Using the Command-Line Interface

This chapter contains the following topics:

• Using the Command-Line Interface, on page 2

Using the Command-Line Interface

This chapter describes the Cisco IOS command-line interface (CLI) and how to use it to configure your switch.

Understanding Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

When you start a session on the switch, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as **show** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode. The examples in the table use the hostname *Switch*.

Mode	Access Method	Prompt	Exit Method	About This Mode
User EXEC	Begin a session with your switch.	Switch>	Enter logout or quit .	Use this mode to Change terminal settings. Perform basic tests. Display system information.
Privileged EXEC	While in user EXEC mode, enter the enable command.	Device#	Enter disable to exit.	Use this mode to verify commands that you have entered. Use a password to protect access to this mode.
Global configuration	While in privileged EXEC mode, enter the configure command.	Device(config)#	To exit to privileged EXEC mode, enter exit or end, or press Ctrl-Z.	Use this mode to configure parameters that apply to the entire switch.

Table 1: Command Mode Summary

Mode	Access Method	Prompt	Exit Method	About This Mode
VLAN configuration	While in global configuration mode, enter the vlan <i>vlan-id</i> command.	Device(config-vlan)#	To exit to global configuration mode, enter the exit command. To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file.
Interface configuration	While in global configuration mode, enter the interface command (with a specific interface).	Device(config-if)#	To exit to global configuration mode, enter exit . To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure parameters for the Ethernet ports.
Line configuration	While in global configuration mode, specify a line with the line vty or line console command.	Device(config-line)#	To exit to global configuration mode, enter exit . To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure parameters for the terminal line.

For more detailed information on the command modes, see the command reference guide for this release.

Understanding the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

Table 2: Help Summary

Command	Purpose
help	Obtains a brief description of the help system in any command mode.
abbreviated-command-entry?	Obtains a list of commands that begin with a particular character string.
Device# di?	
dir disable disconnect	

Command	Purpose
abbreviated-command-entry <tab></tab>	Completes a partial command name.
Device# sh conf <tab> Device# show configuration</tab>	
?	Lists all commands available for a particular command mode.
Switch> ?	
command ?	Lists the associated keywords for a command.
Switch> show ?	
command keyword ?	Lists the associated arguments for a keyword.
Device(config)# cdp holdtime ? <10-255> Length of time (in sec) that receiver must keep this packet	

Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the show configuration privileged EXEC command in an abbreviated form:

Device# show conf

Understanding no and default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to re-enable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

Understanding CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.

Error Message	Meaning	How to Get Help
% Ambiguous command: "show con"	You did not enter enough characters for your switch to recognize the command.	Re-enter the command followed by a question mark (?) with a space between the command and the question mark.
		The possible keywords that you can enter with the command appear.
<pre>% Incomplete command.</pre>	You did not enter all the keywords or values required by this command.	Re-enter the command followed by a question mark (?) with a space between the command and the question mark.
		The possible keywords that you can enter with the command appear.
<pre>% Invalid input detected at `^' marker.</pre>	You entered the command incorrectly. The caret (^) marks the point of the error.	Enter a question mark (?) to display all the commands that are available in this command mode.
		The possible keywords that you can enter with the command appear.

Table 3: Common CLI Error Messages

Using Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

Note Only CLI or HTTP changes are logged.

Using Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. These procedures are optional.

Beginning in privileged EXEC mode, enter this command to change the number of command lines that the switch records during the current terminal session:

Device# terminal history [size number-of-lines]

The range is from 0 to 256.

Beginning in line configuration mode, enter this command to configure the number of command lines the switch records for all sessions on a particular line:

Device(config-line)# history [size number-of-lines]

The range is from 0 to 256.

Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

The arrow keys function only on ANSI-compatible terminals such as VT100s.

Table 4: Recalling Commands

Action	Result
Press Ctrl-P or the up arrow key.	Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.
Press Ctrl-N or the down arrow key.	Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the up arrow key. Repeat the key sequence to recall successively more recent commands.
<pre>show history Device(config)# help</pre>	While in privileged EXEC mode, lists the last several commands that you just entered. The number of commands that appear is controlled by the setting of the terminal history global configuration command and the history line configuration command.

Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. These procedures are optional.

To disable the feature during the current terminal session, enter the **terminal no history** privileged EXEC command.

To disable command history for the line, enter the **no history** line configuration command.

Using Editing Features

This section describes the editing features that can help you manipulate the command line.

L

Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it, re-enable it, or configure a specific line to have enhanced editing. These procedures are optional.

To globally disable enhanced editing mode, enter this command in line configuration mode:

Switch (config-line) # no editing

To re-enable the enhanced editing mode for the current terminal session, enter this command in privileged EXEC mode:

Device# terminal editing

To reconfigure a specific line to have enhanced editing mode, enter this command in line configuration mode:

Device(config-line)# editing

Editing Commands through Keystrokes

This table shows the keystrokes that you need to edit command lines. These keystrokes are optional.

Note The arrow keys function only on ANSI-compatible terminals such as VT100s.

Table 5: Editing Commands through Keystrokes

Capability	Keystroke	Purpose
Move around the command line to make changes or corrections.	Press Ctrl-B , or press the left arrow key.	Moves the cursor back one character.
	Press Ctrl-F , or press the right arrow key.	Moves the cursor forward one character.
	Press Ctrl-A.	Moves the cursor to the beginning of the command line.
	Press Ctrl-E.	Moves the cursor to the end of the command line.
	Press Esc B.	Moves the cursor back one word.
	Press Esc F.	Moves the cursor forward one word.
	Press Ctrl-T.	Transposes the character to the left of the cursor with the character located at the cursor.

I

Capability	Keystroke	Purpose
Recall commands from the buffer and paste them in the command line. The switch provides a buffer with the last ten items that you deleted.	Press Ctrl-Y.	Recalls the most recent entry in the buffer.
	Press Esc Y.	Recalls the next buffer entry.
		The buffer contains only the last 10 items that you have deleted or cut. If you press Esc Y more than ten times, you cycle to the first buffer entry.
Delete entries if you make a mistake or change your mind.	Press the Delete or Backspace key.	Erases the character to the left of the cursor.
	Press Ctrl-D.	Deletes the character at the cursor.
	Press Ctrl-K.	Deletes all characters from the cursor to the end of the command line.
	Press Ctrl-U or Ctrl-X.	Deletes all characters from the cursor to the beginning of the command line.
	Press Ctrl-W.	Deletes the word to the left of the cursor.
	Press Esc D.	Deletes from the cursor to the end of the word.
Capitalize or lowercase words or capitalize a set of letters.	Press Esc C.	Capitalizes at the cursor.
	Press Esc L.	Changes the word at the cursor to lowercase.
	Press Esc U.	Capitalizes letters from the cursor to the end of the word.
Designate a particular keystroke as an executable command, perhaps as a shortcut.	Press Ctrl-V or Esc Q.	

Capability Scroll down a line or screen on displays that are longer than the terminal screen can display.		Keystroke Press the Return key.	Purpose Scrolls down one line.
		Press the Space bar.	Scrolls down one screen.
Redisplay the current command line if the switch suddenly sends a message to your screen.		Press Ctrl-L or Ctrl-R.	Redisplays the current command line.

Editing Command Lines that Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

Note

The arrow keys function only on ANSI-compatible terminals such as VT100s.

In this example, the **access-list** global configuration command entry extends beyond one line. When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign (\$) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.

```
Device (config) # access-list 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1
Device (config) # $ 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1.20 255.255
Device (config) # $t tcp 131.108.2.5 255.255.0 131.108.1.20 255.255.255.0 eq
Device (config) # $108.2.5 255.255.0 131.108.1.20 255.255.255.0 eq 45
```

After you complete the entry, press **Ctrl-A** to check the complete syntax before pressing the **Return** key to execute the command. The dollar sign (\$) appears at the end of the line to show that the line has been scrolled to the right:

Device (config) # access-list 101 permit tcp 131.108.2.5 255.255.255.0 131.108.1\$

The software assumes that you have a terminal screen that is 80 columns wide. If you have a width other than that, use the **terminal width** privileged EXEC command to set the width of your terminal.

Use line wrapping with the command history feature to recall and modify previous complex command entries.

Searching and Filtering Output of show and more Commands

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

To use this functionality, enter a **show** or **more** command followed by the pipe character (|), one of the keywords **begin**, **include**, or **exclude**, and an expression that you want to search for or filter out:

command | {begin | include | exclude} regular-expression

Expressions are case sensitive. For example, if you enter | exclude output, the lines that contain *output* are not displayed, but the lines that contain *Output* appear.

This example shows how to include in the output display only lines where the expression *protocol* appears:

```
Device# show interfaces | include protocol
Vlan1 is up, line protocol is up
Vlan10 is up, line protocol is down
GigabitEthernet1/0/1 is up, line protocol is down
GigabitEthernet1/0/2 is up, line protocol is up
```

Accessing the CLI

You can access the CLI through a console connection, through Telnet, or by using the browser.

You manage the switch stack and the switch member interfaces through the active switch. You cannot manage switch stack members on an individual switch basis. You can connect to the active switch through the console port or the Ethernet management port of one or more switch members. Be careful with using multiple CLI sessions to the active switch. Commands you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

Note We recommend using one CLI session when managing the switch stack.

If you want to configure a specific switch member port, you must include the switch member number in the CLI command interface notation.

To debug a specific switch member, you can access it from the active switch by using the **session** *stack-member-number* privileged EXEC command. The switch member number is appended to the system prompt. For example, *Switch-2#* is the prompt in privileged EXEC mode for switch member 2, and where the system prompt for the active switch is Switch. Only the **show** and **debug** commands are available in a CLI session to a specific switch member.

Accessing the CLI through a Console Connection or through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

CLI access is available before switch setup. After your switch is configured, you can access the CLI through a remote Telnet session or SSH client.

You can use one of these methods to establish a connection with the switch:

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.

The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.

The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

Accessing the CLI through a Console Connection or through Telnet

ip igmp snooping

To globally enable Internet Group Management Protocol (IGMP) snooping on the device or to enable it on a per-VLAN basis, use the **ip igmp snooping** global configuration command on the device stack or on a standalone device. To return to the default setting, use the **no** form of this command.

ip igmp snooping [**vlan** *vlan-id*] **no ip igmp snooping** [**vlan** *vlan-id*]

Syntax Description	vlan <i>vlan-id</i> (Optional) Enables IGMP snooping on the specified VLAN. Ranges are 1—1001 and 1006—4094.		
Command Default	IGMP snooping is globally enabled on the device. IGMP snooping is enabled on VLAN interfaces.		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines When IGMP snooping is enabled globally, it is enabled in all of the existing VLAN interfaces. When IGMP snooping is globally disabled, it is disabled on all of the existing VLAN interfaces.

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping.

Example

The following example shows how to globally enable IGMP snooping:

Device(config) # ip igmp snooping

The following example shows how to enable IGMP snooping on VLAN 1:

Device(config) # ip igmp snooping vlan 1

You can verify your settings by entering the **show ip igmp snooping** command in privileged EXEC mode.

ip igmp snooping last-member-query-count

leave messages.

To configure how often Internet Group Management Protocol (IGMP) snooping will send query messages in response to receiving an IGMP leave message, use the **ip igmp snooping last-member-query-count** command in global configuration mode. To set *count* to the default value, use the **no** form of this command.

ip igmp snooping [vlan vlan-id] last-member-query-count count no ip igmp snooping [vlan vlan-id] last-member-query-count count

Syntax Description vlan *vlan-id* (Optional) Sets the count value on a specific VLAN ID. The range is from 1–1001. Do not enter leading zeroes. Interval at which query messages are sent, in milliseconds. The range is from 1-7. The default count is 2 A query is sent every 2 milliseconds. **Command Default** Global configuration **Command Modes Command History** Release Modification Cisco IOS Release 15.0(2)EX This command was introduced. When a multicast host leaves a group, the host sends an IGMP leave message. To check if this host is the last **Usage Guidelines** to leave the group, IGMP query messages are sent when the leave message is seen until the **last-member-query-interval** timeout period expires. If no response is received to the last-member queries before the timeout period expires, the group record is deleted. Use the ip igmp snooping last-member-query-interval command to configure the timeout period. When both IGMP snooping immediate-leave processing and the query count are configured, immediate-leave processing takes precedence. Note Do not set the count to 1 because the loss of a single packet (the query packet from the device to the host or the report packet from the host to the device) may result in traffic forwarding being stopped even if the receiver is still there. Traffic continues to be forwarded after the next general query is sent by the device, but the interval during which a receiver may not receive the query could be as long as 1 minute (with the default query interval). The leave latency in Cisco IOS software may increase by up to 1 last-member query interval (LMQI) value when the device is processing more than one leave within an LMQI. In such a scenario, the average leave latency is determined by the (count + 0.5) * LMQI. The result is that the default leave latency can range from 2.0 to 3.0 seconds with an average of 2.5 seconds under a higher load of IGMP leave processing. The leave

latency under load for the minimum LMQI value of 100 milliseconds and a count of 1 is from 100 to 200 milliseconds, with an average of 150 milliseconds. This is done to limit the impact of higher rates of IGMP

Example

The following example shows how to set the last member query count to 5:

Device(config)# ip igmp snooping last-member-query-count 5

ip igmp snooping last-member-query-interval

To enable the Internet Group Management Protocol (IGMP) configurable-leave timer globally or on a per-VLAN basis, use the **ip igmp snooping last-member-query-interval** command in global configuration mode. Use the **no** form of the command to return to the default setting.

ip igmp snooping [**vlan** *vlan-id*] **last-member-query-interval** *time* **no ip igmp snooping** [**vlan** *vlan-id*] **last-member-query-interval** *time*

Syntax Description	vlan <i>vlan-id</i> (Optional) Enables IGMP snooping and the leave timer on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.						
	time	<i>time</i> Interval time out in seconds. The range is 100 to 32767 milliseconds.					
Command Default	The default timeout setting is 1000 milliseconds.						
Command Modes	Global config	Global configuration					
Command History	Release Modification						
	Cisco IOS R	elease 15.0(2)EX This command was introduced.					

Usage Guidelines When IGMP snooping is globally enabled, IGMP snooping is enabled on all the existing VLAN interfaces. When IGMP snooping is globally disabled, IGMP snooping is disabled on all the existing VLAN interfaces.

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.

Configuring the leave timer on a VLAN overrides the global setting.

The IGMP configurable leave time is only supported on devices running IGMP Version 2.

The configuration is saved in NVRAM.

Examples

This example shows how to globally enable the IGMP leave timer for 2000 milliseconds:

Device(config) # ip igmp snooping last-member-query-interval 2000

This example shows how to configure the IGMP leave timer for 3000 milliseconds on VLAN 1:

Device(config) # ip igmp snooping vlan 1 last-member-query-interval 3000

This example shows how to configure the IGMP leave timer for 3000 milliseconds on VLAN 1:

Device(config) # ip igmp snooping vlan 1 last-member-query-interval 3000

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

ip igmp snooping querier

To globally enable the Internet Group Management Protocol (IGMP) querier function in Layer 2 networks, use the **ip igmp snooping querier** global configuration command. Use the command with keywords to enable and configure the IGMP querier feature on a VLAN interface. To return to the default settings, use the **no** form of this command.

ip igmp snooping [vlan vlan-id] **querier** [address ip-address | max-response-time response-time | **query-interval** interval-count | **tcn query** {**count** count | **interval** interval} | **timer expiry** expiry-time | **version** version]

no ip igmp snooping [vlan *vlan-id*] querier [address | max-response-time | query-interval | tcn query {count | interval} | timer expiry | version]

Syntax Description	vlan vlan-id	(Optional) Enables IGMP snooping and the IGMP querier function on the specified VLAN. Ranges are 1—1001 and 1006—4094.			
	address ip-address	(Optional) Specifies a source IP address. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.			
	max-response-time response-time	 (Optional) Sets the maximum time to wait for an IGMP querier report. The range is 1—25 seconds. (Optional) Sets the interval between IGMP queriers. The range is 1—18000 seconds. 			
	query-interval interval-count				
	tcn query (Optional) Sets parameters related to Topology Change Notification (TCNs).				
	count countSets the number of TCN queries to be executed during the TCN inter- time. The range is 1—10.interval intervalSets the TCN query interval time. The range is 1—255.				
	timer expiry expiry-time	Optional) Sets the length of time until the IGMP querier expires. The range is 60—300 seconds.			
	version version	(Optional) Selects the IGMP version number that the querier feature uses. Select either 1 or 2.			
Command Default	The IGMP snooping querier feature is globally disabled on the device.				
	When enabled, the IGMP snoop	bing querier disables itself if it detects IGMP traffic from a multicast router.			
Command Modes	Global configuration				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			

Usage Guidelines

Use this command to enable IGMP snooping to detect the IGMP version and IP address of a device that sends IGMP query messages, which is also called a querier.

By default, the IGMP snooping querier is configured to detect devices that use IGMP Version 2 (IGMPv2), but does not detect clients that are using IGMP Version 1 (IGMPv1). You can manually configure the **max-response-time** value when devices use IGMPv2. You cannot configure the max-response-time when devices use IGMPv1. (The value cannot be configured, and is set to zero).

Non-RFC-compliant devices running IGMPv1 might reject IGMP general query messages that have a non-zero value as the **max-response-time** value. If you want the devices to accept the IGMP general query messages, configure the IGMP snooping querier to run IGMPv1.

VLAN IDs 1002—1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping.

Example

The following example shows how to globally enable the IGMP snooping querier feature:

Device(config) # ip igmp snooping querier

The following example shows how to set the IGMP snooping querier maximum response time to 25 seconds:

Device(config)# ip igmp snooping querier max-response-time 25

The following example shows how to set the IGMP snooping querier interval time to 60 seconds:

Device(config) # ip igmp snooping querier query-interval 60

The following example shows how to set the IGMP snooping querier TCN query count to 25:

Device(config) # ip igmp snooping querier tcn count 25

The following example shows how to set the IGMP snooping querier timeout value to 60 seconds:

Device(config) # ip igmp snooping querier timer expiry 60

The following example shows how to set the IGMP snooping querier feature to Version 2:

Device(config) # ip igmp snooping querier version 2

You can verify your settings by entering the **show ip igmp snooping** privileged EXEC command.

ip igmp snooping report-suppression

To enable Internet Group Management Protocol (IGMP) report suppression, use the **ip igmp snooping report-suppression** global configuration command on the device stack or on a standalone device. To disable IGMP report suppression, and to forward all IGMP reports to multicast routers, use the **no** form of this command.

ip igmp snooping report-suppression no ip igmp snooping report-suppression

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** IGMP report suppression is enabled.
- Command Modes Global configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

Usage Guidelines IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

The device uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP report suppression is enabled (the default), the device sends the first IGMP report from all the hosts for a group to all the multicast routers. The device does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the device forwards only the first IGMPv1 or IGMPv2 report from all the hosts for a group to all of the multicast routers. If the multicast router query also includes requests for IGMPv3 reports, the device forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression by entering the **no ip igmp snooping report-suppression** command, all IGMP reports are forwarded to all of the multicast routers.

Example

The following example shows how to disable report suppression:

Device(config) # no ip igmp snooping report-suppression

You can verify your settings by entering the **show ip igmp snooping** command in privileged EXEC mode.

ip igmp snooping robustness-variable

To configure the IGMP robustness variable globally or on a per-VLAN basis, use the **ip igmp snooping robustness-variable** command in global configuration mode. Use the **no** form of the command to return to the default setting.

ip igmp snooping [vlan v	an-id] robustness-var	iable number
no ip igmp snooping [vla	n vlan-id] robustness	-variable number

Syntax Description	vlan <i>vlan-id</i> (Optional) Enables IGMP snooping and the leave timer on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.					
	number	Robustness variable number. The range is 1 to 3.				
Command Default	None					
Command Modes	Global configuration					
Command History	Release Modification					
	Cisco IOS Re	elease 15.0(2)EX This	s command was introduced.			

ip igmp snooping vlan immediate-leave

To enable IGMPv2 immediate leave processing, use the **immediate-leave** global configuration command on the device stack or on a standalone device. To return to the default settings, use the **no** form of this command.

ip igmp snooping vlan *vlan-id* immediate-leave no ip igmp snooping vlan *vlan-id* immediate-leave

Syntax Description	<i>vlan-id</i> Enables IGMPv2 immediate leave processing in the specified VLAN. The range is 1 to 1001 and 1006 to 4094.			
Command Default	By default, IGMPv2 immediate leave processing is	off.		
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	You can verify your settings by entering the show i	p igmp snooping privileged EXEC command.		

ip igmp snooping vlan mrouter

To add a multicast router port or to configure the multicast learning method, use the **ip igmp snooping mrouter** global configuration command on the device stack or on a standalone device. To return to the default settings, use the **no** form of this command.

ip igmp snooping vlan vlan-id mrouter {interface interface-id | learn {cgmp | pim-dvmrp} }
no ip igmp snooping vlan vlan-id mrouter {interface interface-id | learn {cgmp | pim-dvmrp}
}

Syntax Description	vlan-id	Enables IGMP snooping and adds the port in the specified VLAN as the multi router port. Ranges are 1—1001 and 1006—4094.			
	interface interface-id	Specifies the next-hop interface to the multicast router. The <i>interface-id</i> value has these options:			
		• fastethernet interface number—A Fast Ethernet IEEE 802.3 interface.			
		• gigabitethernet interface number—A Gigabit Ethernet IEEE 802.3z interface.			
		• <i>tengigabitethernet interface number</i> —A 10-Gigabit Ethernet IEEE 802.3z interface.			
		• <i>port-channel interface number</i> —A channel interface. The range is 0—48.			
	learn Specifies the multicast router learning method.				
	cgmpSets the switch to learn multicast router ports by snooping on Cisco Group Management Protocol (CGMP) packets.				
	pim-dvmrpSets the switch to learn multicast router ports by snooping on IGMP queries and Protocol-Independent Multicast-Distance Vector Multicast Routing Protocol (PIM-DVMRP) packets.				
Command Default	By default, there are no multicast router ports.				
	The default learning m	ethod is pim-dvmrp to snoop IGMP queries and PIM-DVMRP packets.			
Command Modes	Global configuration				
Command History	Release	Modification			
	Cisco IOS Release 15	.0(2)EX This command was introduced.			
Usage Guidelines	VLAN IDs 1002—1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping The CGMP learn method is useful for reducing control traffic.				
	The configuration is sa	ived in NVRAM.			

Example

The following example shows how to configure a port as a multicast router port: Device (config) # ip igmp snooping vlan 1 mrouter interface gigabitethernet1/0/2 The following example shows how to specify the multicast router learning method as CGMP: Device (config) # ip igmp snooping vlan 1 mrouter learn cgmp

You can verify your settings by entering the **show ip igmp snooping** privileged EXEC command.

Consolidated Platform Command Reference, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switches)

ip igmp snooping vlan static

To enable Internet Group Management Protocol (IGMP) snooping and to statically add a Layer 2 port as a member of a multicast group, use the **ip igmp snooping vlan static** global configuration command on the device stack or on a standalone device. To remove the port specified as members of a static multicast group, use the **no** form of this command.

ip igmp snooping vlan *vlan-id* **static** *ip-address* **interface** *interface-id* **no ip igmp snooping vlan** *vlan-id* **static** *ip-address* **interface** *interface-id*

Syntax Description	_		
, ,	<i>vlan-id</i> Enables IGMP snooping on the specified VLAN. Ranges are 1—1001 and 1006—4094.		
	<i>ip-address</i> Adds a Layer 2 port as a member of a multicast group with the spec address.		
	interface interface-id	Specifies the interface of the member port. The <i>interface-id</i> has these options:	
		• fastethernet interface number—A Fast Ethernet IEEE 802.3 interface.	
		• gigabitethernet interface number—A Gigabit Ethernet IEEE 802.3z interface	
	• <i>tengigabitethernet interface number</i> —A 10-Gigabit Ethernet IEEE 802.3 interface.		
		• <i>port-channel interface number</i> —A channel interface. The range is 0—128.	
Command Default	By default, no ports are	e statically configured as members of a multicast group.	
Command Modes	Global configuration

mvr (global configuration)

To enable the multicast VLAN registration (MVR) feature on the switch, use the **mvr** global configuration command without keywords on the switch stack or on a standalone switch. To return to the default settings, use the **no** form of this command.

	vlan-id]	compatible dynamic] querytime value vlan e [compatible dynamic] querytime value				
Syntax Description	group ip-address	(Optional) Statically configures an MVR group IP multicast address				
		Use the no form of this command to remove a statically configured when no IP address is entered, to remove all statically configured M				
	count	(Optional) Multiple contiguous MVR group addresses. The range is				
	mode	(Optional) Specifies the MVR mode of operation.				
		The default is compatible mode.				
	compatible	(Optional) Sets MVR mode to provide compatibility with Catalyst 29 does not allow dynamic membership joins on source ports.				
	dynamic	(Optional) Sets MVR mode to allow dynamic MVR membership on				
	querytime value	(Optional) Sets the maximum time to wait for IGMP report members receiver-port leave processing. When an IGMP query is sent from a configured MVR querytime for an IGMP group membership report membership.				
		The value is the response time in units of tenths of a second. The ran second.				
		Use the no form of the command to return to the default setting.				
	vlan-id(Optional) Specifies the VLAN on which MVR multicast data which all the source ports belong. The range is 1 to 4094; the					
Command Default	MVR is disabled by default.					
	The default MVR mode is compatible mode.					
	No IP multicast addresses are configured on the switch by default.					
	The default group <i>ip-address count</i> is 0.					
	The default query response time is five-tenths or one-half second.					
	The default multicast VLAN for MVR is VLAN	1.				
Command Modes	Global configuration					

Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EX	This command was introduced.				
Usage Guidelines	A maximum of 256 M	VR multicast groups can be configured on a switch.				
-		keywords to set the MVR mode for a switch, configure the MVR IP multicast address, to wait for a query reply before removing a port from group membership, and to specify AN.				
	Use the mvr group command to statically set up all the IP multicast addresses that will take part in MVR. Any multicast data sent to a configured multicast address is sent to all the source ports on the switch and to all receiver ports that have registered to receive data on that IP multicast address.					
	MVR supports aliased IP multicast addresses on the switch. However, if the switch is interoperating with Catalyst 3550 or Catalyst 3500 XL switches, you should not configure IP addresses that alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx).					
	The mvr querytime co	ommand applies only to receiver ports.				
	If the switch MVR is interoperating with Catalyst 2900 XL or Catalyst 3500 XL switches, set the multicast mode to compatible.					
	When operating in con	npatible mode, MVR does not support IGMP dynamic joins on MVR source ports.				
	MVR can coexist with IGMP snooping on a switch.					
	Multicast routing and MVR cannot coexist on a switch. If you enable multicast routing and a multicast routing protocol while MVR is enabled, MVR is disabled and a warning message appears. If you try to enable MVR while multicast routing and a multicast routing protocol are enabled, the operation to enable MVR is cancelled with an error message.					
	Examples					
	This example shows how to enable MVR:					
	Device(config)# mvr					
	Use the show mvr privileged EXEC command to display the current setting for maximum multicast groups.					
	This example shows how to configure 228.1.23.4 as an IP multicast address:					
	Device(config)# mvr group 228.1.23.4					
	This example shows how to configure ten contiguous IP multicast groups with multicast addresses from 228.1.23.1 to 228.1.23.10:					
	Device(config)# mvr	group 228.1.23.1 10				

Use the **show mvr members** privileged EXEC command to display the IP multicast group addresses configured on the switch.

This example shows how to set the maximum query response time as one second (10 tenths):

Device(config) # mvr querytime 10

This example shows how to set VLAN 2 as the multicast VLAN:

Device(config) # mvr vlan 2

You can verify your settings by entering the show mvr privileged EXEC command.

mvr (interface configuration)

To statically assign a port to an IP multicast VLAN and IP address, use the **mvr** interface configuration command on the switch stack or on a standalone switch. To return to the default settings, use the **no** form of this command.

mvr [**immediate** | **type** { **receiver** | **source** } | **vlan** *vlan-id* **group** [*ip-address*]] **no mvr** [**immediate** | **type** | **vlan** *vlan-id* **group** [*ip-address*]]

Syntax Description	immediate		(Optional) Enables the Immediate Leave feature of M disable the feature.			
	type		(Optional) Configures the port as an MVR receiver por			
			 The default port type is neither an MVR source nor a ras neither a source or a receiver port. Configures the port as a subscriber port that can only remulticast VLAN. Configures the port as an uplink port that can send and range All source ports on a switch belong to a single multication (Optional) Adds the port as a static member of the multication of the multica			
	receiver					
	source					
	vlan vlan-id group					
	ip-address		(Optional) Statically configures the specified MVR IP ID. This is the IP address of the multicast group that the			
Command Default	A port is configured as neither a receiver nor a source.					
	The Immediate Leave feature is disabled on all ports.					
	No receiver port is a member of any configured multicast group.					
Command Modes	Interface configuration					
Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EX	This command was introduced.				
Usage Guidelines	Configure a port as a source port if that port should be able to both send and receive multicast data bound for the configured multicast groups. Multicast data is received on all ports configured as source ports.					
	Receiver ports cannot be trunk ports. Receiver ports on a switch can be in different VLANs, but should not belong to the multicast VLAN.					
		•	ared as an MVR receiver port or a source port. A ceive multicast data with normal switch behavior.			

When Immediate Leave is enabled, a receiver port leaves a multicast group more quickly. Without Immediate Leave, when the switch receives an IGMP leave message from a group on a receiver port, it sends out an IGMP MAC-based query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP MAC-based query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency.

The Immediate Leave feature should be enabled only on receiver ports to which a single receiver device is connected.

The **mvr vlan group** command statically configures ports to receive multicast traffic sent to the IP multicast address. A port statically configured as a member of group remains a member of the group until statically removed. In compatible mode, this command applies only to receiver ports; in dynamic mode, it can also apply to source ports. Receiver ports can also dynamically join multicast groups by using IGMP join messages.

When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.

An MVR port cannot be a private-VLAN port.

Examples

This example shows how to configure a port as an MVR receiver port:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mvr type receiver
```

Use the **show mvr interface** privileged EXEC command to display configured receiver ports and source ports.

This example shows how to enable Immediate Leave on a port:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mvr immediate
```

This example shows how to add a port on VLAN 1 as a static member of IP multicast group 228.1.23.4:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# mvr vlan1 group 230.1.23.4
```

You can verify your settings by entering the **show mvr members** privileged EXEC command.

show ip igmp snooping

To display the Internet Group Management Protocol (IGMP) snooping configuration of the device or the VLAN, use the **show ip igmp snooping** command in user EXEC or privileged EXEC mode.

	show ip igmp	snooping [grou	ps mrouter	querier] [vlan vlan-id] [detail]	
Syntax Description	groups	(Optional) Displ	ays the IGMP snoo	oping multicast table.	
	mrouter	(Optional) Displa	ays the IGMP snoo	oping multicast router ports.	
	querier	(Optional) Displa	ays the configuration	on and operation information for the IGMP querier.	
	vlan vlan-id	(Optional) Speci	fies a VLAN; the r	range is 1 to 1001 and 1006 to 4094.	
	detail	(Optional) Displa	ays operational sta	te information.	
Command Default	None				
Command Modes	User EXEC				
	Privileged EX	EC			
Command History	Release			Modification	
	Cisco IOS Re	elease 15.0(2)EX		This command was introduced.	
Usage Guidelines	VLAN IDs 1002—1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping.				
	Expressions are case sensitive. For example, if you enter exclude output , the lines that contain "output" do not appear, but the lines that contain "Output" appear.				
	Examples				
	The following is a sample output from the show ip igmp snooping vlan 1 command. It shows snooping characteristics for a specific VLAN:

Vlan	Group	Туре	Version	Port List
104	224.1.4.2	igmp	v2	Gi2/0/1, Gi1/0/15

Consolidated Platform Command Reference, Cisco IOS Release 15.2(7)E (Catalyst 2960-X Switches)

show ip igmp snooping mrouter

To display the Internet Group Management Protocol (IGMP) snooping dynamically learned and manually configured multicast router ports for the device or for the specified multicast VLAN, use the **show ip igmp snooping mrouter** command in privileged EXEC mode.

show ip igmp snooping mrouter [vlan vlan-id]

Syntax Description	vlan <i>vlan-id</i> (Optional) Specifies a VLAN; Ranges are from 1—1001 and 1006—4094.			
Command Modes	User EXEC			
	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	VLAN IDs 1002—1005 are reserved for To	oken Ring and FDDI VLANs, and cannot be used in IGMP snooping.		
	When multicast VLAN registration (MVR) is enabled, the show ip igmp snooping mrouter command displays MVR multicast router information and IGMP snooping information.			
	Expressions are case sensitive, for examp not appear, but the lines that contain "Out	le, if you enter exclude output, the lines that contain "output" do put" appear.		
	Example			
	The following is a sample output from the how to display multicast router ports on the same set of the same set.	e show ip igmp snooping mrouter command. It shows he device:		
	Device# show ip igmp snooping mrout	.er		

Vlan ports ---- ----1 Gi2/0/1(dynamic)

show ip igmp snooping querier

To display the configuration and operation information for the IGMP querier that is configured on a device, use the **show ip igmp snooping querier** command in user EXEC mode.

	show ip igmp snooping querier [vl	an vlan-id] [detail]			
Syntax Description	vlan vlan-id (Optional) Specifies a	VLAN; Ranges are from 1—1001 and 1006—4094.			
	detail (Optional) Displays de	tailed IGMP querier information.			
Command Modes	User EXEC				
	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			
Usage Guidelines	Use the show ip igmp snooping querier command to display the IGMP version and the IP address of a detected device, also called a querier, that sends IGMP query messages. A subnet can have multiple multicast routers but only one IGMP querier. In a subnet running IGMPv2, one of the multicast routers is elected as the querier. The querier can be a Layer 3 device.				
	The show ip igmp snooping querier command output also shows the VLAN and the interface on which the querier was detected. If the querier is the device, the output shows the Port field as Router. If the querier is a router, the output shows the port number on which the querier was detected in the Port field.				
	The show ip igmp snooping querier detail user EXEC command is similar to the show ip igmp snooping querier command. However, the show ip igmp snooping querier command displays only the device IP address most recently detected by the device querier.				
	The show ip igmp snooping querier detail command displays the device IP address most recently detected by the device querier and this additional information:				
	• The elected IGMP querier in the	VLAN			
	• The configuration and operational information pertaining to the device querier (if any) that is configured in the VLAN				
	Expressions are case sensitive, for example, if you enter exclude output , the lines that contain "output" do not appear, but the lines that contain "Output" appear.				
	Examples				
	The following is a sample output from	n the show ip igmp snooping querier command:			
	Device> show ip igmp snooping q Vlan IP Address IGMP Ve				

Vlan	IP Address	IGMP Version	Port
1	172.20.50.11	v3	Gi1/0/1
2	172.20.40.20	v2	Router

L

The following is a sample output from the **show ip igmp snooping querier detail** command:

Device> show ip igmp snooping querier detail

show mvr

To display the current Multicast VLAN Registration (MVR) global parameter values, including whether or not MVR is enabled, the MVR multicast VLAN, the maximum query response time, the number of multicast groups, and the MVR mode (dynamic or compatible), use the **show mvr** privileged EXEC command without keywords.

show mvr

Release

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Command History

Modification

Cisco IOS Release	This command was introduced.
15.0(2)EX	

Examples

This is an example of output from the **show mvr** command:

Switch# show mvr MVR Running: TRUE MVR multicast VLAN: 1 MVR Max Multicast Groups: 256 MVR Current multicast groups: 0 MVR Global query response time: 5 (tenths of sec) MVR Mode: compatible

In the preceding display, the maximum number of multicast groups is fixed at 256. The MVR mode is either compatible (for interoperability with Catalyst 2900 XL and Catalyst 3500 XL switches) or dynamic (where operation is consistent with IGMP snooping operation and dynamic MVR membership on source ports is supported).

show mvr interface

To display the Multicast VLAN Registration (MVR) receiver and source ports, use the **show mvr interface** privileged EXEC command without keywords. To display MVR parameters for a specific receiver port, use the command with keywords.

show mvr interface [*interface-id* [**members** [**vlan** *vlan-id*]]]

Syntax Description	interface-i	d		(Optional) Displays MVR type, status, and Immedi		
				Valid interfaces include physical ports (including ty module, and port number).		
	members			(Optional) Displays all MVR groups to which the s		
	vlan vlan-	id		(Optional) Displays all MVR group members on th		
Command Modes	Privileged I	EXEC				
Command History	Release		Modification			
	Cisco IOS 15.0(2)EX		This command was in	troduced.		
Usage Guidelines	If the entered port identification is a non-MVR port or a source port, the command returns an error message. For receiver ports, it displays the port type, per port status, and Immediate-Leave setting.					
	If you enter the members keyword, all MVR group members on the interface appear. If you enter a VLAN ID, all MVR group members in the VLAN appear.					
	Examples					
	This is an example of output from the show mvr interface command:					
	Switch# sł Port	now mvr inte Type	rface Status	Immediate Leave		
	Gi1/0/1 Gi1/0/2	SOURCE RECEIVER	ACTIVE/UP ACTIVE/DOWN	DISABLED DISABLED		
	In the preceding display, Status is defined as follows:					
	• Active means the port is part of a VLAN.					
	• Up/Down means that the port is forwarding/nonforwarding.					
	• Inactive means that the port is not yet part of any VLAN.					
	This is an e	xample of out	put from the show mvr	interface command for a specified port:		

```
Switch# show mvr interface gigabitethernet1/0/2
```

Type: RECEIVER Status: ACTIVE Immediate Leave: DISABLED

This is an example of output from the **show mvr interface** *interface-id* **members** command:

Switch# show mvr interface gigabitethernet1/0/2 members

DYNAMIC ACTIVE
DYNAMIC ACTIVE

I

show mvr members

To display all receiver and source ports that are currently members of an IP multicast group, use the **show mvr members** privileged EXEC command.

show mvr members [*ip-address*] [**vlan** *vlan-id*]

ip-address	(Optional) The IP multicast address. If the address is entered, all receiver and source ports that are members of the multicast group appear. If no address is entered, all members of all Multicast VLAN Registration (MVR) groups are listed. If a group has no members, the group is listed as Inactive.
vlan vlan-id	(Optional) Displays all MVR group members on this VLAN. The range is 1 to 4094.
Privileged EXEC	
Release	Modification
	vlan vlan-id Privileged EXEC

Usage Guidelines

The **show mvr members** command applies to receiver and source ports. For MVR-compatible mode, all source ports are members of all multicast groups.

Examples

This is an example of output from the show mvr members command:

Switch# show	mvr members		
MVR Group IP	Status	Members	
239.255.0.1	ACTIVE	Gi1/0/1(d),	Gi1/0/5(s)
239.255.0.2	INACTIVE	None	
239.255.0.3	INACTIVE	None	
239.255.0.4	INACTIVE	None	
239.255.0.5	INACTIVE	None	
239.255.0.6	INACTIVE	None	
239.255.0.7	INACTIVE	None	
239.255.0.8	INACTIVE	None	
239.255.0.9	INACTIVE	None	
239.255.0.10	INACTIVE	None	
<output td="" trund<=""><td>ated></td><td></td><td></td></output>	ated>		

This is an example of output from the **show mvr members** *ip-address* command. It displays the members of the IP multicast group with that address:

Switch# show mvr	members 239.25	5.0.2				
239.255.00322	ACTIVE	Gi1//1(d),	Gi1/0/2(d),	Gi1/0/3(d),	Gi1/0/4(d),	Gi1/0/5(s)

debug interface

To enable debugging of interface-related activities, use the **debug interface** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug interface {*interface-id* | **counters** {**exceptions** | **protocol memory**} | **null** *interface-number* | **port-channel** *port-channel-number* | **states** | **vlan** *vlan-id*}

no debug interface {*interface-id* | **counters** {**exceptions** | **protocol memory**} | **null** *interface-number* | **port-channel** *port-channel-number* | **states** | **vlan** *vlan-id*}

Syntax Description	interface-id	ID of the physical interface. Displays debug messages for the specified physical port, identified by type switch number/module number/port, for example, gigabitethernet 1/0/2.			
	null interface-numberDisplays debug messages for null interfaces. The interface number is alw 0.port-channel port-channel-numberDisplays debug messages for the specified EtherChannel port-channel interface. The port-channel-number range is 1 to 48.				
					vlan vlan-id
	counters Displays counters debugging information.				
	exceptions	Displays debug messages when a recoverable exceptional condition occurs during the computation of the interface packet and data rate statistics.			
	protocol memory	y Displays debug messages for memory operations of protocol counters.			
	states	Displays intermediary debug messages when an interface's state transitions.			
	Command Default	Debugging is disabled.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			
Usage Guidelines	If you do not specify a keyword	l, all debug messages appear.			
	The undebug interface command is the same as the no debug interface command.				
	When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a member switch, you can start a session from the active switch by using the session <i>switch-number</i> EXEC command. Then enter the debug command at the command-line prompt of the member switch. You also can use the remote command <i>stack-member-number</i> LINE EXEC command on the active switch to enable debugging on a member switch without first starting a session.				

debug IIdp packets

To enable debugging of Link Layer Discovery Protocol (LLDP) packets, use the **debug lldp packets** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug lldp packets no debug lldp packets

Syntax Description This command has no arguments or keywords.

Command Default Debugging is disabled.

Command Modes Privileged EXEC

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines The undebug lldp packets command is the same as the no debug lldp packets command.

When you enable debugging on a switch stack, it is enabled only on the . To enable debugging on a member switch, you can start a session from the by using the **session** *switch-number* EXEC command.

debug nmsp

To enable debugging of the Network Mobility Services Protocol (NMSP) on the switch, use the **debug nmsp** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

all	Displays all NMSP debug messages.		
connection	Displays debug messages for NMSP connection events.		
error	Displays debugging information for NMSP error messages.		
event	Displays debug messages for NMSP events.		
rx	Displays debugging information for NMSP receive messages. Displays debugging information for NMSP transmit messages.		
tx			
packet	Displays debug messages for NMSP packet events.		
Debugging is disabled.

When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a member switch, you can start a session from the active switch by using the **session** *switch-number* EXEC command. Then enter the **debug** command at the command-line prompt of the member switch. You also can use the **remote command** *stack-member-number* LINE EXEC command on the active switch to enable debugging on a member switch without first starting a session.

duplex

To specify the duplex mode of operation for a port, use the **duplex** command in interface configuration mode. To return to the default value, use the **no** form of this command.

duplex {auto | full | half} no duplex {auto | full | half}

Syntax Description	auto Enables automatic duplex configuration. or half-duplex mode, depending on the at	The port automatically detects whether it should run in full- trached device mode.				
	full Enables full-duplex mode.	full Enables full-duplex mode.half Enables half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mb/s.				
Command Default	The default is auto for Fast Ethernet and Gigab	The default is auto for Fast Ethernet and Gigabit Ethernet ports.				
	The default is half for $100BASE-x$ (where $-x$ is	-BX, -FX, -FX-FE, or -LX) SFP modules.				
	Duplex options are not supported on the 1000BA or -ZX) small form-factor pluggable (SFP) mod	ASE- <i>x</i> or 10GBASE- <i>x</i> (where - <i>x</i> is -BX, -CWDM, -LX, -SX, dules.				
Command Modes	Interface configuration					
Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EX	This command was introduced.				
Usage Guidelines	For Fast Ethernet ports, setting the port to auto does not autonegotiate the duplex parameter.	has the same effect as specifying half if the attached device				
	For Gigabit Ethernet ports, setting the port to au does not autonegotiate the duplex parameter.	to has the same effect as specifying full if the attached device				
	Note Half-duplex mode is supported on Gigabit Ethernet interfaces if the duplex mode is auto and the connected device is operating at half duplex. However, you cannot configure these interfaces to operate in half-duple mode.					
	Certain ports can be configured to be either full on the device to which the switch is attached.	duplex or half duplex. How this command is applied depends				
	•••••	, we highly recommend using the default autonegotiation on and the other end does not, configure duplex and speed on supported side.				
	· · · ·	with the device at the other end of the link for the speed setting ted value. The duplex setting remains as configured on each				

and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

You can configure the duplex setting when the speed is set to auto.

```
Â
```

Caution Changing the interface speed and duplex mode configuration might shut down and reenable the interface during the reconfiguration.

You can verify your setting by entering the show interfaces privileged EXEC command.

Examples

This example shows how to configure an interface for full-duplex operation:

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# duplex full
```

errdisable detect cause

To enable error-disable detection for a specific cause or for all causes, use the **errdisable detect cause** command in global configuration mode. To disable the error-disable detection feature, use the **no** form of this command.

errdisable detect cause {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | psp shutdown vlan | security-violation shutdown vlan | sfp-config-mismatch}

no errdisable detect cause {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | psp shutdown vlan | security-violation shutdown vlan | sfp-config-mismatch}

Syntax Description	all	Enables error detection for all error-disabled causes.				
	arp-inspection	Enables error detection for dynamic Address Resolution Protocol (ARP) inspection.				
	bpduguard shutdown vlan	Enables per-VLAN error-disable for BPDU guard.				
	dhcp-rate-limit	Enables error detection for DHCP snooping.				
	dtp-flap	Enables error detection for the Dynamic Trunking Protocol (DTP) flapping.				
	gbic-invalid	Enables error detection for an invalid Gigabit Interface Converter (GBIC) module.				
		Note This error refers to an invalid small form-factor pluggable (SFP) module.				
	inline-power	Enables error detection for the Power over Ethernet (PoE) error-disabled cause.				
		Note This keyword is supported only on switches with PoE ports.				
	link-flap	Enables error detection for link-state flapping.				
	loopback	Enables error detection for detected loopbacks.				
	pagp-flap	Enables error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause.				
	pppoe-ia-rate-limit	Enables error detection for the PPPoE Intermediate Agent rate-limit error-disabled cause.				
	psp shutdown vlan	Enables error detection for protocol storm protection (PSP).				
	security-violation shutdown vlan	Enables voice aware 802.1x security.				
	sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.				

Command Default	Detection is enabled for all causes. All causes, except per-VLAN error disabling, are configured to shut down the entire port.		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines		he reason for the error-disabled state. When a cause is an error-disabled state, an operational state that is similar	
	When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the bridge protocol data unit (BPDU) guard, voice-aware 802.1x security, and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.		
	If you set a recovery mechanism for the cause by entering the errdisable recovery global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the shutdown and then the no shutdown commands to manually recover an interface from the error-disabled state.		
	For protocol storm protection, excess packets are dropped for a maximum of two virtual ports. Virtual port error disabling using the psp keyword is not supported for EtherChannel and Flexlink interfaces.		
	To verify your settings, enter the show errdisable detect privileged EXEC command.		
	This example shows how to enable error-disabled detection for the link-flap error-disabled cause: Device(config)# errdisable detect cause link-flap		
	This command shows how to globally configure BPDU guard for a per-VLAN error-disabled state: Device (config) # errdisable detect cause bpduguard shutdown vlan		
	This command shows how to globally configure voice-aware 802.1x security for a per-VLAN error-disabled state:		
	Device(config)# errdisable detect cause security-violation shutdown vlan		
	You can verify your setting by entering the show	errdisable detect privileged EXEC command.	

errdisable detect cause small-frame

To allow any switch port to be error disabled if incoming VLAN-tagged packets are small frames (67 bytes or less) and arrive at the minimum configured rate (the threshold), use the **errdisable detect cause small-frame** global configuration command on the switch stack or on a standalone switch. Use the **no** form of this command to return to the default setting.

errdisable detect cause small-frame no errdisable detect cause small-frame

Syntax Description	This command has no arguments or keywords.			
Command Default	This feature is disabled.			
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	This command globally enables the small-frame arrival feature. Use the small violation-rate interface configuration command to set the threshold for each port.			
		nabled by using the errdisable recovery cause small-frame e recovery time by using the errdisable recovery interval		
	Examples			
	This example shows how to enable the switch ports small frames arrive at the configured threshold:	s to be put into the error-disabled mode if incoming		

Device(config) # errdisable detect cause small-frame

You can verify your setting by entering the show interfaces privileged EXEC command.

errdisable recovery cause

To enable the error-disabled mechanism to recover from a specific cause, use the **errdisable recovery cause** command in global configuration mode. To return to the default setting, use the **no** form of this command.

errdisable recovery cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control | udld | vmps}

no errdisable recovery cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | psp | security-violation | sfp-config-mismatch | storm-control | udld | vmps}

Syntax Description	all	Enables the timer to recover from all error-disabled causes.		
	arp-inspection	Enables the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.		
	bpduguard	Enables the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.		
	channel-misconfig	Enables the timer to recover from the EtherChannel misconfiguration error-disabled state.		
	dhcp-rate-limit	Enables the timer to recover from the DHCP snooping error-disabled state.		
	dtp-flap	Enables the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.		
	gbic-invalid	Enables the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.		
		Note This error refers to an invalid small form-factor pluggable (SFP) error-disabled state.		
	inline-power	Enables the timer to recover from the Power over Ethernet (PoE) error-disabled state.		
		This keyword is supported only on switches with PoE ports.		
	link-flap	Enables the timer to recover from the link-flap error-disabled state.		
	loopback	Enables the timer to recover from a loopback error-disabled state.		
	mac-limit	Enables the timer to recover from the mac limit error-disabled state.		
	pagp-flap	Enables the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.		

	port-mode-failure	Enables the timer to recover from the port mode change failure error-disabled state.		
	pppoe-ia-rate-limit	Enables the timer to recover from the PPPoE IA rate limit error-disabled state.		
	psecure-violation	Enables the timer to recover from a port security violation disable state.		
	psp	Enables the timer to recover from the protocol storm protection (PSP) error-disabled state.		
	security-violation	Enables the timer to recover from an IEEE 802.1x-violation disabled state.		
	sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.		
	storm-control	Enables the timer to recover from a storm control error.		
	udld	Enables the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.		
	vmps	Enables the timer to recover from the VLAN Membership Policy Server (VMPS) error-disabled state.		
Command Default	Recovery is disabled for all causes.			
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Jsage Guidelines	A cause (such as all or BDPU guard) is defined as the reason that the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in the error-disabled state, an operational state similar to link-down state.			
	When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.			
	the shutdown and the no shutdown	or the cause, the interface stays in the error-disabled state until you enter interface configuration commands. If you enable the recovery for a cause, rror-disabled state and allowed to retry the operation again when all the		
	Otherwise, you must enter the shut interface from the error-disabled sta	tdown and then the no shutdown commands to manually recover an ate.		
	You can verify your settings by entering the show errdisable recovery privileged EXEC command.			
Examples	This example shows how to enable the recovery timer for the BPDU guard error-disabled cause:			
	This example shows now to enable	the recovery timer for the BFDO guard effor-disabled cause.		

I

Device(config) # errdisable recovery cause bpduguard

errdisable recovery cause small-frame

Use the **errdisable recovery cause small-frame** global configuration command on the switch to enable the recovery timer for ports to be automatically re-enabled after they are error disabled by the arrival of small frames. Use the **no** form of this command to return to the default setting.

errdisable recovery cause small-frame no errdisable recovery cause small-frame

Syntax Description	This command	has no a	arguments	or keywords	•

Command Default This feature is disabled.

Command Modes Global configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

Usage Guidelines This command enables the recovery timer for error-disabled ports. You configure the recovery time by using the **errdisable recovery interval** interface configuration command.

This example shows how to set the recovery timer:

Device(config) # errdisable recovery cause small-frame

errdisable recovery interval

To specify the time to recover from an error-disabled state, use the **errdisable recovery interval** command in global configuration mode. To return to the default setting, use the **no** form of this command.

errdisable recovery interval timer-interval no errdisable recovery interval timer-interval

Syntax Description	 <i>timer-interval</i> Time to recover from the error-disabled state. The range is 30 to 86400 seconds. The same interval is applied to all causes. The default interval is 300 seconds. The default recovery interval is 300 seconds. 		
Command Default			
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	The error-disabled recovery timer is initialized at a random differential from the configured interval value. The difference between the actual timeout value and the configured value can be up to 15 percent of the configured interval.		
	You can verify your settings by entering the show e	errdisable recovery privileged EXEC command.	
Examples	This example shows how to set the timer to 500 sec	conds:	
	Device(config)# errdisable recovery interval 500		

IIdp (interface configuration)

To enable Link Layer Discovery Protocol (LLDP) on an interface, use the **lldp** command in interface configuration mode. To disable LLDP on an interface, use the **no** form of this command.

Syntax Description	med-tlv-select	Selects an LLDP Media Endpoint Discovery (MED) time-length-value (TLV) element to send.		
	tlv	String that identifies the TLV element. Valid values are the following:		
		• inventory-management— LLDP MED Inventory Management TLV.		
		Iocation— LLDP MED Location TLV.		
		• network-policy— LLDP MED Network Policy TLV.		
	receive	Enables the interface to receive LLDP transmissions.		
	tlv-select	Selects the LLDP TLVs to send.		
	power-management	Sends the LLDP Power Management TLV.		
	transmit	Enables LLDP transmission on the interface.		
Command Default	LLDP is disabled.			
Command Modes	Interface configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	This command is supported on 802.1 media types.			
	If the interface is configured as a tunnel port, LLDP is automatically disabled.			
	The following example shows how to disable LLDP transmission on an interface:			
	Device(config)# interface gigabitethernet1/0/1 Device(config-if)# no lldp transmit			
	The following example shows how to enable LLDP transmission on an interface:			
	Device(config)# interface g Device(config-if)# lldp tra			

mdix auto

To enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface, use the **mdix auto** command in interface configuration mode. To disable auto-MDIX, use the **no** form of this command.

mdix auto no mdix auto

Syntax Description This command has no arguments or keywords.

Command Default Auto-MDIX is enabled.

Command Modes Interface configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately.

When you enable auto-MDIX on an interface, you must also set the interface speed and duplex to **auto** so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed and duplex) is enabled on one or both of the connected interfaces, link up occurs, even if the cable type (straight-through or crossover) is incorrect.

Auto-MDIX is supported on all 10/100 and 10/100/1000 Mb/s interfaces and on 10/100/1000BASE-TX small form-factor pluggable (SFP) module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

You can verify the operational state of auto-MDIX on the interface by entering the **show** controllers ethernet-controller *interface-id* phy privileged EXEC command.

This example shows how to enable auto-MDIX on a port:

Device# configure terminal Device(config)# interface gigabitethernet1/0/1 Device(config-if)# speed auto Device(config-if)# duplex auto Device(config-if)# mdix auto Device(config-if)# end

network-policy

To apply a network-policy profile to an interface, use the **network-policy** command in interface configuration mode. To remove the policy, use the **no** form of this command.

network-policy profile-number
no network-policy

Syntax Description	<i>profile-number</i> The network-policy profile number to apply to the interface.		
Command Default	No network-policy profiles are applied.		
Command Modes	Interface configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	Use the network-policy <i>profile number</i> interface configuration command to apply a profile to an interface. You cannot apply the switchport voice vlan command on an interface if you first configure a network-policy profile on it. However, if switchport voice vlan <i>vlan-id</i> is already configured on the interface, you can apply a network-policy profile on the interface. The interface then has the voice or voice-signaling VLAN network-policy profile applied.		
	This example shows how to apply network-polic Device (config) # interface gigabitethernet Device (config-if) # network-policy 60		

network-policy profile (global configuration)

To create a network-policy profile and to enter network-policy configuration mode, use the **network-policy** profile command in global configuration mode. To delete the policy and to return to global configuration mode, use the **no** form of this command. **network-policy profile** profile-number **no network-policy profile** profile-number Syntax Description profile-number Network-policy profile number. The range is 1 to 4294967295. No network-policy profiles are defined. **Command Default** Global configuration **Command Modes Command History** Release Modification Cisco IOS Release 15.0(2)EX This command was introduced. Use the **network-policy profile** global configuration command to create a profile and to enter network-policy **Usage Guidelines** profile configuration mode. To return to privileged EXEC mode from the network-policy profile configuration mode, enter the exit command. When you are in network-policy profile configuration mode, you can create the profile for voice and voice signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode. These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV). This example shows how to create network-policy profile 60: Device(config) # network-policy profile 60 Device (config-network-policy) #

nmsp attachment suppress

To suppress the reporting of attachment information from a specified interface, use the **nmsp attachment suppress** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

nmsp attachment suppress no nmsp attachment suppress

Syntax Description	This command has no arguments or keywords.		
Command Default	None		
Command Modes	Interface configuration (config-if)		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	Jsage Guidelines Use the nmsp attachment suppress interface configuration command to configure an interface to not location and attachment notifications to a Cisco Mobility Services Engine (MSE).		
	Attachment information is not supported in Cisco IOS XE Denali 16.1.1 and later releases.		
	This example shows how to configure an interface to not send attachment information to the MSE:		

Device(config)# interface gigabitethernet1/0/1
Device(config-if)# nmsp attachment suppress

power efficient-ethernet auto

To enable Energy Efficient Ethernet (EEE) for an interface, use the **power efficient-ethernet auto** command in interface configuration mode. To disable EEE on an interface, use the **no** form of this command.

power efficient-ethernet auto no power efficient-ethernet auto

Syntax Description This command has no arguments or keywords.

Command Default EEE is enabled

Command Modes Interface configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

Usage Guidelines

ines You can enable EEE on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.

The **power efficient-ethernet auto** command is available only if the interface is EEE capable. To check if an interface is EEE capable, use the **show eee capabilities** EXEC command.

When EEE is enabled, the device advertises and autonegotiates EEE to its link partner. To view the current EEE status for an interface, use the **show eee status** EXEC command.

This command does not require a license.

This example shows how to enable EEE for an interface:

Device(config-if)# power efficient-ethernet auto
Device(config-if)#

This example shows how to disable EEE for an interface:

Device(config-if)# no power efficient-ethernet auto
Device(config-if)#

power inline

To configure the power management mode on Power over Ethernet (PoE) ports, use the **power inline** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

power inline {auto [max max-wattage] | never | port priority {high | low} | static [max max-wattage]} no power inline {auto | never | port priority {high | low} | static [max max-wattage]}

Syntax Description	auto	Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. Allocation is first-come, first-serve
	max max-wattage	(Optional) Limits the power allowed on the port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.
	never	Disables device detection, and disables power to the port.
	port	Configures the power priority of the port. The default priority is low.
	<pre>priority { high low }</pre>	Sets the power priority of the port. In case of a power supply failure, ports configured as low priority are turned off first and ports configured as high priority are turned off last. The default priority is low.
	static	Enables powered-device detection. Pre-allocates (reserves) power for a port before the switch discovers the powered device. This action guarantees that the device connected to the interface receives enough power.
Command Default	The default is auto (enabled).	
	The maximum wattage is 30,000 mW.	
	The default port priority is low.	
Command Default	Interface configuration	

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	This command is supported only on PoE-capable ports. If you enter this command on a port that does not support PoE, this error message appears:		
	Device(config)# interface gigabitethernet1/0/1 Device(config-if)# power inline auto		
	% Invalid input detected at '^' marker.		
	In a switch stack, this command is supported on all ports in the stack that support PoE.		
	Use the max <i>max-wattage</i> option to disallow higher-power the powered device sends Cisco Discovery Protocol (CDP) m wattage, the switch removes power from the port. If the pow	nessages requesting more power than the maximum	

wattage, the switch removes power from the port. If the powered-device IEEE class maximum is greater than the maximum wattage, the switch does not power the device. The power is reclaimed into the global power budget.

Note

The switch never powers any class 0 or class 3 device if the power inline max max-wattage command is configured for less than 30 W.

If the switch denies power to a powered device (the powered device requests more power through CDP messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the **show power inline** privileged EXEC command output shows *power-deny*.

Use the **power inline static max** *max-wattage* command to give a port high priority. The switch allocates PoE to a port configured in static mode before allocating power to a port configured in auto mode. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device needs more than the maximum wattage, the powered device is shut down.

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears: Command rejected: power inline static: pwr not available. The port configuration remains unchanged.

When you configure a port by using the **power inline auto** or the **power inline static** interface configuration command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the **power inline never** command, the port reverts to the configured speed and duplex settings.

Examples

If a port has a Cisco powered device connected to it, you should not use the **power inline never** command to configure the port. A false link-up can occur, placing the port in an error-disabled state.

Use the **power inline port priority {high | low}** command to configure the power priority of a PoE port. Powered devices connected to ports with low port priority are shut down first in case of a power shortage.

You can verify your settings by entering the show power inline EXEC command.

This example shows how to enable detection of a powered device and to automatically power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto
```

This example shows how to configure a PoE port on a switch to allow a class 1 or a class 2 powered device:

```
Device (config) # interface gigabitethernet1/0/2
Device (config-if) # power inline auto max 7000
```

This example shows how to disable powered-device detection and to not power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline never
```

This example shows how to set the priority of a port to high, so that it would be one of the last ports to be shut down in case of power supply failure:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline port priority high
```

power inline consumption

To override the amount of power specified by the IEEE classification for a powered device, use the **power inline consumption** command in global or interface configuration to specify the wattage used by each device. To return to the default power setting, use the **no** form of this command.

power inline consumption [default] wattage
no power inline consumption [default]

Syntax Description default The default keyword appears only in the global configuration. The command has the same effect with or without the keyword. *wattage* Specifies the power that the switch budgets for the port. The range is 4000 to 15400 mW. The default power on each Power over Ethernet (PoE) port is15400 mW. **Command Default** Global configuration **Command Modes** Interface configuration **Command History** Modification Release This command was introduced. Cisco IOS Release 15.0(2)EX This command is supported only on the LAN Base image. **Usage Guidelines** When Cisco powered devices are connected to PoE ports, the switch uses Cisco Discovery Protocol (CDP) to determine the CDP-specific power consumption of the devices, which is the amount of power to allocate based on the CDP messages. The switch adjusts the power budget accordingly. This does not apply to IEEE third-party powered devices. For these devices, when the switch grants a power request, the switch adjusts the power budget according to the powered-device IEEE classification. If the powered device is a class 0 (class status unknown) or a class 3, the switch budgets 15400 mW for the device, regardless of the CDP-specific amount of power needed. If the powered device reports a higher class than its CDP-specific consumption or does not support power classification (defaults to class 0), the switch can power fewer devices because it uses the IEEE class information to track the global power budget.

With PoE+, powered devices use IEEE 802.3at and LLDP power with media dependent interface (MDI) type, length, and value descriptions (TLVs), Power-via-MDA TLVs, for negotiating power up to 30 W. Cisco pre-standard devices and Cisco IEEE powered devices can use CDP or the IEEE 802.3at power-via-MDI power negotiation mechanism to request power levels up to 30 W.

Note

The initial allocation for Class 0, Class 3, and Class 4 powered devices is 15.4 W. When a device starts up and uses CDP or LLDP to send a request for more than 15.4 W, it can be allocated up to the maximum of 30 W.

By using the **power inline consumption** *wattage* configuration command, you can override the default power requirement of the IEEE classification. The difference between what is mandated by the IEEE classification and what is actually needed by the device is reclaimed into the global power budget for use by additional devices. You can then extend the switch power budget and use it more effectively.

Before entering the **power inline consumption** *wattage* configuration command, we recommend that you enable policing of the real-time power consumption by using the **power inline police** [action log] interface configuration command.

```
∕!∖
```

Caution You should carefully plan your switch power budget and make certain not to oversubscribe the power supply.

When you enter the **power inline consumption default** *wattage* or the **no power inline consumption default** global configuration command, or the **power inline consumption** *wattage* or the **no power inline consumption** interface configuration command, this caution message appears.

```
%CAUTION: Interface Gi1/0/1: Misconfiguring the 'power inline consumption/allocation'
command may cause damage to the switch and void your warranty. Take precaution not to
oversubscribe the power supply.
It is recommended to enable power policing if the switch supports it.
Refer to documentation.
```

Note

When you manually configure the power budget, you must also consider the power loss over the cable between the switch and the powered device.

For more information about the IEEE power classifications, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release.

This command is supported only on PoE-capable ports. If you enter this command on a switch or port that does not support PoE, an error message appears.

In a switch stack, this command is supported on all switches or ports in the stack that support PoE.

You can verify your settings by entering the **show power inline consumption** privileged EXEC command.

Examples

This example shows how to use the command in global configuration mode to configure the switch to budget 5000 mW to each PoE port:

```
Device(config)# power inline consumption default 5000
%CAUTION: Interface Gi1/0/1: Misconfiguring the 'power inline consumption/allocation'
command may cause damage to the switch and void your warranty. Take precaution not to
oversubscribe the power supply.
It is recommended to enable power policing if the switch supports it.
Refer to documentation.
```

This example shows how to use the command in interface configuration mode to configure the switch to budget 12000 mW to the powered device connected to a specific PoE port:

```
Device (config) # interface gigabitethernet1/0/2
Device (config-if) # power inline consumption 12000
%CAUTION: Interface Gi1/0/2: Misconfiguring the 'power inline consumption/allocation'
```

command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply.

It is recommended to enable power policing if the switch supports it. Refer to documentation.

power inline police

To enable policing of real-time power consumption on a powered device, use the **power inline police** command in interface configuration mode. To disable this feature, use the **no** form of this command

power inline police [action {errdisable | log}]
no power inline police

Syntax Description	ax Descriptionaction errdisable(Optional) Configures the device to turn off power to the port if the real- consumption exceeds the maximum power allocation on the port. This is the		
			to generate a syslog message while still providing power time power consumption exceeds the maximum power
Command Default	Policing of the real-time power consumption of the powered device is disabled.		
Command Modes	Interface configuration		
Command History	Release		Modification
	Cisco IOS Rel	ease 15.0(2)EX	This command was introduced.
Usage Guidelines	This command	is supported only on the LAN Base i	mage.
	This command is supported only on Power over Ethernet (PoE)-capable ports. If you enter this command on a device or port that does not support PoE, an error message appears.		
In a switch stack, this command is supported on all switches or ports in power-consumption monitoring.			itches or ports in the stack that support PoE and real-time
	When policing of the real-time power consumption is enabled, the device takes action when a powered device consumes more power than the allocated maximum amount.		
	When PoE is enabled, the device senses the real-time power consumption of the powered device. This feature is called <i>power monitoring</i> or <i>power sensing</i> . The device also polices the power usage with the <i>power policing</i> feature.		
	When power policing is enabled, the device uses one of the these values as the cutoff power on the PoE port in this order:		
	 The user-defined power level that limits the power allowed on the port when you enter the power inline auto max max-wattage or the power inline static max max-wattage interface configuration command The device automatically sets the power usage of the device by using CDP power negotiation or by the IEEE classification and LLPD power negotiation. 		
	power negotiat enabled, the de devices to cons	ion or the device IEEE classification a fault value of 30 W is applied. Howe sume more than 15.4 W of power beca	lue, the device automatically determines it by using CDP and LLDP power negotiation. If CDP or LLDP are not ver without CDP or LLDP, the device does not allow use values from 15400 to 30000 mW are only allocated e consumes more than 15.4 W without CDP or LLDP

negotiation, the device might be in violation of the maximum current *Imax* limitation and might experience an *Icut* fault for drawing more current than the maximum. The port remains in the fault state for a time before attempting to power on again. If the port continuously draws more than 15.4 W, the cycle repeats.

When a powered device connected to a PoE+ port restarts and sends a CDP or LLDP packet with a power TLV, the device locks to the power-negotiation protocol of that first packet and does not respond to power requests from the other protocol. For example, if the device is locked to CDP, it does not provide power to devices that send LLDP requests. If CDP is disabled after the device has locked on it, the device does not respond to LLDP power requests and can no longer power on any accessories. In this case, you should restart the powered device.

If power policing is enabled, the device polices power usage by comparing the real-time power consumption to the maximum power allocated on the PoE port. If the device uses more than the maximum power allocation (or *cutoff power*) on the port, the device either turns power off to the port, or the device generates a syslog message and updates the LEDs (the port LEDs are blinking amber) while still providing power to the device.

- To configure the device to turn off power to the port and put the port in the error-disabled state, use the **power inline police** interface configuration command.
- To configure the device to generate a syslog message while still providing power to the device, use the **power inline police action log** command.

If you do not enter the **action log** keywords, the default action is to shut down the port, turn off power to it, and put the port in the PoE error-disabled state. To configure the PoE port to automatically recover from the error-disabled state, use the **errdisable detect cause inline-power** global configuration command to enable error-disabled detection for the PoE cause and the **errdisable recovery cause inline-power interval** *interval* global configuration command to enable the recovery timer for the PoE error-disabled cause.

∕!∖

Caution If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the port, which could adversely affect the device.

You can verify your settings by entering the show power inline police privileged EXEC command.

Examples

This example shows how to enable policing of the power consumption and configuring the device to generate a syslog message on the PoE port on a device:

Device(config)# interface gigabitethernet1/0/2 Device(config-if)# power inline police action log

show eee

To display Energy Efficient Ethernet (EEE) information for an interface, use the **show eee** command in EXEC mode.

show eee{counters | capabilities interface interface-id | status interface interface-id}

Syntax Description	counters	Displays EEE counters.		
	capabilities	Displays EEE capabilities for the specified interface.		
	status	Displays EEE status information for the specified interface.		
	interface interface-id	Specifies the interface for which to display EEE capabilities or status information.		
Command Default	None			
Command Modes	User EXEC			
	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	You can enable EEE on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low power utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.			
	To check if an interface is EEE capable, use the show eee capabilities command. You can enable EEE on an interface that is EEE capable by using the power efficient-ethernet auto interface configuration command.			
	To view the EEE status, LPI status, and wake error count information for an interface, use the show eee status command.			
	This is an example of output from the show eee counters command:			
	Device# show eee counters ASIC #0 			
	LP Active 1G : LP Transitioning 1G : LP Active Tx 100M : LP Transitioning Tx 100M : LP Active Rx 100M : LP Transitioning Rx 100M : ASIC #1	0 0		

LP Active 1G : 0 LP Transitioning 1G : 0 LP Active Tx 100M : 0 LP Transitioning Tx 100M : 0 LP Active Rx 100M : 0 LP Transitioning Rx 100M : 0

This is an example of output from the **show eee capabilities** command on an interface where EEE is enabled:

```
Device# show eee capabilities interface gigabitethernet1/0/1
Gi1/0/1
EEE(efficient-ethernet): yes (100-Tx and 1000T auto)
Link Partner : yes (100-Tx and 1000T auto)
```

This is an example of output from the **show eee capabilities** command on an interface where EEE is not enabled:

```
Device# show eee capabilities interface gigabitethernet2/0/1
Gi2/0/1
EEE(efficient-ethernet): not enabled
Link Partner : not enabled
```

This is an example of output from the **show eee status** command on an interface where EEE is enabled and operational. The table that follows describes the fields in the display.

