent on an interface. Use the Edit DHCP Relay Agent Configuration dialog box to update an existing interface relay agent.

**Note** You cannot enable a DHCP relay agent on an interface where a DHCP relay server is configured. The DHCP relay agent works only with external DHCP servers; it will not forward DHCP requests to a security appliance interface configured as a DHCP server.

The Add DHCP Relay Agent Configuration dialog box and the Edit DHCP Relay Agent Configuration dialog box are virtually identical; the following descriptions apply to both.

### Navigation Path

You can access the Add and Edit DHCP Relay Agent Configuration dialog boxes from the [DHCP Relay Page](#), on page 2010.

*Table 638: Add and Edit DHCP Relay Agent Configuration Dialog Boxes*

| Element           | Description                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------|
| Interface         | Enter or Select the name of the interface on which you want to configure a DHCP relay agent. |
| Enable DHCP Relay | When checked, the DHCP relay is enabled on the specified interface.                          |

| Element   | Description                                                                                                                                                                                                                                                                                                                   |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Set Route | Check this box to configure the DHCP relay agent to modify the default router address in the information returned from the DHCP server. When this option is selected, the DHCP relay agent substitutes the address of the selected interface for the default router address in the information returned from the DHCP server. |

## Add and Edit DHCP Relay Server Configuration Dialog Boxes

Use the Add DHCP Relay Server Configuration dialog box to define a new DHCP relay server; use the Edit DHCP Relay Server Configuration dialog box to update existing server information. You can configure a maximum of 10 DHCPv4 relay servers in single mode and per context, global and interface-specific servers combined, with a maximum of 4 servers per interface.

**Note** PIX Firewalls running an OS earlier than 7.2 only support 4 DHCP relay servers.

The Add DHCP Relay Server Configuration dialog box and the Edit DHCP Relay Server Configuration dialog box are virtually identical; the following descriptions apply to both.

### Navigation Path

You can access the Add and Edit DHCP Relay Server Configuration dialog boxes from the [DHCP Relay Page](#), on page 2010.

| Element   | Description                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------|
| Server    | Enter the IP address or Select a Networks/Hosts object representing the external DHCP server to which DHCP requests are forwarded. |
| Interface | Enter or Select the interface through which DHCP requests are forwarded to the external DHCP server.                               |

## DHCP Relay IPv6 Page

Use the DHCP Relay IPv6 page to configure DHCPv6 relay services for security devices. Dynamic Host Configuration Protocol v6 (DHCPv6) relay passes DHCPv6 requests received on one interface to an external DHCPv6 server located behind a different interface. To configure DHCPv6 relay, you need to specify at least one DHCPv6 relay server and then enable a DHCPv6 relay agent on the interface receiving DHCPv6 requests.

**Note** You cannot enable a DHCPv6 relay agent on an interface where a DHCPv6 relay server is configured. The DHCPv6 relay agent works only with external DHCPv6 servers; it will not forward DHCPv6 requests to a security appliance interface configured as a DHCPv6 server. Beginning with Security Manager version 4.9, DHCP Relay IPv6 is supported for ASA cluster devices running the software version 9.4.0 or later.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Relay IPv6** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Relay IPv6** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

**Note** Two new interface settings have been introduced for DHCPv6: "managed-config-flag" and "other-config-flag." For more information, refer to [Configuring IPv6 Interfaces \(ASA/FWSM\)](#), on page 1865.

## Configuring DHCP Servers

A Dynamic Host Configuration Protocol (DHCP) server provides network configuration parameters, such as IP addresses, to DHCP clients. The security appliance can provide DHCP server or DHCP relay services to DHCP clients attached to the security appliance interfaces. The DHCP server provides network configuration parameters directly to DHCP clients; DHCP relay passes DHCP requests received on one interface to an external DHCP server located behind a different interface. For more information about DHCP relay, see [DHCP Relay Page](#) , on page 2010.

---

**Note** The security appliance DHCP server does not support BOOTP requests. In multiple-context mode, you cannot enable a DHCP server or DHCP relay on an interface that is used by more than one context.

---

You can configure a DHCP server on each interface of the security appliance, and each interface can have its own pool of addresses to draw from. However, the other DHCP settings, such as DNS servers, domain name, options, ping timeout, and WINS servers, are configured globally and used by the DHCP server on all interfaces.

You cannot configure a DHCP client or DHCP relay services on an interface on which the DHCP server is enabled. Additionally, DHCP clients must be directly connected to the interface on which the server is enabled.

