ap hyperlocation

To configure hyperlocation and related parameters, use the **ap hyperlocation** command. To disable hyperlocation and related parameters, use the **no** form of this command.

```
ap hyperlocation [ble-beacon{beacon-id | interval interval-value} | threshold {detection value-in-dBm | reset value-btwn-0-99 | trigger value-btwn-1-100}]

[no] ap hyperlocation [ble-beacon{beacon-id | interval interval-value} | threshold {detection value-in-dBm | reset value-btwn-0-99 | trigger value-btwn-1-100}]
```

ble-beacon	Enables BLE beacon parameters.
beacon-id	BLE beacon ID. The range is from 1 to 4.
interval	Sets the BLE beacon interval.
interval-value	BLE beacon interval value, in hertz. The range is from 1 to 10. The default is1.

threshold detection value-in-dBm	Sets threshold to filter out packets with low RSSI. The [no] form of the command resets the threshold to its default value.	
threshold reset value-btwn-0-99	Resets value in scan cycles after trigger. The [no] form of the command resets the threshold to its default value.	
threshold trigger value-btwn-1-100	Sets the number of scan cycles before sending a BAR to clients. The [no] form of the command resets the threshold to its default value.	
	Note	Ensure that the hyperlocation threshold reset value is less than the threshold trigger value.

Command History

Release	Modification
Cisco IOS XE Denali 16.2.1	This command was introduced.
Cisco IOS XE Denali 16.3.1	This command was modified. The ble-beacon keyword was added.

Related Topics

show ap hyperlocation, on page 64

ap ntp ip

To configure the IPv4 address of the NTP server, directly reachable by the access points, use the **ap ntp ip** command. To remove the IPv4 address that is configured for the NTP server, use the **no** form of the command.

- NTP is mandatory for Hyperlocation to work. If NTP is not defined, Hyperlocation will not be operational.
- NTP server must be reachable from the AP VLAN.
- If the IPv4 address of the NTP server is not configured, the IP address of the globally configured NTP server is used.

Note

The **show** commands display the details of the NTP server that is effectively used. For example, if the globally configured IPv4 address of the NTP server is 0.0.0.0, the **show ap hyperlocation {summary | detail}** command shows the details of the globally configured NTP server.

[no] ap ntp ip ipv4-addr

Syntax Description

ipv4-addr IPv4 address of the NTP server. The [no] form of the command resets the NTP value to 0.0.0.0.

Command History

Release	Modification
Cisco IOS XE Denali 16.2.1	This command was introduced.

Related Topics

show ap hyperlocation, on page 64

arp

To display the contents of the Address Resolution Protocol (ARP) table, use the **arp** command in boot loader mode.

arp [ip_address]

Syntax Description

ip_address (Optional) Shows the ARP table or the mapping for a specific IP address.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IO	OS XE 3.3SE This command was introduced.

Usage Guidelines

The ARP table contains the IP-address-to-MAC-address mappings.

Examples

This example shows how to display the ARP table:

```
Device: arp 172.20.136.8
arp'ing 172.20.136.8...
172.20.136.8 is at 00:1b:78:d1:25:ae, via port 0
```

boot

To load and boot an executable image and display the command-line interface (CLI), use the **boot** command in boot loader mode.

boot [-post | -n | -p | flag] filesystem:/file-url...

-post	(Optional) Run the loaded image with an extended or comprehensive power-on self-test (POST). Using this keyword causes POST to take longer to complete.	
-n	(Optional) Pause for the Cisco IOS Debugger immediately after launching.	
-p	(Optional) Pause for the JTAG Debugger right after loading the image.	
filesystem:	Alias for a file system. Use flash: for the system board flash device; use usbflash0: for USB memory sticks.	
/file-url	Path (directory) and name of a bootable image. Separate image names with a semicolon.	

No default behavior or values.