```
Device# show eee status interface gigabitethernet1/0/4
Gil/0/4 is up
EEE(efficient-ethernet): Operational
Rx LPI Status : Received
Tx LPI Status : Received
```

This is an example of output from the **show eee status** command on an interface where EEE operational and the ports are in low power save mode:

```
Device# show eee status interface gigabitethernet1/0/3
Gil/0/3 is up
EEE(efficient-ethernet): Operational
Rx LPI Status : Low Power
Tx LPI Status : Low Power
Wake Error Count : 0
```

This is an example of output from the **show eee status** command on an interface where EEE is not enabled because a remote link partner is incompatible with EEE:

```
Device# show eee status interface gigabitethernet1/0/3
Gi1/0/3 is down
EEE(efficient-ethernet): Disagreed
Rx LPI Status : None
Tx LPI Status : None
Wake Error Count : 0
```

Field	Description
EEE (efficient-ethernet)	The EEE status for the interface. This field can have any of the following values:
	• N/A—The port is not capable of EEE.
	• Disabled—The port EEE is disabled.
	• Disagreed—The port EEE is not set because a remote link partner might be incompatible with EEE; either it is not EEE capable, or its EEE setting is incompatible.
	• Operational—The port EEE is enabled and operating.
	If the interface speed is configured as 10 Mbps, EEE is disabled internally. When the interface speed moves back to auto, 100 Mbps or 1000 Mbps, EEE becomes active again.
Rx/Tx LPI Status	The Low Power Idle (LPI) status for the link partner. These fields can have any of the following values:
	• N/A—The port is not capable of EEE.
	• Interrupted—The link partner is in the process of moving to low power mode.
	• Low Power—The link partner is in low power mode.
	• None— EEE is disabled or not capable at the link partner side.
	• Received—The link partner is in low power mode and there is traffic activity.
	If an interface is configured as half-duplex, the LPI status is None, which means the interface cannot be in low power mode until it is configured as full-duplex.
Wake Error Count	The number of PHY wake-up faults that have occurred. A wake-up fault can occur when EEE is enabled and the connection to the link partner is broken.
	This information is useful for PHY debugging.

Table 6: show eee status Field Descriptions

show env

To display fan, temperature, redundant power system (RPS) availability, and power information, use the **show env** command in EXEC mode.

show env {all | fan | power [{all | switch [stack-member-number]}] | rps | stack [stack-member-number]
| temperature [status]}

Syntax Description	all	Displays the fan and temperature environmental status and the status of the internal power supplies and the RPS.		
	fan	Displays the switch fan status.		
	power	Displays the internal power status of the active switch.		
	all	(Optional) Displays the status of all the internal power supplies in a standalone switch when the command is entered on the switch, or in all the member switches when the command is entered on the active switch.		
	switch	(Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch. This keyword is available only on stacking-capable switches.		
	stack-member-number	(Optional) Number of the member switch for which to display the status of the internal power supplies or the environmental status.		
		The range is 1 to 8.		
	rps	Displays the RPS status.		
	stack	Displays all environmental status for each switch in the stack or for the specified switch.		
		This keyword is available only on stacking-capable switches.		
	temperature	Displays the switch temperature status.		
	status	(Optional) Displays the switch internal temperature (not the external temperature) and the threshold values.		
Command Default	None			
Command Modes	User EXEC			
	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		

Usage Guidelines Use the **show env** EXEC command to display the information for the switch being accessed—a standalone switch or the active switch. Use this command with the **stack** and **switch** keywords to display all information for the stack or for the specified member switch.

If you enter the **show env temperature status** command, the command output shows the switch temperature state and the threshold level.

You can also use the **show env temperature** command to display the switch temperature status. The command output shows the green and yellow states as *OK* and the red state as *FAULTY*. If you enter the **show env all** command, the command output is the same as the **show env temperature status** command output.

Examples

This is an example of output from the **show env power all** command on the active switch:

Table 7: States in the show env temperature status Command Output

State	Description
Green	The switch temperature is in the <i>normal</i> operating range.
Yellow	The temperature is in the <i>warning</i> range. You should check the external temperature around the switch.
Red	The temperature is in the <i>critical</i> range. The switch might not run properly if the temperature is in this range.

show errdisable detect

To display error-disabled detection status, use the show errdisable detect command in EXEC mode.

	show errdisable detect		
Syntax Description	This command has no arguments or keywords.		
Command Default	None		
Command Modes	User EXEC		
	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	A gbic-invalid error reason refers to an invalid small	l form-factor pluggable (SFP) module.	
	The error-disable reasons in the command output are listed in alphabetical order. The mode column show how error-disable is configured for each feature.		
	You can configure error-disabled detection in these modes:		
	• port mode—The entire physical port is error-di	sabled if a violation occurs.	
	• vlan mode—The VLAN is error-disabled if a v	iolation occurs.	
	 port/vlan mode—The entire physical port is erro on other ports. 	r-disabled on some ports and is per-VLAN error-disabled	

show errdisable recovery

To display the error-disabled recovery timer information, use the **show errdisable recovery** command in EXEC mode.

This command has no arguments or keywords.	
Modification	
This command was introduced.	
refers to an invalid small form-factor pluggable (SFP) module interface.	
the unicast-flood field is not valid.	
-	

This is an example of output from the show errdisable recovery command:

show interfaces

To display the administrative and operational status of all interfaces or for a specified interface, use the **show interfaces** command in privileged EXEC mode.

show interfaces [{*interface-id* | vlan *vlan-id*}] [{accounting | capabilities [module *number*] | debounce | description | etherchannel | flowcontrol | pruning | stats | status [{err-disabled}] | trunk}]

interface-id	(Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels. The port channel range is 1 to 48.			
vlan vlan-id	(Optional) VLAN identification. The range is 1 to 4094.			
accounting	(Optional) Displays accounting information on the interface, including active protocols and input and output packets and octet			
	Note The display shows only packets processed in software; hardware-switched packets do not appear.			
capabilities	(Optional) Displays the capabilities of all interfaces or the specified interface, including the features and options that you can configure on the interface. Though visible in the command line help, this option is not available for VLAN IDs.			
module number	(Optional) Displays capabilities of all interfaces on the switch or specified stack member.			
	The range is 1 to 8.			
	This option is not available if you entered a specific interface ID.			
debounce	(Optional) Displays port debounce timer information for an interface.			
description	(Optional) Displays the administrative status and description set for an interface.			
etherchannel	(Optional) Displays interface EtherChannel information.			
flowcontrol	(Optional) Displays interface flow control information.			
mtu	(Optional) Displays the MTU for each interface or for the specified interface.			
pruning	(Optional) Displays trunk VTP pruning information for the interface.			
stats	(Optional) Displays the input and output packets by switching the path for the interface.			
	vlan vlan-id accounting capabilities module number debounce description etherchannel flowcontrol mtu pruning			

status	(Optional) Displays the status of the interface. A status of unsupported in the Type field means that a non-Cisco small form-factor pluggable (SFP) module is inserted in the module slot.		
err-disabled	(Optional) Displays interfaces in an error-disabled state.		
trunk	(Optional) Displays interface trunk information. If you do not specify an interface, only information for active trunking ports appears.		
-	ommand-line help strings, the crb , fair-queue , irb , mac-accounting , precedence ate-limit keywords are not supported.		
None			
Privileged EXEC			
Release	Modification		
Cisco IOS Release 15.0(2)E	EX This command was introduced.		
The show interfaces capabi	ilities command with different keywords has these results:		
• Use the show interface capabilities module <i>number</i> command to display the capabilities of all interfaces on that switch in the stack. If there is no with that module number in the stack, there is no output.			
• Use the show interfaces <i>interface-id</i> capabilities to display the capabilities of the specified interface.			
• Use the show interface of all interfaces in the s	es capabilities (with no module number or interface ID) to display the capabilities stack.		
This is an example of output 3:	t from the show interfaces command for an interface on stack member

<output truncated>

show interfaces switchport

To display the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings, use the **show interfaces switchport** command in privileged EXEC mode.

show interfaces [interface-id] switchport [{backup [detail] | module number}]

Syntax Description	interface-id		e. Valid interfaces include physical ports (including type, pable switches, module, and port number) and port channels. p 48.			
	backup	backup (Optional) Displays Flex Link backup interface configuration for the specified interface or all interfaces.				
	detail	(Optional) Displays detailed b on the switch or the stack.	ackup information for the specified interface or all interfaces			
	module number	nodule <i>number</i> (Optional) Displays switchport configuration of all interfaces on the switch or specified stack member.				
		The range is 1 to 8.				
		This option is not available in	f you entered a specific interface ID.			
Command Default	None					
Command Modes	Privileged EXEC

Operational Mode: down
Administrative Trunking Encapsulation: dot1q
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 10 (VLAN0010)
```

Administrative Native VLAN tagging: enabled Voice VLAN: none Administrative private-vlan host-association: none Administrative private-vlan mapping: none Administrative private-vlan trunk native VLAN: none Administrative private-vlan trunk Native VLAN tagging: enabled Administrative private-vlan trunk encapsulation: dotlq Administrative private-vlan trunk normal VLANs: none Administrative private-vlan trunk associations: none Administrative private-vlan trunk mappings: none Operational private-vlan: none Trunking VLANs Enabled: 11-20 Pruning VLANs Enabled: 2-1001 Capture Mode Disabled Capture VLANs Allowed: ALL Protected: false

```
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Appliance trust: none
```

Field	Description
Name	Displays the port name.
Switchport	Displays the administrative and operational status of the port. In this display, the port is in switchport mode.
Administrative Mode	Displays the administrative and operational modes.
Operational Mode	
Administrative Trunking Encapsulation	Displays the administrative and operational
Operational Trunking Encapsulation	encapsulation method and whether trunking negotiation is enabled.
Negotiation of Trunking	
Access Mode VLAN	Displays the VLAN ID to which the port is configured.
Trunking Native Mode VLAN	Lists the VLAN ID of the trunk that is in native mode.
Trunking VLANs Enabled	Lists the allowed VLANs on the trunk. Lists the active VLANs on the trunk.
Trunking VLANs Active	
Pruning VLANs Enabled	Lists the VLANs that are pruning-eligible.
Protected	Displays whether or not protected port is enabled (True) or disabled (False) on the interface.
Unknown unicast blocked	Displays whether or not unknown multicast and
Unknown multicast blocked	unknown unicast traffic is blocked on the interface.
Voice VLAN	Displays the VLAN ID on which voice VLAN is enabled.

Field	Description
Appliance trust	Displays the class of service (CoS) setting of the data packets of the IP phone.

This is an example of output from the **show interfaces switchport backup** command:

Device# show interfaces switchport backup Switch Backup Interface Pairs:					
Active Interface	Backup Interface	State			
Gi1/0/1 Gi3/0/3 Pol	Gi1/0/2 Gi4/0/5 Po2	Active Up/Backup Standby Active Down/Backup Up Active Standby/Backup Up			

In this example of output from the **show interfaces switchport backup** command, VLANs 1 to 50, 60, and 100 to 120 are configured on the switch:

```
Device(config)# interface gigabitethernet 2/0/6
Device(config-if)# switchport backup interface gigabitethernet 2/0/8
prefer vlan 60,100-120
```

When both interfaces are up, Gi2/0/8 forwards traffic for VLANs 60, 100 to 120, and Gi2/0/6 will forward traffic for VLANs 1 to 50.

Device# show interfaces switchport backup

When a Flex Link interface goes down (LINK_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Link pair. In this example, if interface Gi2/0/6 goes down, Gi2/0/8 carries all VLANs of the Flex Link pair.

Device# show interfaces switchport backup

When a Flex Link interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Gi2/0/6 comes up, then VLANs preferred on this interface are blocked on the peer interface Gi2/0/8 and forwarded on Gi2/0/6.

Device# show interfaces switchport backup

Switch Backup Interface Pairs: Active Interface Backup Interface State GigabitEthernet2/0/6 GigabitEthernet2/0/8 Active Up/Backup Up Vlans on Interface Gi 2/0/6: 1-50

Vlans on Interface Gi 2/0/8: 60, 100-120

show interfaces transceiver

To display the physical properties of a small form-factor pluggable (SFP) module interface, use the **show interfaces transceiver** command in EXEC mode.

show interfaces [*interface-id*] **transceiver** [{**detail** | **module** *number* | **properties** | **supported-list** | **threshold-table**}]

interface-id		interface, including type, stack member (stacking-capable ort number.			
detail (Optional) Displays calibration properties, including high and low numbers and any al information for any Digital Optical Monitoring (DoM)-capable transceiver if one is installed in the switch.					
module <i>number</i> (Optional) Limits display to interfaces on module on the switch.					
	The range is 1 to 8.				
This option is not available if you entered a specific interface ID. properties (Optional) Displays speed, duplex, and inline power settings on an interface.					
					supported-list (Optional) Lists all supported transceivers.
threshold-table (Optional) Displays alarm and warning threshold table.					
User EXEC					
Privileged EXEC

Table 8: show power inline Field Descriptions

Field	Description
Available	The total amount of configured power ¹ on the PoE switch in watts (W).
Used	The amount of configured power that is allocated to PoE ports in watts.
Remaining	The amount of configured power in watts that is not allocated to ports in the system. (Available – Used = Remaining)
Admin	Administration mode: auto, off, static.
Oper	Operating mode: • on—The powered device is detected, and power is applied. • off—No PoE is applied. • faulty—Device detection or a powered device is in a faulty state. • power-deny—A powered device is detected, but no PoE is available, or the maximum wattage exceeds the detected powered-device maximum.
Power	The maximum amount of power that is allocated to the powered device in watts. This value is the same as the value in the <i>Cutoff Power</i> field in the show power inline police command output.

Field	Description
Device	The device type detected: n/a, unknown, Cisco powered-device, IEEE powered-device, or the name from CDP.
Class	The IEEE classification: n/a or a value from 0 to 4.
Max	The maximum amount of power allocated to the powered device in watts.
AdminPowerMax	The maximum amount power allocated to the powered device in watts when the switch polices the real-time power consumption. This value is the same as the <i>Max</i> field value.
AdminConsumption	The power consumption of the powered device in watts when the switch polices the real-time power consumption. If policing is disabled, this value is the same as the <i>AdminPowerMax</i> field value.

¹ The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

This is an example of output from the **show power inline police** command on a stacking-capable switch:

	Availab		olice Remaini s) (Watts	2		
1	370.	0 0.	0 370.	0		
3	865.	0 864.	0 1.	0		
	Admin	Oper	Admin	Oper	Cutoff	Oper
Interface	State	State	Police	Police	Power	Power
Gi1/0/1	auto	off	none	n/a	n/a	0.0
Gi1/0/2	auto	off	log	n/a	5.4	0.0
Gi1/0/3	auto	off	errdisable	n/a	5.4	0.0
Gi1/0/4	off	off	none	n/a	n/a	0.0
Gi1/0/5	off	off	log	n/a	5.4	0.0
Gi1/0/6	off	off	errdisable	n/a	5.4	0.0
Gi1/0/7	auto	off	none	n/a	n/a	0.0
Gi1/0/8	auto	off	log	n/a	5.4	0.0
Gi1/0/9	auto	on	none	n/a	n/a	5.1
Gi1/0/10	auto	on	log	ok	5.4	4.2
Gi1/0/11	auto	on	log	log	5.4	5.9
Gi1/0/12			errdisable		5.4	
Gi1/0/13	auto	errdisable	errdisable	n/a	5.4	0.0
<output truncated=""></output>						

In the previous example:

- The Gi1/0/1 port is shut down, and policing is not configured.
- The Gi1/0/2 port is shut down, but policing is enabled with a policing action to generate a syslog message.
- The Gi1/0/3 port is shut down, but policing is enabled with a policing action is to shut down the port.
- Device detection is disabled on the Gi1/0/4 port, power is not applied to the port, and policing is disabled.

- Device detection is disabled on the Gi1/0/5 port, and power is not applied to the port, but policing is enabled with a policing action to generate a syslog message.
- Device detection is disabled on the Gi1/0/6 port, and power is not applied to the port, but policing is enabled with a policing action to shut down the port.
- The Gi1/0/7 port is up, and policing is disabled, but the switch does not apply power to the connected device.
- The Gi1/0/8 port is up, and policing is enabled with a policing action to generate a syslog message, but the switch does not apply power to the powered device.
- The Gi1/0/9 port is up and connected to a powered device, and policing is disabled.
- The Gi1/0/10 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/11 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message.
- The Gi1/0/12 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/13 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port.

This is an example of output from the **show power inline police** *interface-id* command on a standalone switch. The table that follows describes the output fields.

Field	Description			
Available	The total amount of configured power ^{2} on the switch in watts (W).			
Used	The amount of configured power allocated to PoE ports in watts.			
Remaining	The amount of configured power in watts that is not allocated to ports in the system. (Available $-$ Used = Remaining)			
Admin State	Administration mode: auto, off, static.			
Oper State	 Operating mode: errdisable—Policing is enabled. faulty—Device detection on a powered device is in a faulty state. off—No PoE is applied. on—The powered device is detected, and power is applied. power-deny—A powered device is detected, but no PoE is available, or the real-time power consumption exceeds the maximum power allocation. Note The operating mode is the current PoE state for the specified PoE port, the specified stack member, or for all PoE ports on the switch. 			

Table 9: show power inline police Field Descriptions

Field	Description
Admin Police	 Status of the real-time power-consumption policing feature: errdisable—Policing is enabled, and the switch shuts down the port when the real-time power consumption exceeds the maximum power allocation. log—Policing is enabled, and the switch generates a syslog message when the real-time power consumption exceeds the maximum power allocation. none—Policing is disabled.
Oper Police	 Policing status: errdisable—The real-time power consumption exceeds the maximum power allocation, and the switch shuts down the PoE port. log—The real-time power consumption exceeds the maximum power allocation, and the switch generates a syslog message. n/a—Device detection is disabled, power is not applied to the PoE port, or no policing action is configured. ok—Real-time power consumption is less than the maximum power allocation.
Cutoff Power	The maximum power allocated on the port. When the real-time power consumption is greater than this value, the switch takes the configured policing action.
Oper Power	The real-time power consumption of the powered device.

² The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

show system mtu

To display the global maximum transmission unit (MTU) or maximum packet size set for the switch, use the **show system mtu** command in privileged EXEC mode.

show system mtu

Syntax Description	This command has no arguments or keywords.	
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	For information about the MTU values and the stack mtu command.	c configurations that affect the MTU values, see the system
Examples	This is an example of output from the show system	n mtu command:
	Device# show system mtu	
	System MTU size is 1500 bytes System Jumbo MTU size is 1500 bytes System Alternate MTU size is 1500 bytes Routing MTU size is 1500 bytes	

To specify the speed of a 10/100/1000/2500/5000 Mbps port, use the **speed** command in interface configuration mode. To return to the default value, use the **no** form of this command.

 $speed \quad \{10 \mid 100 \mid 1000 \mid 2500 \mid 5000 \mid auto \quad [\{10 \mid 100 \mid 1000 \mid 2500 \mid 5000\}] \mid nonegotiate\} \\ no \ speed \quad \label{eq:speed}$

Syntax Description	10	Specifies that the port runs at 10 Mbps.				
	100	100 Specifies that the port runs at 100 Mbps.				
	1000	Specifies that the port runs at 1000 Mbps. Mb/s ports.	This option is valid and visible only on 10/100/1000			
	2500	Specifies that the port runs at 2500 Mbps. multi-Gigabit-supported Ethernet ports.	This option is valid and visible only on			
	5000	5000 Specifies that the port runs at 5000 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.				
	auto	autoDetects the speed at which the port should run, automatically, based on the port at the other end of the link. If you use the 10, 100, 1000, 1000, 2500, or 5000 keyword with the auto keyword, the port autonegotiates only at the specified speeds.				
	nonegotiate	Disables autonegotiation, and the port runs	s at 1000 Mbps.			
Command Default	The default i		s at 1000 Mbps.			
Command Default		is auto .	s at 1000 Mbps.			
	The default i	is auto .	s at 1000 Mbps. Modification

	\triangle	
	Caution	Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.
		guidelines on setting the switch speed and duplex parameters, see the "Configuring Interface Characteristics" pter in the software configuration guide for this release.
	Veri	ify your settings using the show interfaces privileged EXEC command.
Examples	Dev	<pre>following example shows how to set speed on a port to 100 Mbps: ice(config)# interface gigabitethernet1/0/1 ice(config-if)# speed 100</pre>
	Dev	following example shows how to set a port to autonegotiate at only 10 Mbps: ice(config)# interface gigabitethernet1/0/1 ice(config-if)# speed auto 10
	The	following example shows how to set a port to autonegotiate at only 10 or 100 Mbps:

Device(config)# interface gigabitethernet1/0/1
Device(config-if)# speed auto 10 100

switchport backup interface

To configure Flex Links, use the **switchport backup interface** command in interface configuration mode on a Layer 2 interface on the switch stack or on a standalone switch. To remove the Flex Links configuration, use the **no** form of this command.

switchport backup interface interface-id [{mmu primary vlan vlan-id|multicast fast-convergence
| preemption {delay seconds | mode {bandwidth | forced | off}} | prefer vlan vlan-id}]
no switchport backup interface interface-id [{mmu primary vlan | multicast fast-convergence |
preemption {delay | mode} | prefer vlan}]

Syntax Description	interface-id	ID of the physical interface. (Optional) Configures the MAC move update (MMU) for a backup interface pair.			
	mmu				
	primary vlan vlan-id	(Optional) VLAN ID of the primary VLAN. The range is 1 to 4094.			
	multicast fast-convergence	(Optional) Configures multicast fast convergence on the backup interface.			
	preemption	(Optional) Configures a preemption scheme for a backup interface pair.			
	delay secondsSpecifies a preemption delay. The range is 1 to 300 seconds. The default is 35 seconds.				
	mode Specifies the preemption mode.				
	bandwidth Specifies that a higher bandwidth interface is preferred.				
	forced	Specifies that an active interface is preferred.			
	off Specifies that no preemption occurs from backup to active.				
	prefer vlan vlan-id(Optional) Specifies that VLANs are carried on the backup interfaces of a Flex Link pair. VLAN ID range is 1 to 4094.				
Command Default	The default is to have no Flex Links defined. The preemption mode is off. No preemption occurs. Preemption delay is set to 35 seconds.				
Command Modes	Interface configuration				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)E2	X This command was introduced.			
Usage Guidelines	acts as the primary interface a forwarding traffic if the prima link; the specified interface is	faces that provide backup to each other. With Flex Links configured, one link and forwards traffic, while the other interface is in standby mode, ready to begin ary link shuts down. The interface being configured is referred to as the active identified as the backup link. The feature provides an alternative to the Spanning g users to turn off STP and still retain basic link redundancy.			

This command is available only for Layer 2 interfaces.

You can configure only one Flex Link backup link for any active link, and it must be a different interface from the active interface.

- An interface can belong to only one Flex Link pair. An interface can be a backup link for only one active link. An active link cannot belong to another Flex Link pair.
- A backup link does not have to be the same type (Fast Ethernet or Gigabit Ethernet, for instance) as the active link. However, you should configure both Flex Links with similar characteristics so that there are no loops or changes in behavior if the standby link begins to forward traffic.
- Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links, and you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.
- If STP is configured on the switch, Flex Links do not participate in STP in all valid VLANs. If STP is
 not running, be sure that there are no loops in the configured topology.

This example shows how to configure two interfaces as Flex Links:

```
Device# configure terminal
Device(conf)# interface gigabitethernet1/0/1
Device(conf-if)# switchport backup interface gigabitethernet1/0/2
Device(conf-if)# end
```

This example shows how to configure the Gigabit Ethernet interface to always preempt the backup:

```
Device# configure terminal
Device(conf)# interface gigabitethernet1/0/1
Device(conf-if)# switchport backup interface gigabitethernet1/0/2 preemption forced
Device(conf-if)# end
```

This example shows how to configure the Gigabit Ethernet interface preemption delay time:

```
Device# configure terminal
Device(conf)# interface gigabitethernet1/0/1
Device(conf-if)# switchport backup interface gigabitethernet1/0/2 preemption delay 150
Device(conf-if)# end
```

This example shows how to configure the Gigabit Ethernet interface as the MMU primary VLAN:

```
Device# configure terminal
Device(conf)# interface gigabitethernet1/0/1
Device(conf-if)# switchport backup interface gigabitethernet1/0/2 mmu primary vlan 1021
Device(conf-if)# end
```

You can verify your setting by entering the **show interfaces switchport backup** privileged EXEC command.

switchport block

To prevent unknown multicast or unicast packets from being forwarded, use the **switchport block** command in interface configuration mode. To allow forwarding unknown multicast or unicast packets, use the **no** form of this command.

switchport block {multicast | unicast}
no switchport block {multicast | unicast}

Syntax Description	multicast	Specifie	es that unknown multicast traffic	c should be blocked.	
		Note	Only pure Layer 2 multicas or IPv6 information in the l	st traffic is blocked. Multicast packets that contain IPv4 header are not blocked.	
	unicast	Specifie	es that unknown unicast traffic s	hould be blocked.	
Command Default	Unknown	multicas	t and unicast traffic is not block	ed.	
Command Modes	Interface c	configura	tion		
Command History	Release			Modification	
	Cisco IOS	S Release	e 15.0(2)EX	This command was introduced.	
Usage Guidelines	unicast tra	ffic on p		es is sent to all ports. You can block unknown multicast of If unknown multicast or unicast traffic is not blocked on a	
	With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.				
	Blocking unknown multicast or unicast traffic is not automatically enabled on protected ports; you must explicitly configure it.				
	For more information about blocking packets, see the software configuration guide for this release.				
	This example shows how to block unknown unicast traffic on an interface:				
	<pre>Device(config-if)# switchport block unicast</pre>				
	You can ve EXEC cor		r setting by entering the show in	nterfaces interface-id switchport privileged	

I

system mtu

	system mtu {bytes jumbo bytes} no system mtu				
Syntax Description	<i>bytes</i> Set the system MTU for ports that are set to 10 or 100 Mb/s. The range is 1500 to 1998 bytes. This is the maximum MTU received at 10/100-Mb/s Ethernet switch ports.				
	jumbo bytes				rating at 1000 Mb/s or greater. The eived at the physical port for Gigabit
Command Default	The defau	lt MTU size for all	ports is 1500 bytes.		
Command Modes	Global con	nfiguration			
Command History	Release		Modification		
	Cisco IOS 15.0(2)E2		This command was intr	oduced.	
Usage Guidelines	The switch	h does not support	the MTU on a per-interfa	ace basis.	
-	the new co NVRAM a and system copy runn a new swit	onfiguration takes e and becomes effect n mtu jumbo com ning-config startuj tch by using a back icitly configure the	ffect. The system MTU ive when the switch relo mands are not saved in t p-config privileged EXE up configuration file and	setting is saved in ads. The MTU set he switch IOS con C command. Ther want the system N	size, you must reset the switch before the switch environmental variable in tings you enter with the system mtu figuration file, even if you enter the efore, if you use TFTP to configure <i>A</i> TU to be other than the default, you gs on the new switch and then reload
	Gigabit Ethernet ports operating at 1000 Mb/s are not affected by the system mtu command, and 10/100-Mb/s ports are not affected by the system mtu jumbo command.				
	If you enter a value that is outside the range for the specific type of switch, the value is not accepted.				
	You can verify your setting by entering the show system mtu privileged EXEC command.				
	This example shows how to set the global system MTU size to 1600 bytes:				
	Device(config)# system mtu 1600 Changes to the system MTU will not take effect until the next reload is done				
	Device(co	onfig)#			
	This exam	ple shows how to s	set the global system MT	U size to 6000 by	tes:
		onfig)# system m to the system ju	-	e effect until t	the next reload is done
	Device(co	onfig)#			

voice-signaling vlan (network-policy configuration)

To create a network-policy profile for the voice-signaling application type, use the **voice-signaling vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

voice-signaling vlan {*vlan-id* [{**cos** *cos-value* | **dscp** *dscp-value*}] | **dot1p** [{**cos** *l2-priority* | **dscp** *dscp*}] | **none** | **untagged**}

Syntax Description	vlan-id	(Optional) The VLAN for voice traffic	e. The range is 1 to 4094.		
	cos cos-value	(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.			
	dscp dscp-value	(Optional) Specifies the differentiated se VLAN. The range is 0 to 63; the default	ervices code point (DSCP) value for the configured lt is 46.		
	dot1p	(Optional) Configures the phone to use 0 (the native VLAN).	e IEEE 802.1p priority tagging and to use VLAN		
	none	(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.			
	untagged	(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.			
Command Default	No network-policy	v profiles for the voice-signaling applicat	tion type are defined.		
	The default CoS value is 5.				
	The default DSCP value is 46.				
	The default tagging mode is untagged.				
Command Modes	Network-policy pr	ofile configuration			
Command History	Release		Modification		
	Cisco IOS Releas	e 15.0(2)EX	This command was introduced.		
Usage Guidelines	Use the network-p profile configuration		nand to create a profile and to enter network-policy		
	The voice-signaling application type is for network topologies that require a different policy for voice signaling than for voice media. This application type should not be advertised if all of the same network policies apply as those advertised in the voice policy TLV.				
	When you are in network-policy profile configuration mode, you can create the profile for voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.				
			,		

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure voice-signaling for VLAN 200 with a priority 2 CoS:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 200 cos 2
```

This example shows how to configure voice-signaling for VLAN 400 with a DSCP value of 45:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 400 dscp 45
```

This example shows how to configure voice-signaling for the native VLAN with priority tagging:

```
Device(config-network-policy)# voice-signaling vlan dot1p cos 4
```

voice vlan (network-policy configuration)

To create a network-policy profile for the voice application type, use the **voice vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

voice vlan {*vlan-id* [{cos *cos-value* | dscp *dscp-value*}] | dot1p [{cos *l2-priority* | dscp *dscp*}] | none | untagged}

Syntax Description	vlan-id	(Optional) The VLAN for voice traffic. The range is 1 to 4094.				
	cos cos-value	(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.				
	dscp dscp-value	dscp <i>dscp-value</i> (Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.				
	dot1p	(Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).				
	none	(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.				
	untagged	(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.				
Command Default	No network-policy profiles for the voice application type are defined.					
	The default CoS value is 5.					
	The default DSCP value is 46.					
	The default tagging mode is untagged.					
Command Modes	Network-policy profile configuration					
Command History	Release	Modification				
	Cisco IOS Releas	This command was introduced.				
Usage Guidelines	Use the network- profile configuration	policy profile global configuration command to create a profile and to enter network-policy ion mode.				
	The voice application type is for dedicated IP telephones and similar devices that support interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security through isolation from data applications.					
	When you are in network-policy profile configuration mode, you can create the profile for voice by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.					
	These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).					

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure the voice application type for VLAN 100 with a priority 4 CoS:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice vlan 100 cos 4
```

This example shows how to configure the voice application type for VLAN 100 with a DSCP value of 34:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice vlan 100 dscp 34
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Device(config-network-policy) # voice vlan dot1p cos 4
```

channel-group

To assign an Ethernet port to an EtherChannel group, or to enable an EtherChannel mode, or both, use the **channel-group** command in interface configuration mode. To remove an Ethernet port from an EtherChannel group, use the **no** form of this command.

channel-group { auto | channel-group-number mode {active | auto [non-silent] | desirable
[non-silent] | on | passive} }
no channel-group

Syntax Description	auto	Enables auto-LAG feature on individual port interface.
		By default, the auto-LAG feature is enabled on the port.
	channel-group-number	Channel group number. The range is 1 to 24.
	mode	Specifies the EtherChannel mode.
	active	Unconditionally enables Link Aggregation Control Protocol (LACP).
	auto	Enables the Port Aggregation Protocol (PAgP) only if a PAgP device is detected.
	non-silent	(Optional) Configures the interface for nonsilent operation when connected to a partner that is PAgP-capable. Use in PAgP mode with the auto or desirable keyword when traffic is expected from the other device.
	desirable	Unconditionally enables PAgP.
	on	Enables the on mode.
	passive	Enables LACP only if a LACP device is detected.
Command Default	No channel groups are assigned.	
	No mode is configured.	

Command Modes Interface configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	The LAN Lite feature set supports up to six EtherCl	hannels.
	The LAN Base feature set supports up to 24 EtherCl EtherChannels are supported.	hannels; however, in mixed stack configurations, only six
	when the channel group gets its first physical port. Yo in global configuration mode to manually create a p interface first, the <i>channel-group-number</i> can be the	nmand automatically creates the port-channel interface ou do not have to use the interface port-channel command port-channel interface. If you create the port-channel e same as the <i>port-channel-number</i> , or you can use a new up command dynamically creates a new port channel.
	Although it is not necessary to disable the IP address group, we strongly recommend that you do so.	s that is assigned to a physical port that is part of a channel
		ce port-channel command followed by the no switchport ure the port-channel logical interface before putting the
	apply to all the physical ports assigned to the port-c physical port affect only the port where you apply the	h changes that you make on the port-channel interface hannel interface. 		which the port initiates negotiations with other ports by nother port group in either the active or passive mode.
		ate in which the port responds to PAgP packets it receives nel is formed only with another port group in desirable default.
	· · ·	ting state in which the port starts negotiations with other s formed with another port group that is in the desirable eration is the default.
	when the device is connected to a device that is not example of a silent partner is a file server or a packet PAgP on a physical port prevents that port from eve	sirable mode, silent is assumed. The silent mode is used PAgP-capable and rarely, if ever, sends packets. An analyzer that is not generating traffic. In this case, running er becoming operational. However, it allows PAgP to use the port for transmission. Both ends of the link cannot
	In on mode, a usable EtherChannel exists only when	n both connected port groups are in the on mode.
	\triangle	
Ca	•	nual configuration, and ports on both ends of the EtherChan is misconfigured, packet loss or spanning-tree loops can occ

Passive mode places a port into a negotiating state in which the port responds to received LACP packets but does not initiate LACP packet negotiation. A channel is formed only with another port group in active mode.

Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same device or on different devices in the stack (but not in a cross-stack configuration). Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

If you set the protocol by using the **channel-protocol** interface configuration command, the setting is not overridden by the **channel-group** interface configuration command.

Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

Do not configure a secure port as part of an EtherChannel or configure an EtherChannel port as a secure port.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

∕!∖

```
Caution
```

Do not enable Layer 3 addresses on the physical EtherChannel ports. Do not assign bridge groups on the physical EtherChannel ports because it creates loops.

This example shows how to configure an EtherChannel on a single device in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the PAgP mode desirable:

```
Device# configure terminal
Device(config)# interface range GigabitEthernet 2/0/1 - 2
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode desirable
Device(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single device in the stack. It assigns two static-access ports in VLAN 10 to channel 5 with the LACP mode active:

```
Device# configure terminal
Device(config)# interface range GigabitEthernet 2/0/1 - 2
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode active
Device(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel in a device stack. It uses LACP passive mode and assigns two ports on stack member 2 and one port on stack member 3 as static-access ports in VLAN 10 to channel 5:

```
Device# configure terminal
Device(config)# interface range GigabitEthernet 2/0/4 - 5
Device(config-if-range)# switchport mode access
Device(config-if-range)# switchport access vlan 10
Device(config-if-range)# channel-group 5 mode passive
Device(config-if-range)# exit
Device(config)# interface GigabitEthernet 3/0/3
Device(config-if)# switchport mode access
Device(config-if)# switchport access vlan 10
Device(config-if)# switchport access vlan 10
Device(config-if)# channel-group 5 mode passive
Device(config-if)# channel-group 5 mode passive
```

You can verify your settings by entering the show running-config privileged EXEC command.

channel-protocol

To restrict the protocol used on a port to manage channeling, use the **channel-protocol** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

channel-protocol {lacp | pagp} no channel-protocol

Syntax Description	lacpConfigures an EtherChannel with the Link Aggregation Control Protocol (LACP).pagpConfigures an EtherChannel with the Port Aggregation Protocol (PAgP).				
Command Default	No protocol is assigned to the EtherChannel.				
Command Modes	Interface configuration				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			
Usage Guidelines	Use the channel-protocol command only to restrict a channel to LACP or PAgP. If you set the protocol by using the channel-protocol command, the setting is not overridden by the channel-group interface configuration command.				
	You must use the channel-group interface configuration command to configure the EtherChannel parameters. The channel-group command also can set the mode for the EtherChannel.				
	You cannot enable both the PAgP and LACP modes on an EtherChannel group.				
	PAgP and LACP are not compatible; both ends of a channel must use the same protocol.				
	You cannot configure PAgP on cross-stack configurations.				
	This example shows how to specify LACP as the protocol that manages the EtherChannel:				
	Device(config-if)# channel-protocol lacp				
	You can verify your settings by entering the show etherchannel [<i>channel-group-number</i>] protocol privileged EXEC command.				
	Related Topics channel-group, on page 121 show etherchannel, on page 160				

clear lacp

To clear Link Aggregation Control Protocol (LACP) channel-group counters, use the **clear lacp** command in privileged EXEC mode.

clear lacp [channel-group-number] counters

Syntax Description	channel-group-number	(Optional) Channel group number. The ran	nge is 1 to 24.		
	counters	Clears traffic counters.			
Command Default	None				
Command Modes	Privileged EXEC				
Command History	Release		Modification		
	Cisco IOS Release 15.0	(2)EX	This command was introduced.		
Usage Guidelines	the specified channel gro	s by using the clear lacp counters commany oup by using the clear lacp <i>channel-group-t</i> w to clear all channel-group information:			
	This example shows how to clear LACP traffic counters for group 4:				
	Device# clear lacp 4 counters				
	5	nformation was deleted by entering the show <i>ber</i> counters privileged EXEC command.	v lacp counters or the show		
	Related Topics show lacp, on page debug lacp, on page				

clear pagp

To clear the Port Aggregation Protocol (PAgP) channel-group information, use the **clear pagp** command in privileged EXEC mode.

clear pagp [channel-group-number] counters

Syntax Description	channel-group-nu	mber (Optional) Channel group number	er. The range is 1 to 24.
	counters	Clears traffic counters.	
Command Default	None		
Command Modes	Privileged EXEC		
Command History	Release		Modification
	Cisco IOS Releas	e 15.0(2)EX	This command was introduced.
Usage Guidelines	for the specified cl		rs command, or you can clear only the counters <i>hannel-group-number</i> counters command.
	Device# clear p a	agp counters	
	This example shows how to clear PAgP traffic counters for group 10:		
	Device# clear pagp 10 counters		
	You can verify tha command.	t the information was deleted by entering	g the show pagp privileged EXEC
	Related Topics show pagp, or debug pagp, o	1 0	

clear spanning-tree counters

To clear the spanning-tree counters, use the **clear spanning-tree counters** command in privileged EXEC mode.

clear spanning-tree counters [interface interface-id]

Syntax Description	interface interface-id	(Optional) Clears all spanning-tree counters on the specified int include physical ports, VLANs, and port channels.
		The VLAN range is 1 to 4094.
		The port-channel range is 1 to 24.
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	If the <i>interface-id</i> value is not specified, spa	anning-tree counters are cleared for all interfaces.
	This example shows how to clear spanning	-tree counters for all interfaces:

Device# clear spanning-tree counters

clear spanning-tree detected-protocols

To restart the protocol migration process and force renegotiation with neighboring devices on the interface, use the **clear spanning-tree detected-protocols** command in privileged EXEC mode.

clear spanning-tree detected-protocols [interface interface-id]

Syntax Description	interface interface-id	(Optional) Restarts the protocol migration process on the specifie channels.
		The VLAN range is 1 to 4094.
		The port-channel range is 1 to 24.
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	Tree Protocol (MSTP) supports a bui IEEE 802.1D devices. If a rapid-PVS bridge protocol data unit (BPDU) wi BPDUs on that port. A multiple spar	N spanning-tree plus (rapid-PVST+) protocol or the Multiple Spanning lt-in protocol migration method that enables it to interoperate with legacy ST+ or an MSTP device receives a legacy IEEE 802.1D configuration ith the protocol version set to 0, the device sends only IEEE 802.1D ning-tree (MST) device can also detect that a port is at the boundary of PDU, an MST BPDU (Version 3) associated with a different region, or (Version 2).
	802.1D BPDUs because it cannot lea	vert to the rapid-PVST+ or the MSTP mode if it no longer receives IEEE arn whether the legacy switch has been removed from the link unless the sh. Use the clear spanning-tree detected-protocols command in this
	This example shows how to restart the	he protocol migration process on a port:
	Device# clear spanning-tree de	tected-protocols interface gigabitethernet2/0/1

Device# debug platform pm vlans

debug spanning-tree

To enable debugging of spanning-tree activities, use the **debug spanning-tree** command in EXEC mode. To disable debugging, use the **no** form of this command.

debug spanning-tree {all | backbonefast | bpdu | bpdu-opt | config | csuf/csrt | etherchannel | events | exceptions | general | mstp | pvst+ | root | snmp | synchronization | switch | uplinkfast} no debug spanning-tree {all | backbonefast | bpdu | bpdu-opt | config | csuf/csrt | etherchannel | events | exceptions | general | mstp | pvst+ | root | snmp | synchronization | switch | uplinkfast}

Syntax Description	all	Displays all spanning-tree debug messages.		
	backbonefast	Displays BackboneFast-event debug messages.		
	bpdu	Displays spanning-tree bridge protocol data unit (BPDU) debug messages.		
	bpdu-opt	Displays optimized BPDU handling debug messages.		
	config	Displays spanning-tree configuration change debug messages.		
	csuf/csrt	Displays cross-stack UplinkFast and cross-stack rapid transition activity debug messages.		
	etherchannel	Displays EtherChannel-support debug messages.		
	events	Displays spanning-tree topology event debug messages.		
	exceptions	Displays spanning-tree exception debug messages.		
	general	Displays general spanning-tree activity debug messages.		
	mstp	Debugs Multiple Spanning Tree Protocol (MSTP) events.		
	pvst+	Displays per-VLAN spanning-tree plus (PVST+) event debug messages.		
	root	Displays spanning-tree root-event debug messages.		
	snmp	Displays spanning-tree Simple Network Management Protocol (SNMP) handling debug messages.		
	switch	Displays device shim command debug messages. This shim is the software module that is the interface between the generic Spanning Tree Protocol (STP) code and the platform-specific code of various device platforms.		
	synchronization	Displays the spanning-tree synchronization event debug messages.		
	uplinkfast	Displays UplinkFast-event debug messages.		

Command Default	Debugging is dis	sabled.	
Command Modes	Privileged EXE	С	
Command History	Release	Modification	-
	Cisco IOS 15.0(2)EX	This command was introduced.	-
Usage Guidelines	The undebug sp	panning-tree command is the same a	is the no debug spanning-tree command.
	on a stack memb	er, start a session from the stack's acti	only on the stack's active switch. To enable debugging ve switch by using the session <i>switch-number</i> command d at the command-line prompt of the stack member.
	Ŭ	gging on a stack member without firs nd <i>switch-number LINE</i> command i	t starting a session on the stack's active switch, use the n privileged EXEC mode.
	This example sh	nows how to display all spanning-tree	e debug messages:
	Device# debug	spanning-tree all	

debug platform udld

To enable debugging of the platform-dependent UniDirectional Link Detection (UDLD) software, use the **debug platform udld** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug platform udld [{all | error | switch | rpc {events | messages}}] no platform udld [{all | error | rpc {events | messages}}]

Syntax Description			
-	all	(Optional) Displays all UDLD debug messages.	
	error	(Optional) Displays error condition debug messages.	
	rpc {events messages	Optional) Displays UDLD remote procedure call (RPC) debug keywords have these meanings:	messages. The

interface port-channel

To access or create a port channel, use the **interface port-channel** command in global configuration mode. Use the **no** form of this command to remove the port channel.

interface port-channel *port-channel-number* **no interface port-channel**

Syntax Description (Optional) Channel group number. The range is 1 to 24. port-channel-number No port channel logical interfaces are defined. **Command Default** Global configuration **Command Modes Command History** Release Modification Cisco IOS Release 15.0(2)EX This command was introduced. For Layer 2 EtherChannels, you do not have to create a port-channel interface before assigning physical ports **Usage Guidelines** to a channel group. Instead, you can use the **channel-group** interface configuration command, which automatically creates the port-channel interface when the channel group obtains its first physical port. If you create the port-channel interface first, the *channel-group-number* can be the same as the *port-channel-number*, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel. You create Layer 3 port channels by using the interface port-channel command followed by the no switchport interface configuration command. You should manually configure the port-channel logical interface before putting the interface into the channel group. Only one port channel in a channel group is allowed. ∕!∖ Caution When using a port-channel interface as a routed port, do not assign Layer 3 addresses on the physical ports that are assigned to the channel group. ∕!∖ Caution Do not assign bridge groups on the physical ports in a channel group used as a Layer 3 port channel interface because it creates loops. You must also disable spanning tree. Follow these guidelines when you use the interface port-channel command: • If you want to use the Cisco Discovery Protocol (CDP), you must configure it on the physical port and not on the port channel interface. • Do not configure a port that is an active member of an EtherChannel as an IEEE 802.1x port. If IEEE

802.1x is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

This example shows how to create a port channel interface with a port channel number of 5:

```
Device(config) # interface port-channel 5
```

You can verify your setting by entering the **show running-config** privileged EXEC or **show etherchannel** *channel-group-number* **detail** privileged EXEC command.

rep block port

To configure Resilient Ethernet Protocol (REP) VLAN load balancing on a REP primary edge port, use the **rep block port** command in interface configuration mode. To return to the default configuration with VLAN 1 as the administrative VLAN, use the **no** form of this command.

rep block port {id *port-id* | *neighbor-offset* | **preferred**} **vlan {***vlan-list* | **all**} **no rep block port {id** *port-id* | *neighbor-offset* | **preferred**}

Syntax Description	id port-id	Specifies the VLAN blocking alternate port by entering the unique port ID, which is automatically generated when REP is enabled. The REP port ID is a 16-character hexadecimal value.
	neighbor-offset	VLAN blocking alternate port by entering the offset number of a neighbor. The range is from -256 to +256. A value of 0 is invalid.
	preferred	Selects the regular segment port previously identified as the preferred alternate port for VLAN load balancing.
	vlan	Identifies the VLANs to be blocked.
	vlan-list	VLAN ID or range of VLAN IDs to be displayed. Enter a VLAN ID from 1 to 4094, or a range or sequence of VLANs (such as 1-3, 22, and 41-44) to be blocked.
	all	Blocks all the VLANs.
Command Default		navior after you enter the rep preempt segment command in privileged EXEC (for manual to block all the VLANs at the primary edge port. This behavior remains until you configure port command.
		edge port cannot determine which port is to be the alternate port, the default action is no I no VLAN load balancing.
Command Modes	Interface config	guration (config-if)
Command History	Release	Modification
	Cisco IOS Rel	ease 15.2(6)E1 This command was introduced.
Usage Guidelines	port of an edge downstream ne	t an alternate port by entering an offset number, this number identifies the downstream neighbor port. The primary edge port has an offset number of 1; positive numbers above 1 identify ighbors of the primary edge port. Negative numbers identify the secondary edge port (offset its downstream neighbors.
-	Note Do not ent	ter an offset value of 1 because that is the offset number of the primary edge port itself.
	If you have cont	figured a preempt delay time by entering the rep preempt delay seconds command in interface

If you have configured a preempt delay time by entering the **rep preempt delay seconds** command in interface configuration mode and a link failure and recovery occurs, VLAN load balancing begins after the configured

preemption time period elapses without another link failure. The alternate port specified in the load-balancing
configuration blocks the configured VLANs and unblocks all the other segment ports. If the primary edge
port cannot determine the alternate port for VLAN balancing, the default action is no preemption.Each port in a segment has a unique port ID. To determine the port ID of a port, enter the show interfaces
interface-id rep detail command in privileged EXEC mode.ExamplesThe following example shows how to configure REP VLAN load balancing:
Device (config) # interface TenGigabitEthernet 4/1
Device (config-if) # rep block port id 0009001818D68700 vlan 1-100

Related Commands	Command	Description
	show interfaces rep detail	Displays detailed REP configuration and status for all the interfaces or the specified interface, including the administrative VLAN.

rep lsl-age-timer

To configure the Resilient Ethernet Protocol (REP) link status layer (LSL) age-out timer value, use the **rep lsl-age-timer** command in interface configuration mode. To restore the default age-out timer value, use the **no** form of this command.

rep lsl-age-timer milliseconds no rep lsl-age-timer milliseconds

t LSL age-out timer value is 5 ms.	
onfiguration (config-if)	
	Modification
S Release 15.2(6)E1	This command was introduced.
	S Release 15.2(6)E1

Usage Guidelines While configuring REP configurable timers, we recommend that you configure the REP LSL number of retries first and then configure the REP LSL age-out timer value.

Examples The following example shows how to configure a REP LSL age-out timer value:

Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 1 edge primary
Device(config-if)# rep lsl-age-timer 2000

Related Commands	Command	Description
	interface interface-type interface-name	Specifies a physical interface or port channel to receive STCNs.
	rep segment	Enables REP on an interface and assigns a segment ID.

rep preempt delay

To configure a waiting period after a segment port failure and recovery before Resilient Ethernet Protocol (REP) VLAN load balancing is triggered, use the **rep preempt delay** command in interface configuration mode. To remove the configured delay, use the **no** form of this command.

rep preempt delay seconds no rep preempt delay

Syntax Description		onds to delay REP preemption. The range is from 15 to 300 seconds. The default is tion without delay.
Command Default	REP preemption delay is	not set. The default is manual preemption without delay.
Command Modes	Interface configuration (config-if)
Command History	Release	Modification
	Cisco IOS Release 15.2	(6)E1 This command was introduced.
Usage Guidelines	Enter this command on the	he REP primary edge port.
	Enter this command and c after a link failure and re	configure a preempt time delay for VLAN load balancing to be automatically triggered covery.
	starts a delay timer befor When the timer expires, t (configured by using the	is configured after a segment port failure and recovery, the REP primary edge port e VLAN load balancing occurs. Note that the timer restarts after each link failure. the REP primary edge port alerts the alternate port to perform VLAN load balancing rep block port interface configuration command) and prepares the segment for the gured VLAN list is blocked at the alternate port, and all other VLANs are blocked
	You can verify your setti	ngs by entering the show interfaces rep command.
Examples	The following example s primary edge port:	hows how to configure a REP preemption time delay of 100 seconds on the
	Device(config)# inter Device(config-if)# re	face TenGigabitEthernet 4/1 ep preempt delay 100
Related Commands	Command	Description
	rep block port	Configures VLAN load balancing.
	show interfaces rep detail	Displays detailed REP configuration and status for all the interfaces or the specified interface, including the administrative VLAN.

rep preempt segment

To manually start Resilient Ethernet Protocol (REP) VLAN load balancing on a segment, use the **rep preempt** segment command in privileged EXEC mode.

rep preempt segment segment-id

Syntax Description	segment-id ID of the REP segment. The range	is from 1 to 1024.
Command Default	Manual preemption is the default behavior.	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS Release 15.2(6)E1	This command was introduced.
Usage Guidelines	Enter this command on the segment, which has	the primary edge port on the device.
-	balancing. When you enter the rep preempt seg	are completed before setting preemption for VLAN load ment <i>segment-id</i> command, a confirmation message appears aption for VLAN load balancing can disrupt the network.
		<i>nds</i> command in interface configuration mode on the primary the default configuration is to manually trigger VLAN load
	Enter the show rep topology command in privi primary edge port.	leged EXEC mode to see which port in the segment is the
	If you do not configure VLAN load balancing, results in the default behavior, that is, the prima	entering the rep preempt segment segment-id command ary edge port blocks all the VLANs.
	You can configure VLAN load balancing by ent mode on the REP primary edge port before you	tering the rep block port command in interface configuration manually start preemption.
Examples	The following example shows how to manually	r trigger REP preemption on segment 100:

Device# rep preempt segment 100

Related Commands	Command	Description
	rep block port	Configures VLAN load balancing.
	rep preempt delay	Configures a waiting period after a segment port failure and recovery before REP VLAN load balancing is triggered.
	show rep topology	Displays REP topology information for a segment or for all the segments.

rep segment

To enable Resilient Ethernet Protocol (REP) on an interface and to assign a segment ID to the interface, use the **rep segment** command in interface configuration mode. To disable REP on the interface, use the **no** form of this command.

rep segment segment-id [edge [no-neighbor] [primary]] [preferred]
no rep segment

Syntax Description	segment-id	Segment for which REP is enabled. Assign a segment ID to the interface. The range is from 1 to 1024.		
	edge	(Optional) Configures the port as an edge port. Each segment has only two edge ports.		
	no-neighbor	(Optional) Specifies th	e segment edge as one with no external REP neighbor.	
	primary	(Optional) Specifies that the port is the primary edge port where you can configure VLAN load balancing. A segment has only one primary edge port.		
	preferred (Optional) Specifies that the port is the preferred alternate port or the preferred load balancing.		at the port is the preferred alternate port or the preferred port for VLAN	
		alternate p	ng a port as a preferred port does not guarantee that it becomes the port; it merely gives it a slight edge among equal contenders. The port is usually a previously failed port.	
Command Default	REP is disabl	ed on the interface.		
Command Modes	Interface con	figuration (config-if)		
Command History	Release		Modification	
	Cisco IOS R	elease 15.2(6)E1	This command was introduced.	
Jsage Guidelines			02.1Q port or a 802.1AD port. You must configure two edge ports on ort and a secondary edge port.	
		bled on two ports on a d low these rules:	evice, both the ports must be either regular segment ports or edge ports.	
	• If only o	ne port on a device is co	onfigured in a segment, that port should be an edge port.	
	• If two po	orts on a device belong t	to the same segment, both the ports must be regular segment ports.	
			to the same segment, and one is configured as an edge port and one as a iguration), the edge port is treated as a regular segment port.	
Ca		erfaces come up in a bloc e of this to avoid sudder	cked state and remain in a blocked state until notified that it is safe to unb	

When REP is enabled on an interface, the default is for that port to be a regular segment port.

Examples

The following example shows how to enable REP on a regular (nonedge) segment port:

```
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100
```

The following example shows how to enable REP on a port and identify the port as the REP primary edge port:

```
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100 edge primary
```

The following example shows how to enable REP on a port and identify the port as the REP secondary edge port:

```
Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 100 edge
```

The following example shows how to enable REP as an edge no-neighbor port:

Device(config)# interface TenGigabitEthernet 4/1
Device(config-if)# rep segment 1 edge no-neighbor primary

rep stcn

	rep admin vlan	Configures a REP administrative VLAN for the REP	to transmit HFL messages.			

show lacp

To display Link Aggregation Control Protocol (LACP) channel-group information, use the **show lacp** command in user EXEC mode.

show lacp [channel-group-number] {counters | internal | neighbor | sys-id}

Syntax Description	channel-group-	<i>channel-group-number</i> (Optional) Channel group number. The range is 1 to 24.							
	counters	counters Displays traffic information.							
	internal	internal Displays internal information.							
	neighbor	neighbor Displays neighbor information.							
	sys-id	sys-idDisplays the system identifier that is being used by LACP. The system identifie consists of the LACP system priority and the device MAC address.							
Command Default	None								
Command Modes	User EXEC								
Command History	Release						Modification		
	Cisco IOS Rele	ase 15.0((2)EX				This command was introduced.		
Usage Guidelines	You can enter any show lacp command to display the active channel-group information. To display specific channel information, enter the show lacp command with a channel-group number.								
	If you do not spe	ecify a ch	nannel group	, inform	ation for a	ll channel g	groups appears.		
	You can enter th	e channe	el-group-num	<i>ber</i> to sj	pecify a cl	nannel grou	p for all keywords except sys-id .		
	This is an examp follows describe		-		cp count	ers user EX	EC command. The table that		
					Manhan	Deener			
	Device> show]	-	Mai	rker	Marker	Response	LACPDUS		
		LACPDUs ent Rec		rker Recv		Response Recv	LACPDUS Pkts Err		
		LACPDUs ent Rec				-			
	Port Se Channel group: Gi2/0/1 1	LACPDUs ent Rec 	v Sent			-			

Table 10: show lacp counters Field Descriptions

Field	Description
LACPDUs Sent and Recv	The number of LACP packets sent and received by a port.

Field	Description
Marker Sent and Recv	The number of LACP marker packets sent and received by a port.
Marker Response Sent and Recv	The number of LACP marker response packets sent and received by a port.
LACPDUs Pkts and Err	The number of unknown and illegal packets received by LACP for a port.

This is an example of output from the show lacp internal command:

```
Device> show lacp 1 internal

Flags: S - Device is requesting Slow LACPDUS

F - Device is requesting Fast LACPDUS

A - Device is in Active mode P - Device is in Passive mode

Channel group 1

LACP port Admin Oper Port Port

Port Flags State Priority Key Key Number State

Gi2/0/1 SA bndl 32768 0x3 0x3 0x4 0x3D

Gi2/0/2 SA bndl 32768 0x3 0x3 0x5 0x3D
```

The following table describes the fields in the display:

Table 11: show lacp internal Field Descriptions

Field	Description
State	State of the specific port. These are the allowed values:
	• – —Port is in an unknown state.
	• bndl —Port is attached to an aggregator and bundled with other ports.
	• susp —Port is in a suspended state; it is not attached to any aggregator.
	• hot-sby —Port is in a hot-standby state.
	• indiv —Port is incapable of bundling with any other port.
	• indep —Port is in an independent state (not bundled but able to handle data traffic. In this case, LACP is not running on the partner port).
	• down—Port is down.
LACP Port Priority	Port priority setting. LACP uses the port priority to put ports in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Field	Description
Admin Key	Administrative key assigned to this port. LACP automatically generates an administrative key value as a hexadecimal number. The administrative key defines the ability of a port to aggregate with other ports. A port's ability to aggregate with other ports is determined by the port physical characteristics (for example, data rate and duplex capability) and configuration restrictions that you establish.
Oper Key	Runtime operational key that is being used by this port. LACP automatically generates this value as a hexadecimal number.
Port Number	Port number.
Port State	State variables for the port, encoded as individual bits within a single octet with these meanings:
	• bit0: LACP_Activity
	• bit1: LACP_Timeout
	bit2: Aggregation
	bit3: Synchronization
	• bit4: Collecting
	• bit5: Distributing
	• bit6: Defaulted
	• bit7: Expired
	Note In the list above, bit7 is the MSB and bit0 is the LSB.

This is an example of output from the show lacp neighbor command:

Device> show lacp neighbor Flags: S - Device is sending Slow LACPDUS F - Device is sending Fast LACPDUS A - Device is in Active mode P - Device is in Passive mode Channel group 3 neighbors Partner's information: Partner Partner Partner Partner Port System ID Port Number Age Flags Gi2/0/1 32768,0007.eb49.5e80 0xC 19s SP LACP Partner Partner Partner Port Priority Oper Key Port State 32768 0x3 0x3C

Partner's information:

	Partner	Partner		Partner
Port Gi2/0/2	System ID 32768,0007.eb49.5e80	Port Number 0xD	Age 15s	Flags SP
	LACP Partner Port Priority 32768	Partner Oper Key Ox3	Partner Port Sta 0x3C	ate

This is an example of output from the **show lacp sys-id** command:

Device> **show lacp sys-id** 32765,0002.4b29.3a00

The system identification is made up of the system priority and the system MAC address. The first two bytes are the system priority, and the last six bytes are the globally administered individual MAC address associated to the system.

show link state group

To display link-state group information, use the show link state group command in privileged EXEC mode.

	show link state group [{number}][{detail}]				
Syntax Description	<i>number</i> (Optional) Specifies the number of the link-state group number. The range is 1 to 2.				
	detail (Optional) Displays detailed information about the link-state group.				
Command Default	None				
Command Modes	Privileged EXEC				
Command History	Release Modification				
	Cisco IOS This command was introduced. 15.0(2)EX				
Usage Guidelines	This command is supported only on the LAN Base image.				
	To display information about all link-state groups, enter this command without keywords. To display information about a specific link-state group enter the link-state group number.				
	The output for the show link state group detail displays information for only those link-state groups that have link-state tracking enabled or that have upstream or downstream interfaces configured. If the group does not have a configuration, the group is not shown as enabled or disabled.				
	This example shows the output from the show link state group number command:				
	Device# show link state group 1				
	Link State Group: 1 Status: Enabled. Down				
	This example shows the output from the show link state group detail command:

show udld

To display UniDirectional Link Detection (UDLD) administrative and operational status for all ports or the specified port, use the **show udld** command in user EXEC mode.

show udld [{interface_id | neighbors}]

Syntax Description	<i>interface-id</i> (Optional) ID of the interface and port number. Valid interfaces include physical ports, VLANs.				
		and port channels.			
	neighbors	(Optional) Displays neighbor infor	rmation only.		
Command Default	None				
Command Modes	User EXEC				
Command History	Release		Modification		
	Cisco IOS R	elease 15.0(2)EX	This command was introduced.		
Usage Guidelines	This is an exa is enabled on	ample of output from the show udld	e and operational UDLD status for all interfaces appear. I <i>interface-id</i> command. For this display, UDLD etects that the link is bidirectional. The table that		
	Device> show udld gigabitethernet2/0/1 Interface gi2/0/1 				
	Port enable administrative configuration setting: Follows device default Port enable operational state: Enabled Current bidirectional state: Bidirectional Current operational state: Advertisement - Single Neighbor detected Message interval: 60 Time out interval: 5 Entry 1 Expiration time: 146 Device ID: 1 Current neighbor state: Bidirectional Device name: Switch-A Port ID: Gi2/0/1				
	Expiration Device ID: 2 Current neid Device name	1 ghbor state: Bidirectional : Switch-A			

Table 12: show udld Field Descriptions

Field	Description
Interface	The interface on the local device configured for UDLD.

I

Field	Description
Port enable administrative configuration setting	How UDLD is configured on the port. If UDLD is enabled or disabled, the port enable configuration setting is the same as the operational enable state. Otherwise, the enable operational setting depends on the global enable setting.
Port enable operational state	Operational state that shows whether UDLD is actually running on this port.
Current bidirectional state	The bidirectional state of the link. An unknown state appears if the link is down or if it is connected to an UDLD-incapable device. A bidirectional state appears if the link is a normal two-way connection to a UDLD-capable device. All other values mean miswiring.
Current operational state	The current phase of the UDLD state machine. For a normal bidirectional link, the state machine is most often in the Advertisement phase.
Message interval	How often advertisement messages are sent from the local device. Measured in seconds.
Time out interval	The time period, in seconds, that UDLD waits for echoes from a neighbor device during the detection window.
Entry 1	Information from the first cache entry, which contains a copy of echo information received from the neighbor.
Expiration time	The amount of time in seconds remaining before this cache entry is aged out.
Device ID	The neighbor device identification.
Current neighbor state	The neighbor's current state. If both the local and neighbor devices are running UDLD normally, the neighbor state and local state should be bidirectional. If the link is down or the neighbor is not UDLD-capable, no cache entries appear.
Device name	The device name or the system serial number of the neighbor. The system serial number appears if the device name is not set or is set to the default (Switch).
Port ID	The neighbor port ID enabled for UDLD.
Neighbor echo 1 device	The device name of the neighbors' neighbor from which the echo originated.

Field	Description
Neighbor echo 1 port	The port number ID of the neighbor from which the echo originated.
Message interval	The rate, in seconds, at which the neighbor is sending advertisement messages.
CDP device name	The CDP device name or the system serial number. The system serial number appears if the device name is not set or is set to the default (Switch).

This is an example of output from the **show udld neighbors** command:

Device# show udld neighbors

Port	Device Name	Device ID	Port-ID	OperState
Gi2/0/1	Switch-A	1	Gi2/0/1	Bidirectional
Gi3/0/1	Switch-A	2	Gi3/0/1	Bidirectional

spanning-tree backbonefast

To enable BackboneFast to allow a blocked port on a device to change immediately to a listening mode, use the **spanning-tree backbonefast** command in global configuration mode. To return to the default setting, use the **no** form of this command.

spanning-tree backbonefast no spanning-tree backbonefast

Syntax Description This command has no arguments or keywords.

Command Default BackboneFast is disabled.

Command Modes Global configuration

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines Enable BackboneFast so that the device detects indirect link failures and starts the spanning-tree reconfiguration sooner than it would under normal spanning-tree rules.

You can configure BackboneFast for rapid PVST+ or for multiple spanning-tree (MST) mode; however, the feature remains disabled until you change the spanning-tree mode to PVST+.

Use the show spanning-tree privileged EXEC command to verify your settings.

Examples The following example shows how to enable BackboneFast on the device:

Device(config) # spanning-tree backbonefast

Related Topics

show spanning-tree, on page 177

spanning-tree bpdufilter

To enable bridge protocol data unit (BPDU) filtering on the interface, use the **spanning-tree bpdufilter** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree bpdufilter {enable | disable}
no spanning-tree bpdufilter

Syntax DescriptionenableEnables BPDU filtering on this interface.disableDisables BPDU filtering on this interface.

Command Default The setting that is already configured when you enter the **spanning-tree portfast bpdufilter default** command.

Command Modes Interface configuration

۵

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines

This command has three states:

• spanning-tree bpdufilter enable --- Unconditionally enables BPDU filtering on the interface.

- spanning-tree bpdufilter disable —Unconditionally disables BPDU filtering on the interface.
- **no spanning-tree bpdufilter** —Enables BPDU filtering on the interface if the interface is in the operational PortFast state and if you configure the **spanning-tree portfast bpdufilter default** command.

	<u> </u>	
	Caution	Be careful when you enter the spanning-tree bpdufilter enable command. Enabling BPDU filtering on an interface is similar to disabling the spanning tree for this interface. If you do not use this command correctly, you might create bridging loops.
		a can enable BPDU filtering when the device is operating in the per-VLAN spanning-tree plus (PVST+) de, the rapid-PVST mode, or the multiple spanning-tree (MST) mode.
		a can globally enable BPDU filtering on all Port Fast-enabled interfaces with the spanning-tree portfast dufilter default command.
	The	e spanning-tree bpdufilter enable command overrides the PortFast configuration.
Examples	Thi	s example shows how to enable BPDU filtering on this interface:
		rice(config-if)# spanning-tree bpdufilter enable rice(config-if)#

Related Topics

spanning-tree bpduguard

To enable bridge protocol data unit (BPDU) guard on the interface, use the **spanning-tree bpduguard** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree bpduguard {enable | disable}
no spanning-tree bpduguard

Syntax DescriptionenableEnables BPDU guard on this interface.disableDisables BPDU guard on this interface.

Command Default The setting that is already configured when you enter the **spanning-tree portfast bpduguard default** command.

Command Modes Interface configuration

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines Use the BPDU guard feature in a service-provider environment to prevent an access port from participating in the spanning tree. If the port still receives a BPDU, it is put in the error-disabled state as a protective measure. This command has three states:

- spanning-tree bpduguard enable —Unconditionally enables BPDU guard on the interface.
- spanning-tree bpduguard disable Unconditionally disables BPDU guard on the interface.
- **no spanning-tree bpduguard**—Enables BPDU guard on the interface if the interface is in the operational PortFast state and if you configure the **spanning-tree portfast bpduguard default** command.

Examples This example shows how to enable BPDU guard on an interface:

Device(config-if)# spanning-tree bpduguard enable
Device(config-if)#

Related Topics

spanning-tree portfast edge (interface configuration), on page 218

spanning-tree bridge assurance

To enable Bridge Assurance on your network, use the **spanning-tree bridge assurance** command. To disable the feature, use the **no** form of the command.

spanning-tree bridge assurance no spanning-tree bridge assurance

This command has no arguments or keywords. **Syntax Description** Bridge Assurance is enabled **Command Default** Global configuration mode **Command Modes Command History** Modification Release 3.8.0E and 15.2.(4)E Support for the command was introduced. This feature protects your network from bridging loops. It monitors the receipt of BPDUs on point-to-point **Usage Guidelines** links on all network ports. When a port does not receive BPDUs within the allotted hello time period, the port is put into a blocked state (the same as a port inconsistent state, which stops forwarding of frames). When the port resumes receipt of BPDUs, the port resumes normal spanning tree operations. By default, Bridge Assurance is enabled on all operational network ports, including alternate and backup ports. If you have configured the **spanning-tree portfast network** command on all the required ports that are connected Layer 2 switches or bridges, Bridge Assurance is automatically effective on all those network ports. Only Rapid PVST+ and MST spanning tree protocols support Bridge Assurance. PVST+ does not support Bridge Assurance.

