

CHAPTER 2

Catalyst 3560 Switch Cisco IOS Commands

aaa accounting dot1x

Use the **aaa accounting dot1x** global configuration command to enable authentication, authorization, and accounting (AAA) accounting and to create method lists defining specific accounting methods on a per-line or per-interface basis for IEEE 802.1x sessions. Use the **no** form of this command to disable IEEE 802.1x accounting.

aaa accounting dot1x {name | default} start-stop {broadcast group {name | radius | tacacs+} [group {name | radius | tacacs+} ...] | group {name | radius | tacacs+} [group {name | radius | tacacs+} ...]}

no aaa accounting dot1x {*name* | **default**}

Syntax Description	name	Name of a server group. This is optional when you enter it after the broadcast group and group keywords.
	default	Use the accounting methods that follow as the default list for accounting services.
	start-stop	Send a start accounting notice at the beginning of a process and a stop accounting notice at the end of a process. The start accounting record is sent in the background. The requested-user process begins regardless of whether or not the start accounting notice was received by the accounting server.
	broadcast	Enable accounting records to be sent to multiple AAA servers and send accounting records to the first server in each group. If the first server is unavailable, the switch uses the list of backup servers to identify the first server.
	group	Specify the server group to be used for accounting services. These are valid server group names:
		• <i>name</i> —Name of a server group.
		• radius—List of all RADIUS hosts.
		• tacacs +—List of all TACACS+ hosts.
		The group keyword is optional when you enter it after the broadcast group and group keywords. You can enter more than optional group keyword.
	radius	(Optional) Enable RADIUS authorization.
	tacacs+	(Optional) Enable TACACS+ accounting.

Defaults AAA accounting is disabled.

Command Modes Global configuration

 Release
 Modification

 12.2(20)SE
 This command was introduced.

Usage Guidelines This command requires access to a RADIUS server.

We recommend that you enter the **dot1x reauthentication** interface configuration command before configuring IEEE 802.1x RADIUS accounting on an interface.

Examples

This example shows how to configure IEEE 802.1x accounting: Switch(config)# aaa new-model Switch(config)# aaa accounting dot1x default start-stop group radius

The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

Related Commands	Command	Description
	aaa authentication dot1x	Specifies one or more AAA methods for use on interfaces running IEEE 802.1x.
	aaa new-model	Enables the AAA access control model. For syntax information, see the Cisco IOS Security Command Reference, Release 12.2 > Authentication, Authorization, and Accounting > Authentication Commands.
	dot1x reauthentication	Enables or disables periodic reauthentication.
	dot1x timeout reauth-period	Sets the number of seconds between re-authentication attempts.

aaa authentication dot1x

Use the **aaa authentication dot1x** global configuration command to specify the authentication, authorization, and accounting (AAA) method to use on ports complying with the IEEE 802.1x authentication. Use the **no** form of this command to disable authentication.

aaa authentication dot1x {default} method1

no aaa authentication dot1x {default}

Syntax Description	default	Use the listed authentication method that follows this argument as the default method when a user logs in.
	method1	Enter the group radius keywords to use the list of all RADIUS servers for authentication.
Note	Though other key keywords are supp	words are visible in the command-line help strings, only the default and group radius ported.
Defaults	No authentication	is performed.
Command Modes	Global configurat	ion
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	to validate the pas	nent identifies the method that the authentication algorithm tries in the given sequence sword provided by the client. The only method that is truly IEEE 802.1x-compliant is method, in which the client data is validated against a RADIUS authentication server.
		up radius, you must configure the RADIUS server by entering the radius-server host
	Use the show run authentication me	ning-config privileged EXEC command to display the configured lists of thods.
Examples		ws how to enable AAA and how to create an IEEE 802.1x-compliant authentication cation first tries to contact a RADIUS server. If this action returns an error, the user is s to the network.
	Switch(config)# Switch(config)#	aaa new-model aaa authentication dot1x default group radius

Related Commands	Command	Description
	aaa new-model	Enables the AAA access control model. For syntax information, see the Cisco IOS Security Command Reference, Release 12.2 > Authentication, Authorization, and Accounting > Authentication Commands.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

aaa authorization network

Use the **aaa authorization network** global configuration command to the configure the switch to use user-RADIUS authorization for all network-related service requests, such as IEEE 802.1x per-user access control lists (ACLs) or VLAN assignment. Use the **no** form of this command to disable RADIUS user authorization.

aaa authorization network default group radius

no aaa authorization network default

Syntax Description	•	Use the list of all RADIUS hosts in the server group as the default authorization list.	
Defaults	Authorization is disable	ed.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	Use the aaa authorization network default group radius global configuration command to allow the switch to download IEEE 802.1x authorization parameters from the RADIUS servers in the default authorization list. The authorization parameters are used by features such as per-user ACLs or VLAN assignment to get parameters from the RADIUS servers.		
	Use the show running- methods.	config privileged EXEC command to display the configured lists of authorization	
Examples	This example shows ho service requests:	w to configure the switch for user RADIUS authorization for all network-related	
	Switch(config)# aaa authorization network default group radius		
	You can verify your set	ttings by entering the show running-config privileged EXEC command.	
Related Commands	Command	Description	
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.	

action

Use the **action** access-map configuration command to set the action for the VLAN access map entry. Use the **no** form of this command to return to the default setting.

action {drop | forward}

no action

Syntax Description	drop	Drop the packet when the specified conditions are matched.
	forward	Forward the packet when the specified conditions are matched.
Defaults	The default actio	n is to forward packets.
Command Modes	Access-map conf	figuration
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	If the action is d	-map configuration mode by using the vlan access-map global configuration command. rop , you should define the access map, including configuring any access control list match clauses, before applying the map to a VLAN, or all packets could be dropped.
	In access-map co	onfiguration mode, use the match access-map configuration command to define the s for a VLAN map. Use the action command to set the action that occurs when a packet
	The drop and for	ward parameters are not used in the no form of the command.
Examples	-	ows how to identify and apply a VLAN access map <i>vmap4</i> to VLANs 5 and 6 that causes ward an IP packet if the packet matches the conditions defined in access list <i>al2</i> :
	Switch(config-a Switch(config-a Switch(config-a	<pre>* vlan access-map vmap4 access-map)# match ip address al2 access-map)# action forward access-map)# exit * vlan filter vmap4 vlan-list 5-6</pre>
	You can verify y	our settings by entering the show vlan access-map privileged EXEC command.

Related Commands	Command	Description
	access-list {deny permit}	Configures a standard numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
	ip access-list	Creates a named access list. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
	mac access-list extended	Creates a named MAC address access list.
	match (class-map configuration)	Defines the match conditions for a VLAN map.
	show vlan access-map	Displays the VLAN access maps created on the switch.
	vlan access-map	Creates a VLAN access map.

archive download-sw

Use the **archive download-sw** privileged EXEC command to download a new image from a TFTP server to the switch and to overwrite or keep the existing image.

archive download-sw {/allow-feature-upgrade | /directory | /force-reload | /imageonly | /leave-old-sw | /no-set-boot | /overwrite | /reload | /safe } source-url

Syntax Description	/allow-feature-upgrade	Allow installation of an image with a different feature set (for example, upgrade from the IP base image to the IP services image).
	/directory	Specify a directory for the images.
	/force-reload	Unconditionally force a system reload after successfully downloading the software image.
	/imageonly	Download only the software image but not the HTML files associated with the embedded device manager. The HTML files for the existing version are deleted only if the existing version is being overwritten or removed.
	/leave-old-sw	Keep the old software version after a successful download.
	/no-set-boot	Do not alter the setting of the BOOT environment variable to point to the new software image after it is successfully downloaded.
	/overwrite	Overwrite the software image in flash memory with the downloaded one.
	/reload	Reload the system after successfully downloading the image unless the configuration has been changed and not been saved.
	/safe	Keep the current software image; do not delete it to make room for the new software image before the new image is downloaded. The current image is deleted after the download.
	source-url	The source URL alias for a local or network file system. These options are supported:
		• The syntax for the local flash file system: flash:
		• The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/image-name.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/image-name.tar
		• The syntax for the TFTP: tftp:[[//location]/directory]/image-name.tar
		The <i>image-name</i> .tar is the software image to download and install on the switch.

Defaults The current software image is not overwritten with the downloaded image. Both the software image and HTML files are downloaded. The new image is downloaded to the flash: file system. The BOOT environment variable is changed to point to the new software image on the flash: file system.

Image names are case sensitive; the image file is provided in tar format.

Command Modes Privileged EXEC

Release Modification 12.1(19)EA1 This command was introduced. 12.2(20)SE The http and https keywords were added. 12.2(35)SE The allow-feature-upgrade and directory keywords were added.

Usage Guidelines Use the **/allow-feature-upgrade** option to allow installation of an image with a different feature set, for example, upgrading from the IP base image to the IP services image.

Beginning with Cisco IOS release 12.2(35)SE, you can use the **archive download-sw /directory** command to specify a directory one time The **/imageonly** option removes the HTML files for the existing image if the existing image is being removed or replaced. Only the Cisco IOS image (without the HTML files) is downloaded.

Using the **/safe** or **/leave-old-sw** option can cause the new image download to fail if there is insufficient flash memory. If leaving the software in place prevents the new image from fitting in flash memory due to space constraints, an error results.

If you used the **/leave-old-sw** option and did not overwrite the old image when you downloaded the new one, you can remove the old image by using the **delete** privileged EXEC command. For more information, see the "delete" section on page 2-75.

Use the /overwrite option to overwrite the image on the flash device with the downloaded one.

If you specify the command *without* the **/overwrite** option, the download algorithm verifies that the new image is not the same as the one on the switch flash device. If the images are the same, the download does not occur. If the images are different, the old image is deleted, and the new one is downloaded.

After downloading a new image, enter the **reload** privileged EXEC command to begin using the new image, or specify the **/reload** or **/force-reload** option in the **archive download-sw** command.

Use the /directory option to specify a directory for images.

Examples This example shows how to download a new image from a TFTP server at 172.20.129.10 and to overwrite the image on the switch:

Switch# archive download-sw /overwrite tftp://172.20.129.10/test-image.tar

This example shows how to download only the software image from a TFTP server at 172.20.129.10 to the switch:

Switch# archive download-sw /imageonly tftp://172.20.129.10/test-image.tar

L

This example shows how to keep the old software version after a successful download: Switch# archive download-sw /leave-old-sw tftp://172.20.129.10/test-image.tar

Related Co	ommands
-------------------	---------

Command	Description	
archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.	
archive upload-sw	Uploads an existing image on the switch to a server.	
delete	Deletes a file or directory on the flash memory device.	

archive tar

Use the **archive tar** privileged EXEC command to create a tar file, list files in a tar file, or extract the files from a tar file.

archive tar {/create destination-url flash:/file-url} | {/table source-url} | {/xtract source-url flash:/file-url [dir/file...]}

Syntax Description	/create destination-url flash:/file-url	Create a new tar file on the local or network file system.
		For <i>destination-url, specify the</i> destination URL alias for the local or network file system and the name of the tar file to create. These options are supported:
		• The syntax for the local flash filesystem: flash:
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for the Remote Copy Protocol (RCP) is: rcp:[[//username@location]/directory]/tar-filename.tar
		• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar
		The <i>tar-filename</i> .tar is the tar file to be created.
		For flash: / <i>file-url</i> , <i>specify the</i> location on the local flash file system from which the new tar file is created.
		An optional list of files or directories within the source directory can be specified to write to the new tar file. If none are specified, all files and directories at this level are written to the newly created tar file.

/table source-url	Display the contents of an existing tar file to the screen.		
	For <i>source-url</i> , specify the source URL alias for the local or network file system. These options are supported:		
	• The syntax for the local flash file system: flash:		
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tag 		
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for the RCP: rcp:[[//username@location]/directory]/tar-filename.tar 		
	• The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar		
	The <i>tar-filename</i> .tar is the tar file to display.		
/xtract source-url	Extract files from a tar file to the local file system.		
flash:/file-url [dir/file]	For <i>source-url</i> , specify <i>t</i> he source URL alias for the local file system. These options are supported:		
	• The syntax for the local flash file system: flash:		
	 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/tar-filename.tag 		
	 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 		
	 The syntax for the RCP: rcp:[[//username@location]/directory]/tar-filename.tar 		
	 The syntax for the TFTP: tftp:[[//location]/directory]/tar-filename.tar 		
	The <i>tar-filename</i> .tar is the tar file from which to extract.		
	For flash :/ <i>file-url</i> [<i>dir/file</i>], specify the location on the local flash file system into which the tar file is extracted. Use the <i>dir/file</i> option to specify an optional list of files or directories within the tar file to be extracted. If none are specified, all files and directories are extracted.		

Defaults

There is no default setting.

	Switch# archive t	ar /xtract tftp://172.20.10.30/saved.tar flash:/ new-configs

Related Commands	Command	Description
	archive download-sw	Downloads a new image from a TFTP server to the switch.
	archive upload-sw	Uploads an existing image on the switch to a server.

archive upload-sw

Use the archive upload-sw privileged EXEC command to upload an existing switch image to a server.

archive upload-sw [/version version_string] destination-url

Syntax Description	/version version_string	(Optional) Specify the specific version string of the image to be uploaded.	
	destination-url	The destination URL alias for a local or network file system. These options are supported:	
		• The syntax for the local flash file system: flash:	
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/image-name.tar 	
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 	
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar 	
		• The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/image-name.tar	
		• The syntax for the TFTP: tftp:[[//location]/directory]/image-name.tar	
		The <i>image-name</i> .tar is the name of software image to be stored on the server.	
Defaults	Uploads the currently running image from the flash: file system.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	Use the upload feature or installed with the existing	nly if the HTML files associated with the embedded device manager have been g image.	
	The files are uploaded in are uploaded, the softwar	this sequence: the Cisco IOS image, the HTML files, and info. After these files re creates the tar file.	
	Image names are case set	nsitive.	

ExamplesThis example shows how to upload the currently running image to a TFTP server at 172.20.140.2:
Switch# archive upload-sw tftp://172.20.140.2/test-image.tar

Related Commands	Command	Description
	archive download-sw	Downloads a new image to the switch.
	archive tar	Creates a tar file, lists the files in a tar file, or extracts the files from a tar file.

arp access-list

Use the **arp access-list** global configuration command to define an Address Resolution Protocol (ARP) access control list (ACL) or to add clauses to the end of a previously defined list. Use the **no** form of this command to delete the specified ARP access list.

arp access-list acl-name

no arp access-list acl-name

Syntax Description	acl-name	Name of the ACL.			
Defaults	No ARP access list	ts are defined.			
Command Modes	Global configuration	on			
Command History	Release	Modification			
-	12.2(20)SE	This command was introduced.			
Usage Guidelines	After entering the arp access-list command, you enter ARP access-list configuration mode, and these configuration commands are available:				
	• default : returns a command to its default setting.				
	• deny : specifies packets to reject. For more information, see the "deny (ARP access-list configuration)" section on page 2-76.				
	• exit: exits ARP access-list configuration mode.				
	• no : negates a command or returns to default settings.				
		ies packets to forward. For more information, see the "permit (ARP access-list" section on page 2-330.			
	Use the permit and deny access-list configuration commands to forward and to drop ARP packets based on the specified matching criteria.				
	global configuratio to the ACL. All oth permits a packet, th statement, the switch the switch compare	L is defined, you can apply it to a VLAN by using the ip arp inspection filter vlan on command. ARP packets containing only IP-to-MAC address bindings are compared her types of packets are bridged in the ingress VLAN without validation. If the ACL he switch forwards it. If the ACL denies a packet because of an explicit deny ch drops the packet. If the ACL denies a packet because of an implicit deny statement, es the packet to the list of DHCP bindings (unless the ACL is <i>static</i> , which means that npared to the bindings).			

Examples

This example shows how to define an ARP access list and to permit both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 00001.0000.abcd
Switch(config-arp-nacl)# end
```

You can verify your settings by entering the show arp access-list privileged EXEC command.

Related Commands	Command	Description
	deny (ARP access-list configuration)	Denies an ARP packet based on matches compared against the DHCP bindings.
	ip arp inspection filter vlan	Permits ARP requests and responses from a host configured with a static IP address.
	permit (ARP access-list configuration)	Permits an ARP packet based on matches compared against the DHCP bindings.
	show arp access-list	Displays detailed information about ARP access lists.

auto qos voip

Use the **auto qos voip** interface configuration command to automatically configure quality of service (QoS) for voice over IP (VoIP) within a QoS domain. Use the **no** form of this command to return to the default setting.

auto qos voip {cisco-phone | cisco-softphone | trust}

no auto qos voip [cisco-phone | cisco-softphone | trust]

Syntax Description	cisco-phone	Identify this port as connected to a Cisco IP Phone, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted only when the telephone is detected.
	cisco-softphone	Identify this port as connected to a device running the Cisco SoftPhone, and automatically configure QoS for VoIP.
	trust	Identify this port as connected to a trusted switch or router, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packet is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

Defaults

Auto-QoS is disabled on the port.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues as shown in Table 2-1.

Table 2-1 Traffic Types, Packet Labels, and Queues

	VoIP Data Traffic	VoIP Control Traffic	Routing Protocol Traffic	STP ¹ BPDU ² Traffic	Real-Time Video Traffic	All Other T	raffic
DSCP ³	46	24, 26	48	56	34	-	
CoS ⁴	5	3	6	7	3	-	
CoS-to-ingress queue map	2, 3, 4, 5, 6, 7 (queue 2)					0, 1 (queu	e 1)
CoS-to-egress queue map	5 (queue 1)	3, 6, 7 (queue 2) 4 (queue 3)		2 (queue 3)	0, 1 (queue 4)		

1. STP = Spanning Tree Protocol

2. BPDU = bridge protocol data unit

3. DSCP = Differentiated Services Code Point

4. CoS = class of service

Table 2-2 shows the generated auto-QoS configuration for the ingress queues.

Ingress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size
SRR ¹ shared	1	0, 1	81 percent	67 percent
Priority	2	2, 3, 4, 5, 6, 7	19 percent	33 percent

Table 2-2Auto-QoS Configuration for the Ingress Queues

1. SRR = shaped round robin. Ingress queues support shared mode only.

Table 2-3 shows the generated auto-QoS configuration for the egress queues.

Table 2-3 Auto-QoS Configuration for the Egress Queues

Egress Queue	Queue Number	CoS-to-Queue Map	Queue Weight (Bandwidth)	Queue (Buffer) Size for Gigabit-Capable Ports	Queue (Buffer) Size for 10/100 Ethernet Ports
Priority (shaped)	1	5	up to100 percent	16 percent	10 percent
SRR shared	2	3, 6, 7	10 percent	6 percent	10 percent
SRR shared	3	2, 4	60 percent	17 percent	26 percent
SRR shared	4	0, 1	20 percent	61 percent	54 percent

Command Modes Int

Interface configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	12.2(20)SE	The cisco-softphone keyword was added, and the generated auto-QoS configuration changed.
	12.2(40)SE	The information in the command output changed.

Usage Guidelines

Use this command to configure the QoS appropriate for VoIP traffic within the QoS domain. The QoS domain includes the switch, the interior of the network, and edge devices that can classify incoming traffic for QoS.

In releases earlier than Cisco IOS Release 12.2(20)SE, auto-QoS configures the switch only for VoIP with Cisco IP Phones on switch ports.

In Cisco IOS Release 12.2(20)SE or later, auto-QoS configures the switch for VoIP with Cisco IP Phones on switch and routed ports and for VoIP with devices running the Cisco SoftPhone application. These releases support only Cisco IP SoftPhone Version 1.3(3) or later. Connected devices must use Cisco Call Manager Version 4 or later.

Beginning in Cisco IOS Release 12.2(40)SE, the **show auto qos** command output shows the service policy information for the Cisco IP phone.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration *after* you enable auto-QoS.

L

The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enable the auto-QoS feature on the first port, these automatic actions occur:

• QoS is globally enabled (**mls qos** global configuration command), and other global configuration commands are added.

If the switch port was configured by using the **auto qos voip cisco-phone** interface configuration command in Cisco IOS Release 12.2(37)SE or earlier, the auto-QoS generated commands new to Cisco IOS Release 12.2(40)SE are not applied to the port. To have these commands automatically applied, you must remove and then reapply the configuration to the port.

- When you enter the **auto qos voip cisco-softphone** interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the switch uses policing to decide whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. The switch configures ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.
- When you enter the **auto qos voip trust** interface configuration command on a port connected to the interior of the network, the switch trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices). The switch configures the ingress and egress queues on the port according to the settings in Table 2-2 and Table 2-3.

You can enable auto-QoS on static, dynamic-access, and voice VLAN access, and trunk ports. When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.

When a device running Cisco SoftPhone is connected to a switch or routed port, the switch supports only one Cisco SoftPhone application per port.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the **debug auto qos** privileged EXEC command to enable auto-QoS debugging. For more information, see the **debug auto qos** command.

To disable auto-QoS on a port, use the **no auto qos voip** interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the **no auto qos voip** command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid

disrupting traffic on other ports affected by the global configuration). You can use the **no mls qos** global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

Examples

This example shows how to enable auto-QoS and to trust the QoS labels received in incoming packets when the switch or router connected to the port is a trusted device:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# auto gos voip trust

You can verify your settings by entering the **show auto qos interface** *interface-id* privileged EXEC command.

Related Commands Command Description debug auto qos Enables debugging of the auto-QoS feature. mls qos cos Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port. Defines the CoS-to-DSCP map or the DSCP-to-CoS map. **mls qos map** {**cos-dscp** *dscp1* ... *dscp8* | **dscp-cos** *dscp-list* to *cos*} mls qos queue-set output buffers Allocates buffers to a queue-set. mls gos srr-queue input bandwidth Assigns shaped round robin (SRR) weights to an ingress queue. mls qos srr-queue input buffers Allocates the buffers between the ingress queues. mls qos srr-queue input cos-map Maps CoS values to an ingress queue or maps CoS values to a queue and to a threshold ID. Maps DSCP values to an ingress queue or maps DSCP values mls qos srr-queue input dscp-map to a queue and to a threshold ID. mls qos srr-queue input Configures the ingress priority queue and guarantees priority-queue bandwidth. mls qos srr-queue output cos-map Maps CoS values to an egress queue or maps CoS values to a queue and to a threshold ID. mls qos srr-queue output dscp-map Maps DSCP values to an egress queue or maps DSCP values to a queue and to a threshold ID. mls qos trust Configures the port trust state. queue-set Maps a port to a queue-set. Displays auto-QoS information. show auto gos show mls qos interface Displays QoS information at the port level. srr-queue bandwidth shape Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port. srr-queue bandwidth share Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

boot auto-download-sw

Use the **boot auto-download-sw** global configuration command to specify a URL pathname to use for automatic software upgrades. Use the **no** form of this command to return to the default setting.

boot auto-download-sw source-url

no boot auto-download-sw

Syntax Description	source-url	The source URL alias for automatic upgrades. These options are supported:
		• The syntax for the local flash file system: flash:
		 The syntax for the FTP: ftp:[[//username[:password]@location]/directory]/image-name.tar
		 The syntax for an HTTP server: http://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		 The syntax for a secure HTTP server: https://[[username:password]@]{hostname host-ip}[/directory]/image-name.tar
		• The syntax for the Remote Copy Protocol (RCP): rcp:[[//username@location]/directory]/image-name.tar
		• The syntax for the TFTP: tftp:[[//location]/directory]/image-name.tar
		The <i>image-name</i> .tar is the software image to download and install on the switch.
Defaults	Disabled.	
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(35)SE	This command was introduced.

Usage Guidelines Thi

This command specifies a path URL to use for automatic software upgrades. You can use this command to configure the URL for the master switch to access in case of a version-mismatch.

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot boothlpr

Use the **boot boothlpr** global configuration command to load a special Cisco IOS image, which when loaded into memory, can load a second Cisco IOS image into memory and launch it. This variable is used only for internal development and testing. Use the **no** form of this command to return to the default setting.

boot boothlpr *filesystem:/file-url*

no boot boothlpr

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	The path (directory) and name of a bootable helper image.
Defaults	No helper image is	loaded.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	Filenames and direc	ctory names are case sensitive.
		nges the setting of the BOOTHLPR environment variable. For more information, see lyst 3560 Switch Bootloader Commands."
Related Commands	Command	Description

		ges the setting of the CONFIG_FILE environment variable. For more information, atalyst 3560 Switch Bootloader Commands."
Related Commands	Command	Description

boot enable-break

Use the **boot enable-break** global configuration command to enable interrupting the automatic boot process. Use the **no** form of this command to return to the default setting.

boot enable-break

no boot enable-break

Syntax Description	This command has no arguments or keywords.
--------------------	--------------------------------------------

Defaults Disabled. The automatic boot process cannot be interrupted by pressing the Break key on the console.

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines

elines When you enter this command, you can interrupt the automatic boot process by pressing the Break key on the console after the flash file system is initialized.

۵, Note

Despite the setting of this command, you can interrupt the automatic boot process at any time by pressing the MODE button on the switch front panel.

This command changes the setting of the ENABLE_BREAK environment variable. For more information, see Appendix A, "Catalyst 3560 Switch Bootloader Commands."

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot helper

Use the **boot helper** global configuration command to dynamically load files during boot loader initialization to extend or patch the functionality of the boot loader. Use the **no** form of this command to return to the default.

boot helper *filesystem:/file-url* ...

no boot helper

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.
	lfile-url	The path (directory) and a list of loadable files to dynamically load during loader initialization. Separate each image name with a semicolon.
Defaults	No helper files are	loaded.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines		d only for internal development and testing. ctory names are case sensitive.
	This command char	nges the setting of the HELPER environment variable. For more information, see lyst 3560 Switch Bootloader Commands."
Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot helper-config-file

Use the **boot helper-config-file** global configuration command to specify the name of the configuration file to be used by the Cisco IOS helper image. If this is not set, the file specified by the CONFIG_FILE environment variable is used by all versions of Cisco IOS that are loaded. Use the **no** form of this command to return to the default setting.

boot helper-config-file filesystem:/file-url

no boot helper-config file

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.	
	lfile-url	The path (directory) and helper configuration file to load.	
Defaults	No helper configura	ation file is specified.	
Command Modes	Global configuration	n	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	This variable is use	d only for internal development and testing.	
	Filenames and directory names are case sensitive.		
		nges the setting of the HELPER_CONFIG_FILE environment variable. For more opendix A, "Catalyst 3560 Switch Bootloader Commands."	
Related Commands	Command	Description	
	show boot	Displays the settings of the boot environment variables.	

boot manual

Use the **boot manual** global configuration command to enable manually booting the switch during the next boot cycle. Use the **no** form of this command to return to the default setting.

boot manual

no boot manual

Syntax Description	This command has	no arguments or keywords.
--------------------	------------------	---------------------------

Defaults Manual booting is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines The next time you reboot the system, the switch is in boot loader mode, which is shown by the *switch*: prompt. To boot up the system, use the **boot** boot loader command, and specify the name of the bootable image.

This command changes the setting of the MANUAL_BOOT environment variable. For more information, see Appendix A, "Catalyst 3560 Switch Bootloader Commands."

Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot private-config-file

Use the **boot private-config-file** global configuration command to specify the filename that Cisco IOS uses to read and write a nonvolatile copy of the private configuration. Use the **no** form of this command to return to the default setting.

boot private-config-file filename

no boot private-config-file

Syntax Description	filename	The name of the private configuration file.
Defaults	The default configu	aration file is <i>private-config</i> .
Command Modes	Global configuration	n
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	Filenames are case	sensitive.
Examples	This example show	s how to specify the name of the private configuration file to be <i>pconfig</i> :
	Switch(config)# 1	poot private-config-file pconfig
Related Commands	Command	Description
	show boot	Displays the settings of the boot environment variables.

boot system

Use the **boot system** global configuration command to specify the Cisco IOS image to load during the next boot cycle. Use the **no** form of this command to return to the default setting.

boot system *filesystem: /file-url* ...

no boot system

Syntax Description	filesystem:	Alias for a flash file system. Use flash: for the system board flash device.	
	lfile-url	The path (directory) and name of a bootable image. Separate image names with a semicolon.	
Defaults	variable. If this var can by performing a	s to automatically boot up the system by using information in the BOOT environment iable is not set, the switch attempts to load and execute the first executable image it a recursive, depth-first search throughout the flash file system. In a depth-first search	
	of a directory, each original directory.	encountered subdirectory is completely searched before continuing the search in the	
Command Modes	Global configuration	on	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	If you are using the	ctory names are case sensitive. • archive download-sw privileged EXEC command to maintain system images, you	
	never need to use the boot system command. The boot system command is automatically manipulated to load the downloaded image.

channel-group

Use the **channel-group** interface configuration command to assign an Ethernet port to an EtherChannel group, to enable an EtherChannel mode, or both. Use the **no** form of this command to remove an Ethernet port from an EtherChannel group.

channel-group channel-group-number mode {active | {auto [non-silent]} | {desirable
 [non-silent]} | on | passive}

no channel-group

PAgP modes:

channel-group channel-group-number mode {{auto [non-silent]} | {desirable [non-silent}}

LACP modes:

channel-group channel-group-number mode {active | passive}

On mode:

channel-group channel-group-number mode on

Syntax Description	channel-group-number	Specify the channel group number. The range is 1 to 48.
	mode	Specify the EtherChannel mode.
	active	Unconditionally enable Link Aggregation Control Protocol (LACP).
		Active mode places a port into a negotiating state in which the port initiates negotiations with other ports by sending LACP packets. A channel is formed with another port group in either the active or passive mode.
	auto	Enable the Port Aggregation Protocol (PAgP) only if a PAgP device is detected.
		Auto mode places a port into a passive negotiating state in which the port responds to PAgP packets it receives but does not start PAgP packet negotiation. A channel is formed only with another port group in desirable mode. When auto is enabled, silent operation is the default.
	desirable	Unconditionally enable PAgP.
		Desirable mode places a port into an active negotiating state in which the port starts negotiations with other ports by sending PAgP packets. An EtherChannel is formed with another port group that is in the desirable or auto mode. When desirable is enabled, silent operation is the default.
	non-silent	(Optional) Use in PAgP mode with the auto or desirable keyword when traffic is expected from the other device.
	on	Enable on mode.
		In on mode, a usable EtherChannel exists only when both connected port groups are in the on mode.
	passive	Enable LACP only if a LACP device is detected.
		Passive mode places a port into a negotiating state in which the port responds to received LACP packets but does not initiate LACP packet negotiation. A channel is formed only with another port group in active mode.

Defaults No channel groups are assigned.

No mode is configured.

Command Modes Interface configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	12.2(25)SE	The <i>channel-group-number</i> range was changed from 1 to 12 to 1 to 48.

Usage Guidelines

For Layer 2 EtherChannels, you do not have to create a port-channel interface first by using the **interface port-channel** global configuration command before assigning a physical port to a channel group. Instead, you can use the **channel-group** interface configuration command. It automatically creates the port-channel interface when the channel group gets its first physical port if the logical interface is not already created. If you create the port-channel interface first, the *channel-group-number* can be the same as the *port-channel-number*, or you can use a new number. If you use a new number, the **channel-group** command dynamically creates a new port channel.

You do not have to disable the IP address that is assigned to a physical port that is part of a channel group, but we strongly recommend that you do so.

You create Layer 3 port channels by using the **interface port-channel** command followed by the **no switchport** interface configuration command. You should manually configure the port-channel logical interface before putting the interface into the channel group.

After you configure an EtherChannel, configuration changes that you make on the port-channel interface apply to all the physical ports assigned to the port-channel interface. Configuration changes applied to the physical port affect only the port where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port-channel interface, for example, spanning-tree commands or commands to configure a Layer 2 EtherChannel as a trunk.

If you do not specify **non-silent** with the **auto** or **desirable** mode, silent is assumed. The silent mode is used when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. A example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port prevents that port from ever becoming operational. However, it allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission. Both ends of the link cannot be set to silent.

In the **on** mode, an EtherChannel exists only when a port group in the **on** mode is connected to another port group in the **on** mode.

You should use care when using the **on** mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch. Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

Examples

If you set the protocol by using the **channel-protocol** interface configuration command, the setting is not overridden by the **channel-group** interface configuration command.

Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

```
      Note
      If IEEE 802.1x authentication is enabled on a not-yet active port of an EtherChannel in software releases earlier than Cisco IOS Release 12.2(20)SE, the port does not join the EtherChannel.

      Do not configure a secure port as part of an EtherChannel or an EtherChannel port as a secure port. For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

      ▲
      ▲

      Caution
      Do not enable Layer 3 addresses on the physical EtherChannel ports. Do not assign bridge groups on the physical EtherChannel ports because it creates loops.

      This example shows how to configure an EtherChannel. It assigns two static-access ports in VLAN 10 to channel 5 with the PAgP mode desirable:
```

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel. It assigns two static-access ports in VLAN 10 to channel 5 with the LACP mode **active**:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet0/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	channel-protocol	Restricts the protocol used on a port to manage channeling.
	interface port-channel	Accesses or creates the port channel.
	show etherchannel	Displays EtherChannel information for a channel.
	show lacp	Displays LACP channel-group information.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

channel-protocol

Use the **channel-protocol** interface configuration command to restrict the protocol used on a port to manage channeling. Use the **no** form of this command to return to the default setting.

channel-protocol {lacp | pagp}

no channel-protocol

Syntax Description	lacp Configure an EtherChannel with the Link Aggregation Control Protocol (L.			
	pagp	Configure an EtherChannel with the Port Aggregation Protocol (PAgP).		
Defaults	No protocol is a	ssigned to the EtherChannel.		
Command Modes	Interface configuration			
Command History	Release	Modification		
	12.1(19)EA1	This command was introduced.		
Usage Guidelines	Use the channel-protocol command only to restrict a channel to LACP or PAgP. If you set the protocol by using the channel-protocol command, the setting is not overridden by the channel-group interface configuration command.			
	You must use the channel-group interface configuration command to configure the EtherChanned parameters. The channel-group command also can set the mode for the EtherChannel. You cannot enable both the PAgP and LACP modes on an EtherChannel group.			
	PAgP and LACP	are not compatible; both ends of a channel must use the same protocol.		
Examples	This example sh	ows how to specify LACP as the protocol that manages the EtherChannel:		
	Switch(config-if)# channel-protocol lacp			
	You can verify y privileged EXEC	your settings by entering the show etherchannel [<i>channel-group-number</i>] protocol C command.		

Related Commands	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	show etherchannel protocol	Displays protocol information the EtherChannel.

class

Use the **class** policy-map configuration command to define a traffic classification match criteria (through the **police**, **set**, and **trust** policy-map class configuration commands) for the specified class-map name. Use the **no** form of this command to delete an existing class map.

class class-map-name

no class class-map-name

Syntax Description	class-map-name	Name of the class map.	
Defaults	No policy map class-maps are defined.		
Command Modes	Policy-map configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	Before using the class command, you must use the policy-map global configuration command to identify the policy map and to enter policy-map configuration mode. After specifying a policy map, you can configure a policy for new classes or modify a policy for any existing classes in that policy map. You attach the policy map to a port by using the service-policy interface configuration command.		
	After entering the class command, you enter policy-map class configuration mode, and these configuration commands are available:		
	• exit: exits policy	-map class configuration mode and returns to policy-map configuration mode.	
	• no : returns a com	nmand to its default setting.	
	bandwidth limita	policer or aggregate policer for the classified traffic. The policer specifies the tions and the action to take when the limits are exceeded. For more information, d police aggregate policy-map class commands.	
	• set : specifies a value to be assigned to the classified traffic. For more information, see the set command.		
	• trust : defines a trust state for traffic classified with the class or the class-map command. For more information, see the trust command.		
	To return to policy-ma use the end command	ap configuration mode, use the exit command. To return to privileged EXEC mode, l.	
	The class command performs the same function as the class-map global configuration command . Use the class command when a new classification, which is not shared with any other ports, is needed. Use the class-map command when the map is shared among many ports.		

ExamplesThis example shows how to create a policy map called *policy1*. When attached to the ingress direction,
it matches all the incoming traffic defined in *class1*, sets the IP Differentiated Services Code Point
(DSCP) to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding
the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	police	Defines a policer for classified traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map	Displays quality of service (QoS) policy maps.
	trust	Defines a trust state for the traffic classified through the class policy-map configuration command or the class-map global configuration command.

class-map

Use the **class-map** global configuration command to create a class map to be used for matching packets to the class name you specify and to enter class-map configuration mode. Use the **no** form of this command to delete an existing class map and to return to global configuration mode.

class-map [match-all | match-any] class-map-name

no class-map [match-all | match-any] class-map-name

Syntax Description	match-all	(Optional) Perform a logical-AND of all matching statements under this class map. All criteria in the class map must be matched.	
	match-any	(Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria must be matched.	
	class-map-name	Name of the class map.	
Defaults	No class maps are c	lefined.	
	If neither the matcl	h-all or match-any keyword is specified, the default is match-all.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	match criteria and t	to specify the name of the class for which you want to create or modify class-map to enter class-map configuration mode.	
	aggregate policing as part of a globally named service policy applied on a per-port basis.		
	After you are in quality of service (QoS) class-map configuration mode, these configuration commands are available:		
	• description : describes the class map (up to 200 characters). The show class-map privileged EXEC command displays the description and the name of the class-map.		
	• exit: exits from QoS class-map configuration mode.		
	• match : configures classification criteria. For more information, see the match (class-map configuration) command.		
	• no : removes a match statement from a class map.		
		nes the current class map. If you rename a class map with a name that is already used, class-map with this name already exists appears.	

Examples

To define packet classification on a physical-port basis, only one **match** command per class map is supported. In this situation, the **match-all** and **match-any** keywords are equivalent.

Only one access control list (ACL) can be configured in a class map. The ACL can have multiple access control entries (ACEs).

This example shows how to configure the class map called *class1* with one match criterion, which is an access list called *103*:

