## **Overview**

This chapter contains the following sections:

- Information About Cisco Nexus 1000V, page 1
- Information About System Port Profiles and System VLANs, page 4
- Installation Overview, page 5
- Recommended Topologies, page 6

## **Information About Cisco Nexus 1000V**

The Cisco Nexus 1000V is a distributed virtual switch solution that is fully integrated within the VMware virtual infrastructure, including VMware vCenter, for the virtualization administrator. This solution offloads the configuration of the virtual switch and port groups to the network administrator to enforce a consistent data center network policy.

The Cisco Nexus 1000V is compatible with any upstream physical access layer switch that is compliant with the Ethernet standard, including the Catalyst 6500 series switch, Cisco Nexus switches, and switches from other network vendors. The Cisco Nexus 1000V is compatible with any server hardware that is listed in the VMware Hardware Compatibility List (HCL).

Note

We recommend that you monitor and install the patch files for the VMware ESXi host software.

## **Information About the Cisco Nexus 1000V Virtual Supervisor Module**

The VSM uses an external network fabric to communicate with the VEMs. The VSM runs the control plane protocols and configures the state of each VEM, but it never forwards packets. The physical NICs on the VEM server are the uplinks to the external fabric. VEMs switch traffic between the local virtual Ethernet ports that are connected to the VM vNICs but do not switch traffic to other VEMs. Instead, a source VEM switches packets to the uplinks that the external fabric delivers to the target VEM.

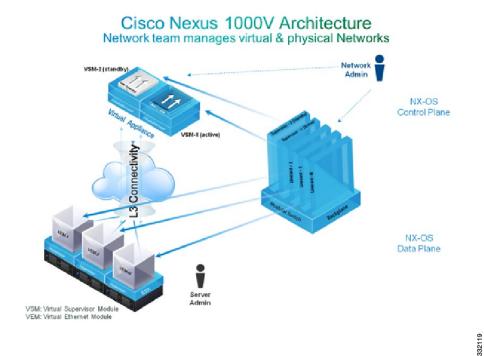

A single Cisco Nexus 1000V instance, including dual-redundant VSMs and managed VEMs, forms a switch domain. Each Cisco Nexus 1000V domain within a VMware vCenter Server must be distinguished by a unique integer called the domain identifier.

A single VSM can control up to 250 VEMs.

See the Cisco Nexus 1000V Resource Availability Reference for information about scale limits.

The Cisco Nexus 1000V architecture is shown in the following figure.

Figure 1: Cisco Nexus 1000V Architecture

### **Information About the Virtual Ethernet Module**

Each hypervisor is embedded with one VEM that replaces the virtual switch by performing the following functions:

- · Advanced networking and security
- Switching between directly attached VMs
- Uplinking to the rest of the network

Only one version of the VEM can be installed on an ESX/ESXi host at any time.

Cisco Nexus 1000V VEM does not support ESXi custom TCP/IP stack and control traffic through the custom TCP/IP stack.

In the Cisco Nexus 1000V, the traffic is switched between VMs locally at each VEM instance. Each VEM also interconnects the local VM with the rest of the network through the upstream access-layer network switch (blade, top-of-rack, end-of-row, and so forth). The VSM runs the control plane protocols and configures the state of each VEM accordingly, but it never forwards packets.

In the Cisco Nexus 1000V, the module slots are for the primary module 1 and secondary module 2. Either module can act as active or standby. The first server or host is automatically assigned to module 3. The network interface card (NIC) ports are 3/1 and 3/2 (vmnic0 and vmnic1 on the ESX/ESXi host). The ports to which the virtual NIC interfaces connect are virtual ports on the Cisco Nexus 1000V where they are assigned with a global number.

#### Information About VSM-to-VEM Communication

The VSM and the VEM can communicate over a Layer 2 network or a Layer 3 network. These configurations are referred to as Layer 2 or Layer 3 control modes.

#### **Layer 3 Control Mode**

Layer 3 control mode is the preferred method of communication between the VSM and the VEMs. In Layer 3 control mode, the VEMs can be in a different subnet than the VSM and from each other. Active and standby VSM control ports should be Layer 2 adjacent. These ports are used to communicate the HA protocol between the active and standby VSMs.

Each VEM needs a designated VMkernel NIC interface that is attached to the VEM that communicates with the VSM. This interface, which is called the Layer 3 Control vmknic, must have a system port profile applied to it (see System Port Profiles, on page 4 and System VLANs, on page 5), so the VEM can enable it before contacting the VSM.

For a sample topology diagram, see Topology for Layer 3 Control Mode, on page 6.

For more information about Layer 3 control mode, see the "Configuring the Domain" chapter in the *Cisco Nexus 1000V System Management Configuration Guide*.

### **Layer 2 Control Mode**

In Layer 2 control mode, the VSM and VEMs are in the same subnet. You can install the VSM and VEMs on different ESXi hosts or on the same ESXi host. This figure shows a VSM and VEM that are running on the same host in Layer 2 control mode.

For a sample topology diagram showing Layer 2 control mode, see Topology for Layer 2 Control Mode, on page 7.

Figure 2: VSM and VEM on the Same Host in Layer 2 Control Mode

## Information About System Port Profiles and System VLANs

## **System Port Profiles**

System port profiles can establish and protect ports and VLANs that need to be configured before the VEM contacts the VSM.

When a server administrator adds a host to a DVS, its VEM must be able to contact the VSM. Because the ports and VLANs used for this communication are not yet in place, the VSM sends a minimal configuration, including the system port profiles and system VLANs, to vCenter Server, which then propagates it to the VEM.

When configuring a system port profile, you assign VLANs and designate them as system VLANs. The port profile becomes a system port profile and is included in the Cisco Nexus 1000V opaque data. Interfaces that use the system port profile, which are members of one of the defined system VLANs, are automatically enabled and forward traffic when the VMware ESX starts even if the VEM does not have communication with the VSM. The critical host functions are enabled even if the VMware ESX host starts and cannot communicate with the VSM.

Caution

VMkernel connectivity can be lost if you do not configure the relevant VLANs as system VLANs.

### System VLANs

You must define a system VLAN in both the Ethernet and vEthernet port profiles to automatically enable a specific virtual interface to forward traffic outside the ESX host. If the system VLAN is configured only on the port profile for the virtual interface, the traffic is not forwarded outside the host. Conversely, if the system VLAN is configured only on the Ethernet port profile, the VMware VMkernel interface that needs that VLAN is not enabled by default and does not forward traffic.

The following ports must use system VLANs:

- Control and packet VLANs in the uplinks that communicate with the VSM.
- The Management VLAN in the uplinks and port profiles (that is, the Ethernet and vEthernet ports) and VMware kernel NICs used for VMware vCenter Server connectivity, Secure Shell (SSH), or Telnet connections.
- The VLAN that is used for remote storage access (iSCSI or NFS).

You must use system VLANs sparingly and only as described in this section. Only 32 system port profiles are supported.

After a system port profile has been applied to one or more ports, you can add more system VLANs, but you can only delete a system VLAN after you remove the port profile from service. This action prevents you from accidentally deleting a critical VLAN, such as a host management VLAN or a VSM storage VLAN.

Note

One VLAN can be a system VLAN on one port and a regular VLAN on another port in the same ESX host.

To delete a system VLAN, see the Cisco Nexus 1000V Port Profile Configuration Guide.

## **Installation Overview**

### **Information About Installing the Cisco Nexus 1000V Manually**

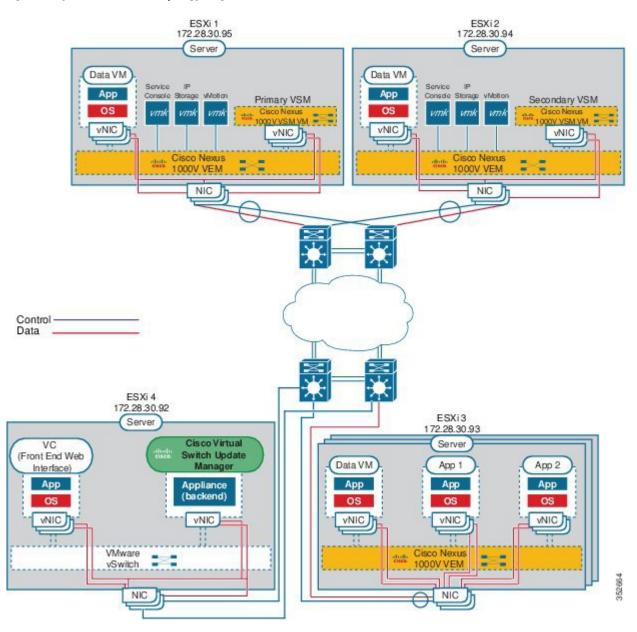

When you install the Cisco Nexus 1000V manually, you download and install all of the necessary software. This installation method gives you the option of deploying Layer 2 or Layer 3 connectivity between the VSM and VEMs. Layer 3 connectivity is the preferred method. For an example of the Layer 3 installation topology, see Topology for Layer 3 Control Mode, on page 6. If you want to use Layer 2 connectivity, see Topology for Layer 2 Control Mode, on page 7.

## **Recommended Topologies**

## **Topology for Layer 3 Control Mode**

Layer 3 control mode is the preferred method of communication between the VSM and VEMs. This figure shows an example of a Layer 3 control mode topology where redundant VSM VMs are installed. The software for the primary VSM is installed on ESXi 1, and the software for the secondary VSM is installed on ESXi 2.

Figure 3: Layer 3 Control Mode Topology Diagram

## **Topology for Layer 2 Control Mode**

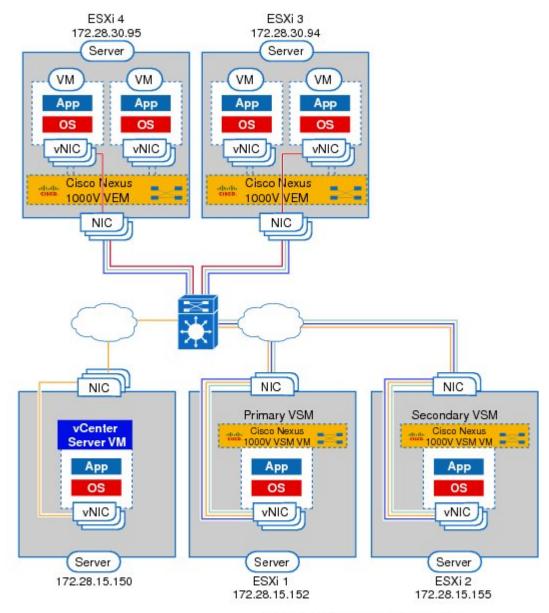

Note

Layer 3 control mode is the preferred method for communications between the VSM and the VEMs. For a topology diagram, see Topology for Layer 3 Control Mode, on page 6.

In Layer 2 control mode, the VSM and VEMs are in the same subnet. This figure shows an example of redundant VSM VMs, where the software for the primary VSM is installed on ESXi 1, and the software for the secondary VSM is installed on ESXi 2.

Figure 4: Layer 2 Control Mode Topology Diagram

Redundant Cisco Nexus 1000V VSMs Primary and secondary VSMs form an HA Pair

Management ——	VLAN 260, vmnic 0
Control -	VLAN 260, vmnic 0
Packet	VLAN 260, vmnic 0
Data	VLAN 20, vmnic 1

## **Control and Management VLAN Topology Options**

You can deploy the control and management interfaces on separate VLANs or on the same VLAN. This figure shows the control and management interfaces on separate VLANs.

**Control and Management VLAN Topology Options** 

## **Installing the Cisco Nexus 1000V Software**

This chapter contains the following sections:

- Installation Workflow, page 11
- Supported VMware vSphere ESXi Hypervisor Versions, page 14
- Prerequisites for Installing the Cisco Nexus 1000V, page 15
- Guidelines and Limitations for Installing the Cisco Nexus 1000V, page 18
- Information Required for Installation, page 20
- Verifying the Authenticity of the Cisco-Signed Image (Optional), page 21
- Installing the Cisco Nexus 1000V Software Using ISO or OVA Files, page 21

## **Installation Workflow**

## **Steps to Install Cisco Nexus 1000V Manually**

You can install Cisco Nexus 1000V manually. Use these high-level steps and the workflow diagram in the section to guide you through the installation process.

#### **SUMMARY STEPS**

- 1. Make sure that all of the VMware prerequisites have been met.
- 2. Make sure that all of the Cisco Nexus 1000V prerequisites have been met.
- **3.** Read and follow the guidelines and limitations for the Cisco Nexus 1000V.
- **4.** Make topology decisions and gather any necessary information.
- **5.** Download the Cisco Nexus 1000V software.
- **6.** (Optional) Verify the authenticity of the Cisco Nexus 1000V image.
- **7.** Install the Virtual Supervisor Module (VSM) software from an ISO image, OVA image, or on a Cisco Nexus Cloud Services Platform.
- **8.** If you installed the VSM software on a CSP, proceed to the next step. If you installed the VSM software on a VM using an ISO or OVA image, you need to establish the SVS connection and configure the VM startup and shutdown parameters.
- **9.** Add the VEM hosts to the Distributed Virtual Switch.
- **10.** If you want to install the VEM software on a stateless ESXi host, proceed to the next step. Otherwise, install the VEM software using VUM, the Cisco Nexus 1000VCLI, or the VMware ESXi CLI.
- 11. Install the VEM software on a stateless ESXi host.

#### **DETAILED STEPS**

- **Step 1** Make sure that all of the VMware prerequisites have been met. For details, see the following sections:
  - Supported VMware vSphere ESXi Hypervisor Versions, on page 14
  - ESXi Host Prerequisites, on page 15
- Step 2 Make sure that all of the Cisco Nexus 1000V prerequisites have been met. For details, see the following sections:.
  - VSM Prerequisites, on page 17
  - VEM Prerequisites, on page 17
  - Upstream Switch Prerequisites, on page 18
- Step 3 Read and follow the guidelines and limitations for the Cisco Nexus 1000V.

  For details, see Guidelines and Limitations for Installing the Cisco Nexus 1000V, on page 18.
- Step 4 Make topology decisions and gather any necessary information. For details, see Information Required for Installation, on page 20.
- **Step 5** Download the Cisco Nexus 1000V software.
- **Step 6** (Optional) Verify the authenticity of the Cisco Nexus 1000V image. For details, see Verifying the Authenticity of the Cisco-Signed Image (Optional), on page 21
- Step 7 Install the Virtual Supervisor Module (VSM) software from an ISO image, OVA image, or on a Cisco Nexus Cloud Services Platform.

For details, see one of the following sections:

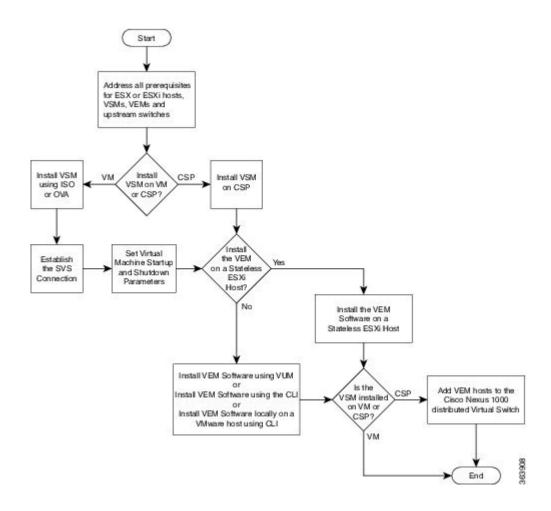

- Installing the Software from the ISO Image, on page 21
- Installing the Software from an OVA Image, on page 25
- Installing a VSM on the Cisco Nexus Cloud Services Platform, on page 49
- Step 8 If you installed the VSM software on a CSP, proceed to the next step. If you installed the VSM software on a VM using an ISO or OVA image, you need to establish the SVS connection and configure the VM startup and shutdown parameters. For details, see Establishing the SVS Connection, on page 32 and Setting Virtual Machine Startup and Shutdown Parameters, on page 33.
- Step 9 Add the VEM hosts to the Distributed Virtual Switch.

  For details, see Adding VEM Hosts to the Cisco Nexus 1000V Distributed Virtual Switch, on page 34.
- Step 10 If you want to install the VEM software on a stateless ESXi host, proceed to the next step. Otherwise, install the VEM software using VUM, the Cisco Nexus 1000VCLI, or the VMware ESXi CLI. For details, see one of the following sections:
  - Installing the VEM Software Using VUM, on page 38
  - Installing the VEM Software Using the CLI, on page 38
  - Installing the VEM Software Locally on a VMware Host Using the CLI, on page 38
- Step 11 Install the VEM software on a stateless ESXi host.

  For more details, see Installing the VEM Software on a Stateless ESXi Host, on page 39.

### **Process Flowchart for Installing the Cisco Nexus 1000V Manually**

Use the procedures in this chapter and the following workflow as a guide to install the Cisco Nexus 1000V for VMware manually.

## Supported VMware vSphere ESXi Hypervisor Versions

Cisco Nexus 1000V supports the following VMware vSphere ESXi Hypervisor versions:

- 6.0
- 5.5
- 5.1
- 5.0

For information about installing or upgrading the VMware software, see Installing and Upgrading VMware, on page 109.

See the following table for detailed compatibility information.

Note

Do not install VMware vSphere 5.5 Patch 2702864 with Cisco Nexus 1000V. The VMware vSphere 5.5 Patch 2702864 is not supported on Cisco Nexus 1000V.

Table 1: VMware vSphere ESXi Hypervisor Software Compatibility Versions

## Prerequisites for Installing the Cisco Nexus 1000V

### **ESXi Host Prerequisites**

ESX or ESXi hosts have the following prerequisites:

- You have already installed and prepared vCenter Server for host management using the instructions from VMware.
- You should have VMware vSphere Client installed.
- You have already installed the VMware Enterprise Plus license on the hosts.
- All VEM hosts must be running ESXi 5.0 or later releases.

Includes patches and updates.

VIB files are available at http://www.vmware.com/patch/download.

<sup>3</sup> VMware bundled software updates require placing the host in maintenance mode.

<sup>&</sup>lt;sup>4</sup> Do not install the VMware vSphere 5.5 Patch 2702864. The VMware vSphere 5.5 Patch 2702864 is not supported on Cisco Nexus 1000V.

- You have two physical NICs on each host for redundancy. Deployment is also possible with one physical NIC
- If you are using a set of switches, make sure that the interswitch trunk links carry all relevant VLANs, including control and packet VLANs. The uplink should be a trunk port that carries all VLANs that are configured on the host.
- You must configure control and management VLANs on the host to be used for the VSM VM.
- Make sure that the VM to be used for the VSM meets the minimum requirements listed in the following table.
- All the vmnics should have the same configuration upstream.

- VSM hardware version 11 is not supported. See table below for supported versions.
- The VSM VM might fail to boot if RAM and CPU are not properly allocated. This document includes procedures for allocating RAM and setting the CPU speed.

The VSM VM might fail to boot if RAM and CPU are not properly allocated. This document includes procedures for allocating RAM and setting the CPU speed.

This table lists the minimum requirements for hosting a VSM.

Table 2: Minimum Requirements for a VM Hosting a VSM

VSM VM Component	Minimum Requirement
VSM Hardware Version	7
	Note VSM hardware versions 7, 8, 9, and 10 are supported. VSM hardware version 11 is not supported.
Platform	64 bit
Туре	Other 64-bit Linux (recommended)
Processor	2
RAM (configured and reserved)	4 GB <sup>5</sup>
NIC	3
SCSI Hard Disk	3 GB with LSI Logic Parallel adapter
CPU speed	2048 MHz <sup>6</sup>

<sup>&</sup>lt;sup>5</sup> If you are installing the VSM using an OVA file, the correct RAM setting is made automatically during the installation of this file. If you are using the CD ISO image, see Installing the Software from the ISO Image, on page 21 to reserve RAM and set the memory size.

If you are installing the VSM using an OVA file, the correct CPU speed setting is made automatically during the installation. If you are using the CD ISO image, see Installing the Software from the ISO Image, on page 21 to reserve CPU and set the CPU reservation.

### **VSM Prerequisites**

The Cisco Nexus 1000V VSM software has the following are prerequisites:

- You have the VSM IP address.
- You have installed the appropriate vCenter Server and VMware Update Manager (VUM) versions.
- If you are installing redundant VSMs, make sure that you first install and set up the software on the primary VSM before installing and setting up the software on the secondary VSM.
- If you are using the OVA file for installation, make sure that the CPU speed is 2048 MHz or greater. If the CPU speed is less than 2048 MHz, then use ISO image for installation.
- You have already identified the HA role for this VSM from the list in the following table.

#### Table 3: HA Roles

HA Role	Single Supervisor System	Dual Supervisor System
Standalone (test environment only)	X	
НА		X

Note

A standalone VSM is not supported in a production environment.

• You are familiar with the Cisco Nexus 1000V topology diagram that is shown in Topology for Layer 3 Control Mode, on page 6.

## **VEM Prerequisites**

The Cisco Nexus 1000V VEM software has the following prerequisites:

Note

If VMware vCenter Server is hosted on the same ESXi host as a Cisco Nexus 1000V VEM, a VUM-assisted upgrade on the host will fail. You should manually VMotion the vCenter Server VM to another host before you perform an upgrade.

- When you perform any VUM operation on hosts that are a part of a cluster, ensure that VMware fault tolerance (FT) and VMware distributed power management (DPM) features are disabled for the entire cluster. Otherwise, VUM cannot install the hosts in the cluster.
- If the hosts are in ESXi stateless mode, enable the PXE booted ESXi host settings under **Home** > **Update**Manager > Configuration > ESXi host/cluster.
- You have a copy of your VMware documentation available for installing software on a host.

- You have already obtained a copy of the VEM software file.
- You have already downloaded the correct VEM software based on the current ESXi host patch level. For more information, see the *Cisco Nexus 1000V and VMware Compatibility Information*.
- For a VUM-based installation, you must deploy VUM and make sure that the VSM is connected to vCenter Server.

