# **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="http://www.cisco.com/go/cfn">http://www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

# **Preventing Unauthorized Access**

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

- At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch.
- For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.
- If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information.
- You can also enable the login enhancements feature, which logs both failed and unsuccessful login
  attempts. Login enhancements can also be configured to block future login attempts after a set number
  of unsuccessful attempts are made. For more information, see the Cisco IOS Login Enhancements
  documentation.

For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="http://www.cisco.com/go/cfn">http://www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

# **Restrictions for Controlling Switch Access with Passwords and Privileges**

The following are the restrictions for controlling switch access with passwords and privileges:

• Disabling password recovery will not work if you have set the switch to boot up manually by using the **boot manual** global configuration command. This command produces the boot loader prompt (*switch:*) after the switch is power cycled.

### **Related Topics**

Disabling Password Recovery, on page 9 Password Recovery, on page 4

# Information About Passwords and Privilege Levels

### **Default Password and Privilege Level Configuration**

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

This table shows the default password and privilege level configuration.

### Table 1: Default Password and Privilege Levels

Feature	Default Setting
1 1	No password is defined. The default is level 15 (privileged EXEC level). The password is not encrypted in the configuration file.

Feature	Default Setting
Enable secret password and privilege level	No password is defined. The default is level 15 (privileged EXEC level). The password is encrypted before it is written to the configuration file.
Line password	No password is defined.

## **Additional Password Security**

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a Trivial File Transfer Protocol (TFTP) server, you can use either the **enable password** or **enable secret** global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the **enable secret** command because it uses an improved encryption algorithm.

If you configure the **enable secret** command, it takes precedence over the **enable password** command; the two commands cannot be in effect simultaneously.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and console and virtual terminal line passwords.

### **Related Topics**

Protecting Enable and Enable Secret Passwords with Encryption, on page 7
Example: Protecting Enable and Enable Secret Passwords with Encryption, on page 18

### **Password Recovery**

By default, any end user with physical access to the switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

To re-enable password recovery, use the **service password-recovery** global configuration command.

#### **Related Topics**

Disabling Password Recovery, on page 9
Restrictions for Controlling Switch Access with Passwords and Privileges, on page 3

### **Terminal Line Telnet Configuration**

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you did not configure this password during the setup program, you can configure it when you set a Telnet password for a terminal line.

### **Related Topics**

Setting a Telnet Password for a Terminal Line, on page 10 Example: Setting a Telnet Password for a Terminal Line, on page 18

### **Username and Password Pairs**

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

### **Related Topics**

Configuring Username and Password Pairs, on page 12

### **Privilege Levels**

Cisco switches (and other devices) use privilege levels to provide password security for different levels of switch operation. By default, the Cisco IOS software operates in two modes (privilege levels) of password security: user EXEC (Level 1) and privileged EXEC (Level 15). You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

#### **Privilege Levels on Lines**

Users can override the privilege level you set using the **privilege level** line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the **disable** command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

For example, if you want many users to have access to the **clear line** command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the **configure** command, you can assign it level 3 security and distribute that password to a more restricted group of users.

### **Command Privilege Levels**

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the **show ip traffic** command to level 15, the **show** commands and **show ip** commands are automatically set to privilege level 15 unless you set them individually to different levels.

### **Related Topics**

Setting the Privilege Level for a Command, on page 14 Example: Setting the Privilege Level for a Command, on page 18 Changing the Default Privilege Level for Lines, on page 15 Logging into and Exiting a Privilege Level, on page 17

# **How to Control Switch Access with Passwords and Privilege Levels**

# **Setting or Changing a Static Enable Password**

The enable password controls access to the privileged EXEC mode. Follow these steps to set or change a static enable password:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. enable password password
- 4 end
- 5. show running-config
- 6. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	enable password password  Example:	Defines a new password or changes an existing password for access to privileged EXEC mode.
	Example.	By default, no password is defined.
	Switch(config)# enable password secret321	For <i>password</i> , specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Crtl-v when you create the password; for example, to create the password abc?123, do this:

	Command or Action	Purpose
		1. Enter abc.
		2. Enter Crtl-v.
		3. Enter ?123.
		When the system prompts you to enter the enable password, you need not precede the question mark with the Ctrl-v; you can simply enter abc?123 at the password prompt.
Step 4	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 5	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 6	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

Example: Setting or Changing a Static Enable Password, on page 17

# **Protecting Enable and Enable Secret Passwords with Encryption**

Follow these steps to establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3.** Use one of the following:
  - enable password [level level] {password encryption-type encrypted-password}
  - enable secret [level level] {password encryption-type encrypted-password}
- 4. service password-encryption
- 5. end

- 6. show running-config
- 7. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable  Example:  Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal  Example:  Switch# configure terminal	Enters the global configuration mode.
Step 3	Use one of the following:  • enable password [level level] {password encryption-type encrypted-password}  • enable secret [level level] {password encryption-type encrypted-password}  Example: Switch(config)# enable password example102  or Switch(config)# enable secret level 1 password secret123sample	<ul> <li>Defines a new password or changes an existing password for access to privileged EXEC mode.</li> <li>Defines a secret password, which is saved using a nonreversible encryption method.</li> <li>(Optional) For level, the range is from 0 to 15. Level 1 is normal user EXEC mode privileges. The default level is 15 (privileged EXEC mode privileges).</li> <li>For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</li> <li>(Optional) For encryption-type, only type 5, a Cisco proprietary encryption algorithm, is available. If you specify an encryption type, you must provide an encrypted password—an encrypted password that you copy from another switch configuration.</li> <li>Note If you specify an encryption type and then enter a clear text password, you can not re-enter privileged EXEC mode. You cannot recover a lost encrypted password by any method.</li> </ul>
Step 4	service password-encryption  Example:	(Optional) Encrypts the password when the password is defined or when the configuration is written.

	Command or Action	Purpose
	Switch(config)# service password-encryption	Encryption prevents the password from being readable in the configuration file.
Step 5	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 6	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

Additional Password Security, on page 4

Example: Protecting Enable and Enable Secret Passwords with Encryption, on page 18

# **Disabling Password Recovery**

Follow these steps to disable password recovery to protect the security of your switch:

### Before you begin

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. system disable password recovery switch  $\{all \mid <1-9>\}$
- 4. end

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable  Example:  Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal  Example:  Switch# configure terminal	Enters the global configuration mode.
Step 3	system disable password recovery switch {all   <1-9>}  Example:  Switch(config) # system disable password recovery switch all	Disables password recovery.  • all - Sets the configuration on switches in stack.  • <1-9> - Sets the configuration on the Switch Number selected.  This setting is saved in an area of the flash memory that is accessible by the boot loader and the Cisco IOS image, but it is not part of the file system and is not accessible by any user.
Step 4	end  Example:  Switch(config) # end	Returns to privileged EXEC mode.

### What to do next

To remove disable password recovery, use the no system disable password recovery switch all global configuration command.

### **Related Topics**

Password Recovery, on page 4

Restrictions for Controlling Switch Access with Passwords and Privileges, on page 3

### **Setting a Telnet Password for a Terminal Line**

Beginning in user EXEC mode, follow these steps to set a Telnet password for the connected terminal line:

### Before you begin

- Attach a PC or workstation with emulation software to the switch console port, or attach a PC to the Ethernet management port.
- The default data characteristics of the console port are 9600, 8, 1, no parity. You might need to press the Return key several times to see the command-line prompt.

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. line vty 0 15
- 4. password password
- end
- 6. show running-config
- 7. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable  Example:  Switch> enable	Note If a password is required for access to privileged EXEC mode, you will be prompted for it.  Enters privileged EXEC mode.
Step 2	<pre>configure terminal Example: Switch# configure terminal</pre>	Enters the global configuration mode.
Step 3	<pre>line vty 0 15 Example: Switch(config) # line vty 0 15</pre>	Configures the number of Telnet sessions (lines), and enters line configuration mode.  There are 16 possible sessions on a command-capable Switch. The 0 and 15 mean that you are configuring all 16 possible Telnet sessions.
Step 4	<pre>password password Example: Switch(config-line)# password abcxyz543</pre>	Sets a Telnet password for the line or lines.  For <i>password</i> , specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.
Step 5	<pre>end Example: Switch(config-line)# end</pre>	Returns to privileged EXEC mode.
Step 6	<pre>show running-config Example: Switch# show running-config</pre>	Verifies your entries.

