Command-Line Interface Troubleshooting Commands

The command-line interface (CLI) allows you to configure and monitor Cisco NX-OS using a local console or remotely using a Telnet or Secure Shell (SSH) session. The CLI provides a command structure similar to Cisco IOS software, with context-sensitive help, **show** commands, multiuser support, and roles-based access control.

Each feature has **show** commands that provide information about the feature configuration, status, and performance. Additionally, you can use the following command for more information:

• **show system**—Provides information about system-level components, including cores, errors, and exceptions. Use the **show system error-id** command to find details on error codes.

```
switch# copy running-config startup-config
[############################# ] 100%
```

```
2013 May 16 09:59:29 zoom %$ VDC-1 %$ %BOOTVAR-2-AUTOCOPY_FAILED: Autocopy of file /bootflash/n9000-dk9.6.1.2.I1.1.bin to standby
```

```
switch# show system error-id 0x401e0008
```

Error Facility: sysmgr Error Description: request was aborted, standby disk may be full

Consistency Checker Commands

Cisco NX-OS provides consistency checker commands to validate the software state with the hardware state. The result of the consistency checker is logged as either PASSED or FAILED.

```
2019 May 1 16:31:39 switch vshd: CC_LINK_STATE: Consistency Check: PASSED
```

Consistency checker is a tool that performs the following functions:

- · Checks for system consistency
- Helps perform root cause analysis and fault isolation
- Checks for consistency between software and hardware tables

Cisco NX-OS supports the following consistency checker commands.

Table 1: Consistency Checker Commands

Command	Description	Supported Platforms
show consistency-checker copp	Verifies CoPP programming.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker dme interfaces	Verifies the DME interfaces.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
show consistency-checker egress-xlate private-vlan	Verifies the private VLAN egress-xlate in the hardware.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker fex-interfaces {fex fex-id interface ethernet fex-id/fex-slot/fex-port} [brief detail]	Compares the software and hardware state of FEX interfaces.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
		Note The fex-slot is always 1.

Command	Description	Supported Platforms
test consistency-checker forwarding {ipv4 ipv6} [vrf vrf-name all] [module module-number all]	Starts the Layer 3 route consistency checker test.	All Cisco Nexus 9000 Series switches
show consistency-checker forwarding {ipv4 ipv6} [vrf vrf-name all] [module module-number all]	Displays the Layer 3 route consistency checker test result.	All Cisco Nexus 9000 Series switches
show consistency-checker forwarding single-route {ipv4 ipv6} ip-address vrf vrf-name} [brief detail]	Checks for Layer 3 route consistency for a specific route. Warns when a single-route fails due to ECMP group table exhaustion.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
		Note Cisco Nexus 34180YC platform switches support only the ipv4 command.
show consistency-checker gwmacdb	Checks for hardware and software consistency in the gateway MAC address database.	All Cisco Nexus 9000 Series switches
	Note This command might show incorrect results for 4-way HSRP.	
show consistency-checker kim interface {ethernet slot/port port-channel number vlan vlan-id} [brief detail]	Verifies the internal connectivity between the supervisor and the line card.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker 12 module module-number	Verifies that learned MAC addresses are consistent between the software and the hardware. It also shows extra entries that are present in the hardware but not in the software and missing entries in the hardware.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards

Command	Description	Supported Platforms
show consistency-checker 12 multicast group ip-address source ip-address vlan vlan-id [brief detail]	Checks for inconsistencies with Layer 2 multicast groups.	Cisco Nexus 9200, 9300-EX, 9300-FX, and 9300-GX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
		Cisco Nexus 9500 series switches with N9K-X9432C-S, N9K-X9536PQ line cards.
		Cisco Nexus 9500 series switches with N9K-X9432C-FM-S, N9K-C9508-FMX-S, N9K-C9508-FM-S fabric modules.
		Cisco Nexus N3K-C3232C, N3K-C3264Q, N3K-C31108TC-V, N3K-C3132Q-40GX, N3K-C3132Q-V, N3K-C31108PC-V, N3K-C3172PQ, N3K-C3172PQ, N3K-C3164Q, and N3K-C31128PQ-10GE switches. Cisco Nexus N9K-C9372TX, N9K-C9372TX-E, N9K-C93120TX, N9K-C9372PX, N9K-C9372PX and N9K-C9372PX eswitches.
show consistency-checker 12 switchport interface {ethernet slot/port port-channel number }[brief detail all]	Checks for inconsistencies with switchport interfaces.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker 13-interface interface ethernet slot/port [brief detail]	Checks for Layer 3 settings of an interface in the hardware and for the following configuration in the hardware: L3 VLAN, CML Flags, IPv4 Enable, VPN ID. This command works for physical interfaces and interfaces that are part of a port channel. It does not validate subinterfaces or FEX interfaces. Beginning Cisco NX-OS Release 9.3(5) this command checks for Layer 3 settings of an SI and SVI interfaces; and the support is extend to Cisco Nexus 9300-GX platform switches.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX devices.
show consistency-checker 13-interface module module-number [brief detail]	Checks for Layer 3 settings of all interfaces in the module and for the following configuration in the hardware: L3 VLAN, CML Flags, IPv4 Enable, VPN ID. This command works for physical interfaces and interfaces that are part of a port channel. It does not validate subinterfaces.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards

Command	Description	Supported Platforms
show consistency-checker 13 multicast group ip-address source ip-address vrf vrf-name [brief detail]	Checks for inconsistencies with Layer 3 multicast groups.	Cisco Nexus 9200, 9300-EX, 9300-FX, and 9300-GX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
		Cisco Nexus 9500 Series switches with N9K-X9432C-S, N9K-X9536PQ line cards; and N9K-X9432C-FM-S, N9K-C9508-FMX-S, and N9K-C9508-FM-S fabric modules.
		Cisco Nexus N3K-C3048TP, N3K-C3064-TC, N3K-C3232C, N3K-C3264Q, N3K-C31108TC-V, N3K-C3132Q-40GX, N3K-C3132Q-V, N3K-C31108PC-V, N3K-C3172PQ, N3K-C3172TQ, N3K-C3164Q, and N3K-C31128PQ-10GE switches.
		Cisco Nexus N9K-C9372TX, N9K-C9372TX-E, N9K-C93120TX, N9K-X9432C-S, N9K-C9332PQ, N9K-C9372PX and N9K-C9372PX-E switches.
show consistency-checker link-state fabric-ieth [module module-number] [brief detail]	Verifies the programming consistency between software and hardware for the link-state status of internal fabric ports.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker link-state interface ethernet slot/port [brief detail]	Verifies the programming consistency between software and hardware for the link-state status of the interfaces. This command works for physical Ethernet interfaces and physical Ethernet interfaces that are part of a port channel. It does not validate subinterfaces or FEX interfaces.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker link-state module module-number [brief detail]	Verifies the software link state of all the interfaces in the module against its hardware link state. This command works for physical Ethernet interfaces and physical Ethernet interfaces that are part of a port channel. It does not validate subinterfaces or FEX interfaces.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker membership port-channels [interface port-channel channel-number] [brief detail]	Checks for port-channel membership in the hardware in all modules and validates it with the software state. This command runs per port channel.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker membership port-channels [brief detail]	Checks for port-channel membership in the hardware in all modules and validates it with the software state. This command runs for all port channels in the system.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker membership vlan vlan-id {native-vlan private-vlan interface {ethernet slot/port port-channel number native-vlan}} [brief detail interface]	Determines that the VLAN membership in the software is the same as programmed in the hardware. It also ignores the interfaces that are in the STP BLK state.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards Note The private-vlan command does not support the brief or detail option.
		Note Cisco Nexus 34180YC platform switches support only the native-vlan command.
show consistency-checker pacl {module module-number port-channels interface port-channel channel-number}	Validates the IPv4, IPv6, and MAC PACL programming consistency between the hardware and software and verifies if < label, entry-location pairs are consistent between the hardware and software.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker pacl extended ingress {ip ipv6 mac} interface {ethernet slot/port port-channel number} [brief detail]	Verifies PACL programming for ingress interfaces (including FEX interfaces) and port channels.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
show consistency-checker pacl extended ingress {ip ipv6 mac} module module-number [brief detail]	Verifies PACL programming across all physical interfaces, subinterfaces, breakout ports, and FEX interfaces for the specified module.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
show consistency-checker port-state fabric-ieth [module module-number [ieth-port ieth-port]] [brief detail]	Verifies the state of internal fabric ports.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker port-state [module module-number] [brief detail]	Verifies the port state for the specified module.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
show consistency-checker racl {module module-number port-channels interface port-channel channel-number svi interface vlan vlan-id}	Validates the IPv4 and IPv6 RACL programming consistency between the hardware and software and verifies if <label, entry-location=""> pairs are consistent between the hardware and software.</label,>	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
	When invoked per module, this command verifies IPv4 and IPv6 ACL consistency for all of the physical interfaces and subinterfaces for that module.	
	 When invoked on a specific port channel, this command verifies for all the member ports. 	
	When invoked on all port channels, this command verifies for each port channel that has an ACL applied.	
	Note This command does not verify IPv4 and IPv6 ACLs and does not verify if qualifiers and actions are matching.	

Command	Description	Supported Platforms
show consistency-checker racl extended ingress {ip ipv6} interface {ethernet slot/port port-channel number vlan vlan-id} [brief detail]	Verifies RACL programming for ingress interfaces, subinterfaces, breakout ports, port channels, or SVIs.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
show consistency-checker racl extended ingress {ip ipv6} module module-number [brief detail]	Verifies RACL programming for ingress interfaces on the specified module. This command runs across all of the physical interfaces, subinterfaces, and breakout ports for that module.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
show consistency-checker stp-state vlan vlan-id [brief detail interface]	Determines whether the spanning tree state in the software is the same as programmed in the hardware. This command is run only on interfaces that are operational (up).	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards.
show consistency-checker vacl extended ingress {ip ipv6 mac} vlan vlan-id [brief detail]	Verifies VACL programming on all of the member interfaces of the VLAN.	Cisco Nexus 34180YC, 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards

Command	Description	Supported Platforms
show consistency-checker vpc [source-interface] [brief detail]	Checks for vPC inconsistencies.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX and -FX line cards
		Cisco Nexus 9500 Series switches with N9K-X9432C-S, N9K-X9536PQ line cards; and N9K-X9432C-FM-S, N9K-C9508-FMX-S, and N9K-C9508-FMX-S fabric modules.
		Cisco Nexus N3K-C3048TP, N3K-C3064-TC, N3K-C3232C, N3K-C3264Q, N3K-C31108TC-V, N3K-C3132Q-40GX, N3K-C3132Q-V, N3K-C3172PQ, N3K-C3172PQ, N3K-C3172PQ, N3K-C3164Q, and N3K-C31128PQ-10GE switches. Cisco Nexus N9K-C9372TX, N9K-C9372TX-E, N9K-C93120TX, N9K-C93120TX, N9K-X9432C-S, N9K-C9332PQ, N9K-C9372PX and N9K-C9372PX-E switches.
show consistency-checker vxlan config-check [verbose-mode]	Verifies the VXLAN EVPN configuration on the switch.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and
		3132C-Z switches. Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.

Command	Description	Supported Platforms
show consistency-checker vxlan infra [verbose-mode]	Checks for inconsistencies with the VXLAN tunnel infrastructure.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.
show consistency-checker vxlan 12 module module-number	Verifies the consistency with VXLAN Layer 2 routes.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.
show consistency-checker vxlan 13 vrf [vrf-name all] [start-scan	Checks for inconsistencies with VXLAN Layer 3 routes.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches
report]		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.

Command	Description	Supported Platforms
show consistency-checker vxlan pv	Verifies if VLAN mappings are programmed consistently between the software and across different tables in the hardware. At least one interface needs to be enabled with port VLAN mappings in order to run this command.	Cisco Nexus 9200, 9300-EX, and 9300-FX/FX2, and 9500 platform switches
show consistency-checker vxlan qinq-qinvni	Checks for a multi-tag VLAN list and associated multi-tag vn-segment being consistent in the software and hardware.	Cisco Nexus 9300-FX/FX2 platform switches
show consistency-checker vxlan selective-qinvni interface {ethernet slot/port port-channel channel-number}	Validates if port-specific selective Q-in-VNI mappings are programmed correctly in the software and hardware in order for the inner tags in the packets to be preserved.	Cisco Nexus 9300-EX and 9300-FX/FX2 platform switches
show consistency-checker vxlan vlan [all vlan-id] [verbose-mode]	Checks for inconsistencies with VXLAN VLANs.	Cisco Nexus 9300-EX and 9300-FX/FX2 platform switches
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.
show consistency-checker vxlan xconnect	Checks for inconsistencies with VXLAN Xconnect VLANs. Validates that Xconnect ACLs are installed on all units and slices and MAC learn is disabled on all Xconnect VLANs.	Cisco Nexus 9200, 9332C, 9364C, 9300-EX, and 9300-FX/FX2 platform switches

Command	Description	Supported Platforms
show consistency-checker vxlan 13 single-route [ipv4 ipv6] [vrf]	Checks for inconsistencies with VXLAN layer 3 single route traffic.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches.
		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches and Cisco Nexus 9200, 9300-EX and 9300-FX platform switches.
show consistency-checker vxlan 12 [mac-address] [mac-address	Checks for inconsistencies with VXLAN layer 2.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches.
] module] [module		Cisco Nexus C31108PC-V, C31108TC-V, C3132Q-V and 3132C-Z switches.
		Cisco Nexus C9396TX, C93128TX, C9396PX, X9564PX, X9564TX and X9536PQ switches and Cisco Nexus 9200, 9300-EX and 9300-FX platform switches.
		Cisco Nexus C3132Q-40GE-SUP, C3132Q-40GX-SUP, C3132Q-XL, C31128PQ-10GE, C3264Q-S, C3264C-E switches.