Command Modes

Boot loader

Command History

Release Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

When you enter the **boot** command without any arguments, the device attempts to automatically boot the system by using the information in the BOOT environment variable, if any.

If you supply an image name for the *file-url* variable, the **boot** command attempts to boot the specified image.

When you specify boot loader **boot** command options, they are executed immediately and apply only to the current boot loader session.

These settings are not saved for the next boot operation.

Filenames and directory names are case sensitive.

Example

This example shows how to boot the device using the new-image.bin image:

Device: set BOOT flash:/new-images/new-image.bin

Device: boot

After entering this command, you are prompted to start the setup program.

cat

To display the contents of one or more files, use the **cat** command in boot loader mode.

cat filesystem:/file-url...

Syntax Description

filesystem: Specifies a file system.

/file-url Specifies the path (directory) and name of the files to display. Separate each filename with a

space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

Filenames and directory names are case sensitive.

If you specify a list of files, the contents of each file appears sequentially.

Examples

This example shows how to display the contents of an image file:

```
Device: cat flash: image_file_name
version_suffix: universal-122-xx.SEx
version_directory: image_file_name
image_system_type_id: 0x00000002
image_name: image_file_name.bin
ios_image_file_size: 8919552
total_image_file_size: 11592192
image_feature: IP|LAYER_3|PLUS|MIN_DRAM_MEG=128
image_family: family
stacking_number: 1.34
board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b
info end:
```

clear location

To clear a specific radio frequency identification (RFID) tag or all of the RFID tags information in the entire database, use the **clear location** command in EXEC mode.

clear location [mac-address mac-address | rfid]

•		-	-		
51	/ntax	Des	cri	ntın	n

mac-address mac-address	MAC address of a specific RFID tag.
rfid	Specifies all of the RFID tags in the database.

Command Default

No default behavior or values.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to clear information about all of the RFID tags in the database:

Device> clear location rfid

clear location statistics

To clear radio-frequency identification (RFID) statistics, use the **clear location statistics** command in EXEC mode.

clear location statistics

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

The following is sample output from the **clear location rfid** command and shows how to clear RFID statistics:

Device> clear location statistics

clear nmsp statistics

To clear the Network Mobility Services Protocol (NMSP) statistics, use the **clear nmsp statistics** command in EXEC mode.

clear nmsp statistics

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

User Exec

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

The following is sample output from the **clear nmsp statistics** command and shows how to clear all statistics about NMSP information exchanged between the controller and the connected Cisco Mobility Services Engine (MSE):

Device> clear nmsp statistics

clear wireless ccx statistics

To clear CCX statistics, use the **clear wireless ccx statistics** command in EXEC mode.

clear wireless ccx statistics

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

The following is sample output from the **clear wireless ccx statistics** command and shows how to clear all collected statistics about CCX clients:

Device> clear wireless ccx statistics

clear wireless client tsm dot11

To clear the traffic stream metrics (TSM) statistics for a particular access point or all of the access points to which this client is associated, use the **clear wireless client tsm dot11** command in EXEC mode.

clear wireless client tsm dot11 {24ghz | 5ghz} client-mac-addr {all | name ap-name}

24ghz	Specifies the 802.11a network.	
5ghz	Specifies the 802.11b network.	
client-mac-addr	MAC address of the client.	
all	Specifies all access points.	

name ap-name Name of a Cisco lightweight access point.

Command Default

No default behavior or values.

Command Modes

User EXEC

Privileged EXEC

Command History

Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

The following is sample output from the **clear wireless client tsm dot11** command and shows how to clear the TSM for the MAC address 00:40:96:a8:f7:98 on all of the access points 5-GHz radios where this client is known:

Device> clear wireless client tsm dot11 5ghz 00:40:96:a8:f7:98 all

clear wireless location s69 statistics

To clear statistics about S69 exchanges with CCXv5 clients, use the **clear wireless location s69 statistics** command in EXEC mode.

clear wireless location s69 statistics

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

S69 messages are exchanged between CCXv5 clients and the wireless infrastructure. The CCXv5 client uses S69 message to request location information, that is then returned by the wireless infrastructure through a S69 response message.