	Command or Action	Purpose
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

Information about Passwords and Privilege Levels

Preventing Unauthorized Access, on page 2

Example: Setting a Telnet Password for a Terminal Line, on page 18

## **Configuring Username and Password Pairs**

Follow these steps to configure username and password pairs:

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3. username** *name* [**privilege** *level*] {**password** *encryption-type password*}
- **4.** Use one of the following:
  - line console 0
  - line vty 0 15
- 5. login local
- 6. end
- 7. show running-config
- 8. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	

	Command or Action	Purpose
Step 3	<pre>username name [privilege level] {password encryption-type password}</pre>	Sets the username, privilege level, and password for each user.
	Example:	• For <i>name</i> , specify the user ID as one word or the MAC address. Spaces and quotation marks are not allowed.
	Switch(config)# username adamsample privilege 1 password secret456	You can configure a maximum of 12000 clients each, for both username and MAC filter.
	Switch(config)# username 11111111111 mac attribute	• (Optional) For <i>level</i> , specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 1 gives user EXEC mode access.
		• For <i>encryption-type</i> , enter 0 to specify that an unencrypted password will follow. Enter 7 to specify that a hidden password will follow.
		• For <i>password</i> , specify the password the user must enter to gain access to the Switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the <b>username</b> command.
Step 4	Use one of the following: • line console 0	Enters line configuration mode, and configures the console port (line 0) or the VTY lines (line 0 to 15).
	• line vty 0 15	
	Example:	
	Switch(config)# line console 0	
	or	
	Switch(config)# line vty 15	
Step 5	login local	Enables local password checking at login time.
	Example:	Authentication is based on the username specified in Step 3.
	Switch(config-line)# login local	
Step 6	end	Returns to privileged EXEC mode.
•	Example:	
	Switch(config)# end	
Step 7	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	

	Command or Action	Purpose
Step 8	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

Information about Passwords and Privilege Levels Preventing Unauthorized Access, on page 2 Username and Password Pairs, on page 5

# **Setting the Privilege Level for a Command**

Follow these steps to set the privilege level for a command:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. privilege mode level level command
- 4. enable password level level password
- 5. end
- 6. copy running-config startup-config

Command or Action	Purpose
enable Example:	Enables privileged EXEC mode. Enter your password if prompted.
Switch> enable	
configure terminal	Enters the global configuration mode.
Example:	
Switch# configure terminal	
privilege mode level level command	Sets the privilege level for a command.
Example:  Switch(config) # privilege exec level 14 configure	• For <i>mode</i> , enter <b>configure</b> for global configuration mode, <b>exec</b> for EXEC mode, <b>interface</b> for interface configuration mode, or <b>line</b> for line configuration
	enable  Example:  Switch> enable  configure terminal  Example:  Switch# configure terminal  privilege mode level level command  Example:

	Command or Action	Purpose
		<ul> <li>For <i>level</i>, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges. Level 15 is the level of access permitted by the <b>enable</b> password.</li> <li>For <i>command</i>, specify the command to which you want to restrict access.</li> </ul>
Step 4	enable password level level password	Specifies the password to enable the privilege level.
	Example:  Switch(config) # enable password level 14  SecretPswd14	<ul> <li>For <i>level</i>, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges.</li> <li>For <i>password</i>, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</li> </ul>
Step 5	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 6	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

Privilege Levels, on page 5

Example: Setting the Privilege Level for a Command, on page 18

# **Changing the Default Privilege Level for Lines**

Follow these steps to change the default privilege level for the specified line:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. line vty line
- 4. privilege level level
- 5. end
- 6. copy running-config startup-config

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. Enter your password if prompted.
	Example:	prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	line vty line	Selects the virtual terminal line on which to restrict access.
	Example:	
	Switch(config)# line vty 10	
Step 4	privilege level level	Changes the default privilege level for the line.
	Example:	For <i>level</i> , the range is from 0 to 15. Level 1 is for normal
	Switch(config)# privilege level 15	user EXEC mode privileges. Level 15 is the level of access permitted by the <b>enable</b> password.
Step 5	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 6	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

### What to do next

Users can override the privilege level you set using the **privilege level** line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the **disable** command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

### **Related Topics**

Privilege Levels, on page 5

## **Logging into and Exiting a Privilege Level**

Beginning in user EXEC mode, follow these steps to log into a specified privilege level and exit a specified privilege level.

#### **SUMMARY STEPS**

- 1. enable level
- 2. disable level

### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable level	Logs in to a specified privilege level.
	Example:	Following the example, Level 15 is privileged EXEC mode.
	Switch> enable 15	For <i>level</i> , the range is 0 to 15.
Step 2	disable level	Exits to a specified privilege level.
	Example:	Following the example, Level 1 is user EXEC mode.
	Switch# disable 1	For <i>level</i> , the range is 0 to 15.

# Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+)

The following are the prerequisites for set up and configuration of switch access with Terminal Access Controller Access Control System Plus (TACACS+) (must be performed in the order presented):

- 1. Configure the switches with the TACACS+ server addresses.
- 2. Set an authentication key.
- **3.** Configure the key from Step 2 on the TACACS+ servers.
- 4. Enable AAA.
- **5.** Create a login authentication method list.
- **6.** Apply the list to the terminal lines.
- 7. Create an authorization and accounting method list.

The following are the prerequisites for controlling switch access with TACACS+:

• You must have access to a configured TACACS+ server to configure TACACS+ features on your switch. Also, you must have access to TACACS+ services maintained in a database on a TACACS+ daemon typically running on a LINUX or Windows workstation.

- You need a system running the TACACS+ daemon software to use TACACS+ on your switch.
- To use TACACS+, it must be enabled.
- Authorization must be enabled on the switch to be used.
- Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.
- To use any of the AAA commands listed in this section or elsewhere, you must first enable AAA with the **aaa new-model** command.
- At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the
  method lists for TACACS+ authentication. You can optionally define method lists for TACACS+
  authorization and accounting.
- The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named *default*). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.
- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.
- Use the local database if authentication was not performed by using TACACS+.

SSH Servers, Integrated Clients, and Supported Versions, on page 70

### **TACACS+ Overview**

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch.

TACACS+ services are maintained in a database on a TACACS+ daemon typically running on a LINUX or Windows workstation. You should have access to and should configure a TACACS+ server before you configure TACACS+ features on your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—independently. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers

UNIX workstation (TACACS+ Catalyst 6500 server 1) series switch 171.20.10.7 UNIX workstation (TACACS+ server 2) 171 20 10 8 Configure the switches with the TACACS+ server addresses. Set an authentication key (also configure the same key on the TACACS+ servers). Enable AAA. Create a login authentication method list. Apply the list to the terminal lines. Create an authorization and accounting method list as required.

Figure 1: Typical TACACS+ Network Configuration

TACACS+, administered through the AAA security services, can provide these services:

- Authentication—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.
- The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother's maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company's password aging policy.
- Authorization—Provides fine-grained control over user capabilities for the duration of the user's session, including but not limited to setting autocommands, access control, session duration, or protocol support.
   You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.

Accounting—Collects and sends information used for billing, auditing, and reporting to the TACACS+
daemon. Network managers can use the accounting facility to track user activity for a security audit or
to provide information for user billing. Accounting records include user identities, start and stop times,
executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+), on page 19

# **TACACS+ Operation**

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

- 1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.
  - TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user's mother's maiden name.
- 2. The switch eventually receives one of these responses from the TACACS+ daemon:
  - ACCEPT—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
  - REJECT—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
  - ERROR—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
  - CONTINUE—The user is prompted for additional authentication information.

After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

- **3.** If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
  - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
  - Connection parameters, including the host or client IP address, access list, and user timeouts

Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+), on page 19

## **TACACS+ Configuration Options**

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

### **Related Topics**

Identifying the TACACS+ Server Host and Setting the Authentication Key, on page 24

## **TACACS+ Login Authentication**

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

### **Related Topics**

Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System
Plus (TACACS+), on page 19

# **TACACS+ Authorization for Privileged EXEC Access and Network Services**

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user's profile, which is located either in the local user database or on the security server, to configure the user's session. The user is granted access to a requested service only if the information in the user profile allows it.

### **Related Topics**

Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services, on page 28 Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+), on page 19

### **TACACS+** Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

Starting TACACS+ Accounting, on page 30

### **Default TACACS+ Configuration**

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

Note

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

# **How to Configure TACACS+**

# Identifying the TACACS+ Server Host and Setting the Authentication Key

Follow these steps to identify the TACACS+ server host and set the authentication key:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- 4. aaa group server tacacs+ group-name
- **5. server** *ip-address*
- 6. end
- 7. show running-config
- 8. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	

	Command or Action	Purpose
Step 3	aaa new-model	Enables AAA.
	Example:	
	Switch(config)# aaa new-model	
Step 4	aaa group server tacacs+ group-name	(Optional) Defines the AAA server-group with a group name.
	Example:	
	<pre>Switch(config)# aaa group server tacacs+ your_server_group</pre>	This command puts the Switch in a server group subconfiguration mode.
Step 5	server ip-address	(Optional) Associates a particular TACACS+ server with
	Example:	the defined server group. Repeat this step for each TACACS+ server in the AAA server group.
	Switch(config)# server 10.1.2.3	Each server in the group must be previously defined in Step 3.
Step 6	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 7	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 8	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

TACACS+ Configuration Options, on page 23

# **Configuring TACACS+ Login Authentication**

Follow these steps to configure TACACS+ login authentication:

### Before you begin

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

For more information about the **ip http authentication** command, see the *Cisco IOS Security Command Reference, Release 12.4.* 

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- **4.** aaa authentication login {default | list-name} method1 [method2...]
- **5. line** [console | tty | vty] line-number [ending-line-number]
- **6. login authentication** {**default** | *list-name*}
- **7.** end
- 8. show running-config
- 9. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable  Example:	Enables privileged EXEC mode. Enter your password if prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	aaa new-model	Enables AAA.
	Example:	
	Switch(config)# aaa new-model	
Step 4	aaa authentication login {default   list-name} method1	Creates a login authentication method list.
	[method2]	• To create a default list that is used when a named list
	Example:	is <i>not</i> specified in the <b>login authentication</b> command,
	<pre>Switch(config) # aaa authentication login default tacacs+ local</pre>	use the <b>default</b> keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.