### **Upstream Switch Prerequisites**

The upstream switch from the Cisco Nexus 1000V has the following prerequisites:

- If you are using a set of switches, make sure that the interswitch trunk links carry all relevant VLANs, including the control and packet VLANs. The uplink must be a trunk port that carries all the VLANs that are configured on the host.
- The following spanning tree prerequisites apply to the upstream switch from the Cisco Nexus 1000V on the ports that are connected to the VEM.
  - On upstream switches, the following configuration is mandatory:
  - On your Catalyst series switches with Cisco IOS software, enter the **spanning-tree portfast trunk** or **spanning-tree portfast edge trunk** command.
  - On your Cisco Nexus 5000 series switches with Cisco NX-OS software, enter the **spanning-tree port type edge trunk** command.
  - On upstream switches we highly recommend that you enable Global BPDU Filtering and Global BPDU Guard globally.
  - On upstream switches, where you cannot globally enable BPDU Filtering and BPDU Guard, we highly recommend that you enter the spanning-tree bpdu filter and spanning-tree bpdu guardcommands.

For more information about spanning tree and its supporting commands, see the documentation for your upstream switch.

• Enter the following commands on the upstream switch:

```
show running interface interface number interface GigabitEthernet interface number description description of interface switchport switchport trunk encapsulation dotlq switchport trunk native VLAN native VLAN switchport trunk allowed vlan list of VLANs switchport mode trunk end
```

## **Guidelines and Limitations for Installing the Cisco Nexus 1000V**

The Cisco Nexus 1000V software installation has the following configuration guidelines and limitations:

• Virtual machine hardware version 11 is not supported.

- Do not enable VMware fault tolerance (FT) for the VSM VM because it is not supported. Instead, Cisco NX-OS HA provides high availability for the VSM.
- The VSM VM supports VMware HA. However, we strongly recommend that you deploy redundant VSMs and configure Cisco NX-OS HA between them. Use the VMware recommendations for the VMware HA.
- Do not enable VM monitoring for the VSM VM because it is not supported, even if you enable the VMware HA on the underlying host. Cisco NX-OS redundancy is the preferred method.
- When you move a VSM from the VMware vSwitch to the Cisco Nexus 1000V DVS, the connectivity between the active and standby VSM might get temporarily lost. In that situation, both active and standby VSMs assume the active role.

The reboot of the VSM is based on the following conditions:

- 1 The number of modules attached to the VSM
  - If more modules are attached on one of the VSMs and there is no virtual channel (VC) connectivity on both VSMs, the VSM that has the smaller number of modules is rebooted.
  - If modules are attached to both VSMs and one of the VSMs has VC connectivity, the VSM without connectivity is rebooted.
- 2 VC connectivity

Note

This option is invoked when the previous condition is not met.

• If both VSMs have the same number of modules, the software makes a selection that is based on the VC connectivity status.

For example, this action is taken if both VSMs have two modules attached or both VSMs have no modules attached.

3 Last configuration change

Note

This condition is invoked when the previous two conditions are not met.

- If both VSMs have the same number of modules and no VC connectivity, the VSM with the latest configuration remains active and the other VSM is rebooted.
- 4 Last active VSM
  - If the previous three conditions are not met, the VSM that became active most recently is rebooted.
- If the VSM is moved from the VMware vSwitch to the Cisco Nexus 1000V DVS, we recommend that you configure port security on the VSM vEthernet interfaces to secure control/packet MAC addresses.
- To improve redundancy, install primary and secondary VSM VMs on separate hosts that are connected to different upstream switches.

- The Cisco Nexus 1000V VSM always uses the following three network interfaces in the same order as specified below:
- 1 Control Interface
- 2 Management Interface
- 3 Packet Interface
- There is no dependency on the VM hardware version, so the VM hardware version can be upgraded if required.
- We recommend that you deploy the VMware vCenter server and VSM in the same physical data center. If you choose to deploy the vCenter server and VSM in different physical data centers, be aware of the following guidelines and limitations:
  - The VSM HA pair must be located in the same site as their storage and the active vCenter Server.
  - Layer 3 control mode is preferred.
  - If you are using Link Aggregation Control Protocol (LACP) on the VEM, use LACP offload.
  - Quality of Service bandwidth guarantees for control traffic over the DCI link.
  - <sup>o</sup> Limit the number of physical data centers to two.
  - $^{\circ}$  A maximum latency of 10 ms is supported for VSM-VSM control traffic when deployed across datacenters.
  - A maximum latency of 100 ms is supported for VSM-VEM control traffic for both L2 and L3 mode of deployments.
  - Cisco Nexus 1000V Release 5.2(1)SV3(1.1) and later supports deployments where vCenter and VSM are in different data centers, provided the number of hosts does not exceed 35 and the link latency does not exceed 200 ms. In these types of deployments, we recommend that you do not edit port profiles when the VSM and the vCenter are disconnected.
- We recommend that you monitor and install all the relevant patch applications from VMware ESX host server.

## **Information Required for Installation**

Before installing the software, make topology decisions and gather any necessary information, as follows:

- Decide whether to deploy the VSM as a VM on a vSphere host or cluster or on a CSP.
- Decide whether to deploy in Layer 2 or Layer 3 control mode (Layer 3 control mode is recommended).
- For Layer 2 control mode, determine the control or packet VLANs that will be used.
- For Layer 3 control mode, decide whether the management and Layer 3 control ports will be unified or separate. If they will be separate, determine the IP address of the Layer 3 control port for each ESXi host.
- Determine the domain ID.
- Determine the management, subnet, and gateway IP addresses for the VSM.
- Determine the administrative password for the VSM.

## Verifying the Authenticity of the Cisco-Signed Image (Optional)

Before you install the Nexus1000v.5.2.1.SV3.2.5.zip image, you have the option to validate the authenticity of it. In the zip file, there is a signature.txt file that contains a SHA-512 signature and an executable script that can be used to verify the authenticity of the Nexus1000v.5.2.1.SV3.2.5.zip image.

Verifying the authenticity of an image is optional. You can still install the image without validating its authenticity.

#### **Before You Begin**

You need to be running a Linux machine with the following utilities installed:

- · openss1
- base64
- **Step 1** Copy the following files to a directory on the Linux machine:
  - Nexus1000v.5.2.1.SV3.2.5.zip signature.txt file
  - cisco n1k image validation v 1 1 script
- **Step 2** Ensure that the script is executable.
- **Step 3** Run the script.

Nexus1000v.5.2.1.SV3.2.5.zip

**Step 4** Check the output. If the validation is successful, the following message displays:

# Installing the Cisco Nexus 1000V Software Using ISO or OVA Files

### **Installing the VSM Software**

### Installing the Software from the ISO Image

#### **Before You Begin**

• Know the location and image name of the ISO image you require for the installation.

- You have already read the Prerequisites for Installing the Cisco Nexus 1000V, on page 15.
- You have already manually provisioned the VM to be used for the VSM. For more information, see the *VMware vSphere Virtual Machine Administration Guide*.
- The VSM VM requires the following and this procedure includes steps for updating these properties:
  - We recommend 4 Gigabit of RAM reserved and allocated.
  - We recommend 2048 MHz of CPU speed.
- **Step 1** Using your VMware documentation, attach the VSM ISO image to the virtual CD-ROM and copy the software to a virtual machine (VM).
- **Step 2** Make sure that the VSM VM is powered off.
- Step 3 In the vSphere client Virtual Machine Properties window Hardware tab, choose Memory.
- **Step 4** In the **Memory Size** field, choose 4 GB.
- **Step 5** In the **Resources** tab, choose **Memory.**

The Resource Allocation settings display in the right-hand pane.

- **Step 6** In the **Reservation** field, choose 4096 MB.
- **Step 7** In the **Resources** tab, choose CPU.

The Resource Allocation settings display in the right-hand pane.

- **Step 8** In the **Reservation** field, choose 2048 MHz.
  - **Note** For optimum performance, we recommend minimum 2048 MHz of CPU speed. You may change the value as per availability.
- Step 9 Click OK.

The VSM VM memory and CPU speed settings are saved in VMware vSphere Client.

- **Step 10** Right-click the VSM and choose **Open Console**.
- Step 11 Choose Install Nexus1000V and bring up the new image entry and press Enter.
- **Step 12** Enter and confirm the Administrator password.

Note All alphanumeric characters and symbols on a standard US keyboard are allowed except for these three: \$\?

**Step 13** Enter the domain ID.

Enter the domain id<1-1023>: 152

**Step 14** Enter the HA role.

If you do not specify a role, standalone is assigned by default.

This example shows the HA role as primary.

```
Enter HA role[standalone/primary/secondary]: primary
[################################## 100%
```

---- Basic System Configuration Dialog ----

This setup utility will guide you through the basic configuration of the system. Setup configures only enough connectivity for management of the system.

```
*Note: setup is mainly used for configuring the system initially, when no configuration is present. So setup always assumes system defaults and not the current system configuration values.

Press Enter at anytime to skip a dialog. Use ctrl-c at anytime to skip the remaining dialogs.

Would you like to enter the basic configuration dialog (yes/no):
```

- **Step 15** Do one of the following:
  - If you are setting up the primary/active VSM, go to Step 18.
  - If you are setting up the secondary/standby VSM, then continue with the next step.
- Step 16 If you have set up the VSM virtual machine (VM) to boot from the CD-ROM, and are installing the secondary VSM from the ISO image attached to your CD-ROM, remove the virtual CD-ROM now so that the VSM does not boot from the CD

This step is necessary if you have set up the VSM VM to boot from the CD-ROM before the hard drive.

- **Step 17** If you are setting up the secondary or standby VSM, do the following:
  - a) Enter the HA role at the following prompt:

```
Enter HA role[standalone/primary/secondary]:
```

b) Enter yes at the following prompt about rebooting the VSM:

```
Setting HA role to secondary will cause a system reboot. Are you sure (yes/no) ?:
```

c) Enter the domain ID at the following prompt:

```
Enter the domain id<1-1023>:
```

The secondary VSM VM is rebooted and brought up in standby mode. The password on the secondary VSM is synchronized with the password on the active/primary VSM. Any configuration made on the active/primary VSM is now automatically synchronized with the standby.

This example shows the system rebooting when the HA role is set to secondary.

**Step 18** Enter yes to enter the basic configuration dialog.

Would you like to enter the basic configuration dialog (yes/no): yes

**Step 19** Enter no to create another Login account.

Create another login account (yes/no) [n]: no

**Step 20** Enter no to configure a read-only SNMP community string.

Configure read-only SNMP community string (yes/no) [n]: no

**Step 21** Enter no to configure a read-write SNMP community string.

Configure read-write SNMP community string (yes/no) [n]: no

**Step 22** Enter a name for the switch.

Enter the switch name: n1000v

**Step 23** Enter yes to configure out-of-band management and then enter the mgmt0 IPv4 address and subnet mask.

```
Continue with Out-of-band (mgmt0) management configuration? [yes/no] [y]: yes
Mgmt0 IPv4 address: 172.28.15.152
Mgmt0 IPv4 netmask: 255.255.255.0
```

**Step 24** Enter yes to configure the default gateway.

```
Configure the default-gateway: (yes/no) [y]: yes IPv4 address of the default gateway: 172.23.233.1
```

**Step 25** Enter no to configure advanced IP options.

Configure Advanced IP options (yes/no)? [n]: no

**Step 26** Enter yes to enable the Telnet service.

Enable the telnet service? (yes/no) [y]: yes

**Step 27** Enter yes to enable the SSH service and then enter the key type and number of key bits.

```
Enable the ssh service? (yes/no) [y]: yes

Type of ssh key you would like to generate (dsa/rsa) : rsa

Number of key bits <768-2048> : 1024
```

For more information, see the document, Cisco Nexus 1000V Security Configuration Guide.

**Step 28** Enter yes to enable the HTTP server.

```
Enable the http-server? (yes/no) [y]: yes
```

**Step 29** Enter no to configure the NTP server.

```
Configure NTP server? (yes/no) [n]: no
```

Step 30 Enter yes to configure the SVS domain parameters and then enter the mode (L2 or L3), and the control and packet VLAN IDs

```
Configure svs domain parameters? (yes/no) [y]: yes Enter SVS Control mode (L2 / L3) [L3] : Press Return
```

**Step 31** Enter yes to configure the VEM feature level and then enter 0 or 1.

```
Vem feature level will be set to 5.2(1)SV3(2.5),

Do you want to reconfigure? (yes/no) [n] yes

Current vem feature level is set to 5.2(1)SV3(2.5)

You can change the feature level to:

vem feature level is set to the highest value possible
```

Note The feature level is the least VEM release that the VSM can support. For example, if the feature level is set to the 5.2(1)SV3(1.4) release, any VEMs with an earlier release are not attached to the VSM.

The system now summarizes the complete configuration and asks if you want to edit it.

```
The following configuration will be applied:
  Switchname n1000v
  interface Mgmt0
  ip address 172.28.15.152 255.255.255.0
  no shutdown
  no telnet server enable
   ssh key rsa 1024 force
   ssh server enable
   feature http-server
   svs-domain
   no control vlan
   no packet vlan
   svs mode L3 interface mgmt0
```

**Step 32** Do one of the following:

- If you do not want to edit the configuration enter no and continue with the next step.
- If you want to edit the configuration, enter yes and return to Step 19 to revisit each command.

```
Would you like to edit the configuration? (yes/no) [n]:no
```

**Step 33** Enter yes to use and save this configuration, answer yes.

**Caution** If you do not save the configuration now, none of your changes will be part of the configuration the next time that the switch is rebooted. Enter yes to save the new configuration and to ensure that the kickstart and system images are also automatically configured.

```
Use this configuration and save it? (yes/no) [y]: yes [####################### 100%
```

The new configuration is saved into nonvolatile storage.

You can use the setup routine to update the configuration done in Step 18 through Step 33 at any time by entering the setup command in EXEC mode. Once setup begins, press **Enter** to skip a command. Press **Ctrl-C** to skip the remaining commands.

If you are installing redundant VSMs, make sure that you configure the software on the primary VSM before installing the software on the secondary VSM.

**Step 34** Create the SVS connection manually or go to Establishing the SVS Connection, on page 32.

#### **Installing the Software from an OVA Image**

#### **Before You Begin**

Before beginning this procedure, you must know or do the following:

- Know the location and image name of the OVA image you require for the installation.
- You have already read the Prerequisites for Installing the Cisco Nexus 1000V, on page 15.
- You have a copy of the following Cisco Nexus 1000V software image files on your local drive, depending on the installation type you are using:
- For detailed information about using the Deploy OVF Template wizard, see the *vSphere Virtual Machine Administration Guide*.
- You have the following information available for creating a VM for the VSM and mapping the required port groups:
  - A name for the new VSM that is unique within the inventory folder and up to 80 characters.
  - The name of the host where the VSM will be installed in the inventory folder.
  - The name of the datastore in which the VM files will be stored.
  - The names of the network port groups used for the VM.
  - The Cisco Nexus 1000V VSM IP address.
- If you are using the OVA file for installation, make sure that you have the following information available for creating and saving an initial configuration file on the VSM:
  - · VSM domain ID

- · Admin password
- · Management IP address, subnet mask, and gateway
- The VSM VM requires the CPU speed to be 2048 MHz or greater. If the CPU speed is less than 2048 MHz, then do not proceed with this procedure. Instead perform Installing the Software from the ISO Image, on page 21.
- **Step 1** From the vSphere Client, choose **File > Deploy OVF Template**.
- **Step 2** In the **Source** screen, specify the location of the OVA file and click **Next.**

The OVF Template Details screen opens displaying product information, including the size of the file and the size of the VM disk.

- Step 3 Click Next.
- **Step 4** Read the Cisco Nexus 1000V License Agreement.
- Step 5 Click Accept and then click Next.
- Step 6 In the Name: field, add the VSM name, choose the folder location within the inventory where it will reside, and click Next.

The name for the VSM must be unique within the inventory folder and less than 80 characters.

**Step 7** From the **Configuration** drop-down list, choose **Nexus 1000V Installer**.

This choice configures the primary VSM using the GUI setup dialog.

- **Step 8** If you want to configure a secondary VSM, select **Nexus 1000V Secondary**.
- Step 9 Click Next.
- **Step 10** Choose the data center or cluster on which to install the VSM.
- Step 11 Click Next.
- **Step 12** Choose the datastore in which to store the file if one is available.

On this page, you choose from datastores already configured on the destination cluster or host. The virtual machine configuration file and virtual disk files are stored on the datastore. Choose a datastore large enough to accommodate the virtual machine and all of its virtual disk files.

- Step 13 Click Next.
- **Step 14** Choose one of the following disk formats for storing virtual machine virtual disks, and click **Next.**

Format	Description
Thick Provision Lazy Zeroed	Creates a virtual disk in a default thick format. In this format, the space required for the virtual disk is allocated when the disk is created. The data remaining on the physical device is not erased during creation. The data is zeroed out on demand at a later time on first write from the virtual machine. Virtual machines do not read stale data from the physical device.

Format	Description
Thick Provision Eager Zeroed	Creates a virtual disk that supports clustering features such as Fault Tolerance. In this format, the space required for the virtual disk is allocated when the disk is created. The data remaining on the physical device is zeroed out when the virtual disk is created. It might take longer to create virtual disks in this format than to create other types of disks.
Thin Provision	Creates a virtual disk in thin provision format. This format is useful for saving storage space. In this format, storage blocks are allocated and zeroed out when they are first accessed.
	Thin provisioning is the fastest method to create a virtual disk because it creates a disk with just the header information. It does not allocate or zero out storage blocks. If the thin disk needs more space later, it can grow to its maximum capacity and occupy the entire datastore space provisioned to it.

- **Step 15** In the **Network Mapping** screen, choose the networks (the control, management, and packet port groups) that are present in your inventory.
- Step 16 Click Next
- **Step 17** Do one of the following:
  - If you are installing software on a primary VSM, specify the following properties for your primary VSM:
    - · VSM domain ID
    - Admin password
    - Management IP address
    - Management IP subnet mask
    - · Management IP gateway
  - If you are installing software on a secondary VSM, specify only the following properties for your secondary VSM (all other properties are acquired on synchronization with the primary VSM), and then click Next:
    - VSM domain ID (use the same domain ID entered for the primary).
    - Admin password (use the same password entered for the primary).
- Step 18 Click Next.
- Step 19 In the Ready to Complete screen, if the configuration is correct, click Finish. A status bar displays as the VM installation progresses.
- Step 20 Click Close.

You have completed installing the Cisco Nexus 1000V software.

- **Step 21** Right-click the VSM and choose **Open Console**.
- **Step 22** Click the **green arrow** to power on the VSM.
- **Step 23** Enter the following commands at the VSM prompt.

```
switch# configure terminal
switch(config)# setup
```

**Step 24** Enter the HA role.

If you do not specify a role, standalone is assigned by default.

This example shows the HA role as primary.

- **Step 25** Do one of the following:
  - If you are setting up the primary/active VSM, go to Step 18.
  - If you are setting up the secondary/standby VSM, then continue with the next step.
- Step 26 If you have set up the VSM virtual machine (VM) to boot from the CD-ROM, and are installing the secondary VSM from the ISO image attached to your CD-ROM, remove the virtual CD-ROM now so that the VSM does not boot from the CD.

This step is necessary if you have set up the VSM VM to boot from the CD-ROM before the hard drive.

- **Step 27** If you are setting up the secondary or standby VSM, do the following:
  - a) Enter the HA role at the following prompt: Enter HA role[standalone/primary/secondary]:
  - b) Enter yes at the following prompt about rebooting the VSM:

```
Setting HA role to secondary will cause a system reboot. Are you sure (yes/no) ?:
```

c) Enter the domain ID at the following prompt:

```
Enter the domain id<1-1023>:
```

The secondary VSM VM is rebooted and brought up in standby mode. The password on the secondary VSM is synchronized with the password on the active/primary VSM. Any configuration made on the active/primary VSM is now automatically synchronized with the standby.