For Bridge Assurance to work properly, it must be supported and configured on both ends of a point-to-point link. If the device on one side of the link has Bridge Assurance enabled and the device on the other side does not, then the connecting port is blocked (a Bridge Assurance inconsistent state). We recommend that you enable Bridge Assurance throughout your network.

To enable Bridge Assurance on a port, BPDU filtering and BPDU Guard must be disabled.

You can enable Bridge Assurance in conjunction with Loop Guard.

You can enable Bridge Assurance in conjunction with Root Guard. The latter is designed to provide a way to enforce the root bridge placement in the network.

Disabling Bridge Assurance causes all configured network ports to behave as normal spanning tree ports.

Use the show spanning-tree summary command to see if the feature is enabled on a port.

Example

The following example shows how to enable Bridge Assurance on all network ports on the switch, and how to configure a network port:

Device(config) # spanning-tree bridge assurance

Device(config)# interface gigabitethernet 5/8
Device(config-if)# spanning-tree portfast network
Device(config-if)# exit

This example show how to display spanning tree information and verify if Bridge Assurance is enabled. Look for these details in the output:

- Portfast Default—Network
- Bridge Assurance—Enabled

```
Device# show spanning-tree summary
Switch is in rapid-pvst mode

spanning-tree cost

To set the path cost of the interface for Spanning Tree Protocol (STP) calculations, use the **spanning-tree cost** command in interface configuration mode. To revert to the default value, use the **no** form of this command.

spanning-tree [vlan vlan-id] cost cost
no spanning-tree cost

Syntax Description	vlan <i>vlan-id</i> (Optional) Specifies the VLAN range associated with the spanning-tree instance. The range of VLAN IDs is 1 to 4094.			
	cost	<i>cost</i> The path cost; valid values are from 1 to 200000000.		
Command Default	The default path cost is computed from the bandwidth setting of the interface. Default path costs are:			
	• 1 Gb/s: 4			
	• 100 Mb/s: 19			
	• 10 Mb/s: 100			
Command Modes	- Interface config	guration		
Command History	Release	Modification		
	Cisco IOS Rel 15.0(2)EX	ease This command was introduced.		
Usage Guidelines	• •	ify VLANs associated with a spanning tree instance, you can specify a single VLAN identified number, a range of VLANs separated by a hyphen, or a series of VLAN IDs separated by a		
	When you specify a value for the cost argument, higher values indicate higher costs. This range applies regardless of the protocol type specified.			
Examples	This example shows how to set the path cost on an interface to a value of 250:			
	Device(config)# interface gigabitethernet2/0/1 Device(config-if)# spanning-tree cost 250			
	This example shows how to set the path cost to 300 for VLANS 10, 12 to 15, and 20:			
	Device(config	g-if)# spanning-tree vlan 10,12-15,20 cost 300		
		tree port-priority, on page 215		

spanning-tree vlan, on page 223

spanning-tree etherchannel guard misconfig

To display an error message when the device detects an EtherChannel misconfiguration, use the **spanning-tree** etherchannel guard misconfig command in global configuration mode. To disable the error message, use the no form of this command. spanning-tree etherchannel guard misconfig no spanning-tree etherchannel guard misconfig This command has no arguments or keywords. **Syntax Description** Error messages are displayed. **Command Default** Global configuration **Command Modes Command History Command History** Release Modification Cisco IOS Release This command was introduced. 15.0(2)EX When the device detects an EtherChannel misconfiguration, this error message is displayed: **Usage Guidelines** PM-4-ERR DISABLE: Channel-misconfig error detected on [chars], putting [chars] in err-disable state. To determine which local ports are involved in the misconfiguration, enter the show interfaces status err-disabled command. To check the EtherChannel configuration on the remote device, enter the show etherchannel summary command on the remote device. After you correct the configuration, enter the shutdown and the no shutdown commands on the associated port-channel interface. Examples This example shows how to enable the EtherChannel-guard misconfiguration: Device (config) # spanning-tree etherchannel guard misconfig

Related Topics

show etherchannel, on page 160

spanning-tree extend system-id

To enable extended system identification, use the **spanning-tree extend system-id** command in global configuration mode. To disable extended system identification, use the **no** form of this command.

spanning-tree extend system-id no spanning-tree extend system-id

Syntax Description This command has no arguments or keywords.

Command Default The extended system ID is enabled.

Command Modes Global configuration

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines

idelines The spanning tree uses the extended system ID, the device priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN or multiple spanning-tree instance. Because a switch stack appears as a single switch to the rest of the network, all switches in the stack use the same bridge ID for a given spanning tree. If the stack's active switch fails, the stack members recalculate their bridge IDs of all running spanning trees based on the new MAC address of the stack's active switch.

Support for the extended system ID affects how you manually configure the root switch, the secondary root switch, and the switch priority of a VLAN.

If your network consists of switches that do not support the extended system ID and switches that do support it, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches.

Examples This example shows how to enable the extended-system ID:

Device(config) # spanning-tree extend system-id

spanning-tree guard

To enable or disable root-guard mode or loop-guard mode on the VLANs associated with an interface, use the **spanning-tree guard** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree guard {loop | root | none}
no spanning-tree guard

Syntax Description	loop Enables the loop-guard mode on the interface.			
	root Enables root-guard mode on the interface.			
	none Sets the guard mode to none.			
Command Default	Root-guard mode is disabled.			
	Loop-guard mode is configured according to the spanning-tree loopguard default command in global configuration mode.			
Command Modes	Interface configuration			
Command History	Release Modification			
	Cisco IOS Release This command was introduced. 15.0(2)EX			
Usage Guidelines	You can enable root guard or loop guard when the device is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode.			
	You cannot enable both root guard and loop guard at the same time.			
	Use the spanning-tree guard loop command to override the setting of the spanning-tree loop guard default setting.			
	When root guard is enabled, if spanning-tree calculations cause an interface to be selected as the root port, the interface transitions to the root-inconsistent (blocked) state to prevent the device from becoming the root switch or from being in the path to the root. The root port provides the best path from the switch to the root switch.			
	When the no spanning-tree guard or the no spanning-tree guard none command is entered, root guard is disabled for all VLANs on the selected interface. If this interface is in the root-inconsistent (blocked) state, it automatically transitions to the listening state.			
	Do not enable root guard on interfaces that will be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and are prevented from reaching the forwarding state. The UplinkFast feature is not available when the device is operating in the rapid-PVST+ or MST mode.			

Examples

This example shows how to enable root guard on all the VLANs associated with the specified interface:

Device(config)# interface gigabitethernet1/0/1
Device(config-if)# spanning-tree guard root

Related Topics

spanning-tree loopguard default, on page 197

spanning-tree link-type

To configure a link type for a port, use the **spanning-tree link-type** command in the interface configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree link-type {point-to-point | shared}
no spanning-tree link-type

Syntax Description	point-to-point	Specifies that the interface is a point-to-point link.	
	shared	Specifies that the interface is a shared medium.	
Command Default	Link type is automatically derived from the duplex setting unless you explicitly configure the link type.		
Command Modes	Interface configu	ration	
Command History	Release	Modification	
	Cisco IOS Relea 15.0(2)EX	This command was introduced.	
Usage Guidelines	Rapid Spanning bridges.	Tree Protocol Plus (RSTP+) fast transition works only on point-to-point links between two	
	By default, the device derives the link type of a port from the duplex mode. A full-duplex port is considered as a point-to-point link while a half-duplex configuration is assumed to be on a shared link.		
	If you designate a port as a shared link, RSTP+ fast transition is forbidden, regardless of the duplex setting.		
Examples	This example shows how to configure the port as a shared link:		
	<pre>Device(config-if)# spanning-tree link-type shared</pre>		
	Related Topics show spann	ing-tree, on page 177	

Examples

spanning-tree loopguard default

To enable loop guard as a default on all ports of a given bridge, use the **spanning-tree loopguard default** command in global configuration mode. To disable loop guard, use the **no** form of this command.

spanning-tree loopguard default no spanning-tree loopguard default

Syntax Description This command has no arguments or keywords.

Command Default Loop guard is disabled.

Command Modes Global configuration

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines Loop guard provides additional security in the bridge network. Loop guard prevents alternate or root ports from becoming the designated port due to a failure that could lead to a unidirectional link.

Loop guard operates only on ports that are considered point-to-point by the spanning tree.

The individual loop-guard port configuration overrides this command.

This example shows how to enable loop guard:

Device(config) # spanning-tree loopguard default

Related Topics

spanning-tree guard, on page 194

spanning-tree mode

To switch between per-VLAN Spanning Tree+ (PVST+), Rapid-PVST+, and Multiple Spanning Tree (MST) modes, use the **spanning-tree mode** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mode {pvst | mst | rapid-pvst}
no spanning-tree mode

Syntax Description	pvst Enables	t Enables PVST+ mode.		
	mst Enables	MST mode.		
	rapid-pvst Enables	Rapid-PVST+ mode.		
Command Default	The default mode is PV	/ST+.		
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command	was introduced.	
Usage Guidelines	Only one mode can be All stack members run		e mode.	
Cat	MST modes. Whe	n you enter the comm	and, all spanning	nd to switch between PVST+, Rapid-PVST+, and g-tree instances are stopped for the previous mode may cause disruption of user traffic.
Examples	This example shows how to enable MST mode:			
	Device(config) # spanning-tree mode mst			
	This example shows how to return to the default mode (PVST+):			
	Device(config)# no spanning-tree mode			
	Related Topics			

show spanning-tree, on page 177

spanning-tree mst configuration

To enter MST-configuration mode, use the **spanning-tree mst configuration** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst configuration no spanning-tree mst configuration

Syntax Description This command has no arguments or keywords.

Command Default The default value for the Multiple Spanning Tree (MST) configuration is the default value for all its parameters:

- No VLANs are mapped to any MST instance (all VLANs are mapped to the Common and Internal Spanning Tree [CIST] instance).
- The region name is an empty string.
- The revision number is 0.

Command Modes Global configuration

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines

You can use these commands for MST configuration:

- abort Exits the MST region configuration mode without applying configuration changes.
- exit Exits the MST region configuration mode and applies all configuration changes.
- instance *instance_id* vlan *vlan_id* Maps VLANs to an MST instance. The range for instance IDs is 1 to 4094. The range for VLANs is 1 to 4094. You can specify a single VLAN identified by a VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma.
- **name** *name* Sets the configuration name. The *name* string is case sensitive and can be up to 32 characters long.
- no Negates the instance, name and revision commands or sets them to their defaults.
- revision version Sets the configuration revision number. The range is 0 to 65535.
- show [current | pending Displays the current or pending MST region configuration.

In MST mode, a switch stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.

For two or more switches to be in the same MST region, they must have the same VLAN mapping, the same configuration name, and the same configuration revision number.

When you map VLANs to an MST instance, the mapping is incremental, and VLANs specified in the command are added to or removed from the VLANs that were previously mapped. To specify a range, use a hyphen; for example, **instance 1 vlan 1-63** maps VLANs 1 to 63 to MST instance 1. To specify a series, use a comma; for example, **instance 1 vlan 10, 20, 30** maps VLANs 10, 20, and 30 to MST instance 1.

All VLANs that are not explicitly mapped to an MST instance are mapped to the common and internal spanning tree (CIST) instance (instance 0) and cannot be unmapped from the CIST by using the **no** form of this command.

Changing an MST-configuration mode parameter can cause connectivity loss. To reduce service disruptions, when you enter MST-configuration mode, make changes to a copy of the current MST configuration. When you have finished editing the configuration, you can apply all the changes at once by using the **exit** keyword, or you can exit the mode without committing any change to the configuration by using the **abort** keyword.

Examples

This example shows how to enter MST-configuration mode, map VLANs 10 to 20 to MST instance 1, name the region region1, set the configuration revision to 1 and display the pending configuration:

```
Device(config) # spanning-tree mst configuration
Device (config-mst) # instance 1 vlan 10-20
Device(config-mst) # name region1
Device(config-mst) # revision 1
Device(config-mst) # show pending
Pending MST configuration
Name
      [region1]
Revision 1
        Vlans Mapped
Instance
_____
         _____
0
         1-9,21-4094
        10-20
1
_____
```

This example shows how to reset the MST configuration to the default settings:

Device(config) # no spanning-tree mst configuration

spanning-tree mst max-age

To set the interval between messages that the spanning tree receives from the root switch, use the **spanning-tree mst max-age** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst max-age seconds no spanning-tree mst max-age

Syntax Description *seconds* Interval, in seconds, between messages the spanning tree receives from the root switch. The range is 6 to 40.

Command Default The default is 20.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Examples

This example shows how to set the max-age timer to 40 seconds:

Device(config) # spanning-tree mst max-age 40

Related Topics

show spanning-tree, on page 177 spanning-tree mst forward-time, on page 202 spanning-tree mst hello-time, on page 203 spanning-tree mst max-hops, on page 205

spanning-tree mst max-hops

To specify the number of possible hops in the region before a bridge protocol data unit (BPDU) is discarded, use the **spanning-tree mst max-hops** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst max-hops hop-count no spanning-tree mst max-hops

Syntax Description *hop-count* Number of possible hops in the region before a BPDU is discarded. The range is 1 to 255.

Command Default The default is 20.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Examples

This example shows how to set the number of possible hops to 25:

Device(config) # spanning-tree mst max-hops 25

spanning-tree mst port-priority

To set the priority for an interface, use the **spanning-tree mst port-priority** command in interface configuration mode. To revert to the default value, use the **no** form of this command.

spanning-tree mst instance-id port-priority priority
no spanning-tree mst instance-id port-priority

Syntax Description	instance-id Range of sp	1 to 4094.		
	<i>priority</i> Priority. Th	<i>priority</i> Priority. The range is 0 to 240 in increments of 16.		
Command Default	The default is 128.	The default is 128.		
Command Modes	Interface configuration	Interface configuration		
Command History	Release Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	lower priority values (hig	her numerical values) that you want e spanning tree (MST) puts the inter	s) to interfaces that you want selected first and selected last. If all interfaces have the same rface with the lowest interface number in the	
	If the switch is a member of a switch stack, you must use the spanning-tree mst <i>instance_id</i> cost <i>cost</i> command to select an interface to put in the forwarding state.			
Examples	This example shows how to increase the likelihood that the interface associated with spanning-tree instances 20 and 22 is placed into the forwarding state if a loop occurs:			

Device(config)# interface gigabitethernet2/0/1
Device(config-if)# spanning-tree mst 20,24 port-priority 0

Related Topics

spanning-tree mst cost, on page 201 spanning-tree mst priority, on page 208

spanning-tree mst pre-standard

To configure a port to transmit only prestandard bridge protocol data units (BPDUs), use the **spanning-tree mst pre-standard** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst pre-standard no spanning-tree mst pre-standard

Syntax Description This command has no arguments or keywords.

Command Default The default is to automatically detect prestandard neighbors.

Command Modes Interface configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines

The port can accept both prestandard and standard BPDUs. If the neighbor types are mismatched, only the common and internal spanning tree (CIST) runs on this interface.

Note If a switch port is connected to a switch running prestandard Cisco IOS software, you must use the **spanning-tree mst pre-standard** interface configuration command on the port. If you do not configure the port to send only prestandard BPDUs, the Multiple STP (MSTP) performance might diminish.

When the port is configured to automatically detect prestandard neighbors, the prestandard flag always appears in the **show spanning-tree mst** commands.

Examples

This example shows how to configure a port to transmit only prestandard BPDUs:

Device(config-if) # spanning-tree mst pre-standard

spanning-tree mst priority

To set the bridge priority for an instance, use the **spanning-tree mst priority** command in global configuration mode. To return to the default setting, use the **no** form of this command.

spanning-tree mst instance priority priority
no spanning-tree mst priority

Syntax Description	<i>instance</i> Instance identification number. The range is 0 to 4094.			
	priority priority Spe	priority <i>priority</i> Specifies the bridge priority. The range is 0 to 614440 in increments of 4096.		
Command Default	The default is 32768.			
Command Modes	Global configuration			
Command History	Release	Modification]	
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	You can set the bridge priority in increments of 4096 only. Valid values are 0, 4096, 8192, 12288, 16384, 20480. 24576, 28672, 32768, 40960, 45056, 49152, 53248, 57344 and 61440.			
	You can enter <i>instance</i> as a single instance or a range of instances, for example, 0-3,5,7-9.			
Examples	This example shows how to set the spanning tree priority for MST instance 0 to 4096:			
	Device(config)# spanning-tree mst 0 priority 4096			
	Related Topics spanning-tree mst co spanning-tree mst ro	onfiguration, on page 199 bot, on page 209		

spanning-tree mst root

To designate the primary and secondary root switch and set the timer value for an instance, use the **spanning-tree mst root** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree mst instance root {primary | secondary}
no spanning-tree mst instance root

	·	1		
Syntax Description	instance	<i>istance</i> Instance identification number. The range is 0 to 4094.		
	primary	itch to be the root switch.		
	secondary	Specifies this switch to act as the root switch, if the primary root fail.		
Command Default	None			
Command Modes	Global confi	guration (config)	()	
Command History	Release		Modification	
	Cisco IOS F 15.0(2)EX	Release	This command was introduced.	
Usage Guidelines	Use this command only on backbone switches. You can enter <i>instance-id</i> as a single instance or a range of instances, for example, 0-3,5,7-9.			
	When you enter the spanning-tree mst <i>instance-id</i> root command, the software tries to set a high enough priority to make this switch the root of the spanning-tree instance. Because of the extended system ID support, the switch sets the switch priority for the instance to 24576 if this value will cause this switch to become the root for the specified instance. If any root switch for the specified instance has a switch priority lower than 24576, the switch sets its own priority to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value.)			
	When you enter the spanning-tree mst <i>instance-id</i> root secondary command, because of support for the extended system ID, the software changes the switch priority from the default value (32768) to 28672. If the root switch fails, this switch becomes the next root switch (if the other switches in the network use the default switch priority of 32768 and are therefore unlikely to become the root switch).			
Examples	This example	This example shows how to configure the switch as the root switch for instance 10:		

Device(config) # spanning-tree mst 10 root primary

spanning-tree mst simulate pvst (global configuration)

To enable PVST + simulation globally, use the **spanning-tree mst simulate pvst global** command. This is enabled by default. To disable PVST+ simulation, use the **no** form of this command.

spanning-tree mst simulate pvst global no spanning-tree mst simulate pvst global

Syntax Description This command has no arguments or keywords.

Command Default PVST+ simulation is enabled by default.

Command Modes Global configuration mode

 Release
 Modification

 3.8.0E and 15.2.(4)E
 Support for the command was introduced.

Usage Guidelines This feature configures MST switches (in the same region) to seamlessly interact with PVST+ switches. Use the **show spanning-tree summary** command to see if the feature is enabled.

To enable PVST+ simulation on a port, see **spanning-tree mst simulate pvst (interface configuration)**.

Example

The following example shows the spanning tree summary when PVST+ simulation is enabled in the MSTP mode:

```
Device# show spanning-tree summary
Switch is in mst mode (IEEE Standard)
Root bridge for: MST0
EtherChannel misconfig guard is enabled
Extended system ID is enabled
Portfast Default is disabled
PortFast BPDU Guard Default is disabled
Portfast BPDU Filter Default is disabled
Loopguard Default is disabled
UplinkFast is disabled
BackboneFast is disabled
Pathcost method used is long
PVST Simulation Default is enabled
Name Blocking Listening Learning Forwarding STP Active
MST0 2 0 0 0 2
```

1 mst 2 0 0 0 2

The following example shows the spanning tree summary when the switch is not in MSTP mode, that is, the switch is in PVST or Rapid-PVST mode. The output string displays the current STP mode:

```
Device# show spanning-tree summary
Switch is in rapid-pvst mode
Root bridge for: VLAN0001, VLAN2001-VLAN2002
EtherChannel misconfig guard is enabled
```

```
Extended system ID is enabled
Portfast Default is disabled
PortFast BPDU Guard Default is disabled
Portfast BPDU Filter Default is disabled
Loopguard Default is disabled
UplinkFast is disabled
BackboneFast is disabled
Pathcost method used is short
PVST Simulation Default is enabled but inactive in rapid-pvst mode
Name Blocking Listening Learning Forwarding STP Active
----- -----
                                                    _____
VLAN0001 2 0 0 0 2
VLAN2001 2 0 0 0 2
VLAN2002 2 0 0 0 2

spanning-tree mst simulate pvst (interface configuration), on page 212 show spanning-tree, on page 177

spanning-tree mst simulate pvst (interface configuration)

To enable PVST + simulation on a port, use the **spanning-tree mst simulate pvst** command in the interface configuration mode. This is enabled by default. To disable PVST+ simulation, use the **no** form of this command, or enter the **spanning-tree mst simulate pvst disable** command.

spanning-tree mst simulate pvst [disable] no spanning-tree mst simulate pvst

 Syntax Description
 disable
 Disables the PVST+ simulation feature. This prevents a port from automatically interoperating with a connecting device that is running Rapid PVST+.

 Command Default
 PVST+ simulation is enabled by default.

 Command Modes
 Interface configuration mode

 Command History
 Release
 Modification

3.8.0E and 15.2.(4)E Support for the command was introduced.

Usage Guidelines This feature configures MST switches (in the same region) to seamlessly interact with PVST+ switches. Use the **show spanning-tree interface** *interface-id* **detail** command to see if the feature is enabled.

To enable PVST+ simulation globally, see spanning-tree mst simulate pvst global.

Example

The following example shows the interface details when PVST+ simulation is explicitly enabled on the port:

```
Device# show spanning-tree interface gi3/13 detail

Port 269 (GigabitEthernet3/13) of VLAN0002 is forwarding

Port path cost 4, Port priority 128, Port Identifier 128.297.

Designated root has priority 32769, address 0013.5f20.01c0

Designated bridge has priority 32769, address 0013.5f20.01c0

Designated port id is 128.297, designated path cost 0

Timers: message age 0, forward delay 0, hold 0

Number of transitions to forwarding state: 1

Link type is point-to-point by default

PVST Simulation is enabled

BPDU: sent 132, received 1
```

The following example shows the interface details when the PVST+ simulation feature is disabled and a PVST Peer inconsistency has been detected on the port:

```
Device# show spanning-tree interface gi3/13 detail

Port 269 (GigabitEthernet3/13) of VLAN0002 is broken (PVST Peer Inconsistent)

Port path cost 4, Port priority 128, Port Identifier 128.297.

Designated root has priority 32769, address 0013.5f20.01c0

Designated bridge has priority 32769, address 0013.5f20.01c0

Designated port id is 128.297, designated path cost 0

Timers: message age 0, forward delay 0, hold 0
```

```
Number of transitions to forwarding state: 1
Link type is point-to-point by default
PVST Simulation is disabled
BPDU: sent 132, received 1
```

spanning-tree pathcost method

To set the default path-cost calculation method, use the **spanning-tree pathcost method** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree pathcost method {long | short} no spanning-tree pathcost method **Syntax Description** Specifies the 32-bit based values for default port-path costs. long short Specifies the 16-bit based values for default port-path costs. short **Command Default** Global configuration **Command Modes Command History** Release Modification Cisco IOS Release This command was introduced. 15.0(2)EX The long path-cost calculation method utilizes all 32 bits for path-cost calculation and yields values in the **Usage Guidelines** range of 1 through 200,000,000. The short path-cost calculation method (16 bits) yields values in the range of 1 through 65535. **Examples** This example shows how to set the default path-cost calculation method to long: Device(config) #spanning-tree pathcost method long This example shows how to set the default path-cost calculation method to short:

Device(config) #spanning-tree pathcost method short

spanning-tree port-priority

To configure an interface priority when two bridges tie for position as the root bridge, use the **spanning-treeport-priority** command in interface configuration mode. To return to the default value, use the **no** form of this command.

spanning-tree [{vlan vlan-id}] port-priority port-priority
no spanning-tree [{vlan vlan-id}] port-priority

 Syntax Description
 vlan vlan-id
 (Optional) Specifies the VLAN range associated with the spanning-tree instance. The range is 1 to 4094.

 port-priority
 The port priority in increments of sixteen. The range is 0 to 240.

 The default is 128.

Command Default The port priority is 128.

Command Modes Interface configuration

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines The priority you set breaks the tie.

Examples

The following example shows how to increase the likelihood that a port will be put in the forwarding state if a loop occurs:

```
Device(config)# interface gigabitethernet2/0/2
Device(config-if)# spanning-tree vlan 20 port-priority 0
```

spanning-tree portfast edge (global configuration)

To enable bridge protocol data unit (BPDU) filtering on PortFast edge-enabled interfaces, the BDPU guard feature on PortFast edge-enabled interfaces, or the PortFast edge feature on all nontrunking interfaces, use the **spanning-tree portfast edge** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree portfast edge {bpdufilter default | bpduguard default | default}
no portfast edge {bpdufilter default | bpduguard default | default}

Syntax Description	bdpufilter default		Enables BDPU filtering on PortFast edge-enabled interfaces and prevents the switch interface connect to end stations from sending or receiving BPDUs.			
	bdpuguard default	Enables the BDPU guard feature on PortFast edge-enabled interfaces and places the interfaces that receive BPDUs in an error-disabled state.				
	default	Enables the Port	tFast edge feature on all nontrunking interfaces.			
Command Default	Disabled					
Command Modes	Global configuration					
Command History	Release		Modification			
	Cisco IOS Release 15.0(2)EX		This command was introduced.			
	Cisco IOS XE 3.8.0E and Cisco IOS 15.2.(4)E		Beginning with this release, if you enter the spanning-tree portfast [trunk] command in the global configuration mode, the system automatically saves it as spanning-tree portfast edge [trunk].			
Usage Guidelines	You can enable these rapid-PVST+, or the r		switch is operating in the per-VLAN spanning-tree plus (PVST+) -tree (MST) mode.			
	BPDU filtering on int state). The interfaces You should globally e receive BPDUs. If a F	uning-tree portfast edge bpdufilter default global configuration command to glob ng on interfaces that are PortFast edge-enabled (the interfaces are in a PortFast edge iterfaces still send a few BPDUs at link-up before the switch begins to filter outbou globally enable BPDU filtering on a switch so that hosts connected to switch interfa Us. If a BPDU is received on a PortFast edge-enabled interface, the interface loses conal status and BPDU filtering is disabled.				
	You can override the spanning-tree portfast edge bpdufilter default command by using the spanning-tree portfast edge bpdufilter interface command.					
Ca		nen using this command. Enabling BPDU filtering on an interface is the same as disabling on it and can result in spanning-tree loops.				
	Use the spanning-tre	e portfast edge b	pduguard default global configuration command to globally enable			

Use the **spanning-tree portfast edge bpduguard default** global configuration command to globally enable BPDU guard on interfaces that are in a PortFast edge-operational state. In a valid configuration, PortFast

edge-enabled interfaces do not receive BPDUs. Receiving a BPDU on a PortFast edge-enabled interface signals an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the interface in the error-disabled state. The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

You can override the **spanning-tree portfast edge bpduguard default** command by using the **spanning-tree portfast edge bpduguard** interface command.

Use the **spanning-tree portfast edge default** command to globally enable the PortFast edge feature on all nontrunking interfaces. Configure PortFast edge only on interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation. A PortFast edge-enabled interface moves directly to the spanning-tree forwarding state when linkup occurs; it does not wait for the standard forward-delay time.

You can override the **spanning-tree portfast edge default** global configuration command by using the **spanning-tree portfast edge** interface configuration command. You can use the **no spanning-tree portfast edge default** global configuration command to disable PortFast edge on all interfaces unless they are individually configured with the **spanning-tree portfast edge** interface configuration command.

Examples This example shows how to globally enable BPDU filtering by default:

Device(config) # spanning-tree portfast edge bpdufilter default

This example shows how to globally enable the BDPU guard feature by default:

Device(config)# spanning-tree portfast edge bpduguard default

This example shows how to globally enable the PortFast feature on all nontrunking interfaces:

Device(config) # spanning-tree portfast edge default

spanning-tree portfast edge (interface configuration)

To enable PortFast edge mode where the interface is immediately put into the forwarding state upon linkup without waiting for the timer to expire, use the **spanning-tree portfast edge** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree portfast edge [{disable | trunk}]
no spanning-tree portfast edge

Syntax Description	disable (Optional) Disables PortFast edge on the inter	face.
	trunk (Optional) Enables PortFast edge mode on the	interface.

Command Default The settings that are configured by the **spanning-tree portfast edge default** command.

Command Modes Interface configuration

Cor

ommand History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
	Cisco IOS XE 3.8.0E and Cisco IOS 15.2.(4)E	Beginning with this release, if you enter the spanning-tree portfast [trunk] command in the global configuration mode, the system automatically saves it as spanning-tree portfast edge [trunk] .

Usage Guidelines You can enable this feature when the switch is operating in the per-VLAN spanning-tree plus (PVST+), Rapid PVST+, or the multiple spanning-tree (MST) mode.

This feature affects all VLANs on the interface.

Use this command only on interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data-packet loop and disrupt the switch and network operation.

To enable PortFast edge on trunk ports, you must use the **spanning-tree portfast edge trunk** interface configuration command. The **spanning-tree portfast edge** command is not supported on trunk ports.

An interface with the PortFast edge feature enabled is moved directly to the spanning-tree forwarding state without the standard forward-time delay.

You can use the **spanning-tree portfast edge default** global configuration command to globally enable the PortFast edge feature on all nontrunking interfaces. Use the **spanning-tree portfast edge** interface configuration command to override the global setting.

If you configure the **spanning-tree portfast edge default** global configuration command, you can disable PortFast edge on an interface that is not a trunk interface by using the **spanning-tree portfast edge disable** interface configuration command.

Examples This example shows how to enable the PortFast edge feature on a port:

Device (config) # interface gigabitethernet1/0/2 Device (config-if) #spanning-tree portfast edge

spanning-tree transmit hold-count

To specify the transmit hold count, use the **spanning-tree transmit hold-count** command in global configuration mode. To return to the default settings, use the **no** form of this command.

spanning-tree transmit hold-count value no spanning-tree transmit hold-count

Syntax Description *value* Number of bridge protocol data units (BPDUs) sent every second. The range is 1 to 20.

Command Default The default is 6.

Command Modes Global configuration

Command History	Release Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines

This command is supported on all spanning-tree modes.

The transmit hold count determines the number of BPDUs that can be sent before pausing for 1 second.

Note Increasing the transmit-hold count value can have a significant impact on CPU utilization, especially in Rapid Per-VLAN Spanning Tree (PVST+) mode. Decreasing this value might result in slow convergence. We recommend that you used the default setting.

Examples This example shows how to specify the transmit hold count 8:

Device(config) # spanning-tree transmit hold-count 8

spanning-tree uplinkfast

To enable UplinkFast, use the **spanning-tree uplinkfast** command in global configuration mode. To disable UplinkFast, use the **no** form of this command.

spanning-tree uplinkfast [max-update-rate packets-per-second]
no spanning-tree uplinkfast [max-update-rate]

Syntax Description	max-update-rate packets-per-second	(Optional) Specifies the rate (number of packets per second) at update packets are sent. The range is 0 to 320000.	
		The default is 150.	
Command Default	UplinkFast is disabled.		
Command Modes	Global configuration		
Command History	Release	Modification]
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	Use this command only o	n access switches.

show spanning-tree, on page 177 spanning-tree vlan, on page 223

To configure Spanning Tree Protocol (STP) on a per-virtual LAN (VLAN) basis, use the spanning-tree vlan command in global configuration mode. To return to the default settings, use the no form of this command.

spanning-tree vlan vlan-id [{forward-time seconds | hello-time seconds | max-age seconds | priority priority | [root {primary | secondary} [diameter net-diameter]]}] no spanning-tree vlan *vlan-id* [{forward-time | hello-time | max-age | priority | root}]

Syntax Description	vlan-id	VLAN range associated with the spanning-tree instance. The range is 1 to 4094.		
	forward-time seconds	(Optional) Sets the STP forward delay time in second. The range is 4 to 30.		
		The default is 15.		
	hello-time seconds	(Optional) Specifies the duration, in seconds, between the generation of configuration messages by the root switch. The range is 1 to 10.		
		The default is 2.		
	max-age seconds	(Optional) Sets the maximum number of seconds the information in a bridge packet data unit (BPDU) is valid. The range is 6 to 40.		
		The default is 20.		
	priority priority	(Optional) Sets the STP bridge priority. The range is 0 to 61440 in increments of 4096.		
		The default for the primary root switch is 24576.		
		The default for the secondary root switch is 28672.		
	root primary	(Optional) Forces this switch to be the root switch.		
	root secondary	(Optional) Specifies this switch to act as the root switch should the primary root fail.		
	diameter <i>net -diameter</i> (Optional) Specifies the maximum number of switches between any two points of attachment of end stations. The range is 2 through 7.			
Command Default	Spanning tree is enabled of	on all VLANs.		
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	If the switch does not hear the spanning-tree topology	r BPDUs within the time specified by the max-age <i>seconds</i> - value, it recomputes y.		
	Use the spanning-tree vla	an <i>vlan-id</i> root only on backbone switches.		

spanning-tree vlan

I

The **spanning-tree vlan** *vlan-id* **root secondary** command alters this switch's priority from 32768 to 28672. If the root switch should fail, this switch becomes the next root switch.

	\triangle	
	Caution	We do not recommend disabling spanning tree, even in a topology that is free of physical loops. Spanning tree is a safeguard against misconfigurations and cabling errors. Do not disable spanning tree in a VLAN without ensuring that there are no physical loops present in the VLAN.
Examples	The	e following example shows how to enable spanning tree on VLAN 200:
	Dev	tice(config)# spanning-tree vlan 200
		e following example shows how to configure the switch as the root switch for VLAN 10 with a work diameter of 4:
	Dev	ice(config)# spanning-tree vlan 10 root primary diameter 4
		e following example shows how to configure the switch as the secondary root switch for VLAN with a network diameter of 4:
	Dev	rice(config)# spanning-tree vlan 10 root secondary diameter 4

switchport access vlan

To configure a port as a static-access port, use the **switchport access vlan** command in interface configuration mode. To reset the access mode to the default VLAN mode, use the **no** form of this command.

switchport access vlan {vlan-id }
no switchport access vlan

Syntax Description	<i>vlan-id</i> (Optional) Number of the VLAN on the interface in access mode. Valid values are from 1 to 4094.			
Command Default	The default access VLAN and trunk interface native VLAN is a default VLAN corresponding to the platform or interface hardware.			
	A dynamic-access port is initially a member of no VLAN and receives its assignment based on the packet it receives.			
Command Modes	Interface configuration mode			
Command History	Release Modification			
	Cisco IOS 15.0(2)EX This command was introduced.			
Usage Guidelines	The port must be in access mode before the switchport access vlan command can take effect.			
	If the switchport mode is set to access vlan <i>vlan-id</i> , the port operates as a member of the specified VLAN. If set to access vlan dynamic , the port starts discovery of VLAN assignment based on the incoming packets it receives. An access port can be assigned to only one VLAN.			
	The no switchport access command resets the access mode VLAN to the appropriate default VLAN for the device.			
Examples	This example show how to first populate the VLAN database by associating a VLAN ID with a VLAN name, and then configure the VLAN (using the name) on an interface, in the access mode: You can also verify your configuration by entering the show interfaces <i>interface-id</i> switchport in privileged EXEC command and examining information in the Access Mode VLAN: row.			
	Part 1 - Making the entry in the VLAN database:			
	Device# configure terminal Device(config)# vlan 33 Device(config-vlan)# name test Device(config-vlan)# end Device#			
	Part 2 - Checking the VLAN database			
	Device # show vlan id 33 VLAN Name Status Ports			
	33 test active			
	VLAN Type SAID MTU Parent RingNo BridgeNo Stp BrdgMode Trans1 Trans2			
	33 enet 100033 1500 0 0			

Remote SPAN VLAN ------Disabled Primary Secondary Type Ports

Part 3 - Setting the VLAN on the interface, by using the vlan name 'test'.

```
Device # configure terminal
Device(config) # interface GigabitEthernet5/1
Device(config-if) # switchport mode access
Device(config-if) # switchport access vlan name test
Device(config-if) # end
Device#
```

Part 4 - Verifying running-config

```
Device # show running-config interface GigabitEthernet5/1
Building configuration...
Current configuration : 113 bytes
!
interface GigabitEthernet5/1
switchport access vlan 33
switchport mode access
Switch#
```

Part 5 - Also can be verified in interface switchport

```
Device # show interface GigabitEthernet5/1 switchport
Name: Gi5/1

switchport mode

To configure the VLAN membership mode of a port, use the **switchport mode** command in interface configuration mode. To reset the mode to the appropriate default for the device, use the **no** form of this command.

switchport mode {access | dynamic | {auto | desirable} | trunk}
noswitchport mode {access | dynamic | {auto | desirable} | trunk}

Syntax Description	access	Sets the port to access mode (either static-access or dynamic-access depending on th setting of the switchport access vlan interface configuration command). The port is set to access unconditionally and operates as a nontrunking, single VLAN interface th sends and receives nonencapsulated (non-tagged) frames. An access port can be assign to only one VLAN.	
	dynamic auto	Sets the port trunking mode dynamic parameter to auto to specify that the interface convert the link to a trunk link. This is the default switchport mode.	
	dynamic desirable	Sets the port trunking mode dynamic parameter to desirable to specify that the interfa actively attempt to convert the link to a trunk link.	
trunkSets the port to trunk unconditionally. The port is a trunking VLAN The port sends and receives encapsulated (tagged) frames that iden origination. A trunk is a point-to-point link between two devices or and a router.			
Command Default	The default mode	e is dynamic auto .

Command History	Release Cisco IOS Relea A configuration the appropriate mode saved, but only on When you enter a the link into a non When you enter t the link into a true	Modification ase 15.0(2)EX This command was introduced. that uses the access,or trunk keywords takes effect only when you configure the port in e by using the switchport mode command. The static-access and trunk configuration are ne configuration is active at a time. access mode, the interface changes to permanent nontrunking mode and negotiates to conventrunk link even if the neighboring interface does not agree to the change. trunk mode, the interface connecting to it does not agree to the change. lynamic auto mode, the interface converts the link to a trunk link if the neighboring interface	

To autonegotiate trunking, the interfaces must be in the same VLAN Trunking Protocol (VTP) domain. Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations. To avoid this problem, configure interfaces connected to devices that do not support DTP to not forward DTP frames, which turns off DTP.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.
- To enable trunking to a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

Access ports and trunk ports are mutually exclusive.

The IEEE 802.1x feature interacts with switchport modes in these ways:

- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- If you try to enable IEEE 802.1x on a port set to **dynamic auto** or **dynamic desirable**, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to **dynamic auto** or **dynamic desirable**, the port mode is not changed.
- If you try to enable IEEE 802.1x on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command and examining information in the *Administrative Mode* and *Operational Mode* rows.

Examples

This example shows how to configure a port for access mode:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode access
```

This example shows how set the port to dynamic desirable mode:

```
Device (config) # interface gigabitethernet2/0/1
Device (config-if) # switchport mode dynamic desirable
```

This example shows how to configure a port for trunk mode:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode trunk
```

switchport access vlan, on page 225

switchport nonegotiate

To specify that Dynamic Trunking Protocol (DTP) negotiation packets are not sent on the Layer 2 interface, use the **switchport nonegotiate** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

switchport nonegotiate no switchport nonegotiate

Syntax Description This command has no arguments or keywords.

Command Default The default is to use DTP negotiation to learn the trunking status.

Command Modes Interface configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines The no switchpo

The **no switchport nonegotiate** command removes nonegotiate status.

This command is valid only when the interface switchport mode is access or trunk (configured by using the **switchport mode access** or the **switchport mode trunk** interface configuration command). This command returns an error if you attempt to execute it in dynamic (auto or desirable) mode.

Internetworking devices that do not support DTP might forward DTP frames improperly and cause misconfigurations. To avoid this problem, turn off DTP by using the **switchport nonegotiate** command to configure the interfaces connected to devices that do not support DTP to not forward DTP frames.

When you enter the **switchport nonegotiate** command, DTP negotiation packets are not sent on the interface. The device does or does not trunk according to the **mode** parameter: **access** or **trunk**.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.
- To enable trunking on a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

This example shows how to cause a port to refrain from negotiating trunking mode and to act as a trunk or access port (depending on the mode set):

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport nonegotiate
```

You can verify your setting by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

cache

To configure a flow cache parameter for a flow monitor, use the **cache** command in flow monitor configuration mode. To remove a flow cache parameter for a flow monitor, use the **no** form of this command.

cache {entries number | timeout {active | inactive | update} seconds | type {normal | permanent}} no cache {entries | timeout {active | inactive | update} | type}

Syntax Description	entries number	Specifies the maximum number of entries in the flow monitor cache. The range is 16 to 1048576. The default is 16640 for each switch in the stack.			
	timeout	Specifies the flow timeout.			
	active	Specifies the active flow timeout.			
	inactive	Specifies the inactive flow timeout.			
	update	Specifies the update timeout for a permanent flow cache.			
	seconds	The timeout value in seconds. The range is 30 to 604800 (7 days) for a normal flow cache. For a permanent flow cache the range is 1 to 604800 (7 days).			
	type	Specifies the type of the flow cache.			
	normal	Configures a normal cache type. The entries in the flow cache will be aged out according to the timeout active <i>seconds</i> and timeout inactive <i>seconds</i> settings. This is the default cache type.			
	permanent	Configures a permanent cache type. This cache type disables flow removal from the flow cache.			
Command Default	The default flow monitor	flow cache parameters are used.			
	The following flow cache	parameters for a flow monitor are enabled:			
	Cache type: normal				
	Maximum number of	entries in the flow monitor cache: 16640			
	• Active flow timeout: 1800 seconds				
	• Inactive flow timeout	:: 30 seconds			
	• Update timeout for a	permanent flow cache: 1800 seconds			
Command Modes	Flow monitor configuration	n			
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)	EX This command was introduced.			

Usage Guidelines

Each flow monitor has a cache that it uses to store all the flows it monitors. Each cache has various configurable elements, such as the time that a flow is allowed to remain in it. When a flow times out, it is removed from the cache and sent to any exporters that are configured for the corresponding flow monitor.

If a cache is already active (that is, you have applied the flow monitor to at least one interface in the device), your changes to the parameters will not take effect until you either reboot the device or remove the flow monitor from every interface and then reapply it. Therefore, whenever possible you should customize the parameters for the cache before you apply the flow monitor to an interface. You can modify the timers, flow exporters, and statistics parameters for a cache while the cache is active.

The **cache timeout active** command controls the aging behavior of the normal type of cache. If a flow has been active for a long time, it is usually desirable to age it out (starting a new flow for any subsequent packets in the flow). This age out process allows the monitoring application that is receiving the exports to remain up to date. By default, this timeout is 1800 seconds (30 minutes), but it can be adjusted according to system requirements. A larger value ensures that long-lived flows are accounted for in a single flow record; a smaller value results in a shorter delay between starting a new long-lived flow and exporting some data for it. When you change the active flow timeout, the new timeout value takes effect immediately.

The **cache timeout inactive** command also controls the aging behavior of the normal type of cache. If a flow has not seen any activity for a specified amount of time, that flow will be aged out. By default, this timeout is 30 seconds, but this value can be adjusted depending on the type of traffic expected. If a large number of short-lived flows is consuming many cache entries, reducing the inactive timeout can reduce this overhead. If a large number of flows frequently get aged out before they have finished collecting their data, increasing this timeout can result in better flow correlation. When you change the inactive flow timeout, the new timeout value takes effect immediately.

The **cache timeout update** command controls the periodic updates sent by the permanent type of cache. This behavior is similar to the active timeout, except that it does not result in the removal of the cache entry from the cache. By default, this timer value is 1800 seconds (30 minutes).

The **cache type normal** command specifies the normal cache type. This is the default cache type. The entries in the cache will be aged out according to the **timeout active** *seconds* and **timeout inactive** *seconds* settings. When a cache entry is aged out, it is removed from the cache and exported via any exporters configured for the monitor associated with the cache.

To return a cache to its default settings, use the **default cache** flow monitor configuration command.

Note

When a cache becomes full, new flows will not be monitored.

Note

A permanent cache uses update counters rather than delta counters. When a flow is exported, the counters represent the totals seen for the full lifetime of the flow and not the additional packets and bytes seen since the last export was sent.

The following example shows how to configure the active timeout for the flow monitor cache:

```
Device (config) # flow monitor FLOW-MONITOR-1
Device (config-flow-monitor) # cache timeout active 4800
```

The following example shows how to configure the inactive timer for the flow monitor cache:

```
Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# cache timeout inactive 30
```

The following example shows how to configure the permanent cache update timeout:

Device (config) # flow monitor FLOW-MONITOR-1 Device (config-flow-monitor) # cache timeout update 5000

The following example shows how to configure a normal cache:

Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# cache type normal

collect flow sampler

To configure the flow sampler ID as a non-key field and enable the collection of the ID of the sampler that is assigned to the flow monitor, use the **collect flow sampler** command in flow record configuration mode. To disable the use of the flow sampler ID as a non-key field for a flow record, use the **no** form of this command.

collect flow sampler no collect flow sampler

Syntax Description This command has no arguments or keywords.

Command Default The flow sampler ID is not configured as a non-key field.

Command Modes Flow record configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines

The NetFlow Lite **collect** commands are used to configure non-key fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases, the values for non-key fields are taken from only the first packet in the flow.

The **collect flow sampler** command is useful when more than one flow sampler is being used with different sampling rates. The **option sampler-table** flow exporter command exports options records with mappings of the flow sampler ID to sampling rate so the collector can calculate the scaled counters for each flow.

To return this command to its default settings, use the **no collect flow sampler** or **default collect flow sampler** flow record configuration command.

The following example configures the ID of the flow sampler that is assigned to the flow as a non-key field:

Device (config) # flow record FLOW-RECORD-1 Device (config-flow-record) # collect flow sampler

collect interface

To configure the input interface name as a non-key field for a flow record, use the **collect interface** command in flow record configuration mode. To disable the use of the input interface as a non-key field for a flow record, use the **no** form of this command.

collect interface input no collect interface input

Syntax Description Configures the input interface name as a non-key field and enables collecting the input interface input from the flows. The input interface name is not configured as a non-key field. **Command Default** Flow record configuration **Command Modes Command History** Modification Release Cisco IOS Release 15.0(2)EX This command was introduced. The NetFlow Lite collect commands are used to configure non-key fields for the flow monitor record and to **Usage Guidelines** enable capturing the values in the fields for the flow created with the record. The values in non-key fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a non-key field does not create a new flow. In most cases, the values for non-key fields are taken from only the first packet in the flow. To return this command to its default settings, use the **no collect interface** or **default collect interface** flow record configuration command. The following example configures the input interface as a non-key field: Device(config) # flow record FLOW-RECORD-1 Device (config-flow-record) # collect interface input **Related Topics**

collect timestamp sys-uptime

To configure the system uptime of the first seen or last seen packet in a flow as a nonkey field for a flow record, use the **collect timestamp sys-uptime** command in flow record configuration mode. To disable the use of the first seen or last seen packet in a flow as a nonkey field for a flow record, use the **no** form of this command.

collect timestamp sys-uptime {first | last}
no collect timestamp sys-uptime {first | last}

Syntax Description first Configures the system uptime for the time the first packet was seen from the flows as a nonkey field and enables collecting time stamps based on the system uptime for the time the first packet was seen from the flows.

last Configures the system uptime for the time the last packet was seen from the flows as a nonkey field and enables collecting time stamps based on the system uptime for the time the most recent packet was seen from the flows.

Command Default The system uptime field is not configured as a nonkey field.

Command Modes Flow record configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
		1 1. 7

Usage Guidelines The NetFlow Lite **collect** commands are used to configure nonkey fields for the flow monitor record and to enable capturing the values in the fields for the flow created with the record. The values in nonkey fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a nonkey field does not create a new flow. In most cases, the values for nonkey fields are taken from only the first packet in the flow.

To return this command to its default settings, use the **no collect timestamp sys-uptime** or **default collect timestamp sys-uptime** flow record configuration command.

Examples The following example configures time stamps based on the system uptime for the time the first packet was seen from the flows as a nonkey field:

Device(config) # flow record FLOW-RECORD-1
Device(config-flow-record) # collect timestamp sys-uptime first

The following example configures the time stamps based on the system uptime for the time the most recent packet was seen from the flows as a nonkey field:

Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect timestamp sys-uptime last

collect transport tcp flags

To enable the collecting of transport TCP flags from a flow, use the **collect transport tcp flags** command in flow record configuration mode. To disable the collecting of transport TCP flags from the flow, use the **no** form of this command.

collect transport tcp flags no collect transport tcp flags

Syntax Description This command has no arguments or keywords.

Command Default The transport layer fields are not configured as a non-key field.

Command Modes Flow record configuration

Command History Release		Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines The values of the transport layer fields are taken from all packets in the flow. You cannot specify which TCP flag to collect. You can only specify to collect transport TCP flags. All TCP flags will be collected with this command. The following transport TCP flags are collected:

- ack—TCP acknowledgement flag
- cwr—TCP congestion window reduced flag
- ece—TCP ECN echo flag
- fin—TCP finish flag
- psh—TCP push flag
- rst—TCP reset flag
- syn—TCP synchronize flag
- urg—TCP urgent flag

To return this command to its default settings, use the **no collect collect transport tcp flags** or **default collect collect transport tcp flags** flow record configuration command.

The following example collects the TCP flags from a flow:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# collect transport tcp flags
```

Syntax Description

To create a flow monitor, or to modify an existing flow monitor, and enter flow monitor configuration mode, use the **flow monitor** command in global configuration mode. To remove a flow monitor, use the **no** form of this command.

Name of the flow monitor that is being created or modified.

flow monitor monitor-name no flow monitor monitor-name

monitor-name

Command Default	NetFlow Lite flow monitors are not present in the configuration.

Command Modes Global configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

Usage Guidelines Flow monitors are the NetFlow Lite component that is applied to interfaces to perform network traffic monitoring. Flow monitors consist of a flow record and a cache. You add the record to the flow monitor after you create the flow monitor. The flow monitor cache is automatically created at the time the flow monitor is applied to the first interface. Flow data is collected from the network traffic during the monitoring process based on the key and nonkey fields in the flow monitor's record and stored in the flow monitor cache.

Examples

The following example creates a flow monitor named FLOW-MONITOR-1 and enters flow monitor configuration mode:

Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)#

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

Usage Guidelines

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

To return this command to its default settings, use the **no match ipv4 destination address** or **default match ipv4 destination address** flow record configuration command.

The following example configures the IPv4 destination address as a key field for a flow record:

Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv4 destination address

Related Topics

match ipv4 source address

To configure the IPv4 source address as a key field for a flow record, use the match ipv4 source address command in flow record configuration mode. To disable the use of the IPv4 source address as a key field for a flow record, use the **no** form of this command.

match ipv4 source address no match ipv4 source address

Syntax Description	This command has no arguments or keywords.				
Command Default	The IPv4 source address is not configured as a key field.				
Command Modes	Flow record configuration				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			
Usage Guidelines	 A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the match command. To return this command to its default settings, use the no match ipv4 source address or default match ipv4 source address flow record configuration command. 				
	The following example configures the IPv4 source address as a key field:

 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

Usage Guidelines A

A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

To return this command to its default settings, use the **no match ipv6 destination address** or **default match ipv6 destination address** flow record configuration command.

The following example configures the IPv6 destination address as a key field:

Device(config) # flow record FLOW-RECORD-1
Device(config-flow-record) # match ipv6 destination address

Related Topics

match ipv6 source address

To configure the IPv6 source address as a key field for a flow record, use the **match ipv6 source address** command in flow record configuration mode. To disable the use of the IPv6 source address as a key field for a flow record, use the **no** form of this command.

match ipv6 source address no match ipv6 source address

	Cisco IOS Release 15.0(2)EX	This command was introduced.
Command History	Release	Modification
Command Modes	Flow record configuration	
Command Default	The IPv6 source address is not	t configured as a key field.
Syntax Description	This command has no argume	nts or keywords.

Usage Guidelines

es A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

To return this command to its default settings, use the **no match ipv6 source address** or **default match ipv6 source address** flow record configuration command.

The following example configures a IPv6 source address as a key field:

Device(config) # flow record FLOW-RECORD-1
Device(config-flow-record) # match ipv6 source address

match transport

To configure one or more of the transport fields as a key field for a flow record, use the **match transport** command in flow record configuration mode. To disable the use of one or more of the transport fields as a key field for a flow record, use the **no** form of this command.

match transport {destination-port | source-port}
no match transport {destination-port | source-port}

Syntax Description	destination-port	Configures the transport destination port as a key field.	
	source-port	Configures the transport source port as a key field.	
Command Default	The transport field	ds are not configured as a key field.	
Command Modes	Flow record config	guration	
Command History	Release	Modification	
	Cisco IOS Release	e 15.0(2)EX This command was introduced.	
Usage Guidelines	-	uires at least one key field before it can be used in a flow monitor. The key fields d low having a unique set of values for the key fields. The key fields are defined us	-
	The following example	ample configures the destination port as a key field:	
		flow record FLOW-RECORD-1 low-record) # match transport destination-port	
	The following example	ample configures the source port as a key field:	
		flow record FLOW-RECORD-1 low-record) # match transport source-port

mode

To specify the type of sampling and the packet interval for a NetFlow Lite sampler, use the **mode** command in sampler configuration mode. To remove the type of sampling and the packet interval information for a NetFlow Lite sampler, use the **no** form of this command.

mode {deterministic | random} 1 out-of window-size
no mode

	<u>.</u>	
Syntax Description	deterministic	Enables deterministic mode sampling for the sampler.
	random	Enables random mode sampling for the sampler.
	1 out-of window-size	P Specifies the window size from which to select packets. The range is 32 to 1022.
Command Default	The mode and the pac	cket interval for a sampler are not configured.
Command Modes	Sampler configuration	n
Command History	Release	Modification
	Cisco IOS Release 15	5.0(2)EX This command was introduced.
Usage Guidelines	A total of four unique	e samplers (random or deterministic) are supported on the .
		e, packets are chosen periodically based on the configured interval. This mode has less n mode and can be useful when the device samples traffic that is random in nature.
		kets are chosen in a manner that should eliminate any bias from traffic patterns and by users to avoid monitoring.
	new free sampler from beyond four attachme a new sampler from t sampler. Because of t correct number of flow	onitor using a deterministic sampler, every attachment with the same sampler uses one in the out of four available samplers. You cannot attach a monitor with any sampler ents. When you attach a monitor using a random sampler, only the first attachment uses he . The remainder of all of the attachments using the same sampler, share the same his behavior, when using a deterministic sampler, you can always make sure that the ws are sampled by comparing the sampling rate and what the sends. If the same random multiple interfaces, flows from any interface can always be sampled, and flows from lways be skipped.
Examples	The following examp	le enables deterministic sampling with a window size of 1000:
	Device(config)# sa Device(config-samp	<pre>mpler SAMPLER-1 ler)# mode deterministic 1 out-of 1000</pre>
		le enables random sampling with a window size of 1000:
	Device(config)# sa Device(config-samp	mpler SAMPLER-1 ler)# mode random 1 out-of 1000

option

To configure optional data parameters for a flow exporter for NetFlow Lite, use the **option** command in flow exporter configuration mode. To remove optional data parameters for a flow exporter, use the **no** form of this command.

option {exporter-stats | interface-table | sampler-table} [{timeout seconds}] no option {exporter-stats | interface-table | sampler-table}

Syntax Description	exporter-stats	Configures the exporter statistics option for flow exporters.
-	interface-table	Configures the interface table option for flow exporters.
	sampler-table	Configures the export sampler table option for flow exporters.
	timeout seconds	(Optional) Configures the option resend time in seconds for flow exporters. The range is 1 to 86400. The default is 600.
Command Default	The timeout is 600 s	econds. All other optional data parameters are not configured.
Command Modes	Flow exporter config	guration
Command History	Release	Modification
	Cisco IOS Release 1	5.0(2)EX This command was introduced.
Usage Guidelines	number of records, b	r-stats command causes the periodic sending of the exporter statistics, including the pytes, and packets sent. This command allows the collector to estimate packet loss for the eives. The optional timeout alters the frequency at which the reports are sent.
	collector to map the	e-table command causes the periodic sending of an options table, which allows the interface SNMP indexes provided in the flow records to interface names. The optional frequency at which the reports are sent.
	configuration of eac	-table command causes the periodic sending of an options table, which details the h sampler and allows the collector to map the sampler ID provided in any flow record to it can use to scale up the flow statistics. The optional timeout can alter the frequency at e sent.
	To return this comma command.	and to its default settings, use the no option or default option flow exporter configuration
	•	ple shows how to enable the periodic sending of the sampler option table, which to map the sampler ID to the sampler type and rate:
	=	<pre>Clow exporter FLOW-EXPORTER-1 w-exporter)# option sampler-table</pre>
	Device (contrig ito	

```
Device(config) # flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter) # option exporter-stats
```

The following example shows how to enable the periodic sending of an options table, which allows the collector to map the interface SNMP indexes provided in the flow records to interface names:

Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# option interface-table

sampler

To create a NetFlow Lite flow sampler, or to modify an existing NetFlow Lite flow sampler, and to enter NetFlow Lite sampler configuration mode, use the **sampler** command in global configuration mode. To remove a sampler, use the **no** form of this command.

sampler sampler-name
no sampler sampler-name

Syntax Description	<i>sampler-name</i> Name of the flow sampler that is being of	created or modified.
Command Default	NetFlow Lite flow samplers are not configured.	
Command Modes	Global configuration	
Command History	Release Modification	
	Cisco IOS Release 15.0(2)EX This command was introdu	ced.
Usage Guidelines	Flow samplers are used to reduce the load placed by NetFl by limiting the number of packets that are analyzed. You of 32 to 1022 packets. Flow samplers are applied to interface sampled NetFlow Lite.	configure a rate of sampling that is 1 out of a range
	To enable flow sampling, you configure the record that yo flow monitor. When you apply a flow monitor with a samp at the rate specified by the sampler and compared with the the analyzed packets meet the criteria specified by the flow	er to an interface, the sampled packets are analyzed e flow record associated with the flow monitor. If
Examples	The following example creates a flow sampler name SAM	IPLER-1:
	Device(config)# sampler SAMPLER-1 Device(config-sampler)#

show flow exporter

To display flow exporter status and statistics, use the **show flow exporter** command in privileged EXEC mode.

show flow exporter [{export-ids netflow-v9|[name] exporter-name [{statistics|templates}]|statistics
| templates}]

Syntax Description	export-ids netflow-v9	(Optional) Displays the NetFlow Version 9 export fields that can be exported and their IDs.				
	name	(Optional) Specifies the name of a flow exporter.				
	exporter-name	(Optional) Name of a flow exporter that was previously configured.				
	statistics	(Optional) Displays statistics for all flow exporters or for the specified flow exporter.				
	templates	(Optional) Displays template information for all flow exporters or for the specified flow exporter.				
Command Default	None					
Command Modes	Privileged EXEC					
Command History	Release	Modification				
	Cisco IOS Release 15.0	(2)EX This command was introduced.				
	The following example displays the status and statistics for all of the flow exporters configured on a device:					
	Device# show flow exporter					
	Flow Exporter FLOW-E	-				
	Description:	Exports to the datacenter				
	Export protocol:	NetFlow Version 9				
	Transport Configur					
	Destination IP a Source IP addres	ddress: 192.168.0.1 s: 192.168.0.2				
	Transport Protoc					
	Destination Port					
	Source Port:	55864				
	DSCP:	0x0				
	TTL:	255				
	Output Features:	Used				
	This table describes the significant fields shown in the display:					
	Table 13: show flow exporter	Field Descriptions				
	ומשום וש. אוטעי ווטעי בגעטונפו	1010 20301101013				

Field	Description
Flow Exporter	The name of the flow exporter that you configured.

Field	Description
Description	The description that you configured for the exporter, or the default description User defined.
Transport Configuration	The transport configuration fields for this exporter.
Destination IP address	The IP address of the destination host.
Source IP address	The source IP address used by the exported packets.
Transport Protocol	The transport layer protocol used by the exported packets.
Destination Port	The destination UDP port to which the exported packets are sent.
Source Port	The source UDP port from which the exported packets are sent.
DSCP	The differentiated services code point (DSCP) value.
TTL	The time-to-live value.
Output Features	Specifies whether the output-features command, which causes the output features to be run on Flexible NetFlow export packets, has been used or not.

The following example displays the status and statistics for all of the flow exporters configured on a device:

```
Device# show flow exporter name FLOW-EXPORTER-1 statistics

Flow Exporter FLOW-EXPORTER-1:

Packet send statistics (last cleared 2w6d ago):

Successfully sent: 0 (0 bytes)
```

Table 14: show flow interface Field Descriptions

Field	Description	
Interface	The interface to which the information applies.	
monitor	The name of the flow monitor that is configured on the interface.	
direction:	The direction of traffic that is being monitored by the flow monitor.	
	The possible values are:	
	• Input—Traffic is being received by the interface.	
	• Output—Traffic is being transmitted by the interface.	

Field	Description
traffic(ip)	Indicates if the flow monitor is in normal mode or sampler mode.
	The possible values are:
	• on—The flow monitor is in normal mode.
	• sampler—The flow monitor is in sampler mode (the name of the sampler will be included in the display).

Update Timeout: 1800 secs

This table describes the significant fields shown in the display.

Table 15: show flow monitor monitor-name Field Descriptions

Field	Description	
Flow Monitor	Name of the flow monitor that you configured.	
Description	Description that you configured or the monitor, or the default description User defined.	
Flow Record	Flow record assigned to the flow monitor.	
Flow Exporter	Exporters that are assigned to the flow monitor.	
Cache	Information about the cache for the flow monitor.	
Туре	Flow monitor cache type.	
	The possible values are:	
	• immediate—Flows are expired immediately.	
	• normal—Flows are expired normally.	
	• Permanent—Flows are never expired.	
Status	Status of the flow monitor cache.	
	The possible values are:	
	• allocated—The cache is allocated.	
	• being deleted—The cache is being deleted.	
	• not allocated—The cache is not allocated.	
Size	Current cache size.	
Inactive Timeout	Current value for the inactive timeout in seconds.	
Active Timeout	Current value for the active timeout in seconds.	
Update Timeout	Current value for the update timeout in seconds.	

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1:

Device# show flow monito	or FLOW-MONITOR-1 cache

This table describes the significant fields shown in the display.

Table 16: show flo	w monitor n	nonitor-name	cache Field	Descriptions

Field	Description
Cache type	Flow monitor cache type.
	The possible values are:
	• Immediate—Flows are expired immediately.
	• Normal—Flows are expired normally.
	• Permanent—Flows are never expired.
Cache Size	Number of entries in the cache.
Current entries	Number of entries in the cache that are in use.
High Watermark	Highest number of cache entries seen.
Flows added	Flows added to the cache since the cache was created.
Flows aged	Flows expired from the cache since the cache was created.
Active timeout	Current value for the active timeout in seconds.
Inactive timeout	Current value for the inactive timeout in seconds.
Event aged	Number of flows that have been aged by an event such as using the force-export option for the clear flow monitor command.
Watermark aged	Number of flows that have been aged because they exceeded the maximum high watermark value.

0 0

Field	Description
Emergency aged	Number of flows that have been aged because the cache size was exceeded.
IP TOS	IP type of service (ToS) value.
IP PROTOCOL	Protocol number.
IPV4 SOURCE ADDRESS	IPv4 source address.
IPV4 DESTINATION ADDRESS	IPv4 destination address.
TRNS SOURCE PORT	Source port for the transport protocol.
TRNS DESTINATION PORT	Destination port for the transport protocol.
INTERFACE INPUT	Interface on which the input is received.
FLOW SAMPLER ID	Flow sampler ID number.
ip source as	Border Gateway Protocol (BGP) source autonomous system number.
ip destination as	BGP destination autonomous system number.
ipv4 next hop address	IPv4 address of the next hop to which the packet is forwarded.
ipv4 source mask	IPv4 source address mask.
ipv4 destination mask	IPv4 destination address mask.
tcp flags	Value of the TCP flags.
interface output	Interface on which the input is transmitted.
counter bytes	Number of bytes that have been counted.
counter packets	Number of packets that have been counted.
timestamp first	Time stamp of the first packet in the flow.
timestamp last	Time stamp of the last packet in the flow.

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1 in a table format:

Device# show flow monitor FLOW-MONITOR-1 cache format table

show flow record

To display the status and statistics for a NetFlow Lite flow record, use the **show flow record** command in privileged EXEC mode.

show flow record [{[name] record-name}]

Syntax Description	name	(Optional) Specifies the name of a flow record.
	record-name	(Optional) Name of a user-defined flow record that was previously configured.
Command Default	None	
Command Modes	Privileged EX	EC
Command History	Release	Modification
	Cisco IOS Re 15.0(2)EX	elease This command was introduced.

The following example displays the status and statistics for FLOW-RECORD-1:

```
Device# show flow record FLOW-RECORD-1
flow record FLOW-RECORD-1:
Description: User defined
No. of users: 0
Total field space: 24 bytes
Fields:
match ipv6 destination address
match transport source-port
collect interface input
```

show sampler

15.0(2)EX

To display the status and statistics for a NetFlow Lite sampler, use the show sampler command in privileged EXEC mode.

	show sampler	[{[name] <i>sampler-name</i> }]	
Syntax Description	name	(Optional) Specifies the name of a sampler.	
	sampler-name	(Optional) Name of a sampler that was previou	usly configured.
Command Default	None		
Command Modes	Privileged EXE	C	
Command History	Release	Modification	-
	Cisco IOS Rel	ease This command was introduced.	_

The following example displays the status and statistics for all of the flow samplers configured:

```
Device# show sampler
Sampler SAMPLER-1:
 LD: 2083940135
export ID: 0
Description
 Description: User defined
 Type:
                Invalid (not in use)
               1 out of 32
 Rate:
 Samples:
               0
 Requests:
                0
 Users (0):
Sampler SAMPLER-2:
 ID: 3800923489
export ID: 1
 ID:
 Description: User defined
 Type: random
 Rate:
                1 out of 100
               1
 Samples:
 Requests:
                124
 Users (1):
   flow monitor FLOW-MONITOR-1 (datalink,vlan1) 0 out of 0
```

This table describes the significant fields shown in the display.

Table 17: show sampler Field Descriptions

Field	Description
ID	ID number of the flow sampler.
Export ID	ID of the flow sampler export.

Field	Description
Description	Description that you configured for the flow sampler, or the default description User defined.
Туре	Sampling mode that you configured for the flow sampler.
Rate	Window size (for packet selection) that you configured for the flow sampler. The range is 2 to 32768.
Samples	Number of packets sampled since the flow sampler was configured or the device was restarted. This is equivalent to the number of times a positive response was received when the sampler was queried to determine if the traffic needed to be sampled. See the explanation of the Requests field in this table.
Requests	Number of times the flow sampler was queried to determine if the traffic needed to be sampled.
Users	Interfaces on which the flow sampler is configured.

source

To configure the source IP address interface for all of the packets sent by a NetFlow Lite flow exporter, use the **source** command in flow exporter configuration mode. To remove the source IP address interface for all of the packets sent by a NetFlow Lite flow exporter, use the **no** form of this command.

source *interface-type interface-number* **no source**

Syntax Description	interface-type	Type of interface whose IP address you packets sent by a NetFlow Lite flow ex	want to use for the source IP address of the porter.
	interface-number	Interface number whose IP address you packets sent by a NetFlow Lite flow ex	want to use for the source IP address of the porter.
Command Default	The IP address of the address.	he interface over which the NetFlow Lite	e datagram is transmitted is used as the source IP
Command Modes	Flow exporter conf	iguration	
Command History	Release	Modification	
	Cisco IOS Release	15.0(2)EX This command was introduce	zd.
Usage Guidelines	The benefits of usin following:	ng a consistent IP source address for the	datagrams that NetFlow Lite sends include the
	determine from that can be use not specify the IP address of the In this situation with different the same device datagrams as i	n which device the NetFlow Lite data is ed to send NetFlow Lite datagrams from e source interface from which the source he interface over which the datagram is tra n the destination system might receive Ne source IP addresses. When the destination with different source IP addresses, the f they were being sent from different devi	etFlow Lite is used by the destination system to arriving. If your network has two or more paths the device to the destination system and you do IP address is to be obtained, the device uses the nsmitted as the source IP address of the datagram. etFlow Lite datagrams from the same device, but on system receives NetFlow Lite datagrams from destination system treats the NetFlow Lite ices. To avoid having the destination system treat from different devices, you must configure the

destination system to aggregate the NetFlow Lite datagrams it receives from all of the possible source IP addresses in the device into a single NetFlow Lite flow.
If your device has multiple interfaces that can be used to transmit datagrams to the destination system, and you do not configure the source command, you will have to add an entry for the IP address of each interface into any access lists that you create for permitting NetFlow Lite traffic. Creating and maintaining access lists for permitting NetFlow Lite traffic from known sources and blocking it from unknown sources

is easier when you limit the source IP address for NetFlow Lite datagrams to a single IP address for each

device that is exporting NetFlow Lite traffic.

I

	Â	
	Caution	The interface that you configure as the source interface must have an IP address configured, and it must be up.
	\wp	
	Tip	When a transient outage occurs on the interface that you configured with the source command, the NetFlow Lite exporter reverts to the default behavior of using the IP address of the interface over which the datagrams are being transmitted as the source IP address for the datagrams. To avoid this problem, use a loopback interface as the source interface because loopback interfaces are not subject to the transient outages that can occur on physical interfaces.
		return this command to its default settings, use the no source or default source flow exporter configuration nmand.
Examples		e following example shows how to configure NetFlow Lite to use a loopback interface as the rce interface for NetFlow traffic:
		rice(config)# flow exporter FLOW-EXPORTER-1 rice(config-flow-exporter)# source loopback 0

statistics packet protocol

To collect protocol distribution statistics for a flow monitor, use the **statistics packet protocol** command in flow monitor configuration mode. To disable collecting protocol distribution statistics and size distribution statistics for a flow monitor, use the **no** form of this command.

statistics packet protocol no statistics packet protocol

Syntax Description This command has no arguments or keywords.

Command Default The collection of protocol distribution statistics for a flow monitor is not enabled by default.

Command Modes Flow monitor configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines

Before you can collect protocol distribution statistics for a flow monitor with the **statistics packet protocol** command, you must define the protocol, source and destination ports, first and last time stamps and packet and bytes counters in the flow record. If you do not define these fields, you will get the following warning:

Warning: Cannot set protocol distribution with this Flow Record. Require protocol, source and destination ports, first and last timestamps and packet and bytes counters.

To return this command to its default settings, use the **no statistics packet protocol** or **default statistics packet protocol** flow monitor configuration command.

The following example enables the collection of protocol distribution statistics for flow monitors:

Device(config)# flow monitor FLOW-MONITOR-1
Device(config-flow-monitor)# statistics packet protocol

Syntax Description

Command History

template data timeout

To specify a timeout period for resending flow exporter template data, use the **template data timeout** command in flow exporter configuration mode. To remove the template resend timeout for a flow exporter, use the **no** form of this command.

template data timeout seconds no template data timeout seconds

Command Default The default template resend timeout for a flow exporter is 600 seconds.

Command Modes Flow exporter configuration

Release

seconds

Cisco IOS Release 15.0(2)EX This command was introduced.

Usage Guidelines Flow exporter template data describes the exported data records. Data records cannot be decoded without the corresponding template. The **template data timeout** command controls how often those templates are exported.

Modification

To return this command to its default settings, use the **no template data timeout** or **default template data timeout** flow record exporter command.

The following example configures resending templates based on a timeout of 1000 seconds:

Timeout value in seconds. The range is 1 to 86400. The default is 600.

Device (config) # flow exporter FLOW-EXPORTER-1 Device (config-flow-exporter) # template data timeout 1000

Related Topics

transport

Command History

To configure the transport protocol for a flow exporter for NetFlow Lite, use the **transport** command in flow exporter configuration mode. To remove the transport protocol for a flow exporter, use the **no** form of this command.

transport udp udp-port no transport udp udp-port

Syntax Description udp *udp-port* Specifies User Datagram Protocol (UDP) as the transport protocol and the UDP port number.

Command Default Flow exporters use UDP on port 9995.

Command Modes Flow exporter configuration

Release

Cisco IOS Release 15.0(2)EX This command was introduced.

Usage Guidelines To return this command to its default settings, use the **no transport** or **default transport flow exporter** configuration command.

Modification

The following example configures UDP as the transport protocol and a UDP port number of 250:

Device (config) # flow exporter FLOW-EXPORTER-1 Device (config-flow-exporter) # transport udp 250

Trunk ports are ets with the monitored VLAN ID are sent to the destination or on a series or range of ports or VLANs. You select a e [, -] options. must enter a space before and after the comma. If you enter a space before and after the hyphen (-). or RSPAN destination ports. A physical port that is a estination port, but it cannot participate in the EtherChannel

You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port; however, IEEE 802.1x authentication is disabled until the port is removed as a SPAN destination. If IEEE 802.1x authentication is not available on the port, the switch returns an error message. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

Destination ports can be configured to function in these ways:

- When you enter monitor session session_number destination interface interface-id with no other keywords, egress encapsulation is untagged, and ingress forwarding is not enabled.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **ingress**, egress encapsulation is untagged; ingress encapsulation depends on the keywords that follow—**dot1q** or **untagged**.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate** with no other keywords, egress encapsulation replicates the source interface encapsulation; ingress forwarding is not enabled. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate ingress**, egress encapsulation replicates the source interface encapsulation; ingress encapsulation depends on the keywords that follow—**dot1q** or **untagged**. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN, RSPAN, FSPAN, and FRSPAN configuration on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Examples

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2:

Device(config)# monitor session 1 source interface gigabitethernet1/0/1 both Device(config)# monitor session 1 destination interface gigabitethernet1/0/2

This example shows how to delete a destination port from an existing local SPAN session:

Device (config) # no monitor session 2 destination interface gigabitethernet1/0/2

This example shows how to configure RSPAN source session 1 to monitor a source interface and to configure the destination RSPAN VLAN 900:

Device(config) # monitor session 1 source interface gigabitethernet1/0/1
Device(config) # monitor session 1 destination remote vlan 900
Device(config) # end

This example shows how to configure an RSPAN destination session 10 in the switch receiving the monitored traffic:

Device(config) # monitor session 10 source remote vlan 900 Device(config) # monitor session 10 destination interface gigabitethernet1/0/2

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation. Egress traffic replicates the source; ingress traffic uses IEEE 802.1Q encapsulation.

 ${\tt Device\,(config)\,\#\,\,monitor\,\,session\,\,2\,\,destination\,\,interface\,\,gigabitethernet1/0/2\,\,encapsulation\,\,dotlq\,\,ingress\,\,dotlq\,\,vlan\,\,5$

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that does not support encapsulation. Egress traffic and ingress traffic are untagged.

Device (config) # monitor session 2 destination interface gigabitethernet1/0/2 ingress untagged vlan 5

monitor session filter

To start a new flow-based SPAN (FSPAN) session or flow-based RSPAN (FRSPAN) source or destination session, or to limit (filter) SPAN source traffic to specific VLANs, use the **monitor session filter** global configuration command. To remove filters from the SPAN or RSPAN session, use the **no** form of this command.