```
Switch(config)# access-list 103 permit ip any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
```

This example shows how to delete the class map *class1*:

Switch(config) # no class-map class1

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	match (class-map configuration)	Defines the match criteria to classify traffic.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	show class-map	Displays QoS class maps.

clear dot1x

Use the **clear dot1x** privileged EXEC command to clear IEEE 802.1x information for the switch or for the specified port.

clear dot1x {all | interface interface-id}

Syntax Description	all	Clear all IEEE 802.1x information for the switch.	
	interface interface-id	Clear IEEE 802.1x information for the specified interface.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Examples	-	ified interface by using the clear dot1x interface <i>interface-id</i> command.	
Examples	Switch# clear dot1x a	w to clear all IEEE 8021.x information:	
	This example shows how to clear IEEE 8021.x information for the specified interface:		
	Switch# clear dot1x interface gigabithethernet0/1		
	You can verify that the in	nformation was deleted by entering the show dot1x privileged EXEC command.	
Related Commands	Command	Description	
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.	

clear eap sessions

Use the **clear eap sessions** privileged EXEC command to clear Extensible Authentication Protocol (EAP) session information for the switch or for the specified port.

clear eap sessions [**credentials** *name* [**interface** *interface-id*] | **interface** *interface-id* | **method** *name* | **transport** *name*] [**credentials** *name* | **interface** *interface-id* | **transport** *name*] ...

Syntax Description	credentials name	Clear EAP credential information for the specified profile.
	interface interface-id	Clear EAP information for the specified interface.
	method name	Clear EAP information for the specified method.
	transport name	Clear EAP transport information for the specified lower level.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
Usage Guidelines	12.2(25)SEE You can clear all counte	This command was introduced.

clear errdisable interface

Use the **clear errdisable interface** privileged EXEC command to re-enable a VLAN that was error disabled.

clear errdisable interface interface-id vlan [vlan-list]

	vlan list	(Optional) Specify a list of VLANs to be re-enabled. If a vlan-list is not specified, then all VLANs are re-enabled.
Command Default	No default is defined	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(37)SE	This command was introduced.
		ble for VLANs by using the clear errdisable interface command.
Fxamples	This example shows how t	
Examples	-	to re-enable all VLANs that were error-disabled on port Gi4/0/2.
	-	to re-enable all VLANs that were error-disabled on port Gi4/0/2.
	Switch# clear errdisabl	to re-enable all VLANs that were error-disabled on port Gi4/0/2.
	Switch# clear errdisabl	to re-enable all VLANs that were error-disabled on port Gi4/0/2. .e interface GigabitEthernet4/0/2 vlan Description Enables error-disabled detection for a specific cause or all
	Switch# clear errdisabl Command errdisable detect cause	to re-enable all VLANs that were error-disabled on port Gi4/0/2. .e interface GigabitEthernet4/0/2 vlan Description Enables error-disabled detection for a specific cause or all causes.
Examples Related Commands	Switch# clear errdisabl Command errdisable detect cause errdisable recovery	to re-enable all VLANs that were error-disabled on port Gi4/0/2. .e interface GigabitEthernet4/0/2 vlan Description Enables error-disabled detection for a specific cause or all causes. Configures the recovery mechanism variables. Displays error-disabled detection status.

clear arp inspection log

Use the **clear ip arp inspection log** privileged EXEC command to clear the dynamic Address Resolution Protocol (ARP) inspection log buffer.

clear ip arp inspection log

Syntax Description This command has no arguments or keyword

- **Defaults** No default is defined.
- Command ModesPrivileged EXEC

 Release
 Modification

 12.2(20)SE
 This command was introduced.

Examples This example shows how to clear the contents of the log buffer:

Switch# clear ip arp inspection log

You can verify that the log was cleared by entering the show ip arp inspection log privileged command.

Related Commands	Command	Description
	arp access-list	Defines an ARP access control list (ACL).
	ip arp inspection log-buffer	Configures the dynamic ARP inspection logging buffer.
	ip arp inspection vlan logging	Controls the type of packets that are logged per VLAN.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

clear ip arp inspection statistics

Use the **clear ip arp inspection statistics** privileged EXEC command to clear the dynamic Address Resolution Protocol (ARP) inspection statistics.

clear ip arp inspection statistics [vlan vlan-range]

Syntax Description	vlan vlan-range	(Optional) Clear statistics for the specified VLAN or VLANs.
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release M	odification
	12.2(20)SE Th	his command was introduced.
Examples		to clear the statistics for VLAN 1:
	You can verify that the statistics were deleted by entering the show ip arp inspecti privileged EXEC command.	
Related Commands	Command	Description
	show inventory statistic	cs Displays statistics for forwarded, dropped, MAC validation failure, and IP validation failure packets for all VLANs or the specified VLAN.

clear ip dhcp snooping

Use the **clear ip dhcp snooping** privileged EXEC command to clear the DHCP snooping binding database, the DHCP snooping binding database agent statistics, or the DHCP snooping statistics counters.

clear ip dhcp snooping {binding {* | *ip-address* | interface *interface-id* | vlan *vlan-id*} | database statistics | statistics}

Syntax Description	binding	Clear the DHCP snooping binding database.	
	*	Clear all automatic bindings.	
	ip-address	Clear the binding entry IP address.	
	interface interface-ia	<i>l</i> Clear the binding input interface.	
	vlan vlan-id	Clear the binding entry VLAN.	
	database statistics	Clear the DHCP snooping binding database agent statistics.	
	statistics	Clear the DHCP snooping statistics counter.	
Defaults	No default is defined.		
Delduits	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
Command mistory		This command was introduced.	
		The statistics keyword was introduced.	
		The *, <i>ip-address</i> , interface <i>interface-id</i> , and vlan <i>vlan-id</i> keywords were	
	· · /	introduced.	
Usage Guidelines	-	lear ip dhcp snooping database statistics command, the switch does not update	
	the entries in the bind	ing database and in the binding file before clearing the statistics.	
Examples	This example shows how to clear the DHCP snooping binding database agent statistics:		
	Switch# clear ip dhcp snooping database statistics		
	You can verify that the statistics were cleared by entering the show ip dhcp snooping database privileged EXEC command.		
	This example shows how to clear the DHCP snooping statistics counters:		
	Switch# clear ip dh	cp snooping statistics	
	You can verify that the statistics were cleared by entering the show ip dhcp snooping statistics user		
	EXEC command.		

Related Commands C

Command	Description
ip dhcp snooping	Enables DHCP snooping on a VLAN.
ip dhcp snooping database	Configures the DHCP snooping binding database agent or the binding file.
show ip dhcp snooping binding	Displays the status of DHCP snooping database agent.
show ip dhcp snooping database	Displays the DHCP snooping binding database agent statistics.
show ip dhcp snooping statistics	Displays the DHCP snooping statistics.

clear ipc

Use the **clear ipc** privileged EXEC command to clear Interprocess Communications Protocol (IPC) statistics.

clear ipc {queue-statistics | statistics}

Syntax Description	queue-statistics	Clear the IPC queue statistics.	
	statistics	Clear the IPC statistics.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(20)SE	This command was introduced.	
Examples		clear ipc queue-statistics command.	
Examples	This example shows how to clear all statistics: Switch# clear ipc statistics		
	This example shows how to clear only the queue statistics:		
	Switch# clear ipc queue-statistics		
	You can verify that the statistics were deleted by entering the show ipc rpc or the show ipc session privileged EXEC command.		
Related Commands	Command	Description	
	show ipc {rpc session	on } Displays the IPC multicast routing statistics.	

2-49

clear l2protocol-tunnel counters

Use the **clear l2protocol-tunnel counters** privileged EXEC command to clear the protocol counters in protocol tunnel ports.

clear l2protocol-tunnel counters [interface-id]

Syntax Description	interface-id	(Optional) Specify interface (physical interface or port channel) for which protocol counters are to be cleared.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.2(25)SE	This command was introduced.
Usage Guidelines	Use this command to c	clear protocol tunnel counters on the switch or on the specified interface.
Examples	This example shows he	ow to clear Layer 2 protocol tunnel counters on an interface:
	Switch# clear 12prot	cocol-tunnel counters gigabitethernet0/3
Related Commands	Command	Description
	show l2protocol-tunr	Displays information about ports configured for Layer 2 protocol tunneling.

clear lacp

Use the **clear lacp** privileged EXEC command to clear Link Aggregation Control Protocol (LACP) channel-group counters.

clear lacp {channel-group-number counters | counters}

Syntax Description	channel-group-number	(Optional) Channel group number. The range is 1 to 48.
	counters	Clear traffic counters.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines		The <i>channel-group-number</i> range was changed from 1 to 12 to 1 to 48. Is by using the clear lacp counters command, or you can clear only the counters group by using the clear lacp <i>channel-group-number</i> counters command.
	You can clear all counter for the specified channel	s by using the clear lacp counters command, or you can clear only the counters l group by using the clear lacp <i>channel-group-number</i> counters command.
Usage Guidelines Examples	You can clear all counter for the specified channel	s by using the clear lacp counters command, or you can clear only the counters I group by using the clear lacp <i>channel-group-number</i> counters command.
	You can clear all counter for the specified channel This example shows how Switch# clear lacp co	s by using the clear lacp counters command, or you can clear only the counters l group by using the clear lacp <i>channel-group-number</i> counters command. v to clear all channel-group information: unters
	You can clear all counter for the specified channel This example shows how Switch# clear lacp co	s by using the clear lacp counters command, or you can clear only the counters l group by using the clear lacp <i>channel-group-number</i> counters command. v to clear all channel-group information: unters v to clear LACP traffic counters for group 4:

clear mac address-table

Use the **clear mac address-table** privileged EXEC command to delete from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, or all dynamic addresses on a particular VLAN. This command also clears the MAC address notification global counters.

clear mac address-table {dynamic [address mac-addr | interface interface-id | vlan vlan-id] |
 notification}

Syntax Description	dynamic	Delete all dynamic MAC addresses.
	dynamic address <i>mac-addr</i>	(Optional) Delete the specified dynamic MAC address.
	dynamic interface <i>interface-id</i>	(Optional) Delete all dynamic MAC addresses on the specified physical port or port channel.
	dynamic vlan vlan-id	(Optional) Delete all dynamic MAC addresses for the specified VLAN. The range is 1 to 4094.
	notification	Clear the notifications in the history table and reset the counters.
Defaults	No default is defined.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Examples	Switch# clear mac add	w to remove a specific MAC address from the dynamic address table: ress-table dynamic address 0008.0070.0007 nformation was deleted by entering the show mac address-table privileged

Related Commands	C

ated Commands	Command	Description
	mac address-table notification	Enables the MAC address notification feature.
	show mac access-group	Displays the MAC address table static and dynamic entries.
	show mac address-table notification	Displays the MAC address notification settings for all interfaces or the specified interface.
	snmp trap mac-notification	Enables the Simple Network Management Protocol (SNMP) MAC address notification trap on a specific interface.

clear mac address-table move update

Use the **clear mac address-table move update** privileged EXEC command to clear the mac address-table-move update-related counters.

clear mac address-table move update

Syntax Description This command has no arguments or keywords.

Defaults No default is defined.

Command ModesPrivileged EXEC

Command History	Release	Modification
	12.2(25)SED	This command was introduced.

Examples This example shows how to clear the mac address-table move update related counters.

Switch# clear mac address-table move update

You can verify that the information was cleared by entering the **show mac address-table move update** privileged EXEC command.

Related Commands	Command	Description
	mac address-table move update {receive transmit}	Configures MAC address-table move update on the switch.
	show mac address-table move update	Displays the MAC address-table move update information on the switch.

clear pagp

Use the **clear pagp** privileged EXEC command to clear Port Aggregation Protocol (PAgP) channel-group information.

clear pagp {channel-group-number counters | counters}

abana al anoun numban	(Optional) Channel group number. The range is 1 to 48.	
	Clear traffic counters.	
counters		
No default is defined.		
Privileged EXEC		
Release	Modification	
12.1(19)EA1	This command was introduced.	
12.2(25)SE	The <i>channel-group-number</i> range was changed from 1 to 12 to 1 to 48.	
	s by using the clear pagp counters command, or you can clear only the counters group by using the clear pagp <i>channel-group-number</i> counters command.	
This example shows how	v to clear all channel-group information:	
Switch# clear pagp counters		
This example shows how to clear PAgP traffic counters for group 10:		
Switch# clear pagp 10 counters		
You can verify that infor	mation was deleted by entering the show pagp privileged EXEC command.	
Command	Description	
show pagp	Displays PAgP channel-group information.	
	Privileged EXEC Release 12.1(19)EA1 12.2(25)SE You can clear all counters for the specified channel This example shows how Switch# clear pagp coor This example shows how Switch# clear pagp 10 You can verify that infor Command	

clear port-security

Use the **clear port-security** privileged EXEC command to delete from the MAC address table all secure addresses or all secure addresses of a specific type (configured, dynamic, or sticky) on the switch or on an interface.

clear port-security {all | configured | dynamic | sticky} [[address mac-addr | interface interface-id] [vlan {vlan-id | {access | voice}}]]

Syntax Description	all	Delete all secure MAC addresses.	
	configured	Delete configured secure MAC addresses.	
	dynamic	Delete secure MAC addresses auto-learned by hardware.	
	sticky	Delete secure MAC addresses, either auto-learned or configured.	
	address mac-addr	(Optional) Delete the specified dynamic secure MAC address.	
	interface interface-id	(Optional) Delete all the dynamic secure MAC addresses on the specified physical port or VLAN.	
	vlan	(Optional) Delete the specified secure MAC address from the specified VLAN. Enter one of these options after you enter the vlan keyword:	
		• <i>vlan-id</i> —On a trunk port, specify the VLAN ID of the VLAN on which this address should be cleared.	
		• access —On an access port, clear the specified secure MAC address on the access VLAN.	
		• voice —On an access port, clear the specified secure MAC address on the voice VLAN.	
		Note The voice keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.	
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(25)SEA	This command was introduced.	
	12.2(25)SEB	The access and voice keywords were added.	
Examples	This example shows how to clear all secure addresses from the MAC address table:		
	Switch# clear port-security all		
	This axample shows how to remove a specific configured secure address from the MAC address tables		
	This example shows how to remove a specific configured secure address from the MAC address table:		
	Switch# clear port-security configured address 0008.0070.0007		

This example shows how to remove all the dynamic secure addresses learned on a specific interface:

Switch # clear port-security dynamic interface gigabitethernet0/1

This example shows how to remove all the dynamic secure addresses from the address table:

Switch# clear port-security dynamic

You can verify that the information was deleted by entering the **show port-security** privileged EXEC command.

Related Commands Command

Command	Description
switchport port-security	Enables port security on an interface.
switchport port-security mac-address mac-address	Configures secure MAC addresses.
switchport port-security maximum <i>value</i>	Configures a maximum number of secure MAC addresses on a secure interface.
show port-security	Displays the port security settings defined for an interface or for the switch.

clear spanning-tree counters

Use the **clear spanning-tree counters** privileged EXEC command to clear the spanning-tree counters.

clear spanning-tree counters [interface interface-id]

Command Modes Privileged EXEC Command History Release Modification 12.1(19)EA1 This command was introduced. Usage Guidelines If the interface-id is not specified, spanning-tree counters are cleared for all interfaces. Examples This example shows how to clear spanning-tree counters for all interfaces: Switch# clear spanning-tree counters Related Commands Command Description	Syntax Description	interface interface-id	(Optional) Clear all spanning-tree counters on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.
Command History Release Modification 12.1(19)EA1 This command was introduced. Usage Guidelines If the interface-id is not specified, spanning-tree counters are cleared for all interfaces. clear vmps statistics

Use the **clear vmps statistics** privileged EXEC command to clear the statistics maintained by the VLAN Query Protocol (VQP) client.

clear vmps statistics

Syntax Description	This command has	no arguments or keywords.	
Defaults	No default is define	ed.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Examples	This example shows how to clear VLAN Membership Policy Server (VMPS) statistics:		
	Switch# clear vmps statistics You can verify that information was deleted by entering the show vmps statistics privilege command.		
Related Commands	Command	Description	
	show vmps	Displays the VQP version, reconfirmation interval, retry count, VMPS IP addresses, and the current and primary servers.	

clear vtp counters

Use the **clear vtp counters** privileged EXEC command to clear the VLAN Trunking Protocol (VTP) and pruning counters.

clear vtp counters

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** No default is defined.
- **Command Modes** Privileged EXEC

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

- **Examples** This example shows how to clear the VTP counters:
 - Switch# clear vtp counters
 - You can verify that information was deleted by entering the **show vtp counters** privileged EXEC command.

Related Commands	Command	Description
	show vtp	Displays general information about the VTP management domain, status, and counters.

cluster commander-address

You do not need to enter this command from a standalone cluster member switch. The cluster command switch automatically provides its MAC address to cluster member switches when these switches join the cluster. The cluster member switch adds this information and other cluster information to its running configuration file. Use the **no** form of this global configuration command from the cluster member switch console port to remove the switch from a cluster only during debugging or recovery procedures.

cluster commander-address mac-address [member number name name]

no cluster commander-address

Syntax Description	mac-address	MAC address of the cluster command switch.
	member number	(Optional) Number of a configured cluster member switch. The range is 0 to 15.
	name name	(Optional) Name of the configured cluster up to 31 characters.
Defaults	The switch is not a m	ember of any cluster.
Command Modes	Global configuration	
Command History	Release	Modification
-	12.1(19)EA1	This command was introduced.
Usage Guidelines	This command is avai	ilable only on the cluster command switch.
	A cluster member car	have only one cluster command switch.
	The cluster member switch retains the identity of the cluster command switch during a system reload by using the <i>mac-address</i> parameter.	
	You can enter the no form on a cluster member switch to remove it from the cluster during debugging or recovery procedures. You would normally use this command from the cluster member switch console port only when the member has lost communication with the cluster command switch. With normal switch configuration, we recommend that you remove cluster member switches only by entering the no cluster member n global configuration command on the cluster command switch.	
	-	obal configuration command on the cluster command switch.

Examples

This is partial sample output from the running configuration of a cluster member.

Switch(config)# show running-configuration

<output truncated>

cluster commander-address 00e0.9bc0.a500 member 4 name my_cluster

<output truncated>

This example shows how to remove a member from the cluster by using the cluster member console.

Switch # configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# no cluster commander-address

You can verify your settings by entering the show cluster privileged EXEC command.

Related Commands Command Description		Description
	debug cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.

2-63

cluster discovery hop-count

Use the **cluster discovery hop-count** global configuration command on the cluster command switch to set the hop-count limit for extended discovery of candidate switches. Use the **no** form of this command to return to the default setting.

cluster discovery hop-count number

no cluster discovery hop-count

The cluster command switch selects the next available to the switch that is joining the cluster. word of the candidate switch for authentication when it joins the cluster he running or startup configuration. After a candidate switch becomes a

Examples This example shows how to add a switch as member 2 with MAC address 00E0.1E00.2222 and the password *key* to a cluster. The cluster command switch adds the candidate to the cluster through VLAN 3.

Switch(config) # cluster member 2 mac-address 00E0.1E00.2222 password key vlan 3

This example shows how to add a switch with MAC address 00E0.1E00.3333 to the cluster. This switch does not have a password. The cluster command switch selects the next available member number and assigns it to the switch that is joining the cluster.

Switch(config)# cluster member mac-address 00E0.1E00.3333

You can verify your settings by entering the **show cluster members** privileged EXEC command on the cluster command switch.

Related Commands	Command	Description
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.
	show cluster candidates	Displays a list of candidate switches.
	show cluster members	Displays information about the cluster members.

cluster outside-interface

Use the **cluster outside-interface** global configuration command to configure the outside interface for cluster Network Address Translation (NAT) so that a member without an IP address can communicate with devices outside the cluster. Use the **no** form of this command to return to the default setting.

cluster outside-interface interface-id

no cluster outside-interface

Syntax Description	interface-id	Interface to serve as the outside interface. Valid interfaces include physical interfaces, port-channels, or VLANs. The port-channel range is 1 to 48. The VLAN range is 1 to 4094.	
Defaults	The default outside int	erface is automatically selected by the cluster command switch.	
Command Modes	Global configuration		
Command History	Release	Modification	
-	12.1(19)EA1	This command was introduced.	
Usage Guidelines	Enter this command on switch, an error messa	ly on the cluster command switch. If you enter this command on a cluster member ge appears.	
Examples	This example shows how to set the outside interface to VLAN 1:		
	Switch(config)# cluster outside-interface vlan 1		
	You can verify your se	tting by entering the show running-config privileged EXEC command.	
Related Commands	Command	Description	
	show running-config	Displays the current operating configuration. For syntax information, select the Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.	

cluster run

Use the **cluster run** global configuration command to enable clustering on a switch. Use the **no** form of this command to disable clustering on a switch.

cluster run

no cluster run

Syntax Description	This command has no arguments or keywords.
--------------------	--------------------------------------------

- **Defaults** Clustering is enabled on all switches.
- Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines When you enter the **no cluster run** command on a cluster command switch, the cluster command switch is disabled. Clustering is disabled, and the switch cannot become a candidate switch.

When you enter the **no cluster run** command on a cluster member switch, it is removed from the cluster. Clustering is disabled, and the switch cannot become a candidate switch.

When you enter the **no cluster run** command on a switch that is not part of a cluster, clustering is disabled on this switch. This switch cannot then become a candidate switch.

 Examples
 This example shows how to disable clustering on the cluster command switch:

 Switch(config)# no cluster run

You can verify your setting by entering the **show cluster** privileged EXEC command.

Related Commands	Command	Description
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.

cluster standby-group

Use the **cluster standby-group** global configuration command to enable cluster command-switch redundancy by binding the cluster to an existing Hot Standby Router Protocol (HSRP). Entering the routing-redundancy keyword enables the same HSRP group to be used for cluster command-switch redundancy and routing redundancy. Use the **no** form of this command to return to the default setting.

cluster standby-group HSRP-group-name [routing-redundancy]

no cluster standby-group

Syntax Description	HSRP-group-name	Name of the HSRP group that is bound to the cluster. The group name is limited to 32 characters.	
	routing-redundancy	(Optional) Enable the same HSRP standby group to be used for cluster command-switch redundancy and routing redundancy.	
Defaults	The cluster is not bour	d to any HSRP group.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	Enter this command only on the cluster command switch. If you enter it on a cluster member switch, an error message appears. The cluster command switch propagates the cluster-HSRP binding information to all cluster-HSRP capable members. Each cluster member switch stores the binding information in its NVRAM. The HSRP group name must be a valid standby group; otherwise, the command exits with an error.		
	The same group name should be used on all members of the HSRP standby group that is to be bound to the cluster. The same HSRP group name should also be used on all cluster-HSRP capable members for the HSRP group that is to be bound. (When not binding a cluster to an HSRP group, you can use different names on the cluster commander and the members.)		
Examples	This example shows how to bind the HSRP group named <i>my_hsrp</i> to the cluster. This command is executed on the cluster command switch.		
	Switch(config)# cluster standby-group my_hsrp		
	This example shows he cluster redundancy.	ow to use the same HSRP group named my_hsrp for routing redundancy and	
	Switch(config)# clus	ter standby-group my_hsrp routing-redundancy	

This example shows the error message when this command is executed on a cluster command switch and the specified HSRP standby group does not exist:

Switch(config)# cluster standby-group my_hsrp
%ERROR: Standby (my_hsrp) group does not exist

This example shows the error message when this command is executed on a cluster member switch:

Switch(config)# cluster standby-group my_hsrp routing-redundancy %ERROR: This command runs on a cluster command switch

You can verify your settings by entering the **show cluster** privileged EXEC command. The output shows whether redundancy is enabled in the cluster.

Related Commands	Command	Description
	standby ip	Enables HSRP on the interface. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.
	show standby	Displays standby group information. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.

cluster timer

Use the **cluster timer** global configuration command to set the interval in seconds between heartbeat messages. Use the **no** form of this command to set the interval to the default value.

cluster timer interval-in-secs

no cluster timer

Syntax Description	interval-in-secs	Interval in seconds between heartbeat messages. The range is 1 to 300 seconds.	
Defaults	The interval is 8 sec	onds.	
Command Modes	Global configuration	1	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	Enter this command with the cluster holdtime global configuration command only on the cluster command switch. The cluster command switch propagates the values to all its cluster members so that the setting is consistent among all switches in the cluster. The holdtime is typically set as a multiple of the heartbeat interval timer (cluster timer). For example, it takes (holdtime-in-secs divided by the interval-in-secs) number of heartbeat messages to be missed in a row to declare a switch down.		
Examples	<pre>switch: Switch(config)# cl</pre>		
	Switch(config)# cluster holdtime 30 You can verify your settings by entering the show cluster privileged EXEC command.		
Related Commands	Command	Description	
	show cluster	Displays the cluster status and a summary of the cluster to which the switch belongs.	

define interface-range

Use the **define interface-range** global configuration command to create an interface-range macro. Use the **no** form of this command to delete the defined macro.

define interface-range macro-name interface-range

no define interface-range macro-name interface-range

Syntax Description	macro-name	Name of the interface-range macro; up to 32 characters.	
	interface-range	Interface range; for valid values for interface ranges, see "Usage Guidelines."	
Defaults	This command has no default setting.		
Command Modes	Global configurati	on	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	The macro name is	s a 32-character maximum character string.	
	A macro can contain up to five ranges.		
	All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs, but you can combine multiple interface types in a macro.		
	When entering the <i>interface-range</i> , use this format:		
	• type {first-interface} - {last-interface}		
	• You must add a space between the first interface number and the hyphen when entering an <i>interface-range</i> . For example, gigabitethernet 0/1 - 2 is a valid range; gigabitethernet 0/1-2 is not a valid range		
	Valid values for <i>type</i> and <i>interface</i> :		
	• vlan vlan-id - vlan-ID, where the VLAN ID is 1 to 4094		
	VLAN interfaces must have been configured with the interface vlan command (the show running-config privileged EXEC command displays the configured VLAN interfaces). VLAN interfaces not displayed by the show running-config command cannot be used in <i>interface-ranges</i> .		
	• port-channel port-channel-number, where port-channel-number is from 1 to 48		
	• fastethernet module/{ <i>first port</i> } - { <i>last port</i> }		
	• gigabitethernet module/{ <i>first port</i> } - { <i>last port</i> }		

For physical interfaces:

- module is always 0.
- the range is type 0/number number (for example, gigabitethernet 0/1 2).

When you define a range, you must enter a space before the hyphen (-), for example:

gigabitethernet0/1 - 2

You can also enter multiple ranges. When you define multiple ranges, you must enter a space after the first entry before the comma (,). The space after the comma is optional, for example:

fastethernet0/3, gigabitethernet0/1 - 2

fastethernet0/3 -4, gigabitethernet0/1 - 2

Examples This example shows how to create a multiple-interface macro:

Switch(config)# define interface-range macrol fastethernet0/1 - 2, gigabitethernet0/1 - 2

Related Commands	Command	Description
	interface range	Executes a command on multiple ports at the same time.
	show running-config	Displays the current operating configuration, including defined macros. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

Use the **delete** privileged EXEC command to delete a file or directory on the flash memory device.

delete [/force] [/recursive] filesystem:/file-url

Contan Description	10		
Syntax Description	/force	(Optional) Suppress the prompt that confirms the deletion.	
	/recursive	(Optional) Delete the named directory and all subdirectories and the files contained in it.	
	filesystem:	Alias for a flash file system.	
	The syntax for the local flash file system: flash:		
	lfile-url	The path (directory) and filename to delete.	
Command Modes	Privileged EXE	C	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	If you use the /recursive keyword without the /force keyword, you are prompted to confirm the deletion of every file. The prompting behavior depends on the setting of the file prompt global configuration command. By default, the switch prompts for confirmation on destructive file operations. For more information about this command, see the <i>Cisco IOS Command Reference for Release 12.1</i> .		
Examples	This example s download of a	hows how to remove the directory that contains the old software image after a successful new image:	
	Switch# delete /force /recursive flash:/old-image		
	You can verify that the directory was removed by entering the dir <i>filesystem</i> : privileged EXEC command.		
Related Commands	Command	Description	
	archive down	oad-sw Downloads a new image to the switch and overwrites or keeps the existing image.	

deny (ARP access-list configuration)

Use the **deny** Address Resolution Protocol (ARP) access-list configuration command to deny an ARP packet based on matches against the DHCP bindings. Use the **no** form of this command to remove the specified access control entry (ACE) from the access list.

- deny {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac mack}]} [log]
- no deny {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]} [log]

Syntax Description	request	(Optional) Define a match for the ARP request. When request is not specified, matching is performed against all ARP packets.
	ip	Specify the sender IP address.
	any	Deny any IP or MAC address.
	host sender-ip	Deny the specified sender IP address.
	sender-ip sender-ip-mask	Deny the specified range of sender IP addresses.
	mac	Deny the sender MAC address.
	host sender-mac	Deny a specific sender MAC address.
	sender-mac sender-mac-mask	Deny the specified range of sender MAC addresses.
	response ip	Define the IP address values for the ARP responses.
	host target-ip	Deny the specified target IP address.
	target-ip target-ip-mask	Deny the specified range of target IP addresses.
	mac	Deny the MAC address values for the ARP responses.
	host target-mac	Deny the specified target MAC address.
	target-mac target-mac-mask	Deny the specified range of target MAC addresses.
	log	(Optional) Log a packet when it matches the ACE.

Defaults

There are no default settings. However, at the end of the ARP access list, there is an implicit **deny ip any mac any** command.

Command Modes ARP access-list configuration

Command History	Release	Modification
	12.2(20)SE	This command was introduced.

show arp access-list

Usage Guidelines	You can add deny clauses to dr	op ARP packets based on matching criteria.	
Examples	-	ine an ARP access list and to deny both ARP requests and ARP responses of 1.1.1.1 and a MAC address of 0000.0000.abcd:	
	Switch(config)# arp access-list static-hosts Switch(config-arp-nacl)# deny ip host 1.1.1.1 mac host 0000.0000.abcd Switch(config-arp-nacl)# end		
	You can verify your settings by entering the show arp access-list privileged EXEC command.		
Related Commands	Command	Description	
	arp access-list	Defines an ARP access control list (ACL).	
	ip arp inspection filter vlan	Permits ARP requests and responses from a host configured with a static IP address.	
	permit (ARP access-list configuration)	Permits an ARP packet based on matches against the DHCP bindings.	

Displays detailed information about ARP access lists.

deny (IPv6 access-list configuration)

Use the **deny** command in IPv6 access list configuration mode to set deny conditions for an IPv6 access list. Use the **no** form of this command to remove the deny conditions.

- deny {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value]
 [time-range name]
- **no deny** {*protocol*} {*source-ipv6-prefix/prefix-length* | **any** | **host** *source-ipv6-address*} [*operator* [*port-number*]] {*destination-ipv6-prefix/prefix-length* | **any** | **host** *destination-ipv6-address*} [*operator* [*port-number*]] [**dscp** *value*] [**fragments**] [**log**] [**log-input**] [**sequence** *value*] [**time-range** *name*]

Internet Control Message Protocol

deny icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log]
 [log-input] [sequence value] [time-range name]

Transmission Control Protocol

deny tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port |
 protocol}] [psh] [range {port | protocol}] [rst] [sequence value] [syn] [time-range name]
 [urg]

User Datagram Protocol

deny udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port |
 protocol}] [sequence value] [time-range name]

This command is available only if the switch is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	protocol	Name or number of an Internet protocol. It can be one of the keywords ahp ,
		esp , icmp , ipv6 , pcp , sctp , tcp , or udp , or an integer in the range from 0 to 255 representing an IPv6 protocol number.
	source-ipv6-prefix/prefix- length	The source IPv6 network or class of networks about which to set deny conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended universal identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	any	An abbreviation for the IPv6 prefix ::/0.
	host source-ipv6-address	The source IPv6 host address for which to set deny conditions.
		This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	operator [port-number]	(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).
		If the operator is positioned after the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port.
		If the operator is positioned after the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port.
		The range operator requires two port numbers. All other operators require one port number.
		The optional <i>port-number</i> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
	destination-ipv6-prefixl prefix-length	The destination IPv6 network or class of networks for which to set deny conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	host	The destination IPv6 host address for which to set deny conditions.
	destination-ipv6-address	This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	dscp value	(Optional) Match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

fragments	(Optional) Match non-initial fragmented packets where the fragment extension header contains a non-zero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] arguments are not specified.	
log	(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages sent to the console is controlled by the logging console command.)	
	The message includes the access list name and sequence number, whether the packet was denied; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets denied in the prior 5-minute interval.	
	Note Logging is not supported for port ACLs.	
log-input	(Optional) Provide the same function as the log keyword, except that the logging message also includes the receiving interface.	
sequence value	(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.	
time-range name	(Optional) Specify the time range that applies to the deny statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.	
icmp-type	(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by an ICMP message type. The type is a number from 0 to 255.	
icmp-code	(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.	
icmp-message	(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or an ICMP message type and code. The possible names are listed in the "Usage Guidelines" section.	
ack	(Optional) Only for the TCP protocol: Acknowledgment (ACK) bit set.	
established	(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.	
fin	(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.	
<pre>neq {port protocol}</pre>	(Optional) Match only packets that are not on a given port number.	
psh	(Optional) Only for the TCP protocol: Push function bit set.	
<pre>range {port protocol}</pre>	(Optional) Match only packets in the range of port numbers.	
rst	(Optional) Only for the TCP protocol: Reset bit set.	
syn	(Optional) Only for the TCP protocol: Synchronize bit set.	
urg	(Optional) Only for the TCP protocol: Urgent pointer bit set.	

<u>Note</u>

Although visible in the command-line help strings, the **flow-label**, **routing**, and **undetermined-transport** keywords are not supported.

Defaults	No IPv6 access list is defined.		
Command Modes	IPv6 access list configuration		
Command History	Release	Modification This command was introduced.	
Usage Guidelines	•	ccess-list configuration mode) command is similar to the deny (IPv4 access-list e) command, except that it is IPv6-specific.	
	Use the deny (IPv6) command after the ipv6 access-list command to enter IPv6 access list configuration mode and to define the conditions under which a packet passes the access list.		
	Specifying IPv6 for the <i>protocol</i> argument matches against the IPv6 header of the packet.		
	By default, the first statement in an access list is number 10, and the subsequent statements are numbered in increments of 10.		
•	list. To add a new	it , deny , or remark statements to an existing access list without re-entering the entire statement anywhere other than at the end of the list, create a new statement with an number that falls between two existing entry numbers to show where it belongs.	
<u>Note</u>	any any statement discovery. To disal nd-ns, there must	as implicit permit icmp any any nd-na , permit icmp any any nd-ns , and deny ipv6 ts as its last match conditions. The two permit conditions allow ICMPv6 neighbor llow ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any be an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement Pv6 ACL must contain at least one entry.	
	The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.		
	Both the <i>source-ipv6-prefix/prefix-length</i> and <i>destination-ipv6-prefix/prefix-length</i> arguments are used for traffic filtering. (The source prefix filters traffic based upon the traffic source; the destination prefix filters traffic based upon the traffic destination.)		
		ts only prefixes from /0 to /64 and EUI-based /128 prefixes for aggregatable global ocal host addresses.	
	The fragments key arguments are not	yword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] specified.	

This is a list of ICMP message names:

beyond-scope	destination-unreachable
echo-reply	echo-request
header	hop-limit
mld-query	mld-reduction
mld-report	nd-na
nd-ns	next-header
no-admin	no-route
packet-too-big	parameter-option
parameter-problem	port-unreachable
reassembly-timeout	renum-command
renum-result	renum-seq-number
router-advertisement	router-renumbering
router-solicitation	time-exceeded
unreachable	

Examples

This example configures the IPv6 access list named CISCO and applies the access list to outbound traffic on a Layer 3 interface. The first deny entry in the list prevents all packets that have a destination TCP port number greater than 5000 from leaving the interface. The second deny entry in the list prevents all packets that have a source UDP port number less than 5000 from leaving the interface. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets to leave the interface. The second permit entry in the list permits all other traffic to leave the interface. The second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access list.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
Switch(config)# interface gigabitethernet0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out
```

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and enters IPv6 access list configuration mode.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	permit (IPv6 access-list configuration)	Sets permit conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

deny (MAC access-list configuration)

Use the **deny** MAC access-list configuration command to prevent non-IP traffic from being forwarded if the conditions are matched. Use the **no** form of this command to remove a deny condition from the named MAC access list.

- {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask |mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]
- no {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]

Syntax Description	any	Keyword to specify to deny any source or destination MAC address.
	host src MAC-addr	Define a host MAC address and optional subnet mask. If the source
	src-MAC-addr mask	address for a packet matches the defined address, non-IP traffic from that address is denied.
	host dst-MAC-addr	Define a destination MAC address and optional subnet mask. If the
	dst-MAC-addr mask	destination address for a packet matches the defined address, non-IP traffic to that address is denied.
	type mask	(Optional) Use the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
		The type is 0 to 65535, specified in hexadecimal.
		The <i>mask</i> is a mask of <i>don't care</i> bits applied to the Ethertype before testing for a match.
	aarp	(Optional) Select Ethertype AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
	amber	(Optional) Select EtherType DEC-Amber.
	cos cos	(Optional) Select a class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message reminds the user if the cos option is configured.
	dec-spanning	(Optional) Select EtherType Digital Equipment Corporation (DEC) spanning tree.
	decnet-iv	(Optional) Select EtherType DECnet Phase IV protocol.
	diagnostic	(Optional) Select EtherType DEC-Diagnostic.
	dsm	(Optional) Select EtherType DEC-DSM.
	etype-6000	(Optional) Select EtherType 0x6000.
	etype-8042	(Optional) Select EtherType 0x8042.
	lat	(Optional) Select EtherType DEC-LAT.
	lavc-sca	(Optional) Select EtherType DEC-LAVC-SCA.

lsap lsap-number mask	(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.
	<i>mask</i> is a mask of <i>don't care</i> bits applied to the LSAP number before testing for a match.
mop-console	(Optional) Select EtherType DEC-MOP Remote Console.
mop-dump	(Optional) Select EtherType DEC-MOP Dump.
msdos	(Optional) Select EtherType DEC-MSDOS.
mumps	(Optional) Select EtherType DEC-MUMPS.
netbios	(Optional) Select EtherType DEC- Network Basic Input/Output System (NETBIOS).
vines-echo	(Optional) Select EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.
vines-ip	(Optional) Select EtherType VINES IP.
xns-idp	(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite (0 to 65535), an arbitrary Ethertype in decimal, hexadecimal, or octal.

Note

Though visible in the command-line help strings, **appletalk** is not supported as a matching condition.

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-4.

Table 2-4 IPX Filtering Criteria

IPX Encapsulation Type		
Cisco IOS Name	Novel Name	Filter Criterion
arpa	Ethernet II	Ethertype 0x8137
snap	Ethernet-snap	Ethertype 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

Defaults This command has no defaults. However; the default action for a MAC-named ACL is to deny.

Related Commands	Command	Description
	mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.
	permit (MAC access-list	Permits non-IP traffic to be forwarded if conditions are matched.

Displays access control lists configured on a switch.

diagnostic monitor

Use the **diagnostic monitor** global configuration command to configure the health-monitoring diagnostic testing. Use the **no** form of this command to disable testing and return to the default settings.

diagnostic monitor test {*test-id* | *test-id-range* | **all**}

diagnostic monitor interval test {test-id | test-id-range | all } hh:mm:ss milliseconds day

diagnostic monitor syslog

diagnostic monitor threshold test {test-id | test-id-range | all} count failure count

no diagnostic monitor test {*test-id* | *test-id-range* | **all**}

no diagnostic monitor interval test {*test-id* | *test-id-range* | **all**}

no diagnostic monitor syslog

no diagnostic monitor threshold test {*test-id* | *test-id-range* | **all**} **failure count**

Syntax Description	test	Specify a test to run.
	test-id	Identification number for the test to be run; see the "Usage Guidelines" section for additional information.
	test-id-range	Range of identification numbers for tests to be run; see the "Usage Guidelines" section for additional information.
	all	Run all the diagnostic tests.
	interval	Specify an interval between tests to be run.
	hh:mm:ss	Specify the number of time between tests; see the "Usage Guidelines" section for formatting guidelines.
	milliseconds	Specify the time in milliseconds; valid values are 0 to 999.
	day	Specify the number of days between tests; see the "Usage Guidelines" section for formatting guidelines.
	syslog	Enable the generation of a syslog message when a health-monitoring test fails.
	threshold	Specify the failure threshold.
	failure count count	Specify the failure threshold count.

Defaults The defaults are as follows:

- Monitoring is disabled.
- syslog is enabled.

Command Modes Global configuration

diagnostic start

Use the **diagnostic start** user command to run the specified diagnostic test.

diagnostic start test { test-id | test-id-range | all | basic | non-disruptive }

	test	Specify a test to run.
	test-id	Identification number for the test to be run; see the "Usage Guidelines"
		section for additional information.
	test-id-range	Range of identification numbers for tests to be run; see the "Usage Guidelines" section for additional information.
	all	Run all diagnostic tests.
	basic	Run basic on-demand diagnostic tests.
	non-disruptive	Run the nondisruptive health-monitoring tests.
Defaults	This command ha	as no default settings.
Command Modes	User EXEC	
Command History	Release	Modification
	12.2(35)SE	This command was introduced.
Usage Guidelines	Enter the show di	agnostic content command to display the test ID list.
	Enter the <i>test-id-r</i> IDs 1, 3, 4, 5, and	<i>tange</i> as integers separated by a comma and a hyphen (for example, 1,3-6 specifies test 1 6).
Examples	This example sho	ws how to start all the diagnostic test on a switch:
	completion of th	unning test(s) 2-6 will cause the switch under test to reload after he test list. unning test(s) 2-6 may disrupt normal system operation
Related Commands	Command	Description

dot1x

Use the **dot1x** global configuration command to globally enable IEEE 802.1x authentication. Use the **no** form of this command to return to the default setting.

dot1x {critical {eapol | recovery delay milliseconds} | {guest-vlan supplicant} |
 system-auth-control}

no dot1x {critical {eapol | recovery delay} | {guest-vlan supplicant} | system-auth-control}

Though visible in the command-line help strings, the **credentials** name keywords are not supported.

Syntax Description	critical {eapol recovery delay milliseconds}	Configure the inaccessible authentication bypass parameters. For more information, see the dot1x critical (global configuration) command.
	guest-vlan supplicant	Enable optional guest VLAN behavior globally on the switch.
	system-auth-control	Enable IEEE 802.1x authentication globally on the switch.

TEEE 802.1X authentication is disabled, and the optional guest VLAN behavior is disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	12.2(25)SE	The guest-vlan supplicant keywords were added.
	12.2(25)SEE	The critical {eapol recovery delay milliseconds} keywords were added.

Usage Guidelines

s You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list before globally enabling IEEE 802.1x authentication. A method list describes the sequence and authentication methods to be used to authenticate a user.

Before globally enabling IEEE 802.1x authentication on a switch, remove the EtherChannel configuration from the interfaces on which IEEE 802.1x authentication and EtherChannel are configured.

If you are using a device running the Cisco Access Control Server (ACS) application for IEEE 802.1x authentication with EAP-Transparent LAN Services (TLS) and with EAP-MD5, make sure that the device is running ACS Version 3.2.1 or later.

You can use the **guest-vlan supplicant** keywords to enable the optional IEEE 802.1x guest VLAN behavior globally on the switch. For more information, see the **dot1x guest-vlan** command.

dot1x

 Examples
 This example shows how to globally enable IEEE 802.1x authentication on a switch:

 Switch(config)# dot1x system-auth-control

This example shows how to globally enable the optional guest VLAN behavior on a switch: Switch(config)# dot1x guest-vlan supplicant

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature on the switch.
	dot1x guest-vlan	Enables and specifies an active VLAN as an IEEE 802.1x guest VLAN.
	dot1x port-control	Enables manual control of the authorization state of the port.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x auth-fail max-attempts

Use the **dot1x auth-fail max-attempts** interface configuration command to configure the maximum allowable authentication attempts before a port is moved to the restricted VLAN. To return to the default setting, use the **no** form of this command.

dot1x auth-fail max-attempts max-attempts

no dot1x auth-fail max-attempts

Syntax Description	max-attempts	Specify a maximum number of authentication attempts allowed before a port is moved to the restricted VLAN. The range is 1 to 3, the default value is 3.
Defaults	The default value	is 3 attempts.
Command Modes	Interface configur	ration
Command History	Release	Modification
	12.2(25)SED	This command was introduced.
Usage Guidelines		e the maximum number of authentication attempts allowed by the VLAN, the change the re-authentication timer expires.
Examples	-	ws how to set 2 as the maximum number of authentication attempts allowed before the the restricted VLAN on port 3:
	Switch(config)#	<pre>tion commands, one per line. End with CNTL/Z. interface gigabitethernet0/3 f)# dot1x auth-fail max-attempts 2 f)# end</pre>
	You can verify yo command.	our settings by entering the show dot1x [interface interface-id] privileged EXEC

Related Commands	Command	Description
	dot1x auth-fail vlan [vlan id]	Enables the optional restricted VLAN feature.
	<pre>dot1x max-reauth-req [count]</pre>	Sets the maximum number of times that the switch restarts the authentication process before a port changes to the unauthorized state.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x auth-fail vlan

Use the **dot1x auth-fail vlan** interface configuration command to enable the restricted VLAN on a port. To return to the default setting, use the **no** form of this command.

dot1x auth-fail vlan vlan-id

no dot1x auth-fail vlan

Syntax Description	vlan-id	Specify a VLAN in the range of 1 to 4094.
Defaults	No restricted VL	AN is configured.
Command Modes	Interface configur	ration
Command History	Release	Modification
	12.2(25)SED	This command was introduced.
Usage Guidelines	You can configure	e a restricted VLAN on ports configured as follows:
	• single-host (default) mode
	• auto mode fo	or authorization
	requests if it is di link-down event c connected through	e re-authentication. The ports in restricted VLANs do not receive re-authentication sabled. To start the re-authentication process, the restricted VLAN must receive a or an Extensible Authentication Protocol (EAP) logoff event from the port. If a host is h a hub, the port might never receive a link-down event when that host is disconnected, night not detect any new hosts until the next re-authentication attempt occurs.
	message is sent to	fails authentication, the port is moved to a restricted VLAN, and an EAP <i>success</i> o the supplicant. Because the supplicant is not notified of the actual authentication ht be confusion about this restricted network access. An EAP success message is sent
		access message is not sent, the supplicant tries to authenticate every 60 seconds (the ending an EAP-start message.
	• Some hosts (f an EAP succe	for example, devices running Windows XP) cannot implement DHCP until they receive ess message.
	success message f	ht cache an incorrect username and password combination after receiving an EAP from the authenticator and re-use that information in every re-authentication. Until the the correct username and password combination, the port remains in the restricted
	Internal VLANs u	used for Layer 3 ports cannot be configured as restricted VLANs.
	You cannot config message is genera	gure a VLAN to be both a restricted VLAN and a voice VLAN. If you do this, a syslog ated.

When a restricted VLAN port is moved to an unauthorized state, the authentication process restarts. If the supplicant fails the authentication process again, the authenticator waits in the held state. After the supplicant has correctly re-authenticated, all IEEE 802.1x ports are reinitialized and treated as normal IEEE 802.1x ports.

When you reconfigure a restricted VLAN as a different VLAN, any ports in the restricted VLAN are also moved, and the ports stay in their currently authorized state.

When you shut down or remove a restricted VLAN from the VLAN database, any ports in the restricted VLAN are immediately moved to an unauthorized state, and the authentication process restarts. The authenticator does not wait in a held state because the restricted VLAN configuration still exists. While the restricted VLAN is inactive, all authentication attempts are counted so that when the restricted VLAN becomes active, the port is immediately placed in the restricted VLAN.

The restricted VLAN is supported only in single host mode (the default port mode). For this reason, when a port is placed in a restricted VLAN, the supplicant's MAC address is added to the MAC address table, and any other MAC address that appears on the port is treated as a security violation.