This example shows the system rebooting when the HA role is set to secondary.

```
Enter HA role[standalone/primary/secondary]: secondary
           Setting HA role to secondary will cause a system reboot. Are you sure (yes/no) ? : y
           Enter the domain id<1-1023>: 1020
           [########### 100%
           HA mode set to secondary. Rebooting now...
           You have completed this procedure for the secondary VSM.
Step 28
           Enter yes to enter the basic configuration dialog.
           Would you like to enter the basic configuration dialog (yes/no): yes
Step 29
           Enter no to create another Login account.
           Create another login account (yes/no) [n]: no
Step 30
           Enter no to configure a read-only SNMP community string.
           Configure read-only SNMP community string (yes/no) [n]: no
           Enter no to configure a read-write SNMP community string.
Step 31
           Configure read-write SNMP community string (yes/no) [n]: no
Step 32
           Enter a name for the switch.
           Enter the switch name: n1000v
Step 33
           Enter yes to configure out-of-band management and then enter the mgmt0 IPv4 address and subnet mask.
           Continue with Out-of-band (mgmt0) management configuration? [yes/no] [y]: yes
           Mgmt0 IPv4 address: 172.28.15.152
           Mgmt0 IPv4 netmask: 255.255.255.0
Step 34
           Enter yes to configure the default gateway.
           Configure the default-gateway: (yes/no) [y]: yes
               IPv4 address of the default gateway : 172.23.233.1
Step 35
           Enter no to configure advanced IP options.
           Configure Advanced IP options (yes/no)? [n]: no
Step 36
           Enter yes to enable the Telnet service.
           Enable the telnet service? (yes/no) [y]: yes
Step 37
           Enter yes to enable the SSH service and then enter the key type and number of key bits.
           Enable the ssh service? (yes/no) [y]: yes
           Type of ssh key you would like to generate (dsa/rsa) : rsa
           Number of key bits <768-2048> : 1024
           For more information, see the document, Cisco Nexus 1000V Security Configuration Guide.
Step 38
           Enter yes to enable the HTTP server.
           Enable the http-server? (yes/no) [y]: yes
Step 39
           Enter no to configure the NTP server.
           Configure NTP server? (yes/no) [n]: no
Step 40
           Enter yes to configure the SVS domain parameters and then enter the mode (L2 or L3), and the control and packet VLAN
           IDs.
           Configure svs domain parameters? (yes/no) [y]: yes
           Enter SVS Control mode (L2 / L3) : L2
           Enter control vlan <1-3967, 4048-4093> : 100
           Enter packet vlan <1-3967, 4048-4093> : 101
```

#### **Step 41** Enter yes to configure the VEM feature level and then enter 0 or 1.

```
Vem feature level will be set to 5.2(1)SV3(2.5),

Do you want to reconfigure? (yes/no) [n] yes

Current vem feature level is set to 5.2(1)SV3(2.5)

You can change the feature level to:

vem feature level is set to the highest value possible
```

The system now summarizes the complete configuration and asks if you want to edit it.

```
The following configuration will be applied:
Switchname n1000v
interface Mgmt0
ip address 172.28.15.152 255.255.255.0
no shut.down
no telnet server enable
  ssh key rsa 1024 force
  ssh server enable
  feature http-server
  svs-domain
    sys mode L2
    control vlan 100
    packet vlan 101
    domain id 101
vlan 100
vlan 101
```

#### **Step 42** Do one of the following:

- If you do not want to edit the configuration enter no and continue with the next step.
- If you want to edit the configuration, enter yes and return to Step 19 to revisit each command.

```
Would you like to edit the configuration? (yes/no) [n]:no
```

**Step 43** Enter yes to use and save this configuration.

**Caution** If you do not save the configuration now, none of your changes will be part of the configuration the next time that the switch is rebooted. Enter yes to save the new configuration and to ensure that the kickstart and system images are also automatically configured.

```
Use this configuration and save it? (yes/no) [y]: yes [###################### 100%
```

The new configuration is saved into nonvolatile storage.

**Note** You can use the setup routine to update the configuration done in Step 18 through Step 33 at any time by entering the **setup** command in EXEC mode. Once setup begins, press **Enter** to skip a command. Press **Ctrl-C** to skip the remaining commands.

**Note** If you are installing redundant VSMs, make sure that you configure the software on the primary VSM before installing the software on the secondary VSM.

- **Step 44** Register the vCenter extension file in VMware vCenter. See Registering a vCenter Extension File in VMware vCenter, on page 31 for more information.
- **Step 45** Create the SVS connection manually or go to Establishing the SVS Connection, on page 32.

# Registering a vCenter Extension File in VMware vCenter

In VMware vCenter, the vCenter extension files are called plug-ins.

## **Before You Begin**

- You know the IP address of the active VSM.
- You have already downloaded a copy of the following file from the VSM home page.
  - ocisco nexus1000v extension.xml

Note

To go to your VSM home page, point your browser to the IP address of the active VSM.

#### **SUMMARY STEPS**

- 1. Start the vSphere Client.
- 2. From the Plug-Ins menu, choose Manage Plug-Ins. The Plug-In Manager dialog box opens.
- **3.** Right-click the white space within the dialog box, and choose **New Plug-In** from the popup menu. The Register Plug-In dialog box opens.
- **4.** Click **Browse** and choose the cisco\_nexus1000v\_extension.xml file that you downloaded from the VSM home page.
- 5. Click Register Plug-In.
- **6.** In the Security Warning dialog box, click **Ignore** to continue using the certificate.
- 7. In the Register Plug-in dialog box, click **OK**. After the plug-in is registered on vCenter, a dialog box appears stating that it has successfully registered.

- **Step 1** Start the vSphere Client.
- **Step 2** From the Plug-Ins menu, choose **Manage Plug-Ins**. The Plug-In Manager dialog box opens.
- Step 3 Right-click the white space within the dialog box, and choose New Plug-In from the popup menu. The Register Plug-In dialog box opens.
- **Step 4** Click **Browse** and choose the cisco\_nexus1000v\_extension.xml file that you downloaded from the VSM home page.
- Step 5 Click Register Plug-In.
- **Step 6** In the Security Warning dialog box, click **Ignore** to continue using the certificate.
- **Step 7** In the Register Plug-in dialog box, click **OK**. After the plug-in is registered on vCenter, a dialog box appears stating that it has successfully registered.

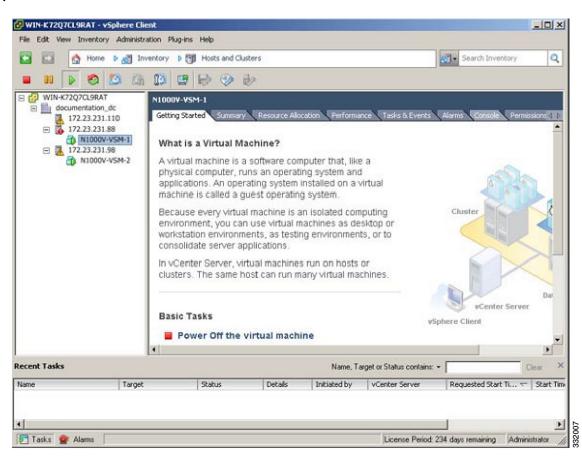

# **Establishing the SVS Connection**

### **SUMMARY STEPS**

- 1. Open the vSphere Client.
- 2. Choose the primary VSM.
- **3.** Choose the **Console** tab.
- **4.** Enter the **show svs connections** command to confirm that there is not an SVS connection.
- **5.** Open a command window.
- **6.** In the **VSM Console**, enter the following command:
- 7. In the vSphere Console window, enter the show svs connections command.

- **Step 1** Open the vSphere Client.
- **Step 2** Choose the primary VSM.

Figure 5: vSphere Client Window

- **Step 3** Choose the **Console** tab.
- **Step 4** Enter the **show svs connections** command to confirm that there is not an SVS connection.
- **Step 5** Open a command window.
- **Step 6** In the **VSM Console**, enter the following command:

```
svs connection <name of the connection>
  protocol vmware-vim
  remote ip address
<vc ip address> port 80
   transport type <ipv4/ipv6>
  vmware dvs datacenter-name <name>
  max-ports 50000
  vmware dvs-version <4.0.0/5.0.0/5.5.0/6.0.0>
  connect.
```

Step 7 In the vSphere Console window, enter the show svs connections command.

The operational status is Connected.

You have completed establishing the SVS connection.

# **Setting Virtual Machine Startup and Shutdown Parameters**

## **Before You Begin**

- You have the following information:
  - · Number of seconds for the default startup delay
  - ° Number of seconds for the default shutdown delay

#### **SUMMARY STEPS**

- 1. In the vSphere Client window, choose a host and click the Configuration tab.
- 2. In the Configuration pane, choose Virtual Machine Startup/Shutdown.
- 3. In the Virtual Machine Startup and Shutdown pane, click the Properties link.
- **4.** In the **System Settings** dialog box, do the following:

- **Step 1** In the **vSphere Client** window, choose a host and click the **Configuration** tab.
- Step 2 In the Configuration pane, choose Virtual Machine Startup/Shutdown.
- Step 3 In the Virtual Machine Startup and Shutdown pane, click the Properties link.
- **Step 4** In the **System Settings** dialog box, do the following:
  - a) Check the Allow virtual machines to start and stop automatically with the system check box.
  - b) In the System Settings pane, do the following:

- Enter the number of seconds in the **Default Startup Delay seconds** field.
- Enter the number of seconds in the **Default Shutdown Delay seconds** field.
- c) In the **Startup Order** pane, do the following:
  - · Choose the VM.
  - Click the Move Up button until the VM is under Automatic Startup.
- d) Click OK.
- e) Repeat Step 2 through Step 4 for the other VM.

Startup and shutdown settings are complete.

# Adding VEM Hosts to the Cisco Nexus 1000V Distributed Virtual Switch

## **Before You Begin**

- You have the following information:
  - · Physical adapters
  - · Uplink port groups

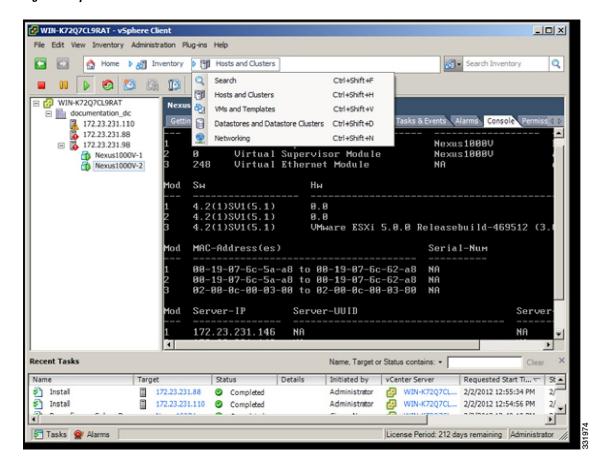

# **SUMMARY STEPS**

- 1. In the vSphere Client window, choose Hosts and Clusters > Networking.
- 2. In the vSphere Client Hosts window, choose the DVS and click the Hosts tab.
- 3. In the Add Hosts to DVS window, right-click the DVS and from the drop-down list, choose Add Host.
- In the Select Hosts and Physical Adapters screen, choose the hosts and the uplink port groups, and click Next.
- **5.** In the **Network Connectivity** screen, do the following tasks:
- 6. In the Virtual Machine Networking screen, click Next.
- 7. In the Ready to Complete screen, click Finish.
- **8.** In the **vSphere Client Hosts** window, confirm that the hosts are in the Connected state.

#### **DETAILED STEPS**

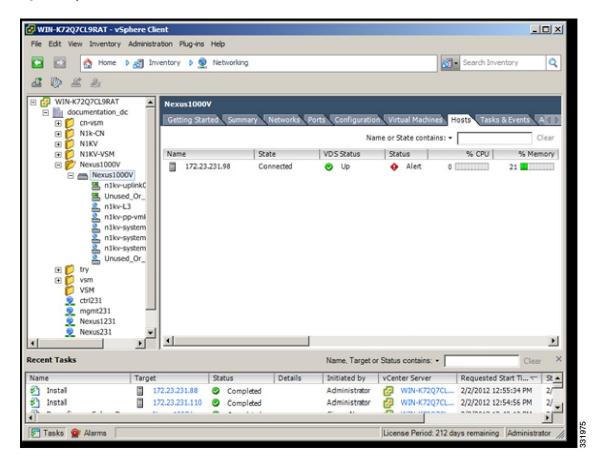

Step 1 In the vSphere Client window, choose Hosts and Clusters > Networking.

Figure 6: vSphere Client WIndow

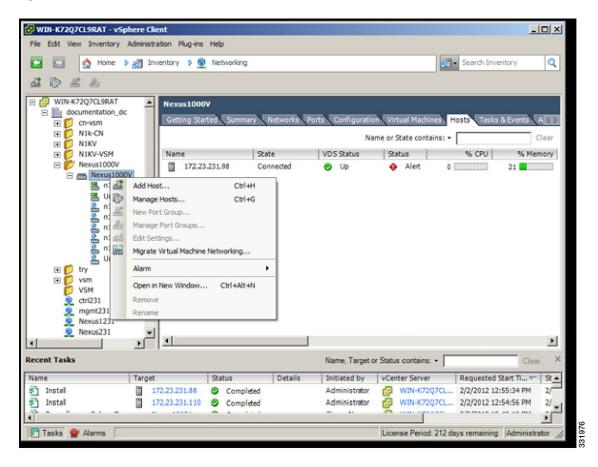

**Step 2** In the **vSphere Client Hosts** window, choose the DVS and click the **Hosts** tab.

Figure 7: vSphere Client Hosts Window

Step 3 In the Add Hosts to DVS window, right-click the DVS and from the drop-down list, choose Add Host.

Figure 8: Add Hosts to DVS

- Step 4 In the Select Hosts and Physical Adapters screen, choose the hosts and the uplink port groups, and click Next.
- **Step 5** In the **Network Connectivity** screen, do the following tasks:

**Note** For Layer 3 communication, you must migrate or create a new Layer 3 vmkernel interface. Migrate your management vmkernel interface into the Layer 3 capable port-profile. Do not use multiple vmkernel interfaces on the same subnet.

- a) Highlight the vmkernel interface that you want to migrate, and choose the destination port group that you created for management traffic earlier.
- b) Click Next.
- Step 6 In the Virtual Machine Networking screen, click Next.
- **Step 7** In the **Ready to Complete** screen, click **Finish**.
- **Step 8** In the **vSphere Client Hosts** window, confirm that the hosts are in the Connected state.

The host connection process is complete.

# **Installing the VEM Software Using VUM**

# **Before You Begin**

VMware Update Manager (VUM) automatically selects the correct VEM software to be installed on the host when the host is added to the DVS.

Make sure that you read the VEM Prerequisites, on page 17 to ensure that the VUM operation proceeds without failure.

# **Installing the VEM Software Using the CLI**

Based on the version of VMware ESX/ESXi software that is running on the server, there are different installation paths.

# Installing the VEM Software Locally on a VMware Host Using the CLI

Note

This procedure applies for VMware 5.0 host and later ESXi versions.

- **Step 1** Copy the VEM software to the /tmp directory.
- Step 2 ~ # esxcli software vib install -v /tmp/VIB\_FILE

Begin the VEM installation procedure.

- Step 3 Verify that the installation was successful by checking for the "VEM Agent (vemdpa) is running" statement in the output of the vem status -v command.
- Step 4 Verify that the VIB has installed by entering the following command: esxcli software vib list | grep cisco
- Step 5 Verify VEM and VSM version by entering the following command: vem show version
- Step 6 Verify the VSM to check that the module is online by entering the following command: vem vesion -v
- **Step 7** Do one of the following:
  - If the installation was successful, the installation procedure is complete.
  - If the installation was not successful, see the "Recreating the Cisco Nexus 1000V Installation" section in the *Cisco Nexus 1000V Troubleshooting Guide*.

```
The following example shows how to install VEM software locally on a VMware 5.5 host using the CLI.
~ # esxcli software vib install -v /Cisco_bootbank_cisco-vem-v320-5.2.1.3.2.5.0-3.2.1.vib
Installation Result
   Message: Operation finished successfully.
   Reboot Required: false
   VIBs Installed: Cisco bootbank cisco-vem-v320-5.2.1.3.2.5.0-3.2.1
   VIBs Removed: Cisco_bootbank_cisco-vem-v198-esx_5.2.1.3.1.6.0-3.2.1
   VIBs Skipped:

# Installing the VEM Software on a Stateless ESXi Host

The following list outlines the VEM installation process on a stateless ESXi host.

### **SUMMARY STEPS**

- 1. See the procedure for Adding the Cisco Nexus 1000V to an ESXi Image Profile, on page 40.
- **2.** Installing the VEM software using one of the two following procedures:
- **3.** See the procedure for Configuring Layer 2 Connectivity, on page 47.

- **Step 1** See the procedure for Adding the Cisco Nexus 1000V to an ESXi Image Profile, on page 40.
- **Step 2** Installing the VEM software using one of the two following procedures:
  - Installing the VEM Software on a Stateless ESXi Host Using esxcli, on page 44
  - Installing the VEM Software on a Stateless ESXi Host Using VUM, on page 46

## **Step 3** See the procedure for Configuring Layer 2 Connectivity, on page 47.

# Stateless ESXi Host

Note

For stateless ESXi, the VLAN that you use for the Preboot Execution Environment (gPXE) and Management must be a native VLAN in the Cisco Nexus 1000V management uplink. It must also be a system VLAN on the management VMkernel NIC and on the uplink.

VMware vSphere 5.0.0 introduces the VMware Auto Deploy, which provides the infrastructure for loading the ESXi image directly into the host's memory. The software image of a stateless ESXi is loaded from the Auto Deploy Server after every boot. In this context, the image with which the host boots is identified as the image profile.

An image profile is a collection of vSphere Installation Bundles (VIBs) required for the host to operate. The image profile includes base VIBs from VMware and additional VIBs from partners.

On a stateless host, you can install or upgrade the VEM software using either the VUM or CLI.

In addition, you should bundle the new or modified VEM in the image profile from which the stateless host boots. If it is not bundled in the image profile, the VEM does not persist across reboots of the stateless host.

For more information about the VMware Auto Deploy Infrastructure and stateless boot process, see the "Installing ESXi using VMware Auto Deploy" chapter of the *vSphere Installation and Setup, vSphere 5.0.0* document.

# Adding the Cisco Nexus 1000V to an ESXi Image Profile

## **Before You Begin**

- Install and set up the VMware Auto Deploy Server. See the vSphere Installation and Setup document.
- Install the VMware PowerCLI on a Windows platform. This step is required for bundling the VEM into the image profile. For more information, see the *vSphere PowerCLI Installation Guide*.
- On the same Windows platform where VMware PowerCLI is installed, do the following:
  - Download the image profile offline bundle, which is a ZIP file, to a local file path.
  - Download the VEM offline bundle, which is a ZIP file, to a local file path.
- **Step 1** Start the vSphere PowerCLI application.
- Step 2 Connect to vCenter Server by entering the following command:

  Connect-VIServer IP address –User Administrator –Password XXXXX.
- Step 3 Load the image profile offline bundle by entering the following command: Add-ESXSoftwareDepot image profile bundle

**Note** Each image profile bundle can include multiple image profiles.

**Step 4** List the image profiles by entering the following command:

[vSphere PowerCLI] > Get-EsxImageProfile

**Step 5** Choose the image profile into which the VEM is to be bundled by entering the following command:

New-EsxImageProfile -CloneProfile image profile name -Name n1kv-Image

**Note** The image profiles are in read-only format. You must clone the image profile before adding the VEM into it. The n1kv-Image is the cloned image profile of the ESXi-5.0.0-standard.

**Step 6** change to Load the Cisco Nexus 1000V offline bundle by entering the following command:

Add-EsxSoftwareDepot VEM bundle

**Note** The offline bundle is a zip file that includes the n1kv-vib file.

**Step 7** Confirm that the n1kv-vib package is loaded by entering the following command:

**Get-EsxSoftwarePackage -Name** cisco\*

Step 8 Bundle the n1kv-package into the cloned image profile by entering the following command:

Add-EsxSoftwarePackage -ImageProfile n1kv-Image -SoftwarePackage n1kv package name

**Step 9** List all the VIBs into the cloned image profile by entering the following command:

- a) \$img = Get-EsxImageProfile n1kv-Image
- b) \$img.vibList
- **Step 10** Export the image profile to a depot file for future use by entering the following command:

Export-EsxImageProfile -ImageProfile n1kv-Image -FilePath C:\n1kv-Image.zip -ExportToBundle

**Step 11** Set up the rule for the host to bott with the image profile by entering the following commands

**Note** Any of the host parameters, such as the MAC address, IPV4 IP address, or domain name, can be used to associate an image profile with the host.

- a) New-deployrule -item \$img -name rule-test -Pattern "mac=00:50:56:b6:03:c1"
- b) Add-DeployRule -DeployRule rule-test
- **Step 12** Display the configured rule to make sure that the correct image profile is associated with the host by entering the following command:

Get-DeployRuleSet

**Step 13** Reboot the host.

The host contacts the Auto-Deploy Server and presents the host boot parameters. The Auto Deploy server checks the rules to find the image profile associated with this host and loads the image to the host's memory. The host boots from the image.

This example shows how to add the Cisco Nexus 1000V to an ESXi image profile:

Note

The examples in the procedure may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

```
vSphere PowerCLI> Set-ExecutionPolicy unrestricted
Execution Policy Change
The execution policy helps protect you from scripts that you do not trust.
Changing the execution policy might expose you to the security risks described
in the about Execution Policies help topic. Do you want to change the execution
 policy?
                  [N] No [S] Suspend [?] Help (default is "Y"): Y
[Y] Yes
vSphere PowerCLI> Connect-VIServer 10.105.231.40 -User administrator -Password 'xxxxxxxx'
Working with multiple default servers?
        Select [Y] if you want to work with more than one default servers. In this
case, every time when you connect to a different server using Connect-VIServer,
  the new server connection is stored in an array variable together with the
previously connected servers. When you run a cmdlet and the target servers
cannot be determined from the specified parameters, the cmdlet runs against all
  servers stored in the array variable.
        Select [N] if you want to work with a single default server. In this case,
when you run a cmdlet and the target servers cannot be determined from the
specified parameters, the cmdlet runs against the last connected server.
        WARNING: WORKING WITH MULTIPLE DEFAULT SERVERS WILL BE ENABLED BY DEFAULT
IN A FUTURE RELEASE. You can explicitly set your own preference at any time by
using the DefaultServerMode parameter of Set-PowerCLIConfiguration.

# Installing the VEM Software on a Stateless ESXi Host Using esxcli

## **Before You Begin**

• When you enter the **esxcli software vib install** command on an ESXi 5.0.0 host, note that the following message appears:

Message: WARNING: Only live system was updated, the change is not persistent.

- **Step 1** Display the VMware version and build number by entering the following commands:
  - vmware -v
  - · vmware -l
- **Step 2** Log in to the ESXi stateless host.
- Step 3 Copy the offline bundle to the host by entering the the following command: esxcli software vib install -d file path/offline bundle

**Note** If the host is an ESXi 5.0.0 stateful host, the "Message: Operation finished successfully" line appears.

- Step 4 Verify that the VIB has installed by entering the following command: esxcli software vib list | grep cisco
- **Step 5** Change to Check that the VEM agent is running by entering the following command:

#### vem status -v

- Step 6 Display the VEM version, VSM version, and ESXi version by entering the following command: vemcmd show version
- Step 7 Display the ESXi version and details about passthrough NICs by entering the following command: vem version -v
- **Step 8** Add the host to the DVS by using the vCenter Server.
- Step 9 On the VSM, verify that the VEM software has been installed by entering the following command: show module

This example shows how to install VEM software on a stateless host using exacli.