```
monitor session session-number filter {vlan vlan-id [, | -] }
no monitor session session-number filter {vlan vlan-id [, | -] }
```

Syntax Description	session-number	The session number identified with the SPAN or RSPAN sess if this switch is stacked with Catalyst 2960-S switches, the r
	vlan vlan-id	Specifies a list of VLANs as filters on trunk source ports to liv VLANs. The <i>vlan-id</i> range is 1 to 4094.
	,	(Optional) Specifies a series of VLANs, or separates a range Enter a space before and after the comma.
	-	(Optional) Specifies a range of VLANs. Enter a space before
Command Default	No monitor sessions are configured.	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	a total of 68 SPAN and RSPAN session	f four local SPAN sessions and RSPAN source sessions. You can have ons on a switch or switch stack. However if this switch is stacked with nited to a combined maximum of two local SPAN sessions and RSPAN 66.
	You can monitor traffic on a single V range of VLANs by using the [, -] o	LAN or on a series or range of ports or VLANs. You select a series or ptions.
	If you specify a series of VLANs, yo of VLANs, you must enter a space be	u must enter a space before and after the comma. If you specify a range efore and after the hyphen (-).
	default, all VLANs are monitored on	etwork traffic on a selected set of VLANs on trunk source ports. By trunk source ports. You can use the monitor session <i>session_number</i> SPAN traffic on trunk source ports to only the specified VLANs.
		ng are mutually exclusive. If a VLAN is a source, VLAN filtering cannot figured, a VLAN cannot become a source.
	SPAN, RSPAN, FSPAN, and FRSPA	ing the show monitor privileged EXEC command. You can display N configuration on the switch by entering the show running-config information appears near the end of the output.

Examples

This example shows how to limit SPAN traffic in an existing session only to specific VLANs:

```
Switch(config) # monitor session 1 filter vlan 100 - 110
```

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2 and to filter IPv4 traffic using access list number 122 in an FSPAN session:

```
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1 both
Switch(config)# monitor session 1 destination interface gigabitethernet1/0/2
Switch(config)# monitor session 1 filter ip access-group 122
```

monitor session source

To start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) source session, or to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, use the **monitor session source** global configuration command. To remove the SPAN or RSPAN session or to remove source interfaces from the SPAN or RSPAN session, use the **no** form of this command.

monitor session session_number source {interface interface-id [, | -] [both | rx | tx] | [remote] vlan vlan-id [, | -] [both | rx | tx] } no monitor session session_number source {interface interface-id [, | -] [both | rx | tx] | [remote] vlan vlan-id [, | -] [both | rx | tx] }

Syntax Description	session_number	The session number identified with the SPAN or RSPAN session. The range is 1 to 68. However if this switch is stacked with Catalyst 2960-S switches, the range is 1 to 66.
	interface interface-id	Specifies the source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type, stack member, module, and port number). For source interface, port channel is also a valid interface type, and the valid range is 1 to 48.
	,	(Optional) Specifies a series of interfaces or VLANs, or separates a range of interfaces or VLANs from a previous range. Enter a space before and after the comma.
	-	(Optional) Specifies a range of interfaces or VLANs. Enter a space before and after the hyphen.
	both rx tx	(Optional) Specifies the traffic direction to monitor. If you do not specify a traffic direction, the source interface sends both transmitted and received traffic.
	remote	(Optional) Specifies the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094.
		The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs).
	vlan vlan-id	When used with only the ingress keyword, sets default VLAN for ingress traffic.
Command Default	No monitor sessions are cor	nfigured.
	On a source interface, the d	efault is to monitor both received and transmitted traffic.
	On a trunk interface used as	s a source port, all VLANs are monitored.
Command Modes	Global configuration	

I

Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			
Usage Guidelines		leaves source ports or source VLANs can be monitored by using SPAN or RSPAN. rce ports or source VLANs cannot be monitored.			
	a total of 68 SPAN ar	ned maximum of four local SPAN sessions and RSPAN source sessions. You can have nd RSPAN sessions on a switch or switch stack. However if this switch is stacked with ches, you are limited to a combined maximum of two local SPAN sessions and RSPAN the range is 1 to 66.			
	A source can be a physical port, a port channel, or a VLAN.				
		lude multiple ingress or egress source ports or VLANs, but you cannot combine source ANs in a single session. Each session can include multiple destination ports.			
	active ports in the sou	N-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all urce VLANs become source ports for the SPAN or RSPAN session. Trunk ports are orts for VSPAN, and only packets with the monitored VLAN ID are sent to the destination			
		fic on a single port or VLAN or on a series or range of ports or VLANs. You select a erfaces or VLANs by using the [, -] options.			
		s of VLANs or interfaces, you must enter a space before and after the comma. If you LANs or interfaces, you must enter a space before and after the hyphen (-).			
		ividual ports while they participate in an EtherChannel, or you can monitor the entire by specifying the port-channel number as the RSPAN source interface.			
	A port used as a desti more than one session	ination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for n at a time.			
	You can enable IEEE	802.1x authentication on a SPAN or RSPAN source port.			
	SPAN, RSPAN, FSPA	settings by entering the show monitor privileged EXEC command. You can display AN, and FRSPAN configuration on the switch by entering the show running-config nmand. SPAN information appears near the end of the output.			
	Examples				
	-	how to create a local SPAN session 1 to monitor both sent and received traffic tack member 1 to destination port 2 on stack member 2:			
		onitor session 1 source interface gigabitethernet1/0/1 both onitor session 1 destination interface gigabitethernet1/0/2			
	-	how to configure RSPAN source session 1 to monitor multiple source interfaces destination RSPAN VLAN 900.			
	Switch(config)# mc	onitor session 1 source interface gigabitethernet1/0/1			

```
Switch(config)# monitor session 1 source interface gigabitethernet1/0/1
Switch(config)# monitor session 1 source interface port-channel 2 tx
Switch(config)# monitor session 1 destination remote vlan 900
```

Switch(config)# end

show monitor

To display information about all Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) sessions, use the **show monitor** command in EXEC mode.

Syntax Description	session	(Optional) Displays information about specified SPAN sessions.
	session_number	The session number identified with the SPAN or RSPAN session. The range is 1 to 68. However if this switch is stacked with Catalyst 2960-S switches, you are limited to a combined maximum of two local SPAN sessions and RSPAN source sessions, and the range is 1 to 66.
	all	(Optional) Displays all SPAN sessions.
	local	(Optional) Displays only local SPAN sessions.
	range list	(Optional) Displays a range of SPAN sessions, where <i>list</i> is the range of valid sessions. The range is either a single session or a range of sessions described by two numbers, the lower one first, separated by a hyphen. Do not enter any spaces between comma-separated parameters or in hyphen-specified ranges.
		Note This keyword is available only in privileged EXEC mode.
	remote	(Optional) Displays only remote SPAN sessions.
	detail	(Optional) Displays detailed information about the specified sessions.
Command Modes	User EXEC	
	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	The output is the same for the sh	now monitor command and the show monitor session all command.
		rce sessions: 4 (applies to source and local sessions) However if this switch witches, you are limited to a combined maximum of two local SPAN sessions

Examples

This is an example of output for the **show monitor** user EXEC command:

```
Device# show monitor
Session 1
Type : Local Session
Source Ports :
RX Only : Gi4/0/1
Both : Gi4/0/2-3,Gi4/0/5-6
Destination Ports : Gi4/0/20
Encapsulation : Replicate
Ingress : Disabled
Session 2
_____
Type : Remote Source Session
Source VLANs :
TX Only : 10
Both : 1-9
Dest RSPAN VLAN : 105
```

This is an example of output for the **show monitor** user EXEC command for local SPAN source session 1:

```
Device# show monitor session 1
Session 1
------
Type : Local Session
Source Ports :
RX Only : Gi4/0/1
Both : Gi4/0/2-3,Gi4/0/5-6
Destination Ports : Gi4/0/20
Encapsulation : Replicate
Ingress : Disabled
```

This is an example of output for the **show monitor session all** user EXEC command when ingress traffic forwarding is enabled:

```
Device# show monitor session all
Session 1
_____
Type : Local Session
Source Ports :
Both : Gi4/0/2
Destination Ports : Gi4/0/3
Encapsulation : Native
Ingress : Enabled, default VLAN = 5
Ingress encap : DOT1Q
Session 2
_____
Type : Local Session
Source Ports :
Both : Gi4/0/8
Destination Ports : Gi4/012
Encapsulation : Replicate
Ingress : Enabled, default VLAN = 4
```

Ingress encap : Untagged

snmp-server enable traps

To enable the device to send Simple Network Management Protocol (SNMP) notifications for various traps or inform requests to the network management system (NMS), use the **snmp-server enable traps** command in global configuration mode. Use the **no** form of this command to return to the default setting.

snmp-server enable traps [bridge | cluster | config | copy-config | cpu threshold | entity
| envmon | errdisable | flash | fru-ctrl | hsrp | ipmulticast | mac-notification | msdp
| ospf | pim | port-security | rtr | snmp | storm-control | stpx | syslog | tty |
vlan-membership | vlancreate | vlandelete | vtp]
no snmp-server enable traps [bridge | cluster | config | copy-config | cpu threshold |
entity | envmon | errdisable | flash | fru-ctrl | hsrp | ipmulticast | mac-notification |
msdp | ospf | pim | port-security | rtr | snmp | storm-control | stpx | syslog | tty
| vlan-membership | vlancreate | vlandelete | vtp]

Syntax Description	bridge	(Optional) Enables SNMP STP Bridge MIB traps.*
	cluster	(Optional) Enables SNMP cluster traps.
	config	(Optional) Enables SNMP configuration traps.
	copy-config	(Optional) Enables SNMP copy-configuration traps.
	cpu threshold	(Optional) Enables CPU related traps.*
	entity	(Optional) Enables SNMP entity traps.
	envmon	(Optional) Enables SNMP environmental monitor traps.*
	errdisable	(Optional) Enables SNMP errdisable notification traps.*
	flash	(Optional) Enables SNMP FLASH notification traps.*
	fru-ctrl	(Optional) Generates entity field-replaceable unit (FRU) control traps. In a device stack, this trap refers to the insertion or removal of a device in the stack.
	hsrp	(Optional) Enables Hot Standby Router Protocol (HSRP) traps.
	ipmulticast	(Optional) Enables IP multicast routing traps.
	mac-notification	(Optional) Enables SNMP MAC Notification traps.*
	msdp	(Optional) Enables Multicast Source Discovery Protocol (MSDP) traps.
	ospf	(Optional) Enables Open Shortest Path First (OSPF) traps.
	pim	(Optional) Enables Protocol-Independent Multicast (PIM) traps.
	port-security	(Optional) Enables SNMP port security traps.*
	rtr	(Optional) Enables SNMP Response Time Reporter (RTR) traps.

I

	sn	mp	(Optional) Enables SNMP traps.*	
	sto	orm-control	(Optional) Enables SNMP storm-control trap parameters.*	
	stį	X	(Optional) Enables SNMP STPX MIB traps.*	
	sy	slog	(Optional) Enables SNMP syslog traps.	
	tty	7	(Optional) Sends TCP connection traps. This is enabled by default.	
	vla	an-membership	(Optional) Enables SNMP VLAN membership traps.	
	vla	ancreate	(Optional) Enables SNMP VLAN-created traps.	
	vla	andelete	(Optional) Enables SNMP VLAN-deleted traps.	
	vtj	p	(Optional) Enables VLAN Trunking Protocol (VTP) traps.

PART **VI**

QoS

- Auto-QoS, on page 333
- QoS, on page 359

Auto-QoS

This chapter contains the following auto-QoS commands:

- auto qos classify, on page 334
- auto qos trust, on page 337
- auto qos video, on page 341
- auto qos voip, on page 346
- debug auto qos, on page 351
- show auto qos, on page 354

auto qos classify

To automatically configure quality of service (QoS) classification for untrusted devices within a QoS domain, use the **auto qos classify** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

auto qos classify [police] no auto qos classify [police]

Syntax Description	police (Optional) Configures QoS policing for untrusted de						
Command Default	Auto-QoS classify is dis	abled on the port.					
Command Modes	Interface configuration						
Command History	Release	Modification					
	Cisco IOS Release 15.0(2)EX	This command was introduced.					

Usage Guidelines Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority (shaped)	1	4, 5	up to 100 percent	15 percent	15 percent
SRR shared	2	2, 3, 6,7	10 percent	25 percent	25 percent
SRR shared	3	0	60 percent	40 percent	40 percent
SRR shared	4	1	20 percent	20 percent	20 percent

Table 18: Auto-QoS Configuration for the Egress Queues

Auto-QoS configures the device for connectivity with a trusted interface. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packets is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

This is the policy map when the **auto qos classify** command is configured:

```
policy-map AUTOQOS-SRND4-CLASSIFY-POLICY
class AUTOQOS_MULTIENHANCED_CONF_CLASS
set dscp af41
class AUTOQOS_BULK_DATA_CLASS
set dscp af11
class AUTOQOS_TRANSACTION_CLASS
set dscp af21
class AUTOQOS_SCAVANGER_CLASS
set dscp cs1
class AUTOQOS_SIGNALING_CLASS
set dscp cs3
class AUTOQOS_DEFAULT_CLASS
set dscp default
```

This is the policy map when the **auto qos classify police** command is configured:

```
policy-map AUTOQOS-SRND4-CLASSIFY-POLICE-POLICY
class AUTOQOS MULTIENHANCED CONF CLASS
set dscp af41
police 5000000 8000 exceed-action drop
class AUTOQOS_BULK_DATA_CLASS
set dscp af11
police 10000000 8000 exceed-action policed-dscp-transmit
class AUTOQOS TRANSACTION CLASS
set dscp af21
police 10000000 8000 exceed-action policed-dscp-transmit
class AUTOQOS SCAVANGER CLASS
set dscp cs1
police 10000000 8000 exceed-action drop
class AUTOQOS SIGNALING CLASS
set dscp cs3
police 32000 8000 exceed-action drop
class AUTOQOS DEFAULT CLASS
set dscp default
police 10000000 8000 exceed-action policed-dscp-transmit
```

Note The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface and apply the new policy map.

To disable auto-QoS, you need remove the auto-QoS commands manually.

Enter the **no mls qos** global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified. The CoS, DSCP, and IP precedence values in the packet are not changed. Traffic is switched in pass-through mode. Packets are switched without any rewrites and classified as best effort without any policing.

To disable auto-QoS on a port, use the **no auto qos trust** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos trust** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

Examples

This example shows how to enable auto-QoS classification of an untrusted device and police traffic:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# auto qos classify police
```

You can verify your settings by entering the **show auto qos interface** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	debug auto qos, on page 351	Enables debugging of the auto-QoS feature.
	mls qos trust, on page 389	Configures the port trust state.
	queue-set, on page 397	Maps a port to a queue-set.
	show auto qos, on page 354	Displays auto-QoS information.
	show mls qos interface, on page 404	Displays QoS information at the port level.
	srr-queue bandwidth share, on page 417	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

auto qos trust

To automatically configure quality of service (QoS) for trusted interfaces within a QoS domain, use the **auto qos trust** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

	auto qos trust {cos no auto qos trust {	· •				
Syntax Description	cos Trusts the CoS packet classification.					
	dsp Trusts the DSCP par	cket classification.				
Command Default	-	ed, it uses the ingress packet la nd egress queues. For more inf	bel to categorize traffic, to assign packet labels, and ormation, see Table 19: Traffic Types, Packet Labels,			
Command Modes	Interface configuration					
Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EX	This command was introduced.				

Usage Guidelines Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS.

Table 19: Traffic Types, Packet Labels, and Queues

	VOIP Data Traffic	VOIP Control Traffic	Routing Protocol Traffic	STP ³ BPDU ⁴ Traffic	Real-Time Video Traffic	All Other Traffic	
DSCP ⁵	46	24, 26	48	56	34	-	
CoS ⁶	5	3	6	7	3	-	
CoS-to-egress queue map	4, 5 (queue 1)	2, 3, 6, 7 (q	ueue 2)		0 (queue 3)	2 (queue 3)	0, 1 (queue 4)

³ STP = Spanning Tree Protocol

- ⁴ BPDU = bridge protocol data unit
- ⁵ DSCP = Differentiated Services Code Point
- ⁶ CoS = class of service

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority (shaped)	1	4, 5	up to 100 percent	15 percent	15 percent
SRR shared	2	2, 3, 6,7	10 percent	25 percent	25 percent
SRR shared	3	0	60 percent	40 percent	40 percent
SRR shared	4	1	20 percent	20 percent	20 percent

Table 20: Auto-QoS Configuration for the Egress Queues

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

This is the auto-QoS generated configuration for the auto qos trust cos command:

Note

The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface and apply the new policy map.

Note To disable auto-QoS, you need to remove the auto-QoS commands manually.

Enter the **no mls qos** global configuration command. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

To disable auto-QoS on a port, use the **no auto qos trust** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos trust** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

Examples

This example shows how to enable auto-QoS for a trusted interface with specific CoS classification:

Device(config)# interface gigabitethernet2/0/1
Device(config-if)# auto qos trust cos

You can verify your settings by entering the **show auto qos interface** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	debug auto qos, on page 351	Enables debugging of the auto-QoS feature.
	mls qos trust, on page 389	Configures the port trust state.
	queue-set, on page 397	Maps a port to a queue-set.
	show auto qos, on page 354	Displays auto-QoS information.
	srr-queue bandwidth share, on page 417	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.
	srr-queue bandwidth share, on page 417	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

auto qos video

To automatically configure quality of service (QoS) for video within a QoS domain, use the **auto qos video** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

auto qos video {cts | ip-camera | media-player} no auto qos video {cts | ip-camera | media-player}

Syntax Description	cts	Identifies this port as connected to a Cisco TelePresence System and automatically configures QoS for video.				
	ip-camera	Identifies this port as connected to a Cisco IP camera and automatically configures QoS for video.				
	media-player	er Identifies this port as connected to a CDP-capable Cisco digital media player and automatically configures QoS for video.				
Command Default	Auto-QoS vid	eo is disabled on the port.				
	-	oS is enabled, it uses the ingress packet lab ne ingress and egress queues.	bel to categorize traffic, to assign packet labels, and			
Command Modes	Interface conf	iguration				
Command History	Release	Modification				
	Cisco IOS Ro 15.0(2)EX	elease This command was introduced.				
Usage Guidelines	Use this command to configure the QoS appropriate for video traffic within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS.					
	Table 21: Traffic 1	Types, Packet Labels, and Queues				

	VOIP Data Traffic	VOIP Control Traffic	Routing Protocol Traffic	STP ⁷ BPDU ⁸ Traffic	Real-Time Video Traffic	All Other T	raffic
DSCP ⁹	46	24, 26	48	56	34	-	
CoS ^{<u>10</u>}	5	3	6	7	3	-	
CoS-to-egress queue map	4, 5 (queue 1)	2, 3, 6, 7 (queue 2)	2, 3, 6, 7 (queue 2)	2, 3, 6, 7 (queue 2)	0 (queue 3)	2 (queue 3)	0, 1 (queue 4)

⁷ STP = Spanning Tree Protocol

⁸ BPDU = bridge protocol data unit

⁹ DSCP = Differentiated Services Code Point

 10 CoS = class of service

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority (shaped)	1	4, 5	up to 100 percent	15 percent	15 percent
SRR shared	2	2, 3, 6, 7	10 percent	25 percent	25 percent
SRR shared	3	0	60 percent	40 percent	40 percent
SRR shared	4	1	20 percent	20 percent	20 percent

Auto-QoS configures the device for video connectivity to a Cisco TelePresence system, a Cisco IP camera, or a Cisco digital media player.

To take advantage of the auto-QoS defaults, enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration after you enable auto-QoS.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

This is the QoS configuration that is automatically generated for the **auto qos video cts** command:

Device (config-if) # auto qos video cts

This is the QoS configuration that is automatically generated for the **auto gos video ip-camera** command:

Device(config-if) # auto qos video ip-camera Mar 16 02:55:43.675 PST: mls qos map cos-dscp 0 8 16 24 32 46 48 56 Mar 16 02:55:43.685 PST: mls gos Mar 16 02:55:43.685 PST: no mls qos srr-queue output cos-map Mar 16 02:55:43.689 PST: no mls qos queue-set output 2 threshold Mar 16 02:55:43.703 PST: no mls gos queue-set output 2 buffers Mar 16 02:55:43.706 PST: mls qos srr-queue output cos-map queue 1 threshold 3 4 5 Mar 16 02:55:43.710 PST: mls qos srr-queue output cos-map queue 2 threshold 1 $\,$ 2 $\,$ Mar 16 02:55:43.710 PST: mls qos srr-queue output cos-map queue 2 threshold 2 3 Mar 16 02:55:43.724 PST: mls qos srr-queue output cos-map queue 2 threshold 3 6 7 Mar 16 02:55:43.727 PST: mls qos srr-queue output cos-map queue 3 threshold 3 $\,$ 0 $\,$ Mar 16 02:55:43.731 PST: mls gos srr-queue output cos-map queue 4 threshold 3 1 Mar 16 02:55:43.734 PST: no mls qos srr-queue output dscp-map Mar 16 02:55:43.741 PST: mls gos srr-queue output dscp-map queue 1 threshold 3 32 33 40 41 42 43 44 45 Mar 16 02:55:43.745 PST: mls qos srr-queue output dscp-map queue 1 threshold 3 46 47 Mar 16 02:55:43.748 PST: mls qos srr-queue output dscp-map queue 2 threshold 1 16 17 18 19 20 21 22 23 Mar 16 02:55:43.762 PST: mls gos srr-queue output dscp-map queue 2 threshold 1 26 27 28 29 30 31 34 Mar 16 02:55:43.766 PST: mls qos srr-queue output dscp-map queue 2 threshold 1 35 36 37 38 39 Mar 16 02:55:43.769 PST: mls qos srr-queue output dscp-map queue 2 threshold 2 24 Mar 16 02:55:43.773 PST: mls qos srr-queue output dscp-map queue 2 threshold 3 48 49 50 51 52 53 54 55 Mar 16 02:55:43.780 PST: mls qos srr-queue output dscp-map queue 2 threshold 3 56 57 58 59 60 61 62 63 Mar 16 02:55:43.783 PST: mls gos srr-queue output dscp-map queue 3 threshold 3 0 1 2 3 4 567 Mar 16 02:55:43.786 PST: mls qos srr-queue output dscp-map queue 4 threshold 1 8 9 11 13 15 Mar 16 02:55:43.790 PST: mls qos srr-queue output dscp-map queue 4 threshold 2 10 12 14 Mar 16 02:55:43.793 PST: mls qos queue-set output 1 threshold 1 100 100 50 200 Mar 16 02:55:43.804 PST: mls qos queue-set output 1 threshold 2 125 125 100 400 Mar 16 02:55:43.807 PST: mls qos queue-set output 1 threshold 3 100 100 100 400 Mar 16 02:55:43.811 PST: mls qos queue-set output 1 threshold 4 60 150 50 200 Mar 16 02:55:43.814 PST: mls qos queue-set output 1 buffers 15 25 40 20 Mar 16 02:55:43.818 PST: auto qos srnd4 Mar 16 02:55:43.832 PST: mls gos trust device ip-camera Mar 16 02:55:43.842 PST: mls qos trust dscp Mar 16 02:55:43.849 PST: no queue-set 1 Mar 16 02:55:43.849 PST: queue-set 1 Mar 16 02:55:43.849 PST: priority-queue out Mar 16 02:55:43.853 PST: srr-queue bandwidth share 1 30 35 5

This is the QoS configuration that is automatically generated for the auto qos video media-player command:

Device (config-if) # auto qos video media-player Mar 16 02:56:39.969 PST: mls qos map cos-dscp 0 8 16 24 32 46 48 56 Mar 16 02:56:39.980 PST: mls gos Mar 16 02:56:39.980 PST: no mls qos srr-queue output cos-map Mar 16 02:56:39.987 PST: no mls qos queue-set output 2 threshold Mar 16 02:56:40.011 PST: no mls qos queue-set output 2 buffers Mar 16 02:56:40.011 PST: mls qos srr-queue output cos-map queue 1 threshold 3 45 Mar 16 02:56:40.015 PST: mls qos srr-queue output cos-map queue 2 threshold 1 2 Mar 16 02:56:40.018 PST: mls qos srr-queue output cos-map queue 2 threshold 2 3 Mar 16 02:56:40.018 PST: mls qos srr-queue output cos-map queue 2 threshold 3 6 7 Mar 16 02:56:40.022 PST: mls qos srr-queue output cos-map queue 3 threshold 3 0 Mar 16 02:56:40.022 PST: mls qos srr-queue output cos-map queue 4 threshold 3 1 Mar 16 02:56:40.029 PST: no mls qos srr-queue output dscp-map Mar 16 02:56:40.029 PST: mls gos srr-queue output dscp-map queue 1 threshold 3 32 33 40 41 42 43 44 45 Mar 16 02:56:40.043 PST: mls qos srr-queue output dscp-map queue 1 threshold 3 46 47 Mar 16 02:56:40.046 PST: mls qos srr-queue output dscp-map queue 2 threshold 1 16 17 18 19 20 21 22 23 Mar 16 02:56:40.050 PST: mls qos srr-queue output dscp-map queue 2 threshold 1 26 27 28 29 30 31 34 Mar 16 02:56:40.053 PST: mls qos srr-queue output dscp-map queue 2 threshold 1 35 36 37 38 39 Mar 16 02:56:40.057 PST: mls qos srr-queue output dscp-map queue 2 threshold 2 24 Mar 16 02:56:40.064 PST: mls qos srr-queue output dscp-map queue 2 threshold 3 48 49 50 51 52 53 54 55 Mar 16 02:56:40.067 PST: mls qos srr-queue output dscp-map queue 2 threshold 3 56 57 58 59 60 61 62 63 Mar 16 02:56:40.071 PST: mls gos srr-queue output dscp-map queue 3 threshold 3 0 1 2 3 4 5 6 7 Mar 16 02:56:40.081 PST: mls gos srr-gueue output dscp-map gueue 4 threshold 1 8 9 11 13 15 Mar 16 02:56:40.085 PST: mls gos srr-queue output dscp-map queue 4 threshold 2 10 12 14 Mar 16 02:56:40.092 PST: mls qos queue-set output 1 threshold 1 100 100 50 200 Mar 16 02:56:40.095 PST: mls qos queue-set output 1 threshold 2 125 125 100 400 Mar 16 02:56:40.099 PST: mls qos queue-set output 1 threshold 3 100 100 100 400 Mar 16 02:56:40.102 PST: mls qos queue-set output 1 threshold 4 60 150 50 200 Mar 16 02:56:40.106 PST: mls qos queue-set output 1 buffers 15 25 40 20 Mar 16 02:56:40.109 PST: auto qos srnd4 Mar 16 02:56:40.130 PST: mls gos trust device media-player Mar 16 02:56:40.133 PST: mls qos trust dscp Mar 16 02:56:40.137 PST: no queue-set 1 Mar 16 02:56:40.137 PST: queue-set 1 Mar 16 02:56:40.140 PST: priority-queue out Mar 16 02:56:40.172 PST: srr-queue bandwidth share 1 30 35 5

Ø

Note The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enable the auto-QoS feature on the first port, QoS is globally enabled (**mls qos** global configuration command), and other global configuration commands are added.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

Note To disable auto-QoS, you need to remove the auto-QoS commands manually.

Enter the **no mls qos** global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

To disable auto-QoS on a port, use the **no auto qos video** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos video** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

Examples

This example shows how to enable auto-QoS for a Cisco Telepresence interface with conditional trust. The interface is trusted only if a Cisco Telepresence device is detected; otherwise, the port is untrusted.

Device(config)# interface gigabitethernet2/0/1
Device(config-if)# auto qos video cts

You can verify your settings by entering the **show auto qos video interface** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	debug auto qos, on page 351	Enables debugging of the auto-QoS feature.
	mls qos trust, on page 389	Configures the port trust state.
	queue-set, on page 397	Maps a port to a queue-set.
	show auto qos, on page 354	Displays auto-QoS information.
	show mls qos interface, on page 404	Displays QoS information at the port level.
	srr-queue bandwidth share, on page 417	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

auto qos voip

To automatically configure quality of service (QoS) for voice over IP (VoIP) within a QoS domain, use the **auto qos voip** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

auto qos voip {cisco-phone | cisco-softphone | trust} no auto qos voip {cisco-phone | cisco-softphone | trust}

Syntax Descriptioncisco-phoneIdentifies this port as connected to a Cisco IP Phone, and automatically configures QoS for
VoIP. The QoS labels of incoming packets are trusted only when the telephone is detected.cisco-softphoneIdentifies this port as connected to a device running the Cisco SoftPhone, and automatically
configures QoS for VoIP.trustIdentifies this port as connected to a trusted device, and automatically configures QoS for
VoIP. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value
of the incoming packet is trusted. For routed ports, the DSCP value of the incoming packet
is trusted.

Command Default Auto-QoS is disabled on the port.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, assign packet labels, and configure the ingress and egress queues. For more information, seeTable 23: Traffic Types, Packet Labels, and Queues, on page 346

Command Modes Interface configuration

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines Use this command to configure the QoS appropriate for VoIP traffic within the QoS domain. The QoS domain includes the device, the network interior, and edge devices that can classify incoming traffic for QoS.

Auto-QoS configures the device for VoIP with Cisco IP Phones on device and routed ports and for VoIP with devices running the Cisco SoftPhone application. These releases support only Cisco IP SoftPhone Version 1.3(3) or later. Connected devices must use Cisco Call Manager Version 4 or later.

To take advantage of the auto-QoS defaults, enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration after you enable auto-QoS.

Table 23: Traffic Types, Packet Labels, and Queues

	VOIP Data Traffic	VOIP Control Traffic	Routing Protocol Traffic	STP ¹¹ BPDU ¹² Traffic	Real-Time Video Traffic	All Other Traffic
DSCP ¹³	46	24, 26	48	56	34	_

	VOIP Data Traffic	VOIP Control Traffic	Routing Protocol Traffic	STP ¹¹ BPDU ¹² Traffic	Real-Time Video Traffic	All Other T	raffic
CoS <u>14</u>	5	3	6	7	3	-	
CoS-to-egress queue map	4, 5 (queue 1)	2, 3, 6, 7 (queue 2)	2, 3, 6, 7 (queue 2)	2, 3, 6, 7 (queue 2)	0 (queue 3)	2 (queue 3)	0, 1 (queue 4)

¹¹ STP = Spanning Tree Protocol

- ¹² BPDU = bridge protocol data unit
- ¹³ DSCP = Differentiated Services Code Point
- ¹⁴ CoS = class of service

The device configures egress queues on the port according to the settings in this table.

Table 24: Auto-QoS	Configuration	for the Egress Queues
--------------------	---------------	-----------------------

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority (shaped)	1	4, 5	up to 100 percent	15 percent	15 percent
SRR shared	2	2, 3, 6, 7	10 percent	25 percent	25 percent
SRR shared	3	0	60 percent	40 percent	40 percent
SRR shared	4	1	20 percent	20 percent	20 percent

Note The device applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the device without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enable the auto-QoS feature on the first port, these automatic actions occur:

- QoS is globally enabled (**mls qos** global configuration command), and other global configuration commands are added.
- When you enter the **auto qos voip cisco-phone** interface configuration command on a port at the edge of the network that is connected to a Cisco IP Phone, the device enables the trusted boundary feature. The device uses the Cisco Discovery Protocol (CDP) to detect the presence of a Cisco IP Phone. When a Cisco IP Phone is detected, the ingress classification on the port is set to trust the QoS label received

in the packet. The device also uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the device changes the DSCP value to 0. When a Cisco IP Phone is absent, the ingress classification is set to not trust the QoS label in the packet. The policing is applied to the traffic that matches the policy-map classification before the device enables the trust boundary feature.

- When you enter the **auto qos voip cisco-softphone** interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the device uses policing to decide whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the device changes the DSCP value to 0.
- When you enter the **auto qos voip trust** interface configuration command on a port connected to the network interior, the device trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices).

You can enable auto-QoS on static, dynamic-access, and voice VLAN access, and trunk ports. When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.

Note

When a device running Cisco SoftPhone is connected to a device or routed port, the device supports only one Cisco SoftPhone application per port.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging.

Note

To disable auto-QoS, you need to remove the auto-QoS commands manually.

Enter the **no mls qos** global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode. Packets are switched without any rewrites and classified as best effort without any policing.

To disable auto-QoS on a port, use the **no auto qos voip** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

This is the enhanced configuration for the **auto qos voip cisco-phone** command:

```
Device(config) # mls qos map policed-dscp 0 10 18 to 8
Device(config) # mls qos map cos-dscp 0 8 16 24 32 46 48 56
Device(config) # class-map match-all AUTOQOS_VOIP_DATA_CLASS
Device(config-cmap) # match ip dscp ef
Device(config) # class-map match-all AUTOQOS_DEFAULT_CLASS
Device(config-cmap) # match access-group name AUTOQOS-ACL-DEFAULT
```

```
Device (config) # class-map match-all AUTOQOS_VOIP_SIGNAL_CLASS
Device (config-cmap) # match ip dscp cs3
Device (config) # policy-map AUTOQOS-SRND4-CISCOPHONE-POLICY
Device (config-pmap) # class AUTOQOS_VOIP_DATA_CLASS
Device (config-pmap-c) # set dscp ef

Device(config-pmap) # class AUTOQOS_DEFAULT_CLASS
Device(config-pmap-c)# set dscp default
Device (config-if) # service-policy input AUTOQOS-SRND4-SOFTPHONE-POLICY
```

Examples

This example shows how to enable auto-QoS and to trust the QoS labels received in incoming packets when the device or router connected to the port is a trusted device:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# auto qos voip trust
```

You can verify your settings by entering the **show auto qos interface** *interface-id* privileged EXEC command.

Related Commands

Command	Description
debug auto qos, on page 351	Enables debugging of the auto-QoS feature.
mls qos cos, on page 371	Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port.
mls qos map, on page 375	Defines the CoS-to-DSCP map or the DSCP-to-CoS map.
mls qos queue-set output buffers, on page 379	Allocates buffers to a queue-set.
mls qos srr-queue output cos-map, on page 385	Maps CoS values to an egress queue or maps CoS values to a queue and to a threshold ID.
mls qos srr-queue output dscp-map, on page 387	Maps DSCP values to an egress queue or maps DSCP values to a queue and to a threshold ID.
mls qos trust, on page 389	Configures the port trust state.
queue-set, on page 397	Maps a port to a queue-set.
show auto qos, on page 354	Displays auto-QoS information.
show mls qos interface, on page 404	Displays QoS information at the port level.
srr-queue bandwidth shape, on page 415	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
srr-queue bandwidth share, on page 417	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

QoS

debug auto qos

To enable debugging of the automatic quality of service (auto-QoS) feature, use the **debug auto qos** command in privileged EXEC mode. Use the **no** form of this command to disable debugging.

debug auto qos no debug auto qos

Syntax Description This command has no arguments or keywords.

Command Default Auto-QoS debugging is disabled.

Command Modes Privileged EXEC

Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EX	This command was introduced.				
Usage Guidelines		To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. You enable debugging by entering the debug auto qos privileged EXEC command.				
	The undebug auto qos command is the	ne same as the no debug auto qos command.				
	When you enable debugging on a device stack, it is enabled only on the active device. To enable debugging on a stack member, you can start a session from the active device by using the session <i>switch-number</i> privileged EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command <i>stack-member-number LINE</i> privileged EXEC command on the active device to enable debugging on a member device without first starting a session.					
Examples	This example shows how to display th auto-QoS is enabled:	e QoS configuration that is automatically generated when				
	Device# debug auto qos Auto QoS debugging is on					
	Device# configure terminal Enter configuration commands, on Device(config)# interface gigabi Device(config-if)#auto qos voip	tethernet1/0/1 cisco-softphone

show auto qos

To display the quality of service (QoS) commands entered on the interfaces on which auto-QoS is enabled, use the **show auto qos** command in privileged EXEC mode.

show auto qos [interface [interface-id]]

	_				
Syntax Description	interface [interface-id]	(Optional) Displays auto-QoS information for the specified port or for all ports. Valid interfaces include physical ports.			
Command Modes	User EXEC				
	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS Release	This command was introduced.			
Usage Guidelines	-	command output shows only the auto qos command entered on each interface. The show <i>interface-id</i> command output shows the auto qos command entered on a specific interface.			
	Use the show runn modifications.	ing-config privileged EXEC command to display the auto-QoS configuration and the user			
	The show auto qos command output shows the service policy information for the Cisco IP phone.				
	To display information about the QoS configuration that might be affected by auto-QoS, use one of these commands:				
	• show mls qos				
	• show mls qos maps cos-dscp				
	• show mls qos interface [interface-id] [buffers queueing]				
	• show mls qos maps [cos-output-q dscp-mutation]				
	• show mls qos input-queue				
	• show running	g-config			
Examples		of output from the show auto qos command after the auto qos voip cisco-phone bip cisco-softphone interface configuration commands are entered:			
	Device# show aut GigabitEthernet2 auto qos voip ci	/0/4			
	GigabitEthernet2 auto qos voip ci				
	GigabitEthernet2	/0/6			

```
auto qos voip cisco-phone
```

This is an example of output from the **show auto qos interface** *interface-id* command when the **auto qos voip cisco-phone** interface configuration command is entered:

```
Device# show auto qos interface gigabitethernet 2/0/5
GigabitEthernet2/0/5
auto qos voip cisco-phone
```

This is an example of output from the **show running-config** privileged EXEC command when the **auto qos voip cisco-phone** and the **auto qos voip cisco-softphone** interface configuration commands are entered:

```
Device# show running-config

I

class

	To define a traffic classification match criteria for the specified class-map name, use the class command in policy-map configuration mode. Use the no form of this command to delete an existing class map.					
	class {class-map-name class-default} no class {class-map-name class-default}					
Syntax Description	class-map-name Assigns a name to the class map.					
	class-default Refers to a system default class that matches unclassified packets.					
Command Default	No policy map class-maps are defined.					
Command Modes	Policy-map configuration					
Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EX	This command was intro				
Usage Guidelines	Before using the class command, you must use the policy-map global configuration command to identify the policy map and enter policy-map configuration mode. After specifying a policy map, you can configure a policy for new classes or modify a policy for any existing classes in that policy map. You attach the policy map to a port by using the service-policy interface configuration command.					
	After entering the class command, you enter policy-map class configuration mode. These configuration commands are available:					
	 exit—Exits policy-map class configuration mode and returns to policy-map configuration no—Returns a command to its default setting. police—Defines a policer or aggregate policer for the classified traffic. The policer specification is and the action to take when the limits are exceeded. For more information page 391 and police aggregate, on page 393. set—Specifies a value to be assigned to the classified traffic. For more information, set trust—Defines a trust state for traffic classified with the class or the class-map configuration, see trust, on page 419. 	ecifies the bandwidth on, see police, on see set, on page 399.				
	To return to policy-map configuration mode, use the exit command. To return to privileg the end command.	ed EXEC mode, use				
	The class command performs the same function as the class-map global configuration c class command when a new classification, which is not shared with any other ports, is n class-map command when the map is shared among many ports.					
	You can configure a default class by using the class class-default policy-map configurate Unclassified traffic (traffic that does not meet the match criteria specified in the traffic c default traffic.					
Examples	This example shows how to configure a default traffic class to a policy map:					

```
Device# configure terminal
Device(config) # class-map cm-3
Device(config-cmap) # match ip dscp 30
Device(config-cmap) # match protocol ipv6
Device(config-cmap)# exit
Device(config) # class-map cm-4
Device(config-cmap)# match ip dscp 40
Device(config-cmap)# match protocol ip
Device(config-cmap)# exit
Device(config) # policy-map pm3
Device(config-pmap) # class class-default
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# exit
Device(config-pmap) # class cm-3
Device(config-pmap-c) set dscp 4
Device(config-pmap-c)# exit
Device(config-pmap) # class cm-4
Device(config-pmap-c) # trust cos
Device(config-pmap-c)# exit
Device(config-pmap)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

This example shows how the default traffic class is automatically placed at the end of policy-map pm3 even though **class-default** was configured first:

```
Device# show policy-map pm3
Policy Map pm3
Class cm-3
set dscp 4
Class cm-4
trust cos
Class class-default
set dscp 10
Device#
```

Related Commands	Command	Description
	class-map, on page 362	Creates a class map to be used for matching packets to the class whose name you specify.
	police, on page 391	Defines a policer for classified traffic.
	policy map, on page 395	Defines a policer for classified traffic.
	set, on page 399	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map, on page 412	Displays quality of service (QoS) policy maps.
	trust, on page 419	Defines a trust state for the traffic classified through the class policy-map configuration command or the class-map global configuration command.

class-map

To create a class map to be used for matching packets to the class whose name you specify and to enter class-map configuration mode, use the **class-map** command in global configuration mode. Use the **no** form of this command to delete an existing class map and to return to global or policy map configuration mode.

class-map [match-any | type] class-map-name
no class-map [match-any | type] class-map-name

Syntax Description	match-any	(Optional) Performs a logical-OR of the matching stateme more criteria must be matched.	nts under this class map. One or			
	type	type (Optional) Configures the CPL class map.				
	class-map-name	Name of the class for the class map. The class name is use configure a policy for the class in the policy map.	ed for both the class map and to			
Command Default	No class maps ar	e defined.				
Command Modes	Global configura	tion				
	Policy map confi	guration				
Command History	Release		Modification			
	Cisco IOS Relea	use 15.0(2)EX	This command was introduced.			
Usage Guidelines	The class-map command and its subcommands are used to define packet classification, marking, and aggregate policing as part of a globally named service policy applied on a per-port basis.					
	After you are in quality of service (QoS) class-map configuration mode, these configuration commands are available:					
	command d	—Describes the class map (up to 200 characters). The show isplays the description and the name of the class map. from QoS class-map configuration mode.	w class-map privileged EXEC			
		nfigures classification criteria. For more information, see the	match (class-map configuration),			
	• no —Removes a match statement from a class map.					
	If you enter the match-any keyword, you can only use it to specify an extended named access control list (ACL) with the match access-group class-map configuration command.					
	To define packet classification on a physical-port basis, only one match command per class map is supported.					
	Only one ACL ca	an be configured in a class map. The ACL can have multiple	le access control entries (ACEs).			
Examples	This example sho is an access list c	ows how to configure the class map called <i>class1</i> with one alled <i>103</i> :	match criterion, which			

```
Device(config)# access-list 103 permit ip any any dscp 10
Device(config)# class-map class1
Device(config-cmap)# match access-group 103
Device(config-cmap)# exit
```

This example shows how to delete the class map *class1*:

```
Device(config) # no class-map class1
```

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class, on page 360	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	match (class-map configuration), on page 365	Defines the match criteria to classify traffic.
	policy map, on page 395	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.

debugging

match (class-map configuration)

To define the match criteria to classify traffic, use the **match** command in class-map configuration mode. Use the **no** form of this command to remove the match criteria.

 $\begin{array}{l} \textbf{match} & \{\textbf{access-group} \ acl-index-or-name \ | \ \textbf{ip} \ \{\textbf{dscp} \ dscp-list \ | \ \textbf{precedence} \ ip-precedence-list\} \ | \ \textbf{protocol} \ \{\textbf{arp} \ | \ \textbf{cdp} \ | \ \textbf{http} \ | \ \textbf{ip} \ | \ \textbf{ip} \ \textbf{b}\} \end{array} \right.$

no match {access-group *acl-index-or-name* | **ip** {dscp *dscp-list* | **precedence** *ip-precedence-list*} | **protocol** {arp | cdp | http | **ip** | **ipv6**}}

Syntax Description	access-group	Specifies the number or name of an access control list (ACL).			
	acl-index-or-name	The range is from 1 to 2799.			
	ip Sets IP specific values.				
		• dscp <i>dscp-list</i> —Lists up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value.			
		• precedence <i>ip-precedence-list</i> —Lists up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.			
	protocol	Specifies the name of a protocol to be used as the match criteria against which packets are checked to determine if they belong to the class specified by the class map.			
	The following protocols are supported: arp,cdp , http , ip , and ipv6 .				
Command Default	No match criteria are	e defined.			
Command Modes	Class-map configura	ıtion			
Command History	Release	Modification			
	Cisco IOS 15.0(2)E	This command was introduced.			
Usage Guidelines		d is used to specify which fields in the incoming packets are examined to classify the access group or the MAC access group matching to the Ether Type/Len are supported.			
	If you enter the class-map match-any <i>class-map-name</i> global configuration command, you can enter the following match commands:				
	match access-group name acl-name				
	 match ip dscp dscp-list match ip precedence ip-precedence-list 				
	You cannot enter the match access-group <i>acl-index</i> command.				
	-	cp <i>dscp-list</i> or the match ip precedence <i>ip-precedence-list</i> command, you can enter a a commonly used value. For example, you can enter the match ip dscp af11 command,			

which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the **match ip precedence 5** command. For a list of supported mnemonics, enter the **match ip dscp ?** or the **match ip precedence ?** command to see the command-line help strings.

You can verify your settings by entering the show class-map privileged EXEC command.

Examples

This example shows how to create a class map called *class2*, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```
Device(config) # class-map class2
Device(config-cmap) # match ip dscp 10 11 12
Device(config-cmap) # exit
```

This example shows how to create a class map called *class3*, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```
Device(config)# class-map class3
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using acl1:

```
Device(config)# class-map class2
Device(config-cmap)# match ip precedence 5 6 7
Device(config-cmap)# no match ip precedence
Device(config-cmap)# match access-group acl1
Device(config-cmap)# exit
```

Related Commands	Command	Description
	class-map, on page 362	Creates a class map to be used for matching packets to the class whose name you specify.
	show class-map, on page 401	Displays quality of service (QoS) class maps.

mls qos

To enable quality of service (QoS) for the entire switch, use the **mls qos** command in global configuration mode. Use the **no** form of this command to reset all the QoS-related statistics and to disable the QoS features for the entire switch.

mls qos no mls qos

Syntax Description This command has no arguments or keywords.

Command Default QoS is disabled. There is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

When QoS is enabled with the **mls qos** global configuration command and all other QoS settings are set to their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. No policy maps are configured. The default port trust state on all ports is untrusted. The default egress queue settings are in effect.

Command Modes Global configuration

Command Modes	Ind Modes Global configuration			
Command History	Release	Modification	_	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	_	
Usage Guidelines	When the mls qos comm	and is entered, QoS is enabled with	the default parameters on all ports in the system.	
	QoS must be globally enabled to use QoS classification, policing, marking or dropping, queueing, and traffic shaping features. You can create a policy map and attach it to a port before entering the mls qos command. QoS processing is disabled until you enter the mls qos command.			
	When you enter the no mls qos command, policy maps and class maps that are used to configure QoS are not deleted from the configuration, but entries corresponding to policy maps are removed from the switch hardware to save system resources. To reenable QoS with the previous configurations, enter the mls qos command.			
	the queue size modificati		lifies (reallocates) the sizes of the queues. During wn during the hardware reconfiguration, and the

	You can verify your setti	ngs by entering the show mls qos p	rivileged EXEC command.	

Related Commands	Command	Description
	show mls qos, on page 402	Displays QoS information.

mls qos aggregate-policer

To define policer parameters that can be shared by multiple classes within the same policy map, use the **mls qos aggregate-policer** command in global configuration mode. Use the **no** form of this command to delete an aggregate policer.

mls qos aggregate-policer *aggregate-policer-name rate-bps burst-byte* exceed-action {drop | policed-dscp-transmit}

no mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte {drop | policed-dscp-transmit}

Syntax Description	aggregate-policer-name	aggregate-policer-name The name of the aggregate policer as referenced by the police aggregate policy-map class configuration command.			
	rate-bps	<i>rate-bps</i> The average traffic rate in bits per second (b/s). The range is 8000 to 1000000000.			
	burst-byte	The normal burst size in bytes. The range is 8000 to 1000000.			
	exceed-action drop	Sets the traffic rate. If the rate is exceeded, the switch drops the packet.			
	exceed-action policed-dscp-transmit	Sets the traffic rate. If the rate is exceeded, the switch changes the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then sends the packet.			
Command Default	No aggregate policers are de	fined.			
Command Modes	Global configuration				
Command History	Release Modific				
	Cisco IOS Release 15.0(2)E	EX This command was			
Usage Guidelines	A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded.				
	Define an aggregate policer if the policer is shared with multiple classes.				
	Policers for a port cannot be shared with other policers for another port; traffic from two different ports cannot be aggregated for policing purposes.				
	The port ASIC device, which controls more than one physical port, supports 256 policers on the switch (255 user-configurable policers plus 1 policer reserved for internal use). The maximum number of configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries. You cannot reserve policers per port (there is no guarantee that a port will be assigned to any policer).				
	You apply an aggregate policer to multiple classes in the same policy map; you cannot use an aggregate policer across different policy maps.				
	You cannot delete an aggregate policer if it is being used in a policy map. You must first use the no police aggregate <i>aggregate-policer-name</i> policy-map class configuration command to delete the aggregate policer from all policy maps before using the no mls qos aggregate-policer <i>aggregate-policer-name</i> command.				

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the *burst-byte* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. For more information, see the software configuration guide for this release.

Examples

This example shows how to define the aggregate policer parameters and how to apply the policer to multiple classes in a policy map:

```
Device(config)# mls qos aggregate-policer agg_policer1 1000000 1000000 exceed-action drop
Device(config)# policy-map policy2
Device(config-pmap)# class class1
Device(config-pmap-c)# police aggregate agg_policer1
Device(config-pmap-c)# exit
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# police aggregate agg_policer1
Device(config-pmap-c)# police aggregate agg_policer1
Device(config-pmap-c)# exit
Device(config-pmap-c)# exit
Device(config-pmap-c)# trust dscp
Device(config-pmap-c)# police aggregate agg_policer2
Device(config-pmap-c)# exit
```

You can verify your settings by entering the **show mls qos aggregate-policer** privileged EXEC command.

Related Commands	Command	Description
	police aggregate, on page 393	Creates a policer that is shared by different classes.

mls qos cos

 To define the default class of service (CoS) value of a port or to assign the default CoS to all incoming packets on the port, use the mls qos cos command in interface configuration mode. Use the no form of this command to return to the default setting.

 mls qos cos {default-cos | override}

 no qos mls cos {default-cos | override}

 default-cos | override}

 default-cos | to verride default cos | override defa

 override
 Overrides the CoS value of the incoming packets, and apply the default CoS value on the port to all incoming packets.

 Command Default
 The default CoS value for a port is 0.

CoS override is disabled.

Command Modes Interface configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EX
 This command was in

Usage Guidelines You can use the default value to assign a CoS and Differentiated Services Code Point (DSCP) value to all incoming packets that are untagged (if the incoming packet does not have a CoS value). You also can assign a default CoS and DSCP value to all incoming packets by using the **override** keyword.

Use the **override** keyword when all incoming packets on certain ports deserve higher or lower priority than packets entering from other ports. Even if a port is previously set to trust DSCP, CoS, or IP precedence, this command overrides the previously configured trust state, and all the incoming CoS values are assigned the default CoS value configured with the **mls qos cos** command. If an incoming packet is tagged, the CoS value of the packet is modified with the default CoS of the port at the ingress port.

Examples This example shows how to configure the default port CoS to 4 on a port:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# mls qos trust cos
Device(config-if)# mls qos cos 4
```

This example shows how to assign all the packets entering a port to the default port CoS value of 4 on a port:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# mls qos cos 4
Device(config-if)# mls qos cos override
```

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Command Modes				
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was in		
Usage Guidelines	If two quality of service (QoS) domains have different DSCP definitions, use the DSCP-to-DSCP-mutation map to translate one set of DSCP values to match the definition of another domain. You apply the DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the boundary of a QoS administrative domain.			
	With ingress mutation, the new DSCP value overwrites the one in the packet, and QoS handles the packet with this new value. The switch sends the packet out the port with the new DSCP value.			
	You can configure multiple DSCP-to-DSCP-mutation maps on ingress ports.			
	You apply the map only to DSCP-trusted ports. If you apply the DSCP mutation map to CoS or IP-precedence trusted port, the command has no immediate effect until the port be	1		
Examples	This example shows how to define the DSCP-to-DSCP mutation map named <i>dscpmutation1</i> and to apply the map to a port:			
	Device(config)# mls qos map dscp-mutation dscpmutation1 10 11 12 13 to 30 Device(config)# interface gigabitethernet3/0/1 Device(config-if)# mls qos trust dscp Device(config-if)# mls qos dscp-mutation dscpmutation1			
	This example shows how to remove the DSCP-to-DSCP mutation map name <i>dscpmutation1</i> from the port and to reset the map to the default:			
	Device(config-if)# no mls qos dscp-mutation dscpmutation1			
	You can verify your settings by entering the show mls qos maps privileged EXEC con	nmand.

Examples

This example shows how to define the IP-precedence-to-DSCP map and to map IP-precedence values 0 to 7 to DSCP values of 0, 10, 20, 30, 40, 50, 55, and 60:

```
Device# configure terminal
Device(config)# mls qos map ip-prec-dscp 0 10 20 30 40 50 55 60
```

This example shows how to define the policed-DSCP map. DSCP values 1, 2, 3, 4, 5, and 6 are marked down to DSCP value 0. Marked DSCP values that not explicitly configured are not modified:

```
Device# configure terminal
Device(config)# mls qos map policed-dscp 1 2 3 4 5 6 to 0
```

This example shows how to define the DSCP-to-CoS map. DSCP values 20, 21, 22, 23, and 24 are mapped to CoS 1. DSCP values 10, 11, 12, 13, 14, 15, 16, and 17 are mapped to CoS 0:

```
Device# configure terminal
Device(config)# mls qos map dscp-cos 20 21 22 23 24 to 1
Device(config)# mls qos map dscp-cos 10 11 12 13 14 15 16 17 to 0
```

This example shows how to define the CoS-to-DSCP map. CoS values 0 to 7 are mapped to DSCP values 0, 5, 10, 15, 20, 25, 30, and 35:

```
Device# configure terminal
Device(config)# mls qos map cos-dscp 0 5 10 15 20 25 30 35
```

This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remain as specified in the null map):

```
Device# configure terminal
Device(config)# mls qos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 10
Device(config)# mls qos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Device(config)# mls qos map dscp-mutation mutation1 20 21 22 to 20
Device(config)# mls qos map dscp-mutation mutation1 0 31 32 33 34 to 30
```

You can verify your settings by entering the **show mls qos maps** privileged EXEC command.

Feature	Queue 1	Queue 2	Queue 3	Queue 4
Reserved threshold	50 percent	100 percent	50 percent	50 percent
Maximum threshold	400 percent	400 percent	400 percent	400 percent

The drop-threshold percentages can exceed 100 percent and can be up to the maximum (if the maximum threshold exceeds 100 percent).

While buffer ranges allow individual queues in the queue set to use more of the common pool when available, the maximum user-configurable number of packets for each queue is still internally limited to 3200 percent, or 32 times the allocated number of buffers. One packet can use one 1 or more buffers.

Note The egress queue default settings are suitable for most situations. Change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to decide whether to grant buffer space to a requesting queue. The switch decides whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over-limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

Examples

This example shows how to map a port to queue set 2. It configures the drop thresholds for queue 2 to 40 and 60 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory this queue can have before packets are dropped:

```
Device(config)# mls qos queue-set output 2 threshold 2 40 60 100 200
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# queue-set 2
```

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

QoS

mls qos rewrite ip dscp

To configure the switch to change or rewrite the Differentiated Services Code Point (DSCP) field of an incoming IP packet, use the **mls qos rewrite ip dscp** command in global configuration mode. Use the **no** form of this command to configure the switch to not modify or rewrite the DSCP field of the packet and to enable DSCP transparency.

mls qos rewrite ip dscp no mls qos rewrite ip dscp

Cisco IOS Release 15.0(2)EX

This command has no arguments or keywords. Syntax Description

DSCP transparency is disabled. The switch changes the DSCP field of the incoming IP packet. **Command Default**

Global configuration **Command Modes**

Release

This command was introd

Modification

Usage Guidelines

Command History

DSCP transparency affects only the DSCP field of a packet at the egress. If DSCP transparency is enabled by using the **no mls qos rewrite ip dscp** command, the switch does not modify the DSCP field in the incoming packet, and the DSCP field in the outgoing packet is the same as that in the incoming packet.

Note

Enabling DSCP transparency does not affect the port trust settings on IEEE 802.1Q tunneling ports.

By default, DSCP transparency is disabled. The switch modifies the DSCP field in an incoming packet, and the DSCP field in the outgoing packet is based on the quality of service (QoS) configuration, including the port trust setting, policing and marking, and the DSCP-to-DSCP mutation map.

Regardless of the DSCP transparency configuration, the switch modifies the internal DSCP value of the packet that the switch uses to generate a class of service (CoS) value representing the priority of the traffic. The switch also uses the internal DSCP value to select an egress queue and threshold.

For example, if QoS is enabled and an incoming packet has a DSCP value of 32, the switch might modify the internal DSCP value based on the policy-map configuration and change the internal DSCP value to 16. If DSCP transparency is enabled, the outgoing DSCP value is 32 (same as the incoming value). If DSCP transparency is disabled, the outgoing DSCP value is 16 because it is based on the internal DSCP value.

Examples

This example shows how to enable DSCP transparency and configure the switch to not change the DSCP value of the incoming IP packet:

Device (config) # mls qos Device(config) # no mls qos rewrite ip dscp

This example shows how to disable DSCP transparency and configure the switch to change the DSCP value of the incoming IP packet:

I

Device(config)# mls qos Device(config)# mls qos rewrite ip dscp

You can verify your settings by entering the **show running config include rewrite** privileged EXEC command.

mls qos trust

To configure the port trust state, use the **mls qos trust** command in interface configuration mode. Use the **no** form of this command to return a port to its untrusted state.

mls qos trust [{cos | device {cisco-phone | cts | ip-camera | media-player} | dscp | ip-precedence}] no mls qos trust [{cos | device {cisco-phone | cts | ip-camera | media-player} | dscp | ip-precedence}]

Syntax Description	cos	(Optional) Classifies an ingress packet by using the packet CoS value. For an untagged packet, use the port default CoS value.	
	device cisco-phone	(Optional) Classifies an ingress packet by trusting the CoS or DSCP value sent from the Cisco IP Phone (trusted boundary), depending on the trust setting.	
	device {cts ip-camera media-player}	(Optional) Classifies an ingress packet by trusting the CoS or DSCP value for these video devices:	
		cts—Cisco TelePresence System	
		• ip-camera—Cisco IP camera	
		• media-player—Cisco digital media player	
		For an untagged packet, use the port default CoS value.	
	dscp	(Optional) Classifies an ingress packet by using the packet DSCP value (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the default port CoS value is used.	
	ip-precedence	(Optional) Classifies an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the port default CoS value is used.	
Command Default	The port is not trusted. If no keyword is specified when you enter the command, the default is dscp .		
Command Modes	Interface configuration	ion	
Command History	Release	Modification	
	Cisco IOS Release 15.0	0(2)EX This command	d was i
Usage Guidelines	are classified at the edge because there is no need	ty of service (QoS) domain are classified at the edge of the domain. When the packets e, the switch port within the QoS domain can be configured to one of the trusted states d to classify the packets at every switch within the domain. Use this command to t is trusted and which fields of the packet to use to classify traffic.	
	the CoS-to-DSCP map i	ed with trust DSCP or trust IP precedence and the incoming packet is a non-IP packet, is used to derive the corresponding DSCP value from the CoS value. The CoS can be k ports or the port default CoS for nontrunk ports.	

I

	If the DSCP is trusted, the DSCP fie CoS value of the packet is modified	ld of the IP packet is not modified. However, it is still possible that the (according to DSCP-to-CoS map).	
	If the CoS is trusted, the CoS field o to CoS-to-DSCP map) if the packet is	f the packet is not modified, but the DSCP can be modified (according is an IP packet.	
	The trusted boundary feature prevents security problems if users disconnect their PCs from networked Cis IP Phones and connect them to the switch port to take advantage of trusted CoS or DSCP settings. You m globally enable the Cisco Discovery Protocol (CDP) on the switch and on the port connected to the IP pho If the telephone is not detected, trusted boundary disables the trusted setting on the switch or routed port a prevents misuse of a high-priority queue.		
	If you configure the trust setting for DSCP or IP precedence, the DSCP or IP precedence values in the incoming packets are trusted. If you configure the mls qos cos override interface configuration command on the switch port connected to the IP phone, the switch overrides the CoS of the incoming voice and data packets and assigns the default CoS value to them.		
	For an inter-QoS domain boundary, you can configure the port to the DSCP-trusted state and apply the DSCP-to-DSCP-mutation map if the DSCP values are different between the QoS domains.		
	Classification using a port trust state (for example, mls qos trust [cos dscp ip-precedence] and a policy map (for example, service-policy input <i>policy-map-name</i>) are mutually exclusive. The last one configured overwrites the previous configuration.

	user-configurable policers plu policers supported per port is	controls more than one physical port, supports 256 policers on the switch (255 is 1 policer reserved for internal use). The maximum number of configurable 63. Policers are allocated on demand by the software and are constrained by the es. You cannot reserve policers per port. There is no guarantee that a port will		
	be assigned to any policer.			
	be assigned to any policer.	guration mode, use the exit command. To return to privileged EXEC mode, use		

Examples

This example shows how to configure a policer that drops packets if traffic exceeds 1 Mb/s average rate with a burst size of 20 KB. The DSCPs of incoming packets are trusted, and there is no packet modification.

```
Device(config) # policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c) # trust dscp
Device(config-pmap-c) # police 1000000 20000 exceed-action drop
Device(config-pmap-c) # exit
```

This example shows how to configure a policer, which marks down the DSCP values with the values defined in policed-DSCP map and sends the packet:

```
Device(config)# policy-map policy2
Device(config-pmap)# class class2
Device(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Device(config-pmap-c)# exit
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

QoS

queue-set

To map a port to a queue set, use the **queue-set** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

queue-set *qset-id* **no queue-set** *qset-id*

Syntax Description *qset-id* Queue-set ID. Each port belongs to a queue set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.

Command Default The queue set ID is 1.

Command Modes Interface configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines For information about automatic generation of the queue-set ID with the **auto qos voip** command, see the "Usage Guidelines" section for the auto qos voip, on page 346 command.

Examples This example shows how to map a port to queue-set 2:

Device(config)# interface gigabitethernet2/0/1
Device(config-if)# queue-set 2

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output buffers, on page 379	Allocates buffers to a queue set.
	mls qos queue-set output threshold, on page 381	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue set.
	show mls qos interface, on page 404	Displays quality of service (QoS) information.

service-policy

To apply a policy map to the input of a physical port, use the **service-policy** command in interface configuration mode. Use the **no** form of this command to remove the policy map and port association.

service-policy {input | output} policy-map-name
no service-policy {input | output} policy-map-name

Syntax Description	input policy-map-name	Applies the specified policy map to the input of a physical port.		
Command Default	No policy maps are att	ached to the port.		
Command Modes	Interface configuration	L		
Command History	Release	Modification		
	Cisco IOS 15.0(2)EX	This command was introduced.		
Usage Guidelines	Though visible in the command-line help strings, the output keyword is not supported.			
	Policy maps can be configured on physical ports. A policy map is defined by the policy map command.			
	Only one policy map is supported per port, per direction. In other words, only one input policy and one output policy is allowed on any one port.			
	You can apply a policy map to incoming traffic on a physical port			
		port trust state (for example, mls qos trust [cos dscp ip-precedence] and a polic vice-policy input <i>policy-map-name</i>) are mutually exclusive. The last one configure s configuration.	•	
Examples	This example shows he	ow to remove <i>plcmap2</i> from a physical port:		
		erface gigabitethernet2/0/2 no service-policy input plcmap2		

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	policy map, on page 395	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show policy-map, on page 412	Displays QoS policy maps.
	show running-config	Displays the operating configuration.

set

To classify IP traffic by setting a Differentiated Services Code Point (DSCP) or an IP-precedence value in the packet, use the **set** command in policy-map class configuration mode. Use the **no** form of this command to remove traffic classification.

set {dscp new-dscp | ip {dscp | precedence} | precedence precedence}
no set {dscp new-dscp | ip {dscp | precedence} | precedence precedence}

Syntax Description	dscp new-dscp	Sets the DSCP value in IPv4 and IPv6 packets.		
		The range is 0 to 63.		
	ip {dscp preceder	nce } Sets the IP values.		
		• dscp —Sets the IP DSCP value.		
		• precedence —Sets the IP precedence value.		
	precedence new-prece	edence Sets the precedence in IPv4 and IPv6 packets.		
		The range is 0 to 7.		
Command Default	No traffic classification	is defined.		
Command Modes	Policy-map class config	uration		
Command History	Release		Modification

set

Examples

This example shows how to assign DSCP 10 to all FTP traffic without any policers:

```
Device(config)# policy-map policy_ftp
Device(config-pmap)# class-map ftp_class
Device(config-cmap)# exit
Device(config)# policy-map policy_ftp
Device(config-pmap)# class ftp_class
Device(config-pmap-c)# set dscp 10
Device(config-pmap)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class, on page 360	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	police, on page 391	Defines a policer for classified traffic.
	policy map, on page 395	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show policy-map, on page 412	Displays QoS policy maps.
	trust, on page 419	Defines a trust state for traffic classified through the class policy-map configuration command or the class-map global configuration command.

show class-map

To display quality of service (QoS) class maps, which define the match criteria to classify traffic, use the **show class-map** command in EXEC mode.