Examples

This example shows how to configure a restricted VLAN on port 1:

```
Switch# configure terminal
```

```
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x auth-fail vlan 40
Switch(config-if)# end
Switch#
```

You can verify your configuration by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x auth-fail max-attempts [max-attempts]	Configures the number of authentication attempts allowed before assigning a supplicant to the restricted VLAN.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x control-direction

Use the **dot1x control-direction** interface configuration command to enable the IEEE 802.1x authentication with the wake-on-LAN (WoL) feature and to configure the port control as unidirectional or bidirectional. Use the **no** form of this command to return to the default setting.

dot1x control-direction {both | in}

no dot1x control-direction

Syntax Description	both	Enable bidirectional control on port. The port cannot receive packets from or send packets to the host.
	in	Enable unidirectional control on port. The port can send packets to the host but cannot receive packets from the host.
Defaults	The port is in bidire	ctional mode.
Command Modes	Interface configurat	ion
Command History	Release	Modification
	12.2(25)SEC	This command was introduced.
Usage Guidelines	Use the both keywo mode.	ord or the no form of this command to return to the default setting, bidirectional
		on about WoL, see the "Using IEEE 802.1x Authentication with Wake-on-LAN" iguring IEEE 802.1x Port-Based Authentication" chapter in the software
Examples	This example shows	s how to enable unidirectional control:
	Switch(config-if)	# dot1x control-direction in
	This example shows	s how to enable bidirectional control:
	Switch(config-if)	# dot1x control-direction both
		settings by entering the show dot1x all privileged EXEC command.
		privileged EXEC command output is the same for all switches except for the port of the port. If a host is attached to the port but is not yet authenticated, a display ars:
	Supplicant MAC 000 AuthSM State = CON BendSM State = IDI PortStatus = UNAU	NNECTING LE

If you enter the **dot1x control-direction in** interface configuration command to enable unidirectional control, this appears in the **show dot1x all** command output:

ControlDirection = In

If you enter the **dot1x control-direction in** interface configuration command and the port cannot support this mode due to a configuration conflict, this appears in the **show dot1x all** command output:

ControlDirection = In (Disabled due to port settings)

Related Commands	Command	Description
	<pre>show dot1x [all interface interface-id]</pre>	Displays control-direction port setting status for the specified interface.

dot1x critical (global configuration)

Use the **dot1x critical** global configuration command on a standalone switch to configure the parameters for the inaccessible authentication bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. To return to default settings, use the **no** form of this command.

dot1x critical {eapol | recovery delay milliseconds}

no dot1x critical {eapol | recovery delay}

Syntax Description	eapol	Specify that the switch sends an EAPOL-Success message when the
		switch puts the critical port in the critical-authentication state.
	recovery delay millise	<i>conds</i> Set the recovery delay period in milliseconds. The range is from 1 to 10000 milliseconds.
Defaults		nd an EAPOL-Success message to the host when the switch successfully al port by putting the critical port in the critical-authentication state.
	The recovery delay per	iod is 1000 milliseconds (1 second).
Command Modes	Global configuration

Related Commands	Command	Description
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature, and configures the access VLAN for the feature.
	show dot1x	Displays IEEE 802.1x status for the specified port.

dot1x critical (interface configuration)

Use the **dot1x critical** interface configuration command on a standalone switch to enable the inaccessible-authentication-bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. You can also configure the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state. To disable the feature or return to default, use the **no** form of this command.

dot1x critical [recovery action reinitialize | vlan vlan-id]

no dot1x critical [recovery | vlan]

Syntax Description	recovery action	reinitialize	Enable the inaccessible-authentication-bypass recovery feature, and specify that the recovery action is to authenticate the port when an authentication server is available.
	vlan vlan-id		Specify the access VLAN to which the switch can assign a critical port. The range is from 1 to 4094.
Defaults	The inaccessible-	authentication	bypass feature is disabled.
	The recovery acti	on is not confi	gured.
	The access VLA		-
Command Modes	Interface configu	ration

Usage Guidelines		ation state, use	which the switch assigns a critical port when the port is in the the vlan <i>vlan-id</i> keywords. The specified type of VLAN must match the
	• If the critical	port is an acce	ess port, the VLAN must be an access VLAN.
	• If the critical	port is a priva	te VLAN host port, the VLAN must be a secondary private VLAN.
	• If the critical	port is a route	d port, you can specify a VLAN, but this is optional.
		-	
		-	XP and the critical port to which the client is connected is in the adows XP might report that the interface is not authenticated.

You can configure the inaccessible authentication bypass feature and the restricted VLAN on an IEEE 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, the switch changes the port state to the critical authentication state, and it remains in the restricted VLAN.

You can configure the inaccessible bypass feature and port security on the same switch port.

Examples

This example shows how to enable the inaccessible authentication bypass feature on port 21:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet0/21
Switch(config-if)# dot1x critical
Switch(config-if)# end
Switch(config)# end
Switch#
```

You can verify your configuration by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature on the switch.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x default

Use the **dot1x default** interface configuration command to reset the IEEE 802.1x parameters to their default values.

dot1x default

Syntax Description	This command has no arguments or keywords.
Defaults	These are the default values:
	• The per-port IEEE 802.1x protocol enable state is disabled (force-authorized).
	• The number of seconds between re-authentication attempts is 3600 seconds.
	• The periodic re-authentication is disabled.
	• The quiet period is 60 seconds.
	• The retransmission time is 30 seconds.
	• The maximum retransmission number is 2 times.
	• The host mode is single host.
	• The client timeout period is 30 seconds.
Command Modes	 The authentication server timeout period is 30 seconds. Interface configuration
	• The authentication server timeout period is 30 seconds. Interface configuration
Command Modes Command History	• The authentication server timeout period is 30 seconds.
Command History	The authentication server timeout period is 30 seconds. Interface configuration Release Modification
Command History	The authentication server timeout period is 30 seconds. Interface configuration Release Modification
	The authentication server timeout period is 30 seconds. Interface configuration Release Modification 12.1(19)EA1 This command was introduced.
Command History	 The authentication server timeout period is 30 seconds. Interface configuration Release Modification 12.1(19)EA1 This command was introduced. This example shows how to reset the IEEE 802.1x parameters on a port:
Command History	 The authentication server timeout period is 30 seconds. Interface configuration Release Modification

dot1x fallback

Use the **dot1xfallback** interface configuration command on the to configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. To return to the default setting, use the **no** form of this command.

dot1x fallback profile

no dot1x fallback

Syntax Description	profile	Specify a fall authentication	back profile for clients that do not support IEEE 802.1x n.		
Defaults	No fallback is en	abled.			
Command Modes	Interface configuration				
Command History	Release	Modification			
	12.2(35)SE	This command wa	as introduced.		
Usage Guidelines	You must enter the dot1x port-control auto interface configuration command on a switch port before entering this command.				
Examples	This example shows how to specify a fallback profile to a switch port that has been configured for IEEE 802.1x authentication:				
	<pre>Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# interface gigabitethernet0/3 Switch(config-if)# dot1x fallback profile1 Switch(config-fallback-profile)# exit Switch(config)# end</pre>				
	You can verify your settings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.				
Related Commands	Command		Description		
		erface interface-id]	Displays IEEE 802.1x status for the specified port.		
	fallback profile	· -	Create a web authentication fallback profile.		
	ip admission		Enable web authentication on a port		
	ip admission na	me proxy http	Enable web authentication globally on a switch		

dot1x guest-vlan

Use the **dot1x guest-vlan** interface configuration command to specify an active VLAN as an IEEE 802.1x guest VLAN. Use the **no** form of this command to return to the default setting.

dot1x guest-vlan vlan-id

no dot1x guest-vlan

Syntax Description	vlan-id	Specify an active VLAN as an IEEE 802.1x guest VLAN. The range is 1 to 4094.	
Defaults	No guest VLAN is	configured.	
Command Modes	Interface configura	tion	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(25)SE	This command was modified to change the default guest VLAN behavior.	
Usage Guidelines	You can configure	a guest VLAN on one of these switch ports:	
	• A static-access port that belongs to a nonprivate VLAN.		
	• A private-VLAN port that belongs to a secondary private VLAN. All the hosts connected to the switch port are assigned to private VLANs, whether or not the posture validation was successful. The switch determines the primary private VLAN by using the primary- and secondary-private-VLAN associations on the switch.		
	For each IEEE 802.1x port on the switch, you can configure a guest VLAN to provide limited services to clients (a device or workstation connected to the switch) not running IEEE 802.1x authentication. These users might be upgrading their systems for IEEE 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.		
	When you enable a guest VLAN on an IEEE 802.1x port, the switch assigns clients to a guest VLAN when it does not receive a response to its Extensible Authentication Protocol over LAN (EAPOL) request/identity frame or when EAPOL packets are not sent by the client.		
	With Cisco IOS Release 12.2(25)SE and later, the switch maintains the EAPOL packet history. If another EAPOL packet is detected on the interface during the lifetime of the link, the guest VLAN feature is disabled. If the port is already in the guest VLAN state, the port returns to the unauthorized state, and authentication restarts. The EAPOL history is reset upon loss of link.		
	allowed clients that packets had been d	Release 12.2(25)SE, the switch did not maintain the EAPOL packet history and t failed authentication access to the guest VLAN, regardless of whether EAPOL etected on the interface. In Cisco IOS Release 12.2(25)SE, you can use the dot1x start global configuration command to enable this behavior.	

However, in Cisco IOS Release 12.2(25)SEE, the **dot1x guest-vlan supplicant** global configuration command is no longer supported. You can use a restricted VLAN to allow clients that failed authentication access to the network by entering the **dot1x auth-fail vlan** *vlan-id* interface configuration command.

Any number of non-IEEE 802.1x-capable clients are allowed access when the switch port is moved to the guest VLAN. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the RADIUS-configured or user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on IEEE 802.1x ports in single-host or multiple-hosts mode.

You can configure any active VLAN except an Remote Switched Port Analyzer (RSPAN) VLAN, a primary private VLAN, or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

After you configure a guest VLAN for an IEEE 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the IEEE 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the IEEE 802.1x authentication process (**dot1x timeout quiet-period** and **dot1x timeout tx-period** interface configuration commands). The amount to decrease the settings depends on the connected IEEE 802.1x client type.

The switch supports *MAC authentication bypass* in Cisco IOS Release 12.2(25)SEE and later. When it is enabled on an IEEE 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified. For more information, see the "Using IEEE 802.1x Authentication with MAC Authentication Bypass" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter of the software configuration guide.

```
This example shows how to specify VLAN 5 as an IEEE 802.1x guest VLAN:
```

Switch(config-if) # dot1x guest-vlan 5

This example shows how to set 3 as the quiet time on the switch, to set 15 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request, and to enable VLAN 2 as an IEEE 802.1x guest VLAN when an IEEE 802.1x port is connected to a DHCP client:

```
Switch(config-if)# dot1x timeout quiet-period 3
Switch(config-if)# dot1x timeout tx-period 15
Switch(config-if)# dot1x guest-vlan 2
```

This example shows how to enable the optional guest VLAN behavior and to specify VLAN 5 as an IEEE 802.1x guest VLAN:

```
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x guest-vlan 5
```

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Examples

Related Commands	Command	Description
dot1x		Enables the optional guest VLAN supplicant feature.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x host-mode

Use the **dot1x host-mode** interface configuration command to allow a single host (client) or multiple hosts on an IEEE 802.1x-authorized port. Use the **multi-domain** keyword to enable multidomain authentication (MDA) on an IEEE 802.1x-authorized port. Use the **no** form of this command to return to the default setting.

dot1x host-mode {multi-host | single-host | multi-domain }

no dot1x host-mode [multi-host | single-host | multi-domain }

Syntax Description	multi-host	Enable multiple-hosts mode on the switch.		
	single-host	Enable single-host mode on the switch.		
	multi-domain	Enable MDA on a switch port.		
Defaults	The default is single-host mode.			
Command Modes	Interface configuration			
Command History	Release	Modification		
	12.1(19)EA1	This command was introduced.		
	12.2(35)SE	The multi-domain keyword was added.		
Usage Guidelines	Use this command to limit an IEEE 802.1x-enabled port to a single client or to attach multiple clients to an IEEE 802.1x-enabled port. In multiple-hosts mode, only one of the attached hosts needs to be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (re-authentication fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is received), all attached clients are denied access to the network.			
	Use the multi-domain keyword to enable MDA on a port. MDA divides the port into both a data domain and a voice domain. MDA allows both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), on the same IEEE 802.1x-enabled port.			
	Before entering this command, make sure that the dot1x port-control interface configuration command is set to auto for the specified port.			
Examples	This example shows how to enable IEEE 802.1x authentication globally, to enable IEEE 802.1x authentication on a port, and to enable multiple-hosts mode: Switch(config)# dot1x system-auth-control Switch(config)# interface gigabitethernet0/1 Switch(config-if)# dot1x port-control auto Switch(config-if)# dot1x host-mode multi-host			

This example shows how to globally enable IEEE 802.1x authentication, to enable IEEE 802.1x authentication, and to enable MDA on the specified port:

Switch(config)# dot1x system-auth-control Switch(config)# interface gigabitethernet3/0/1 Switch(config-if)# dot1x port-control auto Switch(config-if)# dot1x host-mode multi-domain

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x initialize

Use the **dot1x initialize** privileged EXEC command to manually return the specified IEEE 802.1x-enabled port to an unauthorized state before initiating a new authentication session on the port.

dot1x initialize [interface interface-id]

Syntax Description	interface interface-id	(Optional) Port to be initialized.
Defaults	There is no default setting.	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines		alize the IEEE 802.1x state machines and to set up a fresh environment for enter this command, the port status becomes unauthorized. his command.
Examples	-	o manually initialize a port: e interface gigabitethernet0/22
		prized port status by entering the show dot1x [interface <i>interface-id</i>]
Related Commands	Command	Description
	<pre>show dot1x [interface int</pre>	terface-id] Displays IEEE 802.1x status for the specified port.

dot1x mac-auth-bypass

Use the **dot1x mac-auth-bypass** interface configuration command to enable the MAC authentication bypass feature. Use the **no** form of this command to disable MAC authentication bypass feature.

dot1x mac-auth-bypass [eap | timeout activity {value}]

no dot1x mac-auth-bypass

eap timeout activity value	(Optional) Configure the switch to use Extensible Authentication Protocol (EAP) for authentication.(Optional) Configure the number of seconds that a connected host can be inactive before it is placed in an unauthorized state. The range is 1 to 65535.
value

Related Commands	Command	Description
	dot1x timeout tx-perio	•
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x multiple-hosts

This is an obsolete command.

In past releases, the **dot1x multiple-hosts** interface configuration command was used to allow multiple hosts (clients) on an IEEE 802.1x-authorized port.

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Related Commands

S	Command	Description
	dot1x host-mode	Sets the IEEE 802.1x host mode on a port.
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.

Defaults

dot1x pae

Use the **dot1x pae** interface configuration command to configure the port as an IEEE 802.1x port access entity (PAE) authenticator. Use the no form of this command to disable IEEE 802.1x authentication on the port. dot1x pae authenticator no dot1x pae Syntax Description This command has no arguments or keywords. The port is not an IEEE 802.1x PAE authenticator, and IEEE 802.1x authentication is disabled on the port. **Command Modes** Interface configuration **Command History** Release Modification

Usage Guidelines	Use the no dot1x pae interface configuration command to disable IEEE 802.1x authentication on the port.
	When you configure IEEE 802.1x authentication on a port, such as by entering the dot1x port-control

This command was introduced.

interface configuration command, the switch automatically configures the port as an EEE 802.1x authenticator. After the no dot1x pae interface configuration command is entered, the Authenticator PAE operation is disabled.

Examples This example shows how to disable IEEE 802.1x authentication on the port: Switch(config-if) # no dot1x pae

You can verify your settings by entering the show dot1x or show eap privileged EXEC command.

Related Commands	Command	Description
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.
	show eap	Displays EAP registration and session information for the switch or for the specified port.

12.2(25)SEE

dot1x port-control

Use the **dot1x port-control** interface configuration command to enable manual control of the authorization state of the port. Use the **no** form of this command to return to the default setting.

dot1x port-control {auto | force-authorized | force-unauthorized}

no dot1x port-control

Syntax Description	auto	Enable IEEE 802.1x authentication on the port and cause the port to change to the authorized or unauthorized state based on the IEEE 802.1x authentication exchange between the switch and the client.	
	force-authorized	Disable IEEE 802.1x authentication on the port and cause the port to transition to the authorized state without an authentication exchange. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client.	
	force-unauthorized	Deny all access through this port by forcing the port to change to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.	
Defaults	The default is force-a	uthorized.	
Command Modes	Interface configuratio	n	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	. .	able IEEE 802.1x authentication on the switch by using the dot1x global configuration command before enabling IEEE 802.1x authentication on a	
	The IEEE 802.1x star routed ports.	ndard is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3	
	You can use the auto keyword only if the port is not configured as one of these:		
	appears, and IEE	ou try to enable IEEE 802.1x authentication on a trunk port, an error message E 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled error message appears, and the port mode is not changed.	
	you try to enable IEEE 802.1x auth	A port in dynamic mode can negotiate with its neighbor to become a trunk port. If IEEE 802.1x authentication on a dynamic port, an error message appears, and nentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled an error message appears, and the port mode is not changed.	

	You can verify your settings by entering the show dot1x [interface <i>interface-id</i>] privileged EXEC command.
	Switch(config)# interface gigabitethernet0/21 Switch(config-if)# dot1x port-control auto
Examples	This example shows how to enable IEEE 802.1x authentication on a port:
	To globally disable IEEE 802.1x authentication on the switch, use the no dot1x system-auth-control global configuration command. To disable IEEE 802.1x authentication on a specific port or to return to the default setting, use the no dot1x port-control interface configuration command.
	• Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, IEEE 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.
	Note In software releases earlier than Cisco IOS Release 12.2(20)SE, if IEEE 802.1x authentication is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.
	• EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.
	(VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

• Dynamic-access ports—If you try to enable IEEE 802.1x authentication on a dynamic-access

Related Commands	Command	Description
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

2-119

dot1x re-authenticate

Use the **dot1x re-authenticate** privileged EXEC command to manually initiate a re-authentication of the specified IEEE 802.1x-enabled port.

dot1x re-authenticate [interface interface-id]

Syntax Description	interface interface-id	(Optional) Module and port number of the interface to re-authenticate.
Defaults	There is no default settin	ıg.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	s You can use this command to re-authenticate a client without waiting for the configured numb seconds between re-authentication attempts (re-authentiod) and automatic re-authentication.	
xamples	This example shows how	v to manually re-authenticate the device connected to a port:
	Switch# dot1x re-authe	enticate interface gigabitethernet0/21
Related Commands	Switch# dot1x re-authe	enticate interface gigabitethernet0/21 Description
Related Commands		Description

dot1x re-authentication

This is an obsolete command.

In past releases, the **dot1x re-authentication** global configuration command was used to set the amount of time between periodic re-authentication attempts.

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Related Commands	Command	Description
	dot1x reauthentication	Sets the number of seconds between re-authentication attempts.
	show dot1x	Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.

dot1x reauthentication

Use the **dot1x reauthentication** interface configuration command to enable periodic re-authentication of the client. Use the **no** form of this command to return to the default setting.

dot1x reauthentication

no dot1x reauthentication

Syntax Description	This command has no arguments or keywords.
--------------------	--------------------------------------------

Defaults	Periodic re	e-authentication	is disabled.
----------	-------------	------------------	--------------

Command Modes Interface configuration

Release 12.1(19)EA1

Command History

Usage Guidelines You configure the amount of time between periodic re-authentication attempts by using the **dot1x timeout reauth-period** interface configuration command.

This command was introduced.

Examples This example shows how to disable periodic re-authentication of the client:

Modification

Switch(config-if) # no dot1x reauthentication

This example shows how to enable periodic re-authentication and to set the number of seconds between re-authentication attempts to 4000 seconds:

Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000

You can verify your settings by entering the **show dot1x** [**interface** *interface-id*] privileged EXEC command.

Related Commands	Command	Description
	dot1x re-authenticate	Manually initiates a re-authentication of all IEEE 802.1x-enabled ports.
	dot1x timeout reauth-period	Sets the number of seconds between re-authentication attempts.
	<pre>show dot1x [interface interface-id]</pre>	Displays IEEE 802.1x status for the specified port.

dot1x test eapol-capable

Use the **dot1x test eapol-capable** privileged EXEC command to monitor IEEE 802.1x activity on all the switch ports and to display information about the devices that are connected to the ports that support IEEE 802.1x.

dot1x test eapol-capable [interface interface-id]

Syntax Description	interface interface-id	(Optional) Port to be queried.	
Defaults	There is no default sett	ing.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	12.2(44)SE	This command was introduced.	
Usage Guidelines	Use this command to test the IEEE 802.1x capability of the devices connected to all ports or to specific ports on a switch. There is not a no form of this command.		
Examples		w to enable the IEEE 802.1x readiness check on a switch to query a port. It also eived from the queried port verifying that the device connected to it is	
	switch# dot1x test eapol-capable interface gigabitethernet1/0/13

2-123

dot1x test timeout

Use the dot1x test timeout global configuration command on the switch stack or on a standalone switch to configure the timeout used to wait for EAPOL response from a port being queried for IEEE 802.1x readiness.

dot1x test timeout timeout

Syntax Description	timeout	Time in seconds to wait for an EAPOL response. The range is from	
		1 to 65535 seconds.	
Defaults	The default setting i	s 10 seconds.	
Command Modes	Global configuration	1	
Command History	Release	Modification	
	12.2(44)SE	This command was introduced.	
Usage Guidelines	Use this command to configure the timeout used to wait for EAPOL response. There is not a no form of this command.		
Examples		how to configure the switch to wait 27 seconds for an EAPOL response:	
Examples	Switch# dot1x test timeout 27		
	You can verify the t	meout configuration status by entering the show run privileged EXEC command.	
Related Commands	Command	Description	
	<pre>dot1x test eapol-ca interface-id]</pre>	pable [interfaceChecks for IEEE 802.1x readiness on devices connected to all or to specified IEEE 802.1x-capable ports.	

dot1x timeout

Use the **dot1x timeout** interface configuration command to set IEEE 802.1x timers. Use the **no** form of this command to return to the default setting.

dot1x timeout {quiet-period seconds | ratelimit-period seconds | reauth-period {seconds |
server} | server-timeout seconds | supp-timeout seconds | tx-period seconds}

no dot1x timeout {quiet-period | reauth-period | server-timeout | supp-timeout | tx-period}

quiet-period seconds	Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. The range is 1 to 65535.
ratelimit-period seconds	Number of seconds that the switch ignores Extensible Authentication Protocol over LAN (EAPOL) packets from clients that have been successfully authenticated during this duration. The range is 1 to 65535.
reauth-period {seconds	Set the number of seconds between re-authentication attempts.
server}	The keywords have these meanings:
	• <i>seconds</i> —Sets the number of seconds from 1 to 65535; the default is 3600 seconds.
	• server —Sets the number of seconds as the value of the Session-Timeout RADIUS attribute (Attribute[27]).
server-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the switch to the authentication server. The range is 30 to 65535.
supp-timeout seconds	Number of seconds that the switch waits for the retransmission of packets by the switch to the IEEE 802.1x client. The range is 30 to 65535.
tx-period seconds	Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request. The range is 1 to 65535.
	ratelimit-period seconds reauth-period {seconds server} server server-timeout seconds supp-timeout seconds

Defaults

These are the default settings:

reauth-period is 3600 seconds.

quiet-period is 60 seconds.

tx-period is 5 seconds.

supp-timeout is 30 seconds.

server-timeout is 30 seconds.

rate-limit is 1 second.

Command Modes Interface configuration

Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(20)SE	The ranges for the server-timeout , supp-timeout , and tx-period keywords were changed.	
	12.2(25)SEC	The range for tx-period keyword was changed, and the reauth-period server keywords were added.	
	12.2(25)SEE	The ratelimit-period keyword was introduced.	
	12.2(40)SE	The range for tx-period <i>seconds</i> is incorrect. The correct range is from 1 to 65535.	
Usage Guidelines	•	the default value of this command only to adjust for unusual circumstances such as pecific behavioral problems with certain clients and authentication servers.	
	The dot1x timeout reauth-period interface configuration command affects the behavior of the switch only if you have enabled periodic re-authentication by using the dot1x reauthentication interface configuration command.		
	During the quiet period, the switch does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number smaller than the default.		
	When the ratelimit-period is set to 0 (the default), the switch does not ignore EAPOL packets from clients that have been successfully authenticated and forwards them to the RADIUS server.		
Examples	This example shows how to enable periodic re-authentication and to set 4000 as the number of seconds between re-authentication attempts:		
	Switch(config-if)# dot1x reauthentication Switch(config-if)# dot1x timeout reauth-period 4000		
	This example shows how to enable periodic re-authentication and to specify the value of the Session-Timeout RADIUS attribute as the number of seconds between re-authentication attempts:		
	Switch(config-if)# dot1x reauthentication Switch(config-if)# dot1x timeout reauth-period server		
	This example shows	how to set 30 seconds as the quiet time on the switch:	
	Switch(config-if)# dot1x timeout quiet-period 30		
	This example shows how to set 45 seconds as the switch-to-authentication server retransmission time:		
	Switch(config)# dot1x timeout server-timeout 45		
	This example shows how to set 45 seconds as the switch-to-client retransmission time for the EAP request frame:		
	Switch(config-if)# dot1x timeout supp-timeout 45		
	-	how to set 60 as the number of seconds to wait for a response to an y frame from the client before re-transmitting the request:	
		f dot1x timeout tx-period 60	

This example shows how to set 30 as the number of seconds that the switch ignores EAPOL packets from successfully authenticated clients:

Switch(config-if)# dot1x timeout ratelimit-period 30

You can verify your settings by entering the show dot1x privileged EXEC command.

Related Commands	Command	Description
	dot1x max-req	Sets the maximum number of times that the switch sends an EAP-request/identity frame before restarting the authentication process.
	dot1x reauthentication	Enables periodic re-authentication of the client.
	show dot1x	Displays IEEE 802.1x status for all ports.

duplex

Use the **duplex** interface configuration command to specify the duplex mode of operation for a port. Use the **no** form of this command to return the port to its default value.

duplex {auto | full | half}

operate in half-duplex mode.

no duplex

Syntax Description	auto	Enable automatic duplex configuration; port automatically detects whether it		
	0.11	should run in full- or half-duplex mode, depending on the attached device mode.		
	full	Enable full-duplex mode.		
	half	Enable half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mb/s.		
Defaults	The default is au	to for Fast Ethernet and Gigabit Ethernet ports.		
	The default is full for 100BASE-x (where -x is -BX, -FX, -FX-FE, or - LX) SFP modules.			
	Duplex options are not supported on the 1000BASE- <i>x</i> (where - <i>x</i> is -BX, -CWDM, -LX, -SX, or -ZX) SFP modules.			
	For information about which SFP modules are supported on your switch, see the product release notes.			
Command Modes	Interface configu	ration		
Command History	Release	Modification		
·····	12.1(19)EA1	This command was introduced.		
	12.1(20)SE	Support for the half keyword was added for the 100BASE-FX SFP module.		
Usage Guidelines		ports, setting the port to auto has the same effect as specifying half if the attached utonegotiate the duplex parameter.		
	device does not a	rnet ports, setting the port to auto has the same effect as specifying full if the attached utonegotiate the duplex parameter.		
	-	lex mode is supported on Gigabit Ethernet interfaces if the duplex mode is auto and the d device is operating at half duplex. However, you cannot configure these interfaces to		

Certain ports can be configured to be either full duplex or half duplex. Applicability of this command depends on the device to which the switch is attached.

If both ends of the line support autonegotiation, we highly recommend using the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do use the **auto** setting on the supported side.

If the speed is set to **auto**, the switch negotiates with the device at the other end of the link for the speed setting and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

Beginning with Cisco IOS Release 12.2(20)SE1, you can configure the duplex setting when the speed is set to **auto**.

	Ζ	î	/
Cau	ıti	0	n

Examples

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release.

This example shows how to configure an interface for full-duplex operation:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# duplex full

You can verify your setting by entering the show interfaces privileged EXEC command.

Related Commands Command Description		Description
	show interfaces	Displays the interface settings on the switch.
	speed	Sets the speed on a 10/100 or 10/100/1000 Mb/s interface.

2-129

errdisable detect cause

Use the **errdisable detect cause** global configuration command to enable error-disable detection for a specific cause or all causes. Use the **no** form of this command to disable the error-disable detection feature.

- errdisable detect cause {all | arp-inspection | bpduguard | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | pagp-flap | sfp-config-mismatch }
- no errdisable detect cause {all | arp-inspection | bpduguard | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | pagp-flap | sfp-config-mismatch}

For the BPDU guard and port-security features, you can use this command to globally configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

When the per-VLAN error-disable feature is turned off and a BPDU guard violation occurs, the entire port is disabled. Use the **no** form of this command to disable the per-VLAN error-disable feature.

errdisable detect cause bpduguard shutdown vlan

no errdisable detect cause bpduguard shutdown vlan

Syntax Description	all	Enable error detection for all error-disabled causes.		
	arp-inspection	Enable error detection for dynamic Address Resolution Protocol (ARP) inspection.		
	bpduguard shutdown vlan	Enable per-VLAN error-disable for BPDU guard.		
	dhcp-rate-limit	Enable error detection for DHCP snooping.		
	dtp-flap	Enable error detection for the Dynamic Trunking Protocol (DTP) flapping.		
	gbic-invalid	Enable error detection for an invalid Gigabit Interface Converter (GBI module.		
		Note On the Catalyst 3560 switch, this error refers to an invalid small form-factor pluggable (SFP) module.		
	inline-power	Enable error detection for inline power.		
	l2ptguard	Enable error detection for a Layer 2 protocol tunnel error-disabled cause.		
	link-flap	Enable error detection for link-state flapping.		
	loopback	Enable error detection for detected loopbacks.		
	pagp-flap	Enable error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause.		
	sfp-config-mismatch	Enable error detection on an SFP configuration mismatch.		

Command Default

ult Detection is enabled for all causes. All causes, except for per-VLAN error disabling, are configured to shut down the entire port.

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	12.2(20)SE	The arp-inspection keyword was added.
	12.2(25)SE	The l2ptguard keyword was added.
	12.2(37)SE	The Per-VLAN error-detection feature was added. The inline-power and sfp-config-mismatch keywords were added.

Usage Guidelines

A cause (**link-flap**, **dhcp-rate-limit**, and so forth) is the reason why the error-disabled state occurred. When a cause is detected on a port, the port is placed in an error-disabled state, an operational state that is similar to a link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you set a recovery mechanism for the cause by entering the **errdisable recovery** global configuration command for the cause, the port is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the **shutdown** and then the **no shutdown** commands to manually change the port from the error-disabled state.

Examples This example shows how to enable error-disable detection for the link-flap error-disabled cause:

Switch(config)# errdisable detect cause link-flap

This command shows how to globally configure BPDU guard for per-VLAN error disable:

Switch(config)# errdisable detect cause bpduguard shutdown vlan

You can verify your settings by entering the show errdisable detect privileged EXEC command.

Related Commands	Command	Description	
	show errdisable detect	Displays error-disabled detection information. Displays interface status or a list of interfaces in the error-disabled state.	
	show interfaces status err-disabled		
	clear errdisable interface	Clears the error-disabled state from a port or VLAN that was error disabled by the per-VLAN error disable feature.	

errdisable detect cause small-frame

errdisable detect cause small-frame

Use the **errdisable detect cause small-frame** global configuration command on the switch stack or on a standalone switch to allow any switch port to be error disabled if incoming VLAN-tagged packets are small frames (67 bytes or less) and arrive at the minimum configured rate (the threshold). Use the **no** form of this command to return to the default setting.

errdisable detect cause small-frame

no errdisable detect cause small-frame

Syntax Description	This command has no arguments or keywords.	
Defaults	This feature is disabled	
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(44)SE	This command was introduced.
Usage Guidelines	configuration command You can configure the p	enables the small-frame arrival feature. Use the small violation-rate interface I to set the threshold for each port. port to be automatically re-enabled by using the errdisable recovery cause
	•	nfiguration command. You configure the recovery time by using the errdisable <i>twal</i> global configuration command.
Examples	*	w to enable the switch ports to be put into the error-disabled mode if incoming he configured threshold:
	Switch(config)# errd:	isable detect cause small-frame

You can verify your setting by entering the **show interfaces** privileged EXEC command.

Related Commands	Command	Description
	errdisable recovery cause small-frame	Enables the recovery timer.
	errdisable recovery interval interval	Specifies the time to recover from the specified error-disabled state.
	show interfaces	Displays the interface settings on the switch, including input and output flow control.
	small violation-rate	Configures the rate (threshold) for incoming small frames to cause a port to be put into the error-disabled state.

errdisable recovery cause small-frame

Use the **errdisable recovery cause small-frame** global configuration command on the switch stack or on a standalone switch to enable the recovery timer for ports to be automatically re-enabled after they are error disabled by the arrival of small frames. Use the **no** form of this command to return to the default setting.

errdisable recovery cause small-frame

no errdisable recovery cause small-frame

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** This feature is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(44)SE	This command was introduced.

Usage Guidelines This command enables the recovery timer for error-disabled ports. You configure the recovery time by using the errdisable **recovery interval** interval interface configuration command.

Examples This example shows how to set the recovery timer:

Switch(config) # errdisable recovery cause small-frame

You can verify your setting by entering the show interfaces user EXEC command.

Related Commands	Command	Description	
	errdisable detect cause small-frame	Allows any switch port to be put into the error-disabled state if an incoming frame is smaller than the configured minimum size and arrives at the specified rate (threshold).	
	show interfaces	Displays the interface settings on the switch, including input and output flow control.	
	small violation-rate	Configures the size for an incoming (small) frame to cause a port to be put into the error-disabled state.	

errdisable recovery

Use the **errdisable recovery** global configuration command to configure the recover mechanism variables. Use the **no** form of this command to return to the default setting.

- errdisable recovery {cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | pagp-flap | psecure-violation | security-violation | sfp-mismatch | udld | vmps} | {interval interval}
- no errdisable recovery {cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | pagp-flap | psecure-violation | security-violation | sfp-mismatch | udld | vmps} | {interval interval}

Syntax Description	cause	Enable the error-disabled mechanism to recover from a specific cause.
	all	Enable the timer to recover from all error-disabled causes.
	bpduguard	Enable the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state.
	arp-inspection	Enable the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state.
	channel-misconfig	Enable the timer to recover from the EtherChannel misconfiguration error-disabled state.
	dhcp-rate-limit	Enable the timer to recover from the DHCP snooping error-disabled state.
	dtp-flap	Enable the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.
	gbic-invalid	Enable the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.
		Note On the Catalyst 3560 switch, this error refers to an invalid small form-factor pluggable (SFP) error-disabled state.
	inline-power	Enable error detection for inline-power.
	l2ptguard	Enable the timer to recover from a Layer 2 protocol tunnel error-disabled state.
	link-flap	Enable the timer to recover from the link-flap error-disabled state.
	loopback	Enable the timer to recover from a loopback error-disabled state.
	pagp-flap	Enable the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.
	psecure-violation	Enable the timer to recover from a port security violation disable state.
	security-violation	Enable the timer to recover from an IEEE 802.1x-violation disabled state.
	sfp-config-mismatch	Enable error detection on an SFP configuration mismatch.
	udld	Enable the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.

	vmps	Enable the timer to recover from the VLAN Membership Policy Server (VMPS) error-disabled state.	
	interval interval	Specify the time to recover from the specified error-disabled state. The range is 30 to 86400 seconds. The same interval is applied to all causes. The default interval is 300 seconds.	
		Note The error-disabled recovery timer is initialized at a random differential from the configured interval value. The difference between the actual timeout value and the configured value can be up to 15 percent of the configured interval.	
Defaults	Recovery is disabled	for all causes.	
	The default recovery	interval is 300 seconds.	
Command Modes	- Global configuration		
Command History	Release	Modification	
•	12.1(19)EA1	This command was introduced.	
	12.2(18)SE	The channel-misconfig keyword was added.	
	12.2(20)SE	The arp-inspection keyword was added.	
	12.2(25)SE	The l2ptguard keyword was added.	
	12.2(37)SE	The per-VLAN error-detection feature was added. The inline-power and sfp-mismatch keywords were added.	
Usage Guidelines	occurred. When a cau state similar to the lin When a port is error-d BPDU guard and por	pduguard , and so forth) is defined as the reason that the error-disabled state is e is detected on a port, the port is placed in the error-disabled state, an operational nk-down state. isabled, it is effectively shut down, and no traffic is sent or received on the port. For the t-security features, you can configure the switch to shut down just the offending hen a violation occurs, instead of shutting down the entire port.	
	If you do not enable the recovery for the cause, the port stays in the error-disabled state until you enter the shutdown and the no shutdown interface configuration commands. If you enable the recovery for a cause, the port is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out.		
	Otherwise, you must port from the error-d	enter the shutdown and then the no shutdown commands to manually recover a isabled state.	
Examples	-	how to enable the recovery timer for the BPDU guard error-disabled cause:	
	Switch(config)# errdisable recovery cause bpduguard		
	This example shows	how to set the timer to 500 seconds:	
	Switch(config)# er	rdisable recovery interval 500	

You can verify your settings by entering the show errdisable recovery privileged EXEC command.

Relate

ed Commands	Command	Description
	show errdisable recovery	Displays error-disabled recovery timer information.
	show interfaces status err-disabled	Displays interface status or a list of interfaces in error-disabled state.
	clear errdisable interface	Clears the error-disabled state from a port or VLAN that was error disabled by the per-VLAN error disable feature.

exception crashinfo

Use the **exception crashinfo** global configuration command to configure the switch to create the extended crashinfo file when the Cisco IOS image fails. Use the **no** form of this command to disable this feature.

exception crashinfo

no exception crashinfo

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** The switch creates the extended crashinfo file.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(25)SEC	This command was introduced.

Usage Guidelines The basic crashinfo file includes the Cisco IOS image name and version that failed and a list of the processor registers. The extended crashinfo file includes additional information that can help determine the cause of the switch failure.

Use the **no exception crashinfo** global configuration command to configure the switch to not create the extended crashinfo file.

Examples This example shows how to configure the switch to not create the extended crashinfo file: Switch(config)# no exception crashinfo

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description	
	show running-config	Displays the operating configuration, including defined macros. For syntax information, select Cisco IOS Configuration	
		Fundamentals Command Reference, Release 12.2 > File	
		Management Commands > Configuration File Management	
		Commands.	

fallback profile

Use the **fallback profile** global configuration command to create a fallback profile for web authentication. To return to the default setting, use the **no** form of this command.

fallback profile *profile*

no fallback profile

Syntax Description	profile	Specify the fallback profile for clients that do not support IEEE 802.1x authentication.	
Defaults	No fallback pro:	file is configured.	
Command Modes	Global configur	ation	
Command History	Release	Modification	
	12.2(35)SE	This command was introduced.	
Usage Guidelines	-	ofile is used to define the IEEE 802.1x fallback behavior for IEEE 802.1x ports that do cants. The only supported behavior is to fall back to web authentication.	
	After entering the fallback profile command, you enter profile configuration mode, and these configuration commands are available:		
	• ip: Create an IP configuration.		
	• access-group: Specify access control for packets sent by hosts that have not yet been authenticated.		
	• admission: Apply an IP admission rule.		
Examples	This example sh	nows how to create a fallback profile to be used with web authentication:	
	Switch(config) Switch(config- Switch(config- Switch(config- Switch(config)	<pre># ip admission name rule1 proxy http # fallback profile profile1 fallback-profile)# ip access-group default-policy in fallback-profile)# ip admission rule1 fallback-profile)# exit # interface gigabitethernet 1/0/1 if)# dot1x fallback profile1</pre>	
	You can verify y privileged EXE	your settings by entering the show running-configuration [interface <i>interface-id</i>] C command.	

Related Commands Command Description dot1x fallback Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. ip admission Enable web authentication on a switch port ip admission name proxy http Enable web authentication globally on a switch show dot1x [interface interface-id] Displays IEEE 802.1x status for the specified port. show fallback profile Display the configured profiles on a switch.

flowcontrol

Use the **flowcontrol** interface configuration command to set the receive flow-control state for an interface. When flow control **send** is operable and on for a device and it detects any congestion at its end, it notifies the link partner or the remote device of the congestion by sending a pause frame. When flow control **receive** is on for a device and it receives a pause frame, it stops sending any data packets. This prevents any loss of data packets during the congestion period.

Use the receive off keywords to disable flow control.

flowcontrol receive {desired | off | on}

The Catalyst 3560 switch can receive, but not send, pause frames.

Syntax Description	receive	Set whether the interface can receive flow-control packets from a remote device.	
	desired	Allow an interface to operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.	
	off	Turn off the ability of an attached device to send flow-control packets to an interface.	
	on	Allow an interface to operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.	
Defaults	The default is flowcontrol receive off .		
Command Modes	Interface con	figuration	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	The switch do	bes not support sending flow-control pause frames.	
	Note that the on and desired keywords have the same result.		
	When you use the flowcontrol command to set a port to control traffic rates during congestion, you are setting flow control on a port to one of these conditions:		
		on or desired : The port cannot send pause frames, but can operate with an attached device quired to or is able to send pause frames. The port can receive pause frames.	
		ff : Flow control does not operate in either direction. In case of congestion, no indication is the link partner, and no pause frames are sent or received by either device.	

Table 2-5 shows the flow control results on local and remote ports for a combination of settings. The table assumes that **receive desired** has the same results as using the **receive on** keywords.

Flow Control Settings		Flow Control Resolution	Flow Control Resolution	
Local Device Remote Device		Local Device	Remote Device	
send off/receive on	send on/receive on	Receives only	Sends and receives	
	send on/receive off	Receives only	Sends only	
	send desired/receive on	Receives only	Sends and receives	
	send desired/receive off	Receives only	Sends only	
	send off/receive on	Receives only	Receives only	
	send off/receive off	Does not send or receive	Does not send or receive	
send off/receive off	send on/receive on	Does not send or receive	Does not send or receive	
	send on/receive off	Does not send or receive	Does not send or receive	
	send desired/receive on	Does not send or receive	Does not send or receive	
	send desired/receive off	Does not send or receive	Does not send or receive	
	send off/receive on	Does not send or receive	Does not send or receive	
	send off/receive off	Does not send or receive	Does not send or receive	

Table 2-5 Flow Control Settings and Local and Remote Port Flow Control Resolution

Examples This example shows how to configure the local port to not support flow control by the remote port:

Switch(config)# interface gigabitethernet0/21
Switch(config-if)# flowcontrol receive off

You can verify your settings by entering the show interfaces privileged EXEC command.

Related Commands	Command	ommand Description		
	show interfaces	Displays the interface settings on the switch, including input and output flow control.		

interface port-channel

Use the **interface port-channel** global configuration command to access or create the port-channel logical interface. Use the **no** form of this command to remove the port-channel.

interface port-channel port-channel-number

no interface port-channel port-channel-number

Syntax Description	port-channel-number	Port-channel number. The range is 1 to 48.	
Defaults	No port-channel logical interfaces are defined.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(25)SE	The <i>port-channel-number</i> range was changed from 1 to 12 to 1 to 48.

You should manually configure the port-channel logical g the interface into the channel group. in a channel group is allowed.	

interface because it creates loops. You must also disable spanning tree.

Follow these guidelines when you use the interface port-channel command:

- If you want to use the Cisco Discovery Protocol (CDP), you must configure it only on the physical port and not on the port-channel interface.
- Do not configure a port that is an active member of an EtherChannel as an IEEE 802.1x port. If IEEE 802.1x is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.

For a complete list of configuration guidelines, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.

Examples This example shows how to create a port-channel interface with a port channel number of 5: Switch(config)# interface port-channel 5

You can verify your setting by entering the **show running-config** privileged EXEC or **show etherchannel** *channel-group-number* **detail** privileged EXEC command.

Related Commands	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	show etherchannel	Displays EtherChannel information for a channel.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

interface range

Use the **interface range** global configuration command to enter interface range configuration mode and to execute a command on multiple ports at the same time. Use the **no** form of this command to remove an interface range.

interface range {port-range | macro name}

no interface range {*port-range* | **macro** *name*}

Syntax Description	port-range	Port range. For a list of valid values for <i>port-range</i> , see the "Usage Guidelines" section.
	macro name	Specify the name of a macro.
Defaults	This command h	nas no default setting.
Command Modes	Global configura	ation
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	When you enter all interfaces wi	interface range configuration mode, all interface parameters you enter are attributed to thin the range
	For VLANs, you (SVIs). To displa displayed canno	a can use the interface range command only on existing VLAN switch virtual interfaces ay VLAN SVIs, enter the show running-config privileged EXEC command. VLANs not t be used in the interface range command. The commands entered under interface I are applied to all existing VLAN SVIs in the range.
	All configuration is not saved to N	n changes made to an interface range are saved to NVRAM, but the interface range itself VVRAM.
	You can enter th	e interface range in two ways:
	• Specifying	up to five interface ranges
	• Specifying a	a previously defined interface-range macro
	All interfaces in	a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports,

All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs. However, you can define up to five interface ranges with a single command, with each range separated by a comma.

Valid values for *port-range* type and interface:

- vlan vlan-ID vlan-ID, where VLAN ID is from 1 to 4094
- **fastethernet** module/{*first port*} {*last port*}, where module is always **0**
- gigabitethernet module/{first port} {last port}, where module is always 0

For physical interfaces:

- module is always 0
- the range is type 0/number number (for example, gigabitethernet0/1 2)
- **port-channel** *port-channel-number port-channel-number*, where *port-channel-number* is from 1 to 48

When you use the **interface range** command with port channels, the first and last port channel number in the range must be active port channels.

When you define a range, you must enter a space between the first entry and the hyphen (-):

```
interface range gigabitethernet0/1 -2
```

When you define multiple ranges, you must still enter a space after the first entry and before the comma (,):

```
interface range fastethernet0/1 - 2, gigabitethernet0/1 - 2
```

You cannot specify both a macro and an interface range in the same command.

You can also specify a single interface in *port-range*. The command is then similar to the **interface** *interface-id* global configuration command.

For more information about configuring interface ranges, see the software configuration guide for this release.

Examples

This example shows how to use the **interface range** command to enter interface-range configuration mode to apply commands to two ports:

```
Switch(config)# interface range gigabitethernet0/1 - 2
Switch(config-if-range)#
```

This example shows how to use a port-range macro *macrol* for the same function. The advantage is that you can reuse *macrol* until you delete it.