If your firewall is also acting as a DHCP client on the outside interface, you can enable auto-negotiated IP configuration. This allows the firewall to pass the DNS, WINS and domain name parameters it gets from the outside interface (as a DHCP client) to hosts on its inside network. Alternatively, you can manually specify the DNS, WINS and domain name parameters. If you specify those parameters manually and auto-configuration is on, your values take precedence over auto-configuration.

Use the [DHCP Server Page](#) , on page 2016 to manage DHCP server definitions.

## DHCP Server Page

Use the DHCP Server page to configure global DHCP server and dynamic DNS (DDNS) update options, to set up a DHCP server on one or more device interfaces, and to configure advanced server options.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DHCP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DHCP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ping Timeout                                 | Specify the amount of time, in milliseconds, that the firewall device waits to time out a DHCP ping attempt. To avoid address conflicts, firewall devices send two ICMP ping packets to an address before assigning that address to a DHCP client. Valid values range from 10 to 10000 milliseconds.                                                                                                                                     |
| Lease Length                                 | Specify the amount of time, in seconds, that the client can use its allocated IP address before the lease expires. Valid values range from 300 to 1048575 seconds. The default value is 3600 seconds (1 hour).                                                                                                                                                                                                                           |
| Enable auto-configuration (PIX and ASA only) | Select this option to enable DHCP auto configuration.<br>DHCP auto configuration causes the DHCP server to provide DHCP clients with DNS server, domain name, and WINS server information obtained from a DHCP client running on the specified interface. If any of the information obtained through auto configuration is also specified manually, the manually specified information takes precedence over the discovered information. |
| Interface                                    | If Enable auto-configuration is checked, this field is available. Enter or Select the interface running the DHCP client that supplies the DNS, WINS, and domain name parameters.                                                                                                                                                                                                                                                         |
| <b>Define settings (optional)</b>            |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Domain Name                                  | Specify the DNS domain name for DHCP clients. Enter a valid DNS domain name; for example, example.com .                                                                                                                                                                                                                                                                                                                                  |
| Primary DNS Server                           | Enter the IP address or Select a Networks/Hosts object representing the primary DNS server for a DHCP client.                                                                                                                                                                                                                                                                                                                            |
| Primary WINS Server                          | Enter the IP address or Select a Networks/Hosts object representing the primary WINS server for a DHCP client.                                                                                                                                                                                                                                                                                                                           |
| Secondary DNS Server                         | Enter the IP address or Select a Networks/Hosts object representing the alternate DNS server for a DHCP client.                                                                                                                                                                                                                                                                                                                          |

## Add and Edit DHCP Server Interface Configuration Dialog Boxes

Use these dialog boxes to enable DHCP and specify a DHCP address pool for a specified interface, and to enable dynamic DNS (DDNS) updating on the interface.

---

**Note** Other than the titles, the two dialog boxes are identical.

---

### Navigation Path

You can access the Add DHCP Server Interface Configuration and Edit DHCP Server Interface Configuration dialog boxes from the [DHCP Server Page](#) , on page 2016.

**Table 644: Add/Edit DHCP Server Interface Configuration Dialog Boxes**

| Element                   | Description                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface                 | Identifies the interface on which you are configuring a DHCP server. Enter an interface name, or select an interface object.                                                                                                                                                                                                                                           |
| DHCP Address Pool         | Enter an IP address or a range of addresses, separated by a hyphen, that the DHCP server will use when assigning IP addresses. The beginning and ending addresses in the range must be in the same subnet, and the beginning address cannot be greater than the ending address.                                                                                        |
| Enable DHCP Server        | Check this box to enable a DHCP server on this interface.                                                                                                                                                                                                                                                                                                              |
| Enable Dynamic DNS Update | Check this box to enable DDNS updating by this DHCP server. Specify the record(s) to be updated: <ul style="list-style-type: none"> <li>• <b>PTR Record</b> only</li> <li>• <b>A Record and PTR Record</b></li> </ul> <p>You also can select <b>Override DHCP Client Request</b>. If selected, DHCP server updates override any updates requested by DHCP clients.</p> |

## Add/Edit DHCP Server Advanced Configuration Dialog Box

The Add/Edit DHCP Server Advanced Configuration dialog box lets you manage DHCP options configured for the DHCP server. These options provide additional information to DHCP clients. For example, DHCP option 150 and DHCP option 66 provide TFTP server information to Cisco IP Phones and Cisco IOS routers.

### Navigation Path

You can access the Add/Edit DHCP Server Advanced Configuration dialog box by clicking the Advanced button on the [DHCP Server Page](#), on page 2016.