	(Optional) Displays information about control class maps.	-
	(Optional) Displays information about all control class maps.	-

show mls qos interface

To display quality of service (QoS) information at the port level, use the **show mls qos interface** command in EXEC mode.

show mls qos interface [interface-id] [{buffers | queueing | statistics}]

Syntax Description	interface-id	(Optional) The QoS information for the specified port. Valid interfaces include physical ports.
	buffers	(Optional) Displays the buffer allocation among the queues.
	queueing	(Optional) Displays the queueing strategy (shared or shaped) and the weights corresponding to the queues.
	statistics	(Optional) Displays statistics for sent and received Differentiated Services Code Points (DSCPs) and class of service (CoS) values, the number of packets enqueued or dropped per egress queue, and the number of in-profile and out-of-profile packets for each policer.
Command Modes	User EXEC Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introdu
Usage Guidelines	Though visible in the command-line help This command is supported only on the	lp string, the policers keyword is not supported. LAN Base image.
Examples	This is an example of output from the sho QoS is enabled:	ow mls qos interface interface-id command when port-based
	Device# show mls qos interface gig GigabitEthernet1/0/1 trust state: trust cos trust mode: trust cos trust enabled flag: ena COS override: dis default COS: 0 DSCP Mutation Map: Default DSCP Mu Trust device: none qos mode: port-based	
	This is an example of output from the sh o	ow mls qos interface interface-id command when port-based

This is an example of output from the **show mls qos interface** *interface-id* command when port-based QoS is disabled:

```
Device# show mls qos interface gigabitethernet1/0/1
GigabitEthernet1/0/1
QoS is disabled. When QoS is enabled, following settings will be applied
trust state: trust cos
trust mode: trust cos
trust enabled flag: ena
COS override: dis
default COS: 0
DSCP Mutation Map: Default DSCP Mutation Map
Trust device: none
qos mode: port-based
```

This is an example of output from the **show mls qos interface** *interface-id* **buffers** command:

```
Device# show mls qos interface gigabitethernet1/0/2 buffers
GigabitEthernet1/0/2
The port is mapped to qset : 1
The allocations between the queues are : 25 25 25 25
```

This is an example of output from the **show mls qos interface** *interface-id* **queueing** command. The egress expedite queue overrides the configured shaped round robin (SRR) weights.

```
Device# show mls qos interface gigabitethernet1/0/2 queueing
GigabitEthernet1/0/2
Egress Priority Queue :enabled
Shaped queue weights (absolute) : 25 0 0 0
Shared queue weights : 25 25 25 25
The port bandwidth limit : 100 (Operational Bandwidth:100.0)
The port is mapped to qset : 1
```

This is an example of output from the **show mls qos interface** *interface-id* **statistics** command:

Device# show mls qos interface gigabitethernet1/0/1 statistics GigabitEthernet1/0/1 (All statistics are in packets)

srr-queue bandwidth share

QoS

To assign the shared weights and to enable bandwidth sharing on the four egress queues mapped to a port, use the **srr-queue bandwidth share** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

srr-queue bandwidth share weight1 weight2 weight3 weight4 no srr-queue bandwidth share

Syntax Description	weight1 weight2 weight weight4	<i>t3</i> The ratios of <i>weight1</i> , <i>weight2</i> , <i>weight3</i> , and <i>weight4</i> specify the ratio of the frequency in which the SRR scheduler dequeues packets. Separate each value with a space. The range is 1 to 255.	
Command Default	Equal bandwidth is alloc	cated to each queue (Equal bandwidth for weight1, weight2, weight3, and weight4).	
Command Modes	Interface configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0	D(2)EX This command was intr	
Usage Guidelines	The ratio of the weights packets from each queue	is the ratio of frequency in which the shaped round-robin (SRR) scheduler dequeues e.	
	The absolute value of ea	ach weight is meaningless, and only the ratio of parameters is used.	
	In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue empties and does not require a share of the link, the remaining queues can expand into the unused bandwidth and share it among themselves.		
	If you configure a shaped queue weight to 0 by using the srr-queue bandwidth shape interface configuration command, this queue participates in SRR shared mode. The weight specified with the srr-queue bandwidth shape command is ignored, and the weights specified with the srr-queue bandwidth share interface configuration command for a queue take effect.		
	When configuring queue lowest numbered queue	es for the same port for both shaping and sharing, make sure that you configure the for shaping.	
-		efault settings are suitable for most situations. Change them only when you have a thorough ne egress queues and if these settings do not meet your QoS solution.	
Examples	port. Four queues are use $1/(1+2+3+4)$, $2/(1+2+3+4)$ percent, and 40 percent for	w to configure the weight ratio of the SRR scheduler running on an egress red. The bandwidth ratio allocated for each queue in shared mode is +4), $3/(1+2+3+4)$, and $4/(1+2+3+4)$, which is 10 percent, 20 percent, 30 For queues 1, 2, 3, and 4. This means that queue 4 has four times the bandwidth ndwidth of queue 2, and one-and-a-third times the bandwidth of queue 3.	

```
Device (config) # interface gigabitethernet2/0/1
Device (config-if) # srr-queue bandwidth share 1 2 3 4
```

You can verify your settings by entering the **show mls qos interface** [*interface-id* **queueing**] privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output buffers, on page 379	Allocates buffers to a queue set.
	mls qos queue-set output threshold, on page 381	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue set.
	mls qos srr-queue output dscp-map, on page 387	Maps Differentiated Services Code Point (DSCP) values to an egress queue or maps DSCP values to a queue and to a threshold ID.

	Cisco IOS	Release 15.0(2)EX	This command was introduced.
	-		

Usage Guidelines

This command requires access to a RADIUS server.

We recommend that you enter the **dot1x reauthentication** interface configuration command before configuring IEEE 802.1x RADIUS accounting on an interface.

This example shows how to configure IEEE 802.1x accounting:

Device(config)# aaa new-model
Device(config)# aaa accounting dot1x default start-stop group radius

aaa accounting identity

To enable authentication, authorization, and accounting (AAA) for IEEE 802.1x, MAC authentication bypass (MAB), and web authentication sessions, use the **aaa accounting identity** command in global configuration mode. To disable IEEE 802.1x accounting, use the **no** form of this command.

aaa accounting identity {name | default } start-stop { broadcast group {name | radius | tacacs+}
[group {name | radius | tacacs+} ...] | group {name | radius | tacacs+} [group
{name | radius | tacacs+}...] }
no aaa accounting identity {name | default }

Syntax Description	name	Name of a server group. This is optional when you enter it after keywords.	the broadcast group and group			
	default	Uses the accounting methods that follow as the default list for	accounting services.			
	start-stop	Sends a start accounting notice at the beginning of a process ar end of a process. The start accounting record is sent in the bac process begins regardless of whether or not the start accountin accounting server.	ckground. The requested-user			
	broadcast	Enables accounting records to be sent to multiple AAA server the first server in each group. If the first server is unavailable, servers to identify the first server.				
	group	Specifies the server group to be used for accounting services. names:	These are valid server group			
		• <i>name</i> — Name of a server group.				
	• radius — Lists of all RADIUS hosts.					
		• tacacs+ — Lists of all TACACS+ hosts.				
		The group keyword is optional when you enter it after the broad You can enter more than optional group keyword.	lcast group and group keywords.			
	radius	(Optional) Enables RADIUS authorization.				
	tacacs+	s+ (Optional) Enables TACACS+ accounting.				
Command Default	AAA accou	inting is disabled.				
Command Modes	Global conf	iguration				
Command History	Release	Μ	odification			
	Cisco IOS	Release 15.0(2)EX Th	nis command was introduced.			
Usage Guidelines		AAA accounting identity, you need to enable policy mode. To er tion display new-style command in privileged EXEC mode.	nable policy mode, enter the			

This example shows how to configure IEEE 802.1x accounting identity:

Device# authentication display new-style

Please note that while you can revert to legacy style configuration at any time unless you have explicitly entered new-style configuration, the following caveats should be carefully read and understood.

- (1) If you save the config in this mode, it will be written to NVRAM in NEW-style config, and if you subsequently reload the router without reverting to legacy config and saving that, you will no longer be able to revert.
- (2) In this and legacy mode, Webauth is not IPv6-capable. It will only become IPv6-capable once you have entered newstyle config manually, or have reloaded with config saved in 'authentication display new' mode.

Device# configure terminal Device(config)# aaa accounting identity default start-stop group radius

aaa authentication dot1x

To specify the authentication, authorization, and accounting (AAA) method to use on ports complying with the IEEE 802.1x authentication, use the **aaa authentication dot1x** command in global configuration mode on a standalone switch. To disable authentication, use the **no** form of this command.

aaa authentication dot1x {default} method1
no aaa authentication dot1x {default} method1

Syntax Description default The default method when a user logs in. Use the listed authentication method that follows this argument. method1 Specifies the server authentication. Enter the **group radius** keywords to use the list of all RADIUS servers for authentication. Note Though other keywords are visible in the command-line help strings, only the default and group radius keywords are supported. No authentication is performed. **Command Default** Global configuration **Command Modes Command History** Release Modification Cisco IOS Release 15.0(2)EX This command was introduced. **Usage Guidelines** The **method** argument identifies the method that the authentication algorithm tries in the specified sequence to validate the password provided by the client. The only method that is IEEE 802.1x-compliant is the group radius method, in which the client data is validated against a RADIUS authentication server. If you specify group radius, you must configure the RADIUS server by entering the radius-server host global configuration command. Use the **show running-config** privileged EXEC command to display the configured lists of authentication methods. This example shows how to enable AAA and how to create an IEEE 802.1x-compliant authentication list. This authentication first tries to contact a RADIUS server. If this action returns an error, the user is not allowed access to the network. Device (config) # aaa new-model Device (config) # aaa authentication dot1x default group radius

aaa authorization network

To the configure the switch to use user-RADIUS authorization for all network-related service requests, such as IEEE 802.1x VLAN assignment, use the **aaa authorization network** command in global configuration mode. To disable RADIUS user authorization, use the **no** form of this command

aaa authorization network default group radius no aaa authorization network default

Syntax Description	default group radius	Use the list of all RADIUS list.	hosts in the server group as the default authorization
Command Default	Authorization is disable	ed.	
Command Modes	Global configuration		
Command History	Release		Modification
	Cisco IOS Release 15.	0(2)EX	This command was introduced.
Usage Guidelines	to download IEEE 802.	.1x authorization parameters	radius global configuration command to allow the switch from the RADIUS servers in the default authorization es such as VLAN assignment to get parameters from the
	Use the show running-config privileged EXEC command to display the configured lists of authorization methods.		
	This example shows how to configure the switch for user RADIUS authorization for all network-related service requests:		
	Device(config)# aaa	authorization network de	efault group radius

aaa new-model

To enable the authentication, authorization, and accounting (AAA) access control model, issue the **aaa new-model** command in global configuration mode. To disable the AAA access control model, use the **no** form of this command.

aaa new-model no aaa new-model

Syntax Description This command has no arguments or keywords.

Command Default AAA is not enabled.

Command Modes Global configuration (config)

ommand History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines

Co

This command enables the AAA access control system.

If the **login local** command is configured for a virtual terminal line (VTY), and the **aaa new-model** command is removed, you must reload the switch to get the default configuration or the **login** command. If the switch is not reloaded, the switch defaults to the **login local** command under the VTY.

Ŵ

Note We do not recommend removing the aaa new-model command.

The following example shows this restriction:

```
Device(config)# aaa new-model
Device(config)# line vty 0 15
Device(config-line)# login local
Device(config)# no aaa new-model
Device(config)# exit
Device(config)# exit
Device# show running-config | b line vty
line vty 0 4
login local !<=== Login local instead of "login"
line vty 5 15
login local
!</pre>
```

Examples

The following example initializes AAA:

Device(config) # aaa new-model
Device(config) #

Related Commands

Command	Description
aaa accounting	Enables AAA accounting of requested services for billing or security purposes.
aaa authentication arap	Enables an AAA authentication method for ARAP using TACACS+.
aaa authentication enable default	Enables AAA authentication to determine if a user can access the privileged command level.
aaa authentication login	Sets AAA authentication at login.
aaa authentication ppp	Specifies one or more AAA authentication method for use on serial interfaces running PPP.
aaa authorization	Sets parameters that restrict user access to a network.

authentication host-mode

To set the authorization manager mode on a port, use the **authentication host-mode** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

 $authentication\ host-mode\ \{multi-auth\ |\ multi-domain\ |\ multi-host\ |\ single-host\}\ no\ authentication\ host-mode$

ntroduced.		
oice device to gured on the		
port.		
ccess through VLAN is		
Multi-host mode also offers port access for multiple hosts behind a hub, but multi-host mode gives unrestricted port access to the devices after the first user gets authenticated.		

Device(config-if) # authentication host-mode multi-host

This example shows how to enable single-host mode on a port:

Device(config-if) # authentication host-mode single-host

You can verify your settings by entering the **show authentication sessions interface** *interface details* privileged EXEC command.

authentication mac-move permit

To enable MAC move on a device, use the **authentication mac-move permit** command in global configuration mode. To disable MAC move, use the **no** form of this command.

authentication mac-move permit no authentication mac-move permit

Syntax Description This command has no arguments or keywords.

Command Default MAC move is disabled.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines The command enables authenticated hosts to move between 802.1x-enabled ports on a device. For example, if there is a device between an authenticated host and port, and that host moves to another port, the authentication session is deleted from the first port, and the host is reauthenticated on the new port.

If MAC move is disabled, and an authenticated host moves to another port, it is not reauthenticated, and a violation error occurs.

MAC move is not supported on port-security enabled 802.1x ports. If MAC move is globally configured on the switch and a port security-enabled host moves to an 802.1x-enabled port, a violation error occurs.

This example shows how to enable MAC move on a device:

Device(config)# authentication mac-move permit

authentication priority

To add an authentication method to the port-priority list, use the **authentication priority** command in interface configuration mode. To return to the default, use the **no** form of this command.

Syntax Description	do	ot1x	(Optional) Adds 802.1x to the order of authentication methods.	
	m	ab	(Optional) Adds MAC authentication bypass (MAB) to the order of authention methods.	
	we	ebauth	Adds web authentication to the order of authentication methods.	
Command Default	— The	The default priority is 802.1x authentication, followed by MAC authentication bypass and web authentication.		
Command Modes	Inte	erface configuration		
Command History	Re	elease	Modification	
	Ci	isco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	Ordering sets the order of methods that the switch attempts when trying to authenticate a new device is connected to a port.			
	When configuring multiple fallback methods on a port, set web authentication (webauth) last.			
	Assigning priorities to different authentication methods allows a higher-priority method to interrupt an in-progress authentication method with a lower priority.			
	Note	If a client is already authen occurs.	nticated, it might be reauthenticated if an interruption from a higher-priority method	
	The default priority of an authentication method is equivalent to its position in execution-list order: 802.1x authentication, MAC authentication bypass (MAB), and web authentication. Use the dot1x , mab , and webauth keywords to change this default order.			
	This example shows how to set 802.1x as the first authentication method and web authentication as the second authentication method:			
	Device(config-if)# authentication priority dotx webauth			
	This example shows how to set MAB as the first authentication method and web authentication as the second authentication method:			

Device(config-if) # authentication priority mab webauth

	This example shows how to configure an 802.1x-enabled port to ignore a new device when it connects to the port:			
	Device(config-if)# authent	ication violation protect		

This example shows how to configure an 802.1x-enabled port to remove the current session and initiate authentication with a new device when it connects to the port:

Device(config-if) # authentication violation replace

You can verify your settings by entering the show authentication privileged EXEC command.

auto security

To configure global auto security, use the **auto security** command in global configuration mode. To disable auto security, use the **no** form of this command.

auto security no auto security

This command has no arguments and keywords.

Command Default Auto security is enabled globally.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS Release 15	.2(5)E This command was introduced in a release prior to Cisco IOS Release 15.2(5)E.
Usage Guidelines	• •	nuto security in global configuration mode, auto security is enabled on all interfaces. o security, it is disabled on all interfaces.
	To enable auto security mode.	y on specific interfaces, use the auto security-port command in interface configuration

Note In Cisco IOS Release 15.2(5)E, auto security is enabled on interfaces, when the **auto security** command is configured in global configuration mode; however, the **auto security-port** {**host** |**uplink**} command is not explicitly saved to the interface configuration. When auto security is configured on an interface, and then the **auto security-port** {**host** |**uplink**} command is removed from that interface; the **no auto security-port** {**host** |**uplink**} command is saved to interface configuration.

This example shows how to enable auto security globally:

Switch(config) # auto security

Related Commands	Command	Description
	auto security-port	Configures auto security on an interface.
	show auto security	Displays auto security status.

auto security-port

To configure auto security on an interface, use the **auto security-port** command in interface configuration mode. To disable auto security on an interface, use the **no** form of this command.

auto security {host | uplink}
no auto security

Syntax Description	host Configures auto security for a host port.
	uplink Configures auto security for an uplink port.
Command Default	Auto security is disabled on all interfaces.
Command Modes	Interface configuration (config-if)
Command History	Release Modification
	Cisco IOS Release 15.2(5)E This command was introduced in a release prior to Cisco IOS Release 15.2(5)E.
Usage Guidelines	You can enable auto security globally, by using the auto security in global configuration mode.
	Note In Cisco IOS Release 15.2(5)E, auto security is enabled on interfaces, when the auto security command is configured in global configuration mode; however, the auto security-port { host uplink } command is not explicitly saved to the interface configuration. When auto security is configured on an interface, and then the auto security-port { host uplink } command is removed from that interface; the no auto security-port { host uplink } command is saved to interface configuration.
	The following example shows how to configure auto security on an interface:
	Switch(config)# interface gigabitethernet 1/0/2 Switch(config-if)# auto security-port host

Related Commands	Command	Description
	auto security	Configures global auto security.
	show auto security	Displays auto security status.

cisp enable

To enable Client Information Signaling Protocol (CISP) on a switch so that it acts as an authenticator to a supplicant switch and a supplicant to an authenticator switch, use the **cisp** enable global configuration command.

cisp enable no cisp enable

Syntax Description	This command has no arguments or keywords.
--------------------	--

Command Default No default behavior or values.

Command Modes Global configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

 This command was reintroduced.
 This command was not supported in and

Usage Guidelines

The link between the authenticator and supplicant switch is a trunk. When you enable VTP on both switches, the VTP domain name must be the same, and the VTP mode must be server.

To avoid the MD5 checksum mismatch error when you configure VTP mode, verify that:

- VLANs are not configured on two different switches, which can be caused by two VTP servers in the same domain.
- Both switches have different configuration revision numbers.

This example shows how to enable CISP:

Device(config) # cisp enable

Related Commands Co

Command	Description
dot1x credentialsprofile	Configures a profile on a supplicant switch.
dot1x supplicant force-multicast	Forces 802.1X supplicant to send multicast packet
dot1x supplicant controlled transient	Configures controlled access by 802.1X supplican
show cisp	Displays CISP information for a specified interfac

clear errdisable interface vlan

To reenable a VLAN that was error-disabled, use the **clear errdisable interface** command in privileged EXEC mode.

clear errdisable interface interface-id vlan [vlan-list]

Syntax Description	interface-id	Specifies an interface.	
	vlan list	(Optional) Specifies a list of VLANs to be reenabled. I	
Command Default	No default behavior or values.		
Command Modes	Privileged EXEC		
Command History	Release	Modification

show mac address-table	Displays the MAC address table static and dynamic entries.	
show mac address-table move update	Displays the MAC address-table move update information on the switch.	

Command	Description
show mac address-table notification	Displays the MAC address notification settings for all interfaces or on the specified interface when the interface keyword is appended.
snmp trap mac-notification change	Enables the SNMP MAC address notification trap on a specific interface.

debug ip rip

To display information on Routing Information Protocol (RIP) routing transactions, use the **debug ip rip** command in privileged EXEC mode. To disable debugging output, use the **no** form of this command.

debug ip rip [{database | events | trigger}] no debug ip rip [{database | events | trigger}]

Syntax Description	database	(Optional) Displays information about RIP database events.
	events	(Optional) Displays information about RIP protocol-based events.
trigger		(Optional) Displays information about RIP trigger extensions.

Command Modes

Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS Release 15.2(5)E2	This command was introduced.

Examples

In the following example, the router being debugged has received updates from a router at source address 10.89.80.28. In this scenario, information has been sent to about five destinations in the routing table update. Notice that the fourth destination address in the update, 172.31.0.0, is inaccessible because it is more than 15 hops away from the router from which the update was sent. The router being debugged also sends updates, in both cases to broadcast address 255.255.255.255 as the destination.

```
Device# debug ip rip
RIP: received update from 10.89.80.28 on GigabitEthernet0/0/0
10.89.95.0 in 1 hops
10.89.81.0 in 1 hops
10.89.66.0 in 2 hops
172.31.0.0 in 16 hops (inaccessible)
0.0.0.0 in 7 hop
RIP: sending update to 255.255.255.255 via GigabitEthernet0/0/0 (10.89.64.31)
subnet 10.89.94.0, metric 1
172.31.0.0 in 16 hops (inaccessible)
RIP: sending update to 255.255.255.255 via Serial1 (10.89.94.31)
subnet 10.89.64.0, metric 1
subnet 10.89.64.0, metric 3
172.31.0.0 in 16 hops (inaccessible)
default 0.0.0.0, metric 8
```

The second line is an example of a routing table update. It shows the number of hops between a given Internet address and the device.

The entries show that the device is sending updates that are similar, except that the number in parentheses is the source address encapsulated into the IP header.

The following are examples for the **debug ip rip** command of entries that appear at startup, during an interface transition event, or when a user manually clears the routing table:

RIP: broadcasting general request on GigabitEthernet0/0/0 RIP: broadcasting general request on GigabitEthernet1/0/0

The following entry is most likely caused by a malformed packet from the sender:

RIP: bad version 128 from 160.89.80.43

Related Commands	Command	Description	
		Displays summary address entries in the RIP routing database entries if relevant are routes being summarized based upon a summary address.	

deny (MAC access-list configuration)

To prevent non-IP traffic from being forwarded if the conditions are matched, use the **deny** MAC access-list configuration command on the switch stack or on a standalone switch. To remove a deny condition from the named MAC access list, use the **no** form of this command.

deny {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp] [cos cos] no deny {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | appletalk | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp] [cos cos]

Command Modes	Mac-access list configuration	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	You enter MAC-access list configuration mode by command.	using the mac access-list extended global configuration
	If you use the host keyword, you cannot enter an ad enter an address mask.	dress mask; if you do not use the host keyword, you must

When an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in the table.

Table 32: IPX Filtering Criteria

IPX Encapsulation Type		Filter Criterion	
Cisco IOS Name	Novel Name		
arpa	Ethernet II	EtherType 0x8137	
snap	Ethernet-snap	EtherType 0x8137	
sap	Ethernet 802.2	LSAP 0xE0E0	
novell-ether	Ethernet 802.3	LSAP 0xFFFF	

This example shows how to define the named MAC extended access list to deny NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is denied.

Device(config-ext-macl) # deny any host 00c0.00a0.03fa netbios.

This example shows how to remove the deny condition from the named MAC extended access list:

Device(config-ext-macl) # no deny any 00c0.00a0.03fa 0000.0000.0000 netbios.

This example denies all packets with EtherType 0x4321:

Device(config-ext-macl) # deny any any 0x4321 0

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	mac access-list extended	Creates an access list based on MAC addresses for

device-role (IPv6 snooping)

To specify the role of the device attached to the port, use the **device-role** command in IPv6 snooping configuration mode.

	device-role { node switch }	
Syntax Description	node Sets the role of the attached device to node.	
	switch Sets the role of the attached device to switch.	
Command Default	The device role is node.	
Command Modes	IPv6 snooping configuration	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	The device-role command specifies the role of the device node.	e attached to the port. By default, the device role is
	The switch keyword indicates that the remote device is a multiswitch mode; binding entries learned from the port the port is configured as a trust-port, binding entries will be	will be marked with trunk_port preference level. If
	This example shows how to define an IPv6 snooping poli IPv6 snooping configuration mode, and configure the dev	
	Device(config)# ipv6 snooping policy policy1 Device(config-ipv6-snooping)# device-role node	

device-role (IPv6 nd inspection)

To specify the role of the device attached to the port, use the **device-role** command in neighbor discovery (ND) inspection policy configuration mode.

	device-role { host monit	or router switch }	
Syntax Description	host	Sets the role of the attached device to	host.
	monitor	Sets the role of the attached device to	monitor.
	router	Sets the role of the attached device to router.	
	switch	Sets the role of the attached device to	switch.
Command Default	The device role is host.		
Command Modes	ND inspection policy configu	ration	
Command History	Release		Modification
	Cisco IOS Release 15.0(2)EZ	X	This command was introduced.
			The keywords monitor and router are deprecated.
Usage Guidelines	host, and therefore all the inbo	ecifies the role of the device attached to bund router advertisement and redirect n eyword, all messages (router solicitation ort.	nessages are blocked. If the device role
		keyword is used, the multicast RS messa s enabled. However, the monitor keyword	• • • •

messages. When the monitor keyword is used, devices that need these messages will receive them. The switch keyword indicates that the remote device is a switch and that the local switch is now operating in

multiswitch mode; binding entries learned from the port will be marked with trunk port preference level. If the port is configured as a trust-port, binding entries will be marked with trunk_trusted_port preference level.

The following example defines a Neighbor Discovery Protocol (NDP) policy name as policy1, places the device in ND inspection policy configuration mode, and configures the device as the host:

Device(config)# ipv6 nd inspection policy policy1 Device(config-nd-inspection) # device-role host

device-tracking policy

To configure a Switch Integrated Security Features (SISF)-based IP device tracking policy, use the **device-tracking** command in global configuration mode. To delete a device tracking policy, use the **no** form of this command.

device -tracking policy *policy-name* no device-tracking policy *policy-name*

	no device-ti acking poncy poncy-name			
Syntax Description	policy-name	<i>policy-name</i> User-defined name of the device tracking policy. The policy name can be a symbolic string (such as Engineering) or an integer (such as 0).		
Command Default	A device track	king policy is not configured.		
Command Modes	Global configuration			
Command History	Release		Modification	
			This command was introduced.	
Usage Guidelines	device-tracki	ng policy command is enabled, the	nmand to create a device tracking policy. When the configuration mode changes to device-tracking configuration gure the following first-hop security commands:	
	• (Optional) device-role { node] switch }—Specifies the role of the device attached to the port. Default is node .			
	• (Optional) limit address-count value—Limits the number of addresses allowed per target.			
	• (Optional) no —Negates a command or sets it to defaults.			
	• (Optional) destination-glean { recovery log-only }[dhcp]}—Enables binding table recovery by data traffic source address gleaning.			
	• (Optional) data-glean {recovery log-only} [dhcp ndp]}—Enables binding table recovery using source or data address gleaning.			
	• (Optional Default is		bect }—Specifies the level of security enforced by the feature.	
	guard This i inspe	d —Gleans addresses and inspects n is the default option. ct —Gleans addresses, validates me	es and populates the binding table without any verification. Bessages. In addition, it rejects RA and DHCP server messages. Ssages for consistency and conformance, and enforces address	
	owne	rship.		
	• (Optional	l) tracking {disable enable}—S	pecifies a tracking option.	
	learned th	hrough a trusted port have preferen	port. It disables the guard on applicable targets. Bindings ace over bindings learned through any other port. A trusted on while making an entry in the table.	

This example shows how to configure an a device-tracking policy:

Device(config)# device-tracking policy policy1
Device(config-device-tracking)# trusted-port

dot1x critical (global configuration)

To configure the IEEE 802.1X critical authentication parameters, use the **dot1x critical** command in global configuration mode.

dot1x critical eapol

eapol Specifies that the switch send an EAPOL-Success message when the switch successfully auther the critical port.		
eapol is disabled		
Global configuration		
Release	Modification	
Cisco IOS Release 15.0(2)EX	This command was introduced.	
	the critical port. eapol is disabled Global configuration Release	

This example shows how to specify that the switch sends an EAPOL-Success message when the switch successfully authenticates the critical port:

Device (config) # dot1x critical eapol

dot1x pae

To set the Port Access Entity (PAE) type, use the **dot1x pae** command in interface configuration mode. To disable the PAE type that was set, use the **no** form of this command.

dot1x pae {supplicant | authenticator}
no dot1x pae {supplicant | authenticator}

Syntax Description	supplicant	The interface acts only as a suppl an authenticator.	icant and will not respond to messages that are meant for	
	authenticator	authenticator The interface acts only as an authenticator and will not respond to any messages meant for a supplicant.		
Command Default	PAE type is not	set.		
Command Modes	Interface config	uration		
Command History	Release		Modification	
	Cisco IOS Rele	ease 15.0(2)EX	This command was introduced.	
			This command was reintroduced. This command was not supported in and	

Use the no dot1x pae interface configuration command to disable IEEE 802.1x authentication on the port.

When you configure IEEE 802.1x authentication on a port, such as by entering the **dot1x port-control** interface configuration command, the switch automatically configures the port as an IEEE 802.1x authenticator. After the **no dot1x pae** interface configuration command is entered, the Authenticator PAE operation is disabled.

The following example shows that the interface has been set to act as a supplicant:

Device(config) # interface g1/0/3
Device(config-if) # dot1x pae supplicant

dot1x supplicant force-multicast

To force a supplicant switch to send only multicast Extensible Authentication Protocol over LAN (EAPOL) packets whenever it receives multicast or unicast EAPOL packets, use the dot1x supplicant force-multicast command in global configuration mode. To return to the default setting, use the no form of this command.

dot1x supplicant force-multicast no dot1x supplicant force-multicast

This command has no arguments or keywords. Syntax Description

The supplicant switch sends unicast EAPOL packets when it receives unicast EAPOL packets. Similarly, it **Command Default** sends multicast EAPOL packets when it receives multicast EAPOL packets.

Global configuration **Command Modes**

Command History Release Modification Cisco IOS Release 15.0(2)EX This command was introduced. This command was reintroduced. This command was not supported in and

Enable this command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all **Usage Guidelines** host modes.

This example shows how force a supplicant switch to send multicast EAPOL packets to the authenticator switch:

Device (config) # dot1x supplicant force-multicast

dot1x test eapol-capable

To monitor IEEE 802.1x activity on all the switch ports and to display information about the devices that are connected to the ports that support IEEE 802.1x, use the **dot1x test eapol-capable** command in privileged EXEC mode on the switch stack or on a standalone switch.

dot1x test eapol-capable [interface interface-id]

Syntax Description	interface interface-id	(Optional) Port to be queried.	
Command Default	There is no default setting.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	Use this command to test the IEEE 802.1x capability of the devices connected to all ports or to specific ports on a switch.		
	There is not a no form of this command.		
	This example shows how to enable the IEEE 802.1x readiness check on a switch to query a port. It also shows the response received from the queried port verifying that the device connected to it is IEEE 802.1x-capable:		
	Device# dot1x test eapol-capable interface gigabitethernet1/0/13		
	DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC capable	: 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL	
Related Commands	Command	Description	
	dot1x test timeout timeout	Configures the timeout used to	

dot1x test timeout

To configure the timeout used to wait for EAPOL response from a port being queried for IEEE 802.1x readiness, use the **dot1x test timeout** command in global configuration mode on the switch stack or on a standalone switch.

dot1x test timeout timeout

Syntax Description	timeout	Time in seconds to wait for an EAPOL response. The range is from 1 to 65535 seconds.
Command Default	The default setting is 10 seconds.	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	Use this command to configure the timeout used to wait for EAPOL response. There is not a no form of this command. This example shows how to configure the switch to wait 27 seconds for an EAPOL response: Device# dot1x test timeout 27 You can verify the timeout configuration status by entering the show run privileged EXEC command.	
Related Commands	Command	Description
	dot1x test eapol-capable [interface interface-id]	Checks for IEEE 802.1x readiness on devices connected to all or to specified IEEE 802.1x-capable ports.

dot1x timeout

To configure the value for retry timeouts, use the **dot1x timeout** command in global configuration or interface configuration mode. To return to the default value for retry timeouts, use the **no** form of this command.

	dot1x timeout { auth-period <i>seconds seconds</i> server-timeout <i>seconds</i> <i>seconds</i> }	held-period secondsquiet-period secondsratelimit-periodstart-period secondssupp-timeout secondstx-period
Syntax Description	auth-period seconds	Configures the time, in seconds for which a supplicant will stay in the HELD state (that is, the length of time it will wait before trying to send the credentials again after a failed attempt).
		The range is from 1 to 65535. The default is 30.
	held-period seconds	Configures the time, in seconds for which a supplicant will stay in the HELD state (that is, the length of time it will wait before trying to send the credentials again after a failed attempt).
		The range is from 1 to 65535. The default is 60
	quiet-period seconds	Configures the time, in seconds, that the authenticator (server) remains quiet (in the HELD state) following a failed authentication exchange before trying to reauthenticate the client.
		The range is from 1 to 65535. The default is 60
	ratelimit-period seconds	Throttles the EAP-START packets that are sent from misbehaving client PCs (for example, PCs that send EAP-START packets that result in the wasting of switch processing power).
		• The authenticator ignores EAPOL-Start packets from clients that have successfully authenticated for the rate-limit period duration.
		• The range is from 1 to 65535. By default, rate limiting is disabled.
	server-timeout seconds	Configures the interval, in seconds, between two successive EAPOL-Start frames when they are being retransmitted.
		• The range is from 1 to 65535. The default is 30.
		If the server does not send a response to an 802.1X packet within the specified period, the packet is sent again.
	start-period seconds	Configures the interval, in seconds, between two successive EAPOL-Start frames when they are being retransmitted.
		The range is from 1 to 65535. The default is 30.
		In Cisco IOS Release 15.2(5)E, this command is only available in the supplicant mode. If the command is applied in any other mode, the command misses from the configuration.

I

	supp-timeout seconds	Sets the authenticator-to-supplicant retransmission time for all EAP messages other than EAP Request ID.
		The range is from 1 to 65535. The default is 30.
	tx-period seconds	Configures the number of seconds between retransmission of EAP request ID packets (assuming that no response is received) to the client.
		• The range is from 1 to 65535. The default is 30.
		• If an 802.1X packet is sent to the supplicant and the supplicant does not send a response after the retry period, the packet will be sent again.
Command Default	Periodic reauthentication and per	riodic rate-limiting are done.
Command Modes	Interface configuration	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.	
	The dot1x timeout reauth-period interface configuration command affects the behavior of the switch only if you have enabled periodic re-authentication by using the dot1x reauthentication interface configuration command.	
	During the quiet period, the switch does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number smaller than the default.	
	When the ratelimit-period is set to 0 (the default), the switch does not ignore EAPOL packets from clients that have been successfully authenticated and forwards them to the RADIUS server.	
	The following example shows that various 802.1X retransmission and timeout periods have been set:	
	Device(config)# configure t Device(config)# interface g Device(config-if)# dot1x po Device(config-if)# dot1x tin Device(config-if)# dot1x tin	1/0/3 rt-control auto meout auth-period 2000 meout held-period 2400 meout quiet-period 600 meout start-period 90 meout supp-timeout 300 meout tx-period 60

This command was introduced.

epm access-control open

To configure an open directive for ports that do not have an access control list (ACL) configured, use the **epm access-control open** command in global configuration mode. To disable the open directive, use the **no** form of this command.

epm access-control open no epm access-control open

Command Default The default directive applies.

Command Modes Global configuration

Command History

Release Modification

Cisco IOS Release 15.0(2)EX

Usage Guidelines Use this command to configure an open directive that allows hosts without an authorization policy to access ports configured with a static ACL. If you do not configure this command, the port applies the policies of the configured ACL to the traffic. If no static ACL is configured on a port, both the default and open directives allow access to the port.

You can verify your settings by entering the show running-config privileged EXEC command.

This example shows how to configure an open directive.

Device(config) # epm access-control open

Related Commands	Command	Description
	show running-config	Displays the contents of the current running configuration file.

L

ip admission

To enable web authentication, use the **ip admission** command in interface configuration mode. You can also use this command in fallback-profile configuration mode. To disable web authentication, use the **no** form of this command.

ip admission *rule* no ip admission *rule*

 Syntax Description
 rule
 IP admission rule name.

 Command Default
 Web authentication is disabled.

Command Modes Interface configuration

Fallback-profile configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines The ip admission command applies a web authentication rule to a switch port.

This example shows how to apply a web authentication rule to a switchport:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip admission rule1
```

This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.

Device# configure terminal Device(config)# fallback profile profile1 Device(config-fallback-profile)# ip admission rule1

ip admission name

To enable web authentication, use the **ip admission name** command in global configuration mode. To disable web authentication, use the **no** form of this command.

ip admission name name {consent | proxy http} [absolute timer minutes | inactivity-time
minutes | list {acl | acl-name} | service-policy type tag service-policy-name]
no ip admission name name {consent | proxy http} [absolute timer minutes | inactivity-time
minutes | list {acl | acl-name} | service-policy type tag service-policy-name]

Syntax Description	name	Name of network admission control rule.
	consent	Associates an authentication proxy consent web page with the IP admission rule specified using the <i>admission-name</i> argument.
	proxy http	Configures web authentication custom page.
	absolute-timer minutes	(Optional) Elapsed time, in minutes, before the external server times out.
	inactivity-time minutes	(Optional) Elapsed time, in minutes, before the external file server is deemed unreachable.
	list	(Optional) Associates the named rule with an access control list (ACL).
	acl	Applies a standard, extended list to a named admission control rule. The value ranges from 1 through 199, or from 1300 through 2699 for expanded range.
	acl-name	Applies a named access list to a named admission control rule.
	service-policy type tag	(Optional) A control plane service policy is to be configured.
	service-policy-name	Control plane tag service policy that is configured using the policy-map type control tag <i>policyname</i> command, keyword, and argument. This policy map is used to apply the actions on the host when a tag is received.
Command Default	Web authentication is disabled.	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

I

Usage Guidelines	The ip admission name command globally enables web authentication on a switch.		
	After you enable web authentication on a switch, use the ip access-group in and ip admission web-rule interface configuration commands to enable web authentication on a specific interface.		
Examples	This example shows how to configure only web authentication on a switch port:		
	Device# configure terminal Device(config) ip admission name http-rule proxy http Device(config)# interface gigabitethernet1/0/1 Device(config-if)# ip access-group 101 in Device(config-if)# ip admission rule Device(config-if)# end		
	This example shows how to configure IEEE 802.1x authentication with web authentication as a fallback mechanism on a switch port:		
	Device# configure terminal Device(config)# ip admission name rule2 proxy http Device(config)# fallback profile profile1 Device(config)# ip access group 101 in Device(config)# ip admission name rule2 Device(config)# interface gigabitethernet1/0/1 Device(config-if)# dot1x port-control auto Device(config-if)# dot1x fallback profile1 Device(config-if)# end		

Related Commands	Command	Description
	dot1x fallback	Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	fallback profile	Creates a web authentication fallback profile.
	ip admission	Enables web authentication on a port.
	show authentication sessions interface interface detail	Displays information about the web authentication session status.
	show ip admission	Displays information about NAC cached entries or the NAC configuration.

ip device tracking maximum

To configure IP device tracking parameters on a Layer 2 access port, use the **ip device tracking maximum** command in interface configuration mode. To remove the maximum value, use the **no** form of the command.

ip device tracking maximum number no ip device tracking maximum

Syntax Description	<i>number</i> Number of bindings created in the IP device tracking table for a port. The range is 0 (disabled) to 65535.		
Command Default	None		
Command Modes	Interface configuration mode		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
-	Note This command enables IPDT wherever its command		
Examples	This example shows how to configure IP device to Device# configure terminal Enter configuration commands, one per lin Device(config)# ip device tracking Device(config)# interface gigabitethernet Device(config-if)# switchport mode access Device(config-if)# switchport access vlan Device(config-if)# ip device tracking max Device(config-if)# switchport port-securi Device(config-if)# switchport port-securi Device(config-if)# switchport port-securi Device(config-if)# end	e. End with CNTL/Z. 1/0/3 1 imum 5 ty	

ip device tracking probe

To configure the IP device tracking table for Address Resolution Protocol (ARP) probes, use the **ip device tracking probe** command in global configuration mode. To disable ARP probes, use the **no** form of this command.

ip device tracking probe {count number | delay seconds | interval seconds | use-svi address} no ip device tracking probe {count number | delay seconds | interval seconds | use-svi address}

Syntax Description	count number	count <i>number</i> Sets the number of times that the device sends the ARP probe. The range is from 1 to		
	delay seconds	Sets the number of seconds that the devic is from 1 to 120.	e waits before sending the ARP probe. The range	
	interval seconds	Sets the number of seconds that the devic probe. The range is from 30 to 1814400	ce waits for a response before resending the ARP seconds.	
	use-svi	Uses the switch virtual interface (SVI) IP address as source of ARP probes.		
Command Default	The count numb	er is 3.		
	There is no delay.			
	The interval is 30 seconds.			
	The ARP probe default source IP address is the Layer 3 interface and 0.0.0.0 for switchports.			
Command Modes	Global configur	ation		
Command History	Release		Modification	
	Cisco IOS Rele	ase 15.0(2)EX	This command was introduced.	
Usage Guidelines	Use the use-svi keyword to configure the IP device tracking table to use the SVI IP address for ARP probes in cases when the default source IP address 0.0.0.0 for switch ports is used and the ARP probes drop.			
Examples	This example sh	ows how to set SVI as the source for ARP	probes:	
	Device(config)	<pre># ip device tracking probe use-svi</pre>		

ip dhcp snooping database

To configure the Dynamic Host Configuration Protocol (DHCP)-snooping database, use the **ip dhcp snooping database** command in global configuration mode. To disable the DHCP-snooping database, use the **no** form of this command.

ip dhcp snooping database {**flash**:*url* | **flash**1:*url* | **ftp**:*url* | **http**:*url* | **http**:*url* | **http**:*url* | **rcp**:*url* | **scp**:*url* | **tftp**:*url* | **timeout** *seconds* | **write-delay** *seconds*} no **ip dhcp snooping database** [**timeout** | **write-delay**]

Syntax Description	flash1:url	Specifies the database URL for storing entries using flash.
	flash:url	Specifies the database URL for storing entries using flash.
	ftp:url	Specifies the database URL for storing entries using FTP.
	http:url	Specifies the database URL for storing entries using HTTP.
	https:url	Specifies the database URL for storing entries using secure HTTP (https).
	rcp:url	Specifies the database URL for storing entries using remote copy (rcp).
	scp:url	Specifies the database URL for storing entries using Secure Copy (SCP).
	tftp:url	Specifies the database URL for storing entries using TFTP.
	timeout seconds	Specifies the timeout interval; valid values are from 0 to 86400 seconds.
	write-delay seconds	Specifies the amount of time before writing the DHCP-snooping entries to an external server after a change is seen in the local DHCP-snooping database; valid values are from 15 to 86400 seconds.

Command Default Th

The DHCP-snooping database is not configured.

Command Modes Global configuration

Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	You must enable DHCP snooping on the interface before entering this command. Use the ip dhcp snooping command to enable DHCP snooping.			
	This example shows how to specify the database URL using TFTP:			
	Device(config)# ip dhcp snooping database tftp :	://10.90.90.90/snooping-rp2		
	This example shows how to specify the amount of time before writing DHCP snooping entries to an external server:			
	Device(config)# ip dhcp snooping database write	e-delay 15		

ip dhcp snooping information option format remote-id

To configure the option-82 remote-ID suboption, use the **ip dhcp snooping information option format remote-id** command in global configuration mode on the switch to configure the option-82 remote-ID suboption. To configure the default remote-ID suboption, use the **no** form of this command.

ip dhcp snooping information option format remote-id {hostname | string string} no ip dhcp snooping information option format remote-id {hostname | string string}

Syntax Description	hostname	hostname Specify the switch hostname as the remote ID.			
	string string	string string Specify a remote ID, using from 1 to 63 ASCII characters (no spaces).			
Command Default	The switch MAC address is the remote ID.				
Command Modes	Global configu	Global configuration			
Command History	Release		Modification		
	Cisco IOS Re	lease 15.0(2)EX	This command was introduced.		
Usage Guidelines	-	ally enable DHCP snooping by using the ip poping configuration to take effect.	dhcp snooping global configuration command for		
	command allo		-ID suboption is the switch MAC address. This ame or a string of up to 63 ASCII characters (but		
-	Note If the hos	tname exceeds 63 characters it will be trun	cated to 63 characters in the remote-ID configuration		

This example shows how to configure the option- 82 remote-ID suboption:

Device (config) # ip dhcp snooping information option format remote-id hostname

ip dhcp snooping verify no-relay-agent-address

	To disable the DHCP snooping feature from verifying that the relay agent address (giaddr) in a DHCP cli message matches the client hardware address on an untrusted port, use the ip dhcp snooping verify no-relay-agent-address command in global configuration mode. To enable verification, use the no form this command. ip dhcp snooping verify no-relay-agent-address no ip dhcp snooping verify no-relay-agent-address		
Syntax Description	This command has no arguments or keywords.		
Command Default	The DHCP snooping feature verifies that the relay-agent IP address (giaddr) field in DHCP client message on an untrusted port is 0.		
Command Modes	Global configuration		
Command History	Release Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	By default, the DHCP snooping feature verifies that the relay-agent IP address (giaddr) field in DHCP client message on an untrusted port is 0; the message is dropped if the giaddr field is not 0. Use the ip dhcp snooping verify no-relay-agent-address command to disable the verification. Use the no ip dhcp snooping verify no-relay-agent-address to reenable verification.		
	This example shows how to enable verification of the giaddr in a DHCP client message: Device(config) # no ip dhcp snooping verify no-relay-agent-address		

ip source binding

To add a static IP source binding entry, use the **ip source binding** command. Use the **no** form of this command to delete a static IP source binding entry

ip source binding mac-address **vlan** vlan-id ip-address **interface** interface-id **no ip source binding** mac-address **vlan** vlan-id ip-address **interface** interface-id

Syntax Description	tion mac-address Binding MAC add		
	vlan vlan-id	Specifies the Layer 2 VLAN identification; valid values are from 1 to 4094.	
	ip-address	Binding IP address.	
	interface interface-id	ID of the physical interface.	
Command Default	No IP source bindings are configured.		
Command Modes	Global configuration.		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	nesYou can use this command to add a static IP source binding entry only.The no format deletes the corresponding IP source binding entry. It requires the exact match of all require parameter in order for the deletion to be successful. Note that each static IP binding entry is keyed by a MA address and a VLAN number. If the command contains the existing MAC address and VLAN number, th existing binding entry is updated with the new parameters instead of creating a separate binding entry.This example shows how to add a static IP source binding entry:		
	Device# configure terminal Deviceconfig) ip source binding 0100.0230.0002 vl	an 11 10.0.0.4 interface gigabitethernet1/0/1	

ip ssh source-interface

To specify the IP address of an interface as the source address for a Secure Shell (SSH) client device, use the **ip ssh source-interface** command in global configuration mode. To remove the IP address as the source address, use the **no** form of this command.

ip ssh source-interface *interface* **no ip ssh source-interface** *interface*

Syntax Description	<i>interface</i> The interface whose address is used as the source address for the SSH client.		
Command Default	The address of the closest interface to the destination is used as the source address (the closest interface is the output interface through which the SSH packet is sent).		
Command Modes	Global configuration (con	nfig)	
Command History	Release	Modification	
	Cisco IOS Release 15.2(7)E	This command was introduced	
Usage Guidelines	By specifying this command, you can force the SSH client to use the IP address of the source interface as the source address.		
Examples	In the following example, the IP address assigned to GigabitEthernet interface 1/0/1 is used as the source address for the SSH client:		
	Device(config)# ip ssh source-interface GigabitEthernet 1/0/1		

ip verify source

To enable IP source guard on an interface, use the **ip verify source** command in interface configuration mode. To disable IP source guard, use the **no** form of this command.

ip verify source [port-security]
no ip verify source

	port-security	(Optional) Enables IP source guard with IP and MAC address filtering.		
		If you do not enter the port-security keyword, IP source guard with IP address filtering is enabled.		
Command Default	IP source guard is disabled.			
Command Modes	Interface configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	s To enable IP source guard with source IP address filtering, use the ip verify source interface confinement.			
	To enable IP source guard with source IP and MAC address filtering, use the ip verify source p interface configuration command.			
Examples	This example shows how to enable IP source guard with source IP address filtering on an interface:			
	Device(config)# interface gigabitethernet1/0/1 Device(config-if)# ip verify source			
	This example shows how to enable IP source guard with source IP and MAC address filtering:			
	Device(config)# interface gigabitethernet1/0/1 Device(config-if)# ip verify source port-security			
	Device# configure terminal Enter configuration commands, one per li Device(config)# ip dhcp snooping Device(config)# ip dhcp snooping vlan 10 Device(config)# interface gigabitetherne Device(config-if)# switchport trunk encay Device(config-if)# switchport trunk encay Device(config-if)# switchport trunk anti- Device(config-if)# switchport trunk nati- Device(config-if)# switchport trunk allow Device(config-if)# no ip dhcp snooping t Device(config-if)# ip verify source vlan Device(config)# end Device(config)# end	20 t1/0/1 psulation dot1q ve vlan 10 wed vlan 11-20 rust dhcp-snooping		

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan	
Gi1/0/1	-	active			10

	Enter configuration commands, one per line. End with <code>CNTL/Z</code> .					
Device (config) # ip device tracking						
Device(con	fig)# interfa	ce gigabiteth	ernet1/0/3			
Device(con	fig-if)# swit	chport mode a	ccess			
Device(con	fig-if)# swit	chport access	vlan 1			
Device(con	fig-if)# ip d	evice trackin	g maximum 5			
Device(con	fig-if)# swit	chport port-s	ecurity			
Device(con	fig-if)# swit	chport port-s	ecurity maximum	n 5		
Device(con	fig-if)# ip v	erify source	tracking port-s	security		
Device(con	fig-if)# end					

You can verify your settings by entering the show ip verify source privileged EXEC command.

I

ipv6 snooping policy

	e 1 e	commands (prior to) now have corresponding SISF-based device-tracking apply your configuration to both IPv4 and IPv6 address families. For more ing policy	
	• • • •	olicy and enter IPv6 snooping configuration mode, use the ipv6 snooping uration mode. To delete an IPv6 snooping policy, use the no form of this	
	ipv6 snooping policy snooping- no ipv6 snooping policy snoopi	•	
Syntax Description		name of the snooping policy. The policy name can be a symbolic string neering) or an integer (such as 0).	
Command Default	An IPv6 snooping policy is not c	onfigured.	
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	Use the ipv6 snooping policy command to create an IPv6 snooping policy. When the ipv6 snooping policy command is enabled, the configuration mode changes to IPv6 snooping configuration mode. In this mode, the administrator can configure the following IPv6 first-hop security commands:		
	• The device-role command specifies the role of the device attached to the port.		
	• The limit address-count <i>maximum</i> command limits the number of IPv6 addresses allowed to be used on the port.		
	• The protocol command specifies that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP).		
	• The security-level command specifies the level of security enforced.		
	• The tracking command overrides the default tracking policy on a port.		
	• The trusted-port command configures a port to become a trusted port; that is, limited or no verification is performed when messages are received.		
	This example shows how to conf	gure an IPv6 snooping policy:	
	Device(config)# ipv6 snoopir Device(config-ipv6-snooping)		

limit address-count

To limit the number of IPv6 addresses allowed to be used on the port, use the **limit address-count** command in Neighbor Discovery Protocol (NDP) inspection policy configuration mode or IPv6 snooping configuration mode. To return to the default, use the **no** form of this command.

limit address-count maximum no limit address-count

Syntax Description	<i>maximum</i> The number of addresses allowed on the port. The range is from 1 to 10000.			
Command Default	The default is no limit.			
Command Modes	ND inspection policy configuration			
	IPv6 snooping configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	The limit address-count command limits the number of IPv6 addresses allowed to be used on the port on which the policy is applied. Limiting the number of IPv6 addresses on a port helps limit the binding table size. The range is from 1 to 10000.This example shows how to define an NDP policy name as policy1, place the switch in NDP inspection policy configuration mode, and limit the number of IPv6 addresses allowed on the port to 25:			
	Device(config)# ipv6 nd inspection policy policy1 Device(config-nd-inspection)# limit address-count 25			
	This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and limit the number of IPv6 addresses allowed on the port to 25:			
	Device(config)# ipv6 snooping policy poli Device(config-ipv6-snooping)# limit addre	-		

mab request format attribute 32

To enable VLAN ID-based MAC authentication on a switch, use the **mab request format attribute 32 vlan access-vlan** command in global configuration mode. To return to the default setting, use the **no** form of this command.

mab request format attribute 32 vlan access-vlan no mab request format attribute 32 vlan access-vlan

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** VLAN-ID based MAC authentication is disabled.

Command Modes Global configuration

 Command History
 Release
 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

Usage Guidelines Use this command to allow a RADIUS server to authenticate a new user based on the host MAC address and VLAN.

Use this feature on networks with the Microsoft IAS RADIUS server. The Cisco ACS ignores this command.

This example shows how to enable VLAN-ID based MAC authentication on a switch:

Device(config) # mab request format attribute 32 vlan access-vlan

Related Commands	Command	Description
	authentication event	Sets the action for specific authentication events.
	authentication fallback	Configures a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	authentication host-mode	Sets the authorization manager mode on a port.
	authentication open	Enables or disables open access on a port.
	authentication order	Sets the order of authentication methods used on a port.
	authentication periodic	Enables or disables reauthentication on a port.
	authentication port-control	Enables manual control of the port authorization state.
	authentication priority	Adds an authentication method to the port-priority list.
	authentication timer	Configures the timeout and reauthentication parameters for an 802.1x-enabled port.

Command	Description	
authentication violation	Configures the violation modes that occur when a new device connects to a port or when a new device connects to a port with the maximum number of devices already connected to that port.	
mab	Enables MAC-based authentication on a port.	
mab eap	Configures a port to use the Extensible Authentication Protocol (EAP).	
show authentication	Displays information about authentication manager events on the switch.	

match (access-map configuration)

To set the VLAN map to match packets against one or more access lists, use the **match** command in access-map configuration mode on the switch stack or on a standalone switch. To remove the match parameters, use the **no** form of this command.

match {ip address {namenumber} [{namenumber}] [{namenumber}]...|ipv6 address {namenumber} [{namenumber}] [{namenumber}]...|mac address {name} [{name}] [{name}]...} no match {ip address {namenumber} [{namenumber}] [{namenumber}]...|ipv6 address {namenumber} [{namenumber}] [{namenumber}]...|mac address {name} [{name}] [{name}]...}

Syntax Description	ip address	Sets the access map to match pa	ackets against an IP address access list.		
	ipv6 address	s Sets the access map to match packets against an IPv6 address access list.			
	mac address	Sets the access map to match pa	ackets against a MAC address access list.		
	name	Name of the access list to match	n packets against.		
	number	Number of the access list to match packets against. This option is not valid for MAC access lists.			
Command Default	The default action is to have no match parameters applied to a VLAN map.				
Command Modes	Access-map cor	nfiguration			
Command History	y Release		Modification		
	Cisco IOS Rele	ease 15.0(2)EX	This command was introduced.		
Usage Guidelines	You enter access-map configuration mode by using the vlan access-map global configuration command.				
	You must enter one access list name or number; others are optional. You can match packets against one or more access lists. Matching any of the lists counts as a match of the entry.				
	In access-map configuration mode, use the match command to define the match conditions for a VLAN map applied to a VLAN. Use the action command to set the action that occurs when the packet matches the conditions.				
	Packets are matched only against access lists of the same protocol type; IP packets are matched against IP access lists, IPv6 packets are matched against IPv6 access lists, and all other packets are matched against MAC access lists.				
	IP, IPv6, and MAC addresses can be specified for the same map entry.				
	This example shows how to define and apply a VLAN access map vmap4 to VLANs 5 and 6 that will cause the interface to drop an IP packet if the packet matches the conditions defined in access list al2:				
	Device(config)# vlan access-map vmap4 Device(config-access-map)# match ip address al2 Device(config-access-map)# action drop				

```
Device(config-access-map)# exit
Device(config)# vlan filter vmap4 vlan-list 5-6
```

You can verify your settings by entering the show vlan access-map privileged EXEC command.

protocol (IPv6 snooping)

To specify that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP), or to associate the protocol with an IPv6 prefix list, use the **protocol** command. To disable address gleaning with DHCP or NDP, use the **no** form of the command.

protocol {dhcp | ndp} no protocol {dhcp | ndp}

Syntax Description	dhcp Specifies that addresses should be gleaned in	Dynamic Host Configuration Protocol (DHCP) packets.		
	ndp Specifies that addresses should be gleaned	in Neighbor Discovery Protocol (NDP) packets.		
Command Default	Snooping and recovery are attempted using both DF	ICP and NDP.		
Command Modes	IPv6 snooping configuration mode			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	If an address does not match the prefix list associated with DHCP or NDP, then control packets will be dropped and recovery of the binding table entry will not be attempted with that protocol.			
	• Using the no protocol { dhcp ndp } comma or gleaning.	and indicates that a protocol will not be used for snooping		
	• If the no protocol dhcp command is used, DH	CP can still be used for binding table recovery.		
	• Data glean can recover with DHCP and NDP, though destination guard will only recovery through DHCP.			
	This example shows how to define an IPv6 snoopin IPv6 snooping policy configuration mode, and confi			

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# protocol dhcp

radius se	rve	r

Command Modes	Radius server sub-mode configuration	on		
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced to replace the radius-server host command.		
Usage Guidelines	• We recommend that you config for the RADIUS authentication	gure the UDP port for the RADIUS accounting server and the UDP port a server to non-default values.		
	-	eation and encryption key by using the key <i>string</i> sub-mode configuration he key as the last item in this command.		
	• Use the automate-tester <i>name</i> and to specify the username to	keywords to enable automatic server testing of the RADIUS server status be used.		
	This example shows how to configu as the UDP port for the accounting s	are 1645 as the UDP port for the authentication server and 1646 server, and configure a key string:		
	Device(config)# radius server Device(config-radius-server)# Device(config-radius-server)#	address ipv4 10.1.1 auth-port 1645 acct-port 1646		

L

router rip

To configure the Routing Information Protocol (RIP) routing process, use the **route r rip** command in global configuration mode. To turn off the RIP routing process, use the **no** form of this command.

router rip no router rip

Syntax Description This command has no arguments or keywords.

Command Default No RIP routing process is defined.

Command Modes

Global configuration (config)

Command History	Release	Modification	
	Cisco IOS Release 15.2(5)E2	This command was introduced.	

Examples

The following example shows how to begin the RIP routing process:

Device(config) # router rip

Related Commands	Command	Description
	network (RIP)	Specifies a list of networks for the RIP process.

security level (IPv6 snooping)

To specify the level of security enforced, use the **security-level** command in IPv6 snooping policy configuration mode.

security level {glean | guard | inspect}

Syntax Description	glean	Extracts addresses from the messages and installs them into the binding table without performing any verification.	
	guard	Performs both glean and inspect. Additionally, RA and DHCP server messages are rejected unless they are received on a trusted port or another policy authorizes them.	
	inspect	Validates messages for consistency and conformance; in particular, address ownership is enforced. Invalid messages are dropped.	
Command Default	The default security level is g	uard.	
Command Modes	IPv6 snooping configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	X This command was introduced.	

This example shows how to define an IPv6 snooping policy name as policy1, place the device in IPv6 snooping configuration mode, and configure the security level as inspect:

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# security-level inspect

show aaa acct-stop-cache

To show accounting session IDs of poisoned sessions, use the show aaa acct-stop-cache command.

Syntax DescriptionThis command has no arguments or keywords.Command ModesUser EXECCommand HistoryReleaseModificationCisco IOS Release 15.0(2)EXThis command was introduced.Usage GuidelinesAccounting Stop records for poisoned sessions are cached only on the standby switch.
This is an example of output from the show aaa acct-stop-cache command:

Device# show aaa acct-stop-cache

show aaa clients

To show AAA client statistics, use the show aaa clients command.

 show aaa clients [detailed]

 Syntax Description
 detailed (Optional) Shows detailed AAA client statistics.

 Command Modes
 User EXEC

 Command History
 Release

 Modification

 Cisco IOS Release 15.0(2)EX
 This command was introduced.

 This is an example of output from the show aaa clients command:
 Device# show aaa clients

Dropped request packets: 0

L

show aaa command handler

To show AAA command handler statistics, use the show aaa command handler command.

 show aaa command handler

 Syntax Description

 This command has no arguments or keywords.

 Command Modes

 User EXEC

 Command History

 Release
 Modification

 Cisco IOS Release 15.0(2)EX

 This is an example of output from the show aaa command handler command:

 Device# show aaa command handler

 AAA Command Handler Statistics:

```
account-logon: 0, account-logoff: 0
account-query: 0, pod: 0
service-logon: 0, service-logoff: 0
user-profile-push: 0, session-state-log: 0
reauthenticate: 0, bounce-host-port: 0
disable-host-port: 0, update-rbacl: 0
update-sgt: 0, update-cts-policies: 0
invalid commands: 0
async message not sent: 0
```

show aaa local

To show AAA local method options, use the show aaa local command.

 show aaa localuser lockout

 Syntax Description
 user lockout
 Specifies the AAA local locked-out user.

 lockout

dot1x Not run

show auto security

To display auto security status, use the **show auto security** command in privileged EXEC mode.

show auto-security

This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

 Command History
 Release
 Modification

 Cisco IOS Release 15.2(5)E
 This command was introduced in a release prior to Cisco IOS Release 15.2(5)E.

Usage Guidelines Configuring the **auto security** command in global configuration mode, configures auto security globally; including all interfaces. When you disable auto security, it is disabled on all interfaces.

Use the auto security-port command to enable auto security on specific interfaces.

The following is sample output from the **show auto security** command, when auto security is enabled globally:

Switch# show auto security
Auto Security is Enabled globally
AutoSecurity is Enabled on below interface(s):
-----GigabitEthernet1/0/2
GigabitEthernet1/0/3
GigabitEthernet1/0/5
GigabitEthernet1/0/7
GigabitEthernet1/0/10
GigabitEthernet1/0/12
GigabitEthernet1/0/23

The following is sample output from the **show auto security** command, when auto security is enabled on a specific interface:

Switch# show auto security
Auto Security is Disabled globally
AutoSecurity is Enabled on below interface(s):
GigabitEthernet1/0/2

Related Commands

show eap pac peer

To display stored Protected Access Credentials (PAC) for Extensible Authentication Protocol (EAP) Flexible Authentication via Secure Tunneling (FAST) peers, use the **show eap pac peer** command in privileged EXEC mode.

show eap pac peer

Syntax Description This command has no arguments or keywords.

Command Modes Privileged EXEC

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

This is an example of output from the show eap pac peers privileged EXEC command:

Device> **show eap pac peers** No PACs stored

Related Commands	Command	Description	
	clear eap sessions	Clears EAP session information for the switch or for the specified port.	

L

show ip dhcp snooping statistics

To display DHCP snooping statistics in summary or detail form, use the **show ip dhcp snooping statistics** command in user EXEC mode.

show ip dhcp snooping statistics [detail]

Syntax Description detail (Optional) Displays detailed statistics information.

Command Modes User EXEC

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines In a switch stack, all statistics are generated on the stack primary. If a new active switch is elected, the statistics counters reset.

This is an example of output from the show ip dhcp snooping statistics command:

Device> show ip dhcp snooping statistics

Packets	Forwarded			= 0
Packets	Dropped			= 0
Packets	Dropped From	untrusted	ports	= 0

This is an example of output from the show ip dhcp snooping statistics detail command:

Device> show ip dhcp snooping statistics detail

Packets Processed by DHCP Snooping	=	0
Packets Dropped Because		
IDB not known	=	0
Queue full	=	0
Interface is in errdisabled	=	0
Rate limit exceeded	=	0
Received on untrusted ports	=	0
Nonzero giaddr	=	0
Source mac not equal to chaddr	=	0
Binding mismatch	=	0
Insertion of opt82 fail	=	0
Interface Down	=	0
Unknown output interface	=	0
Reply output port equal to input port	=	0
Packet denied by platform	=	0

I

This table shows the DHCP snooping statistics and their descriptions:

Table 36: DHCP Snooping Statistics

DHCP Snooping Statistic	Description
Packets Processed by DHCP Snooping	Total number of packets handled by DHCP snooping, including forwarded and dropped packets.
Packets Dropped Because IDB not known	Number of errors when the input interface of the packet cannot be determined.
Queue full	Number of errors when an internal queue used to process the packets is full. This might happen if DHCP packets are received at an excessively high rate and rate limiting is not enabled on the ingress ports.
Interface is in errdisabled	Number of times a packet was received on a port that has been marked as error disabled. This might happen if packets are in the processing queue when a port is put into the error-disabled state and those packets are subsequently processed.
Rate limit exceeded	Number of times the rate limit configured on the port was exceeded and the interface was put into the error-disabled state.
Received on untrusted ports	Number of times a DHCP server packet (OFFER, ACK, NAK, or LEASEQUERY) was received on an untrusted port and was dropped.
Nonzero giaddr	Number of times the relay agent address field (giaddr) in the DHCP packet received on an untrusted port was not zero, or the no ip dhcp snooping information option allow-untrusted global configuration command is not configured and a packet received on an untrusted port contained option-82 data.
Source mac not equal to chaddr	Number of times the client MAC address field of the DHCP packet (chaddr) does not match the packet source MAC address and the ip dhcp snooping verify mac-address global configuration command is configured.
Binding mismatch	Number of times a RELEASE or DECLINE packet was received on a port that is different than the port in the binding for that MAC address-VLAN pair. This indicates someone might be trying to spoof the real client, or it could mean that the client has moved to another port on the switch and issued a RELEASE or DECLINE. The MAC address is taken from the chaddr field of the DHCP packet, not the source MAC address in the Ethernet header.
Insertion of opt82 fail	Number of times the option-82 insertion into a packet failed. The insertion might fail if the packet with the option-82 data exceeds the size of a single physical packet on the internet.

DHCP Snooping Statistic	Description
Interface Down	Number of times the packet is a reply to the DHCP relay agent, but the SVI interface for the relay agent is down. This is an unlikely error that occurs if the SVI goes down between sending the client request to the DHCP server and receiving the response.
Unknown output interface	Number of times the output interface for a DHCP reply packet cannot be determined by either option-82 data or a lookup in the MAC address table. The packet is dropped. This can happen if option 82 is not used and the client MAC address has aged out. If IPSG is enabled with the port-security option and option 82 is not enabled, the MAC address of the client is not learned, and the reply packets will be dropped.
Reply output port equal to input port	Number of times the output port for a DHCP reply packet is the same as the input port, causing a possible loop. Indicates a possible network misconfiguration or misuse of trust settings on ports.
Packet denied by platform	Number of times the packet has been denied by a platform-specific registry.

show ip rip database

To display summary address entries in the Routing Information Protocol (RIP) routing database entries if relevant are routes being summarized based upon a summary address, use the **show ip rip database** command in privileged EXEC mode.

show	ip	rip	database	[ip-address	mask]
------	----	-----	----------	-------------	-------

Syntax Description	<i>ip-address</i> (Optional) Address about which routing information should be displayed.				
	mask	mask(Optional) Argument for the subnet mask. The subnet mask must also be specified if the IP address argument is entered.			
Command Default	No default b	behavior or values.			
Command Modes	– Privileged E	EXEC(#)			
Command History	Release		М	Modification	
	Cisco IOS	Release 15.2(5)E2	Tł	his command was introduced.	
Usage Guidelines	Summary address entries will appear in the database only if relevant child routes are being summarized. When the last child route for a summary address becomes invalid, the summary address is also removed from the routing table.				
	The RIP priv command.	vate database is populated on	ly if triggered ex	xtensions to RIP are enabled with the ip rip triggered	
Examples	The followin active:	ng output shows a summary a	address entry fo	or route $10.11.0.0/16$, with three child routes	
	Device# show ip rip database				
	10.0.0.0/8 auto-summary 10.0.0.0/8 [1] via 172.16.0.10, 00:00:17, GigabitEthernet7/0/10 192.168.0.0/8 auto-summary 192.168.0.0/8				
		a 172.16.0.10, 00:00:17, 0/8 auto-summary	. 2		
	The table be	elow describes the fields in th	he display		

The table below describes the fields in the display.

Table 37: show ip rip database Field Descriptions

Field	Description
10.0.0/8 auto-summary	Summary address entry.

Field	Description
172.16.0.0/24 directly connected, GigabitEthernet7/0/10	Directly connected entry for GigabitEthernet 7/0/10.

Related Commands

Commands	Description
debug ip rip	Displays information on RIP routing transactions.

show ip ssh

To display the version and configuration data for Secure Shell (SSH), use the **show ip ssh** privileged EXEC command.

show ip ssh

Syntax Description

This command has no arguments or keywords.

Command Modes Privileged EXEC

Command History	Release	Modification
	Cisco IOS Release 15.2(7)E	The output of this command has been enhanced to display the configured RSA key size.
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines Use the **show ip ssh** to view the status of configured options such as retries and timeouts. This command allows you to see if SSH is enabled or disabled.

Examples

The following is sample output from the **show ip ssh** command when SSH has been enabled:

SSH Enabled - version 1.5 Authentication timeout: 120 secs; Authentication retries: 3

The following is sample output from the **show ip ssh** command when SSH has been disabled:

```
Device# show ip ssh
```

Device# show ip ssh

%SSH has not been enabled

The following is sample output from the**show ip ssh**command to display the configured RSA key size:

```
Device# show ip ssh
SSH Disabled - version 1.99
%Please create RSA keys to enable SSH (and of atleast 768 bits for SSH v2).
Authentication methods:publickey,keyboard-interactive,password
Authentication Publickey Algorithms:x509v3-ssh-rsa,ssh-rsa
Hostkey Algorithms:x509v3-ssh-rsa,ssh-rsa
Encryption Algorithms:aes128-ctr,aes192-ctr,aes256-ctr
MAC Algorithms:hmac-shal,hmac-shal-96
Authentication timeout: 120 secs; Authentication retries: 3
Minimum expected Diffie Hellman key size : 1024 bits
```

IOS Keys in SECSH format(ssh-rsa, base64 encoded): NONE

show mls qos copp protocols

To display the Copp parameters and counters for all the configured protocol, use the **show mls qos copp protocols** command in EXEC mode.

show mls qos copp protocols

Syntax Description This command has no arguments or keywords.

Command Default This command has no default settings.

Command Modes Exec mode.

Command History	Release	Modification
	Cisco IOS 15.2.4E	This command was introduced.

Usage Guidelines Use this command to display CoPP parameters and counters for all the configured protocol.

The following example shows the CoPP parameters and counters for all the configured protocol:

```

	mls qos copp protocol	Protects the switch's control plane.	

show radius server-group

To display properties for the RADIUS server group, use the show radius server-group command.

show radius server-group {*name* | **all**}

Syntax Description *name* Name of the server group. The character string used to name the group of servers must be defined using **the aaa group server radius** command.

all Displays properties for all of the server groups.