Note

The examples in the procedure may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

# Installing the VEM Software on a Stateless ESXi Host Using VUM

# **Before You Begin**

• Make sure that the VUM patch repository has the VEM software downloaded.

### **SUMMARY STEPS**

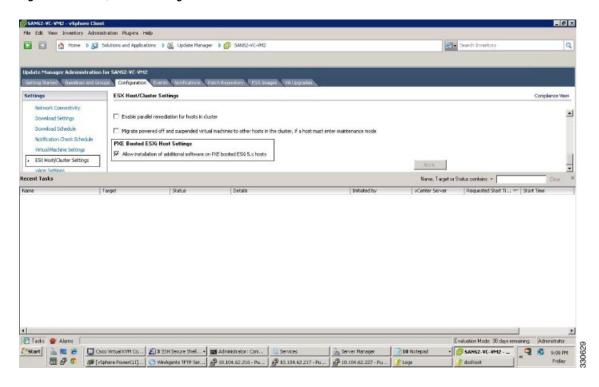

- 1. In vCenter Server, choose Home > Update Manager > Configuration > ESX host/Cluster settings.
- 2. Check the PXE Booted ESXi Host Settings check box.
- **3.** Add the host to the DVS by using vCenter Server.

### **DETAILED STEPS**

In vCenter Server, choose **Home > Update Manager > Configuration > ESX host/Cluster** settings. Step 1 The ESX Host/Cluster Settings window opens.

### Step 2 Check the PXE Booted ESXi Host Settings check box.

Figure 9: ESX Host/Cluster Settings Window

**Step 3** Add the host to the DVS by using vCenter Server.

# **Configuring Layer 2 Connectivity**

Note

Layer 3 connectivity is the preferred method.

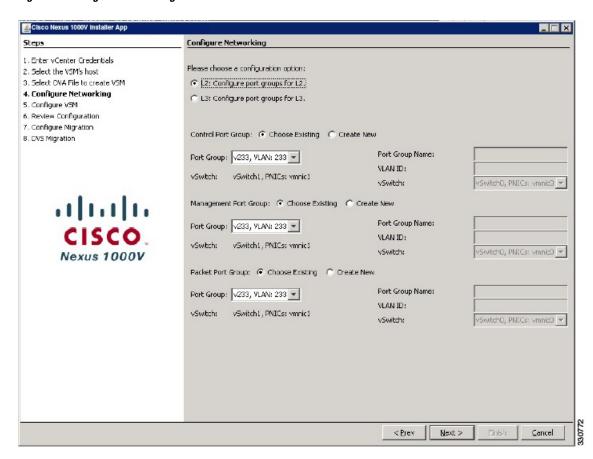

You can configure a different VMware vSwitch port group for each VSM network adapter.

#### **SUMMARY STEPS**

- 1. In the Configure Networking screen click L2: Configure port groups for L2.
- **2.** In the **Configure Networking** screen, do the following:
- **3.** If desired, return to your Standard or Custom installation to enter the remaining Layer 2 configuration information.

- Step 1 In the Configure Networking screen click L2: Configure port groups for L2.
- **Step 2** In the **Configure Networking** screen, do the following:
  - From the **Port Group** drop-down list, choose your port groups.
  - (Optional) In the VLAN ID field, enter the VLAN ID.
  - **Note** The VLAN ID is only needed if you choose to create a new port group.
  - Click **Next**. The Configure Networking screen opens.

Figure 10: Configure Networking Screen

**Step 3** If desired, return to your Standard or Custom installation to enter the remaining Layer 2 configuration information.

# Installing a VSM on the Cisco Nexus Cloud Services Platform

You can install the VSM on the Cisco Nexus Cloud Services Platform and move from Layer 2 to Layer 3 connectivity.

VEMs do not register to the VSM before a vmkernel interface (vmk) is migrated to a Layer 3 control-capable port profile. You must migrate a vmk to the Layer 3 port profile after migrating host vmnics to Ethernet port profiles.

The example may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

### **Before You Begin**

Copy the OVA file to the bootflash:repository/ of the Cisco Nexus Cloud Services Platform.

# **Step 1** Create a virtual service blade.

```
switch(config) # show virtual-service-blade summary
       HA-Role
                 HA-Status Status
______
switch(config) # virtual-service-blade vsm-1
switch(config-vsb-config)# virtual-service-blade-type new n1000v-dk9.5.2.1.SV3.2.5.1010.ova
switch(config-vsb-config)# show virtual-service-blade summary
Name
        HA-Role
                  HA-Status
                            Status
                                             Location
______
       PRIMARY
vsm-1
                 NONE
                           VSB NOT PRESENT
                                             PRIMARY
       SECONDARY NONE
                           VSB NOT PRESENT
                                             SECONDARY
switch(config-vsb-config)#
```

**Step 2** Configure the control, packet, and management interface VLANs for static and flexible topologies.

```
switch(config-vsb-config)# interface management vlan 100
switch(config-vsb-config)# interface control vlan 101
switch(config-vsb-config)# interface packet vlan 101
```

**Step 3** Configure the Cisco Nexus 1000V on the Cisco Nexus 1010.

```
switch(config-vsb-config)# enable
Enter vsb image: [n1000v-dk9.5.2.1.SV3.2.5.1010.ova]
Enter domain id[1-1023]: 127
Enter SVS Control mode (L2 / L3): [L3] L2
Management IP version [V4/V6]: [V4]
Enter Management IP address: 192.0.2.79
Enter Management subnet mask: 255.255.255.0
IPv4 address of the default gateway: 192.0.2.1
```

```
Enter HostName: n1000v
Enter the password for 'admin': *******
Note: VSB installation is in progress, please use show virtual-service-blade commands to check the installation status.
switch(config-vsb-config)#
```

# **Step 4** Display the primary and secondary VSM status.

switch(config-vsb-config)# show virtual-service-blade summary

Name	HA-Role	HA-Status	Status	Location
vsm-1	PRIMARY	NONE	VSB POWER ON IN PROGRESS	PRIMARY
vsm-1	SECONDARY	ACTIVE	VSB POWERED ON	SECONDARY

## **Step 5** Log in to the VSM.

```
switch(config)# virtual-service-blade vsm-1
switch(config-vsb-config)# login virtual-service-blade vsm-1
Telnet escape character is '^\'.
Trying 192.0.2.18...
Connected to 192.0.2.18.
Escape character is '^\'.
Nexus 1000v Switch

switch#
```

# **Step 6** Change svs mode from Layer 2 to Layer 3 in the Cisco Nexus 1000V.

**Note** The configuration in the highlighted code is optional.

```
switch(config)# svs-domain
```

switch(config-svs-domain)# no control vlan

Warning: Config saved but not pushed to vCenter Server due to inactive connection! switch(config-svs-domain) # no packet vlan

Warning: Config saved but not pushed to vCenter Server due to inactive connection!

switch(config-svs-domain) # svs mode L3 interface mgmt0
Warning: Config saved but not pushed to vCenter Server due to inactive connection!
switch(config-svs-domain) # show svs domain
switch(config-svs-domain) # show svs domain

SVS domain config

Domain id: 101 Control vlan: NA Packet vlan: NA L2/L3 Control mode: L3 L3 control interface: mgmt0 Status: Config push to VC successful. switch(config-svs-domain)#

# **Feature History for Installing the Cisco Nexus 1000V**

The following table lists the release history for installing the Cisco Nexus 1000V.

Feature Name	Releases	Feature Information
VEM Installation 5.1	4.2(1)SV2(2.1)	Installing VEM software remotely or locally on a VMware 5.1 host using the CLI is now supported.
Standard and Custom installation application	4.2(1)SV2(1.1)	Installation Application updated with a Standard and Custom version
Updated installation application	4.2(1)SV1(5.2)	Added screens to the Java application.
VSM and VEM Installation	4.2(1)SV1(5.1)	Java applications introduced for VSM and VEM installation.
Installing the Cisco Nexus 1000V	4.0(1)SV1(1)	Introduced in this release.

Feature History for Installing the Cisco Nexus 1000V

# **Upgrading the Cisco Nexus 1000V**

This chapter contains the following sections:

- Information About the Software Upgrade, page 53
- Prerequisites for the Upgrade, page 55
- Prerequisite to Upgrading a VSM to a 3-GB Hard Disk Drive, page 57
- Guidelines and Limitations for Upgrading the Cisco Nexus 1000V, page 61
- Upgrade Procedures, page 63
- Reserving the Memory and CPU on the Virtual Supervisor Module Virtual Machine, page 65
- Reserving the Memory and CPU for the Virtual Supervisor Module in VSB on the Cloud Services Platform, page 66
- VSM Upgrade Procedures, page 67
- VEM Upgrade Procedures, page 72
- Simplified Upgrade Process, page 92
- Migrating from Layer 2 to Layer 3, page 94

# Information About the Software Upgrade

# **Mixed Mode Upgrade Support**

Starting with Cisco Nexus 1000V, Release 5.2(1)SV3(1.15), Cisco Nexus 1000V deployment supports configuration where the VSM version can be same or higher than the VEM version. With the mixed mode upgrade functionality, you can now upgrade the VSM without upgrading the VEM and reduce the overall overheads involved in Cisco Nexus 1000V upgrade. For example, you can upgrade only the VSM to release 5.2(1)SV3(1.15) from a previous release and skip the VEM upgrade. The following table lists the releases that support mixed mode upgrade.

**Table 4: Mixed Mode Support Matrix** 

Software	Release Number
VMware ESX	5.0, 5.1, 5.5, and 6.0
Cisco Nexus 1000V	5.2(1)SV3(1.4) and later

# **Upgrade Software Sources**

An interactive upgrade tool has been provided to assist you in determining the correct upgrade steps based on your current environment and the one to which you want to upgrade.

You can obtain your upgrade-related software from the following sources listed in this table:

Table 5: Obtaining the Upgrade Software

Source	Description
Cisco	Download the current release of the Cisco Nexus 1000V software from http://www.cisco.com/en/US/products/ps9902/index.html.
VMware	Download the VMware software from the VMware website.
	The current Cisco Nexus 1000V software release image for VMware Release 5.1 is at the VMware web site:
	Online portal for VMware Update Manager (VUM): http://hostupdate.vmware.com/ software/VUM/PRODUCTION/csco-main/esx/ csco/csco-index.xml
	Offline patch portal: http://www.vmware.com/ patchmgr/download.portal

For information about your software and platform compatibility, see the *Cisco Nexus 1000V and VMware Compatibility Information* document.

# **Information about NetFlow Upgrade**

With Distributed NetFlow, the switch sends NetFlow export packets directly from the VEMs to the collectors.

During the upgrade process, the switch migrates from the old centralized model to the new distributed model. As part of this migration, unsupported commands are removed and/or converted as part of the VSM upgrade. The new and changed commands are available as soon as all of the VEMs are upgraded and the feature level is updated. Additionally, the following new requirements are imposed on the network reachability:

- The collectors must be Layer 3 reachable from at least one vmknic on each VEM host.
- Strict Reverse Path Forwarding (RPF) might need to be disabled on the routers between the VEM hosts and the collectors.

These are the removed, converted, and new commands:

Command	Change			
cache size	Removed.			
	The cache size is no longer user configurable.			
timeout active	Converted.			
timeout inactive	The configured timeout active and timeout inactive values are consolidated and converted to be the flow timeout active and flow timeout inactive values.  The new consolidated timeouts are set to the maximum of the old individual timeouts.  Note After conversion, subsequent changes to the timeouts do not apply to the existing interface configurations on non-upgraded VEMs.			
source mgmt	Converted.  The configured <b>source mgmt</b> values are converted to be the <b>source lc-exp</b> values. The NetFlow export packets are no longer sent from the VSM's mgmt0 interface.			
netflow layer2-switched input	New. The netflow layer2-switched input command configures the Layer 2 default record.			
match datalink	New. The <b>match datalink</b> command configures the Layer 2 record fields.			

# **Prerequisites for the Upgrade**

# **Before You Begin**

Review the following information before you begin an upgrade:

- Virtual machine hardware version 11 is not supported.
- The Virtual Service Domain (VSD) feature is no longer supported and must be removed before upgrading to Release 5.2(1)SV3(1.4).
- The Upgrade Application cannot be used for the direct upgrade of the Virtual Supervisor Module(VSMs) from Releases 4.2(1)SV1(4), 4.2(1)SV1(5.1), 4.2(1)SV1(5.2), 5.2(1)SV3(1.2), and 5.2(1)SV3(1.3) to the current release.
- A pair of VSMs in a high availability (HA) pair is required in order to support a nondisruptive upgrade.
- A system with a single VSM can only be upgraded in a disruptive manner.
- The network and server administrators must coordinate the upgrade procedure with each other.
- The upgrade process is irrevocable. After the software is upgraded, you can downgrade by removing the current installation and reinstalling the software. For more information, see the "Recreating the Installation" section of the *Cisco Nexus* 1000V Troubleshooting Guide.
- A combined upgrade of ESX and the Virtual Ethernet Module (VEM) in a single maintenance mode is supported in this release. A combined upgrade requires at least vCenter 5.0 Update 1 whether you upgrade manually or are using the VMware Update Manager.
- You can manually upgrade the ESX and VEM in one maintenance mode as follows:
- 1 Place the host in maintenance mode.
- **2** Upgrade ESX to 5.0 or 5.1 as needed.
- 3 Install the VEM vSphere Installation Bundle (VIB) while the host is still in maintenance mode.
- 4 Remove the host from maintenance mode.
- The steps for the manual combined upgrade procedure do not apply for VMware Update Manager (VUM)-based upgrades.
- You can abort the upgrade procedure by pressing Ctrl-C.

# **Prerequisites for Upgrading VSMs**

Upgrading VSMs has the following prerequisites:

- Close any active configuration sessions before upgrading the Cisco Nexus 1000V software.
- Save all changes in the running configuration to the startup configuration.
- Save a backup copy of the running configuration in external storage.
- Perform a VSM backup. For more information, see the "Configuring VSM Backup and Recovery" chapter in the Cisco Nexus 1000V System Management Configuration Guide.
- Use the VSM management IP address to log into VSM and perform management tasks.

# **Important**

If you connect to a VSM using the VSA serial port or the connect host from the Cisco Integrated Management Control (CIMC), do not initiate commands that are CPU intensive, such as copying image from the TFTP server to bootflash or generating a lot of screen output or updates. Use the VSA serial connections, including CIMC, only for operations such as debugging or basic configuration of the VSA.

# Prerequisite to Upgrading a VSM to a 3-GB Hard Disk Drive

Cisco Nexus 1000V for VMware Release 5.2(1)SV3(1.x) and higher requires a minimum of 3-GB of hard disk drive (HDD) space. If you are upgrading from a previous release to Release 5.2(1)SV3(1.x) and you have a 2-GB HDD, you must upgrade to a 3-GB HDD.

# Upgrading Hard Disk Drive Space from 2 GB to 3 GB on a VSM as a VM

We recommend that you upgrade the HDD space from 2 GB to 3 GB on a VSM VM before upgrading VSM to Release 5.2(1)SV3(1.1) or later.

## **Before You Begin**

Make sure that the Cisco Nexus 1000V VSMs are running Release 4.2(1)SV2(1.1) or 4.2(1)SV2(2.1).

Make sure that the existing Cisco Nexus 1000V VSMs are an HA pair with 2 GB HDD.

- **Step 1** Remove the existing standby VSM.
  - a) Right-click the VSM VM and power off the VM.
  - b) Remove it from the Virtual Center inventory.
- Step 2 Bring up the new standby VSM VM (with 3-GB HDD) with the same release as the active VSM using ISO. For example, if the active VSM is running Release 4.2(1)SV2(1.1), bring up the new standby VSM with Release 4.2(1)SV2(1.1).
  - a) Confirm that the same port profiles are used as the primary VSM for 3 network interfaces.
  - b) Provision a 3-GB HDD with a minimum of 2 GB of RAM reserved and allocated, and a minimum CPU speed of 1600 MHz.

For more information, see the *Cisco Nexus 1000V Installation and Upgrade Guide* available at <a href="http://www.cisco.com/c/en/us/support/switches/nexus-1000v-switch-vmware-vsphere/products-installation-guides-list.html">http://www.cisco.com/c/en/us/support/switches/nexus-1000v-switch-vmware-vsphere/products-installation-guides-list.html</a> for more information.

- **Step 3** Power on the standby VSM.
  - a) Confirm the HA role is set as Secondary.
  - b) Confirm the Domain ID is the same as the Primary VSM.
- **Step 4** After the HA pair is formed, perform a system switchover to make the standby VSM become the active VSM.
- **Step 5** Remove the current standby VSM.
  - a) Right-click the VSM VM and power off the VM.

- b) Remove it from the Virtual Center inventory.
- **Step 6** Change the Active VSM system redundancy role to the Primary system by entering **system redundancy role primary**.
- **Step 7** Copy the config to start up and perform a reload.
- **Step 8** Verify the current role by entering **show system redundancy status**. The role should be set as Primary.
- **Step 9** Bring up the new standby VSM VM (with 3-GB HDD) using ISO following Step 2 and Step 3.
- Step 10 After the HA pair is formed, verify it by entering show system internal flash. It should reflect the VSM with 3-GB HDD.

## What to Do Next

Perform an in-service software upgrade (ISSU) to Release 5.2(1)SV3(1.1) or later.

# Upgrading Hard Disk Drive Space from 2 GB to 3 GB on a VSM on a VSB

We recommend that you upgrade the VSM that is deployed on a CSP from a 2-GB HDD to a 3-GB HDD.

# **Step 1** Identify the standby VSM by entering the **show virtual-service-blade summary** command.

N1110# show virtual-service-blade summary

Name	HA-Role	HA-Status	Status	Location
switch	PRIMARY	ACTIVE	VSB POWERED ON VSB POWERED ON	PRIMARY
switch	SECONDARY	STANDBY		SECONDARY

N1110#

The output shows that the standby VSM is running on the secondary Cisco Nexus 1010 Virtual Service Blade (VSB).

- **Step 2** Shut down and delete the standby VSM on the secondary VSB.
  - a) N1110# configure terminal
  - b) N1110#(config)virtual-service-blade name switch
  - c) N1110#(config-vsb-config)shutdown secondary
  - d) N1110#(config-vsb-config)no enable secondary
- **Step 3** Bring up the new secondary VSB with Release 4.2(1)SV2(1.1) using ISO.

See the Cisco Nexus 1100 Series Virtual Services Appliances Deployment Guide White Paper for more information.

**Step 4** Change the disk size to 3 GB or more.

N1110 (config-vsb-config) # disksize 4

**Step 5** Enable the standby VSM on the secondary VSB.

See the Cisco Nexus 1100 Series Virtual Services Appliances Deployment Guide White Paper for more information.

N1110# sh virtual-service-blade summary

Name	HA-Role	HA-Status	Status	Location
switch	PRIMARY	ACTIVE	VSB POWERED ON	PRIMARY

switch	SECONDARY	NONE	VSB NOT PRESENT	SECONDARY
switch1	PRIMARY	NONE	VSB NOT PRESENT	PRIMARY
switch1	SECONDARY	STANDBY	VSB POWERED ON	SECONDARY

N1110#

**Step 6** Perform a system switchover to make the active VSM on the primary VSB become the standby VSM. To do this, enter the **system switchover** command on the active VSM.

N1110# system switchover

N1110(config-vsb-config) # show virtual-service-blade summary

Name	HA-Role	HA-Status	Status	Location
switch	PRIMARY	STANDBY	VSB POWERED ON	PRIMARY
switch	SECONDARY	NONE	VSB NOT PRESENT	SECONDARY
switch1	PRIMARY	NONE	VSB NOT PRESENT	PRIMARY
switch1	SECONDARY	ACTIVE	VSB POWERED ON	SECONDARY

N1110(config-vsb-config#

**Step 7** After the HA pair is formed, shut down and delete the standby VSM on the primary VSB.

N1110(config) # virtual-service-blade switch N1110(config-vsb-config) # shutdown primary N1110(config-vsb-config) # no enable primary

N1110(config-vsb-config) # show virtual-service-blade summary

Name	HA-Role	HA-Status	Status	Location
switch switch switch1 switch1	PRIMARY SECONDAR PRIMARY SECONDAR	NONE	VSB NOT PRE VSB NOT PRE VSB NOT PRE VSB POWEREI	SENT SECONDARY PRIMARY

N1110(config-vsb-config)#

- **Step 8** Bring up the new VSB with Release 4.2(2)SV2(1.1) using ISO.
  - See the Cisco Nexus 1100 Series Virtual Services Appliances Deployment Guide White Paper for more information.
- **Step 9** Enable the primary VSM.

See the Cisco Nexus 1100 Series Virtual Services Appliances Deployment Guide White Paper for more information.

 ${\tt N1110}\,({\tt config})\,{\tt\#}\,\,\,{\tt show}\,\,\,{\tt virtual-service-blade}\,\,\,{\tt summary}$ 

Name	HA-Role	HA-Status	Status	Location
switch	PRIMARY	NONE	VSB NOT PRESENT	PRIMARY
switch	SECONDARY	NONE	VSB NOT PRESENT	SECONDARY
switch1	PRIMARY	STANDBY	VSB POWERED ON	PRIMARY
switch1	SECONDARY	ACTIVE	VSB POWERED ON	SECONDARY

N1110(config-vsb-config)#

Step 10 Verify that the HDD size has changed. The following example shows that the HDD size is 4 GB.