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Option Code | Choose an option from the list of available option codes. All DHCP options (options 1 through 255) are supported except 1, 12, 50-54, 58-59, 61, 67, and 82.<br><br>Detailed information about DHCP option codes is available on cisco.com: <a href="#">DHCP Options Reference</a> .                                                                                                                                                                                                                                                                                                                                                                               |
| Type        | Choose the type of information the option returns to the DHCP client: <ul style="list-style-type: none"> <li>• <b>IP</b> – Choosing this type specifies that one or two IP addresses are returned to the DHCP client. Provide up to two IP addresses.</li> <li>• <b>ASCII</b> – Choosing this type specifies that an ASCII value is returned to the DHCP client. Provide the ASCII character string, which cannot include spaces.</li> <li>• <b>HEX</b> – Choosing this type specifies that a hexadecimal value is returned to the DHCP client. Provide the HEX string with an even number of digits and no spaces; you do not need to use a 0x prefix.</li> </ul> |

## DNS Page

Use the DNS page to configure DNS server groups. The firewall device uses these DNS servers to resolve fully-qualified domain names (host names) to IP addresses for SSL VPN, certificates, and FQDN network/host objects used in identity-aware firewall policies. Other features that define server names (such as AAA) do not support DNS resolution—you must enter the IP address or manually resolve the name to an IP address.

**Tip** The DefaultDNS server group is predefined on the ASA and is used for FQDN network/host object resolution. If you use FQDN objects, ensure that you configure DNS servers for this group; otherwise, the names cannot be resolved. To enhance security, ensure that you specify DNS servers that are trusted and that are preferably inside your network. For more information, see [Requirements for Identity-Aware Firewall Policies](#) , on page 639.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DNS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DNS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

*Table 647: DNS Page*

| Element                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS Server Groups table | This table lists the currently defined DNS server groups. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these group entries.<br><br>The Add Row button opens the Add DNS Server Group dialog box, and the Edit Row button opens the Edit DNS Server Group dialog box; except for the titles these dialog boxes are identical. See <a href="#">Add DNS Server Group Dialog Box</a> , on page 2022 for more information.  |
| DNS Group Map           | <b>Enable DNS To Domain</b> —Check this option to enable mapping of DNS Server Group Name to DNS Group Map domain name. If this option is unchecked, then the DNS Group Map table will be empty.<br><br>The DNS Group Map table lists the currently defined DNS Group Map. Use the Add Row, Edit Row, and Delete Row buttons below the table to manage these group entries. For more information, see <a href="#">Add DNS Group Map Dialog Box</a> . |
| DNS Lookup Interfaces   | Lists the interfaces on which you want to enable DNS lookup. Enter or Select one or more interfaces or interface roles.                                                                                                                                                                                                                                                                                                                              |

| Element                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable DNS Guard (ASA/PIX 7.0(5), 7.2(x) and 8.x only) | <p>Check this box to enable DNS Guard for the selected device or shared policy. DNS Guard tears down the DNS session associated with a DNS query as soon as the DNS reply is forwarded by the security appliance. DNS Guard also monitors the message exchange to ensure that the ID of the DNS reply matches the ID of the DNS query.</p> <p>This command is effective only on interfaces for which DNS inspection is disabled. When DNS inspection is enabled, the DNS Guard function is always performed.</p> <p><b>Note</b> In releases prior to 7.0(5), the DNS Guard functions are always enabled regardless of the configuration of DNS inspection.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DefaultDNS Server Group (ASA 8.4(2)+)                  | <p>Additional settings that apply to the DefaultDNS server group only. These settings are used when resolving FQDN network/host objects to IP addresses.</p> <ul style="list-style-type: none"> <li>• <b>Poll Timer</b>—The time, in minutes, of the polling cycle used to resolve FQDN network/host objects to IP addresses. FQDN objects are resolved only if they are used in a firewall policy. The timer determines the maximum time between resolutions; the DNS entry's time-to-live (TTL) value is also used to determine when to update to IP address resolution, so individual FQDNs might be resolved more frequently than the polling cycle.</li> </ul> <p>The default is 240 (four hours). The range is 1 to 65535 minutes.</p> <ul style="list-style-type: none"> <li>• <b>Expire Entry Timer</b>—The number of minutes after a DNS entry expires (that is, the TTL has passed) that the entry is removed from the DNS lookup table. Removing an entry requires that the table be recompiled, so frequent removals can increase the processing load on the device. Because some DNS entries can have very short TTL (as short as three seconds), you can use this setting to virtually extend the TTL.</li> </ul> <p>The default is 1 minute (that is, the entry is removed one minute after the TTL has passed). The range is 1 to 65535 minutes.</p> |

## Add DNS Server Group Dialog Box

Use the Add DNS Server Group dialog box to define the DNS servers and settings for a DNS server group, used by security devices to resolve server names to IP addresses in policies that support name resolution.