```
Switch(config)# define interface-range macrol gigabitethernet0/1 - 2
Switch(config)# interface range macro macrol
Switch(config-if-range)#
```

Related Commands	Command	Description
	define interface-range	Creates an interface range macro.
	show running-config	Displays the configuration information currently running on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

L

interface vlan

Use the **interface vlan** global configuration command to create or access a dynamic switch virtual interface (SVI) and to enter interface configuration mode. Use the **no** form of this command to delete an SVI.

interface vlan vlan-id

no interface vlan vlan-id

Syntax Description	vlan-id	VLAN number. The range is 1 to 4094.
Defaults	The default VLAN	interface is VLAN 1.
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	-	or the VLAN ID configured for an access port.
Note	When you create an	a SVI, it does not become active until it is associated with a physical port.
	•	I by entering the no interface vlan <i>vlan-id</i> command, the deleted interface is no e output from the show interfaces privileged EXEC command.
Note	You cannot delete t	he VLAN 1 interface.
		a deleted SVI by entering the interface vlan <i>vlan-id</i> command for the deleted face comes back up, but the previous configuration is gone.
		p between the number of SVIs configured on a switch and the number of other gured might have an impact on CPU utilization due to hardware limitations. You can

use the sdm prefer global configuration command to reallocate system hardware resources based on

templates and feature tables. For more information, see the sdm prefer command.

Examples This example shows how to create a new SVI with VLAN ID 23 and to enter interface configuration mode:

Switch(config)# interface vlan 23
Switch(config-if)#

You can verify your setting by entering the **show interfaces** and **show interfaces vlan** *vlan-id* privileged EXEC commands.

Related Commands	Command	Description	
	show interfaces vlan vlan-id	Displays the administrative and operational status of all interfaces or the specified VLAN.	

ip access-group

Use the **ip access-group** interface configuration command to control access to a Layer 2 or Layer 3 interface. Use the **no** form of this command to remove all access groups or the specified access group from the interface.

ip access-group {*access-list-number* | *name*} {**in** | **out**}

no ip access-group [access-list-number | name] {**in** | **out**}

access-list-number	The number of the IP access control list (ACL). The range is 1 to 199 or 1300 to 2699.		
name	The name of an IP ACL, specified in the ip access-list global configuration command.		
in	Specify filtering on inbound packets.		
out	Specify filtering on outbound packets. This keyword is valid only on Layer 3 interfaces.		
No access list is applie	ed to the interface.		
Interface configuration	n		
Release	Modification		
12.1(19)EA1	This command was introduced.		
Usage Guidelines You can apply named or numbered standard or extended IP access lists to access list by name, use the ip access-list global configuration command. access list, use the access list global configuration command. You can use lists ranging from 1 to 99 and 1300 to 1999 or extended access lists ranging 2000 to 2699			
You can use this command to apply an access list to a Layer 2 or Layer 3 interface. How limitations for Layer 2 interfaces (port ACLs):			
• You can only appl interfaces.	y ACLs in the inbound direction; the out keyword is not supported for Layer 2		
• You can only apply one IP ACL and one MAC ACL per interface.			
¹ Tou can only appl	y one if field and one while field per interface.		
	do not support logging; if the log keyword is specified in the IP ACL, it is ignored		
	name in out No access list is applied Interface configuration Release 12.1(19)EA1 You can apply named access list by name, us access list, use the acc lists ranging from 1 to 2000 to 2699. You can use this comm limitations for Layer 2 • You can only applinterfaces.		

You can use router ACLs, input port ACLs, and VLAN maps on the same switch. However, a port ACL takes precedence over a router ACL or VLAN map:

- When an input port ACL is applied to an interface and a VLAN map is applied to a VLAN that the interface is a member of, incoming packets received on ports with the ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
- When an input router ACL and input port ACLs exist in an switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
- When a VLAN map, input router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.
- When a VLAN map, output router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

You can apply IP ACLs to both outbound or inbound Layer 3 interfaces.

A Layer 3 interface can have one IP ACL applied in each direction.

You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.

For standard inbound access lists, after the switch receives a packet, it checks the source address of the packet against the access list. IP extended access lists can optionally check other fields in the packet, such as the destination IP address, protocol type, or port numbers. If the access list permits the packet, the switch continues to process the packet. If the access list denies the packet, the switch discards the packet. If the access list has been applied to a Layer 3 interface, discarding a packet (by default) causes the generation of an Internet Control Message Protocol (ICMP) Host Unreachable message. ICMP Host Unreachable messages are not generated for packets discarded on a Layer 2 interface.

For standard outbound access lists, after receiving a packet and sending it to a controlled interface, the switch checks the packet against the access list. If the access list permits the packet, the switch sends the packet. If the access list denies the packet, the switch discards the packet and, by default, generates an ICMP Host Unreachable message.

If the specified access list does not exist, all packets are passed.

Examples

This example shows how to apply IP access list 101 to inbound packets on a port:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group 101 in

You can verify your settings by entering the **show ip interface**, **show access-lists**, or **show ip access-lists** privileged EXEC command.

 Hosts can find subnermessage. Routers rearry You can disable IP procommand. If the switter to the console. You can use the optic Secondary addresses other than routing up 	et masks using the Internet Control Message Protocol (ICMP) Mask Request spond to this request with an ICMP Mask Reply message. rocessing on a particular interface by removing its IP address with the no ip address
	subnet-mask secondary No IP address is def Interface configurati

If your switch receives its IP address from a Bootstrap Protocol (BOOTP) or a DHCP server and you remove the switch IP address by using the **no ip address** command, IP processing is disabled, and the BOOTP or the DHCP server cannot reassign the address.

A Layer 3 switch can have an IP address assigned to each routed port and SVI. The number of routed ports and SVIs that you can configure is not limited by software; however, the interrelationship between this number and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the **sdm prefer** global configuration command to reallocate system hardware resources based on templates and feature tables. For more information, see the **sdm prefer** command.

Examples	This example shows how to configure the IP address for the Layer 2 switch on a subnetted network:
	Switch(config)# interface vlan 1 Switch(config-if)# ip address 172.20.128.2 255.255.255.0
	This example shows how to configure the IP address for a port on the Layer 3 switch:
	<pre>Switch(config)# ip multicast-routing Switch(config)# interface gigabitethernet0/1 Switch(config-if)# no switchport Switch(config-if)# ip address 172.20.128.2 255.255.255.0</pre>
	You can verify your settings by entering the show running-config privileged EXEC command.
Related Commands	Command Description

Related Commands	Command	Description

ip admission

Use the **ip admission** interface configuration command to enable web authentication. You can also use this command in fallback-profile mode. Use the **no** form of this command to disable web authentication.

ip admission rule

no ip admission

show ip admission

Syntax Description	<i>rule</i> Apply an IP admission rule to the interface.		
Command Modes	Global configuratior	ı	
Command History	Release	Modification	
	12.2(35)SE	This command was introduced.	
Usage Guidelines	The ip admission co	ommand applies a web authentication rule to a switch port.	
Examples	This example shows	how to apply a web authentication rule to a switchport:	
	Switch# configure terminal Switch(config)# interface gigabitethernet0/1 Switch(config-if)# ip admission rule1		
	This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.		
	Switch# configure terminal Switch(config)# fallback profile profile1 Switch(config)# ip admission name rule1 Switch(config)# end		
Related Commands	Command	Description	
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.	
	fallback profile	Enable web authentication on a port	
	ip admission name proxy http	Enable web authentication globally on a switch	

Configuration Guide on Cisco.com.

Displays information about NAC cached entries or the NAC configuration.

For more information, see the Network Admission Control Software

ip admission name proxy http

Use the **ip admission name proxy http** global configuration command to enable web authentication. Use the **no** form of this command to disable web authentication.

ip admission name proxy http

no ip admission name proxy http

Syntax Description	This command has no arguments or keywords.
--------------------	--------------------------------------------

- **Defaults** Web authentication is disabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.2(35)SE	This command was introduced.

Usage Guidelines The **ip admission name proxy http** command globally enables web authentication on a switch.

After you enable web authentication on a switch, use the **ip access-group in** and **ip admission** *web-rule* interface configuration commands to enable web authentication on a specific interface.

Examples

This example shows how to configure only web authentication on a switchport:

```
Switch# configure terminal
Switch(config) ip admission name http-rule proxy http
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip access-group 101 in
Switch(config-if)# ip admission rule
Switch(config-if)# end
```

This example shows how to configure IEEE 802.1x authentication with web authentication as a fallback mechanism on a switchport.