Command	Description	Supported Platforms
show consistency-checker storm-control	Storm control consistency checker	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, -FX, and -R line cards
		Beginning with Cisco NX-OS Release 9.3(5), it is supported on N3K-C3016Q-40GE,N3K-C3048IP-IGE, N3K-C3064PQ-10GE, N3K-C3064PQ-10GX, N3K-C3064T-10GT, N9K-C9504-FM, N9K-C9508-FM, N9K-C9516-FM, N9K-C9508-FM-S, N3K-C31128PQ, N3K-C312Q-V, N3K-C31108PC-V, N3K-C31108TC-V, N3K-C3132Q-V, N3K-C3132C-Z, N9K-C93128TX, N9K-C9396PX, N9K-C9372PX and N9K-C9332PQ devices.
show consistency-checker segment-routing mpls [ip] [ip-address] mask] [mask vrf] [vrf	Checks route consistency for Underlay Segment Routing (ISIS, BGP, OSPF) and Overlay routes Layer 3 VPN and Layer 2 EVPN.	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, and -FX line cards.
		Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX devices.
show consistency-checker segment-routing mpls label	Checks label consistency for Underlay Segment Routing (ISIS, BGP, OSPF) and Overlay routes Layer 3 VPN, Layer 2 EVPN, and ADJ SIDS	Cisco Nexus 9200, 9300-EX, and 9300-FX platform switches and Cisco Nexus 9500 platform switches with -EX, and -FX line cards. Cisco Nexus N9K-C9316D-GX,
		N9K-C93600CD-GX, N9K-C9364C-GX devices.

The following commands do not support JSON output:

 $\bullet \ show\ consistency\text{-}checker\ forwarding\ \{ipv4\ |\ ipv6\}\ [vrf\ \textit{vrf-name}\ |\ all\]\ [module\ \textit{module-number}\ |\ all\]$

- show consistency-checker pacl {module module-number | port-channels interface port-channel channel-number}
- show consistency-checker racl module module-number
- show consistency-checker racl port-channels interface port-channel channel-number}
- show consistency-checker racl svi interface vlan vlan-id
- · show consistency-checker vxlan
- test consistency-checker forwarding {ipv4 | ipv6} [vrf vrf-name | all] [module module-number | all]

The **show consistency-checker vxlan** commands are not modeled.

Multicast Consistency Checker

The multicast consistency checker is a single-route consistency checker for Layer 2 and Layer 3 routes for verifying the state of multicast routes. The multicast consistency checker executes the show commands in each component, parses the relevant information, and then compares the processed information against the other components to check for inconsistencies. The multicast consistency checker commands terminate upon encountering a failure. The **show consistency-checker 12 multicast group** and **show consistency-checker 13 multicast group** commands return the differences in the expected value and the actual value.

The commands support the following output formats:

- verbose: Displays the results in text format.
- **detail**: Displays the results in JSON format.
- **brief**: Displays the results in JSON format with minimal details.

The multicast consistency checker supports the following devices:

- Cisco Nexus 92304QC, 9272Q, 9236C, 92300YC, 93108TC-EX, 93180LC-EX, 93180YC-EX, and 9300-GX platform switches and N9K-X9736C-EX, N9K-X97160YC-EX, N9K-X9732C-EX, and N9K-X9732C-EXM line cards.
- Cisco Nexus 9500 Series switches with N9K-X96136YC-R, N9K-X9636C-R, and N9K-X9636Q-R line cards.

Beginning with Cisco NX-OS Release 9.3(5), multicast consistency checker supports the following devices:

- Cisco Nexus 9500 Series switches with N9K-X9432C-S, N9K-X9536PQ line cards; and N9K-X9432C-FM-S, N9K-C9508-FMX-S, and N9K-C9508-FM-S fabric modules.
- Cisco Nexus N3K-C3232C, N3K-C3264Q, N3K-C31108TC-V, N3K-C3132Q-40GX, N3K-C3132Q-V, N3K-C31108PC-V, N3K-C3172PQ, N3K-C3172TQ, N3K-C3164Q, and N3K-C31128PQ-10GE switches.
- Cisco Nexus N9K-C9372TX, N9K-C9372TX-E, N9K-C93120TX, N9K-X9432C-S, N9K-C9332PQ, N9K-C9372PX, and N9K-C9372PX-E switches.

The Multicast Consistency Checker verifies the programming consistency of the following Layer 2 components:

- IGMP snooping
- MFDM

- MFIBPI
- MFIBPD
- Hardware tables

The Multicast Consistency Checker verifies the programming consistency of the following Layer 3 components:

- PIM
- MRIB
- IGMP snooping
- MFDM
- MFIBPI
- MFIBPD
- · Hardware tables

Output Examples for Multicast Consistency Checker Commands

The following is an example of IGMP snooping output:

The following is an example of MFDM output:

```
switch# show forwarding distribution 12 multicast vlan 222 group 225.12.12.28 source
225.12.12.28

Vlan: 222, Group: 225.12.12.28, Source: 225.12.12.28
   Outgoing Interface List Index: 4
   Reference Count: 204
   Num L3 usages: 4
   Platform Index: 0xa00004
   Vpc peer link exclude flag set
   Number of Outgoing Interfaces: 5
    Ethernet1/2
   Ethernet1/3
   port-channel12
   port-channel18
```

The following is an example of comparing IGMP Snooping with MFDM (passed):

port-channel100

```
MFDM: 12, 100, 18

CC between IGMP Snooping and MFDM PASSED
```

The following is an example of comparing IGMP Snooping with MFDM (failed):

Congestion Detection and Avoidance

Beginning Cisco NX-OS Release 9.3(3), Cisco Nexus 9000 series switches supports **show tech-support slowdrain** command to troubleshoot congestion issues. The **show tech-support slowdrain** command contains some of the congestion detection indications, counters, and log messages as well as other commands that allow an understanding of the switches, Cisco NX-OS versions, and topology.

Since, congestion can propagate from one switch to another, you must gather the **show tech-support slowdrain** command output from all the switches at the same time for a better assessment of the congestion triggers and propagation.

ACL Consistency Checker

Beginning with Cisco NX-OS Release 9.3(3), the ACL consistency checker supports the following devices:

N9K-C9372PX, N9K-C9372PX-E, N9K-C9372TX, N9K-C9372TX-E, N9K-C9332PQ, N9K-C93128TX, N9K-C9396PX, N9K-C9396TX, N9K-C9508-FM-S, N9K-C9508-FM2, N9K-C9504-FM-S, N9K-X9632PC-QSFP100, N9K-X9432C-S

Beginning with Cisco NX-OS Release 9.3(5), the ACL consistency checker is supported on Cisco Nexus N9K-C9316D-GX, N9K-C93600CD-GX, N9K-C9364C-GX, N9K-C93240YC-FX2, N9K-C93180YC-EX, N3K-C3636C-R, N3K-C36180YC-R; and Cisco Nexus 9500 Series switches with N9K-X9636Q-R, N9K-X9636C-R, N9K-X9636C-RX and N9K-X96136YC-R line cards.

The following entities are verified as part of the ACL consistency check:

Action, Protocol, SIP, DIP, source port, destination port, Source MAC, Destination MAC, Ethertype, COS, DSCP, VLAN and UDFs.