	Command or Action	Purpose
		• For <i>list-name</i> , specify a character string to name the list you are creating.
		• For <i>method1</i> , specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.
		Select one of these methods:
		• enable—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the enable password global configuration command.
		• group tacacs+—Uses TACACS+ authentication.  Before you can use this authentication method, you must configure the TACACS+ server.
		• line —Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the <b>password</b> password line configuration command.
		• <i>local</i> —Use the local username database for authentication. You must enter username information in the database. Use the <b>username</b> <i>password</i> global configuration command.
		• <i>local-case</i> —Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <b>username</b> <i>name</i> <b>password</b> global configuration command.
		• none—Do not use any authentication for login.
Step 5	line [console   tty   vty] line-number [ending-line-number]  Example:	Enters line configuration mode, and configures the lines to which you want to apply the authentication list.
	Switch(config)# line 2 4	
Step 6	login authentication {default   list-name}	Applies the authentication list to a line or set of lines.
	Example:	If you specify <b>default</b> , use the default list created with the <b>aaa authentication login</b> command.
	Switch(config-line)# login authentication default	
Step 7	end	Returns to privileged EXEC mode.
	Example:	

	Command or Action	Purpose
	Switch(config-line)# end	
Step 8	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 9	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config

# Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

You can use the **aaa authorization** global configuration command with the **tacacs**+ keyword to set parameters that restrict a user's network access to privileged EXEC mode.

Note

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to specify TACACS+ authorization for privileged EXEC access and network services:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa authorization network tacacs+
- 4. aaa authorization exec tacacs+
- 5. end
- 6. show running-config
- 7. copy running-config startup-config

### **DETAILED STEPS**

de. Enter your password if
n mode.
TACACS+ authorization for
uests.
TACACS+ authorization if
access.
n user profile information mation).
node.
in the configuration file.

# **Starting TACACS+ Accounting**

Follow these steps to start TACACS+ Accounting:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa accounting network start-stop tacacs+
- 4. aaa accounting exec start-stop tacacs+
- 5. end
- 6. show running-config
- 7. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable  Example:  Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal  Example:  Switch# configure terminal	Enters the global configuration mode.
Step 3	aaa accounting network start-stop tacacs+  Example:  Switch(config) # aaa accounting network start-stop tacacs+	Enables TACACS+ accounting for all network-related service requests.
Step 4	aaa accounting exec start-stop tacacs+  Example:  Switch(config) # aaa accounting exec start-stop tacacs+	Enables TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.
Step 5	<pre>end Example: Switch(config)# end</pre>	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 6	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

#### What to do next

To establish a session with a router if the AAA server is unreachable, use the **aaa accounting system guarantee-first** command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the **no aaa accounting system guarantee-first** command.

### **Related Topics**

TACACS+ Accounting, on page 23

### Establishing a Session with a Router if the AAA Server is Unreachable

To establishing a session with a router if the AAA server is unreachable, use the **aaa accounting system guarantee-first** command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the **no aaa accounting system guarantee-first** command.

# Prerequisites for Controlling Switch Access with RADIUS

This section lists the prerequisites for controlling Switch access with RADIUS.

#### General:

- RADIUS and AAA must be enabled to use any of the configuration commands in this chapter.
- RADIUS is facilitated through AAA and can be enabled only through AAA commands.
- At a minimum, you must identify the host or hosts that run the RADIUS server software and define the
  method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization
  and accounting.
- You should have access to and should configure a RADIUS server before configuring RADIUS features on your Switch.
- The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.
- To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

#### For RADIUS operation:

• Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.

### **Related Topics**

RADIUS and Switch Access, on page 34 RADIUS Operation, on page 35

# **Restrictions for Controlling Switch Access with RADIUS**

This topic covers restrictions for controlling Switch access with RADIUS.

General:

• To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

- Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.
- Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication.
   RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.
- Networks using a variety of services. RADIUS generally binds a user to one service model.

### **Related Topics**

**RADIUS** Overview, on page 34

## Information about RADIUS

### **RADIUS and Switch Access**

This section describes how to enable and configure RADIUS. RADIUS provides detailed accounting information and flexible administrative control over the authentication and authorization processes.

### **Related Topics**

Prerequisites for Controlling Switch Access with RADIUS, on page 33 Configuring the Switch for Local Authentication and Authorization, on page 66 SSH Servers, Integrated Clients, and Supported Versions, on page 70

### **RADIUS Overview**

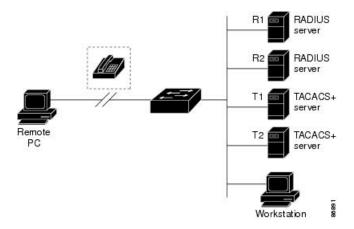

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers
  from several vendors use a single RADIUS server-based security database. In an IP-based network with
  multiple vendors' access servers, dial-in users are authenticated through a RADIUS server that has been
  customized to work with the Kerberos security system.
- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a *smart card* access control system. In one case, RADIUS has been used with Enigma's security cards to validates users and to grant access to network resources.
- Networks already using RADIUS. You can add a Cisco Switch containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 2: Transitioning from RADIUS to TACACS+ Services below.

- Network in which the user must only access a single service. Using RADIUS, you can control user access
  to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE
  802.1x. For more information about this protocol, see Chapter 11, "Configuring IEEE 802.1x Port-Based
  Authentication."
- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

Figure 2: Transitioning from RADIUS to TACACS+ Services

Restrictions for Controlling Switch Access with RADIUS, on page 33

### **RADIUS Operation**

When a user attempts to log in and authenticate to a Switch that is access controlled by a RADIUS server, these events occur:

- 1. The user is prompted to enter a username and password.
- 2. The username and encrypted password are sent over the network to the RADIUS server.
- **3.** The user receives one of the following responses from the RADIUS server:
  - ACCEPT—The user is authenticated.
  - REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
  - CHALLENGE—A challenge requires additional data from the user.
  - CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- · Connection parameters, including the host or client IP address, access list, and user timeouts

Prerequisites for Controlling Switch Access with RADIUS, on page 33

### **RADIUS Change of Authorization**

This section provides an overview of the RADIUS interface including available primitives and how they are used during a Change of Authorization (CoA).

- Change-of-Authorization Requests
- CoA Request Response Code
- CoA Request Commands
- Session Reauthentication
- Stacking Guidelines for Session Termination

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Catalyst switches support the RADIUS Change of Authorization (CoA) extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external authentication, authorization, and accounting (AAA) or policy servers.

The switch supports these per-session CoA requests:

- Session reauthentication
- · Session termination
- Session termination with port shutdown
- Session termination with port bounce

This feature is integrated with Cisco Identity Services Engine, and Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Catalyst switches. However, some basic configuration is required for the following attributes:

- Security and Password—refer to the "Preventing Unauthorized Access to Your Switch" section in this guide.
- Accounting—refer to the "Starting RADIUS Accounting" section in the Configuring Switch-Based Authentication chapter in this guide.

### **Change-of-Authorization Requests**

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

CoA acknowledgment (ACK) [CoA-ACK]

• CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

### **RFC 5176 Compliance**

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.

This table shows the IETF attributes are supported for this feature.

**Table 4: Supported IETF Attributes** 

Attribute Number	Attribute Name
24	State
31	Calling-Station-ID
44	Acct-Session-ID
80	Message-Authenticator
101	Error-Cause

This table shows the possible values for the Error-Cause attribute.

Table 5: Error-Cause Values

Value	Explanation	
201	Residual Session Context Removed	
202	Invalid EAP Packet (Ignored)	
401	Unsupported Attribute	
402	Missing Attribute	
403	NAS Identification Mismatch	
404	Invalid Request	
405	Unsupported Service	
406	Unsupported Extension	
407	Invalid Attribute Value	
501	Administratively Prohibited	
502	Request Not Routable (Proxy)	
503	Session Context Not Found	

Value	Explanation
504	Session Context Not Removable
505	Other Proxy Processing Error
506	Resources Unavailable
507	Request Initiated
508	Multiple Session Selection Unsupported

### **CoA Request Response Code**

The CoA Request response code can be used to convey a command to the switch.

### **Related Topics**

CoA Request Commands, on page 39

### **Session Identification**

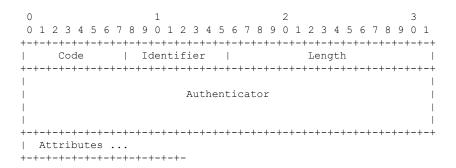

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- Audit-Session-Id (Cisco VSA)
- Acct-Session-Id (IETF attribute #44)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the "Invalid Attribute Value" error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect- negative acknowledgment (NAK) or CoA-NAK with the error code "Invalid Attribute Value."

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.

The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

CoA Disconnect-Request, on page 40

CoA Request: Disable Host Port, on page 40

CoA Request: Bounce-Port, on page 41

#### **CoA ACK Response Code**

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

### **CoA NAK Response Code**

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use **show** commands to verify a successful CoA.

### **CoA Request Commands**

Table 6: CoA Commands Supported on the switch

Command 1	Cisco VSA	
Reauthenticate host	Cisco:Avpair="subscriber:command=reauthenticate"	
Terminate session	This is a standard disconnect request that does not require a VSA	
Bounce host port	Cisco:Avpair="subscriber:command=bounce-host-port"	
Disable host port	Cisco:Avpair="subscriber:command=disable-host-port"	

<sup>&</sup>lt;sup>1</sup> All CoA commands must include the session identifier between the switch and the CoA client.

### **Related Topics**

CoA Request Response Code, on page 38

### **Session Reauthentication**

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: Cisco:Avpair="subscriber:command=reauthenticate" and one or more session identification attributes.

The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -RequestId message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.

If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

#### **Session Termination**

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host's access to the network.