Command Modes User EXEC

Privileged EXEC

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines Use the show radius server-group command to display the server groups that you defined by using the aaa group server radius command.

This is an example of output from the show radius server-group all command:

```
Device# show radius server-group all
Server group radius
Sharecount = 1 sg_unconfigured = FALSE
Type = standard Memlocks = 1
```

This table describes the significant fields shown in the display.

Table 38: show radius server-group command Field Descriptions

Field	Description
Server group	Name of the server group.
Sharecount	Number of method lists that are sharing this server group. For example, if one method list uses a particular server group, the sharecount would be 1. If two method lists use the same server group, the sharecount would be 2.
sg_unconfigured	Server group has been unconfigured.
Туре	The type can be either standard or nonstandard. The type indicates whether the servers in the group accept nonstandard attributes. If all servers within the group are configured with the nonstandard option, the type will be shown as "nonstandard".

Field	Description
Memlocks	An internal reference count for the server-group structure that is in memory. The number represents how many internal data structure packets or transactions are holding references to this server group. Memlocks is used internally for memory management purposes.

show vlan group

To display the VLANs that are mapped to VLAN groups, use the **show vlan group** command in privileged EXEC mode.

show vlan group [{group-name vlan-group-name [user_count]}]

Syntax Description	group-name <i>vlan-group-name</i> (Optional) Displays the VLANs mapped to the specified VLAN group.			
	user_count	(Optional) Displays the number of users in each VLAN mapped to a specified VLAN group.		
Command Default	None			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	The show vlan group command displays the existing VLAN groups and lists the VLANs and VLAN ranges that are members of each VLAN group. If you enter the group-name keyword, only the members of the specified VLAN group are displayed.			
	This example shows how to display the members of a specified VLAN group:

		• A secure port cannot belong to a Gigabit or 10-Gigabit EtherChannel port group.				

- You cannot configure static secure or sticky secure MAC addresses in the voice VLAN.
- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum
 allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP
 phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not
 learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC
 addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure
 enough secure addresses to allow one for each PC and one for the Cisco IP phone.
- · Voice VLAN is supported only on access ports and not on trunk ports.

Sticky secure MAC addresses have these characteristics:

- When you enable sticky learning on an interface by using the **switchport port-security mac-address sticky** interface configuration command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses and adds all sticky secure MAC addresses to the running configuration.
- If you disable sticky learning by using the no switchport port-security mac-address sticky interface configuration command or the running configuration is removed, the sticky secure MAC addresses remain part of the running configuration but are removed from the address table. The addresses that were removed can be dynamically reconfigured and added to the address table as dynamic addresses.
- When you configure sticky secure MAC addresses by using the **switchport port-security mac-address sticky** *mac-address* interface configuration command, these addresses are added to the address table and the running configuration. If port security is disabled, the sticky secure MAC addresses remain in the running configuration.
- If you save the sticky secure MAC addresses in the configuration file, when the switch restarts or the interface shuts down, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost. If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.
- If you disable sticky learning and enter the **switchport port-security mac-address sticky** *mac-address* interface configuration command, an error message appears, and the sticky secure MAC address is not added to the running configuration.

You can verify your settings by using the **show port-security** privileged EXEC command.

This example shows how to configure a secure MAC address and a VLAN ID on a port:

```
Device(config) # interface gigabitethernet 2/0/2
Device(config-if) # switchport mode trunk
Device(config-if) # switchport port-security
Device(config-if) # switchport port-security mac-address 1000.2000.3000 vlan 3
```

This example shows how to enable sticky learning and to enter two sticky secure MAC addresses on a port:

```
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport port-security mac-address sticky
Device(config-if)# switchport port-security mac-address sticky 0000.0000.4141
Device(config-if)# switchport port-security mac-address sticky 0000.0000.000f
```

switchport port-security maximum

To configure the maximum number of secure MAC addresses, use the **switchport port-security maximum** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

switchport port-security maximum *value* [vlan [{*vlan-list* | [{access | voice}]}]] no switchport port-security maximum *value* [vlan [{*vlan-list* | [{access | voice}]}]]

Syntax Description	value	Sets the	e maximum number of secure MAC	addresses for the interface.
	The default setting is 1.			
	vlan	lan (Optional) For trunk ports, sets the maximum number of secure MAC addresses on a VLAN or range of VLANs. If the vlan keyword is not entered, the default value is used.		
	vlan-list		al) Range of VLANs separated by a specified VLANs, the per-VLAN r	a hyphen or a series of VLANs separated by commas. naximum value is used.
	access	(Optiona	al) On an access port only, specifie	s the VLAN as an access VLAN.
	voice	(Optiona	al) On an access port only, specifie	s the VLAN as a voice VLAN.
		Note	The voice keyword is available port is not the access VLAN.	e only if voice VLAN is configured on a port and if that
Command Default	When p addresse		ty is enabled and no keywords are e	entered, the default maximum number of secure MAC
Command Modes	Interfac	e configur	ration	
Command History	Release Modification		Modification	
	Cisco I	OS Releas	ase 15.0(2)EX	This command was introduced.
Usage Guidelines	the max active S the total	imum nun witch Data of availat	mber of available MAC addresses a tabase Management (SDM) template	at you can configure on a switch or switch stack is set by allowed in the system. This number is determined by the e. See the sdm prefer command. This number represents se used for other Layer 2 functions and any other secure
	A secure	A secure port has the following limitations:		
	• A s	• A secure port can be an access port or a trunk port.		
	• A secure port cannot be a routed port.			
	• A secure port cannot be a protected port.			
	- A 2	secure por	rt cannot be a protected port.	
		1	rt cannot be a protected port. rt cannot be a destination port for S	witched Port Analyzer (SPAN).
	• A s	secure port	1 1	• • •

When you enable port security on an interface that is also configured with a voice VLAN, set the maximum
allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP
phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not
learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC
addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure
enough secure addresses to allow one for each PC and one for the Cisco IP phone.

Voice VLAN is supported only on access ports and not on trunk ports.

• When you enter a maximum secure address value for an interface, if the new value is greater than the previous value, the new value overrides the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

Setting a maximum number of addresses to one and configuring the MAC address of an attached device ensures that the device has the full bandwidth of the port.

When you enter a maximum secure address value for an interface, this occurs:

- If the new value is greater than the previous value, the new value overrides the previously configured value.
- If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

You can verify your settings by using the show port-security privileged EXEC command.

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```
Device(config)# interface gigabitethernet 2/0/2
Device(config-if)# switchport mode access
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 5
```

switchport port-security violation

To configure secure MAC address violation mode or the action to be taken if port security is violated, use the **switchport port-security violation** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

switchport port-security violation {protect | restrict | shutdown | shutdown vlan}
no switchport port-security violation {protect | restrict | shutdown | shutdown vlan}

Syntax Description	protect	Sets the security violation protect mode.			
	restrict	Sets the security violation restrict mode.			
	shutdown	Sets the security violation shutdown mode.			
	shutdown vlan	Sets the security violation mode to per-VLAN shutdow	vn.		
Command Default	The default v	iolation mode is shutdown .			
Command Modes	Interface cont	figuration			
Command History	Release		Modification		
	Cisco IOS R	elease 15.0(2)EX	This command was introduced.		
-		ot recommend configuring the protect mode on a trunk por AN reaches its maximum limit, even if the port has not rea			
	any VLA In the security on the port, pa		C addresses reaches the limit allowed you remove a sufficient number of		
	syslog message is logged, and the violation counter increments.

An SNMP trap is sent, a syslog message is logged, and th is in the error-disabled state, you can bring it out of this stat re-violation global configuration command, or you can m d no shutdown interface configuration commands.	ne violation counter increments. When the by entering the errdisable recovery		
	When the sec occurred is er	urity violation mode is set to per-VLAN shutdown, only tror-disabled.	the VLAN on which the violation		

A secure port has the following limitations:

- A secure port can be an access port or a trunk port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Gigabit or 10-Gigabit EtherChannel port group.

A security violation occurs when the maximum number of secure MAC addresses are in the address table and a station whose MAC address is not in the address table attempts to access the interface or when a station whose MAC address is configured as a secure MAC address on another secure port attempts to access the interface.

When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause** *psecure-violation* global configuration command. You can manually re-enable the port by entering the **shutdown** and **no shutdown** interface configuration commands or by using the **clear errdisable interface** privileged EXEC command.

You can verify your settings by using the show port-security privileged EXEC command.

This example show how to configure a port to shut down only the VLAN if a MAC security violation occurs:

```
Device(config) # interface gigabitethernet2/0/2
Device(config) # switchport port-security violation shutdown vlan
```

tacacs server

To configure the TACACS server for IPv6 or IPv4 and enter the TACACS server configuration mode, use the **tacacs server** command in global configuration mode. To remove the configuration, use the **no** form of this command.

tacacs server *name* no tacacs server

Syntax Description	Name of the private TACACS server host.
--------------------	---

Command Default No TACACS+ server is configured.

Command Modes Global configuration (config)

Release	Modification
	The legacy command tacacs-server is deprecated. Use the tacacs server command to configure a TACACS server.

Usage Guidelines The **tacacs server** command configures the TACACS server using the *name* argument and enters TACACS server subconfiguration mode. The configuration is applied once you have finished the configuration steps and exited TACACS server configuration mode.

You can perform the following configurations in the TACACS server subconfiguration mode:

Command	Description
address { ipv6 ipv4 } ipaddress	Configures the IP address of the TACACS+ server.
key keyname	Configures the per-server encryption key on the TACACS server.
port port number	Specifies the TCP port to be used for TACACS+ server connections. The port number can range from 1 to 65535. Default port number is 49.
send-nat-address	Sends a client's post-NAT address to the TACACS+ server.
single-connection	Enables all TACACS packets to be sent to the same server using a single TCP connection.
timeout timeout-value	Configures the time (in seconds) to wait for a reply from the specified TACACS server.

Examples

The following example shows how to configure the TACACS server using the name server1 and enter TACACS+ server configuration mode to perform further configuration of an encryption key on the TACACS server:

Device(config)# tacacs server server1
Device(config-server-tacacs)# key cisco

Device(config-server-tacacs) # exit
Device(config) #

tracking (IPv6 snooping)

To override the default tracking policy on a port, use the **tracking** command in IPv6 snooping policy configuration mode.

tracking {enable [reachable-lifetime {value | infinite}] | disable [stale-lifetime {value | infinite}]

Syntax Description	enable	Enables tracking.		
	reachable-lifetime	(Optional) Specifies the maximum amount of time a reachable entry is considered to be directly or indirectly reachable without proof of reachability.		
		 The reachable-lifetime keyword can be used only with the enable keyword. Use of the reachable-lifetime keyword overrides the global reachable lifetime configured by the ipv6 neighbor binding reachable-lifetime command. 		
	value	Lifetime value, in seconds. The range is from 1 to 86400, and the default is 300. Keeps an entry in a reachable or stale state for an infinite amount of time. Disables tracking. (Optional) Keeps the time entry in a stale state, which overwrites the global stale-lifetime configuration.		
	infinite			
	disable			
	stale-lifetime			
		• The stale lifetime is 86,400 seconds.		
		• The stale-lifetime keyword can be used only with the disable keyword.		
		• Use of the stale-lifetime keyword overrides the global stale lifetime configured by the ipv6 neighbor binding stale-lifetime command.		
Command Default	The time entry is kept in a reachabl	e state.		
Command Modes	IPv6 snooping configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	on the port on which this policy app	the default tracking policy set by the ipv6 neighbor tracking command plies. This function is useful on trusted ports where, for example, you may n entry to stay in the binding table to prevent it from being stolen.		

The **reachable-lifetime** keyword is the maximum time an entry will be considered reachable without proof of reachability, either directly through tracking or indirectly through IPv6 snooping. After the **reachable-lifetime** value is reached, the entry is moved to stale. Use of the **reachable-lifetime** keyword with the tracking command overrides the global reachable lifetime configured by the **ipv6 neighbor binding reachable-lifetime** command.

The **stale-lifetime** keyword is the maximum time an entry is kept in the table before it is deleted or the entry is proven to be reachable, either directly or indirectly. Use of the **reachable-lifetime** keyword with the **tracking** command overrides the global stale lifetime configured by the **ipv6 neighbor binding stale-lifetime** command.

This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and configure an entry to stay in the binding table for an infinite length of time on a trusted port:

Device(config) # ipv6 snooping policy policy1
Device(config-ipv6-snooping) # tracking disable stale-lifetime infinite

trusted-port

To configure a port to become a trusted port, use the **trusted-port** command in IPv6 snooping policy mode or ND inspection policy configuration mode. To disable this function, use the **no** form of this command.

	trusted-port no trusted-port			
Syntax Description	This command has no arguments or keywords.			
Command Default	No ports are trusted.			
Command Modes	ND inspection policy configuration			
	IPv6 snooping configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines	When the trusted-port command is enabled, limited or no verification is performed when messages are received on ports that have this policy. However, to protect against address spoofing, messages are analyzed so that the binding information that they carry can be used to maintain the binding table. Bindings discovered from these ports will be considered more trustworthy than bindings received from ports that are not configured to be trusted.			
	This example shows how to define an NDP policy name as policy1, place the switch in NDP inspection policy configuration mode, and configure the port to be trusted:			
	Device(config)# ipv6 nd inspection policy1 Device(config-nd-inspection)# trusted-port			
	This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and configure the port to be trusted:			
	Device(config)# ipv6 snooping policy policy Device(config-ipv6-snooping)# trusted-port	1		

vlan access-map

To create or modify a VLAN map entry for VLAN packet filtering, and change the mode to the VLAN access-map configuration, use the **vlan access-map** command in global configuration mode on the switch stack or on a standalone switch. To delete a VLAN map entry, use the **no** form of this command.

vlan access-map name [number]
no vlan access-map name [number]

	Note This	s command is not supported on switches r	unning the LAN Base feature set.
Syntax Description	name	Name of the VLAN map.	
	number	If you are creating a VLAN map and the	map entry that you want to create or modify (0 to 65535). e sequence number is not specified, it is automatically om 10. This number is the sequence to insert to, or delete
Command Default	There are	e no VLAN map entries and no VLAN ma	aps applied to a VLAN.
Command Modes	Global co	configuration	
Command History	Release	3	Modification
	Cisco IC	OS Release 15.0(2)EX	This command was introduced.

Use the **vlan filter** interface configuration command to apply a VLAN map to one or more VLANs.

For more information about VLAN map entries, see the software configuration guide for this release.

This example shows how to create a VLAN map named vac1 and apply matching conditions and actions to it. If no other entries already exist in the map, this will be entry 10.

Device(config)# vlan access-map vac1
Device(config-access-map)# match ip address acl1
Device(config-access-map)# action forward

This example shows how to delete VLAN map vac1:

Device(config) # no vlan access-map vac1

vlan filter

To apply a VLAN map to one or more VLANs, use the **vlan filter** command in global configuration mode on the switch stack or on a standalone switch. To remove the map, use the **no** form of this command.

vlan filter mapname vlan-list {list | all} no vlan filter mapname vlan-list {list | all}

	Note This command is not supported on switches running the LA		es running the LAN Base feature set.	
Syntax Description	mapname	Name of the VLAN map entry.		
	vlan-list	Specifies which VLANs to apply t	he map to.	
	list	<i>list</i> The list of one or more VLANs in the form tt, uu-vv, xx, yy-zz, where spaces around command dashes are optional. The range is 1 to 4094.		
	all	Adds the map to all VLANs.		
Command Default	There are n	o VLAN filters.		
Command Modes	Global cont	figuration		
Command History	Release		Modification	
	Cisco IOS	Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	To avoid accidentally dropping too many packets and disabling connectivity in the middle of the configuration process, we recommend that you completely define the VLAN access map before applying it to a VLAN.			
	For more information about VLAN map entries, see the software configuration guide for this release.			
	This example applies VLAN map entry map1 to VLANs 20 and 30:			
	Device(config) # vlan filter map1 vlan-list 20, 30			
	This example shows how to delete VLAN map entry mac1 from VLAN 20:			
	Device(config) # no vlan filter map1 vlan-list 20			
	You can verify your settings by entering the show vlan filter privileged EXEC command.

vlan group

To create or modify a VLAN group, use the **vlan group** command in global configuration mode. To remove a VLAN list from the VLAN group, use the **no** form of this command.

vlan group group-name vlan-list vlan-list no vlan group group-name vlan-list vlan-list

Syntax Description	group-name	<i>group-name</i> Name of the VLAN group. The group name may contain up to 32 characters and must begin with a letter.				
	vlan-list vlan-list	1	to be added to the VLAN group. The <i>vlan-list</i> argument st of VLAN IDs, or VLAN ID range. Multiple entries or a comma (,).			
Command Default	None					
Command Modes	Global configuratio	n				
Command History	Release		Modification			
	Cisco IOS Release	15.0(2)EX	This command was introduced.			
Usage Guidelines	If the named VLAN group does not exist, the vlan group command creates the group and maps the specified VLAN list to the group. If the named VLAN group exists, the specified VLAN list is mapped to the group.					
	The no form of the vlan group command removes the specified VLAN list from the VLAN group. When you remove the last VLAN from the VLAN group, the VLAN group is deleted.					
	A maximum of 100 VLAN groups can be configured, and a maximum of 4094 VLANs can be mapped to a VLAN group.					
	This example shows how to map VLANs 7 through 9 and 11 to a VLAN group:					
	Device(config)# vlan group1 vlan-list 7-9,11					
	This example shows how to remove VLAN 7 from the VLAN group:					
	Device(config)# no vlan group group1 vlan-list 7

debug platform remote-commands

To enable debugging of remote commands, use the **debug platform remote-commands** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug platform remote-commands no debug platform remote-commands

Syntax Description This command has no arguments or keywords.

Command Default Debugging is disabled.

Command Modes Privileged EXEC

 Command History
 Release
 Modification

 Cisco IOS Release
 This command was introduced.

 15.0(2)EX

Usage Guidelines

The **undebug platform remote-commands** command is the same as the **no debug platform remote-commands** command.

When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the stack's active switch by using the **session** *switch-number* privileged EXEC command. Enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** *stack-member-number LINE* privileged EXEC command on the active switch to enable debugging on a member switch without first starting a session.

Related Topics

debug platform stack-manager

To enable debugging of the stack manager software, use the **debug platform stack-manager** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug platform stack-manager {all | rpc | sdp | sim | ssm | tdm | trace} no debug platform stack-manager {all | rpc | sdp | sim | ssm | tdm | trace}

Syntax Description	all Displays all stack manager debug messages.				
	rpcDisplays stack manager remote procedure call (RPC) usage debug messages.sdpDisplays the Stack Discovery Protocol (SDP) debug messages.simDisplays the stack information module debug messages.ssmDisplays the stack state-machine debug messages.				
	tdm Displays the stack manager topology discovery use debug messages.				
	trace Traces the stack manager entry and exit debug messages.				
Command Default	Debugging is disabled.				
Command Modes	Privileged EXEC				
Command History	Release Modification				
	Cisco IOS Release 15.0(2)EX This command was introduced.				
Usage Guidelines	This command is supported only on stacking-capable switches.				
	The undebug platform stack-manager command is the same as the no debug platform stack-manager command.				
	When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the session <i>switch-number</i> EXEC command. Enter the debug command at the command-line prompt of the stack member. You also can use the remote command <i>stack-member-number</i> LINE EXEC command on the active switch to enable debugging on a member switch without first starting a session.				
	Related Topics				
	remote command, on page 548				

session, on page 549

reload

To reload the stack member and to apply a configuration change, use the **reload** command in privileged EXEC mode.

reload [{/noverify | /verify}] [{LINE | at | cancel | in | slot stack-member-number | standby-cpu}]

Syntax Description	/noverify	(Optional) Specifies to not verify the file s	ignature before the reload.	
	/verify	(Optional) Verifies the file signature before	e the reload.	
	LINE	(Optional) Reason for the reload.		
	at	(Optional) Specifies the time in hh:mm for	the reload to occur.	
	cancel	(Optional) Cancels the pending reload.		
	in	(Optional) Specifies a time interval for rele	oads to occur.	
	slot (Optional) Saves the changes on the specified stack membres restarts it.			
	stack-member-number	(Optional) Stack member number on whic range is 1 to 8.	h to save the changes. The	
	standby-cpu (Optional) Reloads the standby route processor (RP).			
command Default	Privileged EXEC	ack member and puts a configuration change into eff

show platform stack manager

To display platform-dependent switch-stack information, use the **show platform stack manager** command in privileged EXEC mode.

show platform stack manager $\{all \mid counters \mid trace \ [\{cs \ [cs] \mid sdp \ [reverse] \mid state \ [reverse] \mid tdm \}]\}$

Syntax Description	all Displays all information for the entire switch stack.				
	counters Displays the stack manager counters.				
	trace Displays trace information.				
	cs (Optional) Displays information about changes in stack-related trace messages.				
	sdp (Optional) Displays Stack Discovery Protocol (SDP) information.				
	reverse (Optional) Displays trace information in reverse chronological order (from recent to older chronological sequence).				
	state (Optional) Displays stack state machine information.				
	tdm (Optional) Displays information about topology discovery including a summary of the stacking over Ethernet state machine events and messages.				
Command Default	None				
Command Modes	Privileged EXEC				
Command History	Release Modification				
	Cisco IOS Release This command was introduced. 15.0(2)EX				
Usage Guidelines	Use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.				
	Note This command is supported only on stacking-capable switches. The summary information about the switch stack shows these states:				
	• Waiting—A switch is booting up and waiting for communication from other switches in the stack. The switch has not determined whether or not it is active switch.				

- Initializing—A switch has determined whether it is the active switch. If not, the switch receives its system- and interface-level configuration from the active switch and loads it.
- Ready—The member has completed loading the system- and interface-level configurations and can forward traffic.
- Ver Mismatch—A switch in version mismatch mode. Version-mismatch mode is when a switch that joins the stack has a different stack protocol minor version number than the active switch.

A typical state transition for a stack member (including the active) booting up is Waiting > Initializing > Ready.

A typical state transition for a stack member to active switch after an election is Ready > Re-Init > Ready.

A typical state transition for a stack member in version mismatch (VM) mode is Waiting > Ver Mismatch.

show switch

.

To display information that is related to the stack member or the switch stack, use the **show switch** command in EXEC mode.

show switch [{stack-member-number | detail | neighbors | stack-ports | stack-ring speed}]

	Note	This command is	s supported only on Catalyst 2960-X swi	tches running the LAN Base image.
Syntax Description	sta	ck-member-number	· (Optional) Number of the stack member	er. The range is 1 to 8.
	de	tail	(Optional) Displays detailed information	on about the stack ring.
	ne	ighbors	(Optional) Displays the neighbors of th	he entire switch stack.
	sta	ck-ports	(Optional) Displays port information for	or the entire switch stack.
	sta	ck-ring	(Optional) Displays information about	the stack ring.
	sp	eed	Displays the stack ring speed.	
Command Default	Nor	ne		
Command Modes	Use	er EXEC (>)		
	Priv	vileged EXEC (#)		
Command History	Re	lease	Modification	
		sco IOS Release .0(2)EX	This command was introduced.	
Usage Guidelines	Thi	s command output	displays these states:	
			ch is booting up and waiting for commu etermined whether or not it is an active st	nication from other switches in the stack. The tack.
		Stack members n stack is elected a		n remain in the waiting state until the active
			witch has determined whether it has the ads the system- and interface-level confi	active stack status. If it is not the active stack, iguration from the active stack.
		• Ready—The mer forward traffic.	mber has completed loading the system-	and interface-level configurations and can
			A switch in version mismatch mode. Ver fferent stack protocol minor version nun	rsion-mismatch mode is when a switch joining nber than the active stack.

- SDM Mismatch—A switch in Switch Database Management (SDM) mismatch mode. SDM mismatch is when a member does not support the SDM template running on the active stack.
- Provisioned—The state of a preconfigured switch before it becomes an active member of a switch stack, or the state of a stack member after it has left the switch stack. The MAC address and the priority number in the display are always 0 for the provisioned switch.

A typical state transition for a stack member (including the active) booting up is Waiting > Initializing > Ready.

A typical state transition for a stack member becoming the active stack after the election is Ready > Re-Init > Ready.

A typical state transition for a stack member in version mismatch (VM) mode is Waiting > Ver Mismatch.

You can use the **show switch** command to identify whether the provisioned switch exists in the switch stack. The **show running-config** and the **show startup-config** privileged EXEC commands do not provide this information.

The display also includes stack MAC-persistency wait-time if persistent MAC address is enabled.

Examples

This example shows how to display summary stack information:

Device# show switch						
Switch/Stack Mac Address : d4a0.2a37.4800						
				H/W	Current	
Switch#	Role	Mac Address	Priority	Version	State	
1	Member	0cd9.9624.f980	7	4	Ready	
*2	Master	d4a0.2a37.4800	1	4	Ready	
6	Member	0003.e31a.1e00	2	4	Ready	

This example shows how to display detailed stack information:

Device# show switch detail						
Switch/Stack Mac Address : d4a0.2a37.4800						
				H/W	Current	
Switch#	Role	Mac Address	Priority	Version	State	
1	Member	0cd9.9624.f980	7	4	Ready	
*2	Master	d4a0.2a37.4800	8	4	Ready	
6	Member	0003.e31a.1e00	2	0	Ready	

		Neighbors		
Port 1	Port 2	Port 1	Port 2	
Ok	Down	2	None	
Down	Ok	None	1	
Down	Ok	None	1	
	Port 1 Ok Down	Ok Down Down Ok	Port 1 Port 2 Port 1 Ok Down 2 Down Ok None	

This example shows how to display the member 6 summary information:

Device#	show swit	ch 6		
Switch#	Role	Mac Address	Priority	State
6	Member	0003.e31a.1e00	1	Ready

This example shows how to display the neighbor information for a stack:

Device# show switch neighbors Switch # Port A Port B ------ -----6 None 8 8 6 None

This example shows how to display stack-port information:

switch sta	.ck-ports
Port A	Port B
Down	Ok
Ok	Down
	Port A Down

stack-mac persistent timer

To enable the persistent MAC address feature, use the **stack-mac persistent timer** command in global configuration mode on the switch stack or on a standalone switch. To disable the persistent MAC address feature, use the **no** form of this command.

stack-mac persistent timer [{0time-value}]
no stack-mac persistent timer

Syntax Description	0 (Optional) Continues using the MAC address of the current active switch after a new active switch takes over. time-value (Optional) Time period in minutes before the stack MAC address changes to that of the new active switch. The range is 1 to 60 minutes. When no value is entered, the default is 4 minutes. We recommend that you configure an explicit value for this command.				
Command Default	Persistent N	IAC address is disabled. The MAC address of t	he stack is always that of the first active switch.		
	When the command is entered with no value, the default time before the MAC address changes is for We recommend that you configure an explicit value for this command.				
Command Modes	Global conf	iguration (config)			
Command History	Release	Modification			
	Cisco IOS	Release 15.0(2)EX This command was introduce	ed.		
Usage Guidelines	state (persis	ddress of the switch stack is determined by the tent MAC address disabled), if a new switch be he MAC address of the new active switch.	MAC address of the active switch. In the default acomes active switch, the stack MAC address		
	that time, if for as long a				
	You can set	the time period to be from 0 to 60 minutes.			
	• If you enter the command with no value, the default delay is 4 minutes.				
	•	enter 0 , the stack continues to use the current state tent timer command.	ck MAC address until you enter the no stack-mac		
			AC address of the previous active switch is used ter the no stack-mac persistent timer command.		

	Note When you enter the stack-mac persistent timer command with or without keywords, a message appears warning that traffic might be lost if the old active switch MAC address appears elsewhere in the network domain. You should use this feature cautiously.			
	If you enter the no stack-mac persistent timer command after a switchover, before the time expires, the switch stack moves to the current stack's active switch MAC address.			
	If the whole stack reloads, when it comes back up, the MAC address of the active switch is the stack MAC address.			
Examples	This example shows how to configure the persistent MAC address feature, with the warning messages for each configuration. It also shows how to verify the configuration:			
	Device(config)# stack-mac persistent timer			
	WARNING: Use of an explicit timer value with the command is recommended. WARNING: Default value of 4 minutes is being used. WARNING: The stack continues to use the base MAC of the old Master WARNING: as the stack-mac after a master switchover until the MAC WARNING: persistency timer expires. During this time the Network WARNING: Administrators must make sure that the old stack-mac does WARNING: not appear elsewhere in this network domain. If it does, WARNING: user traffic may be blackholed.			
	Device(config)# stack-mac persistent timer 0			
	WARNING: Stack MAC persistency timer value of 0 means that, after a WARNING: master switchover, the current stack-mac will continue WARNING: to be used indefinitely. WARNING: The Network Administrators must make sure that the old WARNING: stack-mac does not appear elsewhere in this network WARNING: domain. If it does, user traffic may be blackholed.			
	Device(config)# stack-mac persistent timer 7			
	WARNING: The stack continues to use the base MAC of the old Master WARNING: as the stack-mac after a master switchover until the MAC WARNING: persistency timer expires. During this time the Network WARNING: Administrators must make sure that the old stack-mac does WARNING: not appear elsewhere in this network domain. If it does, WARNING: user traffic may be blackholed.			
	Device(config)# end Device(config)# show switch			
	Switch/Stack Mac Address : 0cd9.9624.dd80 Mac persistency wait time: 7 mins H/W Current			
	Switch# Role Mac Address Priority Version State			
	*1 Master 0cd9.9624.dd80 1 4 Ready			

• **show running-config**—If enabled, **stack-mac persistent timer** and the time in minutes appears in the output.

• **show switch**—If enabled, **Mac persistency wait time** and the number of minutes appears in the output.

switch stack port

To disable or enable the specified stack port on the member, use the **switch** command in privileged EXEC mode on a stack member.

switch stack-member-number stack port port-number {disable | enable}

-	Note This comman	nd is supported only on Catalyst 2960-X switches running the LAN Base image.	
Syntax Description	stack-member-nu	<i>umber</i> Current stack member number. The range is 1 to 8.	
	stack port port-n	number Specifies the stack port on the member. The range is 1 to 2.	
	disable	Disables the specified port.	
	enable	Enables the specified port.	
Command Default	The stack port is e	enabled.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS Releas	se 15.0(2)EX This command was introduced.	
Usage Guidelines	A stack is in the full-ring state when all members are connected through the stack ports and are in the ready state. The stack is in the partial-ring state when the following occurs:		
		s are connected through their stack ports but some are not in the ready state. Ders are not connected through the stack ports.	
-		when using the switch <i>stack-member-number</i> stack port <i>port-number</i> disable command. When the stack port, the stack operates at half bandwidth.	
	If you enter the switch <i>stack-member-number</i> stack port <i>port-number</i> disable privileged EXEC command and the stack is in the full-ring state, you can disable only one stack port. This message appears:		
	Enabling/disabl	ling a stack port may cause undesired stack changes. Continue?[confirm]	
	If you enter the sv	witch <i>stack-member-number</i> stack port <i>port-number</i> disable privileged EXEC command n the partial-ring state, you cannot disable the port. This message appears:	

Examples

This example shows how to disable stack port 2 on member 4:

Device# switch 4 stack port 2 disable

switch provision

To supply a configuration to a new switch before it joins the switch stack, use the **switch provision** command in global configuration mode on the active switch. To delete all configuration information that is associated with the removed switch (a stack member that has left the stack), use the **no** form of this command.

switch stack-member-number provision type
no switch stack-member-number provision

Syntax Description	stack-member-number Stack member number. The range is 1 to 8.
	<i>type</i> Switch type of the new switch before it joins the stack.
Command Default	The switch is not provisioned.
Command Modes	Global configuration (config)
Command History	Release Modification
	Cisco IOS Release 15.0(2)EX This command was introduced.
Usage Guidelines	For <i>type</i> , enter the model number of a supported switch that is listed in the command-line help strings.
	To avoid receiving an error message, you must remove the specified switch from the switch stack before using the no form of this command to delete a provisioned configuration.
	To change the switch type, you must also remove the specified switch from the switch stack. You can change the stack member number of a provisioned switch that is physically present in the switch stack if you do not also change the switch type.
	If the switch type of the provisioned switch does not match the switch type in the provisioned configuration on the stack, the switch stack applies the default configuration to the provisioned switch and adds it to the stack. The switch stack displays a message when it applies the default configuration.
	Provisioned information appears in the running configuration of the switch stack. When you enter the copy running-config startup-config privileged EXEC command, the provisioned configuration is saved in the startup configuration file of the switch stack.
	\triangle
(When you use the switch provision command, memory is allocated for the provisioned configuration. When a new switch type is configured, the previously allocated memory is not fully released. Therefore, do not use this command more than approximately 200 times, or the switch will run out of memory and unexpected behavior will result.
Examples	This example shows how to provision a switch with a stack member number of 2 for the switch stack. The show running-config command output shows the interfaces associated with the provisioned switch.
	Device(config)# switch 2 provision WS-xxxx Device(config)# end

```
Device# show running-config | include switch 2
!
interface GigabitEthernet2/0/1
!
interface GigabitEthernet2/0/2
!
interface GigabitEthernet2/0/3
<output truncated>
```

You also can enter the **show switch** user EXEC command to display the provisioning status of the switch stack.

This example shows how to delete all configuration information about stack member 5 when the switch is removed from the stack:

Device(config) # no switch 5 provision

You can verify that the provisioned switch is added to or removed from the running configuration by entering the **show running-config** privileged EXEC command.

Related Topics

show switch, on page 557

switch renumber

To change the stack member number, use the **switch renumber** command in global configuration mode on the active switch.

switch current-stack-member-number renumber new-stack-member-number

Syntax Description	current-stack-member-number Current stack member number. The range is 1 to 8.			
	<i>new-stack-member-number</i> New stack member number for the stack member. The range is 1 to 8.			
Command Default	The default stack member number is 1.			
Command Modes	Global configuration			
Command History	Release Modification			
	Cisco IOS Release This command was introduced. 15.0(2)EX			
Usage Guidelines	If another stack member is already using the member number that you just specified, the active switch assigns the lowest available number when you reload the stack member.			
	Note If you change the number of a stack member, and no configuration is associated with the new stack member number, that stack member loses its current configuration and resets to its default configuration. Do not use the switch current-stack-member-number renumber new-stack-member-number command on a provisioned switch. If you do, the command is rejected.			
	Use the reload slot <i>current stack member number</i> privileged EXEC command to reload the stack member and to apply this configuration change.			
Examples	This example shows how to change the member number of stack member 6 to 7:			
	Device(config)# switch 6 renumber 7			
	WARNING:Changing the switch number may result in a configuration change for that switch. The interface configuration associated with the old switch number will remain as a provisioned configuration. Do you want to continue?[confirm]

switch stack port-speed 10

To set the switch stack port speed to 10 Gbps and enable mixed stacking with one or more Catalyst 2960-S switches, use the **switch stack port-speed 10** command in global configuration mode. To return to the default setting, use the **no** form of this command.

switch stack port-speed 10 no switch stack port-speed

Syntax Description This command has no arguments or keywords.

Command Default The default port speed is 20 Gbps.

 Command History
 Release
 Modification

 Cisco IOS Release
 This command was introduced.

 15.0(2)EX

Usage Guidelines By default, Catalyst 2960-X switches operate at a port speed of 20 Gbps while 2960-S switches have a maximum port speed of 10 Gbps. In a mixed stack of Catalyst 2960-X and Catalyst 2960-S switches, the stack must operate at the port speed of the Catalyst 2960-S switch; otherwise, the switches will not stack.

To set the port speed of the stack to 10 Gbps, use the **switch stack port-speed 10** global configuration command on a Catalyst 2960-X stack member before you add a Catalyst 2960-S switch to the stack, and then reload the stack.

This example shows how to set the switch stack port speed to 10 Gbps and then reload the stack:

```
Device(config)# switch stack port-speed 10
WARNING: Changing the stack speed may result in a stack speed mismatch.
Do you want to continue?[confirm]
New stack speed will be effective after next reload
Device(config)# exit
```

Device# **reload** System configuration has been modified. Save? [yes/no]:

You can verify your settings by entering the **show switch stack-ring speed** privileged EXEC command.

switch stack port-speed 10

archive download-sw

To download a new image from a TFTP server to the switch or switch stack and to overwrite or keep the existing image, use the **archive download-sw** command in privileged EXEC mode.

archive download-sw {/directory | /force-reload | /imageonly | /leave-old-sw | /no-set-boot | /no-version-check | /overwrite | /reload | /safe} source-url

	<u> </u>	
Syntax Description	/directory	Specifies a directory for the images.
	/force-reload	Unconditionally forces a system reload after successfully downloading the software image.
	/imageonly	Downloads only the software image but not the HTML files associated with embedded Device Manager. The HTML files for the existing version are deleted only if the existing version is being overwritten or removed.
	/leave-old-sw	Keeps the old software version after a successful download.
	/no-set-boot	Stops the setting of the BOOT environment variable from being altered to point to the new software image after it is successfully downloaded.
	/no-version-check	Downloads the software image without verifying its version compatibility with the image that is running on the switch. On a switch stack, downloads the software image without checking the compatibility of the stack protocol version on the image and on the stack.
		This feature is supported only on the LAN Base image.
	/overwrite	Overwrites the software image in flash memory with the downloaded image.
	/reload	Reloads the system after successfully downloading the image, unless the configuration has been changed and has not saved.
	/safe	Keeps the current software image. Does not delete it to make room for the new software image before the new image is downloaded. The current image is deleted after the download.

I

	source-url	Specifies the source URL alias for a local or network file system. These options are supported:
		• The secondary boot loader (BS1):
		bsl:
		• The local flash: file system on the standalone switch or the active switch:
		flash:
		• The local flash: file system on a member:
		flash member number:
		• FTP:
		ftp: [[//username [: password] @location]/directory]/image-name.tar
		• An HTTP server:
		http: //[[username:password] @] { hostname host-ip } [/directory]/image-name.tar
		• A secure HTTP server:
		https://[[username:password]@] { hostname host-ip } [/directory]/image-name.tar
		• Remote Copy Protocol (RCP):
		rcp: [[//username@location]/directory]/image-name. tar
		• TFTP:
		tftp: [[//location]/directory]/image-name.tar
		<i>image-name</i> .tar is the software image to download and install on the switch.
Command Default		re image is not overwritten with the downloaded image. Both the software image and wnloaded. The new image is downloaded to the flash: file system.
		nment variable is changed to point to the new software image on the flash: file system. e-sensitive; the image file is provided in TAR format.
	Compatibility of th stack.	e stack protocol version of the image to be downloaded is checked with the version on the
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	e This command was introduced.
Usage Guidelines	The /imageonly op or replaced.	tion removes the HTML files for the existing image if the existing image is being removed

Using the /safe or /leave-old-sw option can cause the new image download to fail if there is insufficient flash memory.

If you leave the software in place, the new image does not have enough flash memory due to space constraints, and an error message is displayed.

If you used the **/leave-old-sw** option and did not overwrite the old image when you downloaded the new one, you can remove the old image by using the **delete** privileged EXEC command.

For more information, see delete, on page 616.

If you want to download an image that has a different stack protocol version than the one existing on the stack, use the **/no-version-check** option.

Note This feature is supported only on the LAN Base image.

Note

Use the **/no-version-check** option carefully. All members, including the active switch, must have the same stack protocol version to be in the same stack.

This option allows an image to be downloaded without first confirming the compatibility of its stack protocol version with the version of the stack.

Use the **/overwrite** option to overwrite the image on the flash device with the downloaded one.

If you specify the command *without* the **/overwrite** option, the download algorithm determines whether or not the new image is the same as the one on the switch flash device or is running on any stack members.

If the images are the same, the download does not occur. If the images are different, the old image is deleted, and the new one is downloaded.

After downloading a new image, enter the /reload privileged EXEC command to begin using the new image, or specify the /reload or /force-reload option in the archive download-sw command.

Examples

This example shows how to download a new image from a TFTP server at 172.20.129.10 and to overwrite the image on the switch:

Device# archive download-sw /overwrite tftp://172.20.129.10/test-image.tar

This example shows how to download only the software image from a TFTP server at 172.20.129.10 to the switch:

Device# archive download-sw /imageonly tftp://172.20.129.10/test-image.tar

This example shows how to keep the old software version after a successful download:

Device# archive download-sw /leave-old-sw tftp://172.20.129.10/test-image.tar

Device# archive download-sw /imageonly /destination-system 6 /destination-system 8
tftp://172.20.129.10/test-image.tar

I

archive tar

To create a TAR file, list files in a TAR file, or extract the files from a TAR file, use the **archive tar** command in privileged EXEC mode.

archive tar {/**create** destination-url **flash:**/*file-url*} | /**table** source-url | {/**xtract** source-url **flash:**/*file-url* [*dir*/*file*...]}

Syntax Description	/create	Creates a new TAR file on the local or network file system.
	destination-url flash: /file-url	<i>destination-url</i> —Specifies the destination URL alias for the local or network file system and the name of the tar file to create. These options are supported:
		• The local flash file system:
		flash:
		• FTP:
		ftp: [[//username [: password] @location]/directory]/itar-filename.tar
		• An HTTP server:
		http://[[username:password]@] { hostname host-ip } [/directory]/image-name.tar
		• A secure HTTP server:
		https: //[[username:password] @] { hostname host-ip } [/directory]/image-name .tar
		• Remote Copy Protocol (RCP):
		rcp: [[//username@location]/directory]/tar-filename. tar
		• TFTP:
		tftp: [[//location]/directory]/image-name.tar
		tar-filename.tar is the TAR file to be created.
		flash :/ <i>file-url</i> —Specifies the location on the local flash: file system from which the new tar file is created.
		Optionally, you can specify the list of files list of files or directories within the source directory that you want to be written to the new TAR file. If none are specified, all files and directories at this level are written to the newly created TAR file.

L

table source-url Displays the contents of an existing TAR file to the screen. source-url-Specifies the source URL alias for the local or network file system. These options are supported: • The local flash: file system: flash: • FTP: ftp: [[//username [: password] @location]/directory]/itar-filename.tar • An HTTP server: http://[[username:password] @] { hostname | host-ip } [/directory]/image-name.tar • A secure HTTP server: https: //[[username:password] @] { hostname | host-ip } [/directory]/image-name.tar • Remote Copy Protocol (RCP): rcp: [[//username@location]/directory]/tar-filename.tar • TFTP: tftp: [[//location]/directory]/image-name.tar tar-filename.tar is the TAR file to be displayed.

/xtract	Extracts files from a TAR file to the local file system.
source-url flash: /file-url [dir/file]	<i>source-url</i> —Specifies the source URL alias for the local file system. These options are supported:
[• The local flash: file system:
	flash:
	• FTP:
	ftp: [[//username [: password] @location]/directory]/itar-filename.tar
	• An HTTP server:
	http://[[username:password]@] { hostname host-ip } [/directory]/image-name.
	• A secure HTTP server:
	https: //[[username:password] @] { hostname host-ip } [/directory]/image-name. tar
	Remote Copy Protocol (RCP):
	rcp: [[//username@location]/directory]/tar-filename. tar
	• TFTP:
	tftp: [[//location]/directory]/image-name.tar
	tar-filename.tar is the TAR file from which to extract.
	flash :/ <i>file-url</i> [<i>dir/file</i>]—Specifies the location on the local flash: file system from which the new TAR file is extracted. Use the <i>dir/file</i> option to specify an optional list of files or directories within the TAR file to be extracted. If none are specified, all file and directories are extracted.

Command Modes Privileged EXEC

Command History Usage Guidelines	Release	Modification	-
	Cisco IOS Release 15.0(2)EX	This command was introduced.	-
	Filenames and directory names are case sensitive. Image names are case sensitive.		
	Examples		
	-		writes the contents of the <i>new-configs</i> ar on the TFTP server at 172.20.10.30:
	Device# archive tar /	create tftp:172.20.10.30/saved	.tar flash:/new_configs

This example shows how to display the contents of the file that is in flash memory. The contents of the TAR file appear on the screen:

```
Device# archive tar /table flash:c2960-lanbase-tar.12-25.FX.tar
info (219 bytes)
(directory)
(610856 bytes)
info (219 bytes)
info.ver (219 bytes)
```

This example shows how to display only the /html directory and its contents:

```
flash:2960-lanbase-mz.12-25.FX.tar 2960-lanbase-mz.12-25.FX/html
 (directory)
 (556 bytes)
 (9373 bytes)
 (1654 bytes)
<output truncated>
```

This example shows how to extract the contents of a TAR file on the TFTP server at 172.20.10.30. This command extracts just the new-configs directory into the root directory on the local flash: file system. The remaining files in the saved tar file are not extracted.

Device# archive tar /xtract tftp://172.20.10.30/saved.tar flash:/new-configs

I

archive upload-sw

To upload an existing image to the server, use the archive upload-sw privileged EXEC command.

archive upload-sw [/version version_string] destination-url

Syntax Description	/version version_string	(Optional) Specifies the specific version string of the image to be uploaded.			
	destination-url	The destination URL alias for a local or network file system. These options are supported:			
		• The local flash: file system on the standalone switch or the active switch:			
		flash:			
		• The local flash: file system on a member:			
		flash member number:			
		• FTP:			
		ftp: [[//username [: password] @location]/directory]/image-name.tar			
		• An HTTP server:			
		http: //[[username:password] @] { hostname host-ip } [/directory]/image-name. tar			
		• A secure HTTP server:			
		https: //[[username:password] @] { hostname host-ip } [/directory]/image-name. tar			
		Secure Copy Protocol (SCP):			
		<pre>scp: [[//username@location]/directory]/image-name.tar</pre>			
		Remote Copy Protocol (RCP):			
		rcp: [[//username@location]/directory]/image-name. tar			
		• TFTP:			
	tftp: [[//location]/directory]/image-name.tar				
	<i>image-name</i> .tar is the name of the software image to be stored on the server.				
Command Default	Uploads the curre	ently running image from the flash: file system.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS Relea 15.0(2)EX	se This command was introduced.			

Usage Guidelines

Use the upload feature only if the HTML files associated with embedded Device Manager have been installed with the existing image.

The files are uploaded in this sequence: the Cisco IOS image, the HTML files, and info. After these files are uploaded, the software creates the TAR file.

Image names are case sensitive.

Examples

This example shows how to upload the currently running image on member switch 3 to a TFTP server at 172.20.140.2:

Switch# archive upload-sw /source-system-num 3tftp://172.20.140.2/test-image.tar

avc dns-as client

To enable Application Visibility Control (AVC) with Domain Name System as an Authoritative Source (DNS-AS) feature (AVC with DNS-AS) on the switch (DNS-AS client) and maintain a list of trusted domains, enter the **avc dns-as client** in global configuration mode

 avc dns-as client [enable | trusted-domains [domaindomain-name]]

 no avc dns-as client [enable | trusted-domains [domaindomain-name]]]

Syntax Description	enable		Enables AVC with DNS-AS on the DNS-AS client.	
	trusted-domains [domaindomain-name]		Enter the domain name you would like to add to the list of trusted domains for the DNS-AS client. All remaining domains are ignored and will follow default forwarding behavior.	
			You can enter up to 50 domains.	
			You can use regular expressions to match the domain name.	
Command Default	AVC with DNS-AS is dis	abled.		
Command Modes	Global configuration mod	de		
	Trusted domain configura	ation mode		
Command History	Release	Modificatio	 Dn	
	Cisco IOS Release 15.2(5)E1	This comma	and was introduced.	
Usage Guidelines	When you use regular expressions to match a domain name, for example, to represent all the domains for an organization, if you enter:			
	Device(config-trusted-domains)# domain *.example.*			
	The DNS-AS client matches www.example.com, ftp.example.org and any other domain that pertains to the organization "example". Use such an entry in the trusted domain list carefully, because it increases the size of the binding table considerably. Entries in the trusted domain list affect the binding table, because the table serves as a database of parsed DNS server responses, which (among other things) contains the domain name and IP address information.			
	Example			
	The following example shows how to enable AVC with DNS-AS:			
	Device# configure terminal Device(config)# avc dns-as client enable			
	The following example shows how to make entries in the trusted domain list:			
	Device# configure terminal Device(config)# trusted-domains			

Device(config-trusted-domains)#	domain www.example.com
Device(config-trusted-domains)#	domain example.com
Device(config-trusted-domains)#	domain www.example.net
Device(config-trusted-domains)#	domain example.net
Device(config-trusted-domains)#	domain www.example.org
Device(config-trusted-domains)#	domain example.org

Related Commands

I

Command	Description
show avc dns-as client, on page 652	Displays the various AVC with DNS-AS settings you have configured.

show logging smartlog

To display smart logging information, use the show logging smartlog command in privileged EXEC mode.

show logging smartlog [event-ids | events | statistics {interface interface-id | summary}]

Syntax Description	event-ids	event-ids (Optional) Displays the IDs and names of smart log events. The NetFlow collector uses the event IDs to identify each event.		
	events	(Optional) Displays descriptions of smart log events. The display shows the last 10 smart logging events.		
	statistics	(Optional) Displays smart log statistic	S.	
	interface <i>interface-id</i>	(Optional) Displays smart log statistics for the specified interface.		
	summary	(Optional) Displays a summary of the	smart log event statistics.	
Command Default	None			
Command Modes	Privileged EXEC			
Command History	Release	Modification	_	
	Cisco IOS Release 15.0(2)EX	This command was introduced		
Usage Guidelines	You can configure smart logging of packets dropped because of DHCP snooping violations, Dynamic ARP inspection violations, IP source guard denied traffic, or ACL permitted or denied traffic. The packet contents are sent to the identified Cisco IOS NetFlow collector.			
	The statistics counters reflect the number of packets that have been sent to the collector by smart logging.			
	Examples			
	This example shows output from the show logging smartlog event-ids command:			
		<pre>ing smartlog event-ids ription: DHCPSNP</pre>		
	ID Descriptio	n

```

I

boot

To load and boot an executable image and display the command-line interface (CLI), use the **boot** command in boot loader mode.

boot [**-post** | **-n** | **-p** | *flag*] *filesystem:/file-url...*

Syntax Description	-post (Optional) Run the loaded image with an extended or comprehensive power-on self-test (POST). Using this keyword causes POST to take longer to complete.			
	-n	(Optional) Pause for the Cisco IOS Debugger immediately after launching.		
	-р	(Optional) Pause for the JTAG Debugger right after loading the image.		
	filesystem:	Alias for a file system. Use flash: for the system board flash device; use usbflash0: for USB memory sticks.		
	/file-url	Path (directory) and name of a bootable image. Separate image names with a semicolon.		
Command Default	No default beh	havior or values.		
Command Modes	Boot loader			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX This command was introduced.			
Usage Guidelines	When you enter the boot command without any arguments, the device attempts to automatically boot the system by using the information in the BOOT environment variable, if any.			
	If you supply an image name for the <i>file-url</i> variable, the boot command attempts to boot the specified image.			
	When you specify boot loader boot command options, they are executed immediately and apply only to the current boot loader session.			
	These settings are not saved for the next boot operation.			
	Filenames and directory names are case sensitive.			
	Example			
	This example shows how to boot the device using the new-image.bin image:			
	Device: set BOOT flash:/new-images/new-image.bin Device: boot			
	After entering this command, you are prompted to start the setup program.			

boot buffersize

To configure the NVRAM buffer size, use the **boot buffersize** global configuration command.

boot buffersize size **Syntax Description** The NVRAM buffer size in KB. The valid range is from 4096 to 1048576. size The default NVRAM buffer size is 512 KB. **Command Default** Global configuration **Command Modes Command History** Release Modification Cisco IOS Release This command was introduced. 15.0(2)EX After you configure the NVRAM buffer size, reload the switch or switch stack. **Usage Guidelines** When you add a switch to a stack and the NVRAM size differs, the new switch synchronizes with the stack and reloads automatically. Example The following example sets the buffer size to 524288 KB:

Switch(config) # boot buffersize 524288

boot enable-break

To enable the interruption of the automatic boot process on a standalone switch, use the **boot enable-break** global configuration command. Use the **no** form of this command to return to the default setting.

boot enable-break no boot enable-break

Syntax Description This command has no arguments or keywords.

Command Default Disabled. The automatic boot process cannot be interrupted by pressing the **Break** key on the console.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines

This command works properly only from a standalone switch. When you enter this command, you can interrupt the automatic boot process by pressing the **Break** key on the console after the flash: file system is initialized.

Ø

Note Despite setting this command, you can interrupt the automatic boot process at any time by pressing the MODE button on the switch front panel.

This command changes the setting of the ENABLE_BREAK environment variable.

boot host dhcp

To configure the switch to download files from a DHCP server, use the **boot host dhcp** global configuration command.

boot host dhcp

Syntax Description	This command has no arguments or keywords.		
Command Default	None		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Example

This example uses the **boot host dhcp** command to enable auto-configuration with a saved configuration.

Switch(config) # boot host dhcp

boot host retry timeout

To set the amount of time for which the system tries to download a configuration file, use the **boot host retry timeout** global configuration command.

boot host retry timeout timeout-value

Syntax Description	timeout-value	The length of time before the system times of file.	ut, after trying to download a configuration
Command Default	There is no default. If you do not set a timeout, the system indefinitely tries to obtain an IP address from the DHCP server.		
Command Modes	Global configu	ration	
Command History	Release	Modification	
	Cisco IOS Rel 15.0(2)EX	ease This command was introduced.	

Example

This example sets the timeout to 300 seconds:

Switch(config) # boot host retry timeout 300

boot manual

To enable the ability to manually boot a standalone switch during the next boot cycle, use the **boot manual** global configuration command. Use the **no** form of this command to return to the default setting.

boot manual no boot manual

Syntax Description This command has no arguments or keywords.

Command Default Manual booting is disabled.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines This command works properly only from a standalone switch.

The next time you reboot the system, the switch is in boot loader mode, which is shown by the *switch:* prompt. To boot up the system, use the **boot** boot loader command, and specify the name of the bootable image.

This command changes the setting of the MANUAL_BOOT environment variable.

boot system

To specify the name of the configuration file that is used as a boot image, use the **boot system** global configuration command.

boot system *filename* [**switch** {*switch number* | **all**}]

<i>filename</i> The name of the boot image c		e of the boot image configuration file.
switch	(Optional) Sets the system image for switches in the sta
switch number	The swite	ch number.
all	Sets the s	ystem image for all switches in the stack.
None		
Global conf	iguration	
Release		Modification
Cisco IOS 1 15.0(2)EX	Release	This command was introduced.
	switch switch number all None Global conf Release Cisco IOS	switch (Optional switch The switch number all all Sets the s None Global configuration Release Cisco IOS Release

Example

The following example specifies the name of the boot image configuration file as *config-boot.text*: Switch(config) # boot system config-boot.text

cat

I

To display the contents of one or more files, use the **cat** command in boot loader mode.

	cat filesystem:/file-url		
Syntax Description	<i>filesystem:</i> Specifies a file system. / <i>file-url</i> Specifies the path (directory) and name of the files to display. Separate each filename with a space. No default behavior or values. Boot loader		
Command Default			
Command Modes			
Command History	Release Modification		
	Cisco IOS Release 15.0(2)EX This command was introduced.		
Usage Guidelines	Filenames and directory names are case sensitive.		
	If you specify a list of files, the contents of each file appears sequentially.		
Examples	This example shows how to display the contents of an image file:		
	Device: cat flash : <i>image_file_name</i> version_suffix: universal-122-xx.SEx version_directory: <i>image_file_name</i> <i>image_system_type_id</i> : 0x0000002 <i>image_name: image_file_name.bin</i> <i>ios_image_file_size</i> : 8919552 total_image_file_size: 11592192 <i>image_feature: IP\LAYER_3\PLUS\MIN_DRAM_MEG=128</i> <i>image_family: family</i> stacking_number: 1.34 board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b <i>info_end:</i>		

clear logging onboard

To clear all of the on-board failure logging (OBFL) data, use the **clear logging onboard** privileged EXEC command on the switch stack or on a standalone switch. The command clears all of the OBFL data except for the uptime and CLI-command information stored in the flash memory.

```
clear logging onboard [ module { switch-number | all } ]
```

-	Note This command is supported only on the LAN Base image.		
Syntax Description	module	(Optional) Clears OBFL data on specified swi	tches in the stack.
	switch-number	The identity of the specified switch. The rang	e is from 1 to 4.
	all	(Optional) Clears OBFL data on all switches	in the stack.
Command Modes	Privileged EXEC	2	
Command History	Release	Modification	
	Cisco IOS Relea 15.0(2)EX	ase This command was introduced.	
Usage Guidelines	We recommend	that you keep OBFL enabled and do not erase t	he data stored in the flash memory.
	Example		
	This example she information:	ows how to clear all the OBFL information exce	pt for the uptime and CLI-command
		logging onboard onboard buffer [confirm]	
	Vou con verify t	not the information is deleted by entering the st	ow logging onhoard privilaged

You can verify that the information is deleted by entering the **show logging onboard** privileged EXEC command.

clear mac address-table

To delete a specific dynamic address, all dynamic addresses on a particular interface, all dynamic addresses on stack members,

or all dynamic addresses on a particular VLAN from the MAC address table, use the **clear mac address-table** privileged EXEC command.

This command also clears the MAC address notification global counters.

clear mac address-table {**dynamic** [**address** *mac-addr* | **interface** *interface-id* | **vlan** *vlan-id*] | **notification**}

Ŵ

Note This command is supported only on the LAN Base image.

Syntax Description	dynamic	Deletes all dynamic MAC addresses.	
	address mac-addr	(Optional) Deletes the specified dynamic MAC address.	
	interface interface-id	(Optional) Deletes all dynamic MAC addresses on the specified physical port or port channel.	
	vlan vlan-id	(Optional) Deletes all dynamic MAC addresses for the specified VLAN. The range is 1 to 4094.	
	notification	Clears the notifications in the history table and reset the counters.	
Command Default	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
Command mistory			

You can verify that the information is deleted by entering the **show mac address-table** privileged EXEC command.

clear mac address-table move update

To clear the mac address-table-move update-related counters, use the **clear mac address-table move update** privileged EXEC command.

	clear mac address-table move update	
Syntax Description	This command has no arguments or keywords.	
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Example

This example shows how to clear the mac address-table move update-related counters.

Switch# clear mac address-table move update

You can verify that the information is cleared by entering the **show mac address-table move update** privileged EXEC command.

clear nmsp statistics

To clear the Network Mobility Services Protocol (NMSP) statistics, use the **clear nmsp statistics** command in EXEC mode.

clear nmsp statistics

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes User Exec

Privileged EXEC

Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

The following is sample output from the **clear nmsp statistics** command and shows how to clear all statistics about NMSP information exchanged between the controller and the connected Cisco Mobility Services Engine (MSE):

Device> clear nmsp statistics

cluster commander-address

To specify the cluster command MAC address on a cluster member switch when the member has lost communication with the cluster command switch, use the

cluster commander-address global configuration command. Use the **no** form of this global configuration command from the

cluster member switch console port to remove the switch from a cluster only during debugging or recovery procedures.

cluster commander-address mac-address [member number | name name] no cluster commander-address

Syntax Description	mac-address	The MAC address of the cluster command switch.	
	member <i>number</i> (Optional) Specifies the number of a configured cluster member switch. The range is 0 to 15.		
	name name	(Optional) Specifies the name of the configured cluster up to 31 characters.	
Command Default	The switch is not a member of any cluster.		
Command Modes	Global configuration	on	
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	e This command was introduced.	
Usage Guidelines	This command is available only on the cluster command switch. The cluster command switch automatically provides its MAC address to cluster member switches when these switches join the		
	cluster. The cluster member switch adds this information and other cluster information to its runnin configuration file.		
	A cluster member can have only one cluster command switch.		
	The cluster member switch retains the identity of the cluster command switch during a system reload by using the <i>mac-address</i> parameter.		
	You can enter the no form on a cluster member switch to remove it from the cluster during debugging or recovery procedures. You usually use this command from		
	the cluster member switch console port only when the member has lost communication with the cluster command switch. With a typical switch configuration, we recommend that you remove		
	cluster member switches only by entering the no cluster member n global configuration command on the cluster command switch.		
	When a standby cluster command switch becomes active (becomes the cluster command switch), it removes the cluster commander address line from its configuration.		

Example

The following example shows partial output from the running configuration of a cluster member:

Switch(config)# show running-configuration
<output truncated>
cluster commander-address 00e0.9bc0.a500 member 4 name my_cluster
<output truncated>

This example shows how to remove a member from the cluster by using the cluster member console:

```
Switch # configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no cluster commander-address
```

You can verify your settings by entering the show cluster privileged EXEC command.

cluster discovery hop-count

To set the hop-count limit for extended discovery of candidate switches, use the **cluster discovery hop-count** global configuration command on the cluster command switch. Use the **no** form of this command to return to the default setting.

cluster discovery hop-count *number* no cluster discovery hop-count

Syntax Description *number* The number of hops from the cluster edge that the cluster command switch limits the discovery of candidates. The range is 1 to 7.

Command Default The default hop count is 3.

Command Modes Global configuration

Command History	Release Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Usage Guidelines

This command is available only on the cluster command switch. This command does not operate on cluster member switches.

If the hop count is set to 1, extended discovery is disabled. The cluster command switch discovers only candidates that are one hop from the edge of the cluster. The edge of the cluster is the point between the last discovered cluster member switch and the first discovered candidate switch.

Example

This example shows how to set hop count limit to 4. This command is executed on the cluster command switch:

Switch(config)# cluster discovery hop-count 4

You can verify your setting by entering the show cluster privileged EXEC command.

cluster enable

To enable a command-capable switch as the cluster command switch, assign a cluster name, and optionally assign a member number to it, use the

cluster enable global configuration command. Use the **no** form of the command to remove all members and to

make the cluster command switch a candidate switch.

cluster enable name [command-switch-member-number]
no cluster enable

Syntax Description	name	The name of the cluster up to 31 characters. Valid characters include only alphanumerics, dashes, and underscores.		
	<i>command-switch-member-number</i> (Optional) A member number that is assigned to the cluster command switch of the cluster. The range is 0 to 15.			
Command Default	The switch is not a cluste	r command switch.		
	No cluster name is defined.			
	The member number is 0	when the switch is the cluster command switch.		
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Usage Guidelines		ny command-capable switch that is not part of any cluster. This command fails if red as a member of the cluster.		
	You must name the cluster when you enable the cluster command switch. If the switch is already configured as the cluster command switch, this command changes the			
	cluster name if it is differ	ent from the previous cluster name.		
	Example			
	This example shows how to enable the cluster command switch, name the cluster, and set the cluster command switch member number to 4:			
	Switch(config)# cluster enable Engineering-IDF4 4			

cluster holdtime

To set the duration in seconds before a switch (either the command or cluster member switch) declares the other switch down after not receiving heartbeat messages,

use the **cluster holdtime** global configuration command on the cluster command switch. Use the **no** form of this command

to set the duration to the default value.

cluster holdtime *holdtime-in-secs* no cluster holdtime

Syntax Description *holdtime-in-secs* Duration in seconds before a switch (either a command or cluster member switch) declares the other switch down. The range is 1 to 300 seconds.

Command Default The default holdtime is 80 seconds.

Command Modes Global configuration

Command History	Release Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines Enter this command with the **cluster timer** global configuration command only on the cluster command switch. The cluster command switch propagates the

values to all its cluster members so that the setting is consistent among all switches in the cluster.

The holdtime is typically set as a multiple of the interval timer (cluster timer). For example, it takes (holdtime-in-secs divided by the interval-in-secs) number of

heartbeat messages to be missed in a row to declare a switch down.

Example

This example shows how to change the interval timer and the duration on the cluster command switch:

Switch(config) # cluster timer 3
Switch(config) # cluster holdtime 30

You can verify your settings by entering the show cluster privileged EXEC command.

cluster member

To add candidates to a cluster, use the **cluster member** global configuration command on the cluster command switch.

Use the **no** form of the command to remove members from the cluster.

cluster member [n] mac-address *H.H.H* [password enable-password] [vlan vlan-id] no cluster member n

Syntax Description	<i>n</i> (Optional) The number that identifies a cluster member. The range is 0 to 15.				
	mac-address <i>H.H.H</i> Specifies the MAC address of the cluster member switch in hexadecimal format.				
	password enable-password	(Optional) Enables the password of the candidate switch. The password is not required if there is no password on the candidate switch.			
	vlan vlan-id	(Optional) Specifies the ID of the VLAN through which the candidate is added to the cluster by the cluster command switch. The range is 1 to 4094.			
Command Default	A newly enabled cluster comm	nand switch has no associated cluster members.			
Command Modes	Global configuration				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			
Usage Guidelines	Enter this command only on the cluster command switch to add a candidate to or remove a member from the cluster.				
	If you enter this command on a switch other than the cluster command switch, the switch rejects the command and displays an error message.				
	-				
	and displays an error message	nber to remove a switch from the cluster. However, you do not need to enter a			
	and displays an error message. You must enter a member num member number to add a swite	nber to remove a switch from the cluster. However, you do not need to enter a			
	and displays an error message.You must enter a member num member number to add a swite.The cluster command switch s joining the cluster.You must enter the enabled part	her to remove a switch from the cluster. However, you do not need to enter a ch to the cluster.			
	and displays an error message. You must enter a member num member number to add a swite The cluster command switch s joining the cluster. You must enter the enabled par password is not saved in the ru	nber to remove a switch from the cluster. However, you do not need to enter a ch to the cluster. selects the next available member number and assigns it to the switch that is			
	 and displays an error message. You must enter a member num member number to add a swite The cluster command switch s joining the cluster. You must enter the enabled par password is not saved in the run After a candidate switch becom command-switch password. 	her to remove a switch from the cluster. However, you do not need to enter a ch to the cluster. Selects the next available member number and assigns it to the switch that is assword of the candidate switch for authentication when it joins the cluster. The unning or startup configuration. mes a member of the cluster, its password becomes the same as the cluster infigured hostname, the cluster command switch appends a member number to			

If you do not specify a VLAN ID, the cluster command switch automatically chooses a VLAN and adds the candidate to the cluster.