Cisco NX-OS supports the following PACL, RACL, and VACL consistency checker commands.

Command	Description
show consistency-checker pacl extended ingress ip module <module-id> [brief detail]</module-id>	Verifies PACL consistency check for ingress interfaces and port channel for the specified IP module.
show consistency-checker pacl extended ingress ipv6 module <module-id> [brief detail]</module-id>	Verifies PACL consistency check for ingress interfaces and port channel for the specified IPv6 module.
show consistency-checker pacl extended ingress mac module <module-id> [brief detail]</module-id>	Verifies MAC PACL consistency check for ingress interfaces and port channel for the specified MAC module.
show consistency-checker pacl extended ingress ip interface { <int-id> <ch-id> [brief detail]</ch-id></int-id>	Verifies PACL consistency check for the specified ingress interface.
show consistency-checker pacl extended ingress ipv6 interface { <int-id> <ch-id> [brief detail]</ch-id></int-id>	Verifies PACL consistency check for the specified IPv6 ingress interface.
show consistency-checker pacl extended ingress mac interface { <int-id> <ch-id> [brief detail]</ch-id></int-id>	Verifies PACL consistency check for the specified ingress MAC interface.
show consistency-checker racl extended ingress ip module <module-id> [brief detail]</module-id>	Verifies RACL consistency check for ingress interfaces and port channel for the specified IP module.
show consistency-checker racl extended ingress ipv6 module <module-id> [brief detail]</module-id>	Verifies RACL consistency check for ingress interfaces and port channel for the specified IPv6 module.
show consistency-checker racl extended ingress ip interface { <int-id> <ch-id> <vlan-id>} [brief detail]</vlan-id></ch-id></int-id>	Verifies RACL consistency check for the specified ingress interface.
show consistency-checker racl extended ingress ipv6 interface { <int-id> <ch-id> <vlan-id>} [brief detail]</vlan-id></ch-id></int-id>	Verifies RACL consistency check for the specified ingress IPv6 interface.
show consistency-checker vacl extended ingress ip vlan <vlan-id> [brief detail]</vlan-id>	Verifies VACL consistency check for the specified IP VLAN.
show consistency-checker vacl extended ingress ipv6 vlan <vlan-id> [brief detail]</vlan-id>	Verifies VACL consistency check for the specified IPv6 VLAN.
show consistency-checker vacl extended ingress mac vlan <vlan-id> [brief detail]</vlan-id>	Verifies VACL consistency check for the specified ingress MAC VLAN.

Output Examples for ACL Consistency Checker Commands

This example shows the RACL consistency check results:

switch# show consistency-checker racl extended ingress ip module 1 Consistency checker passed for Eth1/3 (ingress, ip, ip-list) switch#

```
switch#
switch# show consistency-checker racl extended ingress ip module 1 brief
   "result": {
   "status": "CC STATUS OK",
   "checkers": [
       "version": 1,
       "type": "CC_TYPE_IF_RACL",
       "status": "CC_STATUS_OK",
        "platformDetails": {
        "classType": "CC PLTFM NXOS BCM"
      "recoveryActions": [],
      "failedEntities": []
    ]
   }
}
switch#
switch # show consistency-checker racl extended ingress ip interface ethernet 3/5
Consistency checker passed for Ethernet3/5 (ingress, ip, ip-list)
switch#
switch# show consistency-checker racl extended ingress ip interface ethernet 3/5 brief
   "result": {
   "status": "CC STATUS OK",
    "checkers": [
       "version": 1,
       "type": "CC_TYPE_IF_RACL",
       "status": "CC STATUS OK",
       "platformDetails": {
       "classType": "CC PLTFM NXOS BCM"
       "recoveryActions": [],
       "failedEntities": []
     }
    1
```

Configuration Files

Configuration files contain the Cisco NX-OS commands used to configure the features on a Cisco NX-OS device. Cisco NX-OS has two types of configuration files: running configuration and startup configuration. The device uses the startup configuration (startup-config) during the device startup to configure the software features. The running configuration (running-config) contains the current changes that you make to the startup-configuration file. You should create a backup version of your configuration files before modifying that configuration. You can back up the configuration files to a remote server. See the configuration file information in the *Cisco Nexus 9000 Series NX-OS Fundamentals Configuration Guide*. You can also create a checkpoint copy of the configuration file that you can roll back to if problems occur. See the rollback feature in the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

Cisco NX-OS features can create internal locks on the startup configuration file. In rare cases, these locks might not be removed by the features. Use the **system startup-config unlock** command to remove these locks.

CLI Debug

Cisco NX-OS supports an extensive debugging feature set for actively troubleshooting a network. Using the CLI, you can enable debugging modes for each feature and view a real-time updated activity log of the control protocol exchanges. Each log entry has a time stamp and is listed chronologically. You can limit access to the debug feature through the CLI roles mechanism to partition access on a per-role basis. While the **debug** commands show real-time information, you can use the **show** commands to list historical and real-time information.

Caution

Use the **debug** commands only under the guidance of your Cisco technical support representative because some **debug** commands can impact your network performance.

Note

You can log debug messages to a special log file, which is more secure and easier to process than sending the debug output to the console.

By using the ? option, you can see the options that are available for any feature. A log entry is created for each entered command in addition to the actual debug output. The debug output shows a time-stamped account of the activity that occurred between the local device and other adjacent devices.

You can use the debug facility to track events, internal messages, and protocol errors. However, you should be careful when using the debug utility in a production environment because some options might prevent access to the device by generating too many messages to the console or creating CPU-intensive events that could seriously affect network performance.

Note

We recommend that you open a second Telnet or SSH session before you enter any **debug** commands. If the debug session overwhelms the current output window, you can use the second session to enter the **undebug all** command to stop the debug message output.

Debug Filters

You can filter out unwanted debug information by using the **debug-filter** command. The **debug-filter** command allows you to limit the debug information produced by related **debug** commands.

The following example limits EIGRP hello packet debug information to Ethernet interface 2/1:

```
switch# debug-filter ip eigrp interface ethernet 2/1
switch# debug eigrp packets hello
```

Ping and Traceroute

Note

Use the ping and traceroute features to troubleshoot problems with connectivity and path choices. Do not use these features to identify or resolve network performance issues.

The **ping** and **traceroute** commands are two of the most useful tools for troubleshooting TCP/IP networking problems. The ping utility generates a series of echo packets to a destination across a TCP/IP internetwork. When the echo packets arrive at the destination, they are rerouted and sent back to the source.

The traceroute utility operates in a similar fashion but can also determine the specific path that a frame takes to its destination on a hop-by-hop basis.

Using Ping

Use the **ping** command to verify connectivity and latency to a particular destination across an IPv4 routed network.

Use the **ping6** command to verify connectivity and latency to a particular destination across an IPv6 routed network.

The ping utility allows you to send a short message to a port or end device. By specifying the IPv4 or IPv6 address, you can send a series of frames to a target destination. Once these frames reach the target, they are looped back to the source and a time stamp is taken.