```
Switch# configure terminal
Switch(config)# ip admission name rule2 proxy http
Switch(config)# fallback profile profile1
Switch(config)# ip access group 101 in
Switch(config)# ip admission name rule2
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x fallback profile1
Switch(config-if)# end
```

Related Commands	Command	Description
	dot1x fallback	Configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication.
	fallback profile	Create a web authentication fallback profile.
	ip admission	Enable web authentication on a port
	show ip admission	Displays information about NAC cached entries or the NAC configuration. For more information, see the <i>Network Admission Control Software</i> <i>Configuration Guide</i> on Cisco.com.

ip arp inspection filter vlan

Use the **ip arp inspection filter vlan** global configuration command to permit or deny Address Resolution Protocol (ARP) requests and responses from a host configured with a static IP address when dynamic ARP inspection is enabled. Use the **no** form of this command to return to the default settings.

ip arp inspection filter *arp-acl-name* vlan *vlan-range* [static]

no ip arp inspection filter *arp-acl-name* **vlan** *vlan-range* [**static**]

Syntax Description	arp-acl-name	ARP access control list (ACL) name.
	vlan-range	VLAN number or range.
		You can specify a single VLAN identified by VLAN ID number, a range of
		VLANs separated by a hyphen, or a series of VLANs separated by a comma.
		The range is 1 to 4094.
	static	(Optional) Specify static to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.
		If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.
Command Modes	Global configura	tion
Command History	Release	Modification
	12.2(20)SE	This command was introduced.
Usage Guidelines	IP-to-MAC addre	CL is applied to a VLAN for dynamic ARP inspection, only the ARP packets with ess bindings are compared against the ACL. If the ACL permits a packet, the switch other packet types are bridged in the ingress VLAN without validation.
		ther packet types are bridged in the ingress vLAN without validation.
	the switch denies	the packet types are bridged in the ingress vLAN without validation. The a packet because of an explicit deny statement in the ACL, the packet is dropped. If a packet because of an implicit deny statement, the packet is then compared against bindings (unless the ACL is <i>static</i> , which means that packets are not compared against

ExamplesThis example shows how to apply the ARP ACL static-hosts to VLAN 1 for dynamic ARP inspection:
Switch(config)# ip arp inspection filter static-hosts vlan 1

You can verify your settings by entering the show ip arp inspection vlan 1 privileged EXEC command.

Related Commands	Command	Description
	arp access-list	Defines an ARP ACL.
	deny (ARP access-list configuration)	Denies an ARP packet based on matches against the DHCP bindings.
	permit (ARP access-list configuration)	Permits an ARP packet based on matches against the DHCP bindings.
	show arp access-list	Displays detailed information about ARP access lists.
	show inventory vlan vlan-range	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.

ip arp inspection limit

Use the **ip arp inspection limit** interface configuration command to limit the rate of incoming Address Resolution Protocol (ARP) requests and responses on an interface. It prevents dynamic ARP inspection from using all of the switch resources if a denial-of-service attack occurs. Use the **no** form of this command to return to the default settings.

ip arp inspection limit {rate pps [burst interval seconds] | none}

no ip arp inspection limit

Syntax Description	rate pps	Specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 packets per second (pps).	
	burst interval seconds	(Optional) Specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15 seconds.	
	none	Specify no upper limit for the rate of incoming ARP packets that can be processed.	
Defaults		rusted interfaces, assuming that the network is a switched network with a host 5 15 new hosts per second.	
	The rate is unlimited on	all trusted interfaces.	
	The burst interval is 1 se	cond.	
Command Modes	Interface configuration		
Command History	Release Mo	odification	
	12.2(20)SE Th	is command was introduced.

The rate of incoming ARP packets on EtherChannel ports equals the sum of the incoming rate of ARP packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on all the channel members.

Examples This example shows how to limit the rate of incoming ARP requests on a port to 25 pps and to set the interface monitoring interval to 5 consecutive seconds:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip arp inspection limit rate 25 burst interval 5

You can verify your settings by entering the **show ip arp inspection interfaces** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	show inventory interfaces	Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.

ip arp inspection log-buffer

Use the **ip arp inspection log-buffer** global configuration command to configure the dynamic Address Resolution Protocol (ARP) inspection logging buffer. Use the **no** form of this command to return to the default settings.

ip arp inspection log-buffer {**entries** *number* | **logs** *number* **interval** *seconds*}

no ip arp inspection log-buffer {entries | logs}

Syntax Description	entries number	Number of entries to be logged in the buffer. The range is 0 to 1024.	
	logs number	Number of entries needed in the specified interval to generate system messages.	
	interval seconds	For logs <i>number</i> , the range is 0 to 1024. A 0 value means that the entry is placed in the log buffer, but a system message is not generated.	
		For interval <i>seconds</i> , the range is 0 to 86400 seconds (1 day). A 0 value means that a system message is immediately generated (and the log buffer is always empty).	
Defaults	When dynamic ARP inspection is enabled, denied or dropped ARP packets are logged. The number of log entries is 32.		
	The number of syst	tem messages is limited to 5 per second.	
	The logging-rate in	iterval is 1 second.	
Command Modes	Global configuration		
Command History	Release	Modification	
-	12.2(20)SE	This command was introduced.	
Usage Guidelines	A value of 0 is not	allowed for both the logs and the interval keywords.	
	The logs and interval settings interact. If the logs <i>number</i> X is greater than interval <i>seconds</i> Y, X divided by Y (X/Y) system messages are sent every second. Otherwise, one system message is sent every Y divided by X (Y/X) seconds. For example, if the logs <i>number</i> is 20 and the interval <i>seconds</i> is 4, the switch generates system messages for five entries every second while there are entries in the log buffer.		
	A log buffer entry can represent more than one packet. For example, if an interface receives many packets on the same VLAN with the same ARP parameters, the switch combines the packets as one entry in the log buffer and generates a system message as a single entry.		
	for the show ip arg appears in place of	erflows, it means that a log event does not fit into the log buffer, and the output display p inspection log privileged EXEC command is affected. A in the output display all data except the packet count and the time. No other statistics are provided for the is entry in the display, increase the number of entries in the log buffer, or increase the	
	logging rate.		

ExamplesThis example shows how to configure the logging buffer to hold up to 45 entries:
Switch(config)# ip arp inspection log-buffer entries 45This example shows how to configure the logging rate to 20 log entries per 4 seconds. With this
configuration, the switch generates system messages for five entries every second while there are entries
in the log buffer.
Switch(config)# ip arp inspection log-buffer logs 20 interval 4
You can verify your settings by entering the show ip arp inspection log privileged EXEC command.

Related Commands	Command	Description
	arp access-list	Defines an ARP access control list (ACL).
	clear ip arp inspection log	Clears the dynamic ARP inspection log buffer.
	ip arp inspection vlan logging	Controls the type of packets that are logged per VLAN.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

ip arp inspection trust

Use the **ip arp inspection trust** interface configuration command to configure an interface trust state that determines which incoming Address Resolution Protocol (ARP) packets are inspected. Use the **no** form of this command to return to the default setting.

ip arp inspection trust

no ip arp inspection trust

- **Syntax Description** This command has no arguments or keywords.
- **Defaults** The interface is untrusted.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.2(20)SE	This command was introduced.

Usage Guidelines The switch does not check ARP packets that it receives on the trusted interface; it simply forwards the packets.

For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the **ip arp inspection vlan logging** global configuration command.

Examples This example shows how to configure a port to be trusted:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ip arp inspection trust

You can verify your setting by entering the **show ip arp inspection interfaces** *interface-id* privileged EXEC command.

Related Commands	Command	Description
	ip arp inspection log-buffer	Configures the dynamic ARP inspection logging buffer.
	show inventory interfaces	Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.

ip arp inspection validate

Use the **ip arp inspection validate** global configuration command to perform specific checks for dynamic Address Resolution Protocol (ARP) inspection. Use the **no** form of this command to return to the default settings.

ip arp inspection validate {[src-mac] [dst-mac] [ip [allow zeros]]}

no ip arp inspection validate [src-mac] [dst-mac] [ip [allow zeros]]

Syntax Description	src-mac	Compare the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses.	
		When enabled, packets with different MAC addresses are classified as invalid and are dropped.	
	dst-mac	Compare the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses.	
		When enabled, packets with different MAC addresses are classified as invalid and are dropped.	
	ір	Compare the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses.	
		Sender IP addresses are compared in all ARP requests and responses. Target IP addresses are checked only in ARP responses.	
	allow-zeros	Modifies the IP validation test so that ARPs with a sender address of 0.0.0.0 (ARP probes) are not denied.	
Defaults	No checks are performed.		
Command Modes	Global configu	iration	
Command History	Release	Modification	
	12.2(20)SE	This command was introduced.	
	12.2(37)SE	The allow-zero keyword was added.	

previous command; that is, if a command enables **src-mac** and **dst-mac** validations, and a second command enables IP validation only, the **src-mac** and **dst-mac** validations are disabled as a result of the second command.

The allow-zeros keyword interacts with ARP access control lists (ACLs) in this way:

- If you configure an ARP ACL to deny ARP probes, they are dropped even if the **allow-zero** keyword is specified.
- If you configure an ARP ACL that specifically permits ARP probes and configure the **ip arp inspection validate ip** command, ARP probes are dropped unless you enter the **allow-zeros** keyword.

The **no** form of the command disables only the specified checks. If none of the options are enabled, all checks are disabled.

Examples This example show how to enable source MAC validation: Switch(config)# ip arp inspection validate src-mac You can verify your setting by entering the show ip arp inspection vlan vlan-range privileged EXEC command.

Related Commands	Command	Description
	show inventory vlan	Displays the configuration and the operating state of dynamic ARP
	vlan-range	inspection for the specified VLAN.

ip arp inspection vlan

Use the **ip arp inspection vlan** global configuration command to enable dynamic Address Resolution Protocol (ARP) inspection on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip arp inspection vlan vlan-range

no ip arp inspection vlan vlan-range

Syntax Description	vlan-range	VLAN number or range.
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
Defaults	ARP inspection is dis	abled on all VLANs.
Command Modes	Global configuration	
Command History	Release	Modification
Command History		This command was introduced.
Usage Guidelines		VLANs on which to enable dynamic ARP inspection. ion is supported on access ports, trunk ports, EtherChannel ports, or private VLAN
Examples	This example shows how to enable dynamic ARP inspection on VLAN 1: Switch(config)# ip arp inspection vlan 1	
		etting by entering the show ip arp inspection vlan <i>vlan-range</i> privileged EXEC
Related Commands	Command	Description
	arp access-list	Defines an ARP access control list (ACL).
	show inventory vlan <i>vlan-range</i>	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.

ip arp inspection vlan logging

Use the **ip arp inspection vlan logging** global configuration command to control the type of packets that are logged per VLAN. Use the **no** form of this command to disable this logging control.

ip arp inspection vlan *vlan-range* logging {acl-match {matchlog | none} | dhcp-bindings {all | none | permit} | arp-probe}

no ip arp inspection vlan vlan-range logging	{acl-match dhcp-bir	idings arp-probe}
----------------------------------------------	-----------------------	---------------------

Syntax Description	vlan-range	Specify the VLANs configured for logging.
		You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
	acl-match {matchlog none}	Specify that the logging of packets is based on access control list (ACL) matches.
		The keywords have these meanings:
		• matchlog —Log packets based on the logging configuration specified in the access control entries (ACE). If you specify the matchlog keyword in this command and the log keyword in the permit or deny ARP access-list configuration command, Address Resolution Protocol (ARP) packets permitted or denied by the ACL are logged.
		• none —Do not log packets that match ACLs.
	dhcp-bindings {permit all none}	Specify the logging of packets is based on Dynamic Host Configuration Protocol (DHCP) binding matches.
		The keywords have these meanings:
		• all —Log all packets that match DHCP bindings.
		• none —Do not log packets that match DHCP bindings.
		• permit —Log DHCP-binding permitted packets.
	arp-probe	Specify logging of packets permitted specifically because they are ARP probes.
Defaults	All denied or all droppe	ed packets are logged. ARP probe packets are not logged.
Command Modes	Global configuration	
Command History	Release M	Iodification
	12.2(20)SE T	his command was introduced.
	12.2(37)SE T	

Usage GuidelinesThe term logged means that the entry is placed into the log buffer and that a system message is generated.
The acl-match and dhcp-bindings keywords merge with each other; that is, when you configure an ACL
match, the DHCP bindings configuration is not disabled. Use the no form of the command to reset the
logging criteria to their defaults. If neither option is specified, all types of logging are reset to log when
ARP packets are denied. These are the options:• acl-match—Logging on ACL matches is reset to log on deny.• dhcp-bindings—Logging on DHCP binding matches is reset to log on deny.If neither the acl-match or the dhcp-bindings keywords are specified, all denied packets are logged.

The implicit deny at the end of an ACL does not include the **log** keyword. This means that when you use the **static** keyword in the **ip arp inspection filter vlan** global configuration command, the ACL overrides the DHCP bindings. Some denied packets might not be logged unless you explicitly specify the **deny ip any mac any log** ACE at the end of the ARP ACL.

Examples This example shows how to configure ARP inspection on VLAN 1 to log packets that match the **permit** commands in the ACL:

Switch(config)# arp access-list test1
Switch(config-arp-nacl)# permit request ip any mac any log
Switch(config-arp-nacl)# permit response ip any any mac any any log
Switch(config-arp-nacl)# exit
Switch(config)# ip arp inspection vlan 1 logging acl-match matchlog

You can verify your settings by entering the **show ip arp inspection vlan** *vlan-range* privileged EXEC command.

Related Commands	Command	Description
	arp access-list	Defines an ARP ACL.
	clear ip arp inspection log	Clears the dynamic ARP inspection log buffer.
	ip arp inspection log-buffer	Configures the dynamic ARP inspection logging buffer.
	show inventory log	Displays the configuration and contents of the dynamic ARP inspection log buffer.
	show inventory vlan <i>vlan-range</i>	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN.

ip dhcp snooping

Use the **ip dhcp snooping** global configuration command to globally enable DHCP snooping. Use the **no** form of this command to return to the default setting.

ip dhcp snooping

no ip dhcp snooping

Syntax Description	This command has n	o arguments or keywords.
--------------------	--------------------	--------------------------

Defaults	DHCP snooping is disabled.
----------	----------------------------

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines For any DHCP snooping configuration to take effect, you must globally enable DHCP snooping.

DHCP snooping is not active until you enable snooping on a VLAN by using the **ip dhcp snooping vlan** *vlan-id* global configuration command.

 Examples
 This example shows how to enable DHCP snooping:

 Switch(config)# ip dhcp snooping

 You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	ip dhcp snooping vlan	Enables DHCP snooping on a VLAN.
	show ip igmp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping binding

Use the **ip dhcp snooping binding** privileged EXEC command to configure the DHCP snooping binding database and to add binding entries to the database. Use the **no** form of this command to delete entries from the binding database.

ip dhcp snooping binding mac-address **vlan** vlan-id ip-address **interface** interface-id **expiry** seconds

no ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id

Syntax Description	mac-address	Specify a MAC address.
	vlan vlan-id	Specify a VLAN number. The range is 1 to 4094.
	ip-address	Specify an IP address.
	interface interface-id	Specify an interface on which to add or delete a binding entry.
	expiry seconds	Specify the interval (in seconds) after which the binding entry is no longer valid. The range is 1 to 4294967295.
Defaults	No default database is d	lefined.
Command Modes	Privileged EXEC	
Command History	Release Mod	ification
	12.2(20)SE This	command was introduced.
Usage Guidelines		n you are testing or debugging the switch. binding database, each database entry, also referred to a binding, has an IP
		MAC address, the lease time (in hexadecimal format), the interface to which the vLAN to which the interface belongs. The database can have up to 8192
		nooping binding privileged EXEC command to display only the configured ip source binding privileged EXEC command to display the dynamically and ndings.
Examples	This example shows how 1000 seconds on a port	w to generate a DHCP binding configuration with an expiration time of in VLAN 1:
	Switch# ip dhcp snoop gigabitethernet0/1 ex	ping binding 0001.1234.1234 vlan 1 172.20.50.5 interface mpiry 1000
	You can verify your setti binding privileged EXE	ings by entering the show ip dhcp snooping binding or the show ip dhcp source EC command.

Related Commands	Com
------------------	-----

Command	Description
ip dhcp snooping	Enables DHCP snooping on a VLAN.
show ip dhcp snooping binding	Displays the dynamically configured bindings in the DHCP snooping binding database and the configuration information.
show ip source binding	Displays the dynamically and statically configured bindings in the DHCP snooping binding database.

ip dhcp snooping database

Use the **ip dhcp snooping database** global configuration command to configure the DHCP snooping binding database agent. Use the **no** form of this command to disable the agent, to reset the timeout value, or to reset the write-delay value.

ip dhcp snooping database { {flash:/filename | ftp://user:password@host/filename |
 http://[[username:password]@]{hostname | host-ip}[/directory]/image-name.tar |
 rcp://user@host/filename | tftp://host/filename} | timeout seconds | write-delay seconds}

no ip dhcp snooping database [timeout | write-delay]

Syntax Description	flash:/filename	Specify that the database agent or the binding file is in the flash memory.
	ftp://user:password@host/filename	Specify that the database agent or the binding file is on an FTP server.
	http://[[username:password]@] {hostname host-ip}[/directory] /image-name. tar	Specify that the database agent or the binding file is on an FTP server.
	rcp: //user@host/filename	Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.
	tftp://host/filename	Specify that the database agent or the binding file is on a TFTP server.
	timeout seconds	Specify (in seconds) how long to wait for the database transfer process to finish before stopping.
		The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely.
	write-delay seconds	Specify (in seconds) the duration for which the transfer should be delayed after the binding database changes. The default is 300 seconds. The range is 15 to 86400.
Defaults	The URL for the database agent or binding file is not defined.	
Defaults	-	-
Defaults	The timeout value is 300 seconds (5 n	ninutes).
Defaults	-	ninutes).
Defaults Command Modes	The timeout value is 300 seconds (5 n	ninutes).
	The timeout value is 300 seconds (5 n The write-delay value is 300 seconds	ninutes).

Usage Guidelines

The DHCP snooping binding database can have up to 8192 bindings.

To ensure that the lease time in the database is accurate, we recommend that Network Time Protocol (NTP) is enabled and configured for these features:

- NTP authentication
- NTP peer and server associations
- NTP broadcast service
- NTP access restrictions

ip dhcp snooping

ip dhcp snooping binding

show ip dhcp snooping database

• NTP packet source IP address

If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.

Because both NVRAM and the flash memory have limited storage capacities, we recommend that you store a binding file on a TFTP server. You must create an empty file at the configured URL on network-based URLs (such as TFTP and FTP) before the switch can first write bindings to the binding file at that URL.

Use the **ip dhcp snooping database flash:***/filename* command to save the DHCP snooping binding database in the NVRAM. If you set the **ip dhcp snooping database timeout** command to 0 seconds and the database is being written to a TFTP file, if the TFTP server goes down, the database agent continues to try the transfer indefinitely. No other transfer can be initiated while this one is in progress. This might be inconsequential because if the server is down, no file can be written to it.

Enables DHCP snooping on a VLAN.

Configures the DHCP snooping binding database. Displays the status of DHCP snooping database agent.

Use the no ip dhcp snooping database command to disable the agent.

Use the **no ip dhcp snooping database timeout** command to reset the timeout value.

Use the **no ip dhcp snooping database write-delay** command to reset the write-delay value.

Related Commands	Command Description
	You can verify your settings by entering the show ip dhcp snooping database privileged EXEC command.
	This example shows how to store a binding file called <i>file01.txt</i> in the NVRAM: Switch(config) # ip dhcp snooping database flash:file01.txt
	Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file
Examples	This example shows how to store a binding file at an IP address of 10.1.1.1 that is in a directory called <i>directory</i> . A file named <i>file</i> must be present on the TFTP server.

Catalyst 3560 Switch	Command Reference
----------------------	--------------------------

ip dhcp snooping information option

Use the **ip dhcp snooping information option** global configuration command to enable DHCP option-82 data insertion. Use the **no** form of this command to disable DHCP option-82 data insertion.

ip dhcp snooping information option

no ip dhcp snooping information option

- Syntax Description This command has no arguments or keywords.
- **Defaults** DHCP option-82 data is inserted.
- **Command Modes** Global configuration

Command History	Release	Modification	
12.1(19)EA1		This command was introduced.	

Usage Guidelines You must globally enable DHCP snooping by using the **ip dhcp snooping** global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled and a switch receives a DHCP request from a host, it adds the option-82 information in the packet. The option-82 information contains the switch MAC address (the remote ID suboption) and the port identifier, **vlan-mod-port**, from which the packet is received (circuit ID suboption). The switch forwards the DHCP request that includes the option-82 field to the DHCP server.

When the DHCP server receives the packet, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or a circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. When the client and server are on the same subnet, the server broadcasts the reply. The switch inspects the remote ID and possibly the circuit ID fields to verify that it originally inserted the option-82 data. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP host that sent the DHCP request.

Examples

This example shows how to enable DHCP option-82 data insertion:

Switch(config) # ip dhcp snooping information option

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping information option allow-untrusted

Use the **ip dhcp snooping information option allow-untrusted** global configuration command on an aggregation switch to configure it to accept DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch. Use the **no** form of this command to return to the default setting.

ip dhcp snooping information option allow-untrusted

no ip dhcp snooping information option allow-untrusted

Syntax Description	This command has no arguments or keywords.
Defaults	The switch drops DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch.
Command Modes	Global configuration

Command History	Release	Modification	
	12.2(25)SEA	This command was introduced.	

Usage Guidelines

s You might want an edge switch to which a host is connected to insert DHCP option-82 information at the edge of your network. You might also want to enable DHCP security features, such as DHCP snooping, IP source guard, or dynamic Address Resolution Protocol (ARP) inspection, on an aggregation switch. However, if DHCP snooping is enabled on the aggregation switch, the switch drops packets with option-82 information that are received on an untrusted port and does not learn DHCP snooping bindings for connected devices on a trusted interface.

If the edge switch to which a host is connected inserts option-82 information and you want to use DHCP snooping on an aggregation switch, enter the **ip dhcp snooping information option allow-untrusted** command on the aggregation switch. The aggregation switch can learn the bindings for a host even though the aggregation switch receives DHCP snooping packets on an untrusted port. You can also enable DHCP security features on the aggregation switch. The port on the edge switch to which the aggregation switch is connected must be configured as a trusted port.

Do not enter the **ip dhcp snooping information option allow-untrusted** command on an aggregation switch to which an untrusted device is connected. If you enter this command, an untrusted device might spoof the option-82 information.

Examples This example shows how to configure an access switch to not check the option-82 information in untrusted packets from an edge switch and to accept the packets:

Switch(config) # ip dhcp snooping information option allow-untrusted

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping information option format remote-id

Use the **ip dhcp snooping information option format remote-id** global configuration command on the switch to configure the option-82 remote-ID suboption. Use the **no** form of this command to configure the default remote-ID suboption.

ip dhcp snooping information option format remote-id [string ASCII-string | hostname]

no ip dhcp snooping information option format remote-id

Syntax Description	stringASCII-string	Specify a remote ID, using from 1 to 63 ASCII characters (no spaces).	
	hostname	Specify the switch hostname as the remote ID.	
Defaults	The switch MAC address is the remote ID.		
Command Modes	Global configuration		
Command History	Release Modi	fication	
	12.2(25)SEE This	command was introduced.	
Usage Guidelines	You must globally enable DHCP snooping by using the ip dhcp snooping global configuration command for any DHCP snooping configuration to take effect. When the option-82 feature is enabled, the default remote-ID suboption is the switch MAC address. Th command allows you to configure either the switch hostname or a string of up to 63 ASCII characters (but no spaces) to be the remote ID.		
Note	If the hostname exceeds 63 c configuration.	haracters, it will be truncated to 63 characters in the remote-ID	
Examples	Switch(config)# ip dhcp s	is example shows how to configure the option- 82 remote-ID suboption: <pre>itch(config)# ip dhcp snooping information option format remote-id hostname u can verify your settings by entering the show ip dhcp snooping user EXEC command.</pre>

	show ip dhep sno		ays the DHCP snooping configuration.
	show ip dhcp sno	oping binding Displ	ays the DHCP snooping binding information.

ip dhcp snooping trust

Use the **ip dhcp snooping trust** interface configuration command to configure a port as trusted for DHCP snooping purposes. Use the **no** form of this command to return to the default setting.

ip dhcp snooping trust

no ip dhcp snooping trust

Syntax Description	This command has no a	arguments or keywords.
--------------------	-----------------------	------------------------

- **Defaults** DHCP snooping trust is disabled.
- **Command Modes** Interface configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines Configure as trusted ports those that are connected to a DHCP server or to other switches or routers. Configure as untrusted ports those that are connected to DHCP clients.

Examples This example shows how to enable DHCP snooping trust on a port:

Switch(config-if)# ip dhcp snooping trust

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.
	show ip dhcp snooping binding	Displays the DHCP snooping binding information.

ip dhcp snooping verify

Use the **ip dhcp snooping verify** global configuration command to configure the switch to verify on an untrusted port that the source MAC address in a DHCP packet matches the client hardware address. Use the **no** form of this command to configure the switch to not verify the MAC addresses.

ip dhcp snooping verify mac-address

no ip dhcp snooping verify mac-address

Defaults The switch verifies the source MAC address in a DHCP packet that is received on untrusted ports matches the client hardware address in the packet.

Command Modes Global configuration

Command History	Release	Modification
	12.2(20)SE	This command was introduced.

Usage Guidelines In a service-provider network, when a switch receives a packet from a DHCP client on an untrusted port, it automatically verifies that the source MAC address and the DHCP client hardware address match. If the addresses match, the switch forwards the packet. If the addresses do not match, the switch drops the packet.

Examples	This example shows how to disable the MAC address verification:
	Switch(config)# no ip dhcp snooping verify mac-address
	You can verify your settings by entering the show ip dhcp snooping user EXEC command.

Related Commands	Command	Description
	show ip dhcp snooping	Displays the DHCP snooping configuration.

ip dhcp snooping vlan

Use the **ip dhcp snooping vlan** global configuration command to enable DHCP snooping on a VLAN. Use the **no** form of this command to return to the default setting.

ip dhcp snooping vlan vlan-range

no ip dhcp snooping vlan vlan-range

Syntax Description	vlan vlan-range	Specify a VLAN range is 1 to 409	I ID or a range of VLANs on which to enable DHCP snooping. The 04.
		IDs separated by	single VLAN ID identified by VLAN ID number, a series of VLAN v commas, a range of VLAN IDs separated by hyphens, or a range eparated by entering the starting and ending VLAN IDs separated
Defaults	DHCP snooping i	s disabled on all V	'LANs.
Command Modes	Global configurat	ion	
Command History	Release	Modification	
	12.1(19)EA1	This commane	d was introduced.
Usage Guidelines	You must first glo	bally enable DHC	P snooping before enabling DHCP snooping on a VLAN.
Examples	1	ws how to enable l	DHCP snooping on VLAN 10:
			ring the show ip dhcp snooping user EXEC command.
Related Commands	Command		Description
	show ip dhcp sno	ooping	Displays the DHCP snooping configuration.
	show ip dhcp sno		Displays the DHCP snooping binding information.

ip dhcp snooping vlan information option format-type circuit-id string

Use the **ip dhcp snooping vlan information option format-type circuit-id string** interface configuration command on the switch to configure the option-82 circuit-ID suboption. Use the **no** form of this command to configure the default circuit-ID suboption.

ip dhcp snooping vlan vlan information option format-type circuit-id string ASCII-string

no ip dhcp snooping vlan vlan information option format-type circuit-id string

Syntax Description	vlan vlan	Specify the VLAN ID. The range is 1 to 4094.	
	stringASCII-strin	Specify a circuit ID, using from 3 to 63 ASCII characters (no spaces).	
Defaults	The switch VLAN	and the port identifier, in the format vlan-mod-port , is the default circuit ID.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	
Usage Guidelines	You must globally enable DHCP snooping by using the ip dhcp snooping global configuration command for any DHCP snooping configuration to take effect. When the option-82 feature is enabled, the default circuit-ID suboption is the switch VLAN and the port identifier, in the format vlan-mod-port . This command allows you to configure a string of ASCII characters to be the circuit ID.		
Note	When configuring a large number of circuit IDs on a switch, consider the impact of lengthy character strings on the NVRAM or flash memory. If the circuit-ID configurations, combined with other data, exceed the capacity of the NVRAM or the flash memory, an error message appears.		
Examples	This example shows how to configure the option-82 circuit-ID suboption:		
	Switch(config-if)# ip dhcp snooping vlan 250 information option format-type circuit-id string customerABC-250-0-0		
	You can verify your settings by entering the show ip dhcp snooping user EXEC command.		

The **show ip dhcp snooping** user EXEC command only displays the global command output, including a remote-ID configuration. It does not display any per-interface, per-VLAN string that you have configured for the circuit ID.

Related Commands	Command	Description	
	ip dhcp snooping information option format remote-id	Configures the option-82 remote-ID suboption.	
	show ip dhcp snooping	Displays the DHCP snooping configuration.	

ip igmp filter

Use the **ip igmp filter** interface configuration command to control whether or not all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an Internet Group Management Protocol (IGMP) profile to the interface. Use the **no** form of this command to remove the specified profile from the interface.

ip igmp filter profile number

no ip igmp filter

Syntax Description	profile number	The IGMP profile number to be applied. The range is 1 to 4294967295.
Defaults	No IGMP filters a	re applied.
Command Modes	Interface configur	ation
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	11.	MP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed al interfaces (SVIs), or ports that belong to an EtherChannel group.
	An IGMP profile of profile applied to	can be applied to one or more switch port interfaces, but one port can have only one it.
Examples	This example show	ws how to apply IGMP profile 22 to a port:
		<pre>interface gigabitethernet0/2 E) # ip igmp filter 22</pre>
	You can verify you specifying an inter	ur setting by using the show running-config privileged EXEC command and by rface.

Related Commands	Command	Description
	ip igmp profile	Configures the specified IGMP profile number.
	show ip dhcp snooping statistics	Displays the characteristics of the specified IGMP profile.
	show running-config interface <i>interface-id</i>	Displays the running configuration on the switch interface, including the IGMP profile (if any) that is applied to an interface. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

ip igmp max-groups

Use the **ip igmp max-groups** interface configuration command to set the maximum number of Internet Group Management Protocol (IGMP) groups that a Layer 2 interface can join or to configure the IGMP throttling action when the maximum number of entries is in the forwarding table. Use the **no** form of this command to set the maximum back to the default, which is to have no maximum limit, or to return to the default throttling action, which is to drop the report.

ip igmp max-groups {number | action {deny | replace}}

no ip igmp max-groups {*number* | **action**}

Syntax Description	number	The maximum number of IGMP groups that an interface can join. The range is 0 to 4294967294. The default is no limit.			
	action deny	When the maximum number of entries is in the IGMP snooping forwarding table, drop the next IGMP join report. This is the default action.			
	action replace	When the maximum number of entries is in the IGMP snooping forwarding table, replace the existing group with the new group for which the IGMP report was received.			
Defaults	The default ma	aximum number of groups is no limit.			
	After the switch learns the maximum number of IGMP group entries on an interface, the default throttling action is to drop the next IGMP report that the interface receives and to not add an entry for the IGMP group to the interface.				
Command Modes	Interface conf	iguration			
Command Modes	Interface confi	iguration Modification			
Command History	Release 12.1(19)EA1 You can use th You cannot set	Modification			
	Release 12.1(19)EA1 You can use th You cannot se belong to an E	Modification This command was introduced. his command only on Layer 2 physical interfaces and on logical EtherChannel interfaces t IGMP maximum groups for routed ports, switch virtual interfaces (SVIs), or ports that			

	• If you configure the throttling action as replace and set the maximum group limitation, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the switch replaces a randomly selected multicast entry with the received IGMP report.
	 When the maximum group limitation is set to the default (no maximum), entering the ip igmp max-groups {deny replace} command has no effect.
Examples	This example shows how to limit to 25 the number of IGMP groups that a port can join:
	Switch(config)# interface gigabitethernet0/2 Switch(config-if)# ip igmp max-groups 25
	This example shows how to configure the switch to replace the existing group with the new group for which the IGMP report was received when the maximum number of entries is in the forwarding table:
	Switch(config)# interface gigabitethernet0/1 Switch(config-if)# ip igmp max-groups action replace
	You can verify your setting by using the show running-config privileged EXEC command and by specifying an interface.
Related Commands	Command Description

ip igmp profile

Use the **ip igmp profile** global configuration command to create an Internet Group Management Protocol (IGMP) profile and enter IGMP profile configuration mode. From this mode, you can specify the configuration of the IGMP profile to be used for filtering IGMP membership reports from a switchport. Use the **no** form of this command to delete the IGMP profile.

ip igmp profile *profile number*

no ip igmp profile profile number

Syntax Description	profile number	<i>profile number</i> The IGMP profile number being configured. The range is 1 to 4294967295.		
Defaults	No IGMP profiles are defined. When configured, the default action for matching an IGMP profile is to deny matching addresses.			
Command Modes				
Command History	Release	Modification		
	12.1(19)EA1	This command was introduced.		
Usage Guidelines	When you are in IGMP profile configuration mode, you can create the profile by using these commands:			
	• deny : specifies that matching addresses are denied; this is the default condition.			
• exit : exits from igmp-profile configuration mode.				
	 no: negates a command or resets to its defaults. permit: specifies that matching addresses are permitted. 			
	• range : specifies a range of IP addresses for the profile. This can be a single IP address or a rang with a start and an end address.			
	When entering a range, enter the low IP multicast address, a space, and the high IP multicast addres			
	You can apply an IGMP profile to one or more Layer 2 interfaces, but each interface can have only one profile applied to it.			
Examples	This example show addresses:	ws how to configure IGMP profile 40 that permits the specified range of IP multicast		
	Switch(config-ig	ip igmp profile 40 mp-profile)# permit mp-profile)# range 233.1.1.1 233.255.255.255		
	You can verify yo	ur settings by using the show ip igmp profile privileged EXEC command.		

Related Commands	Command	Description
	ip igmp filter	Applies the IGMP profile to the specified interface.
	show ip dhcp snooping statistics	Displays the characteristics of all IGMP profiles or the specified IGMP profile number.

ip igmp snooping

Use the **ip igmp snooping** global configuration command to globally enable Internet Group Management Protocol (IGMP) snooping on the switch or to enable it on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping [**vlan** *vlan-id*]

no ip igmp snooping [**v**lan vlan-id]

Syntax Description	vlan vlan-id	(Optional) Enable IGMP snooping on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.	
Defaults	IGMP snooping is g	globally enabled on the switch.	
	IGMP snooping is a	enabled on VLAN interfaces.	
Command Modes	Global configuration	n	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	1	ing is enabled globally, it is enabled in all the existing VLAN interfaces. When IGMP y disabled, it is disabled on all the existing VLAN interfaces.	
	VLAN IDs 1002 to snooping.	1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP	
Examples	-	s how to globally enable IGMP snooping:

ip igmp snooping querier

Use the **ip igmp snooping querier** global configuration command to globally enable the Internet Group Management Protocol (IGMP) querier function in Layer 2 networks. Use the command with keywords to enable and configure the IGMP querier feature on a VLAN interface. Use the **no** form of this command to return to the default settings.

- **ip igmp snooping querier [vlan** *vlan-id*] [**address** *ip-address* | **max-response-time** *response-time* | **query-interval** *interval-count* | **tcn query** [**count** *count* | **interval** *interval*] | **timer expiry** | **version** *version*]
- **no ip igmp snooping querier [vlan** *vlan-id*] [address | max-response-time | query-interval | tcn query { count count | interval interval} | timer expiry | version]

Syntax Description	vlan vlan-id	(Optional) Enable IGMP snooping and the IGMP querier function on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.	
	address ip-address	(Optional) Specify a source IP address. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.	
	max-response-time response-time	(Optional) Set the maximum time to wait for an IGMP querier report. The range is 1 to 25 seconds.	
	query-interval <i>interval-count</i>	(Optional) Set the interval between IGMP queriers. The range is 1 to 18000 seconds.	
	tcn query[count <i>count</i> interval <i>interval</i>]	(Optional) Set parameters related to Topology Change Notifications (TCNs). The keywords have these meanings:	
		• count —Set the number of TCN queries to be executed during the TCN interval time. The range is 1 to 10.	
		• interval <i>interval</i> —Set the TCN query interval time. The range is 1 to 255.	
	timer expiry	(Optional) Set the length of time until the IGMP querier expires. The range is 60 to 300 seconds.	
Defaults	version version	(Optional) Select the IGMP version number that the querier feature uses. Select 1 or 2.	
	The IGMP snooping querier feature is globally disabled on the switch.		
	When enabled, the IGMP snooping querier disables itself if it detects IGMP traffic from a multicast-enabled device.		
Command Modes	Global configuration		
Command Modes	Global configuration Release	Modification	

Usage Guidelines	 Use this command to enable IGMP snooping to detect the IGMP version and IP address of a device that sends IGMP query messages, which is also called a <i>querier</i>. By default, the IGMP snooping querier is configured to detect devices that use IGMP Version 2 (IGMPv2) but does not detect clients that are using IGMP Version 1 (IGMPv1). You can manually configure the max-response-time value when devices use IGMPv2. You cannot configure the max-response-time when devices use IGMPv1. (The value cannot be configured and is set to zero). Non-RFC compliant devices running IGMPv1 might reject IGMP general query messages that have a non-zero value as the max-response-time value. If you want the devices to accept the IGMP general query messages, configure the IGMP snooping querier to run IGMPv1. 				
Examples	This example shows how to globally enable the IGMP snooping querier feature:				
	Switch(config)# ip igmp snooping querier				
	This example shows how to set the IGMP snooping querier maximum response time to 25 seconds:				
	Switch(config)# ip igmp snooping querier max-response-time 25				
	This example shows how to set the IGMP snooping querier interval time to 60 seconds:				
	Switch(config)# ip igmp snooping querier query-interval 60				
	This example shows how to set the IGMP snooping querier TCN query count to 25:				
	Switch(config)# ip igmp snooping querier tcn count 25				
	This example shows how to set the IGMP snooping querier timeout to 60 seconds:				
	Switch(config)# ip igmp snooping querier timeout expiry 60				
	This example shows how to set the IGMP snooping querier feature to version 2:				
	Switch(config)# ip igmp snooping querier version 2				
	You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Г

OL-8554-05

ip igmp snooping report-suppression

Use the **ip igmp snooping report-suppression** global configuration command to enable Internet Group Management Protocol (IGMP) report suppression. Use the **no** form of this command to disable IGMP report suppression and to forward all IGMP reports to multicast routers.

ip igmp snooping report-suppression

no ip igmp snooping report-suppression

Syntax Description	This command has no arguments	or keywords.
--------------------	-------------------------------	--------------

- **Defaults** IGMP report suppression is enabled.
- **Command Modes** Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers. If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression by entering the **no ip igmp snooping report-suppression** command, all IGMP reports are forwarded to all the multicast routers.

ExamplesThis example shows how to disable report suppression:
Switch(config)# no ip igmp snooping report-suppression

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

	show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.

ip igmp snooping tcn flood

Use the **ip igmp snooping tcn flood** interface configuration command to specify multicast flooding as the Internet Group Management Protocol (IGMP) snooping spanning-tree Topology Change Notification (TCN) behavior. Use the **no** form of this command to disable the multicast flooding.

ip igmp snooping tcn flood

no ip igmp snooping tcn flood

Syntax Description	This command has r	no arguments or	keywords.
--------------------	--------------------	-----------------	-----------

Defaults Multicast flooding is enabled on an interface during a spanning-tree TCN event.

Command Modes Interface configuration

Command History	Release	Modification
	12.2(25)SEB	This command was introduced.

Usage Guidelines When the switch receives a TCN, multicast traffic is flooded to all the ports until two general queries are received. If the switch has many ports with attached hosts that are subscribed to different multicast groups, the flooding might exceed the capacity of the link and cause packet loss.

You can change the flooding query count by using the **ip igmp snooping tcn flood query count** global configuration command.

Examples This example shows how to disable the multicast flooding on an interface:

Switch(config)# interface gigabitethernet0/2
Switch(config-if)# no ip igmp snooping tcn flood

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Related Commands	Command	Description
	ip igmp snooping	Enables IGMP snooping on the switch or on a VLAN.
	ip igmp snooping tcn	Configures the IGMP TCN behavior on the switch.
	show ip igmp snooping	Displays the IGMP snooping configuration of the switch or the VLAN.

ip igmp snooping vlan immediate-leave

Use the **ip igmp snooping immediate-leave** global configuration command to enable Internet Group Management Protocol (IGMP) snooping immediate-leave processing on a per-VLAN basis. Use the **no** form of this command to return to the default setting.

ip igmp snooping vlan vlan-id immediate-leave

no ip igmp snooping vlan vlan-id immediate-leave

Syntax Description	vlan-id	Enable IGMP snooping and the Immediate-Leave feature on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.
Defaults	IGMP immediate-lea	ave processing is disabled.
Command Modes	Global configuration	1
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	VLAN IDs 1002 to snooping.	1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP
	-	the Immediate- Leave feature only when there is a maximum of one receiver on AN. The configuration is saved in NVRAM.
	The Immediate-Leav	ve feature is supported only with IGMP Version 2 hosts.
Examples	Ĩ	how to enable IGMP immediate-leave processing on VLAN 1: pigmp snooping vlan 1 immediate-leave
	You can verify your	settings by entering the show ip igmp snooping privileged EXEC command.

ip igmp snooping vlan mrouter

Use the **ip igmp snooping mrouter** global configuration command to add a multicast router port or to configure the multicast learning method. Use the **no** form of this command to return to the default settings.

ip igmp snooping vlan *vlan-id* **mrouter** {**interface** *interface-id* | **learn** {**cgmp** | **pim-dvmrp**}}

no ip igmp snooping vlan *vlan-id* **mrouter** {**interface** *interface-id* | **learn** {**cgmp** | **pim-dvmrp**}}

Syntax Description	vlan-id	Enable IGMP snooping, and add the port in the specified VLAN as the multicast router port. The range is 1 to 1001 and 1006 to 4094.	
	interface interface-id	Specify the next-hop interface to the multicast router. The keywords have these meanings:	
		• fastethernet <i>interface number</i> —a Fast Ethernet IEEE 802.3 interface.	
		• gigabitethernet <i>interface number</i> —a Gigabit Ethernet IEEE 802.3z interface.	
		• port-channel <i>interface number</i> —a channel interface. The range is 0 to 48.	
	learn {cgmp pim-dvmrp}	Specify the multicast router learning method. The keywords have these meanings:	
		• cgmp —Set the switch to learn multicast router ports by snooping on Cisco Group Management Protocol (CGMP) packets.	
		• pim-dvmrp —Set the switch to learn multicast router ports by snooping on IGMP queries and Protocol-Independent Multicast-Distance Vector Multicast Routing Protocol (PIM-DVMRP) packets.	
Defaults	By default, there are no multicast router ports.		
	The default learning me	thod is pim-dvmrp —to snoop IGMP queries and PIM-DVMRP packets.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	VLAN IDs 1002 to 100 snooping.	5 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP	
	The CGMP learn metho	d is useful for reducing control traffic.	

ExamplesThis example shows how to configure a port as a multicast router port:
Switch(config)# ip igmp snooping vlan 1 mrouter interface gigabitethernet0/22
This example shows how to specify the multicast router learning method as CGMP:
Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

Related Commands	Command	Description

	show ip igmp snooping querier	Displays the configuration and operation information for the IGMP querier configured on a switch.

ip igmp snooping vlan static

Use the **ip igmp snooping static** global configuration command to enable Internet Group Management Protocol (IGMP) snooping and to statically add a Layer 2 port as a member of a multicast group. Use the **no** form of this command to remove ports specified as members of a static multicast group.

ip igmp snooping vlan vlan-id static ip-address interface interface-id

no ip igmp snooping vlan vlan-id static ip-address interface interface-id

Syntax Description	vlan-id	Enable IGMP snooping on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.
	ip-address	Add a Layer 2 port as a member of a multicast group with the specified group IP address.
	interface interface-id	Specify the interface of the member port. The keywords have these meanings:
		• fastethernet interface number—a Fast Ethernet IEEE 802.3 interface.
		• gigabitethernet <i>interface number</i> —a Gigabit Ethernet IEEE 802.3z interface.
		• port-channel <i>interface number</i> —a channel interface. The range is 0 to 48.
Defaults	By default, there are no	ports statically configured as members of a multicast group.
Command Modes	Global configuration	
Command History	Release	Modification
Command History	12.1(19)EA1	This command was introduced.
	12.1(1))EM	
Usage Guidelines	VLAN IDs 1002 to 100. snooping.	5 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP
	The configuration is sav	red in NVRAM.
Examples	This example shows how	w to statically configure a host on an interface:
		<pre>mp snooping vlan 1 static 0100.5e02.0203 interface gigabitethernet0/1 bitethernet0/1 on group 0100.5e02.0203</pre>
	You can verify your sett	ings by entering the show ip igmp snooping privileged EXEC command.

Related Commands C

Command	Description
ip igmp snooping report-suppression	Enables IGMP report suppression.
show ip igmp snooping	Displays the snooping configuration.
show ip igmp snooping groups	Displays IGMP snooping multicast information.
show ip igmp snooping mrouter	Displays the IGMP snooping router ports.

ip source binding

Use the **ip** source binding global configuration command to configure static IP source bindings on the switch. Use the **no** form of this command to delete static bindings.

ip source binding mac-address vlan vlan-id ip-address interface interface-id

no source binding mac-address vlan vlan-id ip-address interface interface-id

Syntax Description	mac-address	Specify a MAC address.	
	vlan vlan-id	Specify a VLAN number. The range is from 1 to 4094.	
	ip-address	Specify an IP address.	
	interface <i>interface-id</i>	Specify an interface on which to add or delete an IP source binding.	
Defaults	No IP source bindings a	re configured.	
Command Modes	Global configuration		
Command History	Release Modi	fication	
	12.2(20)SE This	command was introduced.	
Usage Guidelines	A static IP source binding entry has an IP address, its associated MAC address, and its associated VLA number. The entry is based on the MAC address and the VLAN number. If you modify an entry by changing only the IP address, the switch updates the entry instead creating a new one.		
Examples	This example shows how to add a static IP source binding:		
	Switch(config)# ip source binding 0001.1234.1234 vlan 1 172.20.50.5 interface gigabitethernet0/1		
	This example shows how to add a static binding and then modify the IP address for it:		
	gigabitethernet0/1	wurce binding 0001.1357.0007 vlan 1 172.20.50.25 interface	
	You can verify your sett	ings by entering the show ip source binding privileged EXEC command.

	Command	Description
	ip verify source	Enables IP source guard on an interface.
	show ip source binding	Displays the IP source bindings on the switch.
	show ip verify source	Displays the IP source guard configuration on the switch or on a specific interface.

ip ssh

Use the ip ssh global configuration command to configure the switch to run Secure Shell (SSH) Version 1 or SSH Version 2. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the **no** form of this command to return to the default setting. ip ssh version [1 | 2] no ip ssh version [1 | 2] Syntax Description 1 (Optional) Configure the switch to run SSH Version 1 (SSHv1). 2 (Optional) Configure the switch to run SSH Version 2 (SSHv1). Defaults The default version is the latest SSH version supported by the SSH client. **Command Modes** Global configuration **Command History** Release Modification 12.1(19)EA1 This command was introduced. **Usage Guidelines** If you do not enter this command or if you do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2. The switch supports an SSHv1 or an SSHv2 server. It also supports an SSHv1 client. For more information about the SSH server and the SSH client, see the software configuration guide for this release. A Rivest, Shamir, and Adelman (RSA) key pair generated by an SSHv1 server can be used by an SSHv2 server and the reverse. Examples This example shows how to configure the switch to run SSH Version 2: Switch(config)# ip ssh version 2 You can verify your settings by entering the show ip ssh or show ssh privileged EXEC command.

Related Commands	Command	Description
	show ip ssh	Displays if the SSH server is enabled and displays the version and configuration information for the SSH server. For syntax information, select Cisco IOS Release 12.2 Configuration Guides and Command References > Cisco IOS Security Command Reference, Release 12.2 > Other Security Features > Secure Shell Commands .
	show ssh	Displays the status of the SSH server. For syntax information, select Cisco IOS Release 12.2 Configuration Guides and Command References > Cisco IOS Security Command Reference, Release 12.2 > Other Security Features > Secure Shell Commands .

ip verify source

Use the **ip verify source** interface configuration command to enable IP source guard on an interface. Use the **no** form of this command to disable IP source guard.

ip verify source [port-security]

no ip verify source

Syntax Description	port-security	(Optional) Enable IP source guard with IP and MAC address filtering.	
		If you do not enter the port-security keyword, IP source guard with IP address filtering is enabled.	
Defaults	IP source guard	is disabled.	
Command Modes	Interface config	guration	
Command History	Release	Modification	
	12.2(20)SE	This command was introduced.	
	 configuration command. To enable IP source guard with source IP and MAC address filtering, use the ip verify source port-security interface configuration command. To enable IP source guard with source IP and MAC address filtering, you must enable port security on the interface. 		
Examples	-	hows how to enable IP source guard with source IP address filtering: -if)# ip verify source	
	This example shows how to enable IP source guard with source IP and MAC address filtering:		
	Switch(config-if)# ip verify source port-security		
	You can verify	your settings by entering the show ip source binding privileged EXEC command.	
Related Commands	Command	Description	
	ip source bind		
	show ip verify		

ipv6 access-list

Use the **ipv6 access-list** global configuration command to define an IPv6 access list and to place the switch in IPv6 access list configuration mode. To remove the access list, use the **no** form of this command.

ipv6 access-list access-list-name

no ipv6 access-list access-list-name

Noto

This command is available only if the switch is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Syntax Description	access-list-name	Name of the IPv6 access list. Names cannot contain a space or quotation
		mark or begin with a numeric.

Defaults No IPv6 access list is defined.

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SED	This command was introduced.

Usage Guidelines

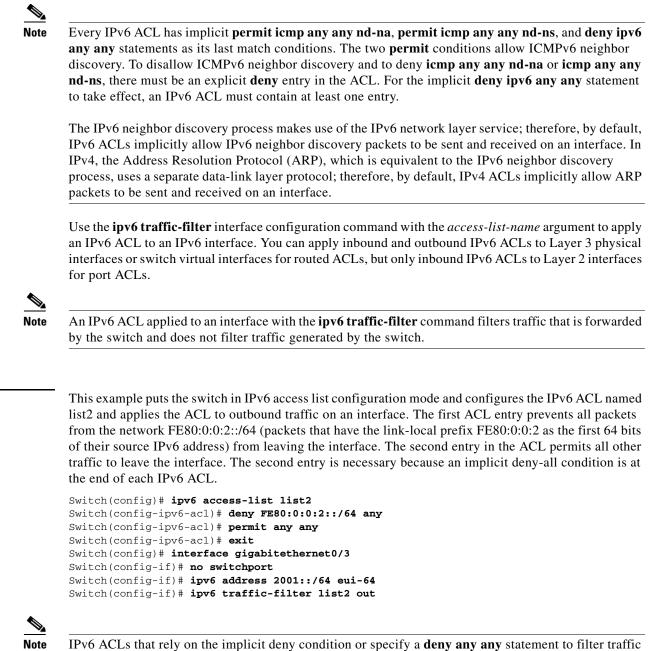

To configure the dual IPv4 and IPv6 template, enter the **sdm prefer dual-ipv4-and-ipv6** {**default** | **vlan**) global configuration command and reload the switch.

The ipv6 access-list command is similar to the ip access-list command, except that it is IPv6-specific.

Note

IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and an IPv6 ACL cannot share the same name.

See the **ipv6 access-list** and **permit (IPv6 access-list configuration**) commands for more information on filtering IPv6 traffic based on IPv6 option headers and optional, upper-layer protocol-type information. See the "Examples" section for an example of a translated IPv6 ACL configuration.

IPv6 ACLs that rely on the implicit deny condition or specify a **deny any any** statement to filter traffic should contain **permit** statements for link-local addresses to avoid the filtering of protocol packets. Additionally IPv6 ACLs that use **deny** statements to filter traffic should also use a **permit any any** statement as the last statement in the list.

Examples

Related Commands	Command	Description
	deny (IPv6 access-list configuration)	Sets deny conditions for an IPv6 access list.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	permit (IPv6 access-list configuration)	Sets permit conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

ipv6 mld snooping

Use the **ipv6 mld snooping** global configuration command without keywords to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN. Use the **no** form of this command to disable MLD snooping on the switch or the VLAN.

ipv6 mld snooping [vlan vlan-id]

no ipv6 mld snooping [vlan vlan-id]

	no ipv6 mld sn	looping [vlan <i>vlan-id</i>]	
Note	This command is available only if the switch is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Syntax Description	vlan vlan-id	(Optional) Enable or disable IPv6 MLD snooping on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.	
Defaults	MLD snooping is g	lobally disabled on the switch.	
	MLD snooping is e VLAN snooping wi	nabled on all VLANs. However, MLD snooping must be globally enabled before ll take place.	
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) global configuration command and reload the switch.		
	When MLD snooping is globally disabled, it is disabled on all the existing VLAN interfaces. When you globally enable MLD snooping, it is enabled on all VLAN interfaces that are in the default state (enabled). VLAN configuration will override global configuration on interfaces on which MLD snooping has been disabled.		
	If MLD snooping is globally disabled, you cannot enable it on a VLAN. If MLD snooping is globally enabled, you can disable it on individual VLANs.		
	range 1006 to 4094) switch in order for	ticast router is a Catalyst 6500 switch and you are using extended VLANs (in the), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 the Catalyst 3750 or Catalyst 3560 switch to receive queries on the VLAN. For Ns (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the h.	
	VLAN numbers 100 in MLD snooping.	02 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used	

Examples	This example shows how to globally enable MLD snooping: Switch(config) # ipv6 mld snooping This example shows how to disable MLD snooping on a VLAN: Switch(config) # no ipv6 mld snooping vlan 11

	show ipv6 mld snooping querier	Displays MLD snooping configuration.

ipv6 mld snooping last-listener-query-interval

Use the **ipv6 mld snooping last-listener-query-interval** global configuration command to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping last-listener query interval on the switch or on a VLAN. This time interval is the maximum time that a multicast router waits after issuing a Multicast Address Specific Query (MASQ) before deleting a port from the multicast group. Use the **no** form of this command to reset the query time to the default settings.

ipv6 mld snooping [vlan vlan-id] last-listener-query-interval integer_value

no ipv6 mld snooping [vlan vlan-id] last-listener-query-interval

Note	This command is available only if the switch is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.		
Syntax Description	vlan vlan-id	(Optional) Configure last-listener query interval on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.	
	integer_value	Set the time period (in thousands of a second) that a multicast router to wait after issuing a MASQ before deleting a port from the multicast group. The range is 100 to 32,768. The default is 1000 (1 second),	
Command Default	The default global q	uery interval (maximum response time) is 1000 (1 second).	
	The default VLAN	query interval (maximum response time) is 0 (the global count is used).	
Command Modes	Global configuration	n	
Command History	Release	Modification	
	12.2(25)SED	This command was introduced.	
Usage Guidelines	•	I IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 { default vlan) in command and reload the switch.	
	In MLD snooping, when the IPv6 multicast router receives an MLD leave message, it sends out queries to hosts belonging to the multicast group. If there are no responses from a port to a MASQ for a length of time, the router deletes the port from the membership database of the multicast address. The last listener query interval is the maximum time that the router waits before deleting a nonresponsive port from the multicast group.		
	When a VLAN query interval is set, this overrides the global query interval. When the VLAN interval is set at 0, the global value is used.		
	VLAN numbers 100 in MLD snooping.	2 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used	

ExamplesThis example shows how to globally set the last-listener query interval to 2 seconds:
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000This example shows how to set the last-listener query interval for VLAN 1 to 5.5 seconds:
Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 5500You can verify your settings by entering the show ipv6 MLD snooping [vlan vlan-id] user EXEC
command.

Related Commands	Command	Description
	ipv6 mld snooping last-listener-query-count	Sets IPv6 MLD snooping last-listener query count.
	sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.
	show ipv6 mld snooping querier	Sets IPv6 MLD snooping last-listener query interval.

ipv6 mld snooping listener-message-suppression

Use the **ipv6 mld snooping listener-message-suppression** global configuration command to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping listener message suppression. Use the **no** form of this command to disable MLD snooping listener message suppression.

ipv6 mld snooping listener-message-suppression

no ipv6 mld snooping listener-message-suppression

Note

This command is available only if the switch is running the advanced IP services image and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

Command Default The default is for MLD snooping listener message suppression to be disabled.

Command Modes Global configuration

Command History	Release	Modification
	12.2(25)SED	This command was introduced.

Usage GuidelinesTo configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 {default | vlan)
global configuration command and reload the switch.

MLD snooping listener message suppression is equivalent to IGMP snooping report suppression. When enabled, received MLDv1 reports to a group are forwarded to IPv6 multicast routers only once in every report-forward time. This prevents the forwarding of duplicate reports.

Examples This example shows how to enable MLD snooping listener-message-suppression: Switch(config)# **ipv6 mld snooping listener-message-suppression**

This example shows how to disable MLD snooping listener-message-suppression:

Switch(config) # no ipv6 mld snooping listener-message-suppression

You can verify your settings by entering the **show ipv6 mld snooping** [**vlan** *vlan-id*] user EXEC command.

Related Commands	Command	Description
	ipv6 mld snooping	Enables IPv6 MLD snooping.
	sdm prefer	Configures an SDM template to optimize system resources based on how the switch is being used.

Usage Guidelines			
Usage Guidelines	global configuration comman	nd and reload the switch.	
Usage Guidelines	global configuration comman	e Immediate-Leave feature when there is only one receiver on every port in	

The configuration and the static ports and groups are saved in NVRAM.

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 3750 or Catalyst 3560 switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

Examples This example shows how to enable MLD Immediate-Leave processing on VLAN 1:

Switch(config)# ipv6 mld snooping vlan 1 immediate-leave

This example shows how to disable MLD Immediate-Leave processing on VLAN 1:

Switch(config) # no ipv6 mld snooping vlan 1 immediate-leave

This example shows how to configure a port as a multicast router port:

Switch(config) # ipv6 mld snooping vlan 1 mrouter interface gigabitethernet1/0/2

This example shows how to configure a static multicast group:

Switch(config)# ipv6 mld snooping vlan 2 static FF12::34 interface gigabitethernet1/0/2

You can verify your settings by entering the **show ipv6 mld snooping vlan** *vlan-id* user EXEC command.

Use the **l2protocol-tunnel** interface configuration command to enable tunneling of Layer 2 protocols on an access port, IEEE 802.1Q tunnel port, or a port channel. You can enable tunneling for Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. You can also enable point-to-point tunneling for Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or UniDirectional Link Detection (UDLD) packets. Use the **no** form of this command to disable tunneling on the interface.

- 12protocol-tunnel [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] | [shutdown-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]] value] | [drop-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] value]
- no l2protocol-tunnel [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]] | [shutdown-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]] | [drop-threshold [cdp | stp | vtp] [point-to-point [pagp | lacp | udld]]]

Syntax Description	l2protocol-tunnel	Enable point-to-multipoint tunneling of CDP, STP, and VTP packets.
	cdp	(Optional) Enable tunneling of CDP, specify a shutdown threshold for CDP, or specify a drop threshold for CDP.
	stp	(Optional) Enable tunneling of STP, specify a shutdown threshold for STP, or specify a drop threshold for STP.
	vtp	(Optional) Enable tunneling or VTP, specify a shutdown threshold for VTP, or specify a drop threshold for VTP.
	point-to-point	(Optional) Enable point-to point tunneling of PAgP, LACP, and UDLD packets.
	pagp	(Optional) Enable point-to-point tunneling of PAgP, specify a shutdown threshold for PAgP, or specify a drop threshold for PAgP.
	lacp	(Optional) Enable point-to-point tunneling of LACP, specify a shutdown threshold for LACP, or specify a drop threshold for LACP.
	udld	(Optional) Enable point-to-point tunneling of UDLD, specify a shutdown threshold for UDLD, or specify a drop threshold for UDLD.
	shutdown-threshold	(Optional) Set a shutdown threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface is shut down.
	drop-threshold	(Optional) Set a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.
	value	Specify a threshold in packets per second to be received for encapsulation before the interface shuts down, or specify the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold.

Defaults

The default is that no Layer 2 protocol packets are tunneled.

The default is no shutdown threshold for the number of Layer 2 protocol packets.

The default is no drop threshold for the number of Layer 2 protocol packets.

Command Modes Interface configuration

Command History	Release Modification	
	12.2(25)SEThis command was introduced.	
Usage Guidelines	You must enter this command, with or without protocol types, to tunnel Layer 2 packets.	
	If you enter this command for a port channel, all ports in the channel must have the same configur	ation
	Layer 2 protocol tunneling across a service-provider network ensures that Layer 2 information is propagated across the network to all customer locations. When protocol tunneling is enabled, pro packets are encapsulated with a well-known Cisco multicast address for transmission across the network when the packets reach their destination, the well-known MAC address is replaced by the Layer 2 protocol MAC address.	vork.
	You can enable Layer 2 protocol tunneling for CDP, STP, and VTP individually or for all three protocol	ocols
	In a service-provider network, you can use Layer 2 protocol tunneling to enhance the creation of EtherChannels by emulating a point-to-point network topology. When protocol tunneling is enable the service-provider switch for PAgP or LACP, remote customer switches receive the protocol data (PDUs) and can negotiate automatic creation of EtherChannels.	
	To enable tunneling of PAgP, LACP, and UDLD packets, you must have a point-to-point network topology. To decrease the link-down detection time, you should also enable UDLD on the interface you enable tunneling of PAgP or LACP packets.	when
	You can enable point-to-point protocol tunneling for PAgP, LACP, and UDLD individually or for three protocols.	all
<u>Caution</u>	PAgP, LACP, and UDLD tunneling is only intended to emulate a point-to-point topology. An error configuration that sends tunneled packets to many ports could lead to a network failure.	eous
	Enter the shutdown-threshold keyword to control the number of protocol packets per second tha received on an interface before it shuts down. When no protocol option is specified with the keyw the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a drop three on the interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than or equal to the drop-threshold value must be greater than	ord, shold
	When the shutdown threshold is reached, the interface is error-disabled. If you enable error recover entering the errdisable recovery cause l2ptguard global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes timed out. If the error recovery mechanism is not enabled for l2ptguard , the interface stays in the error-disabled state until you enter the shutdown and no shutdown interface configuration comm	s have
	Enter the drop-threshold keyword to control the number of protocol packets per second that are rec on an interface before it drops packets. When no protocol option is specified with a keyword, the	eived

on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

The configuration is saved in NVRAM.

For more information about Layer 2 protocol tunneling, see the software configuration guide for this release.

ExamplesThis example shows how to enable protocol tunneling for CDP packets and to configure the shutdown
threshold as 50 packets per second:
Switch(config-if)# 12protocol-tunnel cdp
Switch(config-if)# 12protocol-tunnel shutdown-threshold cdp 50This example shows how to enable protocol tunneling for STP packets and to configure the drop
threshold as 400 packets per second:
Switch(config-if)# 12protocol-tunnel stp
Switch(config-if)# 12protocol-tunnel drop-threshold stp 400This example shows how to enable point-to-point protocol tunneling for PAgP and UDLD packets and
to configure the PAgP drop threshold as 1000 packets per second:
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point pagp
Switch(config-if)# 12protocol-tunnel point-to-point pagp
1000

Related Commands	Command	Description
	l2protocol-tunnel cos	Configures a class of service (CoS) value for all tunneled Layer 2 protocol packets.
	show errdisable recovery	Displays error-disabled recovery timer information.
	show l2protocol-tunnel	Displays information about ports configured for Layer 2 protocol tunneling, including port, protocol, class of service (CoS), and threshold.

l2protocol-tunnel cos

Use the **l2protocol-tunnel cos** global configuration command to configure class of service (CoS) value for all tunneled Layer 2 protocol packets. Use the **no** form of this command to return to the default setting.

l2protocol-tunnel cos value

no l2protocol-tunnel cos

Syntax Description	value	Specify CoS priority value for tunneled Layer 2 protocol packets. If a CoS value is configured for data packets for the interface, the default is to use this CoS value. If no CoS value is configured for the interface, the default is 5. The range is 0 to 7, with 7 being the highest priority.
Defaults		he CoS value configured for data on the interface. If no CoS value is configured, tunneled Layer 2 protocol packets.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(25)SE	This command was introduced.
Usage Guidelines	When enabled, the tur The value is saved in	nneled Layer 2 protocol packets use this CoS value. NVRAM.
Examples	This example shows h	now to configure a Layer-2 protocol-tunnel CoS value of 7:
	Switch(config)# 12p	rotocol-tunnel cos 7
Related Commands	Command	Description
	show l2protocol-tun	nel Displays information about ports configured for Layer 2 protocol tunneling, including CoS.

lacp port-priority

Use the **lacp port-priority** interface configuration command to configure the port priority for the Link Aggregation Control Protocol (LACP). Use the **no** form of this command to return to the default setting.

lacp port-priority priority

no lacp port-priority

Syntax Description	priority	Port priority for LACP. The range is 1 to 65535.
Defaults	The default is 3276	.8.
Command Modes	Interface configura	tion
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	ports are put in hot An LACP channel g	rity interface configuration command determines which ports are bundled and which -standby mode when there are more than eight ports in an LACP channel group. group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, s can be in standby mode.
	eight ports in an LA priority values) for are put in hot-stand	nparisons, a numerically <i>lower</i> value has a <i>higher</i> priority: When there are more than ACP channel-group, the eight ports with the numerically lowest values (highest LACP port priority are bundled into the channel group, and the lower-priority ports lby mode. If two or more ports have the same LACP port priority (for example, they in the default setting of 65535) an internal value for the port number determines the

chapter in the software configuration guide for this release.

ExamplesThis example shows how to configure the LACP port priority on a port:
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# lacp port-priority 1000

You can verify your settings by entering the **show lacp** [*channel-group-number*] **internal** privileged EXEC command.

Related Commands Command

Command	Description
channel-group	Assigns an Ethernet port to an EtherChannel group.
lacp system-priority	Configures the LACP system priority.
<pre>show lacp [channel-group-number] internal</pre>	Displays internal information for all channel groups or for the specified channel group.

lacp system-priority

Use the **lacp system-priority** global configuration command to configure the system priority for the Link Aggregation Control Protocol (LACP). Use the **no** form of this command to return to the default setting.

lacp system-priority priority

no lacp system-priority

Syntax Description	priority	System priority for LACP. The range is 1 to 65535.	
Defaults	The default is 3276	8.	
Command Modes	Global configuratio	'n	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	The lacp system-pr	riority command determines which switch in an LACP link controls port priorities.	
	An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode. When there are more than eight ports in an LACP channel-group, the switch on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other switch (the noncontrolling end of the link) are ignored.		
	In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both switches have the same LACP system priority (for example, they are both configured with the default setting of 32768), the LACP system ID (the switch MAC address) determines which switch is in control.		
	The lacp system-pr	riority command applies to all LACP EtherChannels on the switch.	
	Use the show etherchannel summary privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).		
		on about configuring LACP on physical ports, see the "Configuring EtherChannels" vare configuration guide for this release.	
Examples	-	s how to set the LACP system priority:	
		acp system-priority 20000 r settings by entering the show lacp sys-id privileged EXEC command.	
	Tou can verify your	soungs by cherning the snow lach sys-in privilegen EAEC command.	

location (global configuration)

	Command	Description
	channel-group	Assigns an Ethernet port to an EtherChannel group.
	lacp port-priority	Configures the LACP port priority.
	show lacp sys-id	Displays the system identifier that is being used by LACP.
		l configuration command to configure location information for an endpoint. Use nmand to remove the location information.
	-	tag string civic-location identifier <i>id</i> elin-location string identifier <i>id</i> } in-tag string civic-location identifier <i>id</i> elin-location string identifier <i>id</i> }
Syntax Description	admin-tag	Configure administrative tag or site information.
, ,	civic-location	Configure civic location information.
	elin-location	Configure emergency location information (ELIN).
	identifier <i>id</i>	Specify the ID for the civic location or the elin location. The ID range is 1 to 4095.
	string	Specify the site or location information in alphanumeric format.

 Commands
 Command
 Description

 link state track
 Enables a link-state group.

 show link state group
 Displays the link-state group information.

 show running-config
 Displays the current operating configuration. For syntax information, select

 Cisco IOS Configuration Fundamentals Command Reference for Release 12.2 > Cisco IOS File Management Commands > Configuration File Commands.

link state track

Use the **link state track** user EXEC command to enable a link-state group. Use the **no** form of this command to disable a link-state group.

link state track [number]

no link state track [number]

Syntax Description	number	(Optional) Specify the link-state group number. The group number can be 1 to 2. The default is 1.
Defaults	Link-state tracking is dis	sabled for all groups.
Command Modes	Global configuration	
Command History	Release	Modification
	12.2(25)SEE	This command was introduced.
Usage Guidelines	Use the link state track	global configuration command to enable a link-state group.
Examples	-	v enable link-state group 2:
	Switch(config)# link a You can verify your setti	ings by entering the show running-config privileged EXEC command.
Related Commands	Command	Description
	link state track	Configures an interface as a member of a link-state group.
	show link state group	Displays the link-state group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference for Release 12.2 > Cisco IOS File Management Commands > Configuration File Commands.

logging event

Use the **logging event** interface configuration command to enable notification of interface link status changes. Use the **no** form of this command to disable notification.

logging event {bundle-status | link-status | spanning-tree | status | trunk status }

no logging event {bundle-status | link-status | spanning-tree | status | trunk status}

Syntax Description	bundle-status	Enable notification of BUNDLE and UNBUNDLE messages.
	link-status	Enable notification of interface data link status changes.
	spanning-tree	Enable notification of spanning-tree events.
	status	Enable notification of spanning-tree state change messages.
	trunk-status	Enable notification of trunk-status messages.
Defaults	Event logging is	disabled.
Command Modes	Interface configu	iration
Command History	Release	Modification
	12.2(20)SE	This command was introduced.
Examples	-	ows how to enable spanning-tree logging: if)# logging event spanning-tree

logging event power-inline-status

Use the **logging event power-inline-status** interface configuration command to enable the logging of Power over Ethernet (PoE) events. Use the **no** form of this command to disable the logging of PoE status events; however, the **no** form of this command does not disable PoE error events.

logging event power-inline-status

no logging event power-inline-status

	power-inline-status	Enable the logging of PoE messages.
Defaults	Logging of PoE events	s is enabled.
Command Modes	Interface configuration	1
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	The power-inline-stat	us keyword is available only on PoE interfaces.
	-	
	This example shows h	ow to enable logging of PoE events on a port:
Usage Guidelines Examples	This example shows he Switch(config-if)# i	
	This example shows he Switch(config-if)# i Switch(config-if)# i	ow to enable logging of PoE events on a port:

logging file

Use the **logging file** global configuration command to set logging file parameters. Use the **no** form of this command to return to the default setting.

logging file *filesystem:filename* [*max-file-size* | **nomax** [*min-file-size*]] [*severity-level-number* | *type*]

no logging file *filesystem:filename* [*severity-level-number* | *type*]

Syntax Description	filesystem:filename	Alias for a flash file system. Contains the path and name of the file that contains the log messages.
		The syntax for the local flash file system: flash:
	max-file-size	(Optional) Specify the maximum logging file size. The range is 4096 to 2147483647.
	nomax	(Optional) Specify the maximum file size of 2147483647.
	min-file-size	(Optional) Specify the minimum logging file size. The range is 1024 to 2147483647.
	severity-level-number	(Optional) Specify the logging severity level. The range is 0 to 7. See the <i>type</i> option for the meaning of each level.
	type	(Optional) Specify the logging type. These keywords are valid:
		• emergencies —System is unusable (severity 0).
		• alerts—Immediate action needed (severity 1).
		• critical —Critical conditions (severity 2).
		• errors —Error conditions (severity 3).
		• warnings—Warning conditions (severity 4).
		• notifications —Normal but significant messages (severity 5).
		• informational —Information messages (severity 6).
		• debugging —Debugging messages (severity 7).
Defaults	The minimum file size i	s 2048 bytes; the maximum file size is 4096 bytes.
	The default severity leve	el is 7 (debugging messages and numerically lower levels).
Command Modes	Global configuration	
Command History	Release	Modification
•	12.1(19)EA1	This command was introduced.

Usage Guidelines	The log file is stored in ASCII text format in an internal buffer on the switch. You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. If the switch fails, the log is lost unless you had previously saved it to flash memory by using the logging file flash : <i>filename</i> global configuration command.		
	• •	sh memory by using the logging file flash : <i>filename</i> global configuration e more flash : <i>filename</i> privileged EXEC command to display its contents.	
	0	minimum file size if it is greater than the maximum file size minus 1024; the comes the maximum file size minus 1024.	
	Specifying a <i>level</i> causes	messages at that level and numerically lower levels to be displayed.	
Examples	-	to save informational log messages to a file in flash memory: g file flash:logfile informational	
	You can verify your settin	g by entering the show running-config privileged EXEC command.	
Related Commands	Command	Description	
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .	

mac access-group

Use the **mac access-group** interface configuration command to apply a MAC access control list (ACL) to a Layer 2 interface. Use the **no** form of this command to remove all MAC ACLs or the specified MAC ACL from the interface. You create the MAC ACL by using the **mac access-list extended** global configuration command.

mac access-group {*name*} **in**

no mac access-group {*name*}

Syntax Description	name	Specify a named MAC access list.	
	in	Specify that the ACL is applied in the ingress direction. Outbound ACLs are not supported on Layer 2 interfaces.	
Defaults	No MAC ACL is	applied to the interface.	
Command Modes	Interface configuration (Layer 2 interfaces only)		
Command History	Release	Modification	
-	12.1(19)EA1	This command was introduced.	
	access lists. You IP ACL and a M.	faces, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an AC ACL to the interface. You can apply no more than one IP access list and one MAC same Layer 2 interface.	
	If a MAC ACL is	s already configured on a Layer 2 interface and you apply a new MAC ACL to the w ACL replaces the previously configured one.	
	If you apply an A	ACL to a Layer 2 interface on a switch, and the switch has an input Layer 3 ACL or a ied to a VLAN that the interface is a member of, the ACL applied to the Layer 2	
		d packet is received on an interface with a MAC ACL applied, the switch checks the s in the ACL. If the conditions are matched, the switch forwards or drops the packet, ACL.	
	If the specified A	ACL does not exist, the switch forwards all packets.	
		ation about configuring MAC extended ACLs, see the "Configuring Network Security oter in the software configuration guide for this release.	

ExamplesThis example shows how to apply a MAC extended ACL named macacl2 to an interface:
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mac access-group macacl2 in

You can verify your settings by entering the **show mac access-group** privileged EXEC command. You can see configured ACLs on the switch by entering the **show access-lists** privileged EXEC command.

Related Commands	Command	Description
	show access-lists	Displays the ACLs configured on the switch.
	show link state group	Displays the MAC ACLs configured on the switch.
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

mac access-list extended

Use the **mac access-list extended** global configuration command to create an access list based on MAC addresses for non-IP traffic. Using this command puts you in the extended MAC access-list configuration mode. Use the **no** form of this command to return to the default setting.

mac access-list extended name

no mac access-list extended name

Syntax Description	name	Assign a name to the MAC extended access list.	
Defaults	By default, there are no MAC access lists created.		
Command Modes	Global configuratio	n	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	MAC named extended lists are used with VLAN maps and class maps. You can apply named MAC extended ACLs to VLAN maps or to Layer 2 interfaces; you cannot apply named MAC extended ACLs to Layer 3 interfaces.		
	Entering the mac access-list extended command enables the MAC access-list configuration mode. These configuration commands are available:		
	• default : sets a command to its default.		
	• deny : specifies packets to reject. For more information, see the deny (MAC access-list configuration) MAC access-list configuration command.		
	• exit: exits from MAC access-list configuration mode.		
	• no: negates a command or sets its defaults.		
	• permit : specifies packets to forward. For more information, see the permit (MAC access-list configuration) command.		
		on about MAC extended access lists, see the software configuration guide for this	

Examples This example shows how to create a MAC named extended access list named *mac1* and to enter extended MAC access-list configuration mode:

Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)#

This example shows how to delete MAC named extended access list *mac1*:

Switch(config) # no mac access-list extended mac1

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	deny (MAC access-list configuration)	Configures the MAC ACL (in extended MAC-access list configuration mode).
	permit (MAC access-list configuration)	
	show access-lists	Displays the access lists configured on the switch.
	vlan access-map	Defines a VLAN map and enters access-map configuration mode where you can specify a MAC ACL to match and the action to be taken.

OL-8554-05

mac address-table aging-time

Use the **mac address-table aging-time** global configuration command to set the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated. Use the **no** form of this command to return to the default setting. The aging time applies to all VLANs or a specified VLAN.

mac address-table aging-time {0 | 10-1000000} [vlan vlan-id]

no mac address-table aging-time {**0** | *10-1000000*} [**vlan** *vlan-id*]

Syntax Description		is value disables aging. Static address entries are never aged or removed from table.
	10-1000000 Ag	ing time in seconds. The range is 10 to 1000000 seconds.
		ptional) Specify the VLAN ID to which to apply the aging time. The range is 1 4094.
Defaults	The default is 300 second	ds.
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	Increasing the time can r	nuously, increase the aging time to record the dynamic entries for a longer time. educe the possibility of flooding when the hosts send again. pecific VLAN, this command sets the aging time for all VLANs.
	Increasing the time can r If you do not specify a sp	educe the possibility of flooding when the hosts send again.
	Increasing the time can r If you do not specify a sp This example shows how	educe the possibility of flooding when the hosts send again. pecific VLAN, this command sets the aging time for all VLANs.
Usage Guidelines Examples	Increasing the time can r If you do not specify a sp This example shows how Switch(config)# mac ad	educe the possibility of flooding when the hosts send again. pecific VLAN, this command sets the aging time for all VLANs.
	Increasing the time can r If you do not specify a sp This example shows how Switch(config)# mac ad You can verify your setti	pecific VLAN, this command sets the aging time for all VLANs. To set the aging time to 200 seconds for all VLANs:

mac address-table move update

Use the **mac address-table move update** global configuration command to enable the MAC address-table move update feature. Use the **no** form of this command to return to the default setting.

mac address-table move update {receive | transmit}

no mac address-table move update {receive | transmit}

Syntax Description	receive	Specify that the switch processes MAC address-table move update messages.
	transmit	Specify that the switch sends MAC address-table move update messages to other switches in the network if the primary link goes down and the standby link comes up.
Command Modes	Global configuratio	n.
Defaults	By default, the MA	C address-table move update feature is disabled.
Command History	Release	Modification
	12.2(25)SED	This command was introduced.
Usage Guidelines	convergence if a pri You can configure th	able move update feature allows the switch to provide rapid bidirectional mary (forwarding) link goes down and the standby link begins forwarding traffic. he access switch to send the MAC address-table move update messages if the primary the standby link some up. You can configure the unlink switches to receive and
	•	the standby link comes up. You can configure the uplink switches to receive and ddress-table move update messages.
Examples	This example shows messages:	s how to configure an access switch to send MAC address-table move update
	Switch# configure Switch(conf)# mac Switch(conf)# end	address-table move update transmit
	This example shows update messages:	s how to configure an uplink switch to get and process MAC address-table move
	Switch# configure Switch(conf)# mac Switch(conf)# end	address-table move update receive
	You can verify your command.	settings by entering the show mac address-table move update privileged EXEC

Related Commands	Command	Description
	clear mac address-table move update	Clears the MAC address-table move update global counters.
	debug matm move update	Debugs the MAC address-table move update message processing.
	show mac address-table move update	Displays the MAC address-table move update information on the switch.

mac address-table notification

Use the **mac address-table notification** global configuration command to enable the MAC address notification feature on the switch. Use the **no** form of this command to return to the default setting.

mac address-table notification [history-size value] | [interval value]

no mac address-table notification [history-size | interval]

history-size value	(Optional) Configure the maximum number of entries in the MAC notification history table. The range is 0 to 500 entries.
interval value	(Optional) Set the notification trap interval. The switch sends the notification traps when this amount of time has elapsed. The range is 0 to 2147483647 seconds.
•	address notification feature is disabled.
-	al value is 1 second.

Examples This example shows how to enable the MAC address-table notification feature, set the interval time to 60 seconds, and set the history-size to 100 entries:

```
Switch(config)# mac address-table notification
Switch(config)# mac address-table notification interval 60
Switch(config)# mac address-table notification history-size 100
```

You can verify your settings by entering the **show mac address-table notification** privileged EXEC command.

Related Commands	Command	Description
	clear mac address-table notification	Clears the MAC address notification global counters.
	show mac address-table notification	Displays the MAC address notification settings on all interfaces or on the specified interface.
	snmp-server enable traps	Sends the SNMP MAC notification traps when the mac-notification keyword is appended.
	snmp trap mac-notification	Enables the SNMP MAC notification trap on a specific interface.

mac address-table static

Use the **mac address-table static** global configuration command to add static addresses to the MAC address table. Use the **no** form of this command to remove static entries from the table.

mac address-table static mac-addr vlan vlan-id interface interface-id

no mac address-table static mac-addr vlan vlan-id [interface interface-id]

Syntax Description	mac-addr	Destination MAC address (unicast or multicast) to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.
	vlan vlan-id	Specify the VLAN for which the packet with the specified MAC address is received. The range is 1 to 4094.
	interface interface-id	Interface to which the received packet is forwarded. Valid interfaces include physical ports and port channels.
Defaults	No static addresses are co	onfigured.
Command Modes	Global configuration	
Command History	Release	Modification

	12.1(19)EA1 This example shows how packet is received in VLA specified interface: Switch(config)# mac ad gigabitethernet0/1	This command was introduced. To add the static address c2f3.220a.12f4 to the MAC address table. When a AN 4 with this MAC address as its destination, the packet is forwarded to the ddress-table static c2f3.220a.12f4 vlan 4 interface

mac address-table static drop

Use the **mac address-table static drop** global configuration command to enable unicast MAC address filtering and to configure the switch to drop traffic with a specific source or destination MAC address. Use the **no** form of this command to return to the default setting.

mac address-table static mac-addr vlan vlan-id drop

no mac address-table static mac-addr vlan vlan-id

Syntax Description	mac-addr	Unicast source or destination MAC address. Packets with this MAC address are dropped.
	vlan vlan-id	Specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.
Defaults	Unicast MAC ad destination MAC	ddress filtering is disabled. The switch does not drop traffic for specific source or C addresses.
Command Modes	Global configura	ation
Command History	Release	Modification
-	12.1(19)EA1	This command was introduced.
Usage Guidelines	Multicast M	idelines when using this feature: AC addresses, broadcast MAC addresses, and router MAC addresses are not supported are forwarded to the CPU are also not supported.
	the switch e	unicast MAC address as a static address and configure unicast MAC address filtering, ither adds the MAC address as a static address or drops packets with that MAC address, on which command was entered last. The second command that you entered overrides the nd.
	-	e, if you enter the mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface global configuration command followed by the mac address-table static <i>mac-addr</i>
	v	d drop command, the switch drops packets with the specified MAC address as a source

Examples	This example shows how to enable unicast MAC address filtering and to configure the switch to drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped: Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
	This example shows how to disable unicast MAC address filtering: Switch(config)# no mac address-table static c2f3.220a.12f4 vlan 4 You can verify your setting by entering the show mac address-table static privileged EXEC command.

Related Commands	Command	Description
	show mac address-table static	Displays only static MAC address table entries.

macro apply

Use the **macro apply** interface configuration command to apply a macro to an interface or to apply and trace a macro configuration on an interface.

macro {apply | trace} macro-name [parameter {value}] [parameter {value}]
[parameter {value}]

Syntax Description	apply	Apply a macro to the specified interface.
	trace	Use the trace keyword to apply a macro to an interface and to debug the macro.
	macro-name	Specify the name of the macro.
	parameter value	(Optional) Specify unique parameter values that are specific to the interface. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.
Defaults	This command has	s no default setting.
Command Modes	Interface configura	ation
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	12.2(18)SE	The parameter value keywords were added.
Usage Guidelines		acro trace <i>macro-name</i> interface configuration command to apply and show the an interface or to debug the macro to find any syntax or configuration errors.
	If a command fails because of a syntax error or a configuration error when you apply a macro, the mac continues to apply the remaining commands to the interface.	
		acro that requires the assignment of unique values, use the parameter <i>value</i> keywords s specific to the interface.
	corresponding valu	g is case sensitive. All matching occurrences of the keyword are replaced with the ue. Any full match of a keyword, even if it is part of a larger string, is considered a ced by the corresponding value.
	macro-name ? con	ht contain keywords that require a parameter value. You can use the macro apply nmand to display a list of any required values in the macro. If you apply a macro ne keyword values, the commands are invalid and are not applied.
		efault Smartports macros embedded in the switch software. You can display these mmands they contain by using the show parser macro user EXEC command.

	Follow these guidelines when you apply a Cisco-default Smartports macro on an interface:
	• Display all macros on the switch by using the show parser macro user EXEC command. Display the contents of a specific macro by using the show parser macro name <i>macro-name</i> user EXEC command.
	• Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the parameter <i>value</i> keywords.
	The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.
	When you apply a macro to an interface, the macro name is automatically added to the interface. You can display the applied commands and macro names by using the show running-configuration interface <i>interface-id</i> user EXEC command.
	A macro applied to an interface range behaves the same way as a macro applied to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.
	You can delete a macro-applied configuration on an interface by entering the default interface <i>interface-id</i> interface configuration command.
Examples	After you have created a macro by using the macro name global configuration command, you can apply it to an interface. This example shows how to apply a user-created macro called duplex to an interface:
	Switch(config-if)# macro apply duplex
	To debug a macro, use the macro trace interface configuration command to find any syntax or configuration errors in the macro as it is applied to an interface. This example shows how troubleshoot the user-created macro called duplex on an interface:
	Switch(config-if)# macro trace duplex Applying command`duplex auto' %Error Unknown error. Applying command`speed nonegotiate'
	This example shows how to display the Cisco-default cisco-desktop macro and how to apply the macro and set the access VLAN ID to 25 on an interface:
	Switch# show parser macro cisco-desktop
	 Macro name : cisco-desktop Macro type : default
	# Basic interface - Enable data VLAN only # Recommended value for access vlan (AVID) should not be 1 switchport access vlan \$AVID switchport mode access
	# Enable port security limiting port to a single # MAC address that of desktop switchport port-security
	switchport port-security maximum 1
	# Ensure port-security age is greater than one minute # and use inactivity timer
	switchport port-security violation restrict switchport port-security aging time 2 switchport port-security aging type inactivity
	Saleshpile pole becaller aging erpe indecivity

macro global

macro global

Use the **macro global** global configuration command to apply a macro to a switch or to apply and trace a macro configuration on a switch.

macro global {apply | trace} *macro-name* [**parameter** {*value*}] [**parameter** {*value*}] [**parameter** {*value*}]

Syntax Description	apply	Apply a macro to the switch.	
	trace	Apply a macro to a switch and to debug the macro.	
	macro-name	Specify the name of the macro.	
	parameter value	(Optional) Specify unique parameter values that are specific to the switch. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.	
Defaults	This command has	s no default setting.	
Command Modes	Global configurati	on	
Command History	Release	Modification	
	12.2(20)SE	This command was introduced.	
Usage Guidelines		acro trace <i>macro-name</i> global configuration command to apply and to show the a switch or to debug the macro to find any syntax or configuration errors.	
	If a command fails	because of a syntax error or a configuration error when you apply a macro, the macro the remaining commands to the switch.	
	When creating a macro that requires the assignment of unique values, use the parameter value keywords to designate values specific to the switch.		
	corresponding value	g is case sensitive. All matching occurrences of the keyword are replaced with the ue. Any full match of a keyword, even if it is part of a larger string, is considered a ced by the corresponding value.	
		nt contain keywords that require a parameter value. You can use the macro global <i>e</i> ? command to display a list of any required values in the macro. If you apply a macro	
		he keyword values, the commands are invalid and are not applied.	

Follow these guidelines when you apply a Cisco-default Smartports macro on a switch:

- Display all macros on the switch by using the **show parser macro** user EXEC command. Display the contents of a specific macro by using the **show parser macro** name *macro-name* user EXEC command.
- Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter** *value* keywords.

The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.

When you apply a macro to a switch, the macro name is automatically added to the switch. You can display the applied commands and macro names by using the **show running-configuration** user EXEC command.

You can delete a global macro-applied configuration on a switch only by entering the **no** version of each command contained in the macro.

Examples

After you have created a new macro by using the **macro name** global configuration command, you can apply it to a switch. This example shows how see the **snmp** macro and how to apply the macro and set the hostname to test-server and set the IP precedence value to 7:

```
Switch# show parser macro name snmp
Macro name : snmp
Macro type : customizable
#enable port security, linkup, and linkdown traps
snmp-server enable traps port-security
snmp-server enable traps linkup
snmp-server enable traps linkdown
#set snmp-server host
snmp-server host ADDRESS
#set SNMP trap notifications precedence
snmp-server ip precedence VALUE
```

```
Switch(config)# macro global apply snmp ADDRESS test-server VALUE 7
```

To debug a macro, use the **macro global trace** global configuration command to find any syntax or configuration errors in the macro when it is applied to a switch. In this example, the **ADDRESS** parameter value was not entered, causing the snmp-server host command to fail while the remainder of the macro is applied to the switch:

```
Switch(config)# macro global trace snmp VALUE 7
Applying command...'snmp-server enable traps port-security'
Applying command...'snmp-server enable traps linkdown'
Applying command...'snmp-server host'
%Error Unknown error.
Applying command...'snmp-server ip precedence 7'
```

Related Commands	Command	Description
	macro apply	Applies a macro on an interface or applies and traces a macro on an interface.
	macro description	Adds a description about the macros that are applied to an interface.
	macro global description	Adds a description about the macros that are applied to the switch.
	macro name	Creates a macro.
	show parser macro	Displays the macro definition for all macros or for the specified macro.
		macro.

macro global description

Use the **macro global description** global configuration command to enter a description about the macros that are applied to the switch. Use the **no** form of this command to remove the description.

macro global description text

no macro global description text

Syntax Description	description text Enter	er a description about the macros that are applied to the switch.	
Defaults	This command has no d	lefault setting.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(20)SE	This command was introduced.	
Usage Guidelines	Use the description keyword to associate comment text, or the macro name, with a switch. When multiple macros are applied on a switch, the description text will be from the last applied macro. This example shows how to add a description to a switch:		
	-	o global description udld aggressive mode enabled	
	You can verify your set command.	tings by entering the show parser macro description privileged EXEC	
Related Commands	Command	Description	
	macro apply	Applies a macro on an interface or applies and traces a macro on an interface.	
	macro description	Adds a description about the macros that are applied to an interface.	
	macro global	Applies a macro on a switch or applies and traces a macro on a switch.	
	macro name	Creates a macro.	
	show parser macro	Displays the macro definition for all macros or for the specified macro.	

macro name

Use the **macro name** global configuration command to create a configuration macro. Use the **no** form of this command to delete the macro definition.

macro name macro-name

no macro name macro-name

Syntax Description	<i>macro-name</i> Name of the macro.			
Defaults	This command has no default setting.			
Command Modes	Global configuratio	on		
Command History	Release	Modification		
	12.1(19)EA1	This command was introduced.		
	12.2(20)SE	The help string # macro keywords was added.		
Usage Guidelines	A macro can contain up to 3000 characters. Enter one macro command per line. Use the @ character to end the macro. Use the # character at the beginning of a line to enter comment text within the macro. You can define mandatory keywords within a macro by using a help string to specify the keywords. Enter # macro keywords <i>word</i> to define the keywords that are available for use with the macro. You can enter			
	 up to three help string keywords separated by a space. If you enter more than three macro keywords, or the first three are shown. Macro names are case sensitive. For example, the commands macro name Sample-Macro and mac name sample-macro will result in two separate macros. 			
	When creating a macro, do not use the exit or end commands or change the command mode by using interface <i>interface-id</i> . This could cause commands that follow exit , end , or interface <i>interface-id</i> to execute in a different command mode.			
	The no form of this command only deletes the macro definition. It does not affect the configuration of those interfaces on which the macro is already applied. You can delete a macro-applied configuration of an interface by entering the default interface <i>interface-id</i> interface configuration command. Alternatively, you can create an <i>anti-macro</i> for an existing macro that contains the no form of all the corresponding commands in the original macro. Then apply the anti-macro to the interface.			
	You can modify a macro by creating a new macro with the same name as the existing macro. The newl created macro overwrites the existing macro but does not affect the configuration of those interfaces o which the original macro was applied.			

Examples This example shows how to create a macro that defines the duplex mode and speed:

```
Switch(config)# macro name duplex
Enter macro commands one per line. End with the character `@'.
duplex full
speed auto
@
```

This example shows how create a macro with **# macro keywords**:

```
Switch(config)# macro name test
switchport access vlan $VLANID
switchport port-security maximum $MAX
#macro keywords $VLANID $MAX
@
```

This example shows how to display the mandatory keyword values before you apply the macro to an interface:

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# macro apply test ?
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID ?
WORD Value of first keyword to replace
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
<cr>
Switch(config-if)# macro apply test $VLANID 2
WORD keyword to replace with a value e.g $VLANID,$MAX
```

match (access-map configuration)

Use the match access-map configuration command to set the VLAN map to match packets against one or more access lists. Use the **no** form of this command to remove the match parameters.

- match {ip address {name | number} [name | number] [name | number]...} | {mac address {name} [*name*] [*name*]...}
- **no match** {**ip address** {*name* | *number*} [*name* | *number*] [*name* | *number*]...} | {**mac address** {*name*} [*name*] [*name*]...}

Syntax Description	ip address	p address Set the access map to match packets against an IP address access list.			
	mac address	Set the access map to match packets against a MAC address access list.			
	name	Name of the access list to match packets against.			
	number	Number of the access list to match packets against. This option is not valid for MAC access lists.			
Defaults	The default act	ion is to have no match parameters applied to a VLAN map.			
Command Modes	Access-map co	nfiguration			
Command History	Release	Modification			
	12.1(19)EA1	This command was introduced.			
Usage Guidelines	You enter acces	ss-map configuration mode by using the vlan access-map global configuration command			
oougo duluoliiloo					
		one access list name or number; others are optional. You can match packets against one lists. Matching any of the lists counts as a match of the entry.			
	or more access In access-map o	one access list name or number; others are optional. You can match packets against one			
	or more access In access-map of map applied to the conditions. Packets are mat	one access list name or number; others are optional. You can match packets against one lists. Matching any of the lists counts as a match of the entry. configuration mode, use the match command to define the match conditions for a VLAN			

Examples

This example shows how to define and apply a VLAN access map *vmap4* to VLANs 5 and 6 that will cause the interface to drop an IP packet if the packet matches the conditions defined in access list *al2*.

```
Switch(config)# vlan access-map vmap4
Switch(config-access-map)# match ip address al2
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# vlan filter vmap4 vlan-list 5-6
```

You can verify your settings by entering the show vlan access-map privileged EXEC command.

Related Commands	Command	Description
	access-list	Configures a standard numbered ACL. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands.
	action	Specifies the action to be taken if the packet matches an entry in an access control list (ACL).
	ip access list	Creates a named access list. For syntax information, select Cisco IOS IP Command Reference, Volume 1 of 3:Addressing and Services, Release 12.2 > IP Services Commands .
	mac access-list extended	Creates a named MAC address access list.
	show vlan access-map	Displays the VLAN access maps created on the switch.
	vlan access-map	Creates a VLAN access map.

match (class-map configuration)

Use the **match** class-map configuration command to define the match criteria to classify traffic. Use the **no** form of this command to remove the match criteria.

no match {access-group *acl-index-or-name* | **input-interface** *interface-id-list* | **ip dscp** *dscp-list* | **ip precedence** *ip-precedence-list*}

Syntax Description	access group	Number or name of an IP standard or extended access control list (ACL) or
Syntax Description	access-group acl-index-or-name	MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699.
	input-interface interface-id-list	Specify the physical ports to which the interface-level class map in a hierarchical policy map applies. This command can only be used in the child-level policy map and must be the only match condition in the child-level policy map. You can specify up to six entries in the list by specifying a port (counts as one entry), a list of ports separated by a space (each port counts as an entry), or a range of ports separated by a hyphen (counts as two entries).
	ip dscp dscp-list	List of up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly-used value.
	ip precedence <i>ip-precedence-list</i>	List of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly-used value
Defaults	No match criteria are o	defined.
Command Modes	Class-map configuration	on
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
	12.2(25)SE	The input-interface <i>interface-id-list</i> keyword was added.
Usage Guidelines	the packets. Only the I supported. To define packet classi	is used to specify which fields in the incoming packets are examined to classify IP access group or the MAC access-group matching to the Ether Type/Len are ification on a physical-port basis, only one match command per class map is ation, the match-all and match-any keywords are equivalent.

Catalyst 3560 Switch Command Reference

match {access-group acl-index-or-name | input-interface interface-id-list | ip dscp dscp-list | ip
precedence ip-precedence-list}

For the **match ip dscp** *dscp-list* or the **match ip precedence** *ip-precedence-list* command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **match ip dscp af11** command, which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the **match ip precedence 5** command. For a list of supported mnemonics, enter the **match ip dscp ?** or the **match ip precedence ?** command to see the command-line help strings.

Use the **input-interface** *interface-id-list* keyword when you are configuring an interface-level class map in a hierarchical policy map. For the *interface-id-list*, you can specify up to six entries.

Examples

This example shows how to create a class map called *class2*, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
```

This example shows how to create a class map called *class3*, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using *acl1*:

```
Switch(config)# class-map class2
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# no match ip precedence
Switch(config-cmap)# match access-group acl1
Switch(config-cmap)# exit
```

This example shows how to specify a list of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Switch(config) # class-map match-all class4
Switch(config-cmap) # match input-interface gigabitethernet0/1 gigabitethernet0/2
Switch(config-cmap) # exit
```

This example shows how to specify a range of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Switch(config)# class-map match-all class4
Switch(config-cmap)# match input-interface gigabitethernet0/1 - gigabitethernet0/5
Switch(config-cmap)# exit
```

You can verify your settings by entering the show class-map privileged EXEC command.

Related Commands	Command	Description
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	show class-map	Displays quality of service (QoS) class maps.

mdix auto

Use the **mdix auto** interface configuration command to enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface. When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately. Use the **no** form of this command to disable auto-MDIX.

mdix auto

no mdix auto

Syntax Description	This command ha	as no arguments	or keywords.
--------------------	-----------------	-----------------	--------------

Defaults Auto-MDIX is enabled.

Command Modes Interface configuration

 Command History
 Release
 Modification

 12.1(19)EA1
 This command was introduced.

 12.2(20)SE
 The default setting changed from disabled to enabled.

Usage Guidelines When you enable auto-MDIX on an interface, you must also set the interface speed and duplex to **auto** so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed and duplex) is enabled on one or both of connected interfaces, link up occurs, even if the cable type (straight-through or crossover) is incorrect.

Auto-MDIX is supported on all 10/100 and 10/100/1000 Mb/s interfaces and on 10/100/1000BASE-TX small form-factor pluggable (SFP) module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

Examples This example shows how to enable auto-MDIX on a port:

Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# speed auto
Switch(config-if)# duplex auto
Switch(config-if)# mdix auto
Switch(config-if)# end

You can verify the operational state of auto-MDIX on the interface by entering the **show controllers ethernet-controller** *interface-id* **phy** privileged EXEC command.

Г

Related Commands	Command	Description
	show controllers ethernet-controller interface-id phy	Displays general information about internal registers of an interface, including the operational state of auto-MDIX.

media-type

Use the **media-type** interface configuration command to manually select the interface and type of a dual-purpose uplink port or to enable the switch to dynamically select the type that first links up. Use the **no** form of this command to return to the default setting.

media-type {auto-select | rj45 | sfp}

no media-type

Syntax Description	auto-select	Enable the switch to dynamically select the type based on which one first links up.	
	rj45	Select the RJ-45 interface.	
	sfp	Select the small form-factor pluggable (SFP) module interface.	
Defaults	The default is that the switch dynamically selects auto-select .		
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(35)SE	This command was introduced.	
Usage Guidelines	You cannot us	e the dual-purpose uplinks as redundant links.	
	To configure the When you chan	he speed or duplex settings on a dual-purpose uplink, you must select the interface type. nge the type, the speed and duplex configurations are removed. The switch configures both onegotiation of both speed and duplex (the default).	
	achieved, the s down, the swit	ect auto-select , the switch dynamically selects the type that first links up. When link up is switch disables the other type until the active link goes down. When the active link goes tch enables both types until one of them links up. In auto-select mode, the switch th types with autonegotiation of speed and duplex (the default).	
	it cannot attair dual-purpose p	ect rj45 , the switch disables the SFP module interface. If you connect a cable to this port, n a link up even if the RJ-45 side is down or is not connected. In this mode, the port behaves like a 10/100/1000BASE-TX interface. You can configure the speed and s consistent with this interface type.	
	When you select sfp , the switch disables the RJ-45 interface. If you connect a cable to this port, it cannot attain a link up even if the SFP module side is down or if the SFP module is not present. Based on the type of installed SFP module, you can configure the speed and duplex settings consistent with this interface type.		
	the no shutdo	tch powers on or when you enable a dual-purpose uplink port through the shutdown and wn interface configuration commands, the switch gives preference to the SFP module ll other situations, the switch selects the active link based on which type first links up.	

If you configure **auto-select**, you cannot configure the **speed** and **duplex** interface configuration commands.

Examples This example shows how to select the SFP interface: Switch(config)# interface gigabitethernet0/1 Switch(config-if)# media-type sfp

You can verify your setting by entering the **show interfaces** *interface-id* **capabilities** or the **show interfaces** *interface-id* **transceiver properties** privileged EXEC commands.

Related Commands Command Description show interfaces capabilities Displays the capabilities of all interfaces or the specified interface. show interfaces transceiver properties Displays speed and duplex settings and media-type on an interface.

mls qos

Use the **mls qos** global configuration command to enable quality of service (QoS) for the entire switch. When the **mls qos** command is entered, QoS is enabled with the default parameters on all ports in the system. Use the **no** form of this command to reset all the QoS-related statistics and to disable the QoS features for the entire switch.

mls qos

no mls qos

Syntax Description	This command	has no	arguments	or keywords.
--------------------	--------------	--------	-----------	--------------

DefaultsQoS is disabled. There is no concept of trusted or untrusted ports because the packets are not modified
(the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in
pass-through mode (packets are switched without any rewrites and classified as best effort without any
policing).

When QoS is enabled with the **mls qos** global configuration command and all other QoS settings are set to their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. No policy maps are configured. The default port trust state on all ports is untrusted. The default ingress and egress queue settings are in effect.

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines QoS must be globally enabled to use QoS classification, policing, mark down or drop, queueing, and traffic shaping features. You can create a policy-map and attach it to a port before entering the **mls qos** command. However, until you enter the **mls qos** command, QoS processing is disabled.

Policy-maps and class-maps used to configure QoS are not deleted from the configuration by the **no mls qos** command, but entries corresponding to policy maps are removed from the switch hardware to save system resources. To re-enable QoS with the previous configurations, use the **mls qos** command.

Toggling the QoS status of the switch with this command modifies (reallocates) the sizes of the queues. During the queue size modification, the queue is temporarily shut down during the hardware reconfiguration, and the switch drops newly arrived packets for this queue.

Examples

This example shows how to enable QoS on the switch:

Switch(config) # mls qos

You can verify your settings by entering the show mls qos privileged EXEC command.

Related Commands	Command	Description
	show mls qos	Displays QoS information.

mls qos aggregate-policer

Use the **mls qos aggregate-policer** global configuration command to define policer parameters, which can be shared by multiple classes within the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to delete an aggregate policer.

mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte **exceed-action** {**drop** | **policed-dscp-transmit**}

no mls qos aggregate-policer aggregate-policer-name

Syntax Description	aggregate-policer-name	Name of the aggregate policer referenced by the police aggregate policy-map class configuration command.
	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 8000 to 1000000000.
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.
	exceed-action drop	When the specified rate is exceeded, specify that the switch drop the packet.
	exceed-action policed-dscp-transmit	When the specified rate is exceeded, specify that the switch change the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then send the packet.
Defaults	No aggregate policers are	defined.
Command Modes	Global configuration	
Command Modes Command History	Global configuration Release	Modification
		Modification This command was introduced.
	Release 12.1(19)EA1	
Command History	Release 12.1(19)EA1 Define an aggregate police	This command was introduced. er if the policer is shared with multiple classes. be shared with other policers for another port; traffic from two different port
Command History	Release12.1(19)EA1Define an aggregate policePolicers for a port cannotcannot be aggregated for pThe port ASIC device, whuser-configurable policersuser-configurable policersare constrained by the har	This command was introduced. er if the policer is shared with multiple classes. be shared with other policers for another port; traffic from two different port

You cannot delete an aggregate policer if it is being used in a policy map. You must first use the **no police aggregate** *aggregate-policer-name* policy-map class configuration command to delete the aggregate policer from all policy maps before using the **no mls qos aggregate-policer** *aggregate-policer-name* command.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the *burst-byte* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. For more information, see the software configuration guide for this release.

Examples

This example shows how to define the aggregate policer parameters and how to apply the policer to multiple classes in a policy map:

Switch(config)# mls qos aggregate-policer agg_policer1 1000000 1000000 exceed-action drop Switch(config)# policy-map policy2 Switch(config-pmap)# class class1 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap)# class class2 Switch(config-pmap-c)# set dscp 10 Switch(config-pmap-c)# police aggregate agg_policer1 Switch(config-pmap-c)# exit Switch(config-pmap-c)# exit Switch(config-pmap-c)# exit Switch(config-pmap-c)# trust dscp Switch(config-pmap-c)# police aggregate agg_policer2 Switch(config-pmap-c)# exit

You can verify your settings by entering the **show mls qos aggregate-policer** privileged EXEC command.

Related Commands	Command	Description
	police aggregate	Creates a policer that is shared by different classes.
	show mls qos aggregate-policer	Displays the quality of service (QoS) aggregate policer configuration.

mls qos cos

Use the **mls qos cos** interface configuration command to define the default class of service (CoS) value of a port or to assign the default CoS to all incoming packets on the port. Use the **no** form of this command to return to the default setting.

mls qos cos {default-cos | override}

no mls qos cos {*default-cos* | **override**}

	·	
Syntax Description	default-cos	Assign a default CoS value to a port. If packets are untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7.
	override	Override the CoS of the incoming packets, and apply the default CoS value on the port to all incoming packets.
Defaults	The default Co	S value for a port is 0.
	CoS override is	disabled.
Command Modes	Interface config	guration
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	all incoming pa assign a defaul	e default value to assign a CoS and Differentiated Services Code Point (DSCP) value to ckets that are untagged (if the incoming packet does not have a CoS value). You also can t CoS and DSCP value to all incoming packets by using the override keyword. de keyword when all incoming packets on certain ports deserve higher or lower priority

Examples	This example shows how to configure the default port CoS to 4 on a port:
	Switch(config)# interface gigabitethernet0/1 Switch(config-if)# mls qos trust cos Switch(config-if)# mls qos cos 4
	This example shows how to assign all the packets entering a port to the default port CoS value of 4 on a port:
	Switch(config)# interface gigabitethernet0/1 Switch(config-if)# mls qos cos 4 Switch(config-if)# mls qos cos override
	You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface	Displays quality of service (QoS) information.

mls qos dscp-mutation

Use the **mls qos dscp-mutation** interface configuration command to apply a Differentiated Services Code Point (DSCP)-to-DSCP-mutation map to a DSCP-trusted port. Use the **no** form of this command to return the map to the default settings (no DSCP mutation).

mls qos dscp-mutation dscp-mutation-name

no mls qos dscp-mutation dscp-mutation-name

Syntax Description	dscp-mutation-name	Name of the DSCP-to-DSCP-mutation map. This map was previously defined with the mls qos map dscp-mutation global configuration command.
Defaults	The default DSCP-to- DSCP values.	-DSCP-mutation map is a null map, which maps incoming DSCPs to the same
Command Modes	Interface configuratio	n
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	DSCP-to-DSCP-muta domain. You apply th boundary of a quality With ingress mutation with this new value. T	ice (QoS) domains have different DSCP definitions, use the ation map to translate one set of DSCP values to match the definition of another e DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the of service (QoS) administrative domain. a, the new DSCP value overwrites the one in the packet, and QoS handles the packet The switch sends the packet out the port with the new DSCP value.
	You apply the map on	altiple DSCP-to-DSCP-mutation maps on ingress ports. Ally to DSCP-trusted ports. If you apply the DSCP mutation map to an untrusted are (CoS) or IP-precedence trusted port, the command has no immediate effect until CP-trusted.
Examples	This example shows h the map to a port:	now to define the DSCP-to-DSCP-mutation map named <i>dscpmutation1</i> and to apply
		gos map dscp-mutation dscpmutation1 10 11 12 13 to 30 cerface gigabitethernet0/1

This example show how to remove the DSCP-to-DSCP-mutation map name *dscpmutation1* from the port and to reset the map to the default:

Switch(config-if)# no mls gos dscp-mutation dscpmutation1

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands

Command	Description
mls qos map dscp-mutation	Defines the DSCP-to-DSCP-mutation map.
mls qos trust	Configures the port trust state.
show mls qos maps	Displays QoS mapping information.

2-287

mls qos map

Use the **mls qos map** global configuration command to define the class of service (CoS)-to-Differentiated Services Code Point (DSCP) map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map. Use the **no** form of this command to return to the default map.

no mls qos map {cos-dscp | dscp-cos | dscp-mutation *dscp-mutation-name* | **ip-prec-dscp | policed-dscp}**

	cos-dscp dscp1dscp8	Define the CoS-to-DSCP map.	
		For <i>dscp1dscp8</i> , enter eight DSCP values that correspond to CoS values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.	
	dscp-cos dscp-list to cos	Define the DSCP-to-CoS map.	
		For <i>dscp-list</i> , enter up to eight DSCP values, with each value separated by a space. The range is 0 to 63. Then enter the to keyword.	
		For <i>cos</i> , enter a single CoS value to which the DSCP values correspond. The range is 0 to 7.	
	in-dscp to out-dscp	Define the DSCP-to-DSCP-mutation map.	
		For dscp-mutation-name, enter the mutation map name.	
			For <i>in-dscp</i> , enter up to eight DSCP values, with each value separated by a space. Then enter the to keyword.
		For <i>out-dscp</i> , enter a single DSCP value.	
		The range is 0 to 63.	
	ip-prec-dscp	Define the IP-precedence-to-DSCP map.	
	dscp1dscp8	For <i>dscp1dscp8</i> , enter eight DSCP values that correspond to the IP precedence values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.	
	policed-dscp dscp-list	Define the policed-DSCP map.	
	to mark-down-dscp	For <i>dscp-list</i> , enter up to eight DSCP values, with each value separated by a space. Then enter the to keyword.	
		For <i>mark-down-dscp</i> , enter the corresponding policed (marked down) DSCP value.	
		The range is 0 to 63.	

Defaults

Table 2-6 shows the default CoS-to-DSCP map:

Table 2-6 Default CoS-to-DSCP Map

CoS Value	DSCP Value	
0	0	
1	8	
2	16	
3	24	
4	32	
5	40	
6	48	
7	56	

Table 2-7 shows the default DSCP-to-CoS map:

DSCP Value	CoS Value	
0–7	0	
8–15	1	
16–23	2	
24–31	3	
32–39	4	
40–47	5	
48–55	6	
56-63	7	

 Table 2-7
 Default DSCP-to-CoS Map

Table 2-8 shows the default IP-precedence-to-DSCP map:

Table 2-8 Default IP-Precedence-to-DSCP Map

IP Precedence Value	DSCP Value
0	0
1	8
2	16
3	24
4	32
5	40
6	48
7	56

The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value.

Command Modes Global configuration

Command History	Release	Modification
12.1(19)EA1		This command was introduced.

Usage Guidelines All the maps are globally defined. All the maps, except the DSCP-to-DSCP-mutation map, are applied to all ports. The DSCP-to-DSCP-mutation map is applied to a specific port.

Examples This example shows how to define the IP-precedence-to-DSCP map and to map IP-precedence values 0 to 7 to DSCP values of 0, 10, 20, 30, 40, 50, 55, and 60:

Switch# configure terminal Switch(config)# mls qos map ip-prec-dscp 0 10 20 30 40 50 55 60

This example shows how to define the policed-DSCP map. DSCP values 1, 2, 3, 4, 5, and 6 are marked down to DSCP value 0. Marked DSCP values that not explicitly configured are not modified:

Switch# configure terminal Switch(config)# mls qos map policed-dscp 1 2 3 4 5 6 to 0

This example shows how to define the DSCP-to-CoS map. DSCP values 20, 21, 22, 23, and 24 are mapped to CoS 1. DSCP values 10, 11, 12, 13, 14, 15, 16, and 17 are mapped to CoS 0:

Switch# configure terminal Switch(config)# mls qos map dscp-cos 20 21 22 23 24 to 1 Switch(config)# mls qos map dscp-cos 10 11 12 13 14 15 16 17 to 0

This example shows how to define the CoS-to-DSCP map. CoS values 0 to 7 are mapped to DSCP values 0, 5, 10, 15, 20, 25, 30, and 35:

```
Switch# configure terminal
Switch(config)# mls gos map cos-dscp 0 5 10 15 20 25 30 35
```

This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remain as specified in the null map):

```
Switch# configure terminal
Switch(config)# mls gos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 10
Switch(config)# mls gos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Switch(config)# mls gos map dscp-mutation mutation1 20 21 22 to 20
Switch(config)# mls gos map dscp-mutation mutation1 0 31 32 33 34 to 30
```

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands	Command	Description	
	mls qos dscp-mutation	Applies a DSCP-to-DSCP-mutation map to a DSCP-trusted port.	
	show mls qos maps	Displays quality of service (QoS) mapping information.	

mls qos queue-set output buffers

Use the **mls qos queue-set output buffers** global configuration command to allocate buffers to a queue-set (four egress queues per port). Use the **no** form of this command to return to the default setting.

mls qos queue-set output qset-id buffers allocation1 ... allocation4

no mls qos queue-set output qset-id buffers

Syntax Description	qset-id	ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.
	allocation1 allocation4	Buffer space allocation (percentage) for each queue (four values for queues 1 to 4). For <i>allocation1</i> , <i>allocation3</i> , and <i>allocation4</i> , the range is 0 to 99. For <i>allocation2</i> , the range is 1 to 100 (including the CPU buffer). Separate each value with a space.
Defaults	All allocation va the buffer space.	lues are equally mapped among the four queues (25, 25, 25, 25). Each queue has 1/4 of
Command Modes	Global configura	ation
Command History	Release	Modification
-	12.1(19)EA1	This command was introduced.
	12.2(20)SE	The range for <i>allocation1</i> , <i>allocation3</i> , and <i>allocation4</i> changed from 0 to
		100 to 0 to 99. The range for <i>allocation2</i> changed from 20 to 100 to 1 to 100.
Usage Guidelines	Specify four allo	100 to 0 to 99. The range for <i>allocation2</i> changed from 20 to 100 to 1 to 100.
Usage Guidelines	Allocate buffers	
Usage Guidelines	Allocate buffers buffer to the que To configure diff	ocation values, and separate each with a space. according to the importance of the traffic; for example, give a large percentage of the

Examples This example shows how to map a port to queue-set 2. It allocates 40 percent of the buffer space to egress queue 1 and 20 percent to egress queues 2, 3, and 4:

Switch(config)# mls qos queue-set output 2 buffers 40 20 20 20
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# queue-set 2

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays quality of service (QoS) information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos queue-set output threshold

Use the **mls qos queue-set output threshold** global configuration command to configure the weighted tail-drop (WTD) thresholds, to guarantee the availability of buffers, and to configure the maximum memory allocation to a queue-set (four egress queues per port). Use the **no** form of this command to return to the default setting.

mls qos queue-set output *qset-id* **threshold** *queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold*

no mls qos queue-set output qset-id threshold [queue-id]

Syntax Description	qset-id	ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.		
	queue-id	Specific queue in the queue-set on which the command is performed. The range is 1 to 4.		
	drop-threshold1 drop-threshold2	Two WTD thresholds expressed as a percentage of the allocated memory of the queue. The range is 1 to 3200 percent.		
	reserved-threshold	Amount of memory to be guaranteed (reserved) for the queue and expressed as a percentage of the allocated memory. The range is 1 to 100 percent.		
	maximum-threshold	Enable a queue in the full condition to get more buffers than are reserved for it. This is the maximum memory the queue can have before the packets are dropped. The range is 1 to 3200 percent.		

Defaults

When quality of service (QoS) is enabled, WTD is enabled.

Table 2-9 shows the default WTD threshold settings.

Table 2-9 Default Egress Queue WTD Threshold Settings

Feature	Queue 1	Queue 2	Queue 3	Queue 4
WTD drop threshold 1	100 percent	200 percent	100 percent	100 percent
WTD drop threshold 2	100 percent	200 percent	100 percent	100 percent
Reserved threshold	50 percent	100 percent	50 percent	50 percent
Maximum threshold	400 percent	400 percent	400 percent	400 percent

Command Modes Global configuration

Command History	Release	Modification	
12.1(19)EA1		This command was introduced.	

Usage Guidelines

Use the **mls qos queue-set output** *qset-id* **buffers** global configuration command to allocate a fixed number of buffers to the four queues in a queue-set.

The drop-threshold percentages can exceed 100 percent and can be up to the maximum (if the maximum threshold exceeds 100 percent).

While buffer ranges allow individual queues in the queue-set to use more of the common pool when available, the maximum number of packets for each queue is still internally limited to 400 percent, or 4 times the allocated number of buffers. One packet can use one 1 or more buffers.

The range increased in Cisco IOS Release 12.2(25)SEE1 or later for the *drop-threshold*, *drop-threshold*2, and *maximum-threshold* parameters.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to decide whether to grant buffer space to a requesting queue. The switch decides whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over-limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

Examples

This example shows how to map a port to queue-set 2. It configures the drop thresholds for queue 2 to 40 and 60 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory this queue can have before packets are dropped:

Switch(config)# mls qos queue-set output 2 threshold 2 40 60 100 200
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# queue-set 2

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** or the **show mls qos queue-set** privileged EXEC command.

Related Commands	Command	Description	
	mls qos queue-set output buffers	Allocates buffers to a queue-set.	
	queue-set	Maps a port to a queue-set.	
	show mls qos interface buffers	Displays QoS information.	
	show mls qos queue-set	Displays egress queue settings for the queue-set.	

mls qos rewrite ip dscp

Use the **mls qos rewrite ip dscp** global configuration command to configure the switch to change (rewrite) the Differentiated Services Code Point (DSCP) field of an incoming IP packet. Use the **no** form of this command to configure the switch to not modify (rewrite) the DSCP field of the packet and to enable DSCP transparency.

mls qos rewrite ip dscp

no mls qos rewrite ip dscp

Syntax Description	This command has no arguments or keywords.		
Defaults	DSCP transparency	y is disabled. The switch changes the DSCP field of the incoming IP packet.	
Command Modes	Global configuration	on	
Command History	Release	Modification	
	12.2(25)SE	This command was introduced.	
Usage Guidelines <u>Note</u>	enabled by using th in the incoming pa packet. Enabling DSCP tra	y affects only the DSCP field of a packet at the egress. If DSCP transparency is the no mls qos rewrite ip dscp command, the switch does not modify the DSCP field acket, and the DSCP field in the outgoing packet is the same as that in the incoming ansparency does not affect the port trust settings on IEEE 802.1Q tunneling ports.	
	and the DSCP field	d in the outgoing packet is based on the quality of service (QoS) configuration, trust setting, policing and marking, and the DSCP-to-DSCP mutation map.	
	Regardless of the DSCP transparency configuration, the switch modifies the internal DSCP value of the packet that the switch uses to generate a class of service (CoS) value representing the priority of the traffic. The switch also uses the internal DSCP value to select an egress queue and threshold.		
	the internal DSCP	S is enabled and an incoming packet has a DSCP value of 32, the switch might modify value based on the policy-map configuration and change the internal DSCP value asparency is enabled, the outgoing DSCP value is 32 (same as the incoming value). If	

Examples

This example shows how to enable DSCP transparency and configure the switch to not change the DSCP value of the incoming IP packet:

Switch(config)# mls qos Switch(config)# no mls qos rewrite ip dscp

This example shows how to disable DSCP transparency and configure the switch to change the DSCP value of the incoming IP packet:

Switch(config)# mls qos Switch(config)# mls qos rewrite ip dscp

You can verify your settings by entering the **show running config** | **include rewrite** privileged EXEC command.

Related Commands	Command	Description
	mls qos	Enables QoS globally.
	show mls qos	Displays QoS information.
	show running-config include rewrite	Displays the DSCP transparency setting. For syntax information, select Cisco IOS Release 12.2 Configuration Guides and Command

mls qos srr-queue input bandwidth

Use the **mls qos srr-queue input bandwidth** global configuration command to assign shaped round robin (SRR) weights to an ingress queue. The ratio of the weights is the ratio of the frequency in which the SRR scheduler dequeues packets from each queue. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input bandwidth weight1 weight2

no mls qos srr-queue input bandwidth

Syntax Description	weight1 weight2	Ratio of <i>weight1</i> and <i>weight2</i> determines the ratio of the frequency in which the SRR scheduler dequeues packets from ingress queues 1 and 2. The range is 1 to 100. Separate each value with a space.
Defaults	Weight1 and weight	2 are 4 (1/2 of the bandwidth is equally shared between the two queues).
Command Modes	Global configuratio	n
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	mls qos srr-queue Then SRR shares th	iority queue for its configured weight as specified by the bandwidth keyword in the input priority-queue <i>queue-id</i> bandwidth <i>weight</i> global configuration command. The remaining bandwidth with both ingress queues and services them as specified by ared with the mls qos srr-queue input bandwidth <i>weight1 weight2</i> global mand.
		ingress queue is the priority queue by using the mls qos srr-queue input bal configuration command.
Examples	-	s how to assign the ingress bandwidth for the queues. Priority queueing is disabled, dwidth ratio allocated to queue 1 is $25/(25+75)$ and to queue 2 is $75/(25+75)$:
		ls qos srr-queue input priority-queue 2 bandwidth 0 ls qos srr-queue input bandwidth 25 75
	In this example, que often as queue 1.	eue 2 has three times the bandwidth of queue 1; queue 2 is serviced three times as

This example shows how to assign the ingress bandwidths for the queues. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls gos srr-queue input priority-queue 1 bandwidth 10 Switch(config)# mls gos srr-queue input bandwidth 4 4

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** or the **show mls qos input-queue** privileged EXEC command.

Related Commands	Command	Description	
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.

	mls qos srr-queue in	nput cos-map	Maps class of service (CoS) values to an ingress queue or maps CoS values to a queue and to a threshold ID.
	mls qos srr-queue in	nput dscp-map	Maps Differentiated Services Code Point (DSCP) values to an ingress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos srr-queue in	nput priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue in	nput threshold	Assigns weighted tail-drop (WTD) threshold percentages to an ingress queue.

Command	Description
show mls qos input-queue	Displays ingress queue settings.
show mls qos interface buffers	Displays quality of service (QoS) information.

mls qos srr-queue input cos-map

Use the **mls qos srr-queue input cos-map** global configuration command to map class of service (CoS) values to an ingress queue or to map CoS values to a queue and to a threshold ID. Use the **no** form of this command to return to the default setting.