Example

This example shows how to add a switch as member 2 with MAC address 00E0.1E00.2222 and the password **key** to a cluster. The cluster command switch

adds the candidate to the cluster through VLAN 3:

Switch(config)# cluster member 2 mac-address 00E0.1E00.2222 password key vlan 3

This example shows how to add a switch with MAC address 00E0.1E00.3333 to the cluster. This switch does not have a password. The cluster command switch selects the next

available member number and assigns it to the switch that is joining the cluster:

Switch(config) # cluster member mac-address 00E0.1E00.3333

You can verify your settings by entering the **show cluster members** privileged EXEC command on the cluster command switch.

cluster outside-interface

To configure the outside interface for cluster Network Address Translation (NAT), use the **cluster outside-interface** global configuration

command on the cluster command switch, so that a member without an IP address can communicate with devices outside the cluster. Use the **no** form

of this command to return to the default setting.

cluster outside-interface *interface-id* no cluster outside-interface

Syntax Description *interface-id* Interface to serve as the outside interface. Valid interfaces include physical interfaces, port channels, or VLANs. The port channel range is 1 to 6. The VLAN range is 1 to 4094.

Command Default The default outside interface is automatically selected by the cluster command switch.

Command Modes Global configuration

Command History	Release Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines Enter this command only on the cluster command switch. If you enter this command on a cluster member switch, an error message appears.

Example

This example shows how to set the outside interface to VLAN 1:

Switch(config) # cluster outside-interface vlan 1

You can verify your setting by entering the **show running-config** privileged EXEC command.

cluster run

To enable clustering on a switch, use the **cluster run** global configuration command. Use the **no** form of this command to disable clustering on a switch.

cluster run no cluster run

This command has no arguments or keywords. **Syntax Description**

Clustering is enabled on all switches. **Command Default**

Global configuration **Command Modes**

Command History Modification Release Cisco IOS Release This command was introduced. 15.0(2)EX

Usage Guidelines

When you enter the **no cluster run** command on a cluster command switch, the cluster command switch is disabled. Clustering is disabled, and the switch cannot become a candidate switch.

When you enter the **no cluster run** command on a cluster member switch, it is removed from the cluster. Clustering is disabled, and the switch cannot become a candidate switch.

When you enter the **no cluster run** command on a switch that is not part of a cluster, clustering is disabled on this switch. This switch cannot then become a candidate switch.

Example

This example shows how to disable clustering on the cluster command switch:

Switch (config) # no cluster run

cluster timer

To set the number of seconds between heartbeat messages, use the **cluster timer** global configuration command on the cluster command switch. To set the interval to the default value, use the **no** form of the command

cluster timer *interval-in-secs* no cluster timer

Syntax Description *interval-in-secs* Interval in seconds between heartbeat messages. The range is 1 to 300 seconds.

Command Default The default interval is 8 seconds.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release	This command was introduced.
	15.0(2)EX	

Usage Guidelines

Enter this command with the **cluster holdtime** global configuration command only on the cluster command switch.

The cluster command switch propagates the values to all its cluster members so that the setting is consistent among all switches in the cluster.

The holdtime is typically set as a multiple of the heartbeat interval timer (cluster timer).

For example, the number of heartbeat messages that are missed in a row before a switch is declared down is calculated by dividing the number of seconds of holdtime by the

number of seconds in the interval.

Example

This example shows how to change the heartbeat interval timer and the duration on the cluster command switch:

Switch(config)# cluster timer 3
Switch(config)# cluster holdtime 30

You can verify your settings by entering the show cluster privileged EXEC command.

сору

	To copy a file from a source to a destination, use the copy command in boot loader mode. copy <i>filesystem:/source-file-url filesystem:/destination-file-url</i>			
Syntax Description	filesystem:	Alias for a file system. Use usbflash0: for	USB memory sticks.	
	/source-file-url	Path (directory) and filename (source) to	be copied.	
	/destination-file-u	rl Path (directory) and filename of the desti	nation.	
Command Default	No default behavio	or or values.		
Command Modes	Boot loader			
Command History	Release	Modification		
	Cisco IOS Release	e 15.0(2)EX This command was introduced.		
Usage Guidelines	Filenames and dire	ectory names are case sensitive.		
	•	re limited to 127 characters between the slas deletes, slashes, quotes, semicolons, or colo		
	Filenames are limited to 127 characters; the name cannot contain control characters, spaces, delete quotes, semicolons, or colons.			
	If you are copying	a file to a new directory, the directory must	already exist.	
Examples	This example shows how to copy a file at the root:			
	Device: copy usbflash0:test1.text usbflash0:test4.text File "usbflash0:test1.text" successfully copied to "usbflash0:test4.text"			
	You can verify that	t the file was copied by entering the dir files	system: boot loader command.	

debug cluster

Use the **debug cluster** privileged EXEC command to enable debugging of cluster-specific events. Use the **no** form of this command to disable debugging.

debug cluster {discovery | events | extended | hrsp | http | ip [packet] | members | nat | neighbors | platform | snmp | vqpxy} no debug cluster {discovery | events | extended | hrsp | http | ip [packet] | members | nat | neighbors | platform | snmp | vqpxy}

Syntax Description	discovery	Displays cluster discovery debug messages.				
	events	Displays cluster event debug messages.				
	extended	Displays extended discovery debug messages.				
	hrsp	Displays the Hot Standby Router Protocol (HSRP) debug messages.				
	http	Displays Hypertext Transfer Protocol (HTTP) debug messages.				
	ip [packet]	Displays IP or transport packet debug messages.				
	members	Displays cluster member debug messages.				
	nat	Displays Network Address Translation (NAT) debug messages.				
	neighbors	Displays cluster neighbor debug messages.				
	platform	tform Displays platform-specific cluster debug messages.				
	snmp	snmp Displays Simple Network Management Protocol (SNMP) debug messages.				
	vqpxy	Displays VLAN Query Protocol (VQP) proxy debug messages.				
Command Default	Debugging is d	lisabled.				
Command Modes	Privileged EXE	BC				
Command History	Release	Modification				
	Cisco IOS Rel 15.0(2)EX	lease This command was introduced.				
Usage Guidelines	This command is available only on the cluster command switch stack or cluster command switch.					
-	The undebug of	cluster command works the same as the no debug cluster command.				
	•	ble debugging, it is enabled only on the active switch. To enable debugging on a member switch session from the active switch by using the session <i>switch-number</i> privileged EXEC command				
	Then enter the	debug command at the command-line prompt of the member switch.				

I

You also can use the **remote command** *stack-member-number* LINE privileged EXEC command on the active switch to enable debugging on a member switch without first starting a session.

debug matm move update

To enable debugging of MAC address-table move update message processing, use the **debug matm move** update privileged EXEC command. Use the no form of this command to return to the default setting.

debug matm move update no debug matm move update

Debugging is disabled.

Command Default

Privileged EXEC **Command Modes**

Command History Modification Release Cisco IOS Release This command was introduced. 15.0(2)EX

Usage Guidelines

The undebug matm move update command works the same as the no debug matm move update command.

Note This command is supported only on the LAN Base image.

When you enable debugging, it is enabled only on the active switch. To enable debugging on a member switch, you can start a session from the active switch by using the session switch-number privileged EXEC command.

Then enter the **debug** command at the command-line prompt of the member switch.

You can also use the **remote command** stack-member-number LINE privileged EXEC command on the active switch to enable debugging on a member switch without first starting a session.

delete

	To delete one or more files from the specified file system, use the delete command in boot			
	delete filesystem:/file-url			
Syntax Description	filesystem: Alias for a file system. Use usbflash0: for USB memory sticks.			
	/file-url Path (directory) and filename to delete. Separate each filename with a space.			
Command Default	No default behavior or values.			
Command Modes	Boot loader			
Command History	Release Modification			
	Cisco IOS Release 15.0(2)EX This command was introduced.			
Usage Guidelines	Filenames and directory names are case sensitive.			
	The device prompts you for confirmation before deleting each file.			
Examples	This example shows how to delete two files:			
	Device: delete usbflash0:test2.text usbflash0:test5.text Are you sure you want to delete "usbflash0:test2.text" (y/n)? y File "usbflash0:test2.text" deleted Are you sure you want to delete "usbflash0:test5.text" (y/n)? y File "usbflash0:test2.text" deleted			
	You can verify that the files were deleted by entering the dir usbflash0: boot loader command.			

dir

I

	To display the list of files and directories on the specified file system, use the dir command in boot loader mode.				
	dir filesystem:/file-url				
Syntax Description	filesystem	a: Alias for a file system memory sticks.	. Use flash: for the s	ystem board	flash device; use usbflash0: for USB
	/file-url	(Optional) Path (direc Separate each director			tain the contents you want to display.
Command Default	No defau	It behavior or values.			
Command Modes	Boot Loa	der			
	Privilege	1 EXEC			
Command History	Release	M	odification		
	Cisco IC	S Release 15.0(2)EX Th	is command was intro	oduced.	
Usage Guidelines	Directory	names are case sensitive	b .		
Examples	This exa	nple shows how to displa	ty the files in flash m	emory:	
	Device:	dir flash:			
		y of flash:/			
			01 2013 00:48:15		
			01 2013 04:18:48 01 2013 00:01:39		on-mz-150-2r.EX fs
	6 0			-	iversalk9-mz.150-2.EX
	645 d		01 2013 00:01:11		
	647 -		01 2013 01:14:05	-	
	648 -	rwx 5 Mar	01 2013 00:01:39	private-c	onfig.text
	96453	632 bytes available	(25732096 bytes us	sed)	
	Table 39: di	r Field Descriptions			
	Field	Description			
	2	Index number of the file	е.		1

2	Index number of the file.
-rwx	File permission, which can be any or all of the following: • d—directory • r—readable • w—writable • x—executable

I

Field	Description
1644045	Size of the file.
<date></date>	Last modification date.
env_vars	Filename.

help

To display the available commands, use the help command in boot loader mode.

	help		
Syntax Description	This command has no arguments or keywords.		
Command Default	No default behavio	r or values.	
Command Modes	Boot loader		
Command History	Release	Modification	

Cisco IOS Release 15.0(2)EX This command was introduced.

Example

This example shows how to display a list of available boot loader commands:

```
Device:help
? -- Present list of available commands
arp -- Show arp table or arp-resolve an address
boot -- Load and boot an executable image
cat -- Concatenate (type) file(s)
copy -- Copy a file
delete -- Delete file(s)
dir -- List files in directories
emergency-install -- Initiate Disaster Recovery
...
unset -- Unset one or more environment variables
version -- Display boot loader version
```

hw-module

To enable on-board failure logging (OBFL), use the **hw-module** global configuration command on the switch stack or on a standalone switch. Use the **no** form of this command to disable this feature.

hw-module module [*switch-number*] **logging onboard** [**message level** *level*] **no hw-module module** [*switch-number*] **logging onboard** [**message level** *level*]

Note

This command is supported only on the LAN Base image.

Syntax Description	m module Specifies the module number.			
	switch-number	If the switch is a sta	h number, which is the member switch number. ndalone switch, the switch number is 1. If the the range is 1 to 4, depending on the switch the stack.	
	logging-onboard	Specifies on-board f	failure logging.	
	message level level	, .	the severity of the hardware-related messages e flash memory. The range is from 1 to 7.	
Command Default	OBFL is enabled, and all	messages appear.		
Command Modes	Global configuration			
Command History	Release	Modification	-	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	-	
Usage Guidelines	We recommend that you	keep OBFL enabled and do not erase	e the data stored in the flash memory.	
-		amps in the OBFL data logs are accu Network Time Protocol (NTP).	rate, you should manually set the system clock	
	If you do not enter the m e switch are stored in the fl		hardware-related messages generated by the	
	On a standalone switch, entering the hw-module module [<i>switch-number</i>] logging onboard [message level <i>level</i>] command is the same as entering the hw-module module logging onboard [message level <i>level</i>] command.			
	Entering the hw-module module logging onboard [message level <i>level</i>] command on an active switch enables OBFL on all the member switches that support OBFL.			

Example

This example shows how to enable OBFL on a switch stack and to specify that all the hardware-related messages on member switch 4 are stored in the flash memory when this command is entered on the active switch:

Switch(config) # hw-module module 4 logging onboard

This example shows how to enable OBFL on a standalone switch and to specify that only severity 1 hardware-related messages are stored in the flash memory of the switch:

Switch(config) # hw-module module 1 logging onboard message level 1

You can verify your settings by entering the show logging onboard privileged EXEC command.

ip name-server

To configure the IP address of the domain name server (DNS), use the **ip name-server** command. To delete the name server use the **no** form of this command.

ip name-server [*ip-server-address* | *ipv6-server-address* | *vrf*] **no ip name-server** [*ip-server-address* | *ipv6-server-address* | *vrf*]

Syntax Description	ip-server-address		IPv4 addresses of a name server to use for name and address resolution.		
	ipv6-server-address		IPv4 addresses of a name server to use for name and address resolution.		
	vrf		VRF name		
Command Default	No name server addresse	s are specified.			
Command Modes	Global configuration mo	de			
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduce	ed.		
Usage Guidelines	You can configure up to six name servers (including IPv4 and IPv6 name servers).				
	Separate each server address with a space.				
	The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.				
	Enter theshow ip name-server command to display all the name server IP addresses that have been maintained.				
	Specifics for Application Visibility Control (AVC) with Domain Name System as an Authoritative Source (DNS-AS):				
	Only IPv4 server addresses are supported. Ensure that at least the first two IP addresses in the sequence are IPv4 addresses, because the AVC with DNS-AS feature will use only these. In the example below, the first two addresses are IPv4 (192.0.2.1 and 192.0.2.2), the third one (2001:DB8::1) is an IPv6 address. AVC with DNS-AS uses the first two:				
	Device(config)# ip name-server 192.0.2.1 192.0.2.2 2001:DB8::1				
	Example				
	The following example shows how to specify IPv4 hosts 192.0.2.1 and 192.0.2.2 as the name servers:				
	Device# configure terminal Device(config)# ip name-server 192.0.2.1 192.0.2.2 2001:DB8::1				
	The following example shows how to specify IPv6 hosts 3FFE:C00::250:8BFF:FEE8:F800 and 2001:0DB8::3 as the name servers				

Device# configure terminal Device(config)# ip name-server 3FFE:C00::250:8BFF:FEE8:F800 2001:0DB8::3

Related Commands	Command	Description
	show ip name-server	Displays all the name server IP addresses that have been maintained

license boot level

To boot a new software license on the device, use the license boot level command in global configuration mode. To return to the previously configured license level, use the no form of this command.

license { accept end user agreement force | boot level addon *addon-license-level* { *dna-essentials* | *dna-advantage* } }

no license { **accept end user agreement force** | **boot level addon** *addon-license-level* { *dna-essentials* | *dna-advantage* } }

Syntax Description	accept end user agreement	force Enables acceptance	of the end-user license agreement (EULA).
	boot level addon addon-licer	nse-level Enter the add-on lic	ense level you want to enable on the switch.
		• dna-essentials	
		• dna-advantage	
Command Default	The switch boots the configure	ed image.	
Command Modes	Global configuration (config)		
Command History	Release	Modification	-
	Cisco IOS Release 15.2(6)E1	This command was introduced.	_
Usage Guidelines	You do not have to reboot the	switch for the configure (add-	on license) to take effect.
	Example		
	The following example shows	s how to activate the dna-essent	tials license on the switch:
	Device(config)# license b	oot level addon dna-essen	tials

logging

To log messages to a UNIX syslog server host, use the logging global configuration command.

	logging host		
Syntax Description	<i>host</i> The name or IP ac	ddress of the host to be used as the sys	slog server.
Command Default	None		
Command Modes	Global configuration		
Command History	Release	Modification	-
	Cisco IOS Release 15.0(2)EX	This command was introduced.	-
Usage Guidelines	To build a list of syslog s	servers that receive logging messages	- s, enter this command more than once.
	Example		

The following example specifies the logging host IP as 125.1.1.100: Switch(config) # logging 125.1.1.100

logging buffered

To log messages to an internal buffer, use the **logging buffered** global configuration command. Use it on the switch or on a standalone switch or, in the case of a switch stack, on the active switch.

logging buffered [size]

Syntax Description *size* (Optional) The size of the buffer created, in bytes. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes.

Command Default The default buffer size is 4096 bytes.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release	This command was introduced.
	15.0(2)EX	

Usage Guidelines If a s

If a standalone switch or the active switch fails, the log file is lost unless you previously saved it to flash memory using the **logging file flash** global configuration command.

Do not make the buffer size too large because the switch could run out of memory for other tasks.

Use the **show memory** privileged EXEC command to view the free processor memory on the switch.

However, this value is the maximum number of bytes available, and the buffer size should not be set to this amount.

Example

The following example sets the logging buffer to 8192 bytes:

Switch(config) # logging buffered 8192

logging console

To limit messages logged to the console according to severity, use the **logging console** command. Use the **no** form of this command to disable message logging.

logging console *level* no logging console

Syntax Description	lawl The severity level o	f messages logged to the console. The severity levels are:	
e, max booonprion	-	-System is unusable (severity=0)	
	e		
		diate action needed (severity=1)	
	 Critical—Criti 	cal conditions (severity=2)	
	• Errors—Error	conditions (severity=3)	
	Warnings—Wa	arning conditions (severity=4)	
	• Notifications—	-Normal but significant conditions (severity=5)	
	 Informational- 	-Informational messages (severity=6)	
	• Debugging—I	Debugging messages (severity=7)	
	 Discriminator- 	-Establish MD-Console association	
	• Filtered—Enal	ble filtered logging	
	Guaranteed—Guarantee console messages		
	• XML—Enable	e logging in XML	
Command Default	By default, the console re	eceives debugging messages and numerically lower level	
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Example

The following example sets the level of console messages received to severity 3 (errors) and above: Switch(config) # logging console 3

logging file flash

To store log messages in a file in flash memory, use the **logging file flash** command. Use it on a standalone switch or, in the case of a switch stack, on the active switch.

logging file flash: *filename* [max-file-size [min-file-size]] [severity-level-number | type]

:filename	The log massage filmome	
.juciume	The log message filename.	
max-file-size	(Optional) The maximum logging file size default is 4096 bytes.	ze. The range is 4096 to 2147483647. The
min-file-size	(Optional) The minimum logging file siz default is 2048 bytes.	ze. The range is 1024 to 2147483647. The
max-file-size type	(Optional) Either the logging severity level 0 to 7.	vel or the logging type. The severity range is
The default maximu	m file size is 4096 bytes and the default m	ninimum file size is 1024 bytes.
Global configuration	1	
Release	Modification	
Cisco IOS Release 15.0(2)EX	This command was introduced.	-
	min-file-size max-file-size type The default maximu Global configuration Release Cisco IOS Release	default is 4096 bytes.min-file-size(Optional) The minimum logging file siz default is 2048 bytes.max-file-size type(Optional) Either the logging severity let 0 to 7.The default maximum file size is 4096 bytes and the default nGlobal configurationReleaseModificationCisco IOS ReleaseThis command was introduced.

Example

The following example sets the logging flash: filename to log_msg.txt, the maximum file size to 40960, the minimum file size to 4096, and the message severity level to 3:

Switch(config) # logging file flash:log_msg.txt 40960 4096 3

logging history

To change the default level of syslog messages stored in the history file and sent to the SNMP server, use the **logging history** command.

logging history level

Syntax Description	<i>level</i> Level of syslog n	essages stored in the history file and sent to the SNMP server.
Command Default	By default, warning, erro	r, critical, alert, and emergency messages are sent.
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Example

The following example sets the level of syslog messages stored in the history file and sent to the SNMP server to 3:

Switch(config) # logging history 3

logging history size

To specify the number of syslog messages that can be stored in the history table, use the **logging history size** global configuration command.

v

Note When the history table contains the maximum number of message entries specified, the oldest message entry is deleted from the table to allow the new message entry to be stored.

logging history size number

Syntax Description num	mber	The number of syslog messages that can be stored in the history table.	
------------------------	------	--	--

Command Default The default is to store one message. The range is 0 to 500 messages.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Example

The following example sets the number of syslog messages that can be stored in the history table to 200:

Switch(config) # logging history size 200

logging monitor

To limit messages logged to the terminal lines according to severity, use the logging monitor command.

logging monitor level

Syntax Description	level The severity level of messages logged to the terminal lines. The severity levels are:			
	• Emergencies—System is unusable (severity=0)			
	• Alerts—Immediate action needed (severity=1)			
	Critical—Critical conditions (severity=2)			
	• Errors—Error conditions (severity=3)			
	• Warnings—Warning conditions (severity=4)			
	• Notifications—Normal but significant conditions (severity=5)			
	 Informational—Informational messages (severity=6) 			
	• Debugging—Debugging messages (severity=7)			
Command Default	By default, the terminal receives debugging messages and numerically lower levels.			
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS Release	This command was introduced.		

Example

The following example sets the level of terminal messages received to severity 3 (errors) and above: Switch(config)# logging monitor 3

I

logging trap

To limit messages logged to the syslog servers according to severity, use the logging trap command.

logging trap level

Syntax Description	<i>level</i> The severity leve	el of messages logged to the syslog servers. The severity levels are			
	• Emergencie	s—System is unusable (severity=0)			
	• Alerts—Im	mediate action needed (severity=1)			
	• Critical—Critical conditions (severity=2)				
	• Errors—Err	ror conditions (severity=3)			
	• Warnings—Warning conditions (severity=4)				
	 Notifications—Normal but significant conditions (severity=5) Informational—Informational messages (severity=6) 				
Command Default By default, the syslog servers receive debugging messages and numerically					
Command Modes	Global configuration				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			

Example

The following example sets the level of syslog server messages received to severity 3 (errors) and above:

Switch(config) # logging trap 3

mac address-table aging-time

To set the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated, use the **mac address-table aging-time** global configuration command. Use the **no** form of this command to return to the default setting.

mac address-table aging-time $\{\mathbf{0} \mid 10 - 1000000\}$ [vlan vlan-id] no mac address-table aging-time $\{\mathbf{0} \mid 10 - 1000000\}$ [vlan vlan-id]

Syntax Description	0	This v	alue disables aging. Static address entries are never aged
	10-1000000	Aging	time in seconds. The range is 10 to 1000000 seconds.
	vlan vlan-id	(Optio	nal) Specifies the VLAN ID to which to apply the aging
Command Default	The default is 300 second	S.	
Command Modes	Global configuration		
Command History	Release	Modification	_
	Cisco IOS Release 15.0(2)EX	This command was introduced	_
Usage Guidelines	• • • • • •	all VLANs or a specified VLAN. I ime for all VLANs. Enter 0 second	f you do not specify a specific VLAN, this s to disable aging.
	Example		
	This example shows how	to set the aging time to 200 second	s for all VLANs:
	Device(config)# mac a	ddress-table aging-time 200	

You can verify your setting by entering the **show mac address-table aging-time** privileged EXEC command.

.

mac address-table learning vlan

To enable MAC address learning on a VLAN, use the **mac address-table learning** global configuration command. Use the **no** form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

mac address-table learning vlan vlan-id

no mac address-table learning vlan vlan-id

	Note	This command is su	pported only on the LAN Base image	е.		
Syntax Description	vla	an-id	The VL	AN ID or a range of VLAN IDs separated by a hyphen or		
Command Default	By	default, MAC address	s learning is enabled on all VLANs.			
Command Modes	Gle	obal configuration				
Command History	Re	elease	Modification			
		isco IOS Release 5.0(2)EX	This command was introduced.	-		
Usage Guidelines			address learning on a VLAN, you can ANs, and therefore which ports, can	manage the available MAC address table space learn MAC addresses.		
				(for example, no mac address-table learning address-table learning vlan 1-20, 15).		
		fore you disable MAC itch system configurat		re familiar with the network topology and the		
	Dis	Disabling MAC address learning on a VLAN could cause flooding in the network.				
			ble MAC address learning on a VLA all IP packets in the Layer 2 domain.	N with a configured switch virtual interface		
		f you disable MAC address learning on a VLAN that includes more than two ports, every packet entering he switch is flooded in that VLAN domain.				
		e recommend that you disable MAC address learning only in VLANs that contain two ports and that you e caution before disabling MAC address learning on a VLAN with an SVI.				
	you	u enter in the no mac a		e switch uses internally. If the VLAN ID that command is an internal VLAN, the switch		
		view a list of which in mmand.	iternal VLANs are being used, enter the	he show vlan internal usage privileged EXEC		

If you disable MAC address learning on a VLAN configured as a private VLAN primary or a secondary VLAN, the MAC addresses are still learned on the other VLAN (primary or secondary) that belongs to the private VLAN.

You cannot disable MAC address learning on an RSPAN VLAN. The configuration is not allowed.

If you disable MAC address learning on a VLAN that includes a secure port, MAC address learning is not disabled on the secure port. If you later disable port security on the interface, the disabled MAC address learning state is enabled.

To display the MAC address learning status of all VLANs or a specified VLAN, enter the **show mac-address-table learning** [**vlan** *vlan-id*] command.

Example

This example shows how to disable MAC address learning on VLAN 2003:

Switch(config) # no mac address-table learning vlan 2003

To display the MAC address learning status of all VLANs or a specified VLAN, enter the **mac** address-table learning vlan [*vlan-id*] command.

logging smartlog

To enable smart logging, use the **logging smartlog** command in global configuration mode on the device.

Smart logging sends the contents of specified dropped packets to a Cisco IOS Flexible NetFlow collector.

To disable smart logging or return to the default setting, use the no form of this command.

logging smartlog [exporter *name* | packet capture size *bytes*] no logging smartlog [exporter *name* | packet capture size *bytes*]

exporter name	(Optional) Identifies the Cisco IOS NetFlow exporter (collector) to sent. You must have already configured the exporter using the Flex does not exist, you receive an error message. By default, the devic seconds.		
packet capture size bytes	(Optional) Specifies the size of the smart log packet sent to the col is from 64 to 1024 bytes in 4-byte increments. The default size is 6 size reduces the number of flow records per packet.		
By default, smart logging is not enabled.			
Global configuration.			
Release	Modification		
Cisco IOS Release 15.0(2)EX	This command was introduced.		
You must configure a NetFlow collector before you enable smart logging. For information on configuring Cisco Flexible NetFlow, see the Cisco IOS Flexible NetFlow Configuration Guide.			
You can configure smart logging of packets dropped due to DHCP snooping violations, Dynamic ARP inspection violations, IP source guard denied traffic, or ACL permitted or denied traffic.			
You can verify the configuration by entering the show logging smartlog privileged EXEC command.			
Examples			
This example shows a typical smart logging configuration. It assumes that you have already used the Flexible NetFlow CLI to configure the NetFlow exporter <i>cisco</i> , and configures smart logging to capture the first 128 bytes of the packets:			
Device(config)# logging smartlog Device(config)# logging smartlog cisco Device(config)# logging smartlog packet capture size 128			
	packet capture size bytes By default, smart logging is not enabled. Global configuration. Release Cisco IOS Release 15.0(2)EX You must configure a NetFlow collector be Cisco Flexible NetFlow, see the <i>Cisco IO</i> . You can configure smart logging of packet inspection violations, IP source guard den You can verify the configuration by enterior Examples This example shows a typical smart logging the Flexible NetFlow CLI to configure the capture the first 128 bytes of the packets: Device (config) # logging smartlog Device (config) # logging smartlog cite		

mac address-table notification

To enable the MAC address notification feature on the switch stack, use the **mac address-table notification** global configuration command. Use the **no** form of this command to return to the default setting.

mac address-table notification [mac-move | threshold [[limit percentage] interval time] no mac address-table notification [mac-move | threshold [[limit percentage] interval time]

Syntax Description	mac-move	(Optional) Enables MAC move notification.	
	threshold	(Optional) Enables MAC threshold notification.	
	limit percentage	(Optional) Sets the MAC utilization threshold percentage. The range is 1 to 100 percent. The default is 50 percent.	
	interval time	(Optional) Sets the time between MAC threshold notifications. The range is 120 to 1000000 seconds. The default is 120 seconds.	
Command Default	By default, the	MAC address notification, MAC move, and MAC threshold monitoring are disabled.	
	The default MA	AC utilization threshold is 50 percent.	
	The default tim	e between MAC threshold notifications is 120 seconds.	
Command Modes	Global configu	ration	
Command History	Release	Modification	
	Cisco IOS Rel 15.0(2)EX	ease This command was introduced.	
Usage Guidelines	You can enable traps whenever a MAC address is moved from one port to another in the same VLAN by entering the mac address-table notification mac-move command and the snmp-server enable traps mac-notification move global configuration command.		
	To generate traps whenever the MAC address table threshold limit is reached or exceeded, enter the mac address-table notification <i>threshold</i> [limit <i>percentage</i>] [interval <i>time</i>] command and the snmp-server enable traps mac-notification threshold global configuration command.		
	enable traps m Example		
	enable traps m Example This example s	nac-notification threshold global configuration command.	

mac address-table static

To add static addresses to the MAC address table, use the **mac address-table static** global configuration command. Use the **no** form of this command to remove static entries from the table.

mac address-table static mac-addr **vlan** vlan-id **interface** interface-id **no mac address-table static** mac-addr **vlan** vlan-id **interface** interface-id

Syntax Description	mac-addr		multicast) to add to the address table. Packets d in the specified VLAN are forwarded to the	
	vlan vlan-id	Specifies the VLAN for which the pac The range is 1 to 4094.	ket with the specified MAC address is received	
	interface interface-id	terface <i>interface-id</i> Specifies the interface to which the received packet is forwarded. Valid interfaces include physical ports and port channels.		
Command Default	No static addresses are	configured.		
Command Modes	Global configuration			
Command History	_			
Command History	Release	Modification	-	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	-	
	-	w to add the static address c2f3.220a. VLAN 4 with this MAC address as its c		

Device (config) # mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet6/0/1

You can verify your setting by entering the show mac address-table privileged EXEC command.

mkdir

	To create one or mo	nore directories on the specified file system, use the mkdir command in b	oot loader mode	
	mkdir filesystem:/e	/directory-url		
Syntax Description	<i>filesystem:</i> Alias for a file system. Use usbflash0: for USB memory sticks.			
	/directory-url Na	Jame of the directories to create. Separate each directory name with a space	e.	
Command Default	No default behavio	or or values.		
Command Modes	Boot loader			
Command History	Release	Modification		
	Cisco IOS Release	e 15.0(2)EX This command was introduced.		
Usage Guidelines	Directory names ar	are case sensitive.		
	-	are limited to 127 characters between the slashes (/); the name cannot cont, deletes, slashes, quotes, semicolons, or colons.	tain control	
	Example			
	This example show	ws how to make a directory called Saved_Configs:		
		<pre>sbflash0:Saved_Configs lash0:Saved_Configs" created</pre>		

I

more

	To display the contents of one or more files, use the more command in boot loader mode.			
	more filesystem:/file-url			
Syntax Description	filesystem: Alias for a file system. Use flash: for the system board flash device.			
	/file-url Path (directory) and name of the files to display. Separate each filename with a space.			
Command Default	No default behavior or values.			
Command Modes	Boot loader			
Command History	Release Modification			
	Cisco IOS Release 15.0(2)EX This command was introduced.			
Usage Guidelines	Filenames and directory names are case sensitive.			
	If you specify a list of files, the contents of each file appears sequentially.			
Examples	This example shows how to display the contents of a file:			
	<pre>Device: more flash:image_file_name version_suffix: universal-122-xx.SEx version_directory: image_file_name image_system_type_id: 0x0000002 image_name: image_file_name.bin ios_image_file_size: 8919552 total_image_file_size: 11592192 image_feature: IP LAYER_3 PLUS MIN_DRAM_MEG=128 image_family: family stacking_number: 1.34 board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b info_end:</pre>			

nmsp notification interval

To modify the Network Mobility Services Protocol (NMSP) notification interval value on the controller to address latency in the network, use the **nmsp notification interval** command in global configuration mode.

nmsp notification interval { attachment | location | rssi { clients | rfid | rogues { ap | client }
} }

Syntax Description	attachment	Specifies the time used to aggregate attachment information.		
	location Specifies the time used to aggregate location infor			
	rssi	Specifies the time used to aggregate RSSI information.		
	clients	Specifies the time interval for clients.		
	rfid	Specifies the time interval for rfid tags.		
	rogues	Specifies the time interval for rogue APs and rogue clients		
	ар	Specifies the time used to aggregate rogue APs.		
	client	Specifies the time used to aggregate rogue clients.		
Command Default	No default behavior or values.			
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
	This example shows how to set the NMSP notification interval for the active RFID tags to 25 seconds:			
	Device# configure termina Device(config)# nmsp noti Device(config)# end			
	This example shows how to modify NMSP notification intervals for device attachment (connecting to the network or disconnecting from the network) every 10 seconds:			
	Device# configure termina Device(config)# nmsp noti Device(config)# end	fication-interval attachment 10		
	This example shows how to co change) every 20 seconds:	nfigure NMSP notification intervals for location parameters (location		

Device# configure terminal Device(config)# nmsp notification-interval location 20 Device(config)# end

rcommand

To start a Telnet session and to execute commands, use the **rcommand** user EXEC command. Use it on the switch stack, on the cluster command switch, or on a cluster member switch. To end the session, enter the **exit** command.

rcommand $\{n \mid \text{ commander} \mid \text{ mac-address } hw-addr\}$

Syntax Description	n commander		The number that identifies a cluster member. The range is 0 to 15. Provides access to the cluster command switch from a cluster member switch.	
	mac-address hw-addr	Spe	ecifies the MAC address of the cluster member switch.	
Command Modes	User EXEC			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was i	ntroduced.	
Usage Guidelines	This command is availab	le only on the cluster com	mand switch stack or cluster command switch.	
			e cluster member switch <i>n</i> does not exist, an error message suster members privileged EXEC command on the cluster	
		nd to access a cluster mem and switch from the mem	ber switch from the cluster command-switch prompt or ber-switch prompt.	
	For Catalyst 2900 XL, 3500 XL, 2950, 2960, 2970, 3550, 3560, and 3750 switches, the Telnet session accesses the member-switch command-line interface (CLI) at the same privilege level as on the cluster command switch.			
	For example, if you execute this command at user level on the cluster command switch, the cluster member switch is accessed at user level. If you use this command on the cluster command switch at the privilege level, the command accesses the remote device at the privilege level.			
	If you use an intermediate enable-level lower than the privilege, access to the cluster member switch is at the user level.			
	For Catalyst 1900 and 2820 switches running standard edition software, the Telnet session accesses the menu console (the menu-driven interface) if the cluster command switch is at privilege level 15.			
	If the cluster command switch is at privilege level 1, you are prompted for the password before being able t access the menu console.			

- If the cluster command switch privilege level is from 1 to 14, the cluster member switch is accessed at privilege level 1.
- If the cluster command switch privilege level is 15, the cluster member switch is accessed at privilege level 15.

The Catalyst 1900 and 2820 CLI is available only on switches running Enterprise Edition Software.

This command will not work if the vty lines of the cluster command switch have access-class configurations.

You are not prompted for a password because the cluster member switches inherited the password of the cluster command switch when they joined the cluster.

Example

This example shows how to start a session with member 3. All subsequent commands are directed to member 3 until you enter the **exit** command or close the session:

```
Switch> rcommand 3
Switch-3# show version
Cisco Internet Operating System Software ...
Switch-3# exit
Switch>
```

rename

I

	To rename a file, use the rename command in boot loader mode. rename <i>filesystem:/source-file-url filesystem:/destination-file-url</i>			
Syntax Description	filesystem:	Alias for a file system. Use usbflash0: for	USB memory sticks.	
	/source-file-url	Original path (directory) and filename.		
	/destination-file-u	rl New path (directory) and filename.		
Command Default	No default behavi	or or values.		
Command Modes	Boot loader			
Command History	Release	Modification		
	Cisco IOS Release	e 15.0(2)EX This command was introduced.		
Usage Guidelines	Filenames and dire	ectory names are case sensitive.		
	Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.			
	Filenames are limi quotes, semicolon	· · · · · · · · · · · · · · · · · · ·	in control characters, spaces, deletes, slashes,	
Examples	This example shows a file named <i>config.text</i> being renamed to <i>config1.text</i> :			
	Device: rename	usbflash0:config.text usbflash0:confi	gl.text	
	You can verify that	t the file was renamed by entering the dir fil	esystem: boot loader command.	

reset

To perform a hard reset on the system, use the **reset** command in boot loader mode. A hard reset is similar to power-cycling the device; it clears the processor, registers, and memory.

	reset			
Syntax Description	This command has no arguments or keywords.			
Command Default	No default behavior or values.			
Command Modes	Boot loader			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		
Examples	This example shows how	to reset the system:		
	Device: reset Are you sure you want	to reset the system (y/n)? ${\bf y}$		

System resetting...

rmdir

To remove one or more empty directories from the specified file system, use the **rmdir** command in boot loader mode.

rmdir *filesystem:/directory-url...*

Syntax Description	filesystem:	system: Alias for a file system. Use usbflash0: for USB memory sticks.		
	/directory-url	Path (directory) and name of the empty di with a space.	irectories to remove. Separate each directory name	
Command Default	No default beha	vior or values.		
Command Modes	Boot loader			
Command History	Release	Modification		
	Cisco IOS Rele	ase 15.0(2)EX This command was introdu	ced.	
Usage Guidelines	Directory names are case sensitive and limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.			
	Before removing a directory, you must first delete all of the files in the directory.			
	The device pron	npts you for confirmation before deleting	each directory.	
	Example			
	This example shows how to remove a directory:			
	Device: rmdir	usbflash0:Test		

You can verify that the directory was deleted by entering the dir filesystem: boot loader command.

service sequence-numbers

To display messages with sequence numbers when there is more than one log message with the same time stamp, use the **service sequence-numbers** global configuration command.

service sequence-numbers

Syntax Description This command has no arguments or keywords.

Command Default By default, sequence numbers in log messages are not displayed.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Example

This example shows how to display messages with sequence numbers when there is more than one log message with the same time stamp:

Switch(config) # service sequence-numbers

set

To set or display environment variables, use the **set** command in boot loader mode. Environment variables can be used to control the boot loader or any other software running on the device.

set variable value

Syntax Description	variable	Use one of the following keywords for <i>variable</i> and the appropriate value for <i>value</i> :
	value	MANUAL_BOOT—Decides whether the device automatically or manually boots.
		Valid values are 1/Yes and 0/No. If it is set to 0 or No, the boot loader attempts to automatically boot the system. If it is set to anything else, you must manually boot the device from the boot loader mode.
		BOOT <i>filesystem:/file-url</i> —Identifies a semicolon-separated list of executable files to try to load and execute when automatically booting.
		If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash: file system.
		ENABLE_BREAK —Allows the automatic boot process to be interrupted when the user presses the Break key on the console.
		Valid values are 1, Yes, On, 0, No, and Off. If set to 1, Yes, or On, you can interrupt the automatic boot process by pressing the Break key on the console after the flash: file system has initialized.
		HELPER <i>filesystem:/file-url</i> —Identifies a semicolon-separated list of loadable files to dynamically load during the boot loader initialization. Helper files extend or patch the functionality of the boot loader.
		PS1 prompt—Specifies a string that is used as the command-line prompt in boot loader mode.
		CONFIG_FILE flash: <i>/file-url</i> —Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.
		BAUD <i>rate</i> —Specifies the number of bits per second (b/s) that is used for the baud rate for the console. The Cisco IOS software inherits the baud rate setting from the boot loader and continues to use this value unless the configuration file specifies another setting. The range is from 0 to 128000 b/s. Valid values are 50, 75, 110, 150, 300, 600, 1200, 1800, 2000, 2400, 3600, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 56000, 57600, 115200, and 128000.
		The most commonly used values are 300, 1200, 2400, 9600, 19200, 57600, and 115200.
		SWITCH_NUMBER stack-member-number—Changes the member number of a stack member.
		SWITCH_PRIORITY <i>priority-number</i> —Changes the priority value of a stack member.

Command Default The environment variables have these default values:

set

MANUAL BOOT: No (0)

BOOT: Null string

ENABLE_BREAK: No (Off or 0) (the automatic boot process cannot be interrupted by pressing the **Break** key on the console).

HELPER: No default value (helper files are not automatically loaded).

PS1 device:

CONFIG_FILE: config.text

BAUD: 9600 b/s

SWITCH_NUMBER: 1

SWITCH_PRIORITY: 1

Note

Environment variables that have values are stored in the flash: file system in various files. Each line in the files contains an environment variable name and an equal sign followed by the value of the variable.

A variable has no value if it is not listed in these files; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, "") is a variable with a value.

Many environment variables are predefined and have default values.

Command Modes	bodes Boot loader			
Command History	Release	Modification	-	
	Cisco IOS Release 1	5.0(2)EX This command was introduced.	-	
Usage Guidelines	Environment variab	les are case sensitive and must be entered	as documented.	
	Environment variable	les that have values are stored in flash men	mory outside of the flash: file system.	
Under typical circumstances, it is not necessary to alter the setting of the environment varial			tting of the environment variables.	
	The MANUAL_BO command.	OT environment variable can also be set b	by using the boot manual global configuration	
	The BOOT environr configuration comm	ment variable can also be set by using the and.	boot system <i>filesystem:/file-url</i> global	
	The ENABLE_BRE configuration comm	AK environment variable can also be set and.	by using the boot enable-break global	
	The HELPER enviro configuration comm		he boot helper filesystem: / file-url global	
	The CONFIG_FILE configuration comm	•	ising the boot config-file flash: /file-url global	
		ABER environment variable can also be se er-number renumber new-stack-member-		

The SWITCH_PRIORITY environment variable can also be set by using the device *stack-member-number* **priority** *priority-number* global configuration command.

The boot loader prompt string (PS1) can be up to 120 printable characters not including the equal sign (=).

Example

This example shows how to set the SWITCH_PRIORITY environment variable:

```
Device: set SWITCH_PRIORITY 2
```

You can verify your setting by using the set boot loader command.

show avc dns-as client

To display the various AVC with DNS-AS settings you have configured, enter the **show avc dns-as client** command in Privileged EXEC mode

show avc dns-as client[{binding-table [| detail] | | name-server brief | | rate-limiter-table | | statistics | status | trusted domains}]

Syntax Description	binding-table [detail]	Displays AVC with DNS-AS metadata for the list of trusted domains and resolved entries. You can filter the output by application name, domain name, and so on.
		The optional detail keyword displays the same information, in a different format.
	name-server brief	Displays information about the DNS server to which the metadata request was sent.
	rate-limiter-table	_
	statistics	Displays packet logging information—the number of DNS queries sent and the number of responses received.
	status	Displays current status of the DNS-AS client. Use this command to know whether AVC with DNS-AS is enabled or not.
trusted-domains		Displays list of trusted domains maintined in the binding table.
Command Modes	Privileged EXEC	
Command History	Release	Modification

Cisco IOS Release This command was introduced. 15.2(5)E1

show avc dns-as client binding-table detailed

```
Device# show avc dns-as client binding-table
Switch# show avc dns-as client binding-table detailed
DNS-AS generated protocols:
Max number of protocols :50
Customization interval [min] :N/A

6| www.example.org
```

Related Commands	Command	Description		
	avc dns-as client, on page 586	Enables AVC with DNS-AS on the switch (DNS-AS client) and maintains a list of trusted domains		

show boot

To display the settings of the boot environment variables, use the **show boot** privileged EXEC command.

	show boot			
Syntax Description	This command has no arguments or keywords.			
Command Default	None			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		

Example

This example shows the output from the **show boot** command. The table below describes each field in the display:

```
Switch# show boot
```

```
BOOT path-list:flash:/imageConfig file:flash:/config.textPrivate Config file:flash:/private-config.textEnable Break:noManual Boot:yesHELPER path-list:Auto upgrade:yes
```

For switch stacks, information is shown for each switch in the stack.

This feature is supported only on the LAN Base image.

Table 40: show boot Field Descriptions

Field	Description
BOOT path-list	Displays a semicolon-separated list of executable files to try to load and execute when automatically booting up.
	If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory.
	If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot up with the first bootable file that it can find in the flash: file system.

I

Field	Description
Config file	Displays the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.
Private config file	Displays the filename that Cisco IOS uses to read and write a private nonvolatile copy of the system configuration.
Enable break	Displays whether a break is permitted during booting up is enabled or disabled. If it is set to yes, on, or 1, you can interrupt the automatic bootup process by pressing the Break key on the console after the flash: file system is initialized.
Manual boot	Displays whether the switch automatically or manually boots up. If it is set to no or 0, the bootloader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the bootloader mode.
Helper path-list	Displays a semicolon-separated list of loadable files to dynamically load during the bootloader initialization. Helper files extend or patch the functionality of the bootloader.
Auto upgrade	Displays whether the switch stack is set to automatically copy its software version to an incompatible switch so that it can join the stack.
	A switch in version-mismatch mode is a switch that has a different stack protocol version than the version on the stack. Switches in version-mismatch mode cannot join the stack. If the stack has an image that can be copied to a switch in version-mismatch mode, and if the boot auto-copy-sw feature is enabled, the stack automatically copies the image from another stack member to the switch in version-mismatch mode. The switch then exits version-mismatch mode, reboots, and joins the stack.
NVRAM/Config file buffer size	Displays the buffer size that Cisco IOS uses to hold a copy of the configuration file in memory. The configuration file cannot be larger than the buffer size allocation.

show cable-diagnostics prbs

To display the pseudo-random binary sequence (PRBS) test results, use the **show cable-diagnostics prbs** command in privileged EXEC mode.

show cable-diagnostics prbs interface interface-id

Syntax Description	interface-id The interface on which PRBS is run.				
Command Default	None				
Command Modes	Privileged EXEC				
Command History	Release	Modification		-	
	Cisco IOS Release 15.0(2)EX	This command introduced.	d was	-	
Usage Guidelines	2 11	d on 10-Gigabit Ethern pluggable (SFP) modu	1	supported on 10	/100/100 copper Ethernet ports
	This example shows the on a device:	e output from the show	cable-diagnostic	es prbs interface	interface-id command
	prbs test last ru	diagnostics prbs in an on: March 01 00: Local pair Pair 3	04:08		
	Gi1/0/23 1000M	Pair A 1 Pair B 1 Pair C 1 Pair D 1	+/- 1 meters +/- 1 meters	Pair B	Normal Normal Normal Normal

Table 41: Field Descriptions for the show cable-diagnostics prbs Command Output

Field	Description
Interface	Interface on which PRBS is run.
Speed	Speed of connection.
Local pair	The name of the pair of wires that PRBS is testing on the local interface.
Pair length	The location of the problem on the cable, with respect to your device. PRBS can only find the location in one of these cases:
	The cable is properly connected, the link is up, and the interface speed is 10-Gps.The cable is open.
	• The cable has a short.

Field	Description
Remote pair	The name of the pair of wires to which the local pair is connected. PRBS can learn about the remote pair only when the cable is properly connected and the link is up.
Pair status	 The status of the pair of wires on which PRBS is running: Normal—The pair of wires is properly connected. Not completed—The test is running and is not completed. Not supported—The interface does not support PRBS. Open—The pair of wires is open. Shorted—The pair of wires is shorted. ImpedanceMis—The impedance is mismatched. Short/Impedance Mismatched—The impedance mismatched or the cable is short. InProgress—The diagnostic test is in progress.

This example shows the output from the **show interface** *interface-id* command when PRBS is running:

```
Switch# show interface gigabitethernet1/0/2
gigabitethernet1/0/2 is up, line protocol is up (connected: TDR in Progress)
```

This example shows the output from the **show cable-diagnostics prbs interface** *interface-id* command when PRBS is not running:

```
Switch# show cable-diagnostics PRBS interface gigabitethernet1/0/2 % PRBS test was never issued on Gi1/0/2
```

If an interface does not support PRBS, this message appears:

```
% PRBS test is not supported on device 1
```

show cable-diagnostics tdr

To display the Time Domain Reflector (TDR) results, use the **show cable-diagnostics tdr** command in privileged EXEC mode.

show cable-diagnostics tdr interface interface-id

Syntax Description	<i>interface-id</i> Specifies the interface on which TDR is run.					
Command Default	mand Default No default behavior or values.					
Command Modes	Privileged EXEC					
Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EX	This command was introduced.				

Usage Guidelines TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and small form-factor pluggable (SFP) module ports.

Examples

This example shows the output from the **show cable-diagnostics tdr interface** *interface-id* command on a device:

Device# show cable-diagnostics tdr interface gigabitethernet1/0/23								
TDR test last	run on: March 03	1 00:04:	:08					
Interface Sp	eed Local pair	Pair le	ength	Remote pair	Pair status			
Gi1/0/23 10	00M Pair A	1 +/	/- 1 meters	Pair A	Normal			
	Pair B	1 +/	/- 1 meters	Pair B	Normal			
	Pair C	1 +/	/- 1 meters	Pair C	Normal			
	Pair D	1 +/	/- 1 meters	Pair D	Normal			

Table 42: Field Descriptions for the show cable-diagnostics tdr Command Output

Field	Description
Interface	The interface on which TDR is run.
Speed	The speed of connection.
Local pair	The name of the pair of wires that TDR is testing on the local interface.

Field	Description					
Pair length	The location of the problem on the cable, with respect to your device. TDR can only find the location in one of these cases:					
	 The cable is properly connected, the link is up, and the interface speed is 1000 Mb/s. The cable is open. The cable has a short. 					
Remote pair	The name of the pair of wires to which the local pair is connected. TDR can learn about the remote pair only when the cable is properly connected and the link is up.					
Pair status	us The status of the pair of wires on which TDR is running:					
	• Normal—The pair of wires is properly connected.					
	 Not completed—The test is running and is not completed. 					
	• Not supported—The interface does not support TDR.					
	• Open—The pair of wires is open.					
	• Shorted—The pair of wires is shorted.					
	• ImpedanceMis—The impedance is mismatched.					
	 Short/Impedance Mismatched—The impedance mismatched or the cable is short. 					
	• InProgress—The diagnostic test is in progress.					

This example shows the output from the **show interface** *interface-id* command when TDR is running:

```
Device# show interface gigabitethernet1/0/2
gigabitethernet1/0/2 is up, line protocol is up (connected: TDR in Progress)
```

This example shows the output from the **show cable-diagnostics tdr interface** *interface-id* command when TDR is not running:

```
Device# show cable-diagnostics tdr interface gigabitethernet1/0/2 % TDR test was never issued on gigabitethernet1/0/2
```

If an interface does not support TDR, this message appears:

% TDR test is not supported on device 1

the following error message appears:

the cluster command switch, the switch

show cluster

To display the cluster status and a summary of the cluster to which the switch belongs, use the **show cluster** EXEC command. This command can be entered on the cluster command switch and cluster member switches.

show cluster

Syntax Description	This command has no arguments or keywords.					
Command Modes	User EXEC					
	Privileged EXEC					
Command History	Release	Modification				
	Cisco IOS Release 15.0(2)EX	This command was introduced.				
Usage Guidelines	If you enter this command on a switch that is not a cluster member,					
	Not a management cluster member.					
	On a cluster member switch, this command displays the identity of t member number, and the state of its connectivity with the cluster co					

primary and secondary command-switch information.

member number, and the state of its connectivity with the cluster command switch. On a cluster command switch stack or cluster command switch, this command displays the cluster name and

the total number of members. It also shows the cluster status and time since the status changed. If redundancy is enabled, it displays the

Example

This example shows the output from the **show cluster** command entered on the cluster command switch:

```
Switch# show cluster
Command switch for cluster "Ajang"
   Total number of members: 7
   Status:
                               1 members are unreachable
   Time since last status change: 0 days, 0 hours, 2 minutes
   Redundancv:
                   Enabled
       Standby command switch: Member 1
       Standby Group:
                             Ajang_standby
      Standby Group Number:
                               110
   Heartbeat interval:
                               8
                               80
   Heartbeat hold-time:
   Extended discovery hop count: 3
```

This example shows the output from the show cluster command entered on a cluster member switch:

```
Switch1# show cluster

Member switch for cluster "hapuna"

Member number: 3

Management IP address: 192.192.192.192

Command switch mac address: 0000.0c07.ac14
```

```
Heartbeat interval: 8
Heartbeat hold-time: 80
```

This example shows the output from the **show cluster** command entered on a cluster member switch that has lost connectivity with member 1:

```
Switch# show cluster
Command switch for cluster "Ajang"
Total number of members: 7
Status: 1 members are unreachable
Time since last status change: 0 days, 0 hours, 5 minutes
Redundancy: Disabled
Heartbeat interval: 8
Heartbeat hold-time: 80
Extended discovery hop count: 3
```

This example shows the output from the **show cluster** command entered on a cluster member switch that has lost connectivity with the cluster command switch:

```
Switch# show cluster
```

```
Member switch for cluster "hapuna"
Member number: <UNKNOWN>
Management IP address: 192.192.192.192
Command switch mac address: 0000.0c07.ac14
Heartbeat interval: 8
Heartbeat hold-time: 80
```

show cluster candidates

	To display a list of candidate switches, use the show cluster candidates EXEC command.
	show cluster candidates [detail mac-address H.H.H]
Syntax Description	detail (Optional) Displays detailed information for all candidates.
	mac-address <i>H.H.H</i> (Optional) Specifies the MAC address of the cluster candidate.
Command Modes	User EXEC
	Privileged EXEC
Command History	Release Modification
	Cisco IOS Release This command was introduced. 15.0(2)EX
Usage Guidelines	This command is available only on the cluster command switch stack or cluster command switch.
	Note This feature is supported only on the LAN Base image.
	If the switch is not a cluster command switch, the command displays an empty line at the prompt.
	The SN in the display means <i>switch member number</i> . If E appears in the SN column, it means that the switch is discovered through extended discovery.
	If E does not appear in the SN column, it means that the <i>switch member number</i> is the upstream neighbor of the candidate switch.
	The hop count is the number of devices the candidate is located from the cluster command switch.
	Example
	This example shows the output from the show cluster candidates command:
	Switch# show cluster candidates
	Upstream MAC Address Name Device Type PortIf FEC Hops SN PortIf FEC 00d0.7961.c4c0 StLouis-2 WS-C2960-12T Gi0/1 2 1 Fa0/11 00d0.bbf5.e900 ldf-dist-128 WS-C3524-XL Fa0/7 1 0 Fa0/24

This example shows the output from the **show cluster candidates** that uses the MAC address of a cluster member switch directly connected to the cluster command switch:

Switch# show cluster candidates mac-address 00d0.7961.c4c0 Device 'Tahiti-12' with mac address number 00d0.7961.c4c0

```
Device type: cisco WS-C2960-12T

Upstream MAC address: 00d0.796d.2f00 (Cluster Member 0)

Local port: Gi6/0/1 FEC number:

Upstream port: GI6/0/11 FEC Number:

Hops from cluster edge: 1

Hops from command device: 1
```

This example shows the output from the **show cluster candidates** that uses the MAC address of a cluster member switch that is three hops from the cluster edge:

```
Switch# show cluster candidates mac-address 0010.7bb6.1cc0
Device 'Ventura' with mac address number 0010.7bb6.1cc0
Device type: cisco WS-C2912MF-XL
Upstream MAC address: 0010.7bb6.1cd4
Local port: Fa2/1 FEC number:
Upstream port: Fa0/24 FEC Number:
Hops from cluster edge: 3
Hops from command device: -
```

This example shows the output from the **show cluster candidates detail** command:

```
Switch# show cluster candidates detail
Device 'Tahiti-12' with mac address number 00d0.7961.c4c0
   Device type: cisco WS-C3512-XL
    Upstream MAC address: 00d0.796d.2f00 (Cluster Member 1)
   Local port: Fa0/3 FEC number:
    Upstream port:
                        Fa0/13 FEC Number:
    Hops from cluster edge: 1
   Hops from command device: 2
Device '1900 Switch' with mac address number 00e0.1e7e.be80
   Device type: cisco 1900
   Upstream MAC address: 00d0.796d.2f00 (Cluster Member 2)
                         3
                               FEC number: 0
    Local port:
    Upstream port:
                        Fa0/11 FEC Number:
   Hops from cluster edge: 1
    Hops from command device: 2
Device 'Surfers-24' with mac address number 00e0.1e9f.7a00
    Device type:
                   cisco WS-C2924-XL
    Upstream MAC address: 00d0.796d.2f00 (Cluster Member 3)
   Local port: Fa0/5 FEC number:
Upstream port: Fa0/3 FEC Number:
   Hops from cluster edge: 1
   Hops from command device: 2
```

show cluster members

To display information about cluster members, use the show cluster members privileged EXEC command
--

 show cluster members
 [n | detail]

 Syntax Description
 n
 (Optional) Number that identifies a cluster member. The range is 0 to 15.

 detail
 (Optional) Displays detailed information for all cluster members.

 Command Modes
 Privileged EXEC

 Release
 Modification

 Cisco IOS Release
 This command was introduced.

Usage Guidelines

Note This feature is supported only on the LAN Base image.

If the cluster has no members, this command displays an empty line at the prompt.

Example

15.0(2)EX

This example shows the output from the **show cluster members** command. The SN in the display means *switch number*.

This command is available only on the cluster command switch stack or cluster command switch.

```
Switch# show cluster members
```

	Upstream						
SN MAC Address Name	PortIf	FEC	Hops	SN	PortIf	FEC	State
0 0002.4b29.2e00 StLouis1			0				Up (Cmdr)
1 0030.946c.d740 tal-switch-1	Fa0/13		1	0	Gi0/1		Up
2 0002.b922.7180 nms-2820	10	0	2	1	Fa0/18		Up
3 0002.4b29.4400 SanJuan2	Gi0/1		2	1	Fa0/11		Up
4 0002.4b28.c480 GenieTest	Gi0/2		2	1	Fa0/9		Up

This example shows the output from the **show cluster members** for cluster member 3:

```
Switch# show cluster members 3
Device 'SanJuan2' with member number 3
Device type: cisco WS-C2960
MAC address: 0002.4b29.4400
Upstream MAC address: 0030.946c.d740 (Cluster member 1)
Local port: Gi6/0/1 FEC number:
Upstream port: GI6/0/11 FEC Number:
Hops from command device: 2
```

This example shows the output from the **show cluster members detail** command:

```
Switch# show cluster members detail
Device 'StLouis1' with member number 0 (Command Switch)
Device type: cisco WS-C2960
```

```
MAC address:
                 0002.4b29.2e00
   Upstream MAC address:
   Local port:
                                 FEC number:
   Upstream port:
                                FEC Number:
   Hops from command device: 0
Device 'tal-switch-14' with member number 1
   Device type:
                        cisco WS-C3548-XL
                        0030.946c.d740
   MAC address:
  Upstream MAC address: 0002.4b29.2e00 (Cluster member 0)
   Local port: Fa0/13 FEC number:
                       Gi0/1 FEC Number:
   Upstream port:
   Hops from command device: 1
Device 'nms-2820' with member number 2
   Device type: cisco 2820
MAC address: 0002.b922.
   MAC address:
                       0002.b922.7180
   Upstream MAC address: 0030.946c.d740 (Cluster member 1)
   Local port: 10
                               FEC number: 0
                        Fa0/18
                               FEC Number:
    Upstream port:
   Hops from command device: 2
Device 'SanJuan2' with member number 3
   Device type: cisco WS-C2960
   MAC address:
                       0002.4b29.4400
   Upstream MAC address: 0030.946c.d740 (Cluster member 1)
   Local port: Gi6/0/1 FEC Number:
   Hops from command device: 2
Device 'GenieTest' with member number 4
   Device type: cisco SeaHorse
   MAC address:
                        0002.4b28.c480
   Upstream MAC address: 0030.946c.d740 (Cluster member 1)
   Local port: Gi0/2 FEC number:
   Upstream port:
                       Fa0/9
                               FEC Number:
   Hops from command device: 2
Device 'Palpatine' with member number 5
   Device type: cisco WS-C29241
MAC address: 00b0.6404.f8c0
   Device type:
                        cisco WS-C2924M-XL
   Upstream MAC address: 0002.4b29.2e00 (Cluster member 0)
   Local port: Gi2/1 FEC number:
   Upstream port:
                       Gi0/7
                                FEC Number:
   Hops from command device: 1
```

show ip name-server

To display all the name server IP addresses that have been maintained, enter theshow ip name-server command.

	show ip name-server						
Syntax Description	This command has no arguments or keywords.						
Command Default	None						
Command Modes	Privileged EXEC						
Command History	Release	Modification					
	Cisco IOS Release 15.0(2)EX	This command was introduced.					

Example

Device# **show ip name-server** 192.0.2.1 192.0.2.2 2001:DB8::1

show license right-to-use

To display information related to the right-to-use licenses on the device, use the **show license right-to-use** command in the privileged EXEC mode.

show license right-to-use [default | detail | eula | summary | usage]

Syntax Description	default	Displays the default license information.
	detail	Displays detailed information of all the licenses in the switch stack.
	eula	Displays the end user license agreement.
	summary	Displays a summary of the license information on the entire switch stack.
	usage	Displays detailed information about usage for all licenses in the switch stack.
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.2(6)E1	This command was introduced.

This example shows how to display the default license information:

Device#	show	license	right-to-use default	
slot		License	Name	Туре
0		lanlite		Permanent
0		lanbase		Permanent

This example shows how to display detailed information of all the licenses in the switch stack:

```
Device# show license right-to-use detail
Index 1
License Name : lanlite
Period left : 0 minute 0 second
License Type: Permanent
License State: Inactive
Index 2
License Name : lanbase
Period left : 0 minute 0 second
License Type: Permanent
License State: Active, In use
Index 3
```

License Name	:	dna-essentials
Period left	:	CSSM Managed
License Type	:	Subscription
License State	:	Active, In use
Index 4		
License Name	:	dna-advantage
Period left	:	CSSM Managed
License Type	:	Subscription
License State	:	Not Activated

This example shows how to display summary of the license information on the entire switch stack:

Device# show license right-to-use summary								
License Name	Туре	Period left						
lanlite	Permanent	0 minute 0 second						
lanbase	Permanent	0 minute 0 second						
dna-essentials	Subscription	CSSM Managed						
License Level In Use: lanbase	addon: dna-e	ssentials						
License Level on Reboot: lanba	ase addon: dn	a-essentials						

This example shows how to display detailed information about usage for all licenses in the switch stack:

Device# show	license right-to-use usage			
slot	License Name	Туре	In-use	EULA
0	lanlite	Permanent	yes	yes
0	lanbase	Permanent	yes	yes
	dna-essentials	Subscription	yes	yes

This example shows how to display the end user license agreement:

```
Device# show license right-to-use eula subscription
Feature name
                       EULA Accepted
_____
                        _____
dna-essentials
                        yes
PLEASE READ THE FOLLOWING TERMS CAREFULLY. INSTALLING THE LICENSE OR
LICENSE KEY PROVIDED FOR ANY CISCO SOFTWARE PRODUCT, PRODUCT FEATURE,

show logging onboard

Display the on-board failure logging (OBFL) information using the **show logging onboard** privileged EXEC command.

show logging onboard [module [switch number]] {{clilog | environment | message | poe |
temperature | uptime | voltage} [continuous | detail | summary] [start hh:mm:ss day month
year] [end hh:mm:ss day month year] }

Syntax Description	module [switch number]	(Optional) Displays OBFL information about the specified switches.
		Uses the <i>switch number</i> parameter to specify the switch number, which is the stack member number. If the switch is a standalone switch, the switch number is 1. If the switch is in a stack, the range is 1 to 8, depending on the switch member numbers in the stack.
		For more information about this parameter, see the "Usage Guidelines" section for this command.
	clilog	Displays the OBFL CLI commands that were entered on the standalone switch or specified stack members.
	environment	Displays the unique device identifier (UDI) information for the standalone switch or specified stack members. For all the connected FRU devices, it displays the product identification (PID), the version identification (VID), and the serial number.
	message	Displays the hardware-related system messages generated by the standalone switch or specified stack members.
	рое	Displays the power consumption of PoE ports on the standalone switch or specified stack members.
	temperature	Displays the temperature of the standalone switch or specified stack members.
	uptime	Displays the time when the standalone switch or specified stack members start, the reason the standalone switch or specified members restart, and the length of time the standalone switch or specified stack members have been running since they last restarted.
	voltage	Displays the system voltages of the standalone switch or the specified switch stack members.
	continuous	(Optional) Displays the data in the <i>continuous</i> file.
	detail	(Optional) Displays both the continuous and summary data.
	summary	(Optional) Displays the data in the <i>summary</i> file.
	start <i>hh:mm:ss day month year</i>	(Optional) Displays the data from the specified time and date. For more information, see the "Usage Guidelines" section.
	end hh:mm:ss day month year	(Optional) Displays the data from the specified time and date. For more information, see the "Usage Guidelines" section.

Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
Usage Guidelines	· · · · · · · · · · · · · · · · · · ·	he switch records OBFL data in a continuous file that contains all of the data. The When the continuous file is full, the switch combines the data into a summary file historical file.
	Creating the summary fil	e frees up space in the continuous file so that the switch can write newer data to it
	If you enter the module k about the stack members	eyword, but do not enter the switch number, the switch displays OBFL information that support OBFL.
	Use the start and end key the start and end times, for	words to display data collected only during a particular time period. When specifyin illow these guidelines:
	• <i>hh:mm:ss</i> —Enter th	e time as a two-digit number for a 24-hour clock. Make sure to use the colons (:).
	For example, enter 1	3:32:45.
	• <i>day</i> —Enter the day	of the month. The range is from 1 to 31.
		onth in uppercase or lowercase letters. You can enter the full name of the month, august , or the first three letters of the month, such as jan or Aug
	• <i>year</i> —Enter the yea	as a 4-digit number, such as 2008. The range is from 1993 to 2035.
—	Note This feature is suppo	orted only on the LAN Base image.

This example shows the output from the **show logging onboard clilog continuous** command:

```
Switch# show logging onboard clilog continuous
_____
CLT LOGGING CONTINUOUS INFORMATION

show mac address-table

To display a specific MAC address table entry, use the **show mac address-table** command in EXEC mode.

show mac-address-tableSyntax DescriptionThis command has no arguments or keywords.Command ModesUser EXEC
Privileged EXECCommand HistoryReleaseModificationCisco IOS Release
15.0(2)EXThis command was introduced.

Usage Guidelines

This feature is supported only on the LAN Base image.

This command can display static and dynamic entries or the MAC address table static and dynamic entries on a specific interface or VLAN.

Example

This example shows the output from the show mac address-table command:

Switch	Mac Address Tal				
Vlan	Mac Address	Туре	Ports		
All	0000.0000.0001	STATIC	CPU		
All	0000.0000.0002	STATIC	CPU		
All	0000.0000.0003	STATIC	CPU		
All	0000.0000.0009	STATIC	CPU		
All	0000.0000.0012	STATIC	CPU		
All	0180.c200.000b	STATIC	CPU		
All	0180.c200.000c	STATIC	CPU		
All	0180.c200.000d	STATIC	CPU		
All	0180.c200.000e	STATIC	CPU		
All	0180.c200.000f	STATIC	CPU		
All	0180.c200.0010	STATIC	CPU		
1	0030.9441.6327	DYNAMIC	Gi0/4		
Total	Total Mac Addresses for this criterion: 1				

show mac address-table address

To display MAC address table information for a specified MAC address, use the **show mac address-table address** command in EXEC mode.

show mac address-table address mac-address [interface interface-id] [vlan vlan-id]

Syntax Description	mac-address	The 48-bit MAC address; valid formation	at is H.H.H.
	interface interface-id	<i>l</i> (Optional) Displays information for a specific interface. Valid interfaces include physical ports and port channels.	
	vlan vlan-id	(Optional) Displays entries for the sp	ecific VLAN only. The range is 1 to 4094.
Command Modes	User EXEC		
	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
	Example		

This example shows the output from the **show mac address-table address** command:

show mac address-table aging-time

To display the aging time of address table entries, use the show mac address-table aging-time command in EXEC mode.

show mac address-table aging-time [vlan vlan-id]

Syntax Description vlan (Optional) Displays aging time information for a specific VLAN. The range is 1 to 4094. vlan-id

Command Modes

Privileged EXEC

User EXEC

Command History	Release Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.

If no VLAN number is specified, the aging time for all VLANs appears. This command displays the aging **Usage Guidelines** time of a specific address table instance, all address table instances on a specified VLAN, or, if a specific VLAN is not specified, on all VLANs.

Example

This example shows the output from the **show mac address-table aging-time** command:

Switch# show mac address-table aging-time

Vlan Aging Time ____ 1 300

This example shows the output from the **show mac address-table aging-time vlan 10** command:

Switch# show mac address-table aging-time vlan 10

Vlan Aging Time _ _ _ _ _____ 10 300

show mac address-table count

To display the number of addresses present in all VLANs or the specified VLAN, use the **show mac** address-table count command in EXEC mode.

show mac address-table count [vlan vlan-id]

Syntax Description	vlan (Optional) vlan-id	Displays the number of addresses for	a specific VLAN. The range is 1 to 4094.
Command Modes	User EXEC Privileged EXEC		
Command History	Release	Modification	-
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	If no VLAN number is s	pecified, the address count for all VL	ANs appears.
	Freemale		

Example

This example shows the output from the show mac address-table count command:

Switch# show mac address-table count

Mac Entries for Vlan : 1 Dynamic Address Count : 2 Static Address Count : 0 Total Mac Addresses : 2

I

show mac address-table dynamic

To display only dynamic MAC address table entries, use the **show mac address-table dynamic** command in EXEC mode.

	show mac address-tab	le dynamic [address mac-address]	[interface interface-id] [vlan vlan-id]	
Syntax Description	address mac-address	(Optional) Specifies a 48-bit MAC ad privileged EXEC mode only).	dress; the valid format is H.H.H (available in	
	interface interface-id	(Optional) Specifies an interface to m and port channels.	atch; valid interfaces include physical ports	
	vlan vlan-id	vlan <i>vlan-id</i> (Optional) Displays entries for a specific VLAN; the range is 1 to 4094.		
Command Modes	User EXEC			
	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS Release 15.0(2)EX	This command was introduced.		