Note

We do not recommend using the Ping utility to test network performance with the IP address configured on the Nexus switch. ICMP (Ping) traffic directed to the switch IP address is subject to CoPP (Control Plane Policing) and may be dropped.

```
switch# ping 172.28.230.1 vrf management
PING 172.28.230.1 (172.28.230.1): 56 data bytes
64 bytes from 172.28.230.1: icmp_seq=0 ttl=254 time=1.095 ms
64 bytes from 172.28.230.1: icmp_seq=1 ttl=254 time=1.083 ms
64 bytes from 172.28.230.1: icmp_seq=2 ttl=254 time=1.101 ms
64 bytes from 172.28.230.1: icmp_seq=3 ttl=254 time=1.093 ms
64 bytes from 172.28.230.1: icmp_seq=4 ttl=254 time=1.237 ms
--- 172.28.230.1 ping statistics ---
5 packets transmitted, 5 packets received, 0.00% packet loss round-trip min/avg/max = 1.083/1.121/1.237 ms
```

Using Traceroute

Use traceroute to do the following:

- Trace the route followed by the data traffic.
- Compute the interswitch (hop-to-hop) latency.

The traceroute utility identifies the path taken on a hop-by-hop basis and includes a time stamp at each hop in both directions. You can use traceroute to test the connectivity of ports along the path between the generating device and the device closest to the destination.

Use the **traceroute** { dest-ipv4-addr | hostname } [**vrf** vrf-name] command for IPv4 networks and the **traceroute6** { dest-ipv6-addr | hostname } [**vrf** vrf-name] command for IPv6 networks. If the destination cannot be reached, the path discovery traces the path up to the point of failure.

```
switch# traceroute 172.28.254.254 vrf management
traceroute to 172.28.254.254 (172.28.254.254), 30 hops max, 40 byte packets
1 172.28.230.1 (172.28.230.1)  0.941 ms  0.676 ms  0.585 ms
2 172.24.114.213 (172.24.114.213)  0.733 ms  0.7 ms  0.69 ms
3 172.20.147.46 (172.20.147.46)  0.671 ms  0.619 ms  0.615 ms
4 172.28.254.254 (172.28.254.254)  0.613 ms  0.628 ms  0.61 ms
```

Press **Ctrl-C** to terminate a running traceroute.

You can use the following commands to specify a source interface for the traceroute:

Command	Purpose		
traceroute {dest-ipv4-addr hostname} [source {dest-ipv4-addr hostname interface}] [vrf vrf-name]	Specifies the source IPv4 address of the traceroute packets from the specified IP address, hostname, or		
Example:	interface.		
switch# traceroute 112.112.112.1 source vlan 10			
traceroute6 {dest-ipv6-addr hostname} [source	Specifies the source IPv6 address of the traceroute6		
{dest-ipv6-addr hostname interface}] [vrf vrf-name]	packets from the specified IP address, hostname, or interface.		
Example:			
switch# traceroute6 2010:11:22:0:1000::1 source ethernet 2/2			
Source editeriled 2/2			
[no] ip traceroute source-interface interface [vrf vrf-name]	Generates traceroute or traceroute6 packets with the source IP address from the configured interface.		
Example:			
switch(config)# ip traceroute source-interface loopback 1			
show ip traceroute source-interface [vrf vrf-name]	Displays the configured source interface for the		
Example:	traceroute.		
switch# show ip traceroute source-interface vrf all			
VRF Name Interface			
default loopback1			

Command	Purpose
ip icmp-errors source-interface interface	Generates ICMP error packets with the source IPv4
Example 1:	or IPv6 address from the configured interface.
switch(config)# ip icmp-errors source-interface loopback 1	You can also optionally configure this command within a virtual routing and forwarding instance (VRF).
Example 2:	
switch(config)# vrf context vrf-blue	
<pre>switch(config-vrf)# ip icmp-errors source-interface loopback 2</pre>	

Monitoring Processes and CPUs

Use the **show processes** command to identify the processes that are running and the status of each process. The command output includes the following:

- PID = process ID.
- State = process state.
- PC = current program counter in hexadecimal format.
- Start_cnt = how many times a process has been started (or restarted).
- TTY = terminal that controls the process. A (hyphen) usually means a daemon not running on any particular TTY.
- Process = name of the process.

Process states are as follows:

- D = uninterruptible sleep (usually I/O).
- R = runnable (on run queue).
- S = sleeping.
- T = traced or stopped.
- Z = defunct (zombie) process.
- NR = not-running.
- ER = should be running but currently not-running.

Note

Typically, the ER state designates a process that has been restarted too many times, causing the system to classify it as faulty and disable it.

log	Show	informatio	n about	process	logs
memory	Show	processes	Memory	Info	

switch:	# show	processes				
PID	State	PC	Start_cnt	TTY	Type	Process
1	S	b7f9e468	1	-	0	init
2	S	0	1	-	0	migration/0
3	S	0	1	-	0	ksoftirqd/0
4	S	0	1	-	0	desched/0
5	S	0	1	-	0	migration/1

188	S	0	1	-	0	aio/1
189	S	0	1	-	0	SerrLogKthread

Using the show processes cpu Command

Use the **show processes cpu** command to display CPU utilization. The command output includes the following:

- Runtime(ms) = CPU time that the process has used, expressed in milliseconds.
- Invoked = Number of times that the process has been invoked.
- uSecs = Average CPU time, in microseconds, for each process invocation.
- 1Sec = Percentage of CPU utilization for the last 1 second.

switch# show processes cpu							
PID	Runtime(ms)	Invoked	uSecs	1Sec	Process		
1	2264	108252	20	0	init		
2	950	211341	4	0	migration/0		
3	1154	32833341	0	0	ksoftirqd/0		
4	609	419568	1	0	desched/0		
5	758	214253	3	0	migration/1		
6	2462	155309355	0	0	ksoftirqd/1		
7	2496	392083	6	0	desched/1		
8	443	282990	1	0	events/0		
9	578	260184	2	0	events/1		
10	56	2681	21	0	khelper		
15	0	30	25	0	kthread		
24	0	2	5	0	kacpid		
103	81	89	914	0	kblockd/0		
104	56	265	213	0	kblockd/1		
117	0	5	17	0	khubd		
184	0	3	3	0	pdflush		
185	1796	104798	17	0	pdflush		
187	0	2	3	0	aio/0		
188	0	2	3	0	aio/1		

```
189 0 1 3 0 SerrLogKthread
```

Using the show system resources Command

Use the **show system resources** command to display system-related CPU and memory statistics. The output includes the following:

- Load average is defined as the number of running processes. The average reflects the system load over the past 1, 5, and 15 minutes.
- Processes displays the number of processes in the system and how many are actually running when the command is issued.
- CPU states show the CPU usage percentage in user mode, kernel mode, and idle time in the last 1 second.
- Memory usage provides the total memory, used memory, free memory, memory used for buffers, and memory used for cache in kilobytes. Buffers and cache are also included in the used memory statistics.

```
switch# show system resources
                                5 minutes: 0.02
                                                  15 minutes: 0.05
Load average: 1 minute: 0.00
               355 total, 1 running
Processes :
CPU states : 0.0% user,
                            0.2% kernel,
                                           99.8% idle
       CPUO states : 0.0% user, 1.0% kernel,
                                                   99.0% idle
       CPU1 states : 0.0% user,
CPU2 states : 0.0% user,
                                     0.0% kernel,
                                                    100.0% idle
                                     0.0% kernel,
                                                    100.0% idle
       CPU3 states : 0.0% user,
                                    0.0% kernel,
                                                   100.0% idle
Memory usage: 16402560K total, 2664308K used, 13738252K free
Current memory status: OK
```

Using Onboard Failure Logging

Cisco NX-OS provides the facility to log failure data to the persistent storage, which can be retrieved and displayed for analysis. This onboard failure logging (OBFL) feature stores failure and environmental information in nonvolatile memory on the module. This information will help you analyze failed modules.