N1110 (config) # show system internal flash

Mount-on	l	1K-blocks	Used	Available	Use%	Filesys	tem
	/		307200	87628	219572	29	/dev/root
	/proc		0	0	0	0	proc
	/isan		614400	243076	371324	40	none
	/var/sysmgr		512000	18896	493104	4	none
	/var/sysmgr/ftp		204800	40	204760	1	none
	/dev/shm		358400	30268	328132	9	none
	/volatile		20480	0	20480	0	none
	/debug		2048	8	2040	1	none
	/dev/mqueue		0	0	0	0	none
	/mnt/cfg/0		326681	8360	301455	3	/dev/hda5
	/mnt/cfg/1		326681	8359	301456	3	/dev/hda6
	/var/sysmgr/startu	p-cfg	409600	1168	408432	1	none
	/dev/pts		0	0	0	0	devpts
	/mnt/pss		326671	8625	301178	3	/dev/hda3
	/bootflash		3122988	151756	2812592	6	/dev/hda4
	/bootflash_sup-rem	ote :	3122992	151760	2812592	6	127.1.1.1:/mnt/bootflash/

## What to Do Next

Perform an in-service software upgrade (ISSU) to Release 5.2(1)SV3(1.1) or later.

# Verifying that the VSM Has 3 GB of Hard Disk Drive Storage

You can display the system internal flash to verify that have at least 3 GB of HDD space.

Step 1	Display the system internal flash.

switch# <b>show system i</b>	nternal flash				
Mount-on	1K-blocks	Used	Available	Use%	Filesystem
/	307200	77808	229392	26	/dev/root
/mnt/pss	248895	8164	227879	4	/dev/sda3
/proc	0	0	0	0	proc
/isan	614400	372236	242164	61	none
/var/sysmgr	1048576	488704	559872	47	none
/var/sysmgr/ftp	204800	52	204748	1	none
/nxos/tmp	20480	0	20480	0	none
/dev/shm	358400	89660	268740	26	none
/volatile	20480	0	20480	0	none
/debug	2048	128	1920	7	none
/dev/mqueue	0	0	0	0	none
/mnt/cfg/0	248895	4494	231551	2	/dev/sda5
/mnt/cfg/1	241116	4493	224175	2	/dev/sda6
/var/sysmgr/startup-c	fg 409600	5892	403708	2	none

/dev/pts	0	0	0	0	devpts
/mnt/pss	248895	8164	227879	4	/dev/sda3
/bootflash	2332296	1918624	295196	87	/dev/sda4
/sys	0	0	0	0	sysfs

Note 1 GB of hard disk space is equal to 1073741.824 1K-blocks.

Step 2 Make sure that the sum total of the number of blocks allocated to the /mnt/cfg/0, /mnt/cfg/1, /mnt/pss, and /bootflash partitions is approximately 3 GB.

# Guidelines and Limitations for Upgrading the Cisco Nexus 1000V

Before attempting to migrate to any software image version, follow these guidelines:

During the upgrade process, the Cisco Nexus 1000V does not support any new additions such as modules, virtual NICs (vNICs), or VM NICs and does not support any configuration changes. VM NIC and vNIC port-profile changes might render VM NICs and vNICs in an unusable state.

Note

We recommended that you use vSphere 5.0 Update 1 or later instead of vSphere 5.0.

- You are upgrading the Cisco Nexus 1000V software to the current release.
- Scheduling—Schedule the upgrade when your network is stable and steady. Ensure that everyone who has access to the switch or the network is not configuring the switch or the network during this time. You cannot configure a switch during an upgrade.
- Hardware—Avoid power interruptions to the hosts that run the VSM VMs during any installation procedure.
- Connectivity to remote servers do the following:
  - ° Copy the kickstart and system images from the remote server to the Cisco Nexus 1000V.
  - Ensure that the switch has a route to the remote server. The switch and the remote server must be in the same subnetwork if you do not have a router to route traffic between subnets.
- Software images— Do the following:
  - Make sure that the system and kickstart images are the same version.
  - Retrieve the images in one of two ways:
    - <sup>o</sup> Locally—Images are locally available on the upgrade CD-ROM/ISO image.
    - Remotely—Images are in a remote location and you specify the destination using the remote server parameters and the filename to be used locally.

- Commands to use—Do the following:
  - Verify connectivity to the remote server by using the **ping** command.
  - If you are using Layer 3 mode for VSM-to-VEM connectivity, verify the IP address on the Layer 3 control interface using the **show interface** {**control0** | **mgmt0**} command. If the IP address is missing, re-apply the IP address configuration on the corresponding Layer 3 control interface.
  - Use the install all command to upgrade your software. This command upgrades the VSMs.
  - Do not enter another install all command while running the installation. You can run commands other than configuration commands.
  - During the VSM upgrade, if you try to add a new VEM or any of the VEMs are detached due to uplink flaps, the VEM attachment is queued until the upgrade completes.
  - If VEMs get removed after the VSM upgrade, use the **system switchover** command to perform a system switchover after the HA pair is established.

Note

If the ESX hosts are not compatible with the software image that you install on the VSM, a traffic disruption occurs in those modules, depending on your configuration. The **install all** command output identifies these scenarios. The hosts must be at the right version before the upgrade.

Before upgrading the VEMs, note these guidelines and limitations.

Note

It is your responsibility to monitor and install all the relevant patches on VMware ESX hosts.

- The VEM software can be upgraded manually using the CLI or upgraded automatically using VUM.
- During the VEM upgrade process, VEMs reattach to the VSM.
- Connectivity to the VSM can be lost during a VEM upgrade when the interfaces of a VSM VM connect to its own Distributed Virtual Switch (DVS).
- If you are upgrading a VEM using a Cisco Nexus 1000V bundle, follow the instructions in your VMware documentation. For more details about VMware bundled software, see the Cisco Nexus 1000V and VMware Compatibility Information document.

Caution

Do not enter the **vemlog**, **vemcmd**, or **vempkt** commands during the VEM upgrade process because these commands impact the upgrade.

For ESXi 5.1 update 2 and later, the minimum versions are as follows:

- VMware vCenter Server 5.1, 799731
- VMware Update Manager 5.1, 782803

For ESXi 5.5 update 1 and later, the minimum versions are as follows:

- VMware vCenter Server 5.0.0, 455964
- VMware Update Manager 5.0.0 432001

If you plan to do a combined upgrade of ESX and VEM, the minimum vCenter Server/VUM version required is 623373/639867.

This procedure is different from the upgrade to Release 4.2(1)SV1(4). In this procedure, you upgrade the VSMs first by using the **install all** command and then you upgrade the VEMs.

• You can upgrade the hosts in the DVS a few at a time across multiple maintenance windows. The only exception is if you are upgrading the VEM alone using VUM with the ESX version unchanged.

# **Upgrade Procedures**

The following table lists the upgrade steps.

Note

Ensure that you have changed the VSM mode to advanced, before upgrading VSM. VSG services are not available in the essential mode.

### Table 6: Upgrade Paths from Cisco Nexus 1000V Releases

If you are running this configuration	Follow these steps
Release 4.0(4)SV1(1), 4.0(4)SV1(2), 4.2(1)SV1(4), 4.2(1)SV1(5.1), and 4.2(1)SV1(5.2)	Direct upgrades from these releases are not supported.
Releases 4.0(4)SV1(3x) Series	<ol> <li>Upgrading from Releases         <ul> <li>4.0(4)SV1(3,3a,3b,3c,3d) to release</li> <li>4.2(1)SV2(1.1) or later at the following URL:</li></ul></li></ol>

If you are running this configuration	Follow these steps
Release 4.2(1)SV1(4x) Series with a vSphere release 4.0 Update 1 or later	Upgrading from VMware Release 4.0 to VMwrae Release 5.0 or later.
	2 Upgrading VSMs from releases 4.2(1)SV1(4x) to 4.2(1)SV2(1.1) or later.
	3 Upgrading VEMs from releases 4.2(1)SV1(4x) to 4.2(1)SV2(1.1) or later.
	4 Upgrading VSMs from releases 4.2(1)SV2(1.1) or later to current release.
	5 Upgrading VEMs from releases 4.2(1)SV2(1.1) or later to current release.
Release 4.2(1)SV1(4x) Series with a vSphere release 4.1 GA, patches, or updates	Upgrading from VMware Release 4.1 to VMwrae Release 5.0 or later.
	2 Upgrading VSMs from releases 4.2(1)SV1(4x) to 4.2(1)SV2(1.1) or later.
	3 Upgrading VEMs from releases 4.2(1)SV1(4x) to 4.2(1)SV2(1.1) or later.
	4 Upgrading VSMs from releases 4.2(1)SV2(1.1) or later to current release.
	5 Upgrading VEMs from releases 4.2(1)SV2(1.1) or later to current release.
Release 4.2(1)SV1(4x) with a vSphere release 5.0 GA, patches, or updates.	1 Upgrading VSMs from releases 4.2(1)SV1(4x) to 4.2(1)SV2(1.1) or later.
	2 Upgrading VEMs from releases 4.2(1)SV1(4x) to 4.2(1)SV2(1.1) or later.
	3 Upgrading VSMs from releases 4.2(1)SV2(1.1) or later to current release.
	4 Upgrading VEMs from releases 4.2(1)SV2(1.1) or later to current release.

The following table lists the upgrade steps when upgrading from Release 4.2(1)SV1(5x) and later releases to the current release.

Table 7: Upgrade Paths from Releases 4.2(1)SV1(5x) and Later Releases

If you are running this configuration	Follow these steps
With vSphere 4.1 GA, patches, or updates.	1 Upgrading from VMware Release 4.1 to VMware Release 5.0 or later.
	2 Upgrading VSMs from releases 4.2(1)SV1(5.1x) to 4.2(1)SV2(1.1) or later.
	3 Upgrading VEMs from releases 4.2(1)SV1(5.1x) to 4.2(1)SV2(1.1) or later.
	4 Upgrading VSMs from releases 4.2(1)SV2(1.1) or later to current release.
	5 Upgrading VEMs from releases 4.2(1)SV2(1.1) or later to current release.
With vSphere 5.0 GA, patches, or updates.	1 Upgrading VSMs from releases 4.2(1)SV1(5.1x) to 4.2(1)SV2(1.1) or later.
	2 Upgrading VEMs from releases 4.2(1)SV1(5.1x) to 4.2(1)SV2(1.1) or later.
	3 Upgrading VSMs from releases 4.2(1)SV2(1.1) or later to current release.
	4 Upgrading VEMs from releases 4.2(1)SV2(1.1) or later to current release.
With ESX version upgrade.	Installing and Upgrading VMware

# Reserving the Memory and CPU on the Virtual Supervisor Module Virtual Machine

From the current release of Cisco Nexus 1000V software, the VSM requires 4-GB RAM and two 2048-MHz vCPUs reservation to accommodate the new scalability limits.

Note

When you install the Cisco Nexus 1000V software VSM through the OVA files for the first time, the RAM and CPU reservations are automatically reflected.

To upgrade to the current release of Cisco Nexus 1000V software and update the CPU and RAM reservations, use the following procedure:

- **Step 1** Upgrade from the previous release of Cisco Nexus 1000V software to the current release of Cisco Nexus 1000V software.
- **Step 2** Once the upgrade is complete, power off the secondary VSM.
- **Step 3** Change the RAM size from 2 or 3 GB to 4 GB and change the RAM reservation from 2 or 3 GB to 4 GB.
- **Step 4** Under CPU settings, change the number of vCPUs to 2 and change the CPU reservation from 1.5 GHz to 2048 MHz.
- **Step 5** Power on the secondary VSM.
- **Step 6** Perform a system switch over to get the secondary VSM as Active.
- **Step 7** Power off the primary VSM and repeat steps 3 to 6.
- **Step 8** After the primary and secondary VSM have the correct CPU and RAM reservations, the VSM is able to accommodate the scale numbers that are supported on Release 5.2(1)SV3(1.1) or later.

**Note** You do not have to change the CPU and RAM reservations to continue to support for the scale numbers supported in releases prior to Release 5.2(1)SV3(1.1).

# Reserving the Memory and CPU for the Virtual Supervisor Module in VSB on the Cloud Services Platform

To change the memory reservations in the VSM VSB, use the following procedure:

## **Before You Begin**

From the current release of Cisco Nexus 1000V software, the VSM requires 4-GB RAM and two vCPUs to accommodate the new scalability limits.

- **Step 1** Login to the Cloud Services Platform command prompt.
- **Step 2** Enter the VSM configuration mode.
- **Step 3** Change the RAM size to 4 GB and change the vCPU number to 2.

**Note** With Cisco Nexus Cloud Services Platform Release 4.2(1)SP1(6.1) and later, the virtual service blades can remain powered on when you change the RAM size. In Cisco Nexus Cloud Services Platform releases earlier than 4.2(1)SP1(6.1), the primary/secondary virtual service blades must be powered off before you can change the RAM size.

- **Step 4** Copy the running configuration to the startup configuration.
- **Step 5** Reboot the secondary VSM VSB by using the **shut** and **no shut** commands.
- **Step 6** Check if the secondary VSM has 4-GB RAM and two vCPUs.
- Step 7 Perform a system switch over from the primary VSM to make the secondary VSM as active with 4-GB RAM and two vCPUs.

The primary VSM reboots and is in the standby state with 4-GB RAM and two vCPUs.

# Reserving the Memory and CPU for the Virtual Supervisor Module in VSB on the Cloud Services Platform Using the CLI

To change the memory reservations in the VSM VSB using the CLI, use the following procedure:

#### **Before You Begin**

From the current release of Cisco Nexus 1000V software, VSM requires 4 GB RAM to accommodate the new scalability limits.

#### **DETAILED STEPS**

	Command or Action	Purpose  Enters the global configuration mode.  Enters the VSM configuration mode.		
Step 1	CSP configure terminal			
Step 2	CSP(config)# virtual-service-blade VSM for the current release			
Step 3	CSP(config-vsb-config)# ramsize 4096	Change the RAM size to 4 GB.		
		Note The virtual service blade is powered ON. Restart the VSB to reflect the change in RAM size. Perform a shutdown using the <b>shutdown</b> and <b>no shutdown</b> commands.		
Step 4	CSP(config-vsb-config)# numcpu 2	Changing the number of CPUs to 2.		
Step 5	CSP(config-vsb-config)# copy running-config startup-config	Copies the running configuration to the startup configuration		
Step 6	CSP(config-vsb-config)# shutdown secondary	Shuts down the secondary VSB.		
Step 7	CSP(config-vsb-config)# no shutdown secondary	Applies the RAM and vCPU changes.		
Step 8	VSM# system switchover	Performs a system switch over from primary VSM to make the secondary VSM as active with 4 GB RAM and two vCPUs.		
Step 9	VSM(standby)# show system resources	Displays that the secondary VSM has 4 GB of RAM and two vCPUs.		

# **VSM Upgrade Procedures**

# **Software Images**

The software image install procedure is dependent on the following factors:

- Software images—The kickstart and system image files reside in directories or folders that you can access from the Cisco Nexus 1000V software prompt.
- Image version—Each image file has a version.
- Disk—The bootflash: resides on the VSM.
- ISO file—If a local ISO file is passed to the install all command, the kickstart and system images are
  extracted from the ISO file.

## In-Service Software Upgrades on Systems with Dual VSMs

The Cisco Nexus 1000V software supports in-service software upgrades (ISSUs) for systems with dual VSMs. An ISSU can update the software images on your switch without disrupting data traffic. Only control traffic is disrupted. If an ISSU causes a disruption of data traffic, the Cisco Nexus 1000V software warns you before proceeding so that you can stop the upgrade and reschedule it to a time that minimizes the impact on your network.

On systems with dual VSMs, you should have access to the console of both VSMs to maintain connectivity when the switchover occurs during upgrades. If you are performing the upgrade over Secure Shell (SSH) or Telnet, the connection will drop when the system switchover occurs, and you must reestablish the connection.

An ISSU updates the following images:

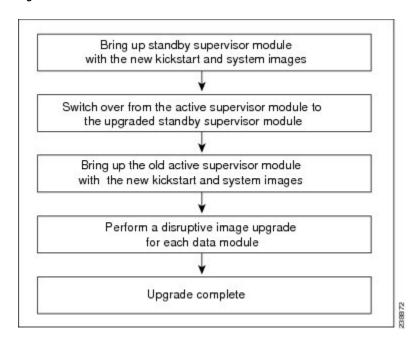

- · Kickstart image
- System image
- VEM images

All of the following processes are initiated automatically by the upgrade process after the network administrator enters the **install all** command.

# **ISSU Process for the Cisco Nexus 1000V**

The following figure shows the ISSU process.

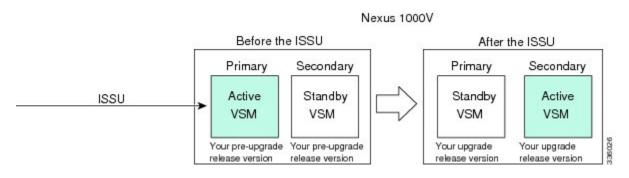

Figure 11: ISSU Process

### **ISSU VSM Switchover**

The following figure provides an example of the VSM status before and after an ISSU switchover.

Figure 12: Example of an ISSU VSM Switchover

#### **ISSU Command Attributes**

#### Support

The **install all** command supports an in-service software upgrade (ISSU) on dual VSMs in an HA environment and performs the following actions:

- Determines whether the upgrade is disruptive and asks if you want to continue.
- Copies the kickstart and system images to the standby VSM. Alternatively, if a local ISO file is passed to the **install all** command instead, the kickstart and system images are extracted from the file.
- · Sets the kickstart and system boot variables.
- Reloads the standby VSM with the new Cisco Nexus 1000V software.
- Causes the active VSM to reload when the switchover occurs.

#### **Benefits**

The **install all** command provides the following benefits:

- You can upgrade the VSM by using the **install all** command.
- You can receive descriptive information on the intended changes to your system before you continue with the installation.
- You have the option to cancel the command. Once the effects of the command are presented, you can continue or cancel when you see this question (the default is no):

```
Do you want to continue (y/n) [n]: y
```

- You can upgrade the VSM using the least disruptive procedure.
- You can see the progress of this command on the console, Telnet, and SSH screens:
  - After a switchover process, you can see the progress from both the VSMs.
  - Before a switchover process, you can see the progress only from the active VSM.
- The install all command automatically checks the image integrity, which includes the running kickstart and system images.
- The install all command performs a platform validity check to verify that a wrong image is not used.
- The Ctrl-C escape sequence gracefully ends the **install all** command. The command sequence completes the update step in progress and returns to the switch prompt. (Other upgrade steps cannot be ended by using Ctrl-C.)
- After running the **install all** command, if any step in the sequence fails, the command completes the step in progress and ends.

# Upgrading VSMs from Releases 4.2(1)SV2(1.1) and Later Releases to Release 5.2(1)SV3(1.2) and Later Release

- **Step 1** Log in to the active VSM.
- Step 2 Log in to Cisco.com to access the links provided in this document. To log in to Cisco.com, go to the URL http://www.cisco.com/ and click Log In at the top of the page. Enter your Cisco username and password.
  - **Note** Unregistered Cisco.com users cannot access the links provided in this document.
- **Step 3** Access the Software Download Center by using this URL: http://www.cisco.com/public/sw-center/index.shtml
- **Step 4** Navigate to the download site for your system. You see links to the download images for your switch.
- **Step 5** Choose and download the Cisco Nexus 1000V zip file and extract the kickstart and system software files to a server.
- Ensure that the required space is available for the image file(s) to be copied by entering the **dir bootflash:** command.

  Tip We recommend that you have the kickstart and system image files for at least one previous release of the Cisco
- Nexus 1000V software on the system to use if the new image files do not load successfully.

  Step 7 Verify that there is space available on the standby VSM by entering the dir bootflash://sup-standby/command.
- **Step 8** Delete any unnecessary files to make space available if you need more space on the standby VSM.
- Step 9 If you plan to install the images from the bootflash:, copy the Cisco Nexus 1000V kickstart and system images or the ISO image to the active VSM by using a transfer protocol. You can use ftp:, tftp:, scp:, or sftp:. The examples in this procedure copies a kickstart and system image using scp:.
  - **Note** When you download an image file, change to your FTP environment IP address or DNS name and the path where the files are located.
  - a) switch# **copy scp:**//filepath/kickstart\_filename **bootflash:**kickstart\_filename Copy the ISO image.
  - b) switch# **copy scp:**//filepath/system\_filename **bootflash:**system\_filename Copy kickstart and system images.
- Step 10 switch# show install all impact kickstart bootflash:kickstart\_filename system bootflash:system\_filename

  Verify the ISSU upgrade for the kickstart and system images or the ISO image. The example in this procedure shows the kickstart and system images.
- **Step 11** Read the release notes for the related image file. See the *Cisco Nexus 1000V Release Notes*.
- Step 12 Determine if the Cisco Virtual Security Gateway (Cisco VSG) is configured in the deployment by using the **show vnm-pa** status command.
  - Note If an output displaying a successful installation is displayed as in the example, the Cisco VSG is configured in the deployment. You must follow the upgrade procedure in the Cisco Virtual Security Gateway and Cisco Virtual Network Management Center Installation and Upgrade Guide. If an output displaying that the policy agent has not installed is displayed, continue to Step 13.
- **Step 13** Save the running configuration to the startup configuration by using the **copy running-config startup-config** command.
- **Step 14** Save the running configuration on the bootflash and externally.
  - **Note** You can also run a VSM backup. See the "Configuring VSM Backup and Recovery" chapter of the *Cisco Nexus* 1000V System Management Configuration Guide.

- a) Save the running configuration on the bootflash by using the copy running-config bootflash:run-cfg-backup command.
- b) Save the running configuration externally by using the copy running-config scp://external backup location command.
- Step 15 Perform the upgrade on the active VSM using the ISO or kickstart and system images by using the install all kickstart bootflash:kickstart\_filename system bootflash:system\_filename command. The example in this procedure shows the kickstart and system images.
- Step 16 Continue with the installation by pressing Y.