```
mls qos srr-queue input cos-map queue queue-id {cos1...cos8 | threshold threshold-id cos1...cos8}
```

no mls qos srr-queue input cos-map

Syntax Description	queue queue-id	Specify a queue number.
		For <i>queue-id</i> , the range is 1 to 2.
	<i>cos1cos8</i>	Map CoS values to an ingress queue.
		For <i>cos1cos8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 7.
	threshold threshold-id	Map CoS values to a queue threshold ID.
	cos1cos8	For <i>threshold-id</i> , the range is 1 to 3.
		For <i>cos1cos8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 7.

Defaults

Table 2-10 shows the default CoS input queue threshold map:

Table 2-10 Default CoS Input Queue Threshold Map

CoS Value	Queue ID - Threshold ID
0–4	1–1
5	2–1
6, 7	1–1

Command Modes

Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines The CoS assigned at the ingress port selects an ingress or egress queue and threshold.

The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state. You can assign two weighted tail-drop (WTD) threshold percentages to an ingress queue by using the **mls qos srr-queue input threshold** global configuration command.

You can map each CoS value to a different queue and threshold combination, allowing the frame to follow different behavior.

Examples This example shows how to map CoS values 0 to 3 to ingress queue 1 and to threshold ID 1 with a drop threshold of 50 percent. It maps CoS values 4 and 5 to ingress queue 1 and to threshold ID 2 with a drop threshold of 70 percent:

```
Switch(config)# mls qos srr-queue input cos-map queue 1 threshold 1 0 1 2 3
Switch(config)# mls qos srr-queue input cos-map queue 1 threshold 2 4 5
Switch(config)# mls qos srr-queue input threshold 1 50 70
```

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue input bandwidth	Assigns shaped round robin (SRR) weights to an ingress queue.
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
	mls qos srr-queue input dscp-map	Maps Differentiated Services Code Point (DSCP) values to an ingress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue input threshold	Assigns WTD threshold percentages to an ingress queue.
	show mls qos maps	Displays QoS mapping information.

mls qos srr-queue input dscp-map

Use the **mls qos srr-queue input dscp-map** global configuration command to map Differentiated Services Code Point (DSCP) values to an ingress queue or to map DSCP values to a queue and to a threshold ID. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input dscp-map queue *queue-id* {*dscp1...dscp8* | **threshold** *threshold-id dscp1...dscp8*}

no mls qos srr-queue input dscp-map

Syntax Description	queue queue-id	Specify a queue number.
		For queue-id, the range is 1 to 2.
	dscp1dscp8	Map DSCP values to an ingress queue.
		For <i>dscp1dscp8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 63.
	threshold threshold-id	Map DSCP values to a queue threshold ID.
	dscp1dscp8	For <i>threshold-id</i> , the range is 1 to 3.
		For <i>dscp1dscp8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 63.

Defaults

Table 2-11 shows the default DSCP input queue threshold map:

Table 2-11 Default DSCP Input Queue Threshold Map

DSCP Value	Queue ID-Threshold ID
0–39	1–1
40–47	2-1
48-63	1–1

Command Modes Global configuration

 Command History
 Release
 Modification

 12.1(19)EA1
 This command was introduced.

Usage Guidelines The DSCP assigned at the ingress port selects an ingress or egress queue and threshold.

The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state. You can assign two weighted tail-drop (WTD) threshold percentages to an ingress queue by using the **mls qos srr-queue input threshold** global configuration command.

You can map each DSCP value to a different queue and threshold combination, allowing the frame to follow different behavior.

You can map up to eight DSCP values per command.

Examples This example shows how to map DSCP values 0 to 6 to ingress queue 1 and to threshold 1 with a drop threshold of 50 percent. It maps DSCP values 20 to 26 to ingress queue 1 and to threshold 2 with a drop threshold of 70 percent:

Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 1 0 1 2 3 4 5 6 Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 2 20 21 22 23 24 25 26 Switch(config)# mls qos srr-queue input threshold 1 50 70

You can verify your settings by entering the show mls qos maps privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue input bandwidth	Assigns shaped round robin (SRR) weights to an ingress queue.
	mls qos srr-queue input buffers	Allocates the buffers between the ingress queues.
	mls qos srr-queue input cos-map	Maps class of service (CoS) values to an ingress queue or maps CoS values to a queue and to threshold ID.
	mls qos srr-queue input priority-queue	Configures the ingress priority queue and guarantees bandwidth.
	mls qos srr-queue input threshold	Assigns WTD threshold percentages to an ingress queue.
	show mls qos maps	Displays QoS mapping information.

mls qos srr-queue input priority-queue

Use the **mls qos srr-queue input priority-queue** global configuration command to configure the ingress priority queue and to guarantee bandwidth on the internal ring if the ring is congested. Use the **no** form of this command to return to the default setting.

mls qos srr-queue input priority-queue queue-id bandwidth weight

no mls qos srr-queue input priority-queue queue-id

Syntax Description	queue-id	Ingress queue ID. The range is 1 to 2.
	bandwidth weight	Bandwidth percentage of the internal ring. The range is 0 to 40.
Defaults	The priority queue is q	ueue 2, and 10 percent of the bandwidth is allocated to it.
Command Modes	Global configuration	
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	You should use the prid which needs minimum	ority queue only for traffic that needs to be expedited (for example, voice traffic, delay and jitter).
	jitter under heavy netw	uaranteed part of the bandwidth on the internal ring, which reduces the delay and work traffic on an oversubscribed ring (when there is more traffic than the nd the queues are full and dropping frames).
	bandwidth keyword in configuration comman services them as specif	RR) services the priority queue for its configured weight as specified by the in the mls qos srr-queue input priority-queue <i>queue-id</i> bandwidth <i>weight</i> global d. Then SRR shares the remaining bandwidth with both ingress queues and fied by the weights configured with the mls qos srr-queue input bandwidth l configuration command.
	To disable priority que priority que	eueing, set the bandwidth weight to 0, for example, mls qos srr-queue input <i>id</i> bandwidth 0 .

Examples

This example shows how to assign the ingress bandwidths for the queues. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls gos srr-queue input priority-queue 1 bandwidth 10 Switch(config)# mls gos srr-queue input bandwidth 4 4

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **queueing** or the **show mls qos input-queue** privileged EXEC command.

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines	The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
 Note	The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your quality of service (QoS) solution.
	You can assign two weighted tail-drop (WTD) threshold percentages to an egress queue by using the mls qos queue-set output <i>qset-id</i> threshold global configuration command.
	You can map each CoS value to a different queue and threshold combination, allowing the frame to follow different behavior.
Examples	This example shows how to map a port to queue-set 1. It maps CoS values 0 to 3 to egress queue 1 and to threshold ID 1. It configures the drop thresholds for queue 1 to 50 and 70 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory that this queue can have before packets are dropped.
	Switch(config)# mls qos srr-queue output cos-map queue 1 threshold 1 0 1 2 3 Switch(config)# mls qos queue-set output 1 threshold 1 50 70 100 200 Switch(config)# interface gigabitethernet0/1 Switch(config-if)# queue-set 1
	You can verify your settings by entering the show mls qos maps , the show mls qos interface [<i>interface-id</i>] buffers , or the show mls qos queue-set privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue output dscp-map	Maps Differentiated Services Code Point (DSCP) values to an egress queue or maps DSCP values to a queue and to a threshold ID.
	mls qos queue-set output threshold	Configures the WTD thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays QoS information.
	show mls qos maps	Displays QoS mapping information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos srr-queue output dscp-map

Use the **mls qos srr-queue output dscp-map** global configuration command to map Differentiated Services Code Point (DSCP) values to an egress or to map DSCP values to a queue and to a threshold ID. Use the **no** form of this command to return to the default setting.

mls qos srr-queue output dscp-map queue *queue-id* {*dscp1...dscp8* | **threshold** *threshold-id dscp1...dscp8*}

no mls qos srr-queue output dscp-map

Syntax Description	queue queue-id	Specify a queue number.
		For <i>queue-id</i> , the range is 1 to 4.
	dscp1dscp8	Map DSCP values to an egress queue.
		For <i>dscp1dscp8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 63.
	threshold threshold-id	Map DSCP values to a queue threshold ID.
	dscp1dscp8	For queue-id, the range is 1 to 4. Map DSCP values to an egress queue. For dscp1dscp8, enter up to eight values, and separate each value with a space. The range is 0 to 63. Id-id Map DSCP values to a queue threshold ID. For threshold-id, the range is 1 to 3.
		For <i>dscp1dscp8</i> , enter up to eight values, and separate each value with a space. The range is 0 to 63.

Defaults

Table 2-13 shows the default DSCP output queue threshold map:

Table 2-13 Default DSCP Output Queue Threshold Map

DSCP Value	Queue ID-Threshold ID
0–15	2-1
16–31	3-1
32–39	4-1
40–47	1–1
48-63	4-1

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidel	ines	The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.
Note		The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.
		You can assign two weighted tail-drop (WTD) threshold percentages to an egress queue by using the mls qos queue-set output <i>qset-id</i> threshold global configuration command.
		You can map each DSCP value to a different queue and threshold combination, allowing the frame to follow different behavior.
		You can map up to eight DSCP values per command.
Examples		This example shows how to map a port to queue-set 1. It maps DSCP values 0 to 3 to egress queue 1 and to threshold ID 1. It configures the drop thresholds for queue 1 to 50 and 70 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory that this queue can have before packets are dropped.
		Switch(config)# mls qos srr-queue output dscp-map queue 1 threshold 1 0 1 2 3 Switch(config)# mls qos queue-set output 1 threshold 1 50 70 100 200 Switch(config)# interface gigabitethernet0/1 Switch(config-if)# queue-set 1
		You can verify your settings by entering the show mls qos maps , the show mls qos interface [<i>interface-id</i>] buffers , or the show mls qos queue-set privileged EXEC command.

Related Commands	Command	Description
	mls qos srr-queue output cos-map	Maps class of service (CoS) values to an egress queue or maps CoS values to a queue and to a threshold ID.
	mls qos queue-set output threshold	Configures the WTD thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	queue-set	Maps a port to a queue-set.
	show mls qos interface buffers	Displays quality of service (QoS) information.
	show mls qos maps	Displays QoS mapping information.
	show mls qos queue-set	Displays egress queue settings for the queue-set.

mls qos trust

Use the **mls qos trust** interface configuration command to configure the port trust state. Ingress traffic can be trusted, and classification is performed by examining the packet Differentiated Services Code Point (DSCP), class of service (CoS), or IP-precedence field. Use the **no** form of this command to return a port to its untrusted state.

mls qos trust [cos | device cisco-phone | dscp | ip-precedence]

no mls qos trust [cos | device | dscp | ip-precedence]

Syntax Description	cos	(Optional) Classify an ingress packet by using the packet CoS value. For an	
, ,		untagged packet, use the port default CoS value.	
	device cisco-phone	(Optional) Classify an ingress packet by trusting the CoS or DSCP value sent from the Cisco IP Phone (trusted boundary), depending on the trust setting.	
	dscp	(Optional) Classify an ingress packet by using the packet DSCP value (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the default port CoS value is used.	
	ip-precedence	(Optional) Classify an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the port default CoS value is used.	
Defaults Command Modes	The port is not trusted Interface configuration	. If no keyword is specified when the command is entered, the default is dscp .	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(20)SE	The usage guidelines were revised to describe how the switch sets the trust state when a Cisco IP Phone is connected to a switch or routed port.	
Usage Guidelines	packets are classified a trusted states because	ality of service (QoS) domain are classified at the edge of the domain. When the at the edge, the switch port within the QoS domain can be configured to one of the there is no need to classify the packets at every switch within the domain. Use this whether the port is trusted and which fields of the packet to use to classify traffic.	

When a port is configured with trust DSCP or trust IP precedence and the incoming packet is a non-IP packet, the CoS-to-DSCP map is used to derive the corresponding DSCP value from the CoS value. The CoS can be the packet CoS for trunk ports or the port default CoS for nontrunk ports.

If the DSCP is trusted, the DSCP field of the IP packet is not modified. However, it is still possible that the CoS value of the packet is modified (according to DSCP-to-CoS map).

If the CoS is trusted, the CoS field of the packet is not modified, but the DSCP can be modified (according to CoS-to-DSCP map) if the packet is an IP packet.

The trusted boundary feature prevents security problems if users disconnect their PCs from networked Cisco IP Phones and connect them to the switch port to take advantage of trusted CoS or DSCP settings. You must globally enable the Cisco Discovery Protocol (CDP) on the switch and on the port connected to the IP phone. If the telephone is not detected, trusted boundary disables the trusted setting on the switch or routed port and prevents misuse of a high-priority queue.

If you configure the trust setting for DSCP or IP precedence, the DSCP or IP precedence values in the incoming packets are trusted. If you configure the **mls qos cos override** interface configuration command on the switch port connected to the IP phone, the switch overrides the CoS of the incoming voice and data packets and assigns the default CoS value to them.

For an inter-QoS domain boundary, you can configure the port to the DSCP-trusted state and apply the DSCP-to-DSCP-mutation map if the DSCP values are different between the QoS domains.

Classification using a port trust state (for example, **mls qos trust** [**cos** | **dscp** | **ip-precedence**] and a policy map (for example, **service-policy input** *policy-map-name*) are mutually exclusive. The last one configured overwrites the previous configuration.

Examples This example shows how to configure a port to trust the IP precedence field in the incoming packet:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mls qos trust ip-precedence

This example shows how to specify that the Cisco IP Phone connected on a port is a trusted device:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mls gos trust device cisco-phone

You can verify your settings by entering the show mls qos interface privileged EXEC command.

Related Commands	Command	Description	
	mls qos cos	Defines the default CoS value of a port or assigns the default CoS to all incoming packets on the port.	
	mls qos dscp-mutation	Applies a DSCP-to DSCP-mutation map to a DSCP-trusted port.	
	mls qos map	Defines the CoS-to-DSCP map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map.	
	show mls qos interface	Displays QoS information.	

mls qos vlan-based

Use the **mls qos vlan-based** interface configuration command to enable VLAN-based quality of service (QoS) on the physical port. Use the **no** form of this command to disable this feature.

mls qos vlan-based

no mls qos vlan-based

Syntax Description	There are no argun	nents or keywords.
Defaults	VLAN-based QoS	is disabled.
Command Modes	Interface configura	tion
Command History	Release	Modification
	12.2(25)SE	This command was introduced.
Usage Guidelines	vlan-based interface	hierarchical policy map to a switch virtual interface (SVI), use the mls qos ce configuration command on a physical port if the port is to be specified in the e level of the hierarchical policy map.
	all traffic belonging	re hierarchical policing, the hierarchical policy map is attached to the SVI and affects g to the VLAN. The individual policer in the interface-level traffic classification only l ports specified for that classification.
		ctions about configuring hierarchical policy maps, see the "Classifying, Policing, and Using Hierarchical Policy Maps" section in the software configuration guide for this
Examples	This example show	vs how to enable VLAN-based policing on a physical port:
		interface gigabitethernet0/1 # mls qos vlan-based
	You can verify you	r settings by entering the show mls qos interface privileged EXEC command.
Related Commands	Command	Description
	show mls qos inte	rface Displays QoS information.

monitor session

Use the **monitor session** global configuration command to start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) source or destination session, to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance), to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, and to limit (filter) SPAN source traffic to specific VLANs. Use the **no** form of this command to remove the SPAN or RSPAN session or to remove source or destination interfaces or filters from the SPAN or RSPAN session. For destination interfaces, the encapsulation options are ignored with the **no** form of the command.

- monitor session_number destination {interface interface-id [, | -] [encapsulation
 replicate] [ingress { dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id }] } | {remote
 vlan vlan-id}
- monitor session session_number filter vlan vlan-id [, | -]
- **monitor session** *session_number* **source** {**interface** *interface-id* [, | -] [**both** | **rx** | **tx**]} | {**vlan** *vlan-id* [, | -] [**both** | **rx** | **tx**]} | {**remote vlan** *vlan-id*}
- **no monitor session** {*session_number* | **all** | **local** | **remote**}
- no monitor session_number destination {interface interface-id [, | -] [encapsulation replicate] [ingress {dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id }] } | {remote vlan vlan-id}
- no monitor session session_number filter vlan vlan-id [, | -]
- **no monitor session** *session_number* **source** {**interface** *interface-id* [, | -] [**both** | **rx** | **tx**]} | {**vlan** *vlan-id* [, | -] [**both** | **rx** | **tx**]} | {**remote vlan** *vlan-id*}

Syntax Description	session_number	Specify the session number identified with the SPAN or RSPAN session. The range is 1 to 66.
	destination	Specify the SPAN or RSPAN destination. A destination must be a physical port.
	interface interface-id	Specify the destination or source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type and port number). For source interface, port channel is also a valid interface type, and the valid range is 1 to 48.
	encapsulation replicate	(Optional) Specify that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).
		These keywords are valid only for local SPAN. For RSPAN, the RSPAN VLAN ID overwrites the original VLAN ID; therefore, packets are always sent untagged.
	ingress	(Optional) Enable ingress traffic forwarding.
	dot1q vlan vlan-id	Accept incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.
	isl	Specify ingress forwarding using ISL encapsulation.

untagged vlan vlan-id	Accept incoming packets with untagged encapsulation with the specified VLAN as the default VLAN.
vlan vlan-id	When used with only the ingress keyword, set default VLAN for ingress traffic.
remote vlan vlan-id	Specify the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094.
	The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs).
,	(Optional) Specify a series of interfaces or VLANs, or separate a range of interfaces or VLANs from a previous range. Enter a space before and after the comma.
-	(Optional) Specify a range of interfaces or VLANs. Enter a space before and after the hyphen.
filter vlan vlan-id	Specify a list of VLANs as filters on trunk source ports to limit SPAN source traffic to specific VLANs. The <i>vlan-id</i> range is 1 to 4094.
source	Specify the SPAN or RSPAN source. A source can be a physical port, a port channel, or a VLAN.
both, rx, tx	(Optional) Specify the traffic direction to monitor. If you do not specify a traffic direction, the source interface sends both transmitted and received traffic.
source vlan vlan-id	Specify the SPAN source interface as a VLAN ID. The range is 1 to 4094.
all, local, remote	Specify all , local , or remote with the no monitor session command to clear all SPAN and RSPAN, all local SPAN, or all RSPAN sessions.

D	efa	ult	ts

No monitor sessions are configured.

On a source interface, the default is to monitor both received and transmitted traffic.

On a trunk interface used as a source port, all VLANs are monitored.

If **encapsulation replicate** is not specified on a local SPAN destination port, packets are sent in native form with no encapsulation tag.

Ingress forwarding is disabled on destination ports.

Command Modes Global configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage GuidelinesTraffic that enters or leaves source ports or source VLANs can be monitored by using SPAN or RSPAN.
Traffic routed to source ports or source VLANs cannot be monitored.

You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN and RSPAN sessions on a switch.

You can have a maximum of 64 destination ports on a switch.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, | -] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

EtherChannel ports cannot be configured as SPAN or RSPAN destination ports. A physical port that is a member of an EtherChannel group can be used as a destination port, but it cannot participate in the EtherChannel group while it is as a SPAN destination.

A private-VLAN port cannot be configured as a SPAN destination port.

You can monitor individual ports while they participate in an EtherChannel, or you can monitor the entire EtherChannel bundle by specifying the **port-channel** number as the RSPAN source interface.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port; however, IEEE 802.1x authentication is disabled until the port is removed as a SPAN destination. If IEEE 802.1x authentication is not available on the port, the switch returns an error message. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

VLAN filtering refers to analyzing network traffic on a selected set of VLANs on trunk source ports. By default, all VLANs are monitored on trunk source ports. You can use the **monitor session** *session_number* **filter vlan** *vlan-id* command to limit SPAN traffic on trunk source ports to only the specified VLANs.

VLAN monitoring and VLAN filtering are mutually exclusive. If a VLAN is a source, VLAN filtering cannot be enabled. If VLAN filtering is configured, a VLAN cannot become a source.

If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

Destination ports can be configured to act in these ways:

- When you enter **monitor session** *session_number* **destination interface** *interface-id* with no other keywords, egress encapsulation is untagged, and ingress forwarding is not enabled.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **ingress**, egress encapsulation is untagged; ingress encapsulation depends on the keywords that follow—**dot1q**, **isl**, or **untagged**.
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate** with no other keywords, egress encapsulation replicates the source interface encapsulation; ingress forwarding is not enabled. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)
- When you enter **monitor session** *session_number* **destination interface** *interface-id* **encapsulation replicate ingress**, egress encapsulation replicates the source interface encapsulation; ingress encapsulation depends on the keywords that follow—**dot1q**, **isl**, or **untagged**. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)

Examples

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 to destination port 2:

```
Switch(config)# monitor session 1 source interface gigabitethernet0/1 both
Switch(config)# monitor session 1 destination interface gigabitethernet0/2
```

This example shows how to delete a destination port from an existing local SPAN session:

Switch(config)# no monitor session 2 destination gigabitethernet0/2

This example shows how to limit SPAN traffic in an existing session only to specific VLANs:

Switch(config) # monitor session 1 filter vlan 100 - 110

This example shows how to configure RSPAN source session 1 to monitor multiple source interfaces and to configure the destination RSPAN VLAN 900.

```
Switch(config)# monitor session 1 source interface gigabitethernet0/1
Switch(config)# monitor session 1 source interface port-channel 2 tx
Switch(config)# monitor session 1 destination remote vlan 900
Switch(config)# end
```

This example shows how to configure an RSPAN destination session 10 in the switch receiving the monitored traffic.

```
Switch(config)# monitor session 10 source remote vlan 900
Switch(config)# monitor session 10 destination interface gigabitethernet0/2
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation. Egress traffic replicates the source; ingress traffic uses IEEE 802.1Q encapsulation.

 ${\rm Switch\,(config)\,\#}$ monitor session 2 destination interface gigabitethernet0/2 encapsulation replicate ingress dot1q vlan 5

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that does not support encapsulation. Egress traffic and ingress traffic are untagged.

 ${\rm Switch}\,({\rm config})\,\#\,\,{\rm monitor}\,\,{\rm session}\,\,2\,\,{\rm destination}\,\,{\rm interface}\,\,{\rm gigabitethernet0/2}\,\,{\rm ingress}\,\,{\rm untagged}\,\,{\rm vlan}\,\,5$

You can verify your settings by entering the **show monitor** privileged EXEC command. You can display SPAN and RSPAN configurations on the switch by entering the **show running-config** privileged EXEC command. SPAN information appears near the end of the output.

Related Commands	Command	Description
	remote-span	Configures an RSPAN VLAN in vlan configuration mode.
	show monitor	Displays SPAN and RSPAN session information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

mvr (global configuration)

Use the **mvr** global configuration command without keywords to enable the multicast VLAN registration (MVR) feature on the switch. Use the command with keywords to set the MVR mode for a switch, configure the MVR IP multicast address, set the maximum time to wait for a query reply before removing a port from group membership, and to specify the MVR multicast VLAN. Use the **no** form of this command to return to the default settings.

mvr [group *ip-address* [count] | mode [compatible | dynamic] | querytime value | vlan vlan-id]

no mvr [group *ip-address* | mode [compatible | dynamic] | querytime value | vlan vlan-id]

Syntax Description	group ip-address	Statically configure an MVR group IP multicast address on the switch.
		Use the no form of this command to remove a statically configured IP multicast address or contiguous addresses or, when no IP address is entered, to remove all statically configured MVR IP multicast addresses.
	count	(Optional) Configure multiple contiguous MVR group addresses. The range is 1 to 256; the default is 1.
	mode	(Optional) Specify the MVR mode of operation.
		The default is compatible mode.
	compatible	Set MVR mode to provide compatibility with Catalyst 2900 XL and Catalyst 3500 XL switches. This mode does not allow dynamic membership joins on source ports.
	dynamic	Set MVR mode to allow dynamic MVR membership on source ports.
	querytime value	(Optional) Set the maximum time to wait for IGMP report memberships on a receiver port. This time applies only to receiver-port leave processing. When an IGMP query is sent from a receiver port, the switch waits for the default or configured MVR querytime for an IGMP group membership report before removing the port from multicast group membership.
		The value is the response time in units of tenths of a second. The range is 1 to 100; the default is 5 tenths or one-half second.
		Use the no form of the command to return to the default setting.
	vlan vlan-id	(Optional) Specify the VLAN on which MVR multicast data is expected to be received. This is also the VLAN to which all the source ports belong. The range is 1 to 4094; the default is VLAN 1.

Defaults MVR is disabled by default.

The default MVR mode is compatible mode.

No IP multicast addresses are configured on the switch by default.

The default group ip address count is 0.

The default query response time is 5 tenths of or one-half second.

The default multicast VLAN for MVR is VLAN 1.

Command Modes Global configuration

Command History	Release	Modification		
	12.1(19)EA1	This command was introduced.		
Usage Guidelines	A maximum of 256	MVR multicast groups can be configured on a switch.		
Usage Guidennes				
	Use the mvr group command to statically set up all the IP multicast addresses that will take part in MVR. Any multicast data sent to a configured multicast address is sent to all the source ports on the switch and to all receiver ports that have registered to receive data on that IP multicast address.			
	MVR supports aliased IP multicast addresses on the switch. However, if the switch is interoperating with Catalyst 3550 or Catalyst 3500 XL switches, you should not configure IP addresses that alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx).			
	The mvr querytime command applies only to receiver ports.			
	If the switch MVR is interoperating with Catalyst 2900 XL or Catalyst 3500 XL switches, set the multicast mode to compatible.			
	When operating in co	When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.		
	MVR can coexist with IGMP snooping on a switch.			
	routing protocol whi enable MVR while n	d MVR cannot coexist on a switch. If you enable multicast routing and a multicast le MVR is enabled, MVR is disabled and a warning message appears. If you try to nulticast routing and a multicast routing protocol are enabled, the operation to elled with an Error message.

	show mvr interface	Displays the configured MVR interfaces with their type, status, and Immediate Leave configuration. Also displays all MVR groups of which the interface is a member.
	show mvr members	Displays all ports that are members of an MVR multicast group; if the group has no members, its status is shown as Inactive.

mvr (interface configuration)

Use the **mvr** interface configuration command to configure a Layer 2 port as a multicast VLAN registration (MVR) receiver or source port, to set the Immediate Leave feature, and to statically assign a port to an IP multicast VLAN and IP address. Use the **no** form of this command to return to the default settings.

mvr [immediate | type { receiver | source } | vlan vlan-id group [ip-address]]

no mvr [**immediate** | **type** {**source** | **receiver**}] **vlan** *vlan-id* **group** [*ip-address*]]

Syntax Description	immediate	(Optional) Enable the Immediate Leave feature of MVR on a port. Use the no mvr immediate command to disable the feature.
	type	(Optional) Configure the port as an MVR receiver port or a source port.
		The default port type is neither an MVR source nor a receiver port. The no mvr type command resets the port as neither a source or a receiver port.
	receiver	Configure the port as a subscriber port that can only receive multicast data. Receiver ports cannot belong to the multicast VLAN.
	source	Configure the port as an uplink port that can send and receive multicast data for the configured multicast groups. All source ports on a switch belong to a single multicast VLAN.
	vlan vlan-id group	(Optional) Add the port as a static member of the multicast group with the specified VLAN ID.
		The no mvr vlan <i>vlan-id</i> group command removes a port on a VLAN from membership in an IP multicast address group.
	ip-address	(Optional) Statically configure the specified MVR IP multicast group address for the specified multicast VLAN ID. This is the IP address of the multicast group that the port is joining.
Defaults	A port is configured as	neither a receiver nor a source.
Defaults	· ·	neither a receiver nor a source. Teature is disabled on all ports.
Defaults	The Immediate Leave f	
	The Immediate Leave f	eature is disabled on all ports. ember of any configured multicast group.
Defaults Command Modes Command History	The Immediate Leave for No receiver port is a mo	eature is disabled on all ports. ember of any configured multicast group.

Usage Guidelines

Configure a port as a source port if that port should be able to both send and receive multicast data bound for the configured multicast groups. Multicast data is received on all ports configured as source ports.

Receiver ports cannot be trunk ports. Receiver ports on a switch can be in different VLANs, but should not belong to the multicast VLAN.

A port that is not taking part in MVR should not be configured as an MVR receiver port or a source port. A non-MVR port is a normal switch port, able to send and receive multicast data with normal switch behavior.

When Immediate Leave is enabled, a receiver port leaves a multicast group more quickly. Without Immediate Leave, when the switch receives an IGMP leave message from a group on a receiver port, it sends out an IGMP MAC-based query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP MAC-based query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency.

The Immediate Leave feature should be enabled only on receiver ports to which a single receiver device is connected.

The **mvr vlan group** command statically configures ports to receive multicast traffic sent to the IP multicast address. A port statically configured as a member of group remains a member of the group until statically removed. In compatible mode, this command applies only to receiver ports; in dynamic mode, it can also apply to source ports. Receiver ports can also dynamically join multicast groups by using IGMP join messages.

When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.

An MVR port cannot be a private-VLAN port.

This example shows how to configure a port as an MVR receiver port:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mvr type receiver

Use the **show mvr interface** privileged EXEC command to display configured receiver ports and source ports.

This example shows how to enable Immediate Leave on a port:

Switch(config)# interface gigabitethernet0/1
Switch(config-if)# mvr immediate

This example shows how to add a port on VLAN 1 as a static member of IP multicast group 228.1.23.4:

Switch(config)# interface gigabitethernet0/2
Switch(config-if)# mvr vlan1 group 230.1.23.4

You can verify your settings by entering the show mvr members privileged EXEC command.

Examples

Related Commands	Command	Description
	mvr (global configuration)	Enables and configures multicast VLAN registration on the switch.
	show mvr	Displays MVR global parameters or port parameters.
	show mvr interface	Displays the configured MVR interfaces or displays the multicast groups to which a receiver port belongs. Also displays all MVR groups of which the interface is a member.
	show mvr members	Displays all receiver ports that are members of an MVR multicast group.

pagp learn-method

Use the **pagp learn-method** interface configuration command to learn the source address of incoming packets received from an EtherChannel port. Use the **no** form of this command to return to the default setting.

pagp learn-method {aggregation-port | physical-port}

no pagp learn-method

Syntax Description	aggregation-port	Specify address learning on the logical port-channel. The switch sends packets to the source using any of the ports in the EtherChannel. This setting is the default. With aggregate-port learning, it is not important on which physical port the packet arrives.
	physical-port	Specify address learning on the physical port within the EtherChannel. The switch sends packets to the source using the same port in the EtherChannel from which it learned the source address. The other end of the channel uses the same port in the channel for a particular destination MAC or IP address.
Defaults	The default is aggreg	ation-port (logical port channel).
Command Modes	Interface configuration	on
Command History	Release	Modification
-	12.1(19)EA1	This command was introduced.
Usage Guidelines	The learn method mu	ast be configured the same at both ends of the link.
Note	physical-port keywo the pagp port-priori	witch supports address learning only on aggregate ports even though the ord is provided in the command-line interface (CLI). The pagp learn-method and ty interface configuration commands have no effect on the switch hardware, but PAgP interoperability with devices that only support address learning by physical talyst 1900 switch.
	the switch as a physic configuration comma using the port-chan	to the Catalyst 3560 switch is a physical learner, we recommend that you configure cal-port learner by using the pagp learn-method physical-port interface and and to set the load-distribution method based on the source MAC address by nel load-balance src-mac global configuration command. Use the pagp are configuration command only in this situation.

Examples This example shows how to set the learning method to learn the address on the physical port within the EtherChannel:

Switch(config-if) # pagp learn-method physical-port

This example shows how to set the learning method to learn the address on the port-channel within the EtherChannel:

Switch(config-if)# pagp learn-method aggregation-port

You can verify your settings by entering the **show running-config** privileged EXEC command or the **show pagp** *channel-group-number* **internal** privileged EXEC command.

Related Commands	Command	Description
	pagp port-priority	Selects a port over which all traffic through the EtherChannel is sent.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

pagp port-priority

Use the **pagp port-priority** interface configuration command to select a port over which all Port Aggregation Protocol (PAgP) traffic through the EtherChannel is sent. If all unused ports in the EtherChannel are in hot-standby mode, they can be placed into operation if the currently selected port and link fails. Use the **no** form of this command to return to the default setting.

pagp port-priority priority

no pagp port-priority

Syntax Description	priority	A priority number ranging from 0 to 255.
Defaults	The default is 128.	
Command Modes	Interface configurat	tion
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines		with the highest priority that is operational and has membership in the same to one selected for PAgP transmission.
Note	The Catalyst 3560 switch supports address learning only on aggregate ports even though the physical-port keyword is provided in the command-line interface (CLI). The pagp learn-method and the pagp port-priority interface configuration commands have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.	
	When the link partner to the Catalyst 3560 switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the pagp learn-method physical-port interface configuration command and to set the load-distribution method based on the source MAC address by using the port-channel load-balance src-mac global configuration command. Use the pagp learn-method interface configuration command only in this situation.	
Examples	This example show	s how to set the port priority to 200:
	Switch(config-if)# pagp port-priority 200	
	You can verify your setting by entering the show running-config privileged EXEC command or the show pagp <i>channel-group-number</i> internal privileged EXEC command.	

Related Commands	Command	Description
	pagp learn-method	Provides the ability to learn the source address of incoming packets.
	show pagp	Displays PAgP channel-group information.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

permit (ARP access-list configuration)

Use the **permit** Address Resolution Protocol (ARP) access-list configuration command to permit an ARP packet based on matches against the Dynamic Host Configuration Protocol (DHCP) bindings. Use the **no** form of this command to remove the specified access control entry (ACE) from the access control list.

- permit {[request] ip { any | host sender-ip | sender-ip sender-ip-mask } mac { any | host sender-mac | sender-mac sender-mac-mask } | response ip { any | host sender-ip | sender-ip sender-ip-mask } [{ any | host target-ip | target-ip target-ip-mask }] mac { any | host sender-mac | sender-mac sender-mac-mask } [{ any | host target-mac | target-mac target-mac-mask }] } [log]
- no permit {[request] ip {any | host sender-ip | sender-ip sender-ip-mask} mac {any | host sender-mac | sender-mac sender-mac-mask} | response ip {any | host sender-ip | sender-ip sender-ip-mask} [{any | host target-ip | target-ip target-ip-mask}] mac {any | host sender-mac | sender-mac sender-mac-mask} [{any | host target-mac | target-mac target-mac-mask}]} [log]

Syntax Description	request	(Optional) Requests a match for the ARP request. When request is not specified, matching is performed against all ARP packets.
	ip	Specify the sender IP address.
	any	Accept any IP or MAC address.
	host sender-ip	Accept the specified sender IP address.
	sender-ip sender-ip-mask	Accept the specified range of sender IP addresses.
	mac	Specify the sender MAC address.
	host sender-mac	Accept the specified sender MAC address.
	sender-mac sender-mac-mask	Accept the specified range of sender MAC addresses.
	response ip	Define the IP address values for the ARP responses.
	host target-ip	(Optional) Accept the specified target IP address.
	target-ip target-ip-mask	(Optional) Accept the specified range of target IP addresses.
	mac	Specify the MAC address values for the ARP responses.
	host target-mac	(Optional) Accept the specified target MAC address.
	target-mac target-mac-mask	(Optional) Accept the specified range of target MAC addresses.
	log	(Optional) Log a packet when it matches the ACE. Matches are logged if you also configure the matchlog keyword in the ip arp inspection vlan logging global configuration command.

Defaults There are no default settings.

Command Modes ARP access-list configuration

Command History	Release	Modification	
	12.2(20)SE	This command was introduced.	
Usage Guidelines	You can add permit o	clauses to forward ARP packets based on some matching criteria.	
Examples	This example shows how to define an ARP access list and to permit both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:		
	Switch(config)# arp access-list static-hosts Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd Switch(config-arp-nacl)# end		
	You can verify your	settings by entering the show arp access-list privileged EXEC command.	
Related Commands	Command	Description	
	arp access-list	Defines an ARP access control list (ACL).	
	deny (ARP access-l configuration)	ist Denies an ARP packet based on matches against the DHCP bindings.	
	ip arp inspection fi	Iter vlan Permits ARP requests and responses from a host configured with a static IP address.	
	show arp access-lis	t Displays detailed information about ARP access lists.	

permit (IPv6 access-list configuration)

Use the **permit** IPv6 access list configuration command to set permit conditions for an IPv6 access list. Use the **no** form of this command to remove the permit conditions.

- permit {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value]
 [time-range name]
- no permit {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value]
 [time-range name]

Note

Although visible in the command-line help strings, the **flow-label**, **reflect**, and **routing** keywords are not supported.

Internet Control Message Protocol

permit icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log]
 [log-input] [sequence value] [time-range name]

Transmission Control Protocol

permit tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port |
 protocol}] [psh] [range {port | protocol}] [rst] [sequence value] [syn] [time-range name]
 [urg]

User Datagram Protocol

permit udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator
 [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
 [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port |
 protocol}] [sequence value] [time-range name]

Although visible in the command-line help strings, the **flow-label**, **reflect**, and **routing** keywords are not supported.

Syntax Description	protocol	Name or number of an Internet protocol. It can be one of the keywords ahp , esp , icmp , ipv6 , pcp , sctp , tcp , or udp , or an integer in the range from 0 to 255 representing an IPv6 protocol number.
	source-ipv6-prefix/prefix- length	The source IPv6 network or class of networks for which to set permit conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended universal identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	any	An abbreviation for the IPv6 prefix ::/0.
	host source-ipv6-address	The source IPv6 host address for which to set permit conditions.
		This <i>source-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	operator [port-number]	(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are lt (less than), gt (greater than), eq (equal), neq (not equal), and range (inclusive range).
		If the operator is positioned after the <i>source-ipv6-prefix/prefix-length</i> argument, it must match the source port.
		If the operator is positioned after the <i>destination-ipv6-prefix/prefix-length</i> argument, it must match the destination port.
		The range operator requires two port numbers. All other operators require one port number.
		The optional <i>port-number</i> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.
	destination-ipv6-prefixl prefix-length	The destination IPv6 network or class of networks for which to set permit conditions.
		This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
		Note Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.
	host	The destination IPv6 host address for which to set permit conditions.
	destination-ipv6-address	This <i>destination-ipv6-address</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.
	dscp value	(Optional) Match a differentiated services codepoint value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

fragments	(Optional) Match noninitial fragmented packets where the fragment extension header contains a nonzero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the <i>operator</i> [<i>port-number</i>] arguments are not specified.
log	(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages logged to the console is controlled by the logging console command.)
	The message includes the access list name and sequence number; whether the packet was permitted; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets permitted in the prior 5-minute interval.
log-input	(Optional) Provide the same function as the log keyword, except that the logging message also includes the receiving interface.
timeout value	(Optional) Interval of idle time (in seconds) after which a reflexive IPv6 access list times out. The acceptable range is from 1 to 4294967295. The default is 180 seconds.
sequence value	(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.
time-range name	(Optional) Specify the time range that applies to the permit statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.
icmp-type	(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by the ICMP message type. The type is a number from 0 to 255.
icmp-code	(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by the ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.
icmp-message	(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or ICMP message type and code. The possible names are listed in the "Usage Guidelines" section.
ack	(Optional) Only for the TCP protocol: acknowledgment (ACK) bit set.
established	(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.
fin	(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.
neq { <i>port</i> <i>protocol</i> }	(Optional) Match only packets that are not on a given port number.
psh	(Optional) Only for the TCP protocol: Push function bit set.
<pre>range {port protocol}</pre>	(Optional) Match only packets in the range of port numbers.
rst	(Optional) Only for the TCP protocol: Reset bit set.
syn	(Optional) Only for the TCP protocol: Synchronize bit set.