Example

The following is sample output from the clear wireless location s69 statistics command and shows how to clear statistics about S69 exchanges with CCXv5 clients:

Device> clear wireless location s69 statistics

copy

To copy a file from a source to a destination, use the **copy** command in boot loader mode.

copy filesystem:/source-file-url filesystem:/destination-file-url

Syntax Description

filesystem:	Alias for a file system. Use usbflash0: for USB memory sticks.
/source-file-url	Path (directory) and filename (source) to be copied.
/destination-file-url	Path (directory) and filename of the destination.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

Filenames and directory names are case sensitive.

Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Filenames are limited to 127 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

If you are copying a file to a new directory, the directory must already exist.

Examples

This example shows how to copy a file at the root:

```
Device: copy usbflash0:test1.text usbflash0:test4.text
File "usbflash0:test1.text" successfully copied to "usbflash0:test4.text"
```

You can verify that the file was copied by entering the **dir** *filesystem*: boot loader command.

copy startup-config tftp:

To copy the configuration settings from a switch to a TFTP server, use the **copy startup-config tftp:** command in Privileged EXEC mode.

copy startup-config tftp: remote host {ip-address}/{name}

Syntax Description	remote host {ip-address}/{name} Host name or IP-address of Remote host.		
Command Default	No default behavio	or or values.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	
	Cisco IOS XE Re	lease 16.1 This command was introduced.	
Usage Guidelines		ent configurations from the switch, run the che configurations are copied onto the TFTI	command copy startup-config tftp: and follow P server.
	, 0	ther switch and run the command copy tft ₁ s are now copied onto the other switch.	p: startup-config and follow the instructions.
Examples	This example show	ws how to copy the configuration settings of	onto a TFTP server:

copy tftp: startup-config

To copy the configuration settings from a TFTP server onto a new switch, use the **copy tftp: startup-config** command in Privileged EXEC mode on the new switch.

copy tftn: startup-config remote host {in-address}/{name}

Device: copy startup-config tftp:
Address or name of remote host []?

	copy tftp: startup	o-config remote host {ip-address}/{name}	
Syntax Description	remote host {ip-address}/{name} Host name or IP-address of Remote host.		
Command Default	No default behavior	or or values.	
Command Modes	Privileged EXEC		
Command History	Release	Modification	-
	Cisco IOS XE Re	lease 16.1 This command was introduced.	
Usage Guidelines	-	ations are copied, to save your configuration or run the copy startup-config running-config run	ns, use write memory command and then either onfig command.

This example shows how to copy the configuration settings from the TFTP server onto a switch:

Device: copy tftp: startup-config

Examples

Address or name of remote host []?

debug call-admission wireless all

To enable debugging of the wireless Call Admission Control (CAC) feature, use the **debug call-admission** wireless all command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug call-admission wireless all [switch switch] no debug call-admission wireless all [switch switch]

Syntax Description

switch Configures debugging options for all wireless CAC messages associated to a particular switch.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

The following is sample output from the **debug call-admission wireless switch** command and shows how to enable debugging options for CAC messages:

Device# debug call-admission wireless switch 1 all

debug rfid

To configure radio-frequency identification (RFID) debug options, use the **debug rfid** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug rfid {debug_leaf_name | all | detail | error | nmsp | receive} [filter | switch | switch]

no debug rfid {debug_leaf_name | all | detail | error | nmsp | receive} [filter | switch | switch]

debug_leaf_name	Debug leaf name.
all	Configures debugging of all RFID.
detail	Configures debugging of RFID detail.
error	Configures debugging of RFID error messages.
nmsp	Configures debugging of RFID Network Mobility Services Protocol (NMSP) messages.
receive	Configures debugging of incoming RFID tag messages.
filter	Debug flag filter name.

switch switch	Configures PEID	debugging for device
SWILCH SWILCH	Configures Ki ID	debugging for device.