To restrict a host's access to the network, use a CoA Request with the

Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

### **CoA Disconnect-Request**

This command is a standard Disconnect-Request. If the session cannot be located, the switch returns a Disconnect-NAK message with the "Session Context Not Found" error-code attribute. If the session is located, the switch terminates the session. After the session has been completely removed, the switch returns a Disconnect-ACK.

If the switch fails-over to a standby switch before returning a Disconnect-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the session is not found following re-sending, a Disconnect-ACK is sent with the "Session Context Not Found" error-code attribute.

### **Related Topics**

Session Identification, on page 38

#### CoA Request: Disable Host Port

This command is carried in a standard CoA-Request message that has this new VSA:

Cisco:Avpair="subscriber:command=disable-host-port"

If the session cannot be located, the switch returns a CoA-NAK message with the "Session Context Not Found" error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active switch.

Note

A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.

Session Identification, on page 38

### **CoA Request: Bounce-Port**

This command is carried in a standard CoA-Request message that contains the following VSA:

Cisco:Avpair="subscriber:command=bounce-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the "Session Context Not Found" error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

### **Related Topics**

Session Identification, on page 38

### **RADIUS Server Host**

Switch-to-RADIUS-server communication involves several components:

- · Hostname or IP address
- Authentication destination port
- Accounting destination port
- · Key string
- Timeout period
- · Retransmission value

You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS\_DEAD message appears, and then the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings.

Identifying the RADIUS Server Host, on page 44
Defining AAA Server Groups, on page 49
Configuring Settings for All RADIUS Servers, on page 54
Configuring RADIUS Login Authentication, on page 46

### **RADIUS Login Authentication**

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list. The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

### **Related Topics**

Configuring RADIUS Login Authentication, on page 46

## **AAA Server Groups**

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one.

### **Related Topics**

Defining AAA Server Groups, on page 49

Example: Using Two Different RADIUS Group Servers, on page 62

### **AAA** Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user's profile, which is in the local user database or on the security server, to configure the user's session. The user is granted access to a requested service only if the information in the user profile allows it.

#### **Related Topics**

Configuring RADIUS Authorization for User Privileged Access and Network Services, on page 51

# **RADIUS Accounting**

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

### **Related Topics**

Starting RADIUS Accounting, on page 53

# **Vendor-Specific RADIUS Attributes**

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco's vendor-ID is 9, and the supported option has vendor-type 1, which is named *cisco-avpair*. The value is a string with this format:

```
protocol : attribute sep value *
```

*Protocol* is a value of the Cisco protocol attribute for a particular type of authorization. *Attribute* and *value* are an appropriate attributevalue (AV) pair defined in the Cisco TACACS+ specification, and *sep* is = for mandatory attributes and is \* for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, "Remote Authentication Dial-In User Service (RADIUS)."

For a complete list of RADIUS attributes or more information about vendor-specific attribute 26, see the "RADIUS Attributes" appendix in the *Cisco IOS Security Configuration Guide*.

### **Related Topics**

Configuring the Switch to Use Vendor-Specific RADIUS Attributes, on page 56

### **Vendor-Proprietary RADIUS Server Communication**

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the **radius-server** global configuration commands.

### **Related Topics**

Configuring the Switch for Vendor-Proprietary RADIUS Server Communication, on page 57

### **Default RADIUS Configuration**

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

# **How to Configure RADIUS**

### **Identifying the RADIUS Server Host**

To apply these settings globally to all RADIUS servers communicating with the Switch, use the three unique global configuration commands: **radius-server timeout**, **radius-server retransmit**, and **radius-server key**. To apply these values on a specific RADIUS server, use the **radius-server host** global configuration command.

You can configure the Switch to use AAA server groups to group existing server hosts for authentication. For more information, see Related Topics below.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the Switch and the key string to be shared by both the server and the Switch. For more information, see the RADIUS server documentation.

Follow these steps to configure per-server RADIUS server communication.

### Before you begin

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the switch, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see Related Topics below.

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3.** radius-server host {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]
- 4. end
- 5. show running-config
- 6. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. Enter your password if
	Example:	prompted.
	Switch> enable	

	Command or Action	Purpose
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	radius-server host {hostname   ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds]	Specifies the IP address or hostname of the remote RADIUS server host.
	[retransmit retries] [key string]  Example:	• (Optional) For <b>auth-port</b> <i>port-number</i> , specify the UDP destination port for authentication requests.
	Switch(config) # radius-server host 172.29.36.49 auth-port 1612 key rad1	• (Optional) For <b>acct-port</b> <i>port-number</i> , specify the UDP destination port for accounting requests.
		• (Optional) For <b>timeout</b> <i>seconds</i> , specify the time interval that the Switch waits for the RADIUS server to reply before resending. The range is 1 to 1000. This setting overrides the <b>radius-server timeout</b> global configuration command setting. If no timeout is set with the <b>radius-server host</b> command, the setting of the <b>radius-server timeout</b> command is used.
		• (Optional) For <b>retransmit</b> <i>retries</i> , specify the number of times a RADIUS request is resent to a server if that server is not responding or responding slowly. The range is 1 to 1000. If no retransmit value is set with the <b>radius-server host</b> command, the setting of the <b>radius-server retransmit</b> global configuration command is used.
		• (Optional) For <b>key</b> <i>string</i> , specify the authentication and encryption key used between the Switch and the RADIUS daemon running on the RADIUS server.
		Note The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the radius-server host command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.
		To configure the Switch to recognize more than one host entry associated with a single IP address, enter this command as many times as necessary, making sure that each UDP port number is different. The Switch software searches for hosts in the order in which you specify them. Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host.

Command or Action	Purpose
end	Returns to privileged EXEC mode.
Example:	
Switch(config)# end	
show running-config	Verifies your entries.
Example:	
Switch# show running-config	
copy running-config startup-config	(Optional) Saves your entries in the configuration file.
Example:	
Switch# copy running-config startup-config	
	end Example: Switch(config)# end  show running-config Example: Switch# show running-config  copy running-config startup-config Example:

RADIUS Server Host, on page 41
Defining AAA Server Groups, on page 49
Configuring Settings for All RADIUS Servers, on page 54

## **Configuring RADIUS Login Authentication**

Follow these steps to configure RADIUS login authentication:

### Before you begin

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- **4.** aaa authentication login {default | list-name} method1 [method2...]
- **5. line** [console | tty | vty] line-number [ending-line-number]
- **6. login authentication** {**default** | *list-name*}
- **7.** end
- 8. show running-config
- 9. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. Enter your password if prompted.
	Example:	prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	aaa new-model	Enables AAA.
	Example:	
	Switch(config)# aaa new-model	
Step 4	aaa authentication login {default   list-name} method1	Creates a login authentication method list.
	[method2]	• To create a default list that is used when a named list
	Example:	is <i>not</i> specified in the <b>login authentication</b> command, use the <b>default</b> keyword followed by the methods that
	<pre>Switch(config)# aaa authentication login default local</pre>	are to be used in default situations. The default method list is automatically applied to all ports.
		• For <i>list-name</i> , specify a character string to name the list you are creating.
		• For <i>method1</i> , specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.
		Select one of these methods:
		• enable—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the enable password global configuration command.
		• group radius—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server.
		• <i>line</i> —Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the <b>password</b> password line configuration command.

	Command or Action	Purpose
		• local—Use the local username database for authentication. You must enter username information in the database. Use the username name password global configuration command.
		• <i>local-case</i> —Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <b>username</b> <i>password</i> global configuration command.
		• <i>none</i> —Do not use any authentication for login.
Step 5	line [console   tty   vty] line-number [ending-line-number]	
	Example:	which you want to apply the authentication list.
	Switch(config)# line 1 4	
Step 6	login authentication {default   list-name}	Applies the authentication list to a line or set of lines.
	Example:	• If you specify <b>default</b> , use the default list created with the <b>aaa authentication login</b> command.
	Switch(config)# login authentication default	• For <i>list-name</i> , specify the list created with the aaa authentication login command.
Step 7	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 8	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 9	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

RADIUS Login Authentication, on page 42 RADIUS Server Host, on page 41

### **Defining AAA Server Groups**

You use the **server** group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional **auth-port** and **acct-port** keywords.

Follow these steps to define AAA server groups:

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3.** radius-server host {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]
- 4. aaa new-model
- 5. aaa group server radius group-name
- **6. server** *ip-address*
- **7.** end
- 8. show running-config
- 9. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	radius-server host {hostname   ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds]	Specifies the IP address or hostname of the remote RADIUS server host.
	[retransmit retries] [key string]  Example:	• (Optional) For <b>auth-port</b> <i>port-number</i> , specify the UDP destination port for authentication requests.
	Switch(config) # radius-server host 172.29.36.49 auth-port 1612 key rad1	• (Optional) For <b>acct-port</b> <i>port-number</i> , specify the UDP destination port for accounting requests.
		• (Optional) For <b>timeout</b> <i>seconds</i> , specify the time interval that the switch waits for the RADIUS server to reply before resending. The range is 1 to 1000. This setting overrides the <b>radius-server timeout</b> global configuration command setting. If no timeout is set

	Command or Action	Purpose
		with the <b>radius-server host</b> command, the setting of the <b>radius-server timeout</b> command is used.
		• (Optional) For <b>retransmit</b> retries, specify the number of times a RADIUS request is resent to a server if that server is not responding or responding slowly. The range is 1 to 1000. If no retransmit value is set with the <b>radius-server host</b> command, the setting of the <b>radius-server retransmit</b> global configuration command is used.
		• (Optional) For <b>key</b> <i>string</i> , specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.
		Note  The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the radius-server host command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.
		To configure the switch to recognize more than one host entry associated with a single IP address, enter this command as many times as necessary, making sure that each UDP port number is different. The switch software searches for hosts in the order in which you specify them. Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host.
Step 4	aaa new-model	Enables AAA.
	Example:	
	Switch(config)# aaa new-model	
Step 5	aaa group server radius group-name	Defines the AAA server-group with a group name.
	Example:	This command puts the switch in a server group configuration mode.
	Switch(config)# aaa group server radius group1	configuration mode.
Step 6	server ip-address  Example:	Associates a particular RADIUS server with the defined server group. Repeat this step for each RADIUS server in the AAA server group.
	Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001	Each server in the group must be previously defined in Step 2.