  If you press N, the installation exits gracefully.
  - **Note** As part of the upgrade process, the standby VSM is reloaded with new images. Once it becomes the HA standby again, the upgrade process initiates a switchover. The upgrade then continues from the new active VSM.
- Step 17 After the installation operation completes, log in and verify that the switch is running the required software version by using the switch# show version command
- Step 18 Copy the running configuration to the startup configuration to adjust the startup-config size by using the switch# copy running-config startup-config command
- **Step 19** Display the log for the last installation by entering the following commands.
  - a) switch# show install all status
  - b) switch# attach module name
  - c) switch# show install all status
- **Step 20** Review information about reserving memory and CPU on the VSM VM at the following URL: Reserving the Memory and CPU on the Virtual Supervisor Module Virtual Machine.

**Note** You must review this information, to accommodate the new scalability limits.

# **VEM Upgrade Procedures**

## **Prerequisites for Upgrading VEMs**

Caution

If VMware vCenter Server is hosted on the same ESX/ESXi host as a Cisco Nexus 1000V VEM, a VUM-assisted upgrade on the host fails. You should manually VMotion the vCenter Server VM to another host before you perform an upgrade.

Note

When you perform any VUM operation on hosts that are a part of a cluster, ensure that VMware HA, VMware fault tolerance (FT), and VMware Distributed Power Management (DPM) features are disabled for the entire cluster. Otherwise, VUM will fail to install the hosts in the cluster.

• If you have VXLAN Gateway installed in your deployment, we recommend that you upgrade the VXLAN gateway service module after upgrading the VSM and *before* upgrading the VEM. This recommendation applies to upgrades to Release 5.2(1)SV3(1.1) and later only.

- You are logged in to the VSM command-line interface (CLI) in EXEC mode.
- You have a copy of your VMware documentation available for installing software on a host.
- You have already obtained a copy of the VEM software file. For more information, see the *Cisco Nexus* 1000V and VMware Compatibility Information document.
- If you need to migrate a vSphere host from ESX to ESXi, do it before the Cisco Nexus 1000V upgrade.
- You have placed the VEM software file in /tmp on the vSphere host. Placing it in the root (/) directory might interfere with the upgrade. Make sure that the root RAM disk has at least 12 MB of free space by entering the **vdf** command.
- On your upstream switches, you must have the following configuration.
  - On Catalyst 6500 Series switches with the Cisco IOS software, enter the portfast trunk command or the portfast edge trunk command.
  - On Cisco Nexus 5000 Series switches with the Cisco NX-OS software, enter the spanning-tree port type edge trunk command.
- On your upstream switches, we highly recommend that you globally enable the following:
  - · Global BPDU Filtering
  - · Global BPDU Guard
- On your upstream switches where you cannot globally enable BPDU Filtering and BPDU Guard, we highly recommend that you enter the following commands:
  - spanning-tree bpdu filter
  - spanning-tree bpdu guard
- The collectors must be L3 reachable from at least one vmknic on each VEM host.
- Strict Reverse Path Forwarding (RPF) may require disabling on the routers between the VEMs and the collectors.
- For more information about configuring spanning tree, BPDU, or PortFast, see the documentation for your upstream switch.

# Upgrading Using a Customized ISO with a VMware ESX Image and a Cisco Nexus 1000V VEM Image

#### **Before You Begin**

- Install the VMware PowerCLI on a Windows platform. For more information, see the VMware vSphere PowerCLI Installation Guide.
- On the same Windows platform, where the VMware PowerCLI is installed, do one of the following:
  - Download the ESX depot, which is a .zip file, to a local file path.
  - Download the VEM offline bundle, which is a .zip file, to a local file path.

#### **SUMMARY STEPS**

- **1.** Start the VMWare PowerCLI application.
- 2. Connect to the vCenter Server by using the Connect-VIServer IP\_address -User Administrator -Password password name command.
- **3.** Load the ESX depot by using the **Add-ESXSoftwareDepot** path name/file name command.
- 4. Display the image profiles by using the Get-EsxImageProfile command.
- **5.** Clone the ESX standard image profile by using the **New-ESxImageProfile -CloneProfile** *ESXImageProfile\_name* **-Name** *clone\_profile* command.
- **6.** Load the Cisco Nexus 1000V VEM offline bundle by using the **Add-EsxSoftwareDepot** *VEM offline bundle* command.
- 7. Confirm that the n1kv-vib package is loaded by using the Get-EsxSoftwarePackage -Name package\_name command.
- **8.** Bundle the n1kv-package into the cloned image profile by using the **Add-EsxSoftwarePackage** -**ImageProfile** n1kv-Image -**SoftwarePackage** cloned\_image\_profile command.
- **9.** Verify that the Cisco VIB is present by listing all the VIBs in the cloned image profile by entering the following commands.
- **10.** Export the image profile to an ISO file by using the **Export-EsxImageProfile -ImageProfile** *n1kv-Image* **-FilePath** *iso filepath* command.

#### **DETAILED STEPS**

- **Step 1** Start the VMWare PowerCLI application.
- Step 2 Connect to the vCenter Server by using the Connect-VIServer IP\_address -User Administrator -Password password name command.
- **Step 3** Load the ESX depot by using the **Add-ESXSoftwareDepot** path name\file name command.
- **Step 4** Display the image profiles by using the **Get-EsxImageProfile** command.
- Step 5 Clone the ESX standard image profile by using the New-ESxImageProfile -CloneProfile ESXImageProfile\_name -Name clone\_profile command.
  - **Note** The image profiles are usually in READ-ONLY format. You must clone the image profile before adding the VEM image to it.
- **Step 6** Load the Cisco Nexus 1000V VEM offline bundle by using the **Add-EsxSoftwareDepot** VEM offline bundle command.
- Step 7 Confirm that the n1kv-vib package is loaded by using the Get-EsxSoftwarePackage -Name package name command.
- Step 8 Bundle the n1kv-package into the cloned image profile by using the Add-EsxSoftwarePackage -ImageProfile n1kv-Image -SoftwarePackage cloned image profile command.
- **Step 9** Verify that the Cisco VIB is present by listing all the VIBs in the cloned image profile by entering the following commands.
  - a) **\$\simg = Get-EsxImageProfile** n1kv-Image
  - b) \$img.vibList

Verify that the Cisco VIB is present by listing all the VIBs in the cloned image profile.

**Step 10** Export the image profile to an ISO file by using the **Export-EsxImageProfile -ImageProfile** *n1kv-Image* **-FilePath** *iso filepath* command.

This example shows how to create an upgrade ISO with a VMware ESX image and a Cisco VEM image.

The example may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

vSphere PowerCLI> Connect-VIServer 10.105.231.40 -User administrator -Password 'XXXXXXXXX'

Working with multiple default servers?

Select [Y] if you want to work with more than one default servers. In this case, every time when you connect to a different server using Connect-VIServer, the new server connection is stored in an array variable together with the previously connected servers. When you run a cmdlet and the target servers cannot be determined from the specified parameters, the cmdlet runs against all servers stored in the array variable.

Select [N] if you want to work with a single default server. In this case, when you run a cmdlet and the target servers cannot be determined from the specified parameters, the cmdlet runs against the last connected server.

WARNING: WORKING WITH MULTIPLE DEFAULT SERVERS WILL BE ENABLED BY DEFAULT IN A FUTURE RELEASE. You can explicitly set your own preference at any time by using the DefaultServerMode parameter of Set-PowerCLIConfiguration.

vSphere PowerCLI> Export-EsxImageProfile -ImageProfile FINAL -FilePath 'C:\Documents and Settings\Administrator\Desktop\FINAL.iso' -ExportToIso

## **Upgrading the vCenter Server**

Note

This upgrade procedure applies to vCenter Server 5.0, 5.0 Update 1 and later, 5.1, and 5.5 versions.

#### **Before You Begin**

- Download the upgrade ISO file that contains your desired ESXi image and the desired Cisco Nexus 1000V image.
- See the *Cisco Nexus 1000V and VMware Compatibility Information* document to determine the correct VIB Version, VEM Bundle, Host Build, vCenter Server, and Update Manager versions.

#### **SUMMARY STEPS**

- 1. Navigate to the VMware vSphere installation file.
- 2. Double-click autorun.
- 3. In the VMware vCenter Installer screen, click vCenter Server.
- 4. Click Install.
- **5.** Choose a language and click **OK**.
- 6. Click Next.
- 7. In the Patent Agreement screen, click Next.
- 8. In the License Agreement screen, click the I agree to the terms in the license agreement radio button.
- 9. Click Next.
- 10. In the Database Options screen, click Next.
- 11. Click the Upgrade existing vCenter Server database radio button and check the I have taken a backup of the existing vCenter Server database and SSL certificates in the folder:

  C:\ProgramData\VMware\VMware \VirtualCenter\SSL\. check box.
- 12. From the Windows Start Menu, click Run.
- 13. Enter the name of the folder that contains the vCenter Server database and click OK.
- **14.** Drag a copy of the parent folder (SSL) to the desktop as a backup.
- **15.** Return to the installer program.
- 16. Click Next.
- 17. In the vCenter Agent Upgrade screen, click the Automatic radio button.
- 18. Click Next.
- 19. In the vCenter Server Service screen, check the Use SYSTEM Account check box.
- 20. Click Next.
- 21. Review the port settings and click Next.
- 22. In the vCenter Server JVM Memory screen based on the number of hosts, click the appropriate memory radio button.
- 23. Click Next.
- 24. Click Install.
- 25. Click Finish.
- **26.** Upgrade the VMware vSphere Client to your desired ESXi version.
- **27.** Open the VMware vSphere Client.
- **28.** From the **Help** menu, choose **About VMware vSphere**.
- **29.** Confirm that the vSphere Client and the VMware vCenter Server are both the same VMware versions.
- **30.** Click **OK**, and exit the VMware vSphere Client.

#### **DETAILED STEPS**

**Step 1** Navigate to the VMware vSphere installation file.

Note If you have the ISO image, you should mount it on the host.

Step 2	Double-click autorun.
Step 3	In the VMware vCenter Installer screen, click vCenter Server.
Step 4	Click Install.
Step 5	Choose a language and click <b>OK</b> .
Step 6	Click Next.
Step 7	In the Patent Agreement screen, click Next.
Step 8	In the License Agreement screen, click the I agree to the terms in the license agreement radio button.
Step 9	Click Next.
Step 10	In the Database Options screen, click Next.
Step 11	Click the <b>Upgrade existing vCenter Server database</b> radio button and check the <b>I have taken a backup of the existing vCenter Server database and SSL certificates in the folder: C:\ProgramData\VMware\VMware VirtualCenter\SSL check box.</b>
Step 12	From the Windows Start Menu, click Run.
Step 13	Enter the name of the folder that contains the vCenter Server database and click OK.
Step 14	Drag a copy of the parent folder (SSL) to the desktop as a backup.
Step 15	Return to the installer program.
Step 16	Click Next.
Step 17	In the vCenter Agent Upgrade screen, click the Automatic radio button.
Step 18	Click Next.
Step 19	In the vCenter Server Service screen, check the Use SYSTEM Account check box.
Step 20	Click Next.
Step 21	Review the port settings and click Next.
Step 22	In the vCenter Server JVM Memory screen based on the number of hosts, click the appropriate memory radio button
Step 23	Click Next.
Step 24	Click Install.
Step 25	Click <b>Finish.</b> This step completes the upgrade of the vCenter Server.
Step 26	Upgrade the VMware vSphere Client to your desired ESXi version.
Step 27	Open the VMware vSphere Client.
Step 28	From the Help menu, choose About VMware vSphere.
Step 29	Confirm that the vSphere Client and the VMware vCenter Server are both the same VMware versions.

#### What to Do Next

Click OK, and exit the VMware vSphere Client.

Complete the steps in Upgrading the vCenter Update Manager to Release 6.0, on page 111.

# **Upgrading VEMs Using VUM**

Step 30

The steps to upgrade VEMS using VUM are as follows:

Upgrading the VEMs Using VMware Update Manager from Release 4.2(1)SV2(1.1x) and Later Releases to the Current Release

#### **SUMMARY STEPS**

- 1. Upgrade the VEM from the VSM. See Upgrading the VEMs Using VMware Update Manager from Release 4.2(1)SV2(1.1x) and Later Releases to the Current Release, on page 80.
- 2. Upgrade the VEM software. See Upgrading the VEM Software Using the vCLI, on page 84.
- **3.** Upgrade both ESX and Cisco Nexus 1000V. See Combined Upgrade of VMware vSphere and Cisco Nexus 1000V, on page 90.

#### **DETAILED STEPS**

- **Step 1** Upgrade the VEM from the VSM. See Upgrading the VEMs Using VMware Update Manager from Release 4.2(1)SV2(1.1x) and Later Releases to the Current Release, on page 80.
- Step 2 Upgrade the VEM software. See Upgrading the VEM Software Using the vCLI, on page 84.
- Step 3 Upgrade both ESX and Cisco Nexus 1000V. See Combined Upgrade of VMware vSphere and Cisco Nexus 1000V, on page 90.

# Upgrading the VEMs Using VMware Update Manager from Release 4.2(1)SV2(1.1x) and Later Releases to the Current Release

Caution

If removable media is still connected (for example, if you have installed the VSM using ISO and forgot to remove the media), host movement to maintenance mode fails and the VUM upgrade fails.

#### **Before You Begin**

When using VUM, the feature http-server enable command must be enabled.

- Step 1 switch# show vmware vem upgrade status
  - Display the current configuration.
- Step 2 switch# vmware vem upgrade notify
  Coordinate with and notify the server administrator of the VEM upgrade process.
- Step 3 switch# show vmware vem upgrade status
  Verify that the upgrade notification was sent.

**Note** Verify that the Upgrade Status contains the highlighted text. If the text is not present, check the Upgrade Error line and consult the *Cisco Nexus 1000V Troubleshooting Guide*.

Step 4 switch# show vmware vem upgrade status

Verify that the server administrator has accepted the upgrade in the vCenter. For more information about how the server administrator accepts the VEM upgrade, see Accepting the VEM Upgrade, on page 83. Coordinate the notification acceptance with the server administrator. After the server administrator accepts the upgrade, proceed with the VEM upgrade.

**Note** Verify that the Upgrade Status contains the highlighted text. If the text is not present, check the Upgrade Error line and consult the *Cisco Nexus 1000V Troubleshooting Guide*.

**Step 5** Initiate the VUM upgrade process with the following commands.

**Note** Before entering the following commands, communicate with the server administrator to confirm that the VUM process is operational.

The vCenter Server locks the DVS and triggers VUM to upgrade the VEMs.

- a) switch# vmware vem upgrade proceed
- b) switch# show vmware vem upgrade status

**Note** The DVS bundle ID is updated and is highlighted.

If the host is using ESXi 5.0.0 or a later release and your DRS settings are enabled to allow it, VUM automatically VMotions the VMs from the host to another host in the cluster and places the ESXi in maintenance mode to upgrade the VEM. This process is continued for other hosts in the DRS cluster until all the hosts are upgraded in the cluster. For details about DRS settings required and vMotion of VMs, visit the VMware documentation related to Creating a DRS Cluster.

#### Step 6 switch# show vmware vem upgrade status

Check for the upgrade complete status.

- **Step 7** Clear the VEM upgrade status after the upgrade process is complete with the following commands.
  - a) switch# vmware vem upgrade complete
  - b) switch# show vmware vem upgrade status
- Step 8 switch# show module

Verify that the upgrade process is complete.

The upgrade is complete.

The following example shows how to upgrade VEMs using VUM.

Note

The example may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

```
switch# show vmware vem upgrade status

switch(config)#

The lines with the bold characters in the preceding example display that all VEMs are upgraded to the current release.

# **Accepting the VEM Upgrade**

#### **Before You Begin**

• The network and server administrators must coordinate the upgrade procedure with each other.

- You have received a notification in the vCenter Server that a VEM software upgrade is available.
- **Step 1** In the vCenter Server, choose **Inventory > Networking**.
- **Step 2** Click the **vSphere Client DVS Summary** tab to check for the availability of a software upgrade.

Figure 13: vSphere Client DVS Summary Tab

#### Step 3 Click Apply upgrade.

The network administrator is notified that you are ready to apply the upgrade to the VEMs.

# **Upgrading the VEM Software Using the vCLI**

You can upgrade the VEM software by using the vCLI.

#### **Before You Begin**

- If you are using vCLI, do the following:
  - $^{\circ}$  You have downloaded and installed the VMware vCLI. For information about installing the vCLI, see the VMware vCLI documentation.
  - You are logged in to the remote host where the vCLI is installed.

Note

The vSphere command-line interface (vCLI) command set allows you to enter common system administration commands against ESXi systems from any machine with network access to those systems. You can also enter most vCLI commands against a vCenter Server system and target any ESXi system that the vCenter Server system manages. vCLI commands are especially useful for ESXi hosts because ESXi does not include a service console.

- Check Cisco Nexus 1000V and VMware Compatibility Information for compatible versions.
- You have already copied the VEM software installation file to the /tmp directory. Do not copy the files to the root (/) folder.

• You know the name of the VEM software file to be installed.

#### Step 1 [root@serialport -]# cd tmp

Go to the directory where the new VEM software was copied.

**Step 2** Determine the upgrade method that you want to use and enter the appropriate command.

#### vihostupdate

Installs the ESXi and VEM software simultaneously if you are using the vCLI.

- **Step 3** For ESXi 5.0.0 or later hosts, enter the appropriate commands as they apply to you.
  - a) ~ # esxcli software vib install -d /absolute-path/VEM bundle
  - b) ~ # esxcli software vib install -v /absolute-path/vib file

**Note** You must specify the absolute path to the *VEM\_bundle* and *vib\_file* files. The absolute path is the path that starts at the root of the file system such as /tmp/vib file.

- **Step 4** Display values with which to compare to *Cisco Nexus 1000V and VMware Compatibility Information* by typing the following commands.
  - a) [root@serialport tmp]# vmware -v
  - b) root@serialport tmp]# # esxupdate query
  - c)  $[root@host212 \sim] \# . \sim \#$  vem status -v
  - d) [root@host212 ~]# vemcmd show version

#### Step 5 switch# show module

Display that the VEMs were upgraded by entering the command on the VSM.

If the upgrade was successful, the installation procedure is complete.

The following example shows how to upgrade the VEM software using the vCLI.

Note

The example may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

Note

The highlighted text in the previous command output confirms that the upgrade was successful.

# Upgrading the VEMs Manually from Release 4.2(1)SV2(1.1x) and Later Releases to the Current Release

#### **Before You Begin**

Note

If VUM is installed, it should be disabled.

To manually install or upgrade the Cisco Nexus 1000V VEM on an ESXi host, follow the steps in Upgrading the VEM Software Using the vCLI, on page 84.

To upgrade the VEMs manually, perform the following steps as network administrator:

Note

This procedure is performed by the network administrator. Before proceeding with the upgrade, make sure that the VMs are powered off if you are not running the required patch level.

Caution

If removable media is still connected, (for example, if you have installed the VSM using ISO and forgot to remove the media), host movement to maintenance mode fails and the VEM upgrade fails.

#### Step 1 switch# vmware vem upgrade notify

Coordinate with and notify the server administrator of the VEM upgrade process.

#### Step 2 switch# show vmware vem upgrade status

Verify that the upgrade notification was sent.

#### Step 3 switch# show vmware vem upgrade status

Verify that the server administrator has accepted the upgrade in vCenter Server. For details about the server administrator accepting the VEM upgrade, see Accepting the VEM Upgrade, on page 83. After the server administrator accepts the upgrade, proceed with the VEM upgrade.

- **Step 4** Perform one of the following tasks:
  - If the ESXi host is not hosting the VSM, proceed to Step 5.
  - If the ESXi host is hosting the VSM, coordinate with the server administrator to migrate the VSM to a host that is not being upgraded. Proceed to Step 5.

#### Step 5 switch# vmware vem upgrade proceed

Initiate the Cisco Nexus 1000V Bundle ID upgrade process.

**Note** If VUM is enabled in the vCenter environment, disable it before entering the **vmware vem upgrade proceed** command to prevent the new VIBs from being pushed to all the hosts.

Enter the **vmware vem upgrade proceed** command so that the Cisco Nexus 1000V Bundle ID on the vCenter Server gets updated. If VUM is enabled and you do not update the Bundle ID, an incorrect VIB version is pushed to the VEM when you next add the ESXi to the VSM.

**Note** If VUM is not installed, the "The object or item referred to could not be found" error appears in the vCenter Server task bar. You can ignore this error message.

#### Step 6 switch# show vmware vem upgrade status

Check for the upgrade complete status.

Step 7 Coordinate with and wait until the server administrator upgrades all ESXi host VEMs with the new VEM software release and informs you that the upgrade process is complete.

The server administrator performs the manual upgrade by using the **vihostupdate** command or the **esxcli** command. For more information, see Upgrading the VEM Software Using the vCLI, on page 84.

#### **Step 8** switch# vmware vem upgrade complete

Clear the VEM upgrade status after the upgrade process is complete.

#### Step 9 switch# show vmware vem upgrade status

Check the upgrade status once again.

#### Step 10 switch# show module

Verify that the upgrade process is complete.

**Note** The line with the bold characters in the preceding example display that all VEMs are upgraded to the current release.

The upgrade is complete.

The following example shows how to upgrade VEMs manually.

Note

The example may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

<sup>\*</sup> this terminal session

# Combined Upgrade of VMware vSphere and Cisco Nexus 1000V

You can perform a combined upgrade of VMware vSphere and Cisco Nexus 1000V.

If any of the hosts are running ESX 4.0 when the VSM is upgraded, the **installer** command displays that some VEMs are incompatible. You can proceed if you are planning a combined upgrade of the Cisco Nexus 1000V 4.2(1)SV1(4), 4.2(1)SV1(4a), 4.2(1)SV2(2.1), and ESX 4.0/4.1 to current release with ESX 5.0/5.1/5.5/6.0.

Note

Starting with the 4.2(1)SV2(2.1) release, during an VSM upgrade, if you have incompatible hosts attached to the VSM you will be allowed to upgrade from the current release of Cisco Nexus 1000V software to the later releases. You will see a warning message on incompatible host when you upgrade. Ignore the warning message and continue with the upgrade and the VSM will be upgraded to the latest version. You can perform a combined upgrade on the incompatible hosts.

Note

A combined upgrade is supported only for vCenter Server 5.0 Update 1 or later.

To perform a combined upgrade, follow the tasks documented in Upgrading from VMware Releases 5.x to VMware Release 6.0, on page 109

## Required Task After Upgrade—Changing the VEM Feature Level

After upgrading to Release 5.2(1)SV3(1.x), you must update the VEM feature level to the corresponding Release. After you perform this task, the new features in Release 5.2(1)SV3(1.x) are available on the Cisco Nexus 1000V and you have the option to increase the VLAN and port channel resource limits.

#### **Before You Begin**

• VSM and VEM have been upgraded to Release 5.2(1)SV3(1.x).

#### **Step 1** switch# configure terminal

Enters global configuration mode.

#### Step 2 switch(config)# show system vem feature level

Displays the current VEM feature level. The current feature level should be 5.2(1)SV3(1.x).

#### Step 3 switch(config)# system update vem feature level value

Configures the VEM feature level.

Note When you run the **system update vem feature level** command after upgrading from Release 5.2(1)SV3(1.6) to Release 5.2(1)SV3(2.5), it displays the following three versions:

- 5.2(1)SV3(1.7)
- 5.2(1)SV3(1.10)
- 5.2(1)SV3(1.15)
- 5.2(1)SV3(2.1)
- 5.2(1)SV3(2.5)

You must select 5.2(1)SV3(2.5) to update the VEM feature level to Release 5.2(1)SV3(2.5).

#### **Step 4** switch(config)# vdc switch-name

Enters VDC configuration mode for the specified switch.

#### **Step 5** switch(config-vdc)# limit-resource port-channel minimum value maximum value

Configures the port channel resource limit.

#### Step 6 switch(config-vdc)# limit-resource vlan minimum value maximum value

Configures the VLAN resource limit

#### Step 7 switch(config-vdc)# show resource

Displays the updated values.

#### Step 8 switch(config-vdc)# exit

Exists the current configuration mode.

#### Step 9 (Optional) switch(config)# copy running-config startup-config

Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to update the VEM feature level after upgrading to Release 5.2(1)SV3(1.x).