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3	SE This command was introduced.

The following is sample output from the **debug rfid** command and shows how to enable debugging of RFID error messages:

Device# debug rfid error switch 1

debug voice diagnostics mac-address

To enable debugging of voice diagnostics for voice clients, use the **debug voice diagnostics mac-address** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug voice diagnostics mac-address mac-address l verbose mac-address mac-address verbose nodebug voice diagnostics mac-address mac-address l verbose mac-address mac-address verbose

Syntax Description

voice diagnostics	Configures voice debugging for voice clients.
mac-address mac-address1 mac-address mac-address2	Specifies MAC addresses of the voice clients.
verbose	Enables verbose mode for voice diagnostics.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

The following is sample output from the **debug voice diagnostics mac-address** command and shows how to enable debugging of voice diagnostics for voice client with MAC address of 00:1f:ca:cf:b6:60:

Device# debug voice diagnostics mac-address 00:1f:ca:cf:b6:60

debug wps mfp

To enable WPS MFP debugging options, use the **debug wps mfp** command in privileged EXEC mode. To disable debugging, use the no form of this command.

debug wps mfp {all | capwap | client | detail | mm | report} [switch switch]

Syntax Description

wps mfp	Configures WPS MFP debugging options.
all	Displays all WPS MFP debugging messages.
capwap	Displays MFP messages.
client	Displays client MFP messages.
detail	Displays detailed MFP CAPWAP messages.
mm	Displays MFP mobility (inter-controller) messages.
report	Displays MFP reports.
switch switch	Displays the WPS MFP debugging for the device.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to enable WPS MFP debugging options for client:

Device# debug wps mfp client switch 1

delete

To delete one or more files from the specified file system, use the **delete** command in boot loader mode.

delete *filesystem:/file-url...*

Syntax Description

filesystem: Alias for a file system. Use **usbflash0:** for USB memory sticks.

//file-url... Path (directory) and filename to delete. Separate each filename with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

Filenames and directory names are case sensitive.

The device prompts you for confirmation before deleting each file.

Examples

This example shows how to delete two files:

Device: delete usbflash0:test2.text usbflash0:test5.text
Are you sure you want to delete "usbflash0:test2.text" (y/n)?y
File "usbflash0:test2.text" deleted
Are you sure you want to delete "usbflash0:test5.text" (y/n)?y
File "usbflash0:test2.text" deleted

You can verify that the files were deleted by entering the dir usbflash0: boot loader command.

dir

To display the list of files and directories on the specified file system, use the **dir** command in boot loader mode.

dir filesystem:/file-url

Syntax Description

filesystem: Alias for a file system. Use **flash:** for the system board flash device; use **usbflash0:** for USB memory sticks.

/file-url (Optional) Path (directory) and directory name that contain the contents you want to display. Separate each directory name with a space.

Command Default

No default behavior or values.

Command Modes

Boot Loader

Privileged EXEC

Command History

Kelease	Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

Directory names are case sensitive.

Examples

This example shows how to display the files in flash memory:

```
Device: dir flash:
Directory of flash:/

2 -rwx 561 Mar 01 2013 00:48:15 express_setup.debug
3 -rwx 2160256 Mar 01 2013 00:01:39 multiple-fs
4 -rwx 1048 Mar 01 2013 02:01:42 c2960x-universalk9-mz.150-2.EX
6 drwx 512 Mar 01 2013 02:01:11 dc_profile_dir
647 -rwx 4316 Mar 01 2013 00:01:39 private-config.text
```

96453632 bytes available (25732096 bytes used)

Table 1: dir Field Descriptions

Field	Description
2	Index number of the file.
-rwx	File permission, which can be any or all of the following: • d—directory • r—readable • w—writable • x—executable
1644045	Size of the file.
<date></date>	Last modification date.
env_vars	Filename.