	Command or Action	Purpose
Step 7	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 8	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 9	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config

# Configuring RADIUS Authorization for User Privileged Access and Network Services

Note

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to configure RADIUS authorization for user priviledged access and network services:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa authorization network radius
- 4. aaa authorization exec radius
- 5. end
- 6. show running-config
- 7. copy running-config startup-config

### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	aaa authorization network radius	Configures the switch for user RADIUS authorization for
	Example:	all network-related service requests.
	Switch(config)# aaa authorization network radius	
Step 4	aaa authorization exec radius	Configures the switch for user RADIUS authorization if
	Example:	the user has privileged EXEC access.
	Switch(config)# aaa authorization exec radius	The <b>exec</b> keyword might return user profile information (such as <b>autocommand</b> information).
Step 5	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 6	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

### What to do next

You can use the **aaa authorization** global configuration command with the **radius** keyword to set parameters that restrict a user's network access to privileged EXEC mode.

The aaa authorization exec radius local command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

AAA Authorization, on page 42

# **Starting RADIUS Accounting**

Follow these steps to start RADIUS accounting:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa accounting network start-stop radius
- 4. aaa accounting exec start-stop radius
- 5. end
- 6. show running-config
- 7. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.
	Switch> enable	
Step 2	configure terminal  Example:	Enters the global configuration mode.
	Switch# configure terminal	
Step 3	aaa accounting network start-stop radius  Example:	Enables RADIUS accounting for all network-related service requests.
	Switch(config)# aaa accounting network start-stop radius	
Step 4	aaa accounting exec start-stop radius  Example: Switch(config) # aaa accounting exec start-stop radius	Enables RADIUS accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.

	Command or Action	Purpose
Step 5	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 6	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

### What to do next

To establishing a session with a router if the AAA server is unreachable, use the **aaa accounting system guarantee-first** command. This command guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the **no aaa accounting system guarantee-first** command.

### **Related Topics**

RADIUS Accounting, on page 43

## **Configuring Settings for All RADIUS Servers**

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

### **SUMMARY STEPS**

- 1. configure terminal
- 2. radius-server key string
- 3. radius-server retransmit retries
- 4. radius-server timeout seconds
- 5. radius-server deadtime minutes
- end
- 7. show running-config
- 8. copy running-config startup-config

	Command or Action	Purpose
Step 1	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 2	radius-server key string  Example:	Specifies the shared secret text string used between the switch and all RADIUS servers.
	Switch(config)# radius-server key your_server_key	Note  The key is a text string that must match the encryption key used on the RADIUS server.  Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.
Step 3	radius-server retransmit retries  Example:	Specifies the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.
	Switch(config)# radius-server retransmit 5	
Step 4	radius-server timeout seconds	Specifies the number of seconds a switch waits for a reply
	Example:	to a RADIUS request before resending the request. The default is 5 seconds; the range is 1 to 1000.
	Switch(config)# radius-server timeout 3	
Step 5	radius-server deadtime minutes	When a RADIUS server is not responding to authentication
	Example:	requests, this command specifies a time to stop the request on that server. This avoids the wait for the request to timeout
	Switch(config)# radius-server deadtime 0	before trying the next configured server. The default is 0; the range is 1 to 1440 minutes.
Step 6	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 7	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	

	Command or Action	Purpose
Step 8	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

Identifying the RADIUS Server Host, on page 44 RADIUS Server Host, on page 41

# **Configuring the Switch to Use Vendor-Specific RADIUS Attributes**

Follow these steps to configure the switch to use vendor-specific RADIUS attributes:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. radius-server vsa send [accounting | authentication]
- 4. end
- 5. show running-config
- 6. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable Example:	Enables privileged EXEC mode. Enter your password if prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:  Switch# configure terminal	
Step 3	radius-server vsa send [accounting   authentication]  Example:  Switch(config) # radius-server vsa send	Enables the switch to recognize and use VSAs as defined by RADIUS IETF attribute 26.  • (Optional) Use the <b>accounting</b> keyword to limit the set of recognized vendor-specific attributes to only accounting attributes.

	Command or Action	Purpose
		• (Optional) Use the <b>authentication</b> keyword to limit the set of recognized vendor-specific attributes to only authentication attributes.
		If you enter this command without keywords, both accounting and authentication vendor-specific attributes are used.
Step 4	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 5	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 6	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

Vendor-Specific RADIUS Attributes, on page 43

# Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

Follow these steps to configure the switch to use vendor-proprietary RADIUS server communication:

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. radius-server host {hostname | ip-address} non-standard
- 4. radius-server key string
- 5. end
- 6. show running-config
- 7. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable  Example:  Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	radius-server host {hostname   ip-address} non-standard	Specifies the IP address or hostname of the remote RADIUS
	Example:	server host and identifies that it is using a vendor-proprietary implementation of RADIUS.
	Switch(config) # radius-server host 172.20.30.15 nonstandard	
Step 4	radius-server key string	Specifies the shared secret text string used between the
	Example:  Switch(config) # radius-server key rad124	switch and the vendor-proprietary RADIUS server. The switch and the RADIUS server use this text string to encrypt
		passwords and exchange responses.
		Note  The key is a text string that must match the encryption key used on the RADIUS server.  Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.
Step 5	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 6	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	

Command or Action	Purpose
Switch# copy running-config startup-config	

### What to do next

This feature allows access and authentication requests to be evenly across all RADIUS servers in a server group. For more information, see the "RADIUS Server Load Balancing" chapter of the *Cisco IOS Security Configuration Guide, Release 12.4*.

### **Related Topics**

Vendor-Proprietary RADIUS Server Communication, on page 43

# **Configuring CoA on the Switch**

Follow these steps to configure CoA on a switch. This procedure is required.

### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- 4. aaa server radius dynamic-author
- **5. client** {*ip-address* | *name*} [**vrf** *vrfname*] [**server-key** *string*]
- **6.** server-key  $[0 \mid 7]$  string
- **7. port** *port-number*
- 8. auth-type {any | all | session-key}
- 9. ignore session-key
- 10. ignore server-key
- 11. authentication command bounce-port ignore
- 12. authentication command disable-port ignore
- **13**. end
- 14. show running-config
- 15. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. Enter your password if
	Example:	prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	

	Command or Action	Purpose
	Switch# configure terminal	
Step 3	aaa new-model	Enables AAA.
	Example:	
	Switch(config)# aaa new-model	
Step 4	aaa server radius dynamic-author	Configures the switch as an authentication, authorization,
	Example:	and accounting (AAA) server to facilitate interaction with an external policy server.
	Switch(config)# aaa server radius dynamic-author	
Step 5	client {ip-address   name} [vrf vrfname] [server-key string]	Enters dynamic authorization local server configuration mode and specifies a RADIUS client from which a device will accept CoA and disconnect requests.
Step 6	server-key [0   7] string	Configures the RADIUS key to be shared between a device
	Example:	and RADIUS clients.
	<pre>Switch(config-sg-radius)# server-key your_server_key</pre>	
Step 7	port port-number	Specifies the port on which a device listens for RADIUS
	Example:	requests from configured RADIUS clients.
	Switch(config-sg-radius)# port 25	
Step 8	auth-type {any   all   session-key}	Specifies the type of authorization the switch uses for
	Example:	RADIUS clients.
	Switch(config-sg-radius)# auth-type any	The client must match all the configured attributes for authorization.
Step 9	ignore session-key	(Optional) Configures the switch to ignore the session-key.
		For more information about the <b>ignore</b> command, see the <i>Cisco IOS Intelligent Services Gateway Command Reference</i> on Cisco.com.
Step 10	ignore server-key	(Optional) Configures the switch to ignore the server-key.
	Example:  Switch(config-sg-radius)# ignore server-key	For more information about the <b>ignore</b> command, see the <i>Cisco IOS Intelligent Services Gateway Command Reference</i> on Cisco.com.

	Command or Action	Purpose
Step 11	authentication command bounce-port ignore  Example:  Switch(config-sg-radius)# authentication command bounce-port ignore	(Optional) Configures the switch to ignore a CoA request to temporarily disable the port hosting a session. The purpose of temporarily disabling the port is to trigger a DHCP renegotiation from the host when a VLAN change occurs and there is no supplicant on the endpoint to detect the change.
Step 12	authentication command disable-port ignore  Example:  Switch(config-sg-radius)# authentication command disable-port ignore	(Optional) Configures the switch to ignore a nonstandard command requesting that the port hosting a session be administratively shut down. Shutting down the port results in termination of the session.  Use standard CLI or SNMP commands to re-enable the port.
Step 13	<pre>end Example: Switch(config-sg-radius)# end</pre>	Returns to privileged EXEC mode.
Step 14	<pre>show running-config Example: Switch# show running-config</pre>	Verifies your entries.
Step 15	copy running-config startup-config  Example:  Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

# **Monitoring CoA Functionality**

### Table 7: Privileged EXEC show Commands

Command	Purpose
show aaa attributes protocol radius	Displays AAA attributes of RADIUS commands.