The data stored by the OBFL facility includes the following:

- Time of initial power on
- Slot number of the module in the chassis
- Initial temperature of the module
- Firmware, BIOS, FPGA, and ASIC versions
- Serial number of the module
- Stack trace for crashes
- CPU hog information
- Memory leak information
- Software error messages
- Hardware exception logs

- · Environmental history
- OBFL specific history information
- ASIC interrupt and error statistics history
- ASIC register dumps

For more information about configuring OBFL, see the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

Using OBFL Error Status Command

Beginning Cisco NX-OS Release 9.3(3), Cisco Nexus 9000 series switches supports several counters to monitor and log fibre channel interfaces. The counters help identify and troubleshoot issues at FCMAC level.

Use the **show logging onboard error-stats** command to display onboard error statistics. The output includes the following counters:

- FCP_CNTR_MAC_RX_BAD_WORDS_FROM_DECODER
- FCP_CNTR_MAC_RX_EOFA
- FCP_CNTR_MAC_RX_CRC
- FCP_CNTR_MAC_RX_MAX_FRAME_TRUNCATE
- FCP_CNTR_MAC_RX_MIN_FRAME_PAD
- FCP_CNTR_CREDIT_LOSS
- FCP_CNTR_TX_WT_AVG_B2B_ZERO

The following is an example outout of the **show logging onboard error-stats** command:

switch# show logging onboard error-stats
----Module: 1

ERROR STATISTICS	INFORMATION FOR DEVICE: FCMAC		
Interface Range	 Error Stat Counter Name 	 Count	Time Stamp MM/DD/YY HH:MM:SS
fc1/9	FCP_CNTR_MAC_RX_BAD_WORDS_FROM_DECODER	4	11/15/19 09:54:40
fc1/33	FCP_CNTR_MAC_RX_BAD_WORDS_FROM_DECODER	4	11/15/19 09:37:53
fc1/36	FCP_CNTR_MAC_RX_BAD_WORDS_FROM_DECODER	4	11/15/19 09:05:13
fc1/37	FCP_CNTR_MAC_RX_BAD_WORDS_FROM_DECODER	4	11/15/19 08:42:56

Using Diagnostics

Generic online diagnostics (GOLD) define a common framework for diagnostic operations across Cisco platforms. The GOLD implementation checks the health of hardware components and verifies proper operation of the system data and control planes. Some tests take effect when the system is booting up; other tests take effect when the system is operational. A booting module goes through a series of checks before coming online to allow the system to detect faults in the hardware components at bootup and to ensure that a failing module is not introduced in a live network.

Defects are also diagnosed during system operation or runtime. You can configure a series of diagnostic checks to determine the condition of an online system. You must distinguish between disruptive and nondisruptive diagnostic tests. Although nondisruptive tests occur in the background and do not affect the system data or control planes, disruptive tests do affect live packet flows. You should schedule disruptive tests during special maintenance windows. The **show diagnostic content module** command output displays test attributes such as disruptive or nondisruptive tests.

You can configure runtime diagnostic checks to run at a specific time or to run continually in the background.

Health-monitoring diagnostic tests are nondisruptive, and they run in the background while the system is in operation. The role of online diagnostic health monitoring is to proactively detect hardware failures in the live network environment and inform you of a failure.

GOLD collects diagnostic results and detailed statistics for all tests including the last execution time, the first and last test pass time, the first and last test failure time, the total run count, the total failure count, the consecutive failure count, and the error code. These test results help administrators determine the condition of a system and understand the reason for a system failure. Use the **show diagnostic result** command to view diagnostic results.

For more information about configuring GOLD, see the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

Using Embedded Event Manager

Embedded Event Manager (EEM) is a policy-based framework that allows you to monitor key system events and then act on those events through a set policy. The policy is a preprogrammed script that you can load that defines actions that the device should invoke based on set events occurring. The script can generate actions, including, but not limited to, generating custom syslog or SNMP traps, invoking CLI commands, forcing a failover, and much more.

For more information about configuring EEM, see the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

Using Ethanalyzer

Ethanalyzer is a Cisco NX-OS protocol analyzer tool implementation of the open source software TShark which is a terminal version of Wireshark (formerly Ethereal). You can use Ethanalyzer to troubleshoot your

network by capturing and analyzing control-plane traffic on inband and management interfaces across all Nexus platforms.

To configure Ethanalyzer, use the following commands:

Command	Purpose
ethanalyzer local interface inband	Captures packets sent or received by the supervisor through the inband interface and displays summarized protocol information for captured packets.
ethanalyzer local interface inband-in	Captures packets received by the supervisor through the inband interface and displays summarized protocol information for captured packets.
ethanalyzer local interface inband-out	Captures packets sent by the supervisor through the inband interface and displays summarized protocol information for captured packets.
ethanalyzer local interface mgmt	Captures packets sent or received by the management interface and displays summarized protocol information for captured packets.
ethanalyzer local interface front-panel	Captures packets sent or received by the supervisor through a Layer 3 (routed) front-panel port and displays summarized protocol information for captured packets.
	Note This command does not support capturing packets sent or received by the supervisor through Layer 2 (switchport) front-panel ports.
ethanalyzer local interface port-channel	Captures packets sent or received by the supervisor through a Layer 3 (routed) port-channel interface and displays summarized protocol information for captured packets.
	Note This command does not support capturing packets sent or received by the supervisor through Layer 2 (switchport) port-channel interfaces.
ethanalyzer local interface vlan	Captures packets sent or received by the supervisor through a Layer 3 Switch Virtual Interface (SVI) and displays summarized protocol information.
ethanalyzer local interface netstack	Captures packets sent or received by the supervisor through the Netstack software component and displays summarized protocol information.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} limit-captured-frames	Limits the number of frames to capture within the Ethanalyzer session. The number of frames can be an integer value from 0 to 500,000. If 0 is provided, then a maximum of 500,000 frames will be captured before the Ethanalyzer session automatically stops.