**Note** With the exception of its title, the Edit DNS Server Group dialog box is identical to this one, and the following descriptions apply to both.

### Navigation Path

You can access the Add DNS Server Group and Edit DNS Server Group dialog boxes from the [DNS Page](#), on page 2020.

## Field Reference

**Table 648: Add/Edit DNS Server Group Dialog Boxes**

| Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | <p>Provide a name for the group of DNS servers.</p> <p><b>Tip</b> The name DefaultDNS is predefined on the ASA and includes the servers used for policies that do not allow the selection of a specific group, such as for FQDN network/host object resolution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DNS Servers | <p>Lists the DNS servers in this group. You can specify up to six servers to which DNS requests can be forwarded. The security appliance tries each DNS server in top-to-bottom order until it receives a response.</p> <p><b>Note</b> You also must specify at least one interface on which DNS is enabled in the DNS Lookup section of the <a href="#">DNS Page</a> , on page 2020.</p> <p>Use the buttons next to this list to manage the entries; from the top down, they are:</p> <ul style="list-style-type: none"> <li>• Add a DNS server to the list; opens the <a href="#">Add DNS Server Dialog Box</a> , on page 2023.</li> <li>• Delete the currently selected DNS server entry from the list.</li> <li>• Move the currently selected entry up one row.</li> <li>• Move the currently selected entry down one row.</li> </ul> |
| Timeout     | <p>Specify the number of seconds, from 1 to 30, to wait before trying the next DNS server; the default is 2 seconds. Each time the security device retries the list of servers, this timeout doubles.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Retries     | <p>Specify the number of times, from 0 to 10, to retry the list of DNS servers when the security device does not receive a response.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Domain Name | <p>Optionally, specify a valid DNS domain name for the server; for example, <b>dnsexample.com</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Add DNS Server Dialog Box

Use the Add DNS Server dialog box to add a DNS server to the DNS servers list in the Add DNS Server Group or Edit DNS Server Group dialog boxes.

### Navigation Path

You can access the Add DNS Server dialog box from the Add DNS Server Group or Edit DNS Server Group dialog boxes. For more information about these dialog boxes, see [Add DNS Server Group Dialog Box](#) , on page 2022.

| Element                         | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DNS Server                      | The IP address, or the host network/host object that defines the address, of the DNS server. Enter the address or click <b>Select</b> to select the network/host object from a list or to create a new object.                                                                                                                                                                                                   |
| Interface (ASA 9.5(1) or later) | Click select to choose an interface. The Interface selector dialog box lists only Interface Roles and not Physical Interfaces. Therefore you must add a Physical Interface to the Interface Role before selecting the Source Interface. There is no default value for the interface.<br><br>This feature is available in Security Manager version 4.9 and later for devices running ASA version 9.5(1) or later. |

## Add DNS Group Map Dialog Box

Use the Add DNS Group Map dialog box to define the DNS Group Map name and domain.

**Note** To edit the Group Map entries, use the Edit DNS Group Map dialog box.

### Navigation Path

You can access the Add DNS Group Map and Edit DNS Group Map dialog boxes from the [DNS Page](#).

### Field Reference

*Table 650: Add/Edit DNS Group Map Dialog Boxes*

| Element     | Description                                                                                                                                                         |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | Provide a name for the DNS Group Map.                                                                                                                               |
| Domain Name | Specify a valid DNS domain name for the group map; for example, <b>dnsexample.com</b> .<br><br><b>Note</b> Enter a unique domain value for each DNS Group Map name. |

## Configuring DDNS

Dynamic DNS (DDNS) provides IP-address and domain-name mapping updates so hosts can find each other even though their DHCP-assigned IP addresses may change frequently. Also, beginning with the version 7.2(3), Cisco security appliances can generate DDNS updates. The DDNS page is where you configure this feature.

The DDNS mappings are maintained on the DHCP server in two types of resource records (RRs): the address or *A* records contain the name-to-IP-address mappings, while the pointer or *PTR* records map addresses to host names.