### **Table 8: Global Troubleshooting Commands**

Command	Purpose	
debug radius	Displays information for troubleshooting RADIUS.	
debug aaa coa	Displays information for troubleshooting CoA processing.	

Command	Purpose
debug aaa pod	Displays information for troubleshooting POD packets.
debug aaa subsys	Displays information for troubleshooting POD packets.
debug cmdhd [detail   error   events]	Displays information for troubleshooting command headers.

For detailed information about the fields in these displays, see the command reference for this release.

# **Configuration Examples for Controlling Switch Access with RADIUS**

## **Examples: Identifying the RADIUS Server Host**

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

```
Switch(config) # radius-server host 172.29.36.49 auth-port 1612 key rad1
Switch(config) # radius-server host 172.20.36.50 acct-port 1618 key rad2
```

This example shows how to configure *host1* as the RADIUS server and to use the default ports for both authentication and accounting:

```
Switch(config)# radius-server host host1
```

# **Example: Using Two Different RADIUS Group Servers**

In this example, the switch is configured to recognize two different RADIUS group servers (*group1* and *group2*). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a fail-over backup to the first entry.

```
Switch(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Switch(config)# aaa new-model
Switch(config)# aaa group server radius group1
Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config-sg-radius)# exit
Switch(config)# aaa group server radius group2
Switch(config-sg-radius)# server 172.20.0.1 auth-port 2000 acct-port 2001
Switch(config-sg-radius)# exit
```

### **Related Topics**

```

## **Examples: Configuring the Switch to Use Vendor-Specific RADIUS Attributes**

For example, this AV pair activates Cisco's *multiple named ip address pools* feature during IP authorization (during PPP IPCP address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

This example shows how to specify an authorized VLAN in the RADIUS server database:

```
cisco-avpair= "tunnel-type(#64)=VLAN(13)"
cisco-avpair= "tunnel-medium-type(#65)=802 media(6)"
cisco-avpair= "tunnel-private-group-id(#81)=vlanid"
```

This example shows how to apply an input ACL in ASCII format to an interface for the duration of this connection:

```
cisco-avpair= "ip:inacl#1=deny ip 10.10.10.10 0.0.255.255 20.20.20.20 255.255.0.0"
cisco-avpair= "ip:inacl#2=deny ip 10.10.10.10 0.0.255.255 any"
cisco-avpair= "mac:inacl#3=deny any any decnet-iv"
```

This example shows how to apply an output ACL in ASCII format to an interface for the duration of this connection:

```
cisco-avpair= "ip:outacl#2=deny ip 10.10.10.10 0.0.255.255 any"
```

# **Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication**

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of *rad124* between the switch and the server:

```
Switch(config) # radius-server host 172.20.30.15 nonstandard
Switch(config) # radius-server key rad124
```

# **Feature Information for RADIUS**

Release	Feature Information
	This feature was introduced.
Cisco IOS 12.2(52)SE	Introduced support for per-session CoA requests.
Cisco IOS 12.2(52)SE	Introduced support for the following CoA Request commands:
	Reauthenticate host
	Terminate session
	Bounce host port
	Disable host port

# **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="http://www.cisco.com/go/cfn">http://www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

# **How to Configure Local Authentication and Authorization**

### **Configuring the Switch for Local Authentication and Authorization**

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- 4. aaa authentication login default local
- 5. aaa authorization exec local
- 6. aaa authorization network local
- 7. **username** [privilege level] {password encryption-type password}
- 8. end
- 9. show running-config
- 10. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. Enter your password if
	Example:	prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	aaa new-model	Enables AAA.
	Example:	

	Command or Action	Purpose
	Switch(config)# aaa new-model	
Step 4	aaa authentication login default local  Example:  Switch(config) # aaa authentication login default local	Sets the login authentication to use the local username database. The <b>default</b> keyword applies the local user database authentication to all ports.
Step 5	aaa authorization exec local  Example:  Switch(config) # aaa authorization exec local	Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell.
Step 6	aaa authorization network local  Example:  Switch(config) # aaa authorization network local	Configures user AAA authorization for all network-related service requests.
Step 7	<pre>username name [privilege level] {password encryption-type password}  Example:  Switch(config) # username your_user_name privilege 1 password 7 secret567</pre>	Enters the local database, and establishes a username-based authentication system.  Repeat this command for each user.  • For <i>name</i> , specify the user ID as one word. Spaces and quotation marks are not allowed.  • (Optional) For <i>level</i> , specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access.  • For <i>encryption-type</i> , enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows.  • For <i>password</i> , specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the <b>username</b> command.
Step 8	end Example: Switch(config)# end	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 9	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 10	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config

# Prerequisites for Configuring the Switch for Secure Shell (SSH) and Secure Copy Protocol (SCP)

The following are the prerequisites for configuring the switch for secure shell (SSH):

- To use SSH, you must install the cryptographic (encrypted) software image on your switch.
- For SSH to work, the switch needs an RSA public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.
- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.
- SCP relies on SSH for security.
- SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.
- A user must have appropriate authorization to use SCP.
- A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the **copy** command. An authorized administrator can also do this from a workstation.

Secure Copy Protocol, on page 72

# **Restrictions for Configuring the Switch for SSH**

The following are restrictions for configuring the Switch for secure shell.

- The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
- SSH supports only the execution-shell application.
- The SSH server and the SSH client are supported only on DES (56-bit) and 3DES (168-bit) data encryption software.
- The Switch supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.
- This software release does not support IP Security (IPSec).
- When using SCP, you cannot enter the password into the **copy** command. You must enter the password when prompted.

### **Related Topics**

Secure Copy Protocol, on page 72

# **Information About SSH**

### **SSH and Switch Access**

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

# SSH Servers, Integrated Clients, and Supported Versions

The SSH feature has an SSH server and an SSH integrated client, which are applications that run on the switch. You can use an SSH client to connect to a switch running the SSH server. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client also works with the SSH server supported in this release and with non-Cisco SSH servers.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

SSH supports the Data Encryption Standard (DES) encryption algorithm, the Triple DES (3DES) encryption algorithm, and password-based user authentication.

SSH also supports these user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

Configuring the Switch for Local Authentication and Authorization, on page 66 TACACS+ and Switch Access, on page 20 RADIUS and Switch Access, on page 34

# **SSH Configuration Guidelines**

Follow these guidelines when configuring the switch as an SSH server or SSH client:

- An RSA key pair generated by a SSHv1 server can be used by an SSHv2 server, and the reverse.
- If the SSH server is running on a stack master and the stack master fails, the new stack master uses the RSA key pair generated by the previous stack master.
- If you get CLI error messages after entering the **crypto key generate rsa** global configuration command, an RSA key pair has not been generated. Reconfigure the hostname and domain, and then enter the **crypto key generate rsa** command. For more information, see Related Topics below.
- When generating the RSA key pair, the message No host name specified might appear. If it does, you must configure a hostname by using the **hostname** global configuration command.
- When generating the RSA key pair, the message No domain specified might appear. If it does, you must configure an IP domain name by using the **ip domain-name** global configuration command.