Command	Purpose
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} limit-frame-size	Limits the length of the frame to capture. The length of frame can be an integer value from 192 to 65,536.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} capture-filter	Filters the types of packets to capture using Berkeley Packet Filter (BPF) syntax.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} display-filter	Filtersthe types of captured packets to display using Wireshark or TShark Display Filters.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} write	Saves the captured data to a file. Valid storage options include the switch's bootflash, logflash, a USB storage device, or volatile storage.
ethanalyzer local read	Opens a captured data file and analyzes the file. Valid storage options include the switch's bootflash, logflash, a USB storage device, or volatile storage.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} autostop	Specifies a condition that will automatically stop the Ethanalyzer session. You can specify the duration of the session in seconds, number of files to capture when writing captured packets to a file using the write keyword, and file size when writing captured packets to a file using the write keyword.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} capture-ring-buffer	Specifies the capture ring buffer options for Ethanalyzer. This option will continuously write to one or more files in a ring buffer when combined with the write keyword. You can specify the duration in seconds that Ethanalyzer will wait before writing to a new file, the number of files to keep as part of the ring buffer, and the file size of each individual file in the ring buffer.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} detail	Displays detailed protocol information for captured packets.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} raw	Displays captured packets inhex format.
ethanalyzer local interface {front-panel inband inband-in inband-out mgmt port-channel vlan} vrf	Specifies the VRF that the Layer 3 interface is a member if the Layer 3 interface is in a non-default VRF.

Guidelines and Limitations

• If a Layer 3 interface is a member of a non-default VRF and is specified in an Ethanalyzer session (for example, through the **ethanalyzer local interface front-panel ethernet1/1** or **ethanalyzer local interface port-channel1** commands), you must specify the VRF that the Layer 3 interface is a member of within

the Ethanalyzer session using the **vrf** keyword. For example, to capture packets received or sent by the supervisor through Layer 3 front-panel port Ethernet1/1 in VRF "red", use the **ethanalyzer local interface front-panel ethernet1/1 vrf red** command.

• When writing to a file, Ethanalyzer will automatically stop if the Ethanalyzer session captures 500,000 packets, or if the size of the file reaches ~11 megabytes, whichever comes first.

Examples

```
switch(config) # ethanalyzer local interface inband
> Redirect it to a file
>> Redirect it to a file in append mode
autostop Capture autostop condition
capture-filter Filter on ethanalyzer capture capture-ring-buffer Capture ring buffer option
decode-internal Include internal system header decoding detail Display detailed protocol
information
display-filter Display filter on frames captured
limit-captured-frames Maximum number of frames to be captured (default is 10) limit-frame-size
Capture only a subset of a frame
mirror Filter mirrored packets
raw Hex/Ascii dump the packet with possibly one line summary
write Filename to save capture to
| Pipe command output to filter
switch(config) # ethanalyzer local interface inband Capturing on 'ps-inb'

```

Use the capture-filter option to select which packets to display or save to disk during capture. A capture filter maintains a high rate of capture while it filters. Because full dissection has not been done on the packets, the filter fields are predefined and limited.

Use the display-filter option to change the view of a capture file. A display filteruses fully dissected packets, so you can do very complex and advanced filtering when you analyze a network tracefile. Ethanalyzer writes captured data to a temporary file if it is not instructed to write captured data to a file elsewhere. This temporary file can fill quickly when a display filter is used without the user's knowledge, since all packets matching the capture-filter option are written to the temporary file, but only packets matching the display-filter option are displayed.

In this example, limit-captured-frames is set to 5. With the capture-filter option, Ethanalyzer shows you five packets which match the filter host 10.10.10.2. With the display-filter option, Ethanalyzer first captures five packets then displays only the packets that match the filter ip.addr==10.10.10.2.

```
switch(confiq) # ethanalyzer local interface inband capture-filter "host 10.10.10.2"
limit-captured-frames 5

2 packets captured
```

The write option lets you write the capture data to a file in one of the storage devices (such as boothflash or logflash) on the Cisco Nexus 9000 Series Switch for later analysis. The capture file size is limited to 10 MB.

An example Ethanalyzer command with a write option is **ethanalyzer local interface inband** writebootflash:capture_file_name. The following is an example of a write option with capture-filter and an output file name of first-capture:

```
switch(config) # ethanalyzer local interface inband capture-filter "host 10.10.10.2"
limit-captured-frame 5 write ?
bootflash: Filename logflash: Filename slot0: Filename
usb1: Filename
usb2: Filename volatile: Filename
switch(config) # ethanalyzer local interface inband capture-filter "host 10.10.10.2"
limit-captured-frame 5 write bootflash:first-capture
```

When the capture data is saved to a file, the captured packets are, by default, not displayed in the terminal window. The display option forces Cisco NX-OS to display the packets while it saves the capture data to a file.

The capture-ring-buffer option creates multiple files after a specified number of seconds, a specified number of files, or a specified file size. The following are the definitions of those options:

```
switch(config)# ethanalyzer local interface inband capture-ring-buffer ? duration Stop writing to the file or switch to the next file after value seconds have elapsed files Stop writing to capture files after value number of files were written or begin again with the first file after value number of files were written (form a ring buffer) filesize Stop writing to a capture file or switch to the next file after it reaches a size of value kilobytes
```

The read option lets you read the saved file on the device itself.

```
switch(config) # ethanalyzer local read bootflash:first-capture

Ethanalyzer does not capture data traffic that Cisco NX-OS forwards in the hardware.

Ethanalyzer uses the same capture filter syntax as **tcpdump** and uses the Wireshark display filter syntax.

This example shows captured data (limited to four packets) on the management interface:

switch(config)# ethanalyzer local interface mgmt limit-captured-frames 4 Capturing on eth1

```

SNMP and RMON Support

Cisco NX-OS provides extensive SNMPv1, v2, and v3 support, including Management Information Bases (MIBs) and notifications (traps and informs).

The SNMP standard allows any third-party applications that support the different MIBs to manage and monitor Cisco NX-OS.

SNMPv3 provides extended security. Each device can be selectively enabled or disabled for SNMP service. In addition, each device can be configured with a method of handling SNMPv1 and v2 requests.

Cisco NX-OS also supports Remote Monitoring (RMON) alarms and events. RMON alarms and events provide a mechanism for setting thresholds and sending notifications based on changes in network behavior.

The *Alarm Group* allows you to set alarms. Alarms can be set on one or multiple parameters within a device. For example, you can set an RMON alarm for a specific level of CPU utilization on a device. The *EventGroup*

allows you to configure events that are actions to be taken based on an alarm condition. The types of events that are supported include logging, SNMP traps, and log-and-trap.

For more information about configuring SNMP and RMON, see the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

Using the PCAP SNMP Parser

The PCAP SNMP parser is a tool to analyze SNMP packets captured in .pcap format. It runs on the switch and generates a statistics report for all of the SNMP get, getnext, getbulk, set, trap, and response requests sent to the switch.

To use the PCAP SNMP parser, use one of the following commands:

• debug packet-analysis snmp [mgmt0 | inband] duration seconds [output-file] [keep-pcap]—Captures packets for a specified number of seconds using Tshark, saves them in a temporary .pcap file, and then analyzes them based on this .pcap file.

The results are saved in the output file or printed to the console, if the output file is not specified. The temporary .pcap file will be deleted by default, unless you use the **keep-pcap** option. Packet capture can be performed on the management interface (mgmt0), which is the default, or the inband interface.