The system is not configured to boot automatically. The
following command will finish loading the operating system
software:

boot
```

exit

To return to the previous mode or exit from the CLI EXEC mode, use the **exit** command.

exit

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to exit the configuration mode:

```
Device(config)# exit
Device#
```

flash_init

To initialize the flash: file system, use the **flash_init** command in boot loader mode.

flash_init

Syntax Description

This command has no arguments or keywords.

The flash: file system is automatically initialized during normal system operation.

Command Modes

Boot loader

Command History

Release Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

During the normal boot process, the flash: file system is automatically initialized.

Use this command to manually initialize the flash: file system. For example, you use this command during the recovery procedure for a lost or forgotten password.

help

To display the available commands, use the **help** command in boot loader mode.

help

Re

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

elease	Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Example

This example shows how to display a list of available boot loader commands:

```
Device:help
? -- Present list of available commands
arp -- Show arp table or arp-resolve an address
boot -- Load and boot an executable image
cat -- Concatenate (type) file(s)
copy -- Copy a file
delete -- Delete file(s)
dir -- List files in directories
emergency-install -- Initiate Disaster Recovery
...
...
unset -- Unset one or more environment variables
```

version -- Display boot loader version

ip nbar protocol-discovery

To configure Networked-Based Application Recognition (NBAR) to discover traffic for all protocols known to NBAR on a particular interface, use the **ip nbar protocol-discovery** interface configuration command. To disable traffic discovery, use the no form of this command.

ip nbar protocol-discovery

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Interface configuration mode

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

The following example configures protocol discovery on an GigabitEthernet interface:

Device# interface Gigabitethernet 1/0/1
Device(config-if)# ip nbar protocol-discovery

12 traceroute

To enable the Layer 2 traceroute server, use the **12 traceroute** command in global configuration mode. Use the **no** form of this command to disable the Layer 2 traceroute server.

12 traceroute no 12 traceroute

Syntax Description

This command has no arguments or keywords.

Command Modes

Global configuration (config#)

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SE	The command was introduced.

Usage Guidelines

Layer 2 traceroute is enabled by default and opens a listening socket on User Datagram Protocol (UDP) port 2228. To close the UDP port 2228 and disable Layer 2 traceroute, use the **no l2 traceroute** command in global configuration mode.

The following example shows how to configure Layer 2 traceroute using the 12 traceroute command.

Device# configure terminal
Device(config)# 12 traceroute

license right-to-use

To configure right-to-use access point adder licenses on the device, use the **license right-to-use** command in privileged EXEC mode.

license right-to-use {activate | deactivate} apcount | ipbase | ipservices | lanbase

Syntax Description

activate	Activates permanent or evaluation ap-count licenses.
deactivate	Deactivates permanent or evaluation ap-count licenses.
apcount count	Specifies the number of ap-count licenses added.
	You can configure the number of adder licenses from 5 to 50.
ipbase count Activates ipbase licens switch.	
ipservices count Activates ipservices switch.	
lanbase count	Activates lanbase licenses on the switch.

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to activate an ap-count evaluation license:

Device# license right-to-use activate apcount evaluation Device# end

This example shows how to activate an ap-count permanent license:

```
Device# license right-to-use deactivate apcount evaluation Device# end
```

This example shows how to add a new ap-count license:

```
Device# license right-to-use activate apcount 500 slot 1
Device# end
```

location

To configure location information for an endpoint, use the **location** command in global configuration mode. To remove the location information, use the **no** form of this command.