- When configuring the local authentication and authorization authentication method, make sure that AAA
  is disabled on the console.

### **Related Topics**

Setting Up the Switch to Run SSH, on page 72 Configuring the Switch for Local Authentication and Authorization

### **Secure Copy Protocol Overview**

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

Note

When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

# **Secure Copy Protocol**

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the switch can determine whether the user has the correct privilege level. To configure the Secure Copy feature, you should understand the SCP concepts.

### **Related Topics**

Prerequisites for Configuring the Switch for Secure Shell (SSH) and Secure Copy Protocol (SCP), on page 69

Restrictions for Configuring the Switch for SSH, on page 70

### Information about SSH

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

# **How to Configure SSH**

### **Setting Up the Switch to Run SSH**

Follow these steps to set up your Switch to run SSH:

#### Before you begin

Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- 3. hostname hostname
- 4. ip domain-name domain name
- 5. crypto key generate rsa
- 6. end
- 7. show running-config

#### 8. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. Enter your password if
	Example:	prompted.
	Switch> enable	
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	hostname hostname	Configures a hostname and IP domain name for your
	Example:	Switch.
	Switch(config)# hostname your_hostname	Note Follow this procedure only if you are configuring the Switch as an SSH server.
Step 4	ip domain-name domain_name	Configures a host domain for your Switch.
	Example:	
	Switch(config)# ip domain-name your_domain	
Step 5	crypto key generate rsa	Enables the SSH server for local and remote authentication
	Example:	on the Switch and generates an RSA key pair. Generating an RSA key pair for the Switch automatically enables SSH.
	Switch(config)# crypto key generate rsa	We recommend that a minimum modulus size of 1024 bits.
		When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.
		Note Follow this procedure only if you are configuring the Switch as an SSH server.
Step 6	end	Returns to privileged EXEC mode.
	Example:	
	Switch(config)# end	
Step 7	show running-config	Verifies your entries.
	Example:	

	Command or Action	Purpose
	Switch# show running-config	
Step 8	copy running-config startup-config  Example:	(Optional) Saves your entries in the configuration file.
	Switch# copy running-config startup-config	

#### **Related Topics**

SSH Configuration Guidelines, on page 71 Configuring the Switch for Local Authentication and Authorization

## **Configuring the SSH Server**

Follow these steps to configure the SSH server:

Note

This procedure is only required if you are configuring the Switch as an SSH server.

#### **SUMMARY STEPS**

- 1. enable
- 2. configure terminal
- **3.** ip ssh version [1 | 2]
- **4.** ip ssh {timeout seconds | authentication-retries number}
- **5.** Use one or both of the following:
  - line vtyline\_number[ending\_line\_number]
  - transport input ssh
- 6. end
- 7. show running-config
- 8. copy running-config startup-config

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode. Enter your password if
	Example:	prompted.
	Switch> enable	

	Command or Action	Purpose
Step 2	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
	Switten Conzigure Columnat	
Step 3	ip ssh version [1   2]	(Optional) Configures the Switch to run SSH Version 1 or
	Example:	SSH Version 2.
	Switch(config)# ip ssh version 1	• 1—Configure the Switch to run SSH Version 1.
		• 2—Configure the Switch to run SSH Version 2.
		If you do not enter this command or do not specify a
		keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client
		supported by the SSH chefit. For example, if the SSH chefit supports SSHv1 and SSHv2, the SSH server selects SSHv2.
Step 4	ip ssh {timeout seconds   authentication-retries number}	Configures the SSH control parameters:
	Example:	Specify the time-out value in seconds; the default is
	Cuit ch (confin) H in coh timesut 00	120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After
	Switch(config)# ip ssh timeout 90 authentication-retries 2	the connection is established, the Switch uses the
		default time-out values of the CLI-based sessions.
		By default, up to five simultaneous, encrypted SSH
		connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After
		the execution shell starts, the CLI-based session
		time-out value returns to the default of 10 minutes.
		Specify the number of times that a client can
		re-authenticate to the server. The default is 3; the range
		is 0 to 5.
		Repeat this step when configuring both parameters.
Step 5	Use one or both of the following:	(Optional) Configures the virtual terminal line settings.
	• line vtyline_number[ending_line_number]	Enters line configuration mode to configure the virtual
	• transport input ssh	terminal line settings. For <i>line_number</i> and <i>ending line number</i> , specify a pair of lines. The range
	Example:	is 0 to 15.
	Switch(config) # line vty 1 10	Specifies that the Switch prevent non-SSH Telnet
	or	connections. This limits the router to only SSH
	Switch(config-line)# transport input ssh	connections.
	Sales (config fine) is cranspore input son	
Step 6	end	Returns to privileged EXEC mode.
	Example:	

	Command or Action	Purpose
	Switch(config-line)# end	
Step 7	show running-config	Verifies your entries.
	Example:	
	Switch# show running-config	
Step 8	copy running-config startup-config	(Optional) Saves your entries in the configuration file.
	Example:	
	Switch# copy running-config startup-config	

# **Monitoring the SSH Configuration and Status**

This table displays the SSH server configuration and status.

Table 9: Commands for Displaying the SSH Server Configuration and Status

Command	Purpose
show ip ssh	Shows the version and configuration information for the SSH server.
show ssh	Shows the status of the SSH server.

## **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="http://www.cisco.com/go/cfn">http://www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

## **Information about Secure Sockets Layer (SSL) HTTP**

### **Secure HTTP Servers and Clients Overview**

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with https:// instead of http://.

Note

SSL evolved into Transport Layer Security (TLS) in 1999, but is still used in this particular context.

The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.

The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

## **Certificate Authority Trustpoints**

Certificate authorities (CAs) manage certificate requests and issue certificates to participating network devices. These services provide centralized security key and certificate management for the participating devices. Specific CA servers are referred to as *trustpoints*.

When a connection attempt is made, the HTTPS server provides a secure connection by issuing a certified X.509v3 certificate, obtained from a specified CA trustpoint, to the client. The client (usually a Web browser), in turn, has a public key that allows it to authenticate the certificate.

For secure HTTP connections, we highly recommend that you configure a CA trustpoint. If a CA trustpoint is not configured for the device running the HTTPS server, the server certifies itself and generates the needed RSA key pair. Because a self-certified (self-signed) certificate does not provide adequate security, the connecting client generates a notification that the certificate is self-certified, and the user has the opportunity to accept or reject the connection. This option is useful for internal network topologies (such as testing).

If you do not configure a CA trustpoint, when you enable a secure HTTP connection, either a temporary or a persistent self-signed certificate for the secure HTTP server (or client) is automatically generated.

- If the switch is not configured with a hostname and a domain name, a temporary self-signed certificate is generated. If the switch reboots, any temporary self-signed certificate is lost, and a new temporary new self-signed certificate is assigned.
- If the switch has been configured with a host and domain name, a persistent self-signed certificate is generated. This certificate remains active if you reboot the switch or if you disable the secure HTTP server so that it will be there the next time you re-enable a secure HTTP connection.

Note

The certificate authorities and trustpoints must be configured on each device individually. Copying them from other devices makes them invalid on the switch.

If a self-signed certificate has been generated, this information is included in the output of the **show running-config** privileged EXEC command. This is a partial sample output from that command displaying a self-signed certificate.