```
switch# configure terminal
Enter configuration commands, one per line. End with \mathtt{CNTL}/\mathtt{Z}.
switch(config)# system update vem feature ?
  level Updating vem feature level
switch(config) # system update vem feature level ?
         Version number index from the list above
switch(config)# system update vem feature level
             Version
Level
             String
           4.2(1)SV2(2.1)
           4.2(1)SV2(2.2)
           4.2(1)SV2(2.3)
           5.2(1)SV3(1.1)
           5.2(1)SV3(1.2)
           5.2(1)SV3(1.3)
           5.2(1)SV3(1.4)
           5.2(1)SV3(1.5)
           5.2(1)SV3(1.6)
10
           5.2(1)SV3(1.7)
11
           5.2(1)SV3(1.10)
12
           5.2(1)SV3(1.15)
           5.2(1)SV3(2.1)
14
           5.2(1)SV3(2.5)
switch (config) #
switch(config)# system update vem feature level 14
switch(config) # copy running-config startup-config
```

# **Simplified Upgrade Process**

#### **Combined Upgrade**

You can upgrade the VEM and ESX version simultaneously. It requires vSphere version 5.0 Update1 and later versions. It is supported in Cisco Nexus 1000V Release 4.2(1)SV1(5.2) and later. This upgrade can be implemented manually or by using VUM.

#### **Selective Upgrade**

You can upgrade a selective set of VEMs and a few hosts or clusters at a time in a single maintenance window. This enables incremental upgrades during short maintenance windows. It is supported with combined upgrades of VEM and ESX, and also with manual upgrades of VEMs only. It is supported for VUM-based combined upgrades with select hosts or clusters using the GUI. It is not supported with VUM-based upgrades of VEMs alone. To upgrade manually using this procedure follow these general steps:

- Identify the cluster or set of hosts in a cluster.
- Place the selected hosts in maintenance mode (to vacate the VMs).
- Upgrade the VEM image on the hosts using the manual command or scripts.
- Take the hosts out of maintenance mode, allowing Distributed Resource Scheduler (DRS) to rebalance VMs.

#### **Allowed Infrastructure Operations Under Selective Upgrade**

These operations are allowed under selective upgrades:

- vMotion of VMs with the following releases:
  - ∘ pre-5.2(1)SV3(1.x) to 5.2(1)SV3(1.x)
  - $\circ$  5.2(1)SV3(1.x) to pre-5.2(1)SV3(1.x)
  - $\circ$  5.2(1)SV3(1.x) to 5.2(1)SV3(1.x)
  - ° pre5.2(1)SV3(1.x) to pre-5.2(1)SV3(1.x)
- VEM restart
- Host Reboot
- Add modules in 5.2(1)SV3(1.x)
- Add or remove ports vEth ports
- Shut or no-shut on port
- Migrate ports to or from vSwitch
- · Add or delete VLAN or VLAN ranges

#### **Background Upgrade**

You can upgrade VEMs without a maintenance window for VEMs. You use the manual procedure to upgrade VEMs during production. Place the host in maintenance mode, upgrade the VEM, and remove the host from the maintenance mode. You do not have to shut off HA Admission Control and such (as you would during VUM upgrades). You must ensure the spare capacity in the cluster and perform a health check before the upgrade. To upgrade using this procedure follow these general steps:

- Upgrade the VSM first as usual. This may be done in a maintenance window
- Place one host at a time in maintenance mode (to vacate the VMs)
- Upgrade the VEM image on that host using manual commands or scripts
- Take the host out of maintenance mode, allowing the DRS to rebalance the VMs.
- Repeat the same procedure for every host in the DVS.

Note

Make sure there is enough spare capacity for HA and that all required ports have system profiles (such as mgmt vmk). Check the host health before upgrading.

#### **Extended Upgrade**

You can modify configurations between the upgrade maintenance windows. VSM configuration changes are allowed where you can add or remove modules, port configurations, VLANs, and other similar changes. If a set of hosts are upgraded to the latest VEM version using the Selective Upgrade or the Background Upgrade, the remaining set of hosts will remain in older VEM versions. During that time, various Cisco Nexus 1000V configuration changes are allowed between maintenanance windows.

Note

Do not make configuration changes during a maintenance window when the VEMs are being upgraded.

The list of allowed configuration changes are as follows:

- Add or remove modules
- Add or remove ports (ETH and VETH)
- Shut or no-shut a port
- · Migrate ports to or from a vswitch
- Change port modes (trunk or access) on ports
- Add or remove port profiles
- Modify port profiles to add or remove specific features such as VLANS, ACLs, QoS, or PortSec.
- Change port channel modes in uplink port profiles
- · Add or delete VLANs and VLAN ranges
- Add or delete static MACs in VEMs

Queuing configuration changes are not supported on QoS.

# Migrating from Layer 2 to Layer 3

## **Layer 3 Advantages**

The following lists the advantages of using a Layer 3 configuration over a Layer 2 configuration:

- The VSM can control the VEMs that are in a different subnets.
- The VEMs can be in different subnets.
- Because the VEMs can be in different subnets, there is no constraint on the physical location of the hosts.
- Minimal VLAN configurations are required for establishing the VSM-VEM connection when compared
  to Layer 2 control mode. The IP address of the VEM (Layer 3 capable vmknic's IP address) and the
  VSM's control0/mgmt0 interface are the only required information.
- In the VSM, either the mgmt0 or the control0 interface can be used as the Layer 3 control interface. If mgmt0 is used, there is no need for another IP address as the VSM's management IP address is used for VSM-VEM Layer 3 connection.
- If the management VMKernel (vmk0) is used as the Layer 3 control interface in the VEM, there is no need for another IP address because the host's management IP address is used for VSM-VEM Layer 3 connectivity.

Note

These advantages are applicable only for ESX-Visor hosts. On ESX-Cos hosts, a new VMKernel must be created.

## **Layer 2 to 3 Conversion Tool**

#### **About VSM-VEM Layer 2 to 3 Conversion Tool**

Use the VSM-VEM Layer 2 to 3 Conversion Tool as an optional, simplified method to migrate from Layer 2 to Layer 3 mode. The tool enables you to do the following:

- Check whether the prerequisites are met for the migration from L2 to L3 mode.
- Migrate the VSM from Layer 2 to Layer 3 Mode, with user interaction.

In the process of migration, the tool creates a port profile. You can use port profiles to configure interfaces, which you can assign to other interfaces to give them the same configuration. The VSM-VEM Layer 2 to 3 Conversion Tool also gives you the option of retrieving the IP addresses from a local file (static).

### Prerequisites for Using VSM-VEM Layer 2 to 3 Conversion Tool

The L2-L3\_CT.zip file contains the applications required to run VSM-VEM Layer 2 to 3 Conversion Tool Before you begin:

- Log in as administrator to use this conversion tool script.
- Download the L2-L3 CT.zip file from the CCO Download Center.
- Install Tool Conversion Language (TCL) version 8.4 or later on the workstation.
- Install VMware PowerShell API version 5.0 or later on both the vCenter and the workstation.
- Install OpenSSH on the workstation.
- In the workstation environment variables, add installation\_directory\_for\_OpenSSH\bin directory to the end of the Windows path variable.
- Ensure that VLANs are allowed on the uplinks.

Note

You must install vCenter, VSM, and OpenSSH with admin privileges.

#### **Using VSM-VEM Layer 2 to 3 Conversion Tool**

**Step 1** On your workstation, unzip the L2-L3\_CT.zip file to any folder.

When you unzip the file, a Pre-Migrate-Check-Logs folder is created that holds all the running logs. Debugging log files will be created in this folder.

**Step 2** Inside the L2-L3\_CT folder, run migration.bat as an administrator.

This starts the VSM-VEM Layer 2 to 3 Conversion Tool.

- **Step 3** Enter the VSM IP address.
- **Step 4** Enter the VSM username.
- **Step 5** Enter the vCenter IP.
- **Step 6** Enter the vCenter username.
- **Step 7** Enter the VSM password.
- **Step 8** Enter the vCenter password.

The migration tool begins creating the .csv file for the user, and then checks for a port profile with layer 3 capability.

- **Step 9** If there is no layer 3-capable port profile, the tool will prompt for the creation of one. If you don't want to create a layer-3 capable port profile, skip to the next step.
  - a) Enter yes to confirm when asked to create 1 layer 3-capable port profile.
  - b) Enter a layer 3 port profile name.
  - c) Enter access VLAN ID

This creates a port profile with the required configuration. You can select this port profile when prompted by the tool. The migration tool checks for connectivity between VSM, vCenter, and VEM modules. Wait for the message to display that all connectivity is fine.

**Step 10** Enter yes to continue when asked if you want to continue.

The migration tool proceeds to create an extract .csv file.

- **Step 11** Open the extract.csv file (in C:\Windows\Temp).
- **Step 12** Enter the vmknic IP details at the end of the text, delimited by semicolons, and save the file as convert.csv.
- **Step 13** Press any key to continue.
- **Step 14** Enter yes to confirm when asked if you are sure you completed the required steps.
- **Step 15** Enter the VSM password.
- **Step 16** Enter the vCenter password.

The migration tool connects to the vCenter and VSM of the user.

**Step 17** Enter yes to confirm when asked if you want to continue.

The migration process continues.

**Step 18** Enter the port profile name from the list of port profiles that appears at the prompt.

Once the port profile is selected, the max port value is automatically changed to 128.

- **Step 19** Enter yes to confirm when asked if you have updated convert.csv file as per the instructions.
- **Step 20** Enter yes to confirm, when asked if you want to continue.

The tool checks the connectivity between VSM, vCenter, and VEM modules. A message is displayed that the addition to vmknics are successful and all connectivity is fine. The **VmkNicAddingToHost** window will remain open until the configuration is complete.

- **Step 21** Enter yes to confirm that you would like to proceed with mode change from L2 to L3.
- Step 22 Enter yes to confirm when asked if you wish to continue.

Wait for the SUCCESSFULLY COMPLETED MIGRATION message to display. The migration from layer 2 to layer 3 is now complete. The operating mode should now be listed as L3.

#### **Using Extract Mode**

You can use Extract Mode to extract the attached VEM states and save them to the Extract.csv file, which is located in C:\Windows\Temp.

#### **SUMMARY STEPS**

1. Choose extract mode when prompted by VSM-VEM Layer 2 to 3 Conversion Tool. You can now view the data in the Extract.csv file in the Windows temp folder of your workstation.

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	Choose extract mode when prompted by VSM-VEM Layer 2 to 3 Conversion Tool. You can now view the data in the Extract.csv file in the Windows temp folder of your workstation.	This mode will not migrate the VSM.

#### **Using Convert Mode**

You can use Convert Mode to migrate the VSM from Layer 2 to Layer 3.

#### **SUMMARY STEPS**

- 1. Rename the Extract.csv file to Convert.csv
- **2.** Populate your Convert.csv file (in C:\Windows\Temp) with the vmknic IP address and netmask.
- 3. Run migration.bat.

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	Rename the Extract.csv file to Convert.csv	The migration tool will retrieve the data from the Convert.csv file.

	Command or Action	Purpose
Step 2	Populate your Convert.csv file (in C:\Windows\Temp) with the vmknic IP address and netmask.	
Step 3	Run migration.bat.	This will migrate the VSM mode from Layer 2 to Layer 3.

#### **Example**

The following example shows how to use the VSM-VEM Layer 2 to 3 Conversion Tool.

```
Enter VSM IP:
enter VSM Username:
Enter VC IP:
enter VC Username:
Enter VSM password:
Enter VC password:
create the Csv File for User I/P: C:\windows\temp\extract.csv

```

## Interface Comparisons Between mgmt0 and control0

The following describes the differences between using a mgmt0 interface or a control0 interface:

- On the VSM, there are two ways of connectivity via the mgmt0 or control0 interface.
- Setting mgmt0 as Layer 3 interface uses the mgmt0 interface on the VSM.
- The control0 interface is a special interface created for Layer 3 connectivity.
- The Layer 3 interface on the VEM is selected by designating the interface with the Layer 3 control capability.
- The egress control traffic route is decided by the VMware routing stack.
- On a VEM, the management vmknic (vmk0) can be used for Layer 3 control connectivity if it is managed by the Cisco Nexus 1000V and is designated with the Layer 3 control capability.

## **Configuring the Layer 3 Interface**

Configure either the control0 (see Step 1) or mgmt0 interface (see Step 2).

#### **Step 1** Configuring the control 0 interface.

**Note** When using control as the control interface on the VSM, the control interface must be assigned with an IP address.

a) Configure the IP address.

```
switch# configure terminal
switch(config)# interface control 0
switch(config-if)# ip address 5.5.5.2 255.255.255.0
```

b) Display the running configuration of the control0 interface.

```
switch# show running-config interface control 0
!Command: show running-config interface control0
!Time: Mon DEC 02 02:41:47 2015
version 5.2(1)SV3(2.1)
interface control0
  ip address 5.5.5.2/24
```

#### **Step 2** Configure the mgmt0 interface.

When using mgmt0 as the control interface, no configuration on the VSM is required as the mgmt0 interface is assigned with the host's management IP address.

a) Display the running configuration of the mgmt0 interface.

```
switch# show running-config interface mgmt 0
!Command: show running-config interface mgmt0
```

```
!Time: Mon DEC 02 02:43:25 2015
version 5.2(1)SV3(2.1)
interface mgmt0
  ip address 10.104.249.37/27
```

## **Creating a Port Profile with Layer 3 Control Capability**

#### **Before You Begin**

- You are creating a port profile with Layer 3 control capability.
- Allow the VLAN that you use for VSM to VEM connectivity in this port profile.
- Configure the VLAN as a system VLAN.

Note

VEM modules will not register to the VSM before a vmkernel interface (vmk) is migrated to a Layer 3 control capable port profile. You must migrate a vmk to the Layer 3 port profile after migrating host vmnics to Ethernet port profiles. Migrate your management vmkernel interface into the Layer 3 capable port profile. Do not use multiple vmkernel interfaces on the same subnet.

#### **Step 1** Create a Layer 3 port profile.

```
VSM_1# configure terminal

VSM_1(config)# port-profile type vethernet 13_control

VSM_1(config-port-prof)# switchport mode access

VSM_1(config-port-prof)# switchport access vlan 3160

VSM_1(config-port-prof)# capability 13control

VSM_1(config-port-prof)# vmware port-group

VSM_1(config-port-prof)# state enabled

VSM 1(config-port-prof)# no shutdown
```

#### **Step 2** Display the port profile.

```
VSM_1# show port-profile name 13_control
port-profile 13_control
type: Vethernet
description:
status: enabled
max-ports: 32
min-ports: 1
inherit:
config attributes:
switchport mode access
switchport access vlan 3160 (Allow the VLAN in access mode.)
no shutdown
evaluated config attributes:
switchport mode access
switchport mode access
switchport access vlan 3160
```

```
no shutdown
assigned interfaces:
Vethernet1
port-group: 13_control
system vlans: 3160 (Configure the VLAN as a system VLAN.)
capability 13control: yes (Configure capability 13 control.)
capability iscsi-multipath: no
capability vxlan: no
capability 13-vn-service: no
port-profile role: none port-binding: static
```

## **Creating a VMKernel on the Host**

Step	1	Log in	to the v	Center	Server.	
	_			-		

- **Step 2** Choose **Home > Inventory > Hosts and Clusters**.
- **Step 3** Choose the host.
- Step 4 Click the Configuration tab.
- **Step 5** In the Hardware pane, choose **Networking**.
- Step 6 Click the vSphere Distributed Switch button.
- Step 7 Go to Manage Virtual Adapters.
- **Step 8** Add and create a new VMKernel.

**Note** The management vmkernel can also be used as a Layer 3 control interface. For ESX-Visor hosts only. Migrate your management vmkernel interface into the Layer 3 capable port profile. Do not use multiple vmkernel interface on the same subnet.

- **Step 9** Assign the VMkernel to the port profile created in Creating a Port Profile with Layer 3 Control Capability, on page 101.
- **Step 10** Assign an IP address.

# **Configuring the SVS Domain in the VSM**

#### **Before You Begin**

The control or mgmt0 interface can be assigned as the Layer 3 control interface.

#### **Step 1** Disconnect the VSM to vCenter Server connection.

```
switch# configure terminal
switch(config)# svs connection toVC
switch(config-svs-conn)# no connect
switch(config-svs-conn)# exit
```

**Step 2** (Optional) Remove the control and the packet VLAN configuration.

```
switch(config) # svs-domain
switch(config-svs-domain) # no control vlan
switch(config-svs-domain) # no packet vlan
```

**Step 3** Change the svs mode from Layer 2 to Layer 3 with the mgmt0 interface as the Layer 3 control interface.

```
switch(config-svs-domain)# svs mode l3 interface mgmt0
switch(config-svs-domain)# exit
```

Note If the control interface is being used as the Layer 3 control interface, enter the svs mode 13 interface control command:

**Step 4** Restore the VSM to vCenter Server connection.

```
switch(config) # svs connection toVC
switch(config-svs-conn) # connect
switch(config-svs-conn) # end
```

**Note** After entering the **svs connection toVC** command, the module is detached and reattached in Layer 3 mode. If this delay is more than six seconds, a module flap occurs. This does not affect the data traffic.

**Step 5** Display the SVS domain configuration.

```
switch# show svs domain
```

```
SVS domain config:

Domain id: 3185

Control vlan: NA

Packet vlan: NA

L2/L3 Control mode: L3

L3 control interface: mgmt0

Status: Config push to VC successful.
```

Note: Control VLAN and Packet VLAN are not used in L3 mode.

Configuring the SVS Domain in the VSM

# **Upgrading a Standalone VSM**

This chapter contains the following sections:

- Upgrading a System with a Standalone VSM, page 105
- Upgrading a Standalone VSM, page 105

# **Upgrading a System with a Standalone VSM**

# **Upgrading a Standalone VSM**

Note

The example may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the Cisco Nexus 1000V and VMware Compatibility Information for your specific versions and filenames.

- Step 1 Log in to the VSM on the console.
- Step 2 Log in to Cisco.com to access the links provided in this document.

To log in, go to the URL http://www.cisco.com/ and click Log In at the top of the page. Enter your Cisco username and password.

Note Unregistered Cisco.com users cannot access the links provided in this document.

- Step 3 Access the Software Download Center by using this URL: http://www.cisco.com/public/sw-center/index.shtml
- Step 4 Navigate to the download site for your switch. You see links to the download images for your switch.
- Step 5 Select and download the Cisco Nexus 1000V zip file and extract the kickstart and system software files to a server.
- Ensure that the required space is available for the image files to be copied. Step 6 switch# dir bootflash:

```
Usage for bootflash://
485830656 bytes used
1109045248 bytes free
1594875904 bytes total
```

- We recommend that you have the kickstart and system image files for at least one previous release of the Cisco Nexus 1000V software on the system to use if the new image files do not load successfully.
- **Step 7** Delete unnecessary files to make space available if you need more space on the VSM bootflash,
- **Step 8** If you plan to install the images from the bootflash:, copy the Cisco Nexus 1000V kickstart and system images to the active VSM bootflash using a transfer protocol. You can use ftp:, tftp:, scp:, or sftp:. The examples in this procedure use scp:.

**Note** When you download an image file, change to your FTP environment IP address or DNS name and the path where the files are located.

```
switch# copy scp://user@scpserver.cisco.com//downloads/
nexus-1000v-kickstart.5.2.1.SV3.2.5.bin
switch# copy scp://user@scpserver.cisco.com//downloads/
nexus-1000v-kickstart.5.2.1.SV3.2.5.bin
```

- **Step 9** Read the release notes for the related image file. See the *Cisco Nexus 1000V Release Notes*.
- **Step 10** Determine the VSM status.