By automatically recording the association between assigned addresses and host names at defined intervals, DDNS allows frequently changing address-host name associations to be updated frequently. Mobile hosts, for example, can then move freely on a network without user or administrator intervention.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > DDNS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > DDNS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

| Element                                            | Description                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic DNS Interface Settings                     | This table lists currently defined DDNS interface-update methods. Use the Add Row, Edit Row, and Delete Row buttons below the table to manage these methods; the Add Row and Edit Row buttons open the <a href="#">Add/Edit DDNS Interface Rule Dialog Box</a> , on page 2025.                                                                                    |
| DHCP Client requests DHCP Server to update records | The global setting on the appliance for DHCP client update requests. This option enables the client to send DDNS updates via the DHCP server, and specifies what is updated: the PTR resource record, both the A and PTR resource records, or neither. Choose <b>Not Selected</b> , <b>Only PTR Record</b> , <b>Both A and PTR Record</b> , or <b>No Update</b> . |
| DHCP Client ID Interface                           | Specify the interface(s) for global DHCP client update requests: enter an interface name or IP address, or Select an interface object.                                                                                                                                                                                                                            |
| Enable DHCP Client Broadcast                       | Select this option to allow DHCP clients on the device to broadcast DDNS updates. Available on ASA/PIX 7.2(3)+ devices only.                                                                                                                                                                                                                                      |

## Add/Edit DDNS Interface Rule Dialog Box

Use the Add/Edit DDNS Interface Rule dialog box to manage rules for dynamic DNS updates. These rules are defined on a per-interface basis.

### Navigation Path

You access the Add/Edit DDNS Interface Rule dialog box from the [Configuring DDNS](#), on page 2024.

| Edit Row button | Opens the <a href="#">Add/Edit DDNS Update Methods Dialog Box</a> , on page 2027, where you can edit the method currently selected in the table. |

| Element           | Description                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------------|
| Delete Row button | Deletes the method currently selected in the Update Methods table; confirmation may be required. |

### Add/Edit DDNS Update Methods Dialog Box

Use the Add/Edit DDNS Update Methods dialog box to define or edit a DDNS update method; currently defined methods are listed in the [DDNS Update Methods Dialog Box](#) , on page 2026.

#### Navigation Path

You access the Add/Edit DDNS Update Methods dialog box by clicking the Add Row or the Edit Row buttons in the [DDNS Update Methods Dialog Box](#) , on page 2026.

#### Related Topics

- [Configuring DDNS](#) , on page 2024

#### Field Reference

*Table 654: Add/Edit DDNS Update Methods Dialog Box*

| Element         | Description                                                                                                                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Method Name     | Provide an identifier for this method.                                                                                                                                                                                                                                             |
| Update Interval | Specify how often records are to be updated for this method: provide a number of days, hours, minutes, and seconds. Note that while zero is the default value for hours, minutes and seconds, there is no default Day value: you must enter a number for Day.                      |
| Update Records  | Specify the resource record(s) to be updated: select <b>Not Defined</b> , <b>A Records</b> , or <b>Both A and PTR Records</b> . Selecting A Records or Both A and PTR Records overrides the setting in the <a href="#">Add/Edit DDNS Interface Rule Dialog Box</a> , on page 2025. |

## NTP Page

Network Time Protocol (NTP) is used to implement a hierarchical system of servers that provide precisely synchronized timing for network systems. This kind of accuracy is required for time-sensitive operations, such as validating Certificate Revocation Lists (CRLs), which include a precise time stamp. You can configure multiple NTP servers. The security device chooses the server with the lowest stratum—a measure of how reliable the data is.

---

**Note** This page is not available on Catalyst 6500 service modules (the Firewall Services Module and the Adaptive Security Appliance Service Module).

---

Use the NTP page to enable NTP and manage the NTP servers used to dynamically set the time on a security device.

---

**Note** Time derived from an NTP server overrides any time set manually on the Clock page.

---

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > NTP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Field Reference

|------------|---------------------------------------------------|
| IP Address | Enter or Select the IP address of the NTP server. |

| Element             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preferred           | <p>If checked, this NTP server is the preferred server when multiple servers are similarly accurate.</p> <p>NTP uses an algorithm to determine which server is the most accurate and synchronizes to that one. If multiple servers are of similar accuracy, then this option specifies which of those servers to use. However, if a server is significantly more accurate than the preferred one, the security appliance uses the more accurate server. For example, the security appliance uses a server of stratum 2 over a server of stratum 3 that is preferred. We recommend that you configure an NTP server as preferred only when multiple servers are likely to have the same stratum.</p> |
| Interface           | Enter or Select the interface used for NTP traffic, if you want to override the default interface in to the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Authentication Type | <p>Adding to MD5, the following authentication types are also supported in Cisco Security Manager starting from version 4.20 for ASA 9.13(1) and higher devices:</p> <ul style="list-style-type: none"> <li>• sha1</li> <li>• sha256</li> <li>• sha512</li> <li>• cmac</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Key Number          | Enter the ID for this authentication key. The NTP server packets must also use this key ID. If you previously configured a key ID for another server, you can select it in the list; otherwise, type a number between 1 and 4294967295.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Trusted             | Sets this key as a trusted key. You must select this option for authentication to work.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Key Value           | Enter the authentication key as a string up to 32 characters in length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Confirm             | Re-enter the authentication key to verify it is correct.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## SMTP Server Page

Use the SMTP Server page to specify the IP address of an SMTP server and optionally, the IP address of a backup server, to which e-mail alerts and notifications are sent in response to specific events.

### Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > SMTP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > SMTP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

*Table 657: SMTP Server Page*

| Element                     | Description                                              |
|-----------------------------|----------------------------------------------------------|
| Primary Server IP Address   | Enter or Select the IP address of the SMTP server.       |
| Secondary Server IP Address | Enter or Select the IP address of a back-up SMTP server. |

# TFTP Server Page

The Trivial File Transfer Protocol (TFTP) is a simple client/server file transfer protocol described in RFC783 and RFC1350 Rev. 2. You can use the TFTP Server page to configure the security appliance as a TFTP client so it can transfer a copy of its running configuration file to a TFTP server. In this way, you can back up and propagate configuration files to multiple security appliances. Only one server is supported.

## Navigation Path

- (Device view) Select **Platform > Device Admin > Server Access > TFTP Server** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > Server Access > TFTP Server** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

## Field Reference

*Table 658: TFTP Server Page*

| Element    | Description                                                                                                                                                                                                                                                        |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface  | Enter or Select the name of interface on which the TFTP server is accessed.                                                                                                                                                                                        |
| IP Address | Enter or Select the IP address of the TFTP server.                                                                                                                                                                                                                 |
| Directory  | Enter the path on the TFTP server, beginning with a forward slash (/) and ending in the file name, to which the configuration files will be written (for example, <b>/tftpboot/asa/config3</b> ).<br><br><b>Note</b> The path must begin with a forward slash (/). |

## CHAPTER 53

# Configuring FXOS Server Access Settings on Firepower 2100 Series Devices

---

The FXOS Server Access section contains pages for configuring FXOS server access on Firepower 2100 Series devices; FXOS Server Access is under Device Admin in the Device or Policy selector.

The Firepower 2100 Series devices supported by ASA and Cisco Security Manager are:

- Cisco FPR-2110 Adaptive Security Appliance
- Cisco FPR-2120 Adaptive Security Appliance
- Cisco FPR-2130 Adaptive Security Appliance
- Cisco FPR-2140 Adaptive Security Appliance

This chapter contains the following topics:

- [HTTPS Page, on page 2031](#)
- [SSH Page, on page 2032](#)
- [SNMP Page, on page 2034](#)

## HTTPS Page

The HTTPS page allows you to configure the device to access the FXOS server through HTTPS. When you deploy configurations with this protocol, Cisco Security Manager encrypts the configuration file before sending it to the device.

### Navigation Path

- (Device view) Select **Platform > Device Admin > FXOS Server Access > HTTPS** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > FXOS Server Access > HTTPS** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

### Related Topics

- [Add and Edit HTTPS Dialog Boxes , on page 2032](#)

## Field Reference

*Table 659: HTTPS Page*

| Element    | Description                                                                                                                          |
|------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Action     | The permit action allows configuring the Firepower 2100 Series device with IP address and port. It supports IPv4 and IPv6 addresses. |
| Interface  | The name of the device interface for which the HTTPS is configured. HTTPS cannot be configured on a Bridge Groups (BG) interface.    |
| IP Address | The IP address of the device. It can be an IPv4 or an IPv6 address.                                                                  |
| Port       | The port on which communications with the FXOS server take place.                                                                    |

## Add and Edit HTTPS Dialog Boxes

Use the Add HTTPS Configuration dialog box to create the HTTPS rules. The security appliance will automatically poll this server for image and configuration updates.

The Edit HTTPS Configuration dialog box is identical to the Add HTTPS Configuration dialog box. The following descriptions apply to both.

### Navigation Path

You can access the Add and Edit HTTPS Configuration dialog boxes from the [HTTPS Page, on page 2031](#).

## Field Reference

*Table 660: Add and Edit HTTPS Configuration Dialog Boxes*

| Element    | Description                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Action     | Select Permit.                                                                                                                                  |
| Interface  | Click Select and choose the interface. The Bridge Groups (BG) interface cannot be configured with HTTPS.                                        |
| IP Address | Click Select and choose the IP address of the device that can access the FXOS server. It can be an IPv4 or an IPv6 address.                     |
| Port       | This value defaults to 3443 when you save the page. You can also enter the port on which communications with the FXOS server should take place. |

## SSH Page

Use the Secure Shell page to configure port that permit FXOS server access to a Firepower 2100 Series device using the SSH protocol. The rules permit SSH access to a specific IP address and netmask.