```
Switch# show running-config
Building configuration...
<output truncated>
crypto pki trustpoint TP-self-signed-3080755072
 enrollment selfsigned
 subject-name cn=IOS-Self-Signed-Certificate-3080755072
 revocation-check none
 rsakeypair TP-self-signed-3080755072
crypto ca certificate chain TP-self-signed-3080755072
 certificate self-signed 01
  3082029F 30820208 A0030201 02020101 300D0609 2A864886 F70D0101 04050030
  59312F30 2D060355 04031326 494F532D 53656C66 2D536967 6E65642D 43657274
  69666963 6174652D 33303830 37353530 37323126 30240609 2A864886 F70D0109
  02161743 45322D33 3535302D 31332E73 756D6D30 342D3335 3530301E 170D3933
  30333031 30303030 35395A17 0D323030 31303130 30303030 305A3059 312F302D
<output truncated>
```

You can remove this self-signed certificate by disabling the secure HTTP server and entering the **no crypto pki trustpoint TP-self-signed-30890755072** global configuration command. If you later re-enable a secure HTTP server, a new self-signed certificate is generated.

Note

The values that follow TP self-signed depend on the serial number of the device.

You can use an optional command (**ip http secure-client-auth**) to allow the HTTPS server to request an X.509v3 certificate from the client. Authenticating the client provides more security than server authentication by itself.

For additional information on Certificate Authorities, see the "Configuring Certification Authority Interoperability" chapter in the *Cisco IOS Security Configuration Guide, Release 12.4.* 

### **CipherSuites**

A CipherSuite specifies the encryption algorithm and the digest algorithm to use on a SSL connection. When connecting to the HTTPS server, the client Web browser offers a list of supported CipherSuites, and the client and server negotiate the best encryption algorithm to use from those on the list that are supported by both. For example, Netscape Communicator 4.76 supports U.S. security with RSA Public Key Cryptography, MD2, MD5, RC2-CBC, RC4, DES-CBC, and DES-EDE3-CBC.

For the best possible encryption, you should use a client browser that supports 128-bit encryption, such as Microsoft Internet Explorer Version 5.5 (or later) or Netscape Communicator Version 4.76 (or later). The SSL\_RSA\_WITH\_DES\_CBC\_SHA CipherSuite provides less security than the other CipherSuites, as it does not offer 128-bit encryption.

The more secure and more complex CipherSuites require slightly more processing time. This list defines the CipherSuites supported by the switch and ranks them from fastest to slowest in terms of router processing load (speed):

- 1. SSL\_RSA\_WITH\_DES\_CBC\_SHA—RSA key exchange (RSA Public Key Cryptography) with DES-CBC for message encryption and SHA for message digest
- 2. SSL\_RSA\_WITH\_NULL\_SHA key exchange with NULL for message encryption and SHA for message digest (only for SSL 3.0).
- **3.** SSL\_RSA\_WITH\_NULL\_MD5 key exchange with NULL for message encryption and MD5 for message digest (only for SSL 3.0).
- SSL\_RSA\_WITH\_RC4\_128\_MD5—RSA key exchange with RC4 128-bit encryption and MD5 for message digest
- 5. SSL\_RSA\_WITH\_RC4\_128\_SHA—RSA key exchange with RC4 128-bit encryption and SHA for message digest
- **6.** SSL\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA—RSA key exchange with 3DES and DES-EDE3-CBC for message encryption and SHA for message digest
- 7. SSL\_RSA\_WITH\_AES\_128\_CBC\_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).
- **8.** SSL\_RSA\_WITH\_AES\_256\_CBC\_SHA—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

- 9. SSL\_RSA\_WITH\_DHE\_AES\_128\_CBC\_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).
- **10.** SSL\_RSA\_WITH\_DHE\_AES\_256\_CBC\_SHA—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

Note

The latest versions of Chrome do not support the four original cipher suites, thus disallowing access to both web GUI and guest portals.

RSA (in conjunction with the specified encryption and digest algorithm combinations) is used for both key generation and authentication on SSL connections. This usage is independent of whether or not a CA trustpoint is configured.

## **Default SSL Configuration**

The standard HTTP server is enabled.

SSL is enabled.

No CA trustpoints are configured.

No self-signed certificates are generated.

## **SSL Configuration Guidelines**

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the stack master.

## **How to Configure Secure HTTP Servers and Clients**

### **Configuring a CA Trustpoint**

For secure HTTP connections, we recommend that you configure an official CA trustpoint. A CA trustpoint is more secure than a self-signed certificate.

Beginning in privileged EXEC mode, follow these steps to configure a CA Trustpoint:

#### **SUMMARY STEPS**

- 1. configure terminal
- 2. hostname hostname
- 3. ip domain-name domain-name
- 4. crypto key generate rsa

- 5. crypto ca trustpoint name
- **6. enrollment url** *url*
- 7. **enrollment http-proxy** host-name port-number
- 8. crl query url
- 9. primary name
- **10.** exit
- 11. crypto ca authentication name
- **12**. **crypto ca enroll** *name*
- **13**. end

	Command or Action	Purpose
Step 1	configure terminal	Enters the global configuration mode.
	Example:	
	Switch# configure terminal	
Step 2	hostname hostname	Specifies the hostname of the switch (required only if you
	Example:	have not previously configured a hostname). The hostname is required for security keys and certificates.
	Switch(config)# hostname your_hostname	
Step 3	ip domain-name domain-name	Specifies the IP domain name of the switch (required only
	Example:	if you have not previously configured an IP domain name). The domain name is required for security keys and
	Switch(config)# ip domain-name your_domain	certificates.
Step 4	crypto key generate rsa	(Optional) Generates an RSA key pair. RSA key pairs are
	Example:	required before you can obtain a certificate for the switch. RSA key pairs are generated automatically. You can use
	Switch(config)# crypto key generate rsa	this command to regenerate the keys, if needed.
Step 5	crypto ca trustpoint name	Specifies a local configuration name for the CA trustpoint
	Example:	and enter CA trustpoint configuration mode.
	Switch(config)# crypto ca trustpoint your_trustpoint	
Step 6	enrollment url url	Specifies the URL to which the switch should send
	Example:	certificate requests.
	Switch(ca-trustpoint)# enrollment url	

	Command or Action	Purpose
	http://your_server:80	
Step 7	<pre>enrollment http-proxy host-name port-number Example:  Switch(ca-trustpoint)# enrollment http-proxy your_host 49</pre>	<ul> <li>(Optional) Configures the switch to obtain certificates from the CA through an HTTP proxy server.</li> <li>• For <i>host-name</i>, specify the proxy server used to get the CA.</li> <li>• For <i>port-number</i>, specify the port number used to access the CA.</li> </ul>
Step 8	<pre>crl query url Example: Switch(ca-trustpoint) # crl query ldap://your_host:49</pre>	Configures the switch to request a certificate revocation list (CRL) to ensure that the certificate of the peer has not been revoked.
Step 9	<pre>primary name Example: Switch(ca-trustpoint)# primary your_trustpoint</pre>	<ul><li>(Optional) Specifies that the trustpoint should be used as the primary (default) trustpoint for CA requests.</li><li>For <i>name</i>, specify the trustpoint that you just configured.</li></ul>
Step 10	<pre>exit Example: Switch(ca-trustpoint)# exit</pre>	Exits CA trustpoint configuration mode and return to global configuration mode.
Step 11	<pre>crypto ca authentication name Example:  Switch(config) # crypto ca authentication your_trustpoint</pre>	Authenticates the CA by getting the public key of the CA. Use the same name used in Step 5.
Step 12	<pre>crypto ca enroll name Example: Switch(config)# crypto ca enroll your_trustpoint</pre>	Obtains the certificate from the specified CA trustpoint. This command requests a signed certificate for each RSA key pair.
Step 13	<pre>end Example: Switch(config) # end</pre>	Returns to privileged EXEC mode.

### **Configuring the Secure HTTP Server**

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP server:

#### Before you begin

If you are using a certificate authority for certification, you should use the previous procedure to configure the CA trustpoint on the switch before enabling the HTTP server. If you have not configured a CA trustpoint, a self-signed certificate is generated the first time that you enable the secure HTTP server. After you have configured the server, you can configure options (path, access list to apply, maximum number of connections, or timeout policy) that apply to both standard and secure HTTP servers.

To verify the secure HTTP connection by using a Web browser, enter https://URL, where the URL is the IP address or hostname of the server switch. If you configure a port other than the default port, you must also specify the port number after the URL. For example:

https://209.165.129:1026 or

https://host.domain.com:1026

#### **SUMMARY STEPS**

- 1. show ip http server status
- 2. configure terminal
- 3. ip http secure-server
- **4. ip http secure-port** *port-number*
- 5. ip http secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}
- 6. ip http secure-client-auth
- 7. ip http secure-trustpoint name
- 8. ip http path path-name
- 9. ip http access-class access-list-number
- 10. ip http max-connections value
- 11. ip http timeout-policy idle seconds life seconds requests value
- **12**. end

	Command or Action	Purpose
Step 1	show ip http server status	(Optional) Displays the status of the HTTP server to
	Example:	determine if the secure HTTP server feature is supporte in the software. You should see one of these lines in the
Switch# show ip http server	Switch# show ip http server status	output:
		HTTP secure server capability: Present
		or

	Command or Action	Purpose
		HTTP secure server capability: Not present
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Switch# configure terminal	
Step 3	ip http secure-server	Enables the HTTPS server if it has been disabled. The
	Example:	HTTPS server is enabled by default.
	Switch(config)# ip http secure-server	
Step 4	ip http secure-port port-number	(Optional) Specifies the port number to be used for the
	Example:	HTTPS server. The default port number is 443. Valid options are 443 or any number in the range 1025 to 65535.
	Switch(config)# ip http secure-port 443	
Step 5	ip http secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}	(Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS
	Example:	connection. If you do not have a reason to specify a
		particularly CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support.
	Switch(config)# ip http secure-ciphersuite rc4-128-md5	This is the default.
Step 6	ip http secure-client-auth	(Optional) Configures the HTTP server to request an
	Example:	X.509v3 certificate from the client for authentication during the connection process. The default is for the client
	Switch(config)# ip http secure-client-auth	to request a certificate from the server, but the server does not attempt to authenticate the client.
Step 7	ip http secure-trustpoint name	Specifies the CA trustpoint to use to get an X.509v3
	Example:	security certificate and to authenticate the client certificate connection.
	Switch(config) # ip http secure-trustpoint your_trustpoint	Note Use of this command assumes you have already configured a CA trustpoint according to the
		previous procedure.
Step 8	ip http path path-name	(Optional) Sets a base HTTP path for HTML files. The
	Example:	path specifies the location of the HTTP server files on the local system (usually located in system flash memory).
	Switch(config)# ip http path /your_server:80	

·	Command or Action	Purpose	
Step 9	ip http access-class access-list-number  Example:	(Optional) Specifies an access list to use to allow access to the HTTP server.	
	Switch(config)# ip http access-class 2		
Step 10	ip http max-connections value	(Optional) Sets the maximum number of concurrent connections that are allowed to the HTTP server. We recommend that the value be at least 10 and not less. This	
	Example:		
	Switch(config)# ip http max-connections 4	is required for the UI to function as expected.	
Step 11	ip http timeout-policy idle seconds life seconds requests value	(Optional) Specifies how long a connection to the HTTP server can remain open under the defined circumstances:	
	Example:  Switch(config) # ip http timeout-policy idle 120 life 240 requests 1	• idle—the maximum time period when no data is received or response data cannot be sent. The range is 1 to 600 seconds. The default is 180 seconds (3 minutes).	
		• life—the maximum time period from the time that the connection is established. The range is 1 to 86400 seconds (24 hours). The default is 180 seconds.	
		• requests—the maximum number of requests processed on a persistent connection. The maximum value is 86400. The default is 1.	
Step 12	end	Returns to privileged EXEC mode.	
	Example:		
	Switch(config)# end		

## **Configuring the Secure HTTP Client**

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP client:

#### Before you begin

The standard HTTP client and secure HTTP client are always enabled. A certificate authority is required for secure HTTP client certification. This procedure assumes that you have previously configured a CA trustpoint on the switch. If a CA trustpoint is not configured and the remote HTTPS server requires client authentication, connections to the secure HTTP client fail.

#### **SUMMARY STEPS**

- 1. configure terminal
- 2. ip http client secure-trustpoint name

- 3. ip http client secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}
- 4. end

#### **DETAILED STEPS**

	Command or Action	Purpose	
Step 1	configure terminal	Enters the global configuration mode.	
	Example:		
	Switch# configure terminal		
Step 2	ip http client secure-trustpoint name	(Optional) Specifies the CA trustpoint to be used if the	
	Example:	remote HTTP server requests client authentication. Using this command assumes that you have already configured a	
	<pre>Switch(config)# ip http client secure-trustpoint your_trustpoint</pre>	CA trustpoint by using the previous procedure. The command is optional if client authentication is not need or if a primary trustpoint has been configured.	
Step 3	ip http client secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}	(Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS	
	Example:	connection. If you do not have a reason to specify a particular CipherSuite, you should allow the server and	
	Switch(config)# ip http client secure-ciphersuite rc4-128-md5	client to negotiate a CipherSuite that they both support. This is the default.	
Step 4	end	Returns to privileged EXEC mode.	
	Example:		
	Switch(config)# end		

# **Monitoring Secure HTTP Server and Client Status**

To monitor the SSL secure server and client status, use the privileged EXEC commands in the following table.

Table 10: Commands for Displaying the SSL Secure Server and Client Status

Command	Purpose
show ip http client secure status	Shows the HTTP secure client configuration.
show ip http server secure status	Shows the HTTP secure server configuration.
show running-config	Shows the generated self-signed certificate for secure HTTP connections.