Examples:

```
switch# debug packet-analysis snmp duration 100
switch# debug packet-analysis snmp duration 100 bootflash:snmp_stats.log
switch# debug packet-analysis snmp duration 100 bootflash:snmp_stats.log keep-pcap
switch# debug packet-analysis snmp inband duration 100
switch# debug packet-analysis snmp inband duration 100 bootflash:snmp_stats.log
switch# debug packet-analysis snmp inband duration 100 bootflash:snmp_stats.log keep-pcap
```

• **debug packet-analysis snmp** *input-pcap-file* [*output-file*]—Analyzes the captured packets on an existing .pcap file.

Examples:

```
switch# debug packet-analysis snmp bootflash:snmp.pcap
switch# debug packet-analysis snmp bootflash:snmp.pcap bootflash:snmp stats.log
```

The following example shows a sample statistics report for the **debug packet-analysis snmp [mgmt0 inband] duration** command:

```
switch# debug packet-analysis snmp duration 10
Capturing on eth0

Using RADIUS

The RADIUS protocol is used to exchange attributes or credentials between a head-end RADIUS server and a client device. These attributes relate to three classes of services:

- Authentication
- Authorization
- Accounting

Authentication refers to the authentication of users for access to a specific device. You can use RADIUS to manage user accounts for access to a Cisco NX-OS device. When you try to log into a device, Cisco NX-OS validates you with information from a central RADIUS server.

Authorization refers to the scope of access that you have once you have been authenticated. Assigned roles for users can be stored in a RADIUS server with a list of actual devices that the user should have access to. Once the user has been authenticated, the device can then refer to the RADIUS server to determine the access that the user will have.

Accounting refers to the log information that is kept for each management session in a device. You can use this information to generate reports for troubleshooting purposes and user accountability. You can implement accounting locally or remotely (using RADIUS).

This example shows how to display accounting log entries:

```
switch# show accounting log
```

```
Sun May 12 04:02:27 2007:start:/dev/pts/0_1039924947:admin
Sun May 12 04:02:28 2007:stop:/dev/pts/0_1039924947:admin:vsh exited normally
Sun May 12 04:02:33 2007:start:/dev/pts/0_1039924953:admin
Sun May 12 04:02:34 2007:stop:/dev/pts/0_1039924953:admin:vsh exited normally
Sun May 12 05:02:08 2007:start:snmp_1039928528_172.22.95.167:public
Sun May 12 05:02:08 2007:update:snmp_1039928528_172.22.95.167:public:Switchname
```

Note

The accounting log shows only the beginning and end (start and stop) for each session.

Using syslog

The system message logging software saves messages in a log file or directs the messages to other devices. This feature provides the following capabilities:

- Logging information for monitoring and troubleshooting
- Selection of the types of logging information to be captured
- Selection of the destination of the captured logging information

You can use syslog to store a chronological log of system messages locally or to send this information to a central syslog server. The syslog messages can also be sent to the console for immediate use. These messages can vary in detail depending on the configuration that you choose.

The syslog messages are categorized into seven severity levels from debug to critical events. You can limit the severity levels that are reported for specific services within the device. For example, you might want to report debug events only for the OSPF service but record all severity level events for the BGP service.

Log messages are not saved across system reboots. However, a maximum of 100 log messages with a severity level of critical and below (levels 0, 1, and 2) are saved in NVRAM. You can view this log at any time with the **show logging nvram** command.

Logging Levels

Cisco NX-OS supports the following logging levels:

- 0-emergency
- 1-alert
- 2-critical
- 3-error
- 4-warning
- 5-notification
- 6-informational
- 7-debugging

By default, the device logs normal but significant system messages to a log file and sends these messages to the system console. Users can specify which system messages should be saved based on the type of facility and the severity level. Messages have a time stamp to enhance real-time debugging and management.

Enabling Logging for Telnet or SSH

System logging messages are sent to the console based on the default or configured logging facility and severity values.

- To disable console logging, use the **no logging console** command in configuration mode.
- To enable logging for Telnet or SSH, use the **terminal monitor** command in EXEC mode.
- When logging to a console session is disabled or enabled, that state is applied to all future console sessions. If a user exits and logs in again to a new session, the state is preserved. However, when logging to a Telnet or SSH session is enabled or disabled, that state is applied only to that session. The state is not preserved after the user exits the session.

The **no logging console** command disables console logging and is enabled by default.

```
switch (config) # no logging console
```

The **terminal monitor** command enables logging for Telnet or SSH and is disabled by default.

```
switch# terminal monitor
```

For more information about configuring syslog, see the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

Using SPAN

You can use the Switched Port Analyzer (SPAN) utility to perform detailed troubleshooting or to take a sample of traffic from a particular application host for proactive monitoring and analysis.

When you have a problem in your network that you cannot solve by fixing the device configuration, you typically need to take a look at the protocol level. You can use **debug** commands to look at the control traffic between an end node and a device. However, when you need to focus on all the traffic that originates from or is destined to a particular end node, you can use a protocol analyzer to capture protocol traces.

To use a protocol analyzer, you must insert the analyzer inline with the device under analysis, which disrupts input and output (I/O) to and from the device.

In Ethernet networks, you can solve this problem by using the SPAN utility. SPAN allows you to take a copy of all traffic and direct it to another port within the device. The process is nondisruptive to any connected devices and is facilitated in the hardware, which prevents any unnecessary CPU load.

SPAN allows you to create independent SPAN sessions within the device. You can apply a filter to capture only the traffic received or the traffic transmitted.

For more information about configuring SPAN, see the *Cisco Nexus 9000 Series NX-OS System Management Configuration Guide*.

Using the Blue Beacon Feature

On some platforms, you can cause the platform LEDs to blink. This feature is a useful way to mark a piece of hardware so that a local administrator can quickly identify the hardware for troubleshooting or replacement.

To flash the LEDs on a hardware entity, use the following commands:

Command	Purpose
blink chassis	Flashes the chassis LED.
blink fan number	Flashes one of the fan LEDs.
blink module slot	Flashes the selected module LED.
blink powersupply number	Flashes one of the power supply LEDs.

Using the watch Command

The **watch** command allows you to refresh and monitor Cisco NX-OS CLI command output or Unix command output (through the **run bash** *command* command).

Use the command as follows:

watch [differences] [interval seconds] commandwatch

- differences—Highlights the differences in the command output.
- **interval** *seconds*—Specifies how often the command output is refreshed. The range is from 0 to 2147483647 seconds.
- command—Specifies the command that you want to watch.

The following example shows how the **watch** command can be used to refresh the output of the **show interface eth1/15 counters** command every second and to highlight any differences:

switch# watch differences interval 1 show interface eth1/15 counters		
Every 1.0s:	vsh -c "show interface eth1/15 coun	Mon Aug 31 15:52:53 2015
Port	InOctets	InUcastPkts
Eth1/15	583736	0
Port	InMcastPkts	InBcastPkts
Eth1/15	2433	0
Port	OutOctets	OutUcastPkts
Eth1/15	5247672	0
Port	OutMcastPkts	OutBcastPkts