**Navigation Path**

- (Device view) Select **Platform > Device Admin > FXOS Server Access > SSH** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > FXOS Server Access > SSH** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Port       | The port on which communications with the FXOS server take place.                                                                                              |

## Add and Edit SSH Dialog Boxes

Use the Add SSH Configuration dialog box to create the SSH rules. The security appliance will automatically poll this server for image and configuration updates.

The Edit SSH Configuration dialog box is identical to the Add SSH Configuration dialog box. The following descriptions apply to both.

**Navigation Path**

You can access the Add and Edit SSH Configuration dialog boxes from the [HTTPS Page, on page 2031](#).

**Field Reference***Table 662: Add and Edit SSH Configuration Dialog Boxes*

| Element   | Description                                                                                            |
|-----------|--------------------------------------------------------------------------------------------------------|
| Action    | Select Permit.                                                                                         |
| Interface | Click Select and choose the interface. The Bridge Groups (BG) interface cannot be configured with SSH. |

| Element    | Description                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| IP Address | Click Select and choose the IP address of the device that can access the FXOS server. It can be an IPv4 or an IPv6 address.                     |
| Port       | This value defaults to 3022 when you save the page. You can also enter the port on which communications with the FXOS server should take place. |

## SNMP Page

SNMP is an application layer protocol that facilitates the exchange of management information between network devices. You can use the SNMP page to configure the Firepower 2100 Series devices for monitoring by SNMP.

### Navigation Path

- (Device view) Select **Platform > Device Admin > FXOS Server Access > SNMP** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Device Admin > FXOS Server Access > SNMP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Interface  | The name of the device interface for which the SNMP is configured. SNMP cannot be configured on a Bridge Groups (BG) interface.                                |
| IP Address | The IP address of the device. It can be an IPv4 or an IPv6 address.                                                                                            |
| Port       | The port on which communications with the FXOS server take place.                                                                                              |

## Add and Edit SNMP Dialog Boxes

Use the Add SNMP Configuration dialog box to create the SNMP rules. The security appliance will automatically poll this server for image and configuration updates.

The Edit SNMP Configuration dialog box is identical to the Add SNMP Configuration dialog box. The following descriptions apply to both.

### Navigation Path

You can access the Add and Edit SNMP Configuration dialog boxes from the [SNMP Page, on page 2034](#).

### Field Reference

**Table 664: Add and Edit SNMP Configuration Dialog Boxes**

| Element    | Description                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Action     | Select Permit.                                                                                                                                  |
| Interface  | Click Select and choose the interface. The Bridge Groups (BG) interface cannot be configured with SNMP.                                         |
| IP Address | Click Select and choose the IP address of the device that can access the FXOS server. It can be an IPv4 or an IPv6 address.                     |
| Port       | This value defaults to 3161 when you save the page. You can also enter the port on which communications with the FXOS server should take place. |

## CHAPTER 54

# Configuring Logging Policies on Firewall Devices

The Logging feature lets you enable and manage NetFlow “collectors,” and enable system logging, set up logging parameters, configure event lists (syslog filters), apply the filters to a destination, set up syslog messages, configure syslog servers, and specify e-mail notification parameters.

After you enable logging and set up the logging parameters using the Logging Setup page, the Event Lists page lets you configure filters (for a set of syslogs) which can be sent to a logging destination. The Logging Filters page lets you specify a logging destination for the syslogs to be sent. Finally, the Syslog and E-Mail pages configure syslog and e-mail setup.

This chapter contains the following topics:

- [Configuring Syslog Server Setup](#) , on page 2057
- [Defining Syslog Servers](#) , on page 2063

## NetFlow Page

A device configured for NetFlow data export captures flow-based traffic statistics on the device. This information is periodically transmitted from the device to a NetFlow collection server, in the form of User Datagram Protocol (UDP) datagrams.

The NetFlow page lets you enable NetFlow export on the selected device, and define and manage NetFlow “collectors” to which collected flow information is transmitted.

### Navigation Path

- (Device view) Select **Platform** > **Logging** > **NetFlow** from the Device Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform** > **Logging** > **NetFlow** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