Defaults	No IPv6 access list is defined.			
Command Modes	IPv6 access-list con	IPv6 access-list configuration		
Command History	Release	Modification		
	12.2(25)SED	This command was introduced.		
Usage Guidelines		ccess-list configuration mode) command is similar to the permit (IPv4 access-list command, except that it is IPv6-specific.		
		6) command after the ipv6 access-list command to enter IPv6 access-list and to define the conditions under which a packet passes the access list.		
	Specifying IPv6 for	Specifying IPv6 for the <i>protocol</i> argument matches against the IPv6 header of the packet.		
	By default, the first statement in an access list is number 10, and the subsequent statements are incremented by 10.			
list. To add a new statement		deny , or remark statements to an existing access list without re-entering the entire atement anywhere other than at the end of the list, create a new statement with an mber that falls between two existing entry numbers to show where it belongs.		
•	See the ipv6 access	list command for more information on defining IPv6 ACLs.		
Note	any any statements discovery. To disalle nd-ns, there must be	implicit permit icmp any any nd-na , permit icmp any any nd-ns , and deny ipv6 as its last match conditions. The two permit conditions allow ICMPv6 neighbor w ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any e an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement v6 ACL must contain at least one entry.		
	The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.			
	for traffic filtering (6-prefix/prefix-length and destination-ipv6-prefix/prefix-length arguments are used the source prefix filters traffic based upon the traffic source; the destination prefix upon the traffic destination).		

The switch supports only prefixes from /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.

The fragments keyword is an option only if the operator [port-number] arguments are not specified.

This is a list of ICMP message names:

beyond-scope	destination-unreachable
echo-reply	echo-request
header	hop-limit
mld-query	mld-reduction
mld-report	nd-na
nd-ns	next-header
no-admin	no-route
packet-too-big	parameter-option
parameter-problem	port-unreachable
reassembly-timeout	renum-command
renum-result	renum-seq-number
router-advertisement	router-renumbering
router-solicitation	time-exceeded
unreachable	

Examples

This example configures two IPv6 access lists named OUTBOUND and INBOUND and applies both access lists to outbound and inbound traffic on a Layer 3 interface. The first and second permit entries in the OUTBOUND list permit all TCP and UDP packets from network 2001:ODB8:0300:0201::/64 to leave the interface. The deny entry in the OUTBOUND list prevents all packets from the network FE80:0:0:0201::/64 (packets that have the link-local prefix FE80:0:0:0201 as the first 64 bits of their source IPv6 address) from leaving the interface. The third permit entry in the OUTBOUND list permits all ICMP packets to exit the interface.

The permit entry in the INBOUND list permits all ICMP packets to enter the interface.

```
Switch(config)#ipv6 access-list OUTBOUND
Switch(config-ipv6-acl)# permit tcp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# permit udp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# deny FE80:0:0:0201::/64 any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config-ipv6-acl)# exit
Switch(config)# interface gigabitethernet0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter OUTBOUND out
Switch(config-if)# ipv6 traffic-filter INBOUND in
```

Given that a **permit any any** statement is not included as the last entry in the OUTBOUND or INBOUND access list, only TCP, UDP, and ICMP packets are permitted out of and into the interface (the implicit deny-all condition at the end of the access list denies all other packet types on the interface).

Related Commands	Command	Description
	ipv6 access-list	Defines an IPv6 access list and enters IPv6 access list configuration mode.
	ipv6 traffic-filter	Filters incoming or outgoing IPv6 traffic on an interface.
	deny (IPv6 access-list configuration)	Sets deny conditions for an IPv6 access list.
	show ipv6 access-list	Displays the contents of all current IPv6 access lists.

permit (MAC access-list configuration)

Use the **permit** MAC access-list configuration command to allow non-IP traffic to be forwarded if the conditions are matched. Use the **no** form of this command to remove a permit condition from the extended MAC access list.

- {permit | deny} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr |
 dst-MAC-addr mask} [type mask | cos cos | aarp | amber | dec-spanning | decnet-iv |
 diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console |
 mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]
- no {permit | deny} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} [type mask | cos cos | aarp | amber | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp]

Though visible in the command-line help strings, appletalk is not supported as a matching condition.

Syntax Description	any	Keyword to specify to deny any source or destination MAC address.
	host src-MAC-addr src-MAC-addr mask	Define a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.
	host <i>dst-MAC-addr</i> <i>dst-MAC-addr</i> mask	Define a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.
	type mask	(Optional) Use the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet.
		• <i>type</i> is 0 to 65535, specified in hexadecimal.
		• <i>mask</i> is a mask of <i>don't care</i> bits applied to the Ethertype before testing for a match.
	aarp	(Optional) Select Ethertype AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
	amber	(Optional) Select EtherType DEC-Amber.
	cos cos	(Optional) Select an arbitrary class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message appears if the cos option is configured.
	dec-spanning	(Optional) Select EtherType Digital Equipment Corporation (DEC) spanning tree.
	decnet-iv	(Optional) Select EtherType DECnet Phase IV protocol.
	diagnostic	(Optional) Select EtherType DEC-Diagnostic.
	dsm	(Optional) Select EtherType DEC-DSM.
	etype-6000	(Optional) Select EtherType 0x6000.
	etype-8042	(Optional) Select EtherType 0x8042.
	lat	(Optional) Select EtherType DEC-LAT.
	lavc-sca	(Optional) Select EtherType DEC-LAVC-SCA.

lsap lsap-number mask	(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.	
	The <i>mask</i> is a mask of <i>don't care</i> bits applied to the LSAP number before testing for a match.	
mop-console	(Optional) Select EtherType DEC-MOP Remote Console.	
mop-dump	(Optional) Select EtherType DEC-MOP Dump.	
msdos	(Optional) Select EtherType DEC-MSDOS.	
mumps	(Optional) Select EtherType DEC-MUMPS.	
netbios	(Optional) Select EtherType DEC- Network Basic Input/Output System (NETBIOS).	
vines-echo	(Optional) Select EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.	
vines-ip	(Optional) Select EtherType VINES IP.	
xns-idp	(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite.	

To filter IPX traffic, you use the *type mask* or **lsap** *lsap mask* keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-14.

Table 2-14	IPX Filtering Criteria
------------	------------------------

IPX Encapsulation Typ		
Cisco IOS Name	Novell Name	Filter Criterion
arpa	Ethernet II	Ethertype 0x8137
nap	Ethernet-snap	Ethertype 0x8137
sap	Ethernet 802.2	LSAP 0xE0E0
novell-ether	Ethernet 802.3	LSAP 0xFFFF

Defaults This command has no defaults. However, the default action for a MAC-named ACL is to deny.

Command Modes MAC access-list configuration

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines You enter MAC access-list configuration mode by using the **mac access-list extended** global configuration command.

If you use the **host** keyword, you cannot enter an address mask; if you do not use the **any** or **host** keywords, you must enter an address mask.

After an access control entry (ACE) is added to an access control list, an implied **deny-any-any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

For more information about MAC-named extended access lists, see the software configuration guide for this release.

Examples This example shows how to define the MAC-named extended access list to allow NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is allowed.

Switch(config-ext-macl)# permit any host 00c0.00a0.03fa netbios

This example shows how to remove the permit condition from the MAC-named extended access list: Switch(config-ext-macl)# no permit any 00c0.00a0.03fa 0000.0000 netbios

This example permits all packets with Ethertype 0x4321:

Switch(config-ext-macl)# permit any any 0x4321 0

You can verify your settings by entering the show access-lists privileged EXEC command.

Related Commands	Command	Description
	deny (MAC access-list configuration)	Denies non-IP traffic to be forwarded if conditions are matched.
	mac access-list extended	Creates an access list based on MAC addresses for non-IP traffic.
	show access-lists	Displays access control lists configured on a switch.

police

Use the **police** policy-map class configuration command to define a policer for classified traffic. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove an existing policer.

police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]

no police *rate-bps burst-byte* [**exceed-action** {**drop** | **policed-dscp-transmit**}]

Syntax Description	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 1000000 to 1000000000.
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.
	exceed-action drop	(Optional) When the specified rate is exceeded, specify that the switch drop the packet.
	exceed-action policed-dscp-transmit	(Optional) When the specified rate is exceeded, specify that the switch changes the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then sends the packet.
Defaults	No policers are defined.	
Command Modes	Policy-map class configu	uration
Command History	Release	Modification
	12.1(19)EA1	This command was introduced.
Usage Guidelines	When configuring hierar secondary interface-leve	chical policy maps, you can only use the police policy-map command in a l policy map.
	user-configurable policer user-configurable policer	which controls more than one physical port, supports 256 policers (255 rs plus 1 policer reserved for internal use). The maximum number of rs supported per port is 63. Policers are allocated on demand by the software and
		rdware and ASIC boundaries. You cannot reserve policers per port. There is no l be assigned to any policer.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the *burst-byte* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. You configure how quickly (the average rate) the tokens are removed from the bucket by using the *rate-bps* option of the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration for the **police** policy-map class configuration command or the **mls qos aggregate-policer** global configuration command. For more information, see the software configuration guide for this release.

Examples

This example shows how to configure a policer that drops packets if traffic exceeds 1 Mb/s average rate with a burst size of 20 KB. The DSCPs of incoming packets are trusted, and there is no packet modification.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action drop
Switch(config-pmap-c)# exit
```

This example shows how to configure a policer, which marks down the DSCP values with the values defined in policed-DSCP map and sends the packet:

```
Switch(config)# policy-map policy2
Switch(config-pmap)# class class2
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration commands) for the specified class-map name.
	mls qos map policed-dscp	Applies a policed-DSCP map to a DSCP-trusted port.
	policy-map	Creates or modifies a policy map that can be attached to multiple ports to specify a service policy.
	set	Classifies IP traffic by setting a DSCP or IP-precedence value in the packet.
	show policy-map	Displays quality of service (QoS) policy maps.
	trust	Defines a trust state for traffic classified through the class policy-map configuration or the class-map global configuration command.

police aggregate

Use the **police aggregate** policy-map class configuration command to apply an aggregate policer to multiple classes in the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove the specified policer.

police aggregate aggregate-policer-name

no police aggregate *aggregate-policer-name*

Syntax Description	aggregate-policer-r	name Name of the aggregate policer.	
Defaults	No aggregate police	ers are defined.	
Command Modes	Policy-map class co	onfiguration	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	user-configurable po user-configurable po are constrained by the	ce, which controls more than one physical port, supports 256 policers (255 olicers plus 1 policer reserved for internal use). The maximum number of olicers supported per port is 63. Policers are allocated on demand by the software and he hardware and ASIC boundaries. You cannot reserve policers per port. There is no 't will be assigned to any policer.	
	You set aggregate policer parameters by using the mls qos aggregate-policer global configuration command. You apply an aggregate policer to multiple classes in the same policy map; you cannot use an aggregate policer across different policy maps.		
	To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	You cannot configu	re aggregate policers in hierarchical policy maps.	

Examples	This example shows how to define the aggregate policer parameters and to apply the policer to multiple classes in a policy map:
	Switch(config)# mls qos aggregate-policer agg_policer1 10000 1000000 exceed-action drop Switch(config)# policy-map policy2 Switch(config-pmap)# class class1
	Switch(config-pmap-c)# police aggregate agg_policer1
	Switch(config-pmap-c)# exit
	Switch(config-pmap)# class class2
	Switch(config-pmap-c)# set dscp 10
	Switch(config-pmap-c)# police aggregate agg_policer1
	Switch(config-pmap-c)# exit
	Switch(config-pmap)# class class3
	Switch(config-pmap-c)# trust dscp
	Switch(config-pmap-c)# police aggregate agg_policer2
	Switch(config-pmap-c)# exit

You can verify your settings by entering the show mls qos aggregate-policer privileged EXEC command.

Related Commands	Command	Description
	mls qos aggregate-policer	Defines policer parameters, which can be shared by multiple classes within a policy map.
	show mls qos aggregate-policer	Displays the quality of service (QoS) aggregate policer configuration.

Catalyst 3560 Switch Command Reference

policy-map

Use the **policy-map** global configuration command to create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

policy-map policy-map-name

no policy-map policy-map-name

Syntax Description	policy-map-name	Name of the policy map.	
Defaults	No policy maps are defined. The default behavior is to set the Differentiated Services Code Point (DSCP) to 0 if the packet is an IP packet and to set the class of service (CoS) to 0 if the packet is tagged. No policing is performed.		
Command Modes	Global configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(25)SE	Support for policy maps on SVIs was added.	
Usage Guidelines		icy-map command, you enter policy-map configuration mode, and these	
	 configuration commands are available: class: defines the classification match criteria for the specified class map. For more information, see the "class" section on page 2-37. 		
	• description : describes the policy map (up to 200 characters).		
	• exit: exits policy-map configuration mode and returns you to global configuration mode.		
	• no : removes a previously defined policy map.		
	• rename : renames the current policy map.		
	To return to global configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	Before configuring policies for classes whose match criteria are defined in a class map, use the policy-map command to specify the name of the policy map to be created, added to, or modified. Entering the policy-map command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.		
	You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the class-map global configuration and match class-map configuration commands. You define packet classification on a physical-port basis.		

Only one policy map per ingress port or SVI is supported. You can apply the same policy map to multiple physical ports or SVIs.

In software releases earlier than Cisco IOS Release 12.2(25)SE, you can apply a policy map and configure policing only on physical ports. You can configure the trust state, set a new DSCP or IP precedence value in the packet, or define an individual or aggregate policer. For more information, see the "Policing on Physical Ports" section in the "Configuring QoS" chapter of the software configuration guide for this release.

In Cisco IOS Release 12.2(25)SE or later, you can apply a nonhierarchical policy maps to physical ports or to SVIs. A nonhierarchical policy map is the same as a port-based policy maps in software releases earlier than Cisco IOS Release 12.2(25)SE. However, you can only apply a hierarchical policy map to SVIs.

A hierarchical policy map has two levels. The first level, the VLAN level, specifies the actions to be taken against a traffic flow on an SVI. The second level, the interface level, specifies the actions to be taken against the traffic on the physical ports that belong to the SVI and are specified in the interface-level policy map.

In a primary VLAN-level policy map, you can only configure the trust state or set a new DSCP or IP precedence value in the packet. In a secondary interface-level policy map, you can only configure individual policers on physical ports that belong to the SVI.

After the hierarchical policy map is attached to an SVI, an interface-level policy map cannot be modified or removed from the hierarchical policy map. A new interface-level policy map also cannot be added to the hierarchical policy map. If you want these changes to occur, the hierarchical policy map must first be removed from the SVI.

For more information about hierarchical policy maps, see the "Policing on SVIs" section in the "Configuring QoS" chapter of the software configuration guide for this release.

Examples

This example shows how to create a policy map called *policy1*. When attached to the ingress port, it matches all the incoming traffic defined in *class1*, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

This example shows how to configure multiple classes in a policy map called *policymap2*:

```
Switch(config)# policy-map policymap2
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 100000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# set dscp 0 (no policer)
Switch(config-pmap-c)# exit
```

This example shows how to create a hierarchical policy map and attach it to an SVI:

```
Switch(config) # class-map cm-non-int
Switch(config-cmap) # match access-group 101
Switch(config-cmap)# exit
Switch(config) # class-map cm-non-int-2
Switch(config-cmap)# match access-group 102
Switch(config-cmap)# exit
Switch(config) # class-map cm-test-int
Switch(config-cmap)# match input-interface gigabitethernet0/2 - gigabitethernet0/3
Switch(config-cmap)# exit
Switch(config) # policy-map pm-test-int
Switch(config-pmap)# class cm-test-int
Switch(config-pmap-c)# police 18000000 8000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap) # exit
Switch(config)# policy-map pm-test-pm-2
Switch(config-pmap) # class cm-non-int
Switch(config-pmap-c)# set dscp 7
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap)# class cm-non-int-2
Switch(config-pmap-c)# set dscp 15
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap-c)# end
Switch(config-cmap)# exit
Switch(config)# interface vlan 10
Switch(config-if)# service-policy input pm-test-pm-2
```

This example shows how to delete *policymap2*:

Switch(config) # no policy-map policymap2

You can verify your settings by entering the show policy-map privileged EXEC command.

Related Commands	Command	Description
	class	Defines a traffic classification match criteria (through the police , set , and trust policy-map class configuration command) for the specified class-map name.
	class-map	Creates a class map to be used for matching packets to the class whose name you specify.
	service-policy	Applies a policy map to a port.
	show mls qos vlan	Displays the quality of service (QoS) policy maps attached to an SVI.
	show policy-map	Displays QoS policy maps.

port-channel load-balance

Use the **port-channel load-balance** global configuration command to set the load-distribution method among the ports in the EtherChannel. Use the **no** form of this command to return to the default setting.

port-channel load-balance {dst-ip | dst-mac | src-dst-ip | src-dst-mac | src-ip | src-mac}

no port-channel load-balance

Syntax Description	dst-ip	Load distribution is based on the destination host IP address.	
	dst-mac	Load distribution is based on the destination host MAC address. Packets to the same destination are sent on the same port, but packets to different destinations are sent on different ports in the channel.	
	src-dst-ip Load distribution is based on the source and destination host IP address.		
	src-dst-mac	Load distribution is based on the source and destination host MAC address.	
	src-ip	Load distribution is based on the source host IP address.	
	src-mac	Load distribution is based on the source MAC address. Packets from different hosts use different ports in the channel, but packets from the same host use the same port.	
Defaults	The default is	src-mac.	
Command Modes	Global config	uration	
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	For information about when to use these forwarding methods, see the "Configuring EtherChannels" chapter in the software configuration guide for this release.		
Examples	-	shows how to set the load-distribution method to dst-mac :	
	Switch(config)# port-channel load-balance dst-mac		
	You can verify your setting by entering the show running-config privileged EXEC command or the show etherchannel load-balance privileged EXEC command.		

Related Commands	Command	Description
	interface port-channel	Accesses or creates the port channel.
	show etherchannel	Displays EtherChannel information for a channel.
	show running-config	Displays the current operating configuration. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands.

power inline

Use the **power inline** interface configuration command to configure the power management mode on the Power over Ethernet (PoE) ports. Use the **no** form of this command to return to the default settings.

power inline {auto [max max-wattage] | never | static [max max-wattage]}

no power inline {auto | never | static}

Syntax Description	auto	Enable powered-device detection. If enough power is available, automatically allocate power to the PoE port after device detection.	
	max max-wattage	(Optional) Limit the power allowed on the port. The range is 4000 to 15400 milliwatts. If no value is specified, the maximum is allowed.	
	never	Disable device detection, and disable power to the port.	
	static	Enable powered-device detection. Pre-allocate (reserve) power for a port before the switch discovers the powered device.	
Defaults	The default is auto (e	enabled)	
		ge is 15400 milliwatts.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
	12.2(25)SE	The static and max max-wattage options were added.	
Usage Guidelines	This command is supported only on PoE-capable ports. If you enter this command on a port that does not support PoE, this error message appears: Switch(config)# interface gigabitethernet0/1		
	Switch(config-if)# power inline auto		
	% Invalid input detected at '^' marker.		
	when the powered de the maximum wattag	<i>ttage</i> option to disallow higher-power powered devices. With this configuration, vice sends Cisco Discovery Protocol (CDP) messages requesting more power that e, the switch removes power from the port. If the powered-device IEEE class than the maximum wattage, the switch does not power the device. The power is obal power budget.	
<u>Note</u>	The switch never pow	vers any Class 0 or Class 3 device if the power inline max max-wattage command	
NOLG	is configured for less		

If the switch denies power to a powered device (the powered device requests more power through CDP messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the **show power inline** user EXEC command output shows *power-deny*.

Use the **power inline static max** *max-wattage* command to give a port high priority. The switch allocates PoE to a port configured in static mode before allocating power to a port configured in auto mode. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device needs more than the maximum wattage, the powered device is shut down.

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears: Command rejected: power inline static: pwr not available. The port configuration remains unchanged.

When you configure a port by using the **power inline auto** or the **power inline static** interface configuration command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the **power inline never** command, the port reverts to the configured speed and duplex settings.

If a port has a Cisco powered device connected to it, you should not use the **power inline never** command to configure the port. A false link-up can occur on the port, placing it into an error-disabled state.

Caution

In releases earlier than Cisco IOS Release 12.2(20)SE1, power was sometimes still applied to a PoE port even after a powered device was removed. This could cause damage to a nonpowered device when it was later connected to that port. Make sure that your switch is running Cisco IOS Release 12.2(20)SE1 or later.

Examples

This example shows how to enable detection of a powered device and to automatically power a PoE port:

Switch(config)# interface fastethernet0/2
Switch(config-if)# power inline auto

This example shows how to configure a PoE port to allow a Class 1 or a Class 2 powered device:

Switch(config)# interface fastethernet0/2
Switch(config-if)# power inline auto max 7000

This example shows how to disable powered-device detection and to not power a PoE port:

Switch(config)# interface fastethernet0/2
Switch(config-if)# power inline never

You can verify your settings by entering the show power inline user EXEC command.

Related Commands	Command	Description
	logging event power-inline-status	Enables the logging of PoE events.
	show controllers power inline	Displays the values in the registers of the specified PoE controller.
	show power inline	Displays the PoE status for the specified PoE port or for all PoE ports.

of power sp	ver inline consumption global or interface configuration command to override the amount ecified by the IEEE classification for the device by specifying the wattage used by each vice. Use the no form of this command to return to the default power setting.	nt
	nline consumption default <i>wattage</i> er inline consumption default	

Syntax Description	wattage	Specify the power that the switch budgets for the port. The range is 4000 to 15400 milliwatts.	
Defaults	The default power on each Power over Ethernet (PoE) port is 15400 milliwatts.		
Command Modes	Global configuration Interface configuration		
Command History	Release	Modification	
	12.2(25)SEC	This command was introduced.	
Usage Guidelines	(CDP) to determine budget accordingly. the switch grants a p IEEE classification budgets 15400 milli device reports a hig	ed devices are connected to PoE ports, the switch uses Cisco Discovery Protocol e the <i>actual</i> power consumption of the devices, and the switch adjusts the power . This does not apply to IEEE third-party powered devices. For these devices, when power request, the switch adjusts the power budget according to the powered-device . If the powered device is a Class 0 (class status unknown) or a Class 3, the switch invatts for the device, regardless of the actual amount of power needed. If the powered ther class than its actual consumption or does not support power classification), the switch can power fewer devices because it uses the IEEE class information to wer budget.	
	By using the power inline consumption <i>wattage</i> configuration command, you can override the default power requirement specified by the IEEE classification. The difference between what is mandated by the IEEE classification and what is actually needed by the device is reclaimed into the global power budget for use by additional devices. You can then extend the switch power budget and use it more effectively.		
	For example, if the switch budgets 15400 milliwatts on each PoE port, you can connect only 24 Class 0 powered devices. If your Class 0 device power requirement is actually 5000 milliwatts, you can set the consumption wattage to 5000 milliwatts and connect up to 48 devices. The total PoE output power available on a 24-port or 48-port switch is 370,000 milliwatts.		
<u> </u>	You should carefull supply.	ly plan your switch power budget and make certain not to oversubscribe the power	

power inline consumption

Catalyst 3560 Switch Command Reference

Related Commands	Command Description
	You can verify your settings by entering the show power inline consumption default privileged EXEC command.
	Switch(config)# interface gigabitethernet1/0/2 Switch(config-if)# power inline consumption default 12000 %CAUTION: Interface Gi0/2: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation.
	By using the interface configuration command, this example shows how to configure the switch to budget 12000 milliwatts to the powered device connected to a specific PoE port:
	Switch(config)# power inline consumption default 5000 %CAUTION: Interface Gi0/1: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation.
Examples	By using the global configuration command, this example shows how to configure the switch to budget 5000 milliwatts to each PoE port:
	This command is supported only on PoE-capable ports. If you enter this command on a switch or port that does not support PoE, an error message appears.
	For more information about the IEEE power classifications, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release.
<u> </u>	When you manually configure the power budget, you must also consider the power loss over the cable between the switch and the powered device.
•	%CAUTION: Interface <i>interface-id</i> : Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation.
	When you enter the power inline consumption default <i>wattage</i> or the no power inline consumption default command, this caution message appears:

power inline	Configures the power management mode on PoE ports.
show power inline	Displays the PoE status for the specified PoE port or for all PoE ports

priority-queue

Use the **priority-queue** interface configuration command to enable the egress expedite queue on a port. Use the **no** form of this command to return to the default setting.

priority-queue out

no priority-queue out

Syntax Description	out	Enable the egress expedite queue.	
Defaults	The egress expedite	queue is disabled.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	When you configure the priority-queue out command, the shaped round robin (SRR) weight ratios are affected because there is one fewer queue participating in SRR. This means that <i>weight1</i> in the srr-queue bandwidth shape or the srr-queue bandwidth shape interface configuration command is ignored (not used in the ratio calculation). The expedite queue is a priority queue, and it is serviced until empty before the other queues are serviced.		
	Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:		
	• If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.		
	• If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.		
	• If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services the queue in shared mode.		
Examples	This example shows how to enable the egress expedite queue when the SRR weights are configured. The egress expedite queue overrides the configured SRR weights.		
	Switch(config)# i Switch(config-if) Switch(config-if)	nterface gigabitethernet0/2 # srr-queue bandwidth shape 25 0 0 0 # srr-queue bandwidth share 30 20 25 25 # priority-queue out	

This example shows how to disable the egress expedite queue after the SRR shaped and shared weights are configured. The shaped mode overrides the shared mode.

```
Switch(config)# interface gigabitethernet0/2
Switch(config-if)# srr-queue bandwidth shape 25 0 0 0
Switch(config-if)# srr-queue bandwidth share 30 20 25 25
Switch(config-if)# no priority-queue out
```

You can verify your settings by entering the **show mls qos interface** *interface-id* **queueing** or the **show running-config** privileged EXEC command.

Related Commands	Command	Description
	show mls qos interface queueing	Displays the queueing strategy (SRR, priority queueing), the weights corresponding to the queues, and the CoS-to-egress-queue map.
	srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.
	srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.

2-357

private-vlan

Use the **private-vlan** VLAN configuration command to configure private VLANs and to configure the association between private-VLAN primary and secondary VLANs. Use the **no** form of this command to return the VLAN to normal VLAN configuration.

private-vlan {association [add | remove] secondary-vlan-list | community | isolated | primary}

no private-vlan {association | community | isolated | primary}

Syntax Description	association	Create an association between the primary VLAN and a secondary VLAN.
	secondary-vlan-list	Specify one or more secondary VLANs to be associated with a primary VLAN in a private VLAN.
	add	Associate a secondary VLAN to a primary VLAN.
	remove	Clear the association between a secondary VLAN and a primary VLAN.
	community	Designate the VLAN as a community VLAN.
	isolated	Designate the VLAN as a community VLAN.
	primary	Designate the VLAN as a community VLAN.
Command Modes	VLAN configuration	
Command History	Release	Modification
	12.2(20)SE	This command was introduced.
Usage Guidelines	Before configuring private VLANs, you must disable VTP (VTP mode transparent). After you configure a private VLAN, you should not change the VTP mode to client or server.	
	VTP does not propagate private-VLAN configuration. You must manually configure private VLANs on all switches in the Layer 2 network to merge their Layer 2 databases and to prevent flooding of private-VLAN traffic.	
	private-VLAN traffic.	

You can **associate** a secondary (isolated or community) VLAN with only one primary VLAN. A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it.

- A secondary VLAN cannot be configured as a primary VLAN.
- The *secondary_vlan_list* parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.
- If you delete either the primary or secondary VLANs, the ports associated with the VLAN become inactive.

A **community** VLAN carries traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

An **isolated** VLAN is used by isolated ports to communicate with promiscuous ports. It does not carry traffic to other community ports or isolated ports with the same primary vlan domain.

A **primary** VLAN is the VLAN that carries traffic from a gateway to customer end stations on private ports.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The private-vlan commands do not take effect until you exit from VLAN configuration mode.

Do not configure private-VLAN ports as EtherChannels. While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive.

Do not configure a private VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN.

Do not configure a private VLAN as a voice VLAN.

Do not configure fallback bridging on switches with private VLANs.

Although a private VLAN contains more than one VLAN, only one STP instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

For information about configuring host ports and promiscuous ports, see the **switchport mode private-vlan** command.

For more information about private-VLAN interaction with other features, see the software configuration guide for this release.

Examples

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, and to associate them in a private VLAN:

```
Switch# configure terminal
Switch(config) # vlan 20
Switch(config-vlan) # private-vlan primary
Switch(config-vlan)# exit
Switch(config) # vlan 501
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan) # exit
Switch(config) # vlan 502
Switch(config-vlan) # private-vlan community
Switch(config-vlan)# exit
Switch(config) # vlan 503
Switch(config-vlan) # private-vlan community
Switch(config-vlan)# exit
Switch(config) # vlan 20
Switch(config-vlan) # private-vlan association 501-503
Switch(config-vlan)# end
```

You can verify your setting by entering the **show vlan private-vlan** or **show interfaces status** privileged EXEC command.

Related Commands	Command	Description
	show interfaces status	Displays the status of interfaces, including the VLANs to which they belong.
	show vlan private-vlan	Displays the private VLANs and VLAN associations configured on the switch.
	switchport mode private-vlan	Configures a private-VLAN port as a host port or promiscuous port.

private-vlan mapping

Use the **private-vlan mapping** interface configuration command on a switch virtual interface (SVI) to create a mapping between a private-VLAN primary and secondary VLANs so that both VLANs share the same primary VLAN SVI. Use the **no** form of this command to remove private-VLAN mappings from the SVI.

private-vlan mapping {[add | remove] secondary-vlan-list}

no private-vlan mapping

Syntax Description	secondary-vlan-list	Specify one or more secondary VLANs to be mapped to the primary VLAN SVI.	
	add	(Optional) Map the secondary VLAN to the primary VLAN SVI.	
	remove	(Optional) Remove the mapping between the secondary VLAN and the primary VLAN SVI.	
Defaults	The default is to have r	no private VLAN SVI mapping configured.	
Command Modes	Interface configuration		
Command History	Release	Modification	
	12.2(20)SE	This command was introduced.	
Usage Guidelines	The switch must be in	VTP transparent mode when you configure private VLANs.	
	The SVI of the primary	VLAN is created at Layer 3.	
	Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.		
	The <i>secondary_vlan_list</i> parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.		
	Traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.		
	•	n be mapped to only one primary SVI. IF you configure the primary VLAN as a SVIs specified in this command are brought down.	
		ping between two VLANs that do not have a valid Layer 2 private-VLAN ng configuration does not take effect.	

Examples

This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

Switch# configure terminal Switch# interface vlan 18 Switch(config-if)# private-vlan mapping 20 Switch(config-vlan)# end

This example shows how to permit routing of secondary VLAN traffic from secondary VLANs 303 to 305 and 307 through VLAN 20 SVI:

Switch# configure terminal Switch# interface vlan 20 Switch(config-if)# private-vlan mapping 303-305, 307 Switch(config-vlan)# end

You can verify your setting by entering the **show interfaces private-vlan mapping** privileged EXEC command.

Related Commands	Command	Description
	show interfaces private-vlan	Display private-VLAN mapping information for the VLAN SVIs.
	mapping	

queue-set

Use the **queue-set** interface configuration command to map a port to a queue-set. Use the **no** form of this command to return to the default setting.

queue-set *qset-id*

no queue-set qset-id

Syntax Description	qset-id	1	ich port belongs to a queue-set, which defines all the our egress queues per port. The range is 1 to 2.
Defaults	The queue-se	t ID is 1.	
Command Modes	Interface con	figuration	
Command History	Release	Modification	
	12.1(19)EA1	This comma	nd was introduced.
Examples	This example shows how to map a port to queue-set 2: Switch(config)# interface gigabitethernet0/1 Switch(config-if)# queue-set 2		
	You can verif EXEC comm		g the show mls qos interface [<i>interface-id</i>] buffers privileged
Related Commands	Command		Description
	mls qos que	ie-set output buffers	Allocates buffers to a queue-set.
	mls qos que	ie-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue-set.
	show mls qo	s interface buffers	Displays quality of service (QoS) information.

radius-server dead-criteria

Use the **radius-server dead-criteria** global configuration command to configure the conditions that determine when a RADIUS server is considered unavailable or *dead*. Use the **no** form of this command to return to the default settings.

radius-server dead-criteria [time seconds [tries number] | tries number]

no radius-server dead-criteria [time seconds [tries number] | tries number]

Syntax Description	time seconds (Optional) Set the time in seconds during which the switch does not need to get a valid response from the RADIUS server. The range is from 1 to 120 seconds.		
	tries number	(Optional) Set the number of times that the switch does not get a valid response from the RADIUS server before the server is considered unavailable. The range is from 1 to 100.	
Defaults	-	namically determines the <i>seconds</i> value that is from 10 to 60 seconds. namically determines the <i>tries</i> value that is from 10 to 100.	
Command Modes	Global configu	uration	
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.

Catalyst 3560 Switch Command Reference

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature.
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature on an interface and configures the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state.
	radius-server retransmit retries	Specifies the number of times that the switch tries to reach the RADIUS servers before considering the servers to be unavailable. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	radius-server timeout seconds	Specifies the time in seconds during which the switch waits for a RADIUS server to respond before the IEEE 802.1x authentication times out. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands.
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

radius-server host

Use the **radius-server host** global configuration command to configure the RADIUS server parameters, including the RADIUS accounting and authentication. Use the **no** form of this command to return to the default settings.

radius-server host *ip-address* **[acct-port** *udp-port*] **[auth-port** *udp-port*] **[test username** *name* [**idle-time** *time*] **[ignore-acct-port**] **[ignore-auth-port**]] **[key** *string*]

no radius-server host ip-address

Syntax Description	ip-address	Specify the IP address of the RADIUS server.	
	acct-port udp-port	(Optional) Specify the UDP port for the RADIUS accounting server. The range is from 0 to 65536.	
	auth-port udp-port	(Optional) Specify the UDP port for the RADIUS authentication server. The range is from 0 to 65536.	
	test username name	(Optional) Enable automatic server testing of the RADIUS server status, and specify the username to be used.	
	idle-time time	(Optional) Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes.	
	ignore-acct-port	(Optional) Disables testing on the RADIUS-server accounting port.	
	ignore-auth-port	(Optional) Disables testing on the RADIUS-server authentication port.	
	key string	(Optional) Specify the authentication and encryption key for all RADIUS communication between the switch and the RADIUS daemon. The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in this command. Leading spaces are ignored, but spaces within and at the end of the key are used. If there are spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.	
Defaults	The UDP port for the RADIUS accounting server is 1646. The UDP port for the RADIUS authentication server is 1645.		
	Automatic server testing is disabled.		
	The idle time is 60 minutes (1 hour).		
	When the automatic testing is enabled, testing occurs on the accounting and authentication UDP ports.		
	The authentication and	encryption key (string) is not configured.	
Command Modes	Global configuration		
Command History	Release	Modification	
	12.2(25)SEE	This command was introduced.	

Usage Guidelines We recommend that you configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.

Use the **test username** *name* keywords to enable automatic server testing of the RADIUS server status and to specify the username to be used.

You can configure the authentication and encryption key by using the **radius-server host** *ip-address* **key** *string* or the **radius-server key** {0 *string* | 7 *string* | *string*} global configuration command. Always configure the key as the last item in this command.

Examples

This example shows how to configure 1500 as the UDP port for the accounting server and 1510 as the UDP port for the authentication server:

Switch(config)# radius-server host 1.1.1.1 acct-port 1500 auth-port 1510

This example shows how to configure the UDP port for the accounting server and the authentication server, enable automated testing of the RADIUS server status, specify the username to be used, and configure a key string:

Switch(config)# radius-server host 1.1.1.2 acct-port 800 auth-port 900 test username
aaafail idle-time 75 key abc123

You can verify your settings by entering the show running-config privileged EXEC command.

Related Commands	Command	Description
	dot1x critical (global configuration)	Configures the parameters for the inaccessible authentication bypass feature.
	dot1x critical (interface configuration)	Enables the inaccessible authentication bypass feature on an interface and configures the access VLAN to which the switch assigns the critical port when the port is in the critical-authentication state.
	<pre>radius-server key {0 string 7 string string }</pre>	Sets the authentication and encryption key for all RADIUS communications between the router and the RADIUS daemon. For syntax information, select Cisco IOS Security Command Reference, Release 12.2 > Server Security Protocols > RADIUS Commands .
	show running-config	Displays the running configuration on the switch. For syntax information, select Cisco IOS Configuration Fundamentals Command Reference, Release 12.2 > File Management Commands > Configuration File Management Commands .

rcommand

Use the **rcommand** user EXEC command to start a Telnet session and to execute commands on a cluster member switch from the cluster command switch. To end the session, enter the **exit** command.

rcommand {*n* | **commander** | **mac-address** *hw-addr*}

Syntax Description	n	Provide the number that identifies a cluster member. The range is 0 to 15.	
	commander Provide access to the cluster command switch from a cluster switch.		
	mac-address hw-addr	MAC address of the cluster member switch.	
Command Modes	User EXEC		
Command History	Release	Modification	
	12.1(19)EA1	This command was introduced.	
Usage Guidelines	This command is availab	le only on the cluster command switch.	
	If the switch is the cluster command switch but the cluster member switch <i>n</i> does not exist, an error message appears. To get the switch number, enter the show cluster members privileged EXEC command on the cluster command switch.		
	You can use this command to access a cluster member switch from the cluster command-switch prompt or to access a cluster command switch from the member-switch prompt.		
	accesses the member-swi command switch. For exa switch, the cluster memb command switch at privil	500 XL, 2950, 2960, 2970, 3550, 3560, and 3750 switches, the Telnet session tch command-line interface (CLI) at the same privilege level as on the cluster ample, if you execute this command at user level on the cluster command er switch is accessed at user level. If you use this command on the cluster leged level, the command accesses the remote device at privileged level. If you le-level lower than <i>privileged</i> , access to the cluster member switch is at user	
	For Catalyst 1900 and 2820 switches running standard edition software, the Telnet session accesses the menu console (the menu-driven interface) if the cluster command switch is at privilege level 15. If the cluster command switch is at privilege level 1, you are prompted for the password before being able to access the menu console. Cluster command switch privilege levels map to the cluster member switches running standard edition software as follows:		
	• If the cluster comman at privilege level 1.	nd switch privilege level is from 1 to 14, the cluster member switch is accessed	
	• If the cluster comma privilege level 15.	nd switch privilege level is 15, the cluster member switch is accessed at	
	The Catalyst 1900 and 28	320 CLI is available only on switches running Enterprise Edition Software.	

This command will not work if the vty lines of the cluster command switch have access-class configurations.

You are not prompted for a password because the cluster member switches inherited the password of the cluster command switch when they joined the cluster.

Examples

This example shows how to start a session with member 3. All subsequent commands are directed to member 3 until you enter the **exit** command or close the session.

Switch# rcommand 3
Switch-3# show version
Cisco Internet Operating System Software ...
...
Switch-3# exit
Switch#

Related Commands	Command	Description
	show cluster members	Displays information about the cluster members.

remote-span

Use the **remote-span** VLAN configuration command to configure a VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN. Use the **no** form of this command to remove the RSPAN designation from the VLAN.

remote-span

no remote-span

Syntax Description	This command has no arguments	or keywords.
--------------------	-------------------------------	--------------

Defaults No RSPAN VLANs are defined.

Command Modes VLAN configuration (config-VLAN)

Command History	Release	Modification
	12.1(19)EA1	This command was introduced.

Usage Guidelines You can configure RSPAN VLANs only in config-VLAN mode (entered by using the **vlan** global configuration command), not the VLAN configuration mode entered by using the **vlan database** privileged EXEC command.

If VLAN Trunking Protocol (VTP) is enabled, the RSPAN feature is propagated by VTP for VLAN-IDs that are lower than 1005. If the RSPAN VLAN ID is in the extended range, you must manually configure intermediate switches (those in the RSPAN VLAN between the source switch and the destination switch).

Before you configure the RSPAN **remote-span** command, use the **vlan** (global configuration) command to create the VLAN.

The RSPAN VLAN has these characteristics:

- No MAC address learning occurs on it.
- RSPAN VLAN traffic flows only on trunk ports.
- Spanning Tree Protocol (STP) can run in the RSPAN VLAN, but it does not run on RSPAN destination ports.

When an existing VLAN is configured as an RSPAN VLAN, the VLAN is first deleted and then recreated as an RSPAN VLAN. Any access ports are made inactive until the RSPAN feature is disabled.

Examples

This example shows how to configure a VLAN as an RSPAN VLAN.

Switch(config)# vlan 901 Switch(config-vlan)# remote-span

This example shows how to remove the RSPAN feature from a VLAN.

Switch(config)# vlan 901 Switch(config-vlan)# no remote-span

You can verify your settings by entering the show vlan remote-span user EXEC command.

Commands Command Description monitor session Enables Switched Port Analyzer (SPAN) and RSPAN monitoring on a port and configures a port as a source or destination port. vlan (global configuration) Changes to config-vlan mode where you can configure VLANs 1 to 4094.

2-371

renew ip dhcp snooping database

Use the **renew ip dhcp snooping database** privileged EXEC command to renew the DHCP snooping binding database.

renew ip dhcp snooping database [{flash:/filename | ftp://user:password@host/filename |
nvram:/filename | rcp://user@host/filename | tftp://host/filename}] [validation none]

Syntax Description	flash:/filename	(Optional) Specify that the database agent or the binding file is in the flash memory.	
	ftp: //user : password @host/filename	(Optional) Specify that the database agent or the binding file is on an FTP server.	
	nvram:/filename	(Optional) Specify that the database agent or the binding file is in the NVRAM.	
	rcp:// user@host/file name	(Optional) Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.	
	tftp://host/filename	(Optional) Specify that the database agent or the binding file is on a TFTP server.	
	validation none	(Optional) Specify that the switch does not verify the cyclic redundancy check (CRC) for the entries in the binding file specified by the URL.	
Defaults	No default is defined		
Defaults	No default is defined.		
Command Modes	Privileged EXEC		
Command History	Release Mo	odification	
	12.2(20)SE Th	is command was introduced.	
Usage Guidelines	If you do not specify a URL, the switch tries to read the file from the configured URL.		
Examples	This example shows how to renew the DHCP snooping binding database without checking CRC values in the file:		
	Switch# renew ip dhcp snooping database validation none		
	Switch# renew ip dh	cp snooping database validation none	

R

Related Commands	Command	Description
	ip dhcp snooping	Enables DHCP snooping on a VLAN.
	ip dhcp snooping binding	Configures the DHCP snooping binding database.
	show ip dhcp snooping database	Displays the status of the DHCP snooping database agent.