Example

This example shows the output from the show mac address-table dynamic command:

Switch# show mac address-table dynamic

	Mac Address	Table	
Vlan	Mac Address	Tvpe	Ports
1	0030.b635.7862	DYNAMIC	Gi0/2

Total	Mac Addresses fo	r this cri	terion: 2

show mac address-table interface

To display the MAC address table information for a specified interface on a specified VLAN, use the **show** mac address-table interface EXEC command.

show mac address-table interface *interface-id* [**vlan** *vlan-id*]

Syntax Description	<i>interface-id</i> The interface type; valid interfaces include physical ports and port channels.		
	vlan (Optional) Displays entries for a specific VLAN; the range is 1 to 4094. <i>vlan-id</i>		
Command Modes	User EXEC Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	

Example

This example shows the output from the show mac address-table interface command:

Switch# show mac address-table interface gigabitethernet0/2

Mac Address Table Vlan Mac Address Type Ports 1 0030.b635.7862 DYNAMIC Gi0/2 1 00b0.6496.2741 DYNAMIC Gi0/2 Total Mac Addresses for this criterion: 2

show mac address-table learning

To display the status of MAC address learning for all VLANs or a specified VLAN, use the **show mac** address-table learning command in EXEC mode.

show mac address-table learning [vlan vlan-id]

Syntax Description vlan (Optional) Displays information for a specific VLAN. The range is 1 to 4094. vlan-id User EXEC **Command Modes** Privileged EXEC **Command History** Release Modification Cisco IOS Release This command was 15.0(2)EX introduced. Use the show mac address-table learning command without any keywords to display configured VLANs **Usage Guidelines** and whether MAC address learning is enabled or disabled on them. The default is that MAC address learning is enabled on all VLANs. Use the command with a specific VLAN ID to display the learning status on an individual VLAN. Ø Note This command is supported only on the LAN Base image.

Example

This example shows the output from the **show mac address-table learning** command showing that MAC address learning is disabled on VLAN 200:

Switch# show mac address-table learning

 VLAN
 Learning Status

 1
 yes

 100
 yes

 200
 no

L

show mac address-table move update

To display the MAC address-table move update information on the device, use the **show mac address-table move update** command in EXEC mode.

show mac address-table move update

Syntax Description This command has no arguments or keywords.

Command Default No default behavior or values.

Command Modes User EXEC

Privileged EXEC

Command History

Cisco IOS Release 15.0(2)EX

Example

Release

This example shows the output from the **show mac address-table move update** command:

Device# show mac address-table move update

```
Switch-ID : 010b.4630.1780
Dst mac-address : 0180.c200.0010
Vlans/Macs supported : 1023/8320
Default/Current settings: Rcv Off/On, Xmt Off/On
Max packets per min : Rcv 40, Xmt 60
Rcv packet count : 10
Rcv conforming packet count : 5
Rcv invalid packet count : 0
Rcv packet count this min : 0
Rcv threshold exceed count : 0
Rcv last sequence# this min : 0
Rcv last interface : Po2
Rcv last src-mac-address : 0003.fd6a.8701
Rcv last switch-ID : 0303.fd63.7600
Xmt packet count : 0
Xmt packet count this min : 0
Xmt threshold exceed count : 0
Xmt pak buf unavail cnt : 0
Xmt last interface : None
```

show mac address-table multicast

To display information about the multicast MAC address table, use the **show mac-address-table multicast** command.

show mac-address-table multicast [count | {igmp-snooping [count]} | {user [count]} |
{vlan vlan_num}]

Command History	Release	Modification	-
	vlan vlan_num	(Optional) Displays information for a spe 4094.	cific VLAN only; valid values are from 1 to
	user	(Optional) Displays only the user-entered	static addresses.
	igmp-snooping	(Optional) Displays only the addresses lea	arned by IGMP snooping.
Syntax Description	count	(Optional) Displays the number of multic	ast entries.

-			
	Cisco IOS Release	This command was	
	15.0(2)EX	introduced.	

Usage Guidelines For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the "vlan" column, not the internal VLAN number.

Example

This example shows how to display multicast MAC address table information for a specific VLAN:

```
Switch# show mac-address-table multicast vlan 1
```

This example shows how to display the number of multicast MAC entries for all VLANs:

Switch# show mac-address-table multicast count

```
MAC Entries for all vlans:

Multicast MAC Address Count: 141

Total Multicast MAC Addresses Available: 16384

Switch#
```

show mac address-table notification

To display the MAC address notification settings for all interfaces or the specified interface, use the **show mac address-table notification** command in EXEC mode.

Syntax Description	change	The MAC change notification feature parameters and history table.			
	interface	(Optional) Displays information for all interfaces. Valid interfaces include physical ports and port channels.			
	interface-id	(Optional) The specified interface. Valid interfaces include physical ports and port channels.			
	mac-move	Displays status for MAC address move notifications.			
	threshold	Displays status for MAC address-table threshold monitoring.			
Command Default		ress notification, MAC move, and MAC threshold monitoring are disabled. ion threshold is 50 percent.			
	The default time between	MAC threshold notifications is 120 seconds.			
Command Modes	User EXEC				
	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX	This command was introduced.			
Usage Guidelines	Use the show mac address-table notification change command without keywords to see if the MAC address change notification feature is enabled or disabled, the number of seconds in the MAC notification interval,				
	the maximum number of entries allowed in the history table, and the history table contents.				
	Use the interface keyword to display the notifications for all interfaces. If the interface ID is included, only the flags for that interface appear.				
	Example				
	This example shows the	output from the show mac address-table notification change command:			
	Switch# show mac addr	ess-table notification change			

Number of Notifications sent to NMS : 3 Maximum Number of entries configured in History Table : 100 Current History Table Length : 3 MAC Notification Traps are Enabled History Table contents ------History Index 0, Entry Timestamp 1032254, Despatch Timestamp 1032254 MAC Changed Message : Operation: Added Vlan: 2 MAC Addr: 0000.0000.0001 Module: 0 Port: 1 History Index 1, Entry Timestamp 1038254, Despatch Timestamp 1038254 MAC Changed Message : Operation: Added Vlan: 2 MAC Addr: 0000.0000.0000 Module: 0 Port: 1 Operation: Added Vlan: 2 MAC Addr: 0000.0000.0002 Module: 0 Port: 1 Operation: Added Vlan: 2 MAC Addr: 0000.0000.0003 Module: 0 Port: 1 History Index 2, Entry Timestamp 1074254, Despatch Timestamp 1074254 MAC Changed Message : Operation: Deleted Vlan: 2 MAC Addr: 0000.0000.0001 Module: 0 Port: 1 Operation: Deleted Vlan: 2 MAC Addr: 0000.0000.0002 Module: 0 Port: 1 Operation: Deleted Vlan: 2 MAC Addr: 0000.0000.0003 Module: 0 Port: 1

show mac address-table secure

To display only secure MAC address table entries, use the **show mac address-table secure** command in EXEC mode.

	show mac address-tab	le secure [address mac-address]	[interface interface-id]	[vlan vlan-id]
Syntax Description	address mac-address	(Optional) Specifies a 48-bit MAC as privileged EXEC mode only).	ddress; the valid format is	H.H.H (available in
	interface interface-id	(Optional) Specifies an interface to n and port channels.	natch; valid interfaces inc	lude physical ports
	vlan vlan-id	(Optional) Displays entries for a spec	cific VLAN; the range is	1 to 4094.
Command Modes	User EXEC			
	Privileged EXEC			
Command History	Release	Modification	-	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	-	

Example

This example shows the output from the show mac address-table secure command:

Switch# show mac address-table secure

	Mac Address	Table		
Vlan	Mac Address	Type	Ports	
1	0030.b635.7862	DYNAMIC	Gi0/2	
1	00b0.6496.2741	DYNAMIC	Gi0/2	
Total	Mac Addresses fo	r this cri	terion:	2

show mac address-table static

To display only static MAC address table entries, use the show mac address-table static command in EXEC mode.

show mac address-table static [address mac-address] [interface interface-id] [vlan vlan-id]

Syntax Description	address mac-address	(Optional) Specifies a 48-bit MAC add privileged EXEC mode only).	dress; the valid format is H.H.H (available in
	interface interface-id	(Optional) Specifies an interface to ma port channels.	tch; valid interfaces include physical ports and
	vlan vlan-id	(Optional) Specifies the address for a s	specific VLAN. The range is from 1 to 4094.
Command Modes	User EXEC		
	Privileged EXEC		
Command History	Release	Modification	-
	Cisco IOS Release 15.0(2)EX	This command was introduced.	-

15.0(2)EX

Example

This example shows the output from the show mac address-table static command:

Switch# show mac address-table static

	Mac Address	Table	
Vlan	Mac Address	Type Ports	-
All	0100.0ccc.cccc	STATIC CPU	
All	0180.c200.0000	STATIC CPU	
All	0100.0ccc.cccd	STATIC CPU	
All	0180.c200.0001	STATIC CPU	
All	0180.c200.0004	STATIC CPU	
All	0180.c200.0005	STATIC CPU	
4	0001.0002.0004	STATIC Drop	
6	0001.0002.0007	STATIC Drop	
Total	Mac Addresses for	this criterion: 8	

show mac address-table vlan

To display the MAC address table information for a specified VLAN, use the **show mac address-table vlan** command in EXEC mode.

show mac address-table vlan vlan-id

Syntax Description	<i>vlan-id</i> The address for a	a specific VLAN. The range is 1 to 4094.
Command Modes	User EXEC	
	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release	This command was

Example

This example shows the output from the show mac address-table vlan 1 command:

```
Switch# show mac address-table vlan 1
```

	Mac Addres	s Table		
Vlan	Mac Address	Туре	Ports	
1	0100.0ccc.cccc	STATIC	CPU	
1	0180.c200.0000	STATIC	CPU	
1	0100.0ccc.cccd	STATIC	CPU	
1	0180.c200.0001	STATIC	CPU	
1	0180.c200.0002	STATIC	CPU	
1	0180.c200.0003	STATIC	CPU	
1	0180.c200.0005	STATIC	CPU	
1	0180.c200.0006	STATIC	CPU	
1	0180.c200.0007	STATIC	CPU	
Total	Mac Addresses fo	or this	criterion:	9

show nmsp

To display the Network Mobility Services Protocol (NMSP) configuration settings, use the **show nmsp** command.

show nmsp {attachment | {suppress interfaces} | capability | notification interval | statistics {connection | summary} | status | subscription detail [ip-addr] | summary}

Syntax Description	attachment suppress interfaces	Displays attachment suppress interfaces.
	capability	Displays NMSP capabilities.
	notification interval	Displays the NMSP notification interval.
	statistics connection	Displays all connection-specific counters.
	statistics summary	Displays the NMSP counters.
	status	Displays status of active NMSP connections.
	subscription detail <i>ip-addr</i>	The details are only for the NMSP services subscribed to by a specific IP address.
	subscription summary	Displays details for all of the NMSP services to which the controller is subscribed. The details are only for the NMSP services subscribed to by a specific IP address.
Command Default	No default behavior or values.	
Command Modes	Privileged EXEC	

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

The following is sample output from the show nmsp notification interval command:

```
Device# show nmsp notification interval

NMSP Notification Intervals

------

RSSI Interval:

Client : 2 sec

RFID : 2 sec

Rogue AP : 2 sec

Rogue Client : 2 sec

Attachment Interval : 30 sec

Location Interval : 30 sec
```

show onboard switch

To display OBFL information use the **show onboard switch** privileged EXEC command.

show onboard switch switch-number{clilog | environment | message | counter | temperature | uptime |
voltage | status}

Syntax Description	switch-number	Specifies the switch or stack member numbers.
	clilog	Displays the OBFL CLI commands that were entered on a standalone switch or the specified stack members.
	environment	Displays the UDI information for a standalone switch or the specified stack members. For all the connected FRU devices, it displays the PID, the VID, and the serial number.
	message	Displays the hardware-related messages generated by a standalone switch or the specified stack members.
	counter	Displays the counter information on a standalone switch or the specified stack members.
	temperature	Displays the temperature of a standalone switch or the specified switch stack members.
	uptime	Displays the time when a standalone switch or the specified stack members start, the reason the standalone switch or specified stack members restart, and the length of time that the standalone switch or specified stack members have been running since they last restarted.
	voltage	Displays the system voltages of a standalone switch or the specified stack members.
	status	Displays the status of a standalone switch or the specified stack members.
Command Modes	Priviledged EXE	EC

Command History	Release Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Example

The following example displays the OBFL CLI commands entered on a standalone switch or the specified stack member:

Switch# show onboard switch 1 clilog

The following example displays the UDI information for a standalone switch or the specified stack members. For all the connected FRU devices, it displays the PID, the VID, and the serial number.

Switch# show onboard switch 1 environment

The following example displays the hardware-related messages generated by a standalone switch or the specified stack members.

```
Switch# show onboard switch 1 message
```

The following example displays the counter information on a standalone switch or the specified stack members.

Switch# show onboard switch 1 counter

The following example displays the temperature of a standalone switch or the specified stack members.

Switch# show onboard switch 1 temperature

The following example displays the time when a standalone switch or the specified stack members start, the reason the standalone switch or the specified stack members restart, and the length of time that the standalone switch or the specified stack members have been running since they last restarted.

Switch# show onboard switch 1 uptime

The following example displays the system voltages of a standalone switch or the specified stack members.

Switch# show onboard switch 1 voltage

The following example displays the status of a standalone switch or the specified stack members.

Switch# show onboard switch 1 status

shutdown

	To shut down VLAN switchin configuration set, use the no for		d in global configuration mode. To disable the
	shutdown [vlan <i>vlan-id</i>] no shutdown		
Syntax Description	vlan vlan-id	VLAN ID of VLAN to	shutdown.
Command Default	No default behavior or values.		
Command Modes	Global configuration		
Command History	Release	Modification	_
	Cisco IOS Release 15.0(2)EX	This command was introduced.	_
	Evamplas		_

Examples

This example shows how to shutdown a VLAN:

Device(config) # vlan open1 Device(config-wlan) # shutdown

This example shows that the access point is not shut down:

```
Device# configure terminal
Device(config) # ap name 3602a no shutdown
```

test cable-diagnostics prbs

To run the pseudo-random binary sequence (PRBS) feature on an interface, use the **test cable-diagnostics prbs** command in privileged EXEC mode.

test cable-diagnostics prbs interface interface-id

Syntax Description	<i>interface-id</i> The interface on which to run PRBS.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	-
	Cisco IOS Release 15.0(2)EX	This command was introduced	_
Usage Guidelines	11 5	on 10-Gigabit Ethernet ports. It is not uggable (SFP) module ports.	supported on 10/100/100 copper Ethernet ports
	5	sing the test cable-diagnostics prbs interface interface-id privileged EX	interface <i>interface-id</i> command, use the show EC command to display the results.
Usage Guidelines	PRBS is supported only of and small form-factor plu After you run PRBS by u	on 10-Gigabit Ethernet ports. It is not uggable (SFP) module ports. sing the test cable-diagnostics prbs	supported on 10/100/100 copper Ethernet interface interface-id command, use the

Example

This example shows how to run PRBS on an interface:

Switch# test cable-diagnostics prbs interface gigabitethernet1/0/2 PRBS test started on interface Gi1/0/2 A PRBS test can take a few seconds to run on an interface Use 'show cable-diagnostics prbs' to read the TDR results

test cable-diagnostics tdr

To run the Time Domain Reflector (TDR) feature on an interface, use the **test cable-diagnostics tdr** command in privileged EXEC mode.

test cable-diagnostics tdr interface interface-id

Syntax Description	interface-id The interface	e on which to run TDR.	
Command Default	No default behavior or v	alues.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	-
	Cisco IOS Release 15.0(2)EX	This command was introduced.	-
Usage Guidelines	· · · ·	n 10/100/100 copper Ethernet ports. ggable (SFP) module ports.	It is not supported on 10-Gigabit Ethernet ports
	After you run TDR by using the test cable-diagnostics tdr interface <i>interface-id</i> command, use the show cable-diagnostics tdr interface <i>interface-id</i> privileged EXEC command to display the results.		
	This example shows how	v to run TDR on an interface:	
	TDR test started on : A TDR test can take a	iagnostics tdr interface gigab interface Gi1/0/2 a few seconds to run on an inte nostics tdr' to read the TDR re	erface
	•	le-diagnostics tdr interface <i>interfac</i> beed of 10 or 100 Mb/s, these messa	<i>ee-id</i> command on an interface that has ges appear:
	TDR test on Gi1/0/9 T TDR test started on A TDR test can take a	iagnostics tdr interface gigab: will affect link state and tra: interface Gi1/0/3 a few seconds to run on an inte nostics tdr' to read the TDR re	ffic erface

traceroute mac

To display the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address, use the **traceroute mac** command in privileged EXEC mode.

traceroute mac [interface interface-id] source-mac-address [interface interface-id] destination-mac-address [vlan vlan-id] [detail]

Syntax Description	interface interface-id	(Optional) Specifies an interface of	n the source or destination device.	
	source-mac-address	The MAC address of the source device in hexadecimal format.		
	destination-mac-address	The MAC address of the destination	n device in hexadecimal format.	
	vlan vlan-id		which to trace the Layer 2 path that the packets destination device. Valid VLAN IDs are 1 to	
	detail	(Optional) Specifies that detailed in	nformation appears.	
Command Default	No default behavior or v	alues.		
Command Modes	Privileged EXEC			
Command History	Release	Modification	-	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	_	
Usage Guidelines	For Layer 2 traceroute to devicees in the network.		Protocol (CDP) must be enabled on all of the	
	When the device detects a device in the Layer 2 path that does not support Layer 2 traceroute, the device continues to send Layer 2 trace queries and lets them time out.			
	The maximum number of hops identified in the path is ten.			
		rts only unicast traffic. If you specify dentified, and an error message app	a multicast source or destination MAC address, ears.	
	The traceroute mac command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN.			
	If you specify source and identified, and an error n		o different VLANs, the Layer 2 path is not	
		If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong.		
	If the VLAN is not speci	ified, the path is not identified, and a	an error message appears.	
		eature is not supported when multip DP neighbors are detected on a port	le devices are attached to one port through hubs t).	

When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5 (2.2.5.5 ) : Gi0/0/3 => Gi0/0/1
con1 (2.2.1.1 ) : Gi0/0/1 => Gi0/0/2
con2 (2.2.2.2 ) : Gi0/0/2 => Gi0/0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed
```

This example shows how to display the Layer 2 path by using the **detail** keyword:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201 detail
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)
con6 / WS-C3750E-24PD / 2.2.6.6 :
    Gi0/0/2 [auto, auto] => Gi0/0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
    Fa0/3 [auto, auto] => Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the interfaces on the source and destination devicees:

Device# traceroute mac interface fastethernet0/1 0000.0201.0601 interface fastethernet0/3 0000.0201.0201

Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6) con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3 con5 (2.2.5.5 Gi0/0/3 => Gi0/0/1) : con1 (2.2.1.1)) : Gi0/0/1 => Gi0/0/2 (2.2.1.1)) : (2.2.2.2)) : Gi0/0/2 => Gi0/0/1 con2 Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2) Layer 2 trace completed

This example shows the Layer 2 path when the device is not connected to the source device:

```
Device# traceroute mac 0000.0201.0501 0000.0201.0201 detail
Source not directly connected, tracing source .....
Source 0000.0201.0501 found on con5[WS-C3750E-24TD] (2.2.5.5)
con5 / WS-C3750E-24TD / 2.2.5.5 :
        Gi0/0/1 [auto, auto] => Gi0/0/3 [auto, auto]
```

```
con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows the Layer 2 path when the device cannot find the destination port for the source MAC address:

```
Device# traceroute mac 0000.0011.1111 0000.0201.0201
Error:Source Mac address not found.
Layer2 trace aborted.
```

This example shows the Layer 2 path when the source and destination devices are in different VLANs:

```
Device# traceroute mac 0000.0201.0601 0000.0301.0201
Error:Source and destination macs are on different vlans.
Layer2 trace aborted.
```

This example shows the Layer 2 path when the destination MAC address is a multicast address:

```
Device# traceroute mac 0000.0201.0601 0100.0201.0201
Invalid destination mac address
```

This example shows the Layer 2 path when source and destination devicees belong to multiple VLANs:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201
Error:Mac found on multiple vlans.
Layer2 trace aborted.
```

traceroute mac ip

To display the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname, use the **traceroute mac ip** command in privileged EXEC mode.

traceroute mac ip {*source-ip-address source-hostname*} {*destination-ip-address destination-hostname*} [**detail**]

Syntax Description	source-ip-address	The IP address of the source device as a 32-bit quantity in dotted-decimal formation	
	source-hostname	The IP hostname of the source device.	
	destination-ip-address	The IP address of the destination device as a 32-bit quantity in dotted-decimal form	
	destination-hostname	The IP hostname of the destination device.	
	detail	(Optional) Specifies that detailed information appears.	
Command Default	No default behavior of	values.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Usage Guidelines	For Layer 2 traceroute in the network. Do not	to function properly, Cisco Discovery Protocol (CDP) must be enabled on each de disable CDP.	
		ts a device in the Layer 2 path that does not support Layer 2 traceroute, the devicer 2 trace queries and lets them time out.	
	The maximum numbe	of hops identified in the path is ten.	
	The traceroute mac ip command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet.		
	When you specify the IP addresses, the device uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.		
	 If an ARP entry exists for the specified IP address, the device uses the associated MAC address and identifies the physical path. If an ARP entry does not exist, the device sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and an error message appears. 		
	IP addresses mus		
	IP addresses mus an error message The Layer 2 traceroute		

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the **detail** keyword:

```
Device# traceroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac ....
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / WS-C3750E-24TD / 2.2.6.6 :
        Gi0/0/1 [auto, auto] => Gi0/0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
        Fa0/3 [auto, auto] => Gi0/0/3 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
        Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
        Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

```
Device# traceroute mac ip con6 con2
Translating IP to mac ....
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201
Source 0000.0201.0601 found on con6
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5 (2.2.5.5 ) : Gi0/0/3 => Gi0/1
con1 (2.2.1.1 ) : Gi0/0/1 => Gi0/2
con2 (2.2.2.2 ) : Gi0/0/2 => Fa0/1
Destination 0000.0201.0201 found on con2
Layer 2 trace completed
```

This example shows the Layer 2 path when ARP cannot associate the source IP address with the corresponding MAC address:

```
Device# traceroute mac ip 2.2.66.66 2.2.77.77
Arp failed for destination 2.2.77.77.
Layer2 trace aborted.
```

type

I

	To display the contents of one or more files, use the type command in boot loader mode. type <i>filesystem:/file-url</i>			
Syntax Description	<i>filesystem:</i> Alias for a file system. Use flash: for the system board flash device; use usbflash0: for USB memory sticks.			
	/file-url Path (directory) and name of the files to display. Separate each filename with a space.			
Command Default	No default behavior or values.			
Command Modes	Boot loader			
Command History	Release Modification			
	Cisco IOS Release 15.0(2)EX This command was introduced.			
Usage Guidelines	Filenames and directory names are case sensitive.			
	If you specify a list of files, the contents of each file appear sequentially.			
Examples	This example shows how to display the contents of a file:			
	Device: type flash : <i>image_file_name</i> version_suffix: universal-122-xx.SEx version_directory: <i>image_file_name</i> <i>image_system_type_id</i> : 0x0000002 <i>image_name: image_file_name.bin</i> <i>ios_image_file_size</i> : 8919552 total_image_file_size: 11592192 <i>image_feature</i> : IP LAYER_3 PLUS MIN_DRAM_MEG=128 <i>image_family: family</i> stacking_number: 1.34 board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b <i>info_end</i> :			

I

unset

To reset one or more environment variables, use the **unset** command in boot loader mode.

unset variable...

Cuntor Description	- · · · · · · · · · · · · · · · · · · ·									
Syntax Description	variable	Use one of these keywords for <i>variable</i> :								
		MANUAL_BOOT—Specifies whether the device automatically or manually boots.								
		BOOT —Resets the list of executable files to try to load and execute when automatically booting. If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash: file system.								
	ENABLE_BREAK—Specifies whether the automatic boot process can be interrupted by using the Break key on the console after the flash: file system has been initialized. HELPER—Identifies the semicolon-separated list of loadable files to dynamically load during the boot loader initialization. Helper files extend or patch the functionality of the boot loader. PS1—Specifies the string that is used as the command-line prompt in boot loader mode. CONFIG_FILE—Resets the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.									
						BAUD —Resets the rate in bits per second (b/s) used for the console. The Cisco IOS software inherits the baud rate setting from the boot loader and continues to use this value unless the configuration file specifies another setting.				
					Command Default	No default behav	default behavior or values.			
					Command Modes	Boot loader				
	Command History	Release	Modification							
Cisco IOS Rele 15.0(2)EX		ase This command was introduced.								
Usage Guidelines	Under typical circumstances, it is not necessary to alter the setting of the environment variables.									
	The MANUAL_BOOT environment variable can also be reset by using the no boot manual global configuration command.									
	The BOOT environment variable can also be reset by using the no boot system global configuration command.									
	The ENABLE_I configuration co	BREAK environment variable can also be reset by using the no boot enable-break global mmand.								

The HELPER environment variable can also be reset by using the **no boot helper** global configuration command.

The CONFIG_FILE environment variable can also be reset by using the **no boot config-file** global configuration command.

Example

This example shows how to unset the SWITCH_PRIORITY environment variable:

Device: unset SWITCH_PRIORITY

version

To display the boot loader version, use the version command in boot loader mode.

	version		
Syntax Description	This command has no argume	ents or keywords.	
Command Default	No default behavior or values	l.	
Command Modes	Boot loader		
Command History	Release	Modification	
	Cisco IOS Release 15.0(2)EX	This command was introduced.	
Examples	This example shows how to d	lisplay the boot loader version on	a device:
	Device: version	W UDOOM M) Moreign 15 0/2m)

client vlan

	To configure a WLAN interface or an interface group, use the client vlan command. To disable the WLAN interface, use the no form of this command.			
	client vlan interface-id-name-or-group-name no client vlan			
Syntax Description	<i>interface-id-name-or-group-name</i> Interface ID, name, or VLAN group name. The interface ID can also be in digits too.			
Command Default	The default interface is configured.			
Command Modes	WLAN configuration			
Command History	Release Modification			
	Cisco IOS Release 15.0(2)EX This command was introduced.			
Usage Guidelines	You must disable the WLAN before using this command. See Related Commands section for more information on how to disable a WLAN.			
	This example shows how to enable a client VLAN on a WLAN:			
	Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wlan wlan1 Device(config-wlan)# client vlan client-vlan1 Device(config-wlan)# end			
	This example shows how to disable a client VLAN on a WLAN:			
	Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wlan wlan1 Device(config-wlan)# no client vlan Device(config-wlan)# end			

clear vmps statistics

To clear the VLAN Membership Policy Server (VMPS) statistics maintained by the VLAN Query Protocol (VQP) client, use the **clear vmps statistics** command in privileged EXEC mode.

	clear vmps statistics	
Syntax Description	This command has no ar	guments or keywords.
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

This example shows how to clear VLAN Membership Policy Server (VMPS) statistics:

Device# clear vmps statistics

You can verify that information was deleted by entering the **show vmps statistics** privileged EXEC command.

Related Topics

show vmps, on page 725

I

clear vtp counters

To clear the VLAN Trunking Protocol (VTP) and pruning counters, use the **clear vtp counters** command in privileged EXEC mode.

clear vtp counters

Syntax Description	This command has no arguments or keywords.	
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.
	This example shows how to clear the VTP counters: Device# clear vtp counters	

You can verify that information was deleted by entering the **show vtp counters** privileged EXEC command.

debug platform vlan

To enable debugging of the VLAN manager software, use the **debug platform vlan** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug platform vlan {error | mvid | rpc} no debug platform vlan {error | mvid | rpc}

Syntax Description	error Displays V		
	mvid Displays m	apped VLAN ID allocations and free	debug messages.
	rpc Displays re	emote procedure call (RPC) debug me	essages.
Command Default	Debugging is disa	bled.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS Releas	e 15.0(2)EX This command was intro	oduced.
Usage Guidelines	The undebug pla	tform vlan command is the same as t	the no debug platform vlan command.
	debugging on a sta EXEC command, also can use the re	ack member, start a session from the st and then enter the debug command at	abled only on the stack's active switch. To enable stack's active switch using the session <i>switch-number</i> at the command-line prompt of the stack member. You <i>ber LINE</i> EXEC command on the stack's active switch starting a session.
	TT1 ' 1 1		

This example shows how to display VLAN error debug messages:

Device# debug platform vlan error

debug sw-vlan

To enable debugging of VLAN manager activities, use the **debug sw-vlan** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug sw-vlan {badpmcookies | cfg-vlan {bootup | cli} | events | ifs | mapping | notification | packets | redundancy | registries | vtp} no debug sw-vlan {badpmcookies | cfg-vlan {bootup | cli} | events | ifs | mapping | notification | packets

Syntax Description	hadnmcookies	Displays debug messages for VLAN manager incidents of bad port manager cookies.			
-,					
	cfg-vlan	Displays VLAN configuration debug messages.			
	bootup	Displays messages when the switch is booting up.			
	cli	Displays messages when the command-line interface (CLI) is in VLAN configuration mode.			
	events	Displays debug messages for VLAN manager events.			
	ifs	Displays debug messages for the VLAN manager IOS file system (IFS). See debug sw-vlan ifs, on page 714 for more information.			
	mapping	Displays debug messages for VLAN mapping.			
	notification	Displays debug messages for VLAN manager notifications. See debug sw-vlan notification, on page 715 for more information.			
	packets	Displays debug messages for packet handling and encapsulation processes.			
	redundancy	Displays debug messages for VTP VLAN redundancy.			
	registries	Displays debug messages for VLAN manager registries.			
	vtp	Displays debug messages for the VLAN Trunking Protocol (VTP) code. See debug sw-vlan vtp, on page 717 for more information.			
Command Default	Debugging is d	isabled.			
Command Modes	Privileged EXE	C			
Command History	Release	Modification			
	Cisco IOS Rele	ease 15.0(2)EX This command was introduced.			
Usage Guidelines	The undebug s	w-vlan command is the same as the no debug sw-vlan command.			
	specific stack n	ble debugging on a switch stack, it is enabled only on the stack's active switch. To debug a nember, you can start a CLI session from the stack's active switch by using the session privileged EXEC command. You also can use the remote command <i>stack-member-number</i>			

LINE EXEC command on the stack's active switch to enable debugging on a member switch without first starting a session.

This example shows how to display debug messages for VLAN manager events:

Device# debug sw-vlan events

interface vlan

To create or access a dynamic switch virtual interface (SVI) and to enter interface configuration mode, use the **interface vlan** command in global configuration mode. To delete an SVI, use the **no** form of this command.

interface vlan vlan-id no interface vlan vlan-id

Syntax Description	<i>vlan-id</i> VLAN number. The range is 1 to 4094.				
Command Default	The default VLAN interface is VLAN 1.				
command Modes	Global configuration				
command History	Release Modification				
	Cisco IOS Release 15.0(2)EX This command was introduced.				
sage Guidelines	SVIs are created the first time you enter the interface vlan <i>vlan-id</i> command for a particular VLAN. The <i>vlan-id</i> corresponds to the VLAN-tag associated with data frames on an IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port.				
	Note When you create an SVI, it does not become active until it is associated with a physical port.				
	Note When you create an SVI, it does not become active until it is associated with a physical port.

I

show vlan

To display the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) on the switch, use the **show vlan** command in user EXEC mode.

show vlan [{brief group id vlan-id mtu name vlan-name remote-spa	oan summary }
--	-----------------

Syntax Description	brief	(Optional) Displays one line for each VLAN with the VLAN name, status, and its ports.			
	group	(Optional) Displays information about VLAN groups.			
	id vlan-id	(Optional) Displays information about a single VLAN identified by the VLAN ID number. For <i>vlan-id</i> , the range is 1 to 4094.			
	mtu	(Optional) Displays a list of VLANs and the minimum and maximum transmission unit (MTU) sizes configured on ports in the VLAN.			
	name vlan-name	(Optional) Displays information about a single VLAN identified by the VLAN name. The VLAN name is an ASCII string from 1 to 32 characters.			
	remote-span	(Optional) Displays information about Remote SPAN (RSPAN) VLANs.			
	summary (Optional) Displays VLAN summary information.				
-	Note The ifindex keyword is not supported, even though it is visible in the command-line help string.				
Command Default	None				
Command Modes	User EXEC				
Command History	Release	Modification			
	Cisco IOS Release 15.0(2)EX This command was introduced.				
Usage Guidelines	have the same MTU. Table 43: show vlan Command Output Fields

Field	Description
VLAN	VLAN number.
Name	Name, if configured, of the VLAN.
Status	Status of the VLAN (active or suspend).
Ports	Ports that belong to the VLAN.
Туре	Media type of the VLAN.

Field	Description
SAID	Security association ID value for the VLAN.
MTU	Maximum transmission unit size for the VLAN.
Parent	Parent VLAN, if one exists.
RingNo	Ring number for the VLAN, if applicable.
BrdgNo	Bridge number for the VLAN, if applicable.
Stp	Spanning Tree Protocol type used on the VLAN.
BrdgMode	Bridging mode for this VLAN—possible values are source-route bridging (SRB) and source-route transparent (SRT); the default is SRB.
Trans1	Translation bridge 1.
Trans2	Translation bridge 2.
Remote SPAN VLANs	Identifies any RSPAN VLANs that have been configured.

This is an example of output from the show vlan summary command:

```
Device> show vlan summary
```

```

Examples

This is an example of output from the **show vmps** command:

This is an example of output from the **show vmps statistics** command. The table that follows describes each field in the display.

```
Device> show vmps statistics
VMPS Client Statistics
_____
                         0
VOP Oueries:
VQP Responses:
                         0
VMPS Changes:
                         0
VQP Shutdowns:
                         0
VQP Denied:
                         0
VQP Wrong Domain:
                         0
VQP Wrong Version:
                         0
VQP Insufficient Resource: 0
```

Field	Description		
VQP Queries	Number of queries sent by the client to the VMPS.		
VQP Responses	Number of responses sent to the client from the VMPS.		
VMPS Changes	Number of times that the VMPS changed from one server to another.		
VQP Shutdowns	Number of times the VMPS sent a response to shut down the port. The client disables the port and removes all dynamic addresses on this port from the address table. You must administratively reenable the port to restore connectivity.		
VQP Denied	Number of times the VMPS denied the client request for security reasons. When the VMPS response denies an address, no frame is forwarded to or from the workstation with that address (broadcast or multicast frames are delivered to the workstation if the port has been assigned to a VLAN). The client keeps the denied address in the address table as a blocked address to prevent more queries from being sent to the VMPS for each new packet received from this workstation. The client ages the address if no new packets are received from this workstation on this port within the aging time period.		
VQP Wrong Domain	Number of times the management domain in the request does not match the one for the VMPS. Any previous VLAN assignments of the port are not changed. This response means that the server and the client have not been configured with the same VTP management domain.		
VQP Wrong Version	Number of times the version field in the query packet contains a value that is higher than the version supported by the VMPS. The VLAN assignment of the port is not changed. The switches send only VMPS Version 1 requests.		
VQP Insufficient Resource	Number of times the VMPS is unable to answer the request because of a resource availability problem. If the retry limit has not yet been reached, the client repeats the request with the same server or with the next alternate server, depending on whether the per-server retry count has been reached.

Gi1/0/48	0	0	0
Gi2/0/1	0	0	0
Gi3/0/2	0	0	0

Table 45: show vtp counters Field Descriptions

Field	Description
Summary advertisements received	Number of summary advertisements received by this device on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow.
Subset advertisements received	Number of subset advertisements received by this device on its trunk ports. Subset advertisements contain all the information for one or more VLANs.
Request advertisements received	Number of advertisement requests received by this device on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.

Field	Description
Summary advertisements transmitted	Number of summary advertisements sent by this device on its trunk ports. Summary advertisements contain the management domain name, the configuration revision number, the update timestamp and identity, the authentication checksum, and the number of subset advertisements to follow.
Subset advertisements transmitted	Number of subset advertisements sent by this device on its trunk ports. Subset advertisements contain all the information for one or more VLANs.
Request advertisements transmitted	Number of advertisement requests sent by this device on its trunk ports. Advertisement requests normally request information on all VLANs. They can also request information on a subset of VLANs.
Number of configuration revision errors	Number of revision errors.
	Whenever you define a new VLAN, delete an existing one, suspend or resume an existing VLAN, or modify the parameters on an existing VLAN, the configuration revision number of the device increments.
	Revision errors increment whenever the device receives an advertisement whose revision number matches the revision number of the device, but the MD5 digest values do not match. This error means that the VTP password in the two devices is different or that the devices have different configurations.
	These errors indicate that the device is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.
Number of configuration digest errors	Number of MD5 digest errors.
	Digest errors increment whenever the MD5 digest in the summary packet and the MD5 digest of the received advertisement calculated by the device do not match. This error usually means that the VTP password in the two devices is different. To solve this problem, make sure the VTP password on all devices is the same.
	These errors indicate that the device is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.

Field	Description
Number of V1 summary errors	Number of Version 1 errors.
	Version 1 summary errors increment whenever a device in VTP V2 mode receives a VTP Version 1 frame. These errors indicate that at least one neighboring device is either running VTP Version 1 or VTP Version 2 with V2-mode disabled. To solve this problem, change the configuration of the devices in VTP V2-mode to disabled.
Join Transmitted	Number of VTP pruning messages sent on the trunk.
Join Received	Number of VTP pruning messages received on the trunk.
Summary Advts Received from non-pruning-capable device	Number of VTP summary messages received on the trunk from devices that do not support pruning.

This is an example of output from the **show vtp status** command. The table that follows describes each field in the display.

Table 46: show vtp status Field Descriptions

MD5 digest

Field	Description
VTP Version capable	Displays the VTP versions that are capable of operating on the device.
VTP Version running	Displays the VTP version operating on the device. By default, the device implements Version 1 but can be set to Version 2.
VTP Domain Name	Name that identifies the administrative domain for the device.

: 0xA0 0xA1 0xFE 0x4E 0x7E 0x5D 0x97 0x41

0x89 0xB9 0x9B 0x70 0x03 0x61 0xE9 0x27

Field	Description			
VTP Pruning Mode	Displays whether pruning is enabled or disabled. Enabling pruning on a VTP server enables pruning for the entire management domain. Pruning restricts flooded traffic to those trunk links that the traffic must use to access the appropriate network devices.			
VTP Traps Generation	Displays whether VTP traps are sent to a network management station.			
Device ID	Displays the MAC address of the local device.			
Configuration last modified	Displays the date and time of the last configuration modification. Displays the IP address of the device that caused the configuration change to the database.			
VTP Operating Mode	Displays the VTP operating mode, which can be server, client, or transparent.			
	Server —A device in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on it. The device guarantees that it can recover all the VLAN information in the current VTP database from NVRAM after reboot. By default, every device is a VTP server.			
	Note The device automatically changes from VTP server mode to VTP client mode if it detects a failure while writing the configuration to NVRAM and cannot return to server mode until the NVRAM is functioning.			
	Client —A device in VTP client mode is enabled for VTP, can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on it. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.			
	Transparent —A device in VTP transparent mode is disabled for VTP, does not send or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The device receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.			
Maximum VLANs Supported Locally	Maximum number of VLANs supported locally.			
Number of Existing VLANs	Number of existing VLANs.			

Field	Description
Configuration Revision	Current configuration revision number on this device.
MD5 Digest	A 16-byte checksum of the VTP configuration.

This is an example of output from the **show vtp status** command for a device running VTP version 3:

```
Device# show vtp status
VTP Version capable
                                   : 1 to 3

switchport priority extend

To set a port priority for the incoming untagged frames or the priority of frames received by the IP phone connected to the specified port, use the **switchport priority extend** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

switchport priority extend {cos value | trust}
no switchport priority extend

Syntax Description	cos value					
	trust Sets the IP phone port to trust the IEEE 802.1p priority received from the PC or the attached device.					
Command Default	The default port priority is set to a CoS value of 0 for untagged frames received on the port.					
Command Modes	Interface configuration					
Command History	Release		Modification			
	Cisco IC 15.0(2)E	OS Release EX	This command w	vas introduced.		
Usage Guidelines	When voice VLAN is enabled, you can configure the device to send the Cisco Discovery Protocol (CDP) packets to instruct the IP phone how to send data packets from the device attached to the access port on the Cisco IP Phone. You must enable CDP on the device port connected to the Cisco IP Phone to send the configuration to the Cisco IP Phone. (CDP is enabled by default globally and on all device interfaces.)					
	You should configure voice VLAN on device access ports.					
	Before you enable voice VLAN, we recommend that you enable quality of service (QoS) on the device by entering the mls qos global configuration command and configure the port trust state to trust by entering the mls qos trust cos interface configuration command.					
	This example shows how to configure the IP phone connected to the specified port to trust the received IEEE 802.1p priority:					
	Device(config)# interface gigabitethernet1/0/2 Device(config-if)# switchport priority extend trust					
	You can y EXEC co		ngs by entering the sh	ow interfaces	interface-id switchport privileged	

switchport trunk

To set the trunk characteristics when the interface is in trunking mode, use the **switchport trunk** command in interface configuration mode. To reset a trunking characteristic to the default, use the **no** form of this command.

switchport trunk {allowed vlan vlan-list | native vlan vlan-id | pruning vlan vlan-list} no switchport trunk {allowed vlan | native vlan | pruning vlan}

native vlan vlan-id	Sets the list of allowed VLANs that can receive and send traffic on this interface in tagged format when in trunking mode. See the Usage Guidelines for the <i>vlan-list</i> choices. Sets the native VLAN for sending and receiving untagged traffic when the interface is in IEEE 802.1Q trunking mode. The range is 1 to 4094. Sets the list of VLANs that are eligible for VTP pruning when in trunking mode.			
	is in IEEE 802.1Q trunking mode. The range is 1 to 4094. Sets the list of VLANs that are eligible for VTP pruning when in trunking mode.			
pruning vlan vlan-list				
	See the Usage Guidelines for the <i>vlan-list</i> choices.			
LAN 1 is the default nat	ive VLAN ID on the port.			
The default for all VLAN	lists is to include all VLANs.			
nterface configuration				
Release	Modification			
Cisco IOS Release 15.0(2)EX	This command was introduced.			
The <i>vlan-list</i> format is all none [add remove except] <i>vlan-atom</i> [, <i>vlan-atom</i>]:				
• all specifies all VLANs from 1 to 4094. This is the default. This keyword is not allowed on commands that do not permit all VLANs in the list to be set at the same time.				
	pty list. This keyword is not allowed on commands that require certain VLANs to VLAN to be set.			
	list of VLANs to those currently set instead of replacing the list. Valid IDs are from range VLANs (VLAN IDs greater than 1005) are valid in some cases.			
	nded-range VLANs to the allowed VLAN list, but not to the VLAN list.			
	hterface configuration Release Cisco IOS Release 15.0(2)EX The vlan-list format is all • all specifies all VLA that do not permit all • none specifies an embe set or at least one • add adds the defined 1 to 1005; extended-1			

• **remove** removes the defined list of VLANs from those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLAN IDs are valid in some cases.

- except lists the VLANs that should be calculated by inverting the defined list of VLANs. (VLANs are added except the ones specified.) Valid IDs are from 1 to 1005. Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.
- *vlan-atom* is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.

Native VLANs:

- All untagged traffic received on an IEEE 802.1Q trunk port is forwarded with the native VLAN configured for the port.
- If a packet has a VLAN ID that is the same as the sending-port native VLAN ID, the packet is sent without a tag; otherwise, the switch sends the packet with a tag.
- The **no** form of the **native vlan** command resets the native mode VLAN to the appropriate default VLAN for the device.

Allowed VLAN:

- To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), Dynamic Trunking Protocol (DTP), and VLAN Trunking Protocol (VTP) in VLAN 1.
- The **no** form of the **allowed vlan** command resets the list to the default list, which allows all VLANs.

Trunk pruning:

- The pruning-eligible list applies only to trunk ports.
- Each trunk port has its own eligibility list.
- If you do not want a VLAN to be pruned, remove it from the pruning-eligible list. VLANs that are pruning-ineligible receive flooded traffic.
- VLAN 1, VLANs 1002 to 1005, and extended-range VLANs (VLANs 1006 to 4094) cannot be pruned.

This example shows how to configure VLAN 3 as the default for the port to send all untagged traffic:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk native vlan 3
```

This example shows how to add VLANs 1, 2, 5, and 6 to the allowed list:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk allowed vlan add 1,2,5,6
```

This example shows how to remove VLANs 3 and 10 to 15 from the pruning-eligible list:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport trunk pruning vlan remove 3,10-15
```

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command.

switchport voice vlan

To configure voice VLAN on the port, use the **switchport voice vlan** command in interface configuration mode. To return to the default setting, use the **no** form of this command.

switchport voice vlan {vlan-id | dot1p | none | untagged | name vlan_name}
no switchport voice vlan

Syntax Description	vlan-id	The VLAN to be used for voice traffic. The range is 1 to 4094. By default, the IP phone forwards the voice traffic with an IEEE 802.1Q priority of 5.				
	dot1p	native VLAN). By default, the Cisco IP phone forwards the voice traffic with an IEEE 802.1p priority of 5.				
	none					
	untagged	Configures the telephone to send untagged voice traffic. This is the default for the telephone.				
	name vlan_name	(Optional) Specifies the VLAN name to be used for voice traffic. You can enter up to 128 characters.				
Command Default	The default is not to automatically configure the telephone (none).					
	The telephone default is not to tag frames.					
Command Modes	Interface configura	ation				
Command History	Release	Modification				
	Cisco IOS Release	e 15.0(2)EX This command was introduced.				
		Option to specify a VLAN name for voice VLAN. The 'name' keyword was added.				
Usage Guidelines	You should configure voice VLAN on Layer 2 access ports.					
Ū						
		Sisco Discovery Protocol (CDP) on the switch port connected to the Cisco IP phone for the				
	device to send conf Before you enable entering the mls q	Sisco Discovery Protocol (CDP) on the switch port connected to the Cisco IP phone for the figuration information to the phone. CDP is enabled by default globally and on the interface. voice VLAN, we recommend that you enable quality of service (QoS) on the switch by				
	device to send conf Before you enable entering the mls q mls qos trust cos i When you enter a	Sisco Discovery Protocol (CDP) on the switch port connected to the Cisco IP phone for the figuration information to the phone. CDP is enabled by default globally and on the interface. voice VLAN, we recommend that you enable quality of service (QoS) on the switch by os global configuration command and configure the port trust state to trust by entering the				
	device to send conf Before you enable entering the mls qo mls qos trust cos i When you enter a v specified VLAN II	Sisco Discovery Protocol (CDP) on the switch port connected to the Cisco IP phone for the figuration information to the phone. CDP is enabled by default globally and on the interface. voice VLAN, we recommend that you enable quality of service (QoS) on the switch by os global configuration command and configure the port trust state to trust by entering the interface configuration command.				

When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to 2. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but not on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.

If any type of port security is enabled on the access VLAN, dynamic port security is automatically enabled on the voice VLAN.

You cannot configure static secure MAC addresses in the voice VLAN.

The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.

This example show how to first populate the VLAN database by associating a VLAN ID with a VLAN name, and then configure the VLAN (using the name) on an interface, in the access mode: You can also verify your configuration by entering the **show interfaces** *interface-id* **switchport** in privileged EXEC command and examining information in the Voice VLAN: row.

Part 1 - Making the entry in the VLAN database:

```
Device# configure terminal
Device(config)# vlan 55
Device(config-vlan)# name test
Device(config-vlan)# end
Device#
```

Part 2 - Checking the VLAN database:

Device# show vlan id 55

Part 3- Assigning VLAN to the interface by using the name of the VLAN:

```
Device# configure terminal
Device(config)# interface gigabitethernet3/1/1
Device(config-if)# switchport mode access
Device(config-if)# switchport voice vlan name test
Device(config-if)# end
Device#
```

Part 4 - Verifying configuration:

```
Device# show running-config
interface gigabitethernet3/1/1
Building configuration...
Current configuration : 113 bytes
!
interface GigabitEthernet3/1/1
switchport voice vlan 55
```

```
switchport mode access
Switch#
Part 5 - Also can be verified in interface switchport:
Device# show interface GigabitEthernet3/1/1 switchport
Name: Gi3/1/1
Switchport: Enabled
Administrative Mode: static access
Operational Mode: static access
Administrative Trunking Encapsulation: dotlq
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: 55 (test)
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dotlq
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Appliance trust: none
Device#
```

vlan

		d to enter the VLAN configuration mode, VLAN, use the no form of this command	use the vlan command in global configuration l.
	vlan vlan-id no vlan vlan-id		
Syntax Description			nge is 1 to 4094. You can enter a single VLAN a range of VLAN IDs separated by hyphens.
Command Default	None		
Command Modes	Global configuration	n	
Command History	Release	Modification	-
	Cisco IOS Release	15.0(2)EX This command was introduced	
Usage Guidelines	-	are supported when the is running the L. 64 VLANs are supported when the is run	AN Base image with the LAN Base default ning the LAN Lite image.
	1005) or extended-r VLANs is always sa vlan privileged EXI VTP and are not add VLANs, you must u mode. When VTP n	range VLANs (VLAN IDs 1006 to 4094). aved in the VLAN database, and you can EC command. With VTP version 1 and 2, led to the VLAN database. With VTP version se the vtp transparent global configuration	to add normal-range VLANs (VLAN IDs 1 to Configuration information for normal-range display this information by entering the show extended-range VLANs are not recognized by on 1 and version 2, before adding extended-range n command to put the device in VTP transparent n name and all VLAN configurations are saved vice startup configuration file.
		oorts propagation of extended-range VLA ersions 1 and 2 propagate only VLANs 1	Ns and you can create them in VTP server or to 1005.
	When you save the configuration is sele	•	tup configuration file and reboot the device, the
	name from the ignored (cleare	VLAN database matches that in the start	n and the VLAN database and the VTP domain up configuration file, the VLAN database is is in the startup configuration file are used. The the VLAN database.
		de or domain name in the startup configur and VTP mode and configuration for VLA	ation do not match the VLAN database, the AN IDs 1 to 1005 use the VLAN database
		and version 2, if you try to create an extende, the VLAN is rejected, and you receiv	ended-range VLAN when the device is not in e an error message.
	If you enter an inval	lid VLAN ID, you receive an error messag	ge and do not enter VLAN configuration mode.

Entering the **vlan** command with a VLAN ID enables VLAN configuration mode. When you enter the VLAN ID of an existing VLAN, you do not create a new VLAN, but you can modify VLAN parameters for that VLAN. The specified VLANs are added or modified when you exit the VLAN configuration mode. Only the **shutdown** command (for VLANs 1 to 1005) takes effect immediately.

Note Although all commands are visible, the only VLAN configuration commands that are supported on extended-range VLANs are **mtu** *mtu-size* and **remote-span**. For extended-range VLANs, all other characteristics must remain at the default state.

These configuration commands are available in VLAN configuration mode. The **no** form of each command returns the characteristic to its default state:

- **are** *are-number*—Defines the maximum number of all-routes explorer (ARE) hops for this VLAN. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7. If no value is entered, 0 is assumed to be the maximum.
- backupcrf—Specifies the backup CRF mode. This keyword applies only to TrCRF VLANs.
 - enable—Backup CRF mode for this VLAN.
 - disable—Backup CRF mode for this VLAN (the default).
- **bridge** {*bridge-number* | **type**}—Specifies the logical distributed source-routing bridge, the bridge that interconnects all logical rings that have this VLAN as a parent VLAN in FDDI-NET, Token Ring-NET, and TrBRF VLANs. The range is 0 to 15. The default bridge number is 0 (no source-routing bridge) for FDDI-NET, TrBRF, and Token Ring-NET VLANs. The **type** keyword applies only to TrCRF VLANs and is one of these:
 - srb—Ssource-route bridging
 - srt—Source-route transparent) bridging VLAN
- exit—Applies changes, increments the VLAN database revision number (VLANs 1 to 1005 only), and exits VLAN configuration mode.
- media—Defines the VLAN media type and is one of these:

Note The device supports only Ethernet ports. You configure only FDDI and Token Ring media-specific characteristics for VLAN Trunking Protocol (VTP) global advertisements to other devices. These VLANs are locally suspended.

- ethernet—Ethernet media type (the default).
- fd-net—FDDI network entity title (NET) media type.
- fddi—FDDI media type.
- tokenring—Token Ring media type if the VTP v2 mode is disabled, or TrCRF if the VTP Version 2 (v) mode is enabled.
- tr-net—Token Ring network entity title (NET) media type if the VTP v2 mode is disabled or TrBRF media type if the VTP v2 mode is enabled.

See the table that follows for valid commands and syntax for different media types.

- **mtu** *mtu-size*—Specifies the maximum transmission unit (MTU) (packet size in bytes). The range is 576 to 18190. The default is 1500 bytes.
- **name** *vlan-name*—Names the VLAN with an ASCII string from 1 to 32 characters that must be unique within the administrative domain. The default is VLANxxxx where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number.
- no—Negates a command or returns it to the default setting.
- **parent** *parent-vlan-id*—Specifies the parent VLAN of an existing FDDI, Token Ring, or TrCRF VLAN. This parameter identifies the TrBRF to which a TrCRF belongs and is required when defining a TrCRF. The range is 0 to 1005. The default parent VLAN ID is 0 (no parent VLAN) for FDDI and Token Ring VLANs. For both Token Ring and TrCRF VLANs, the parent VLAN ID must already exist in the database and be associated with a Token Ring-NET or TrBRF VLAN.
- remote-span—Configures the VLAN as a Remote SPAN (RSPAN) VLAN. When the RSPAN feature
 is added to an existing VLAN, the VLAN is first deleted and is then recreated with the RSPAN feature.
 Any access ports are deactivated until the RSPAN feature is removed. If VTP is enabled, the new RSPAN
 VLAN is propagated by VTP for VLAN IDs that are lower than 1024. Learning is disabled on the VLAN.

Note The RSPAN feature is supported only on switches running the LAN Base image.

- **ring** *ring-number*—Defines the logical ring for an FDDI, Token Ring, or TrCRF VLAN. The range is 1 to 4095. The default for Token Ring VLANs is 0. For FDDI VLANs, there is no default.
- said *said-value*—Specifies the security association identifier (SAID) as documented in IEEE 802.10. The range is 1 to 4294967294, and the number must be unique within the administrative domain. The default value is 100000 plus the VLAN ID number.
- shutdown—Shuts down VLAN switching on the VLAN. This command takes effect immediately. Other commands take effect when you exit VLAN configuration mode.
- state—Specifies the VLAN state:
 - active means the VLAN is operational (the default).
 - suspend means the VLAN is suspended. Suspended VLANs do not pass packets.
- ste *ste-number*—Defines the maximum number of spanning-tree explorer (STE) hops. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7.
- **stp type**—Defines the spanning-tree type for FDDI-NET, Token Ring-NET, or TrBRF VLANs. For FDDI-NET VLANs, the default STP type is ieee. For Token Ring-NET VLANs, the default STP type is ibm. For FDDI and Token Ring VLANs, the default is no type specified.
 - ieee—IEEE Ethernet STP running source-route transparent (SRT) bridging.
 - ibm—IBM STP running source-route bridging (SRB).
 - **auto**—STP running a combination of source-route transparent bridging (IEEE) and source-route bridging (IBM).

• **tb-vlan1** *tb-vlan1-id* and **tb-vlan2** *tb-vlan2-id*—Specifies the first and second VLAN to which this VLAN is translationally bridged. Translational VLANs translate FDDI or Token Ring to Ethernet, for example. The range is 0 to 1005. If no value is specified, 0 (no transitional bridging) is assumed.

Media Type	Valid Syntax
Ethernet	name vlan-name, media ethernet, state {suspend active}, said said-value, mtu mtu-size, remote-span, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
FDDI	name vlan-name, media fddi, state {suspend active}, said said-value, mtu mtu-size, ringring-number, parent parent-vlan-id, tb-vlan1tb-vlan1-id, tb-vlan2 tb-vlan2-id
FDDI-NET	name vlan-name, media fd-net , state {suspend active}, said said-value, mtu mtu-size, bridge bridge-number, stp type {ieee ibm auto}, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
	If VTP v2 mode is disabled, do not set the stp type to auto.
Token Ring	VTP v1 mode is enabled.
	name vlan-name, media tokenring , state { suspend active }, said said-value, mtu mtu-size, ring ring-number, parent parent-vlan-id, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
Token Ring concentrator relay function (TrCRF)	VTP v2 mode is enabled.
	name vlan-name, media tokenring, state {suspend active}, said said-value, mtu mtu-size, ring ring-number, parent parent-vlan-id, bridge type {srb srt}, are are-number, ste ste-number, backupcrf {enable disable}, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
Token Ring-NET	VTP v1 mode is enabled.
	name vlan-name, media tr-net , state { suspend active }, said said-value, mtu mtu-size, bridge bridge-number, stp type { ieee ibm }, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id
Token Ring bridge relay function (TrBRF)	VTP v2 mode is enabled.
	name vlan-name, media tr-net , state { suspend active }, said said-value, mtu mtu-size, bridge bridge-number, stp type { ieee ibm auto }, tb-vlan1 tb-vlan1-id, tb-vlan2 tb-vlan2-id

The following table describes the rules for configuring VLANs:

Table 48: VLAN Configuration Rules

Configuration	Rule
VTP v2 mode is enabled, and you are configuring a TrCRF VLAN media type.	Specify a parent VLAN ID of a TrBRF that already exists in the database.
	Specify a ring number. Do not leave this field blank.
	Specify unique ring numbers when TrCRF VLANs have the same parent VLAN ID. Only one backup concentrator relay function (CRF) can be enabled.
VTP v2 mode is enabled, and you are configuring VLANs other than TrCRF media type.	Do not specify a backup CRF.
VTP v2 mode is enabled, and you are configuring a TrBRF VLAN media type.	Specify a bridge number. Do not leave this field blank.
VTP v1 mode is enabled.	No VLAN can have an STP type set to auto.
	This rule applies to Ethernet, FDDI, FDDI-NET, Token Ring, and Token Ring-NET VLANs.
Add a VLAN that requires translational bridging (values are not set to zero).	The translational bridging VLAN IDs that are used must already exist in the database.
	The translational bridging VLAN IDs that a configuration points to must also contain a pointer to the original VLAN in one of the translational bridging parameters (for example, Ethernet points to FDDI, and FDDI points to Ethernet).
	The translational bridging VLAN IDs that a configuration points to must be different media types than the original VLAN (for example, Ethernet can point to Token Ring).
	If both translational bridging VLAN IDs are configured, these VLANs must be different media types (for example, Ethernet can point to FDDI and Token Ring).

This example shows how to add an Ethernet VLAN with default media characteristics. The default includes a *vlan-name* of VLAN *xxxx*, where *xxxx* represents four numeric digits (including leading zeros) equal to the VLAN ID number. The default media is ethernet; the state is active. The default said-value is 100000 plus the VLAN ID; the mtu-size variable is 1500; the stp-type is ieee. When you enter the **exit** VLAN configuration command, the VLAN is added if it did not already exist; otherwise, this command does nothing.

This example shows how to create a new VLAN with all default characteristics and enter VLAN configuration mode:

Device(config)# vlan 200
Device(config-vlan)# exit
Device(config)#

This example shows how to create a new extended-range VLAN with all the default characteristics, to enter VLAN configuration mode, and to save the new VLAN in the device startup configuration file:

```
Device(config)# vtp mode transparent
Device(config)# vlan 2000
Device(config-vlan)# end
Device# copy running-config startup config
```

You can verify your setting by entering the show vlan privileged EXEC command.

vmps reconfirm (global configuration)

To change the reconfirmation interval for the VLAN Query Protocol (VQP) client, use the **vmps reconfirm** global configuration command. To return to the default setting, use the **no** form of this command.

vmps reconfirm *interval* no vmps reconfirm

Syntax DescriptionintervalReconfirmation interval for VQP client queries to the VLAN Membership Policy Server (VMPS)
to reconfirm dynamic VLAN assignments. The range is 1 to 120 minutes.

Command Default The default reconfirmation interval is 60 minutes.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS Release 15.0(2)EX	This command was introduced.

Usage Guidelines You can verify your setting by entering the **show vmps** privileged EXEC command and examining information in the Reconfirm Interval row.

Examples This example shows how to set the VQP client to reconfirm dynamic VLAN entries every 20 minutes:

Device(config) # vmps reconfirm 20

vtp (global configuration)

To set or modify the VLAN Trunking Protocol (VTP) configuration characteristics, use the **vtp** command in global configuration mode. To remove the settings or to return to the default settings, use the **no** form of this command.

vtp {domain domain-name | file filename | interface interface-name [only] | mode {client | off | server | transparent} [{mst | unknown | vlan}] | password password [{hidden | secret}] | pruning | version number}

no vtp {file | interface | mode [{client | off | server | transparent}] [{mst | unknown | vlan}] | password | pruning | version}

Syntax Description	domain domain-name	Specifies the VTP domain name, an ASCII string from 1 to 32 characters that identifies the VTP administrative domain for the device. The domain name is case sensitive.
	file filename	Specifies the Cisco IOS file system file where the VTP VLAN configuration is stored.
	interface interface-name	Specifies the name of the interface providing the VTP ID updated for this device.
	only	(Optional) Uses only the IP address of this interface as the VTP IP updater.
	mode	Specifies the VTP device mode as client, server, or transparent.
	client	Places the device in VTP client mode. A device in VTP client mode is enabled for VTP, and can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on a VTP client. VLANs are configured on another device in the domain that is in server mode. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.
	off	Places the device in VTP off mode. A device in VTP off mode functions the same as a VTP transparent device except that it does not forward VTP advertisements on trunk ports.
	server	Places the device in VTP server mode. A device in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on the device. The device can recover all the VLAN information in the current VTP database from nonvolatile storage after reboot.
	transparent	Places the device in VTP transparent mode. A device in VTP transparent mode is disabled for VTP, does not send advertisements or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The device receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received.
		When VTP mode is transparent, the mode and domain name are saved in the device running configuration file, and you can save them in the device startup configuration file by entering the copy running-config startup config privileged EXEC command.
	mst	(Optional) Sets the mode for the multiple spanning tree (MST) VTP database (only VTP Version 3).

	unknown	(Optional) Sets the mode for unknown VTP databases (only VTP Version 3).	
	vlan	(Optional) Sets the mode for VLAN VTP databases. This is the default (only VTP Version 3).	
	password password	Sets the administrative domain password for the generation of the 16-byte secret value used in MD5 digest calculation to be sent in VTP advertisements and to validate received VTP advertisements. The password can be an ASCII string from 1 to 32 characters. The password is case sensitive.	
	hidden	(Optional) Specifies that the key generated from the password string is saved in the VLAN database file. When the hidden keyword is not specified, the password string is saved in clear text. When the hidden password is entered, you need to reenter the password to issue a command in the domain. This keyword is supported only in VTP Version 3.	
	secret	(Optional) Allows the user to directly configure the password secret key (only VTP Version 3).	
	pruning	Enables VTP pruning on the device.	
	version number	Sets the VTP Version to Version 1, Version 2, or Version 3.	
Command Default	The default filenam	e is <i>flash:vlan.dat</i> .	
	The default mode is server mode and the default database is VLAN.		
	In VTP Version 3, f	or the MST database, the default mode is transparent.	
	No domain name or	password is defined.	
	No password is con	figured.	
	Pruning is disabled.		
	The default version	is Version 1.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	Cisco IOS Release	15.0(2)EX This command was introduced.	
Usage Guidelines	VTP Version 3 is su	upported only when the switch is running the LAN Base image.	
		P mode, domain name, and VLAN configurations in the device startup configuration file ce, the VTP and VLAN configurations are selected by these conditions:	
	name from the ignored (cleare	de is transparent in the startup configuration and the VLAN database and the VTP domain VLAN database matches that in the startup configuration file, the VLAN database is ed), and the VTP and VLAN configurations in the startup configuration file are used. The se revision number remains unchanged in the VLAN database.	
		de or domain name in the startup configuration do not match the VLAN database, the and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database	

The **vtp file** *filename* cannot be used to load a new database; it renames only the file in which the existing database is stored.

Follow these guidelines when configuring a VTP domain name:

- The device is in the no-management-domain state until you configure a domain name. While in the no-management-domain state, the device does not send any VTP advertisements even if changes occur to the local VLAN configuration. The device leaves the no-management-domain state after it receives the first VTP summary packet on any port that is trunking or after you configure a domain name by using the **vtp domain** command. If the device receives its domain from a summary packet, it resets its configuration revision number to 0. After the device leaves the no-management-domain state, it cannot be configured to reenter it until you clear the NVRAM and reload the software.
- Domain names are case-sensitive.
- After you configure a domain name, it cannot be removed. You can only reassign it to a different domain.

Follow these guidelines when setting VTP mode:

- The **no vtp mode** command returns the device to VTP server mode.
- The **vtp mode server** command is the same as **no vtp mode** except that it does not return an error if the device is not in client or transparent mode.
- If the receiving device is in client mode, the client device changes its configuration to duplicate the configuration of the server. If you have devices in client mode, be sure to make all VTP or VLAN configuration changes on a device in server mode, as it has a higher VTP configuration revision number. If the receiving device is in server mode or transparent mode, the device configuration is not changed.
- A device in transparent mode does not participate in VTP. If you make VTP or VLAN configuration changes on a device in transparent mode, the changes are not propagated to other devices in the network.
- If you change the VTP or VLAN configuration on a device that is in server mode, that change is propagated to all the devices in the same VTP domain.
- The **vtp mode transparent** command disables VTP from the domain but does not remove the domain from the device.
- In VTP Versions 1 and 2, the VTP mode must be transparent for you to add extended-range VLANs or for VTP and VLAN information to be saved in the running configuration file. VTP supports extended-range VLANs in client and server mode and saves them in the VLAN database.
- With VTP Versions 1 and 2, if extended-range VLANs are configured on the device and you attempt to set the VTP mode to server or client, you receive an error message, and the configuration is not allowed. Changing VTP mode is allowed with extended VLANs in VTP Version 3.
- The VTP mode must be transparent for you to add extended-range VLANs or for VTP and VLAN information to be saved in the running configuration file.
- VTP can be set to either server or client mode only when dynamic VLAN creation is disabled.
- The vtp mode off command sets the device to off. The no vtp mode off command resets the device to the VTP server mode.

Follow these guidelines when setting a VTP password:

• Passwords are case sensitive. Passwords should match on all devices in the same domain.

- When you use the **no vtp password** form of the command, the device returns to the no-password state.
- The **hidden** and **secret** keywords are supported only in VTP Version 3. If you convert from VTP Version 2 to VTP Version 3, you must remove the hidden or secret keyword before the conversion.

Follow these guidelines when setting VTP pruning:

- VTP pruning removes information about each pruning-eligible VLAN from VTP updates if there are no stations belonging to that VLAN.
- If you enable pruning on the VTP server, it is enabled for the entire management domain for VLAN IDs 1 to 1005.
- Only VLANs in the pruning-eligible list can be pruned.
- Pruning is supported with VTP Version 1 and Version 2.

Follow these guidelines when setting the VTP version:

- Toggling the Version 2 (v2) mode state modifies parameters of certain default VLANs.
- Each VTP device automatically detects the capabilities of all the other VTP devices. To use Version 2, all VTP devices in the network must support Version 2; otherwise, you must configure them to operate in VTP Version 1 mode.
- If all devices in a domain are VTP Version 2-capable, you only need to configure Version 2 on one device; the version number is then propagated to the other Version-2 capable devices in the VTP domain.
- If you are using VTP in a Token Ring environment, VTP Version 2 must be enabled.
- If you are configuring a Token Ring bridge relay function (TrBRF) or Token Ring concentrator relay function (TrCRF) VLAN media type, you must use Version 2.
- If you are configuring a Token Ring or Token Ring-NET VLAN media type, you must use Version 1.
- In VTP Version 3, all database VTP information is propagated across the VTP domain, not only VLAN database information.
- Two VTP Version 3 regions can only communicate over a VTP Version 1 or VTP Version 2 region in transparent mode.

You cannot save password, pruning, and version configurations in the device configuration file.

This example shows how to rename the filename for VTP configuration storage to vtpfilename:

```
Device(config) # vtp file vtpfilename
```

This example shows how to clear the device storage filename:

```
Device (config) # no vtp file vtpconfig
Clearing device storage filename.
```

This example shows how to specify the name of the interface providing the VTP updater ID for this device:

```
Device(config) # vtp interface gigabitethernet
```

This example shows how to set the administrative domain for the device:

Device(config) # vtp domain OurDomainName

This example shows how to place the device in VTP transparent mode: Device(config) # vtp mode transparent

This example shows how to configure the VTP domain password:

```
Device(config) # vtp password ThisIsOurDomainsPassword
```

This example shows how to enable pruning in the VLAN database:

```
Device(config)# vtp pruning
Pruning switched ON
```

This example shows how to enable Version 2 mode in the VLAN database:

```
Device(config) # vtp version 2
```

You can verify your settings by entering the show vtp status privileged EXEC command.