```
switch# show system redundancy status
Redundancy role
     administrative: standalone
        operational: standalone
Redundancy mode
_____
     administrative:
       operational:
                     None
This supervisor (sup-1)
_____
   Redundancy state: Active
   Supervisor state: Active
     Internal state: Active with no standby
Other supervisor (sup-2)
   Redundancy state: Not present
```

**Step 11** Save the running configuration to the start configuration.

```
switch# copy running-config startup-config
```

**Step 12** Update the boot variables and module images on the VSM.

[############### 100% -- SUCCESS

```
switch# install all system bootflash:nexus-1000v.5.2.1.SV3.2.5.bin kickstart
bootflash: nexus-1000v-kickstart.5.2.1.SV3.2.5.bin

Verifying image bootflash:/nexus-1000v-kickstart-5.2(1)SV3(2.5).bin for boot variable "kickstart".
[#################] 100% -- SUCCESS

Verifying image bootflash:/nexus-1000v-5.2(1)SV3(2.5).bin for boot variable "system".
```

```
Verifying image type.
[################ 100% -- SUCCESS
Extracting "system" version from image bootflash:/nexus-1000v.5.2(1)SV3(2.5).bin.
[############### 100% -- SUCCESS
Extracting "kickstart" version from image bootflash:/nexus-1000v-kickstart.5.2(1)SV3(2.5).bin.
[############### 100% -- SUCCESS
Notifying services about system upgrade.
[################ 1 100% -- SUCCESS
Compatibility check is done:
Module bootable
                    Impact Install-type Reason
1
          yes
                  disruptive
                                  reset Reset due to single supervisor
```

Images will be upgraded according to following table:

Module	Image	Running-Version	New-Version Upg-Re	sion Upg-Required		
1	system kickstart	5.2(1)SV3(2.1) 5.2(1)SV3(2.1)	5.2(1)SV3(2.5) 5.2(1)SV3(2.5)	yes yes		
Module	Running-Version	ESX Version	VSM Compatibility	ESX Compatibility		
3	5.2(1)SV3(2.1)	VMware ESXi 5.0.0 Releasebuild-1311175 (3.0)	COMPATIBLE	COMPATIBLE		

Switch will be reloaded for disruptive upgrade. Do you want to continue with the installation (y/n)? [n]

#### **Step 13** Continue with the installation by pressing Y.

# **Note** If you press N, the installation exits gracefully.

Install is in progress, please wait.

Setting boot variables.

[################ 100% -- SUCCESS

Performing configuration copy.

[################ 100% -- SUCCESS

Finishing the upgrade, switch will reboot in 10 seconds.

#### **Step 14** After the switch completes the reload operation, log in and verify that the switch is running the required software version.

#### Example:

switch# show version

#### **What to Do Next**

Continue to Upgrading the VEMs Manually from Release 4.2(1)SV2(1.1x) and Later Releases to the Current Release, on page 87.

# **Installing and Upgrading VMware**

This chapter contains the following sections:

- Upgrading from VMware Releases 5.x to VMware Release 6.0, page 109
- Installing VMware Release 5.x and 6.x Patches, page 117
- Verifying the Build Number and Upgrade, page 121

# **Upgrading from VMware Releases 5.x to VMware Release 6.0**

The steps to upgrade are as follows:

Note

Do not install VMware vSphere 5.5 Patch 2702864 with Cisco Nexus 1000V. The VMware vSphere 5.5 Patch 2702864 is not supported on Cisco Nexus 1000V.

#### **SUMMARY STEPS**

- **1.** Installing the vCenter Server, on page 110
- **2.** Upgrading the vSphere Client, on page 111
- **3.** Upgrading the vCenter Update Manager to Release 6.0, on page 111
- **4.** Creating a Customized Upgrade ISO with a VMware ESX Image and a Cisco Nexus 1000V VEM Image, on page 113
- **5.** Installing VMware Release 5.x or 6.x Patches:
  - Creating the Host Patch Baseline for 5.x or 6.x Patches, on page 117
  - Upgrading the ESXi Hosts to Release 5.x or 6.x Patches Using VMware Update Manager, on page 118
  - Upgrading the ESXi Hosts to Release 5.x or 6.x Using the CLI, on page 119
- **6.** Verifying the Build Number and Upgrade, on page 121

#### **DETAILED STEPS**

- Step 1 Installing the vCenter Server, on page 110
- **Step 2** Upgrading the vSphere Client, on page 111
- **Step 3** Upgrading the vCenter Update Manager to Release 6.0, on page 111
- Step 4 Creating a Customized Upgrade ISO with a VMware ESX Image and a Cisco Nexus 1000V VEM Image, on page 113
- **Step 5** Installing VMware Release 5.x or 6.x Patches:
  - Creating the Host Patch Baseline for 5.x or 6.x Patches, on page 117
  - Upgrading the ESXi Hosts to Release 5.x or 6.x Patches Using VMware Update Manager, on page 118
  - Upgrading the ESXi Hosts to Release 5.x or 6.x Using the CLI, on page 119
- **Step 6** Verifying the Build Number and Upgrade, on page 121

### Installing the vCenter Server

#### **Before You Begin**

- Download the upgrade ISO file that contains the ESXi image and the Cisco Nexus 1000V software image files.
- See the *Cisco Nexus 1000V and VMware Compatibility Information* document to determine the correct VIB Version, VEM Bundle, Host Build, vCenter Server, and Update Manager versions.
- **Step 1** Mount the vCenter Server 6.0 ISO image.
- **Step 2** Unzip the ISO image.
- **Step 3** If autorun doesn't start, double-click autorun.exe.
- Step 4 In the VMware vCenter Installer window, select vCenter Server for Windows and click Install.
- Step 5 Click Next.
- **Step 6** Accept the license agreements.
- **Step 7** Enter the vCenter Single Sign On password and the service account password if applicable and click **Next**.
- **Step 8** After the pre-upgrade checks are complete, accept the default ports and click **Next**.
- **Step 9** Check the box to verify that you have backed up this vCenter Server and its database and click **Upgrade**.
- Step 10 Click Finish.

#### What to Do Next

Complete the steps in Upgrading the vSphere Client, on page 111.

### **Upgrading the vSphere Client**

- **Step 1** Run the vSphere Client installer.
  - Start the vCenter Server installer. Double-click the autorun.exe file and select vSphere Client.
  - If you downloaded the vSphere Client, double-click the VMware-viclient-build number.exe file.
- Step 2 Click Next.
- **Step 3** Accept the terms in the license agreements and click **Next**.
- Step 4 Click Next.
- Step 5 Click Install.
- **Step 6** Click **Finish** after the installation completes.

#### What to Do Next

Complete the steps in Upgrading the vCenter Update Manager to Release 6.0, on page 111.

### **Upgrading the vCenter Update Manager to Release 6.0**

#### **Before You Begin**

You have upgraded the vCenter Server to the vSphere Client to a compatible version.

#### **SUMMARY STEPS**

- 1. In the VMware vCenter Installer window, select vCenter Update Manager Server and check Use Microsoft SQL Server 2012 Express as the embedded database.
- 2. Click Install.
- 3. Choose a language and click **OK**. The vCenter Update Manager Installer appears.
- 4. Click OK.
- **5.** Click **Next** to being the upgrade.
- **6.** View the patent agreement and click **Next**.
- 7. Click the I agree to the terms in the license agreement radio button and click Next.
- **8.** Verify the IP address and username in the VMware vCenter Server Information area .
- **9.** In the Password field, enter your password and click **Next**.
- 10. Click Next.
- 11. Click the Yes, I want to upgrade my Update Manager database radio button and click Next.
- **12.** Verify the Update Manager port settings and click **Next**.
- **13.** Verify the proxy settings and click **Next**.
- **14.** Click **Install** to begin the database upgrade.
- **15.** Click **OK** to acknowledge that a reboot will be required to complete the setup. During the upgrade, the vSphere Client is disconnected.
- **16.** Click **Cancel** for the attempt to reconnect.
- 17. Click **OK** in the Server Connection Invalid window.
- 18. Click Finish.
- 19. Reboot the vCenter Update Manager and vCenter Server.
- **20.** Select **Other (Planned)** from the Option drop-down list in the Shut Down Windows dialog box and enter a value in the comment field.
- 21. Click OK.
- **22.** After the system reboots, navigate to the C:\ProgramData\VMware Update Manager\Logs\folder and open the vmware-vum-server-log4cpp file.
- 23. Choose Manage Plug-ins from the VMware vCenter Server's Plug-in menu.
- 24. Click Download and Install for VMware vSphere Update Manager Extension under Available Plug-ins..

#### **DETAILED STEPS**

Step 1 In the VMware vCenter Installer window, select vCenter Update Manager Server and check Use Microsoft SQL Server 2012 Express as the embedded database.

**Note** If the Installer window is not open, run the autorun.exe file.

- Click Install. Step 2 Step 3 Choose a language and click **OK**. The vCenter Update Manager Installer appears. Click OK. Step 4
- Step 5 Click **Next** to being the upgrade.
- Step 6 View the patent agreement and click **Next**.
- Step 7 Click the I agree to the terms in the license agreement radio button and click Next.
- Step 8 Verify the IP address and username in the VMware vCenter Server Information area.
- Step 9 In the Password field, enter your password and click **Next**.
- Step 10 Click Next.
- Step 11 Click the Yes, I want to upgrade my Update Manager database radio button and click Next.
- Step 12 Verify the Update Manager port settings and click **Next**.
- Step 13 Verify the proxy settings and click Next.
- Step 14 Click **Install** to begin the database upgrade.
- Step 15 Click **OK** to acknowledge that a reboot will be required to complete the setup. During the upgrade, the vSphere Client is disconnected.
- Step 16 Click **Cancel** for the attempt to reconnect.
- Step 17 Click **OK** in the Server Connection Invalid window.
- Step 18 Click Finish.
- Step 19 Reboot the vCenter Update Manager and vCenter Server.
- Select Other (Planned) from the Option drop-down list in the Shut Down Windows dialog box and enter a value in the Step 20 comment field.
- Click OK. Step 21
- Step 22 After the system reboots, navigate to the C:\ProgramData\VMware Update Manager\Logs\folder and open the vmware-vum-server-log4cpp file.
- Step 23 Choose Manage Plug-ins from the VMware vCenter Server's Plug-in menu.
- Click Download and Install for VMware vSphere Update Manager Extension under Available Plug-ins.. Step 24

#### What to Do Next

Complete the steps in Creating a Customized Upgrade ISO with a VMware ESX Image and a Cisco Nexus 1000V VEM Image, on page 113.

### Creating a Customized Upgrade ISO with a VMware ESX Image and a Cisco **Nexus 1000V VEM Image**

#### **Before You Begin**

- Install the VMware PowerCLI on a Windows platform. For more information, see the vSphere PowerCLI Installation Guide.
- On the same Windows platform, where the VMware PowerCLI is installed, do one of the following:
  - Download the ESX depot, which is a .zip file, to a local file path.

• Download the VEM offline bundle, which is a .zip file, to a local file path.

- **Step 1** Start the VMWare PowerCLI application.
- Step 2 Run the Set-ExecutionPolicy unrestricted command.
- Step 3 Connect to the vCenter Server by using the Connect-VIServer IP\_address -User Administrator -Password password\_name command.
- Step 4 Load the ESXi depot by using the Add-ESXSoftwareDepot path name\file name command.
- Step 5 Display the image profiles by using the Get-EsxImageProfile command.
- Step 6 Clone the ESX standard image profile by using the New-ESxImageProfile -CloneProfile ESXImageProfile\_name -Name clone profile command.
  - **Note** The image profiles are usually in READ-ONLY format. You must clone the image profile before adding the VEM image to it.
- Step 7 Load the Cisco Nexus 1000V VEM offline bundle by using the Add-EsxSoftwareDepot VEM offline bundle command.
- **Step 8** Confirm that the n1kv-vib package is loaded by using the **Get-EsxSoftwarePackage -Name** package\_name command.
- Step 9 Bundle the n1kv-package into the cloned image profile by using the Add-EsxSoftwarePackage -ImageProfile n1kv-Image -SoftwarePackage cloned\_image\_profile command.
- **Step 10** Verify that the Cisco VIB is present by listing all the VIBs in the cloned image profile by entering the following commands.
  - a) **\$\simg = Get-EsxImageProfile** nlkv-Image
  - b) **\$img.vibList**

Verify that the Cisco VIB is present by listing all the VIBs in the cloned image profile.

**Step 11** Export the image profile to an ISO file by using the **Export-EsxImageProfile -ImageProfile** *n1kv-Image* **-FilePath** *iso filepath* command.

This example shows how to create an upgrade ISO with a VMware ESX image and a Cisco VEM image.

Note

The example may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

vSphere PowerCLI> Connect-VIServer 10.105.231.40 -User administrator -Password 'XXXXXXXXX

Working with multiple default servers?

Select [Y] if you want to work with more than one default servers. In this case, every time when you connect to a different server using Connect-VIServer, the new server connection is stored in an array variable together with the previously connected servers. When you run a cmdlet and the target servers cannot be determined from the specified parameters, the cmdlet runs against all servers stored in the array variable.

Select [N] if you want to work with a single default server. In this case, when you run a cmdlet and the target servers cannot be determined from the specified parameters, the cmdlet runs against the last connected server.

WARNING: WORKING WITH MULTIPLE DEFAULT SERVERS WILL BE ENABLED BY DEFAULT IN A FUTURE RELEASE. You can explicitly set your own preference at any time by using the DefaultServerMode parameter of Set-PowerCLIConfiguration.

## Installing VMware Release 5.x and 6.x Patches

### **Creating the Host Patch Baseline for 5.x or 6.x Patches**

#### **Before You Begin**

- VMware release 5.x or 6.x must be installed prior to installing a patch.
- Ensure you configure the VMware Update Manager Download settings with proxy enabled and VMware production portal links for VMware ESX/ESXi in connected state and download those images into the VUM patch repository.

Note

Do not install VMware vSphere 5.5 Patch 2702864 with Cisco Nexus 1000V. The VMware vSphere 5.5 Patch 2702864 is not supported on Cisco Nexus 1000V.

- Step 1 Under Home > Solutions and Applications > Update Manager, select Baselines and Groups tab.
- **Step 2** Under **Baseline**, click **Create** to create a baseline.
- Step 3 In the Baseline Name and Type window, enter a name for the baseline, select the Host Patch radio button and click Next.
- **Step 4** In the **Patch Options** window, select the **Fixed** radio button and click **Next**.
- Step 5 In the Patches window, select the required patch to upgrade to and move the selected patch to Fixed patches to Add column and click Next.

**Note** To find the 6.x or 5.1 update 1 and later patches, refer to http://www.vmware.com/patchmgr/findPatch.portal

Note

In the combined upgrade scenario, add the required Cisco Nexus 1000V VEM patch that corresponds to 6.x and 5.x releases to the **Fixed patches to Add** column along with ESXi 6.x and 5.x patches. You can get the required Cisco Nexus 1000V VEM patches into the VUM patch repository either from www.cisco.com, VMWare production portal links or through the VSM home page.

# Upgrading the ESXi Hosts to Release 5.x or 6.x Patches Using VMware Update Manager

Follow the same procedure to upgrade ESXi hosts 5.0 to 5.0 Update 1 and later.

- **Step 1** In the vSphere Client, choose **Home** > **Hosts and Clusters**.
- **Step 2** From the left navigation pane, select the host or cluster that needs to be upgraded and click **Update Manager**.
- Step 3 Click Attach.
- **Step 4** In the Individual Baselines by Type area, select your Patch baseline's radio button check box.
- Step 5 Click Attach.
- Step 6 Click Scan.
- Step 7 In the Confirm Scan dialog box, check the Patches and extensions box and click Scan. Verify if all the hosts are non-compliant.
- Step 8 Click Stage.
- **Step 9** In Baseline Selection window, keep the default selected baseline and click **Next**.
- **Step 10** In Patch and Extension exclusion window, keep the default selected baseline and click **Next**.
- Step 11 Click Finish.
- Step 12 Click Remediate and click Next.
- Step 13 In Patch and Extension exclusion window, keep the default selected baseline and click Next.
- Step 14 Click Next.
- Step 15 In the Host Remediate Options window, under Maintenance Mode Options, select the Disable any removable media devices connected to the virtual machines on the host check box.

Note If you have stateless host in your setup, select Enable Patch Remediation on Powered on PXE booted ESXi hosts radio button.

- Step 16 Click Next.
- Step 17 In the Cluster Remediation Options window, select all the check boxes and click Next.
- **Step 18** Click **Finish** to begin the remediation.

To check the host versions, on the left-hand pane, click on each host to confirm if version 6.x and 5.x appears in the top-left corner of the right-hand pane and the version information matches the information provided under the *Cisco Nexus 1000V and VMware Compatibility Information* guide.

You can also confirm if the upgrade was successful by executing the **show module** command on the VSM and check if the VEMs are running the correct build.

### Upgrading the ESXi Hosts to Release 5.x or 6.x Using the CLI

You can upgrade an ESXi host by installing a VMware patch or update with the compatible Cisco Nexus 1000V VEM software.

Do not install VMware vSphere 5.5 Patch 2702864 with Cisco Nexus 1000V. The VMware vSphere 5.5 Patch 2702864 is not supported on Cisco Nexus 1000V.

#### **Before You Begin**

- You have downloaded and installed the VMware vCLI. For information about installing the vCLI, see the VMware vCLI documentation.
- You are logged in to the remote host when the vCLI is installed.

Note

The vSphere Command-Line Interface (vSphere CLI) command set allows you to enter common system administration commands against ESXi systems from any machine with network access to those systems. You can also enter most vSphere CLI commands against a vCenter Server system and target any ESXi system that the vCenter Server system manages. vSphere CLI commands are especially useful for ESXi hosts because ESXi does not include a service console.

- If you are using the esxupdate command, you are logged into the ESX host.
- Check the Cisco Nexus 1000V and VMware Compatibility Information for compatible versions.
- You have already copied the ESXi host software and VEM software installation file to the /tmp directory.
- You know the name of the ESXi and VEM software file to be installed.
- **Step 1** Download the VEM software and copy them to the local host.
- **Step 2** Determine the upgrade method that you want to use.

If you are using the vCLI, enter the exceli command and install the ESXi and VEM software simultaneously.

#### esxcli software vib install -v full-path-to-vib

When using the esxcli software VIB install command, you must log in to each host and enter the command. ESXi expects the VIB to be in the /var/log/vmware directory if the absolute path is not specified.

```
# esxcli software vib update -d /var/tmp/update-from-esxi5.1-5.1_update01.zip
Installation Result
   Message: The update completed successfully, but the system needs to be rebooted for the changes to be effective.
   Reboot Required: true
   VIBs Installed: VMware_bootbank_esx-base_5.1.0-0.12.1065491,
VMware_locker_tools-light_5.1.0-0.12.1065491
   VIBs Removed: VMware_bootbank_esx-base_5.1.0-0.3.799733,

```

### **Upgrading the VMware DVS Version Using the VSM CLI**

You can upgrade the VMware DVS version from the current version (4.0 or 5.0) to 5.0 and above using the VSM commands.

#### **Before You Begin**

• You have upgraded the VSM to the current Cisco Nexus 1000V release.

The VMware ESXi host should be compatible with the new DVS version. Supported DVS versions are 5.0.0, 5.1.0, 5.5.0 or 6.0.0. If the ESXi host is incompatible with the new DVS version, the upgrade process fails.

- **Step 1** Log in to **sys-connection** command mode in the VSM.
- **Step 2** Configure the DVS version using **vmware dvs-version** *version\_no* command.

```
vsm(config-svs-conn)#
vsm(config-svs-conn)# vmware dvs-version 5.1.0
```

**Step 3** Verify the DVS version upgrade using **show svs connections** command.

vsm(config-svs-conn) # show svs connections

```
connection n1k-vc:
   hostname: -
   ip address: 103.3.176.26
   ipv6 address: -
   remote port: 80
   transport type: ipv4
   protocol: vmware-vim https
   certificate: default
   datacenter name: dc-tb22
   admin:
   max-ports: 12000
   DVS uuid: a4 a7 0f 50 c8 79 ba a2-85 86 75 fd 53 7f d9 25
   dvs version: 5.1.0
   config status: Enabled
   operational status: Connected
   sync status: Complete
   version: VMware vCenter Server 6.0.0 build-2559268
   vc-uuid: 4fd42386-8cba-4055-8872-6340e2f61d86
   ssl-cert: self-signed or not authenticated
```

# **Verifying the Build Number and Upgrade**

Note

The examples in the procedure may contain Cisco Nexus 1000V versions and filenames that are not relevant to your release. Refer to the *Cisco Nexus 1000V and VMware Compatibility Information* for your specific versions and filenames.

#### **Before You Begin**

• You have upgraded the VSMs and VEMs to the current Cisco Nexus 1000V release.

Note

The VSM upgrade will not proceed if ESX/ESXi 4.0 or 4.1 is part of the DVS. You must either remove ESX 4.0 or 4.1 from the DVS and proceed with VSM upgrade or upgrade ESX 4.0 or 4.1 to 5.0 or later releases and proceed with the VSM upgrade.

- You have upgraded the vCenter Server.
- You have upgraded the VMware Update Manager.
- You have upgraded your ESX/ESXi hosts.

#### **Step 1** Verify the build number on the ESXi host.

```
~ # vmware -v -1
VMware ESXi 5.5.0 build-2068190
VMware ESXi 5.5.0 Update 2
~ #
```

#### **Step 2** Verify the VIB installed

Cisco PartnerSupported

#### **Step 3** Verify VEM status.

#### ~ # vem status -v

```
Package vssnet-esxesx2013-release
Version 5.2.1.3.2.5.0-3.2.1
Build 1
Date Wed Sep 16:27:37 PST 2016
```

VEM modules are loaded