| Element                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Flow Export       | If checked, NetFlow data export is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Template Export Interval | Interval (in minutes) between transmissions of flow information to the collectors. The value can be from one to 3600 minutes; the default is 30.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Active Refresh Interval  | For active connections, specifies the time interval between flow-update events in minutes. Valid values are from 1 to 60 minutes. The default value is 1 minute.                                                                                                                                                                                                                                                                                                                                                                                                         |
| Delay Flow Create        | Delays the sending of a flow-create event by the specified number of seconds. The value can be from one to 180 seconds.<br><br>If no value is entered, there is no delay, and the flow-create event is exported as soon as the flow is created. If the flow is torn down before the configured delay, the flow-create event is not sent; an extended flow teardown event is sent instead.                                                                                                                                                                                |
| Collectors table         | Lists the currently defined NetFlow collectors. Use the Add Row, Edit Row and Delete Row buttons below the table to manage these entries.<br><br>The Add Row and Edit Row buttons open the <a href="#">Add and Edit Collector Dialog Boxes (NetFlow)</a> , on page 2038.<br><br><b>Note</b> Cisco Security Manager does not allow duplicate netflow collectors for ASA 9.6(4) to 9.7.0, and 9.8(2) and above devices. Change the current configuration or remove the duplicate or overlapping configuration ( <b>Platform&gt; Logging &gt; Netflow</b> ) for the device. |

## Add and Edit Collector Dialog Boxes (NetFlow)

Use the Add Collector and Edit Collector dialog boxes to define and edit NetFlow “collectors.” Except for the title, the two dialog boxes are identical; the following information applies to both.

**Navigation Path**

You can open the Add and Edit Collector dialog boxes from the [NetFlow Page](#) , on page 2037.

## Field Reference

**Table 666: Add and Edit Collector Dialog Boxes**

| Element   | Description                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Interface | Enter or Select the name of the device interface through which the collector is contacted.                                                    |
| Collector | Enter the IP address or the network name of the server to which NetFlow packets will be sent. You also can Select a Networks/Hosts object.    |
| UDP Port  | Specify the UDP port on the specified Collector to which NetFlow packets will be sent. Values can range from 1 to 65535; the default is 2055. |

# Embedded Event Manager

The Embedded Event Manager (EEM) enables you to debug problems and provides general purpose logging for troubleshooting. There are two components: events to which the EEM responds or listens, and event manager applets that define actions as well as the events to which the EEM responds. You may configure multiple event manager applets to respond to different events and perform different actions.

---

**Note** Embedded Event Manager is supported on ASA 9.2(1)+ only.

---

## Supported Events

The EEM supports the following events:

- Syslog—The ASA uses syslog message IDs to identify syslog messages that trigger an event manager applet. You may configure multiple syslog events, but the syslog message IDs may not overlap within a single event manager applet.
- Timers—You may use timers to trigger events. You may configure each timer only once for each event manager applet. Each event manager applet may have up to three timers. The three types of timers are the following:
  - Watchdog (periodic) timers trigger an event manager applet after the specified time period following the completion of the applet's actions and restart automatically.
  - Countdown (one-shot) timers trigger an event manager applet once after the specified time period and do not restart unless they are removed, then re-added.
  - Absolute (once-a-day) timers cause an event to occur once a day at a specified time, and restart automatically. The time-of-day format is in hh:mm:ss.

You may configure only one timer event of each type for each event manager applet.

- None—The none event is triggered when you run an event manager applet manually.
- Crash—The crash event is triggered when the ASA crashes. Regardless of the value of the output command, the action commands are directed to the crashinfo file. The output is generated before the show tech command.

---

**Note** Be careful when using a range of Syslog IDs and when using timers. Incorrect configuration can cause an ASA loop and prevent the applet from executing normally.

---

### Configuring Actions

When an event manager applet is triggered, the actions on the event manager applet are performed. Each action has a number that is used to specify the sequence of the actions. The sequence number must be unique within an event manager applet. You may configure multiple actions for an event manager applet. The commands are typical CLI commands, such as **show blocks**.

### Configuring Output Destinations

You may send the output of the action CLI commands to one of three locations:

- None, which is the default and discards the output
- Console, which sends the output to the ASA console
- File, which sends the output to a file. The following four file options are available:
  - new—creates a new, uniquely named file each time that an event manager applet is invoked.
  - overwrite—overwrites a specified file each time that an event manager applet is invoked.
  - append—appends to a specified file each time that an event manager applet is invoked. If the file does not yet exist, it is created.
  - rotate—creates a set of uniquely named files that are rotated each time that an event manager applet is invoked.

### Guidelines and Limitations

- Supported in single mode only. Not supported in multiple context mode.
- Supported in routed and transparent firewall modes.
- EEM will be enabled irrespective of whether logging functionality is enabled on the device or not.
- The EEM functionality on the ASA only contains a subset of the EEM functionality found on Cisco routers.
- During a crash, the state of the ASA is generally unknown. Some commands may not be safe to run during this condition.
- The name of an event manager applet may not contain spaces.
- You cannot modify the None event and Crashinfo event parameters.
- Performance may be affected because syslog messages are sent to the EEM for processing.
- The default output is none for each event manager applet. To change this setting, you must enter a different output value.
- You may have only one output option defined for each event manager applet.