```
location {admin-tag string | algorithm | civic-location identifier {hostid} | civic-location identifier
{hostid} | elin-location { string | identifier id} |
expiry {calibrating-clienttimeout-value | clienttimeout-value | rouge-apstimeout-value | tagstimeout-value}
| geo-location identifier | hostid | notify-threshold \{clientdb | rouge-apsdb | tagsdb | plm\{calibrating |
{multiband | uniband} | clientburst-interval} | prefer { cdp weightpriority-value | lldp-med
weightpriority-value | static config weightpriority-value | | rfid {status
calibrating-clientseconds | clientseconds | rogue-apsseconds | tagsseconds |
no location {admin-tag string | algorithm | civic-location identifier {hostid} | civic-location identifier
{hostid} | elin-location {string | identifier id} |
expiry {calibrating-clienttimeout-value | clienttimeout-value | rouge-apstimeout-value | tagstimeout-value}
geo-location identifier {hostid} | notify-threshold {clientdb | rouge-apsdb | tagsdb | plm {calibrating |
{multiband | uniband} | clientburst-interval} | prefer { cdp weightpriority-value | lldp-med
weightpriority-value | static config weightpriority-value | | rfid {status
calibrating-clientseconds | clientseconds | rogue-apsseconds | tagsseconds |
```

admin-tagstring	Configures administrative tag or site information. Site or location information in alphanumeric format.
algorithm	Configures the algorithm used to average RSSI and SNR values.
civic-location	Configures civic location information.
identifier	Specifies the name of the civic location, emergency, or geographical location.
host	Defines the host civic or geo-spatial location.

id	Name of the civic, emergency, or geographical location.		
	Note The identifier for the civic location in the LLDP-MED switch TLV is limited to 250 bytes or less. To avoid error messages about available buffer space during switch configuration, be sure that the total length of all civic-location information specified for each civic-location identifier does not exceed 250 bytes.		
elin-location	Configures emergency location information (ELIN).		
expiry {calibrating-client client rogue-aps tags} timeout-value	Configures the timeout for RSSI values for calibrating clients, clients, rouge access points, and RFID tags.		
	The valid range for the timeout parameter for calibrating clients is 1 to 3600 seconds, and the default value is 5 seconds.		
	The valid range for the timeout parameter for clients, rogue access points, and RFID tags is 5 to 3600 seconds, and the default value is 5 seconds		
geo-location	Configures geo-spatial location information.		
notify-threshold {client rogue-aps	Configures the NMSP notification threshold for RSSI measurements.		
tags} db	The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.		
calibrating {multiband uniband} client seconds	Configures path loss measurement (CCX S60) request for calibrating clients and burst interval for clients.		
	The valid range for the burst interval parameter is 0 to 3600 seconds.		
prefer	Sets location information source priority.		
rfid	Configures RFID tag tracking for a location.		
rssi-half-life	Configures the RSSI half life for various devices.		

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

After entering the **location civic-location identifier** global configuration command, you enter civic location configuration mode. After entering the **location geo-location identifier** global configuration command, you enter geo location configuration mode.

The civic-location identifier must not exceed 250 bytes.

The host identifier configures the host civic or geo-spatial location. If the identifier is not a host, the identifier only defines a civic location or geo-spatial template that can be referenced on the interface.

The **host** keyword defines the device location. The civic location options available for configuration using the **identifier** and the **host** keyword are the same. You can specify the following civic location options in civic location configuration mode:

- additional-code—Sets an additional civic location code.
- additional-location-information—Sets additional civic location information.
- branch-road-name—Sets the branch road name.
- building—Sets building information.
- city—Sets the city name.
- **country**—Sets the two-letter ISO 3166 country code.
- county—Sets the county name.
- **default**—Sets a command to its defaults.
- division—Sets the city division name.
- exit—Exits from the civic location configuration mode.
- floor—Sets the floor number.
- landmark—Sets landmark information.
- leading-street-dir—Sets the leading street direction.
- name—Sets the resident name.
- **neighborhood**—Sets neighborhood information.
- no—Negates the specified civic location data and sets the default value.
- number—Sets the street number.
- post-office-box—Sets the post office box.
- **postal-code**—Sets the postal code.
- postal-community-name—Sets the postal community name.
- primary-road-name—Sets the primary road name.
- road-section—Sets the road section.
- room—Sets room information.
- seat—Sets seat information.
- state—Sets the state name.
- **street-group**—Sets the street group.
- **street-name-postmodifier**—Sets the street name postmodifier.
- **street-name-premodifier**—Sets the street name premodifier.
- **street-number-suffix**—Sets the street number suffix.
- **street-suffix**—Sets the street suffix.
- sub-branch-road-name—Sets the sub-branch road name.
- trailing-street-suffix—Sets the trailing street suffix.
- type-of-place—Sets the type of place.
- unit—Sets the unit.

You can specify the following geo-spatial location information in geo-location configuration mode:

- altitude—Sets altitude information in units of floor, meters, or feet.
- **latitude**—Sets latitude information in degrees, minutes, and seconds. The range is from -90 degrees to 90 degrees. Positive numbers indicate locations north of the equator.
- **longitude**—Sets longitude information in degrees, minutes, and seconds. The range is from -180 degrees to 180 degrees. Positive numbers indicate locations east of the prime meridian.

- **resolution**—Sets the resolution for latitude and longitude. If the resolution value is not specified, default value of 10 meters is applied to latitude and longitude resolution parameters. For latitude and longitude, the resolution unit is measured in meters. The resolution value can also be a fraction.
- default—Sets the geographical location to its default attribute.
- exit—Exits from geographical location configuration mode.
- no—Negates the specified geographical parameters and sets the default value.

Use the **no lldp med-tlv-select location information** interface configuration command to disable the location TLV. The location TLV is enabled by default.

This example shows how to configure civic location information on the switch:

```
Device(config) # location civic-location identifier 1
Device(config-civic) # number 3550
Device(config-civic) # primary-road-name "Cisco Way"
Device(config-civic) # city "San Jose"
Device(config-civic) # state CA
Device(config-civic) # building 19
Device(config-civic) # room C6
Device(config-civic) # county "Santa Clara"
Device(config-civic) # country US
Device(config-civic) # end
```

You can verify your settings by entering the **show location civic-location** privileged EXEC command.

This example shows how to configure the emergency location information on the switch:

```
Device (config) # location elin-location 14085553881 identifier 1
```

You can verify your settings by entering the **show location elin** privileged EXEC command.

The example shows how to configure geo-spatial location information on the switch:

```
Device(config)# location geo-location identifier host
Device(config-geo)# latitude 12.34
Device(config-geo)# longitude 37.23
Device(config-geo)# altitude 5 floor
Device(config-geo)# resolution 12.34
```

You can use the **show location geo-location identifier** command to display the configured geo-spatial location details.

location algorithm

To configure the algorithm used to average RSSI and SNR values, use the **location algorithm** command in global configuration mode. To remove the algorithm used to average RSSI and SNR values, use the **no** form of this command.

```
location algorithm {rssi-average | simple}
no location algorithm {rssi-average | simple}
```

rssi-average	Specifies a more accurate algorithm but with more CPU overhead.
simple	Specifies faster algorithm with smaller CPU overhead but less accuracy.

RSSI average

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to configure a more accurate algorithm but with more CPU overhead:

Device# configure terminal
Device(config)# location algorithm rssi-average
Device(config)# end

location expiry

To configure the timeout for RSSI values, use the **location expiry** command in global configuration mode.

location expiry {calibrating-client | client | rogue-aps | tags } timeout-value

Syntax Description

calibrating-client	Specifies the RSSI timeout value for calibrating clients.			
client	(Optional) Specifies the RSSI timeout value for clients.			
rogue-aps	Specifies the RSSI timeout value for rogue access points.			
tags	Specifies the RSSI timeout value for RFID tags.			
timeout-value	The valid range for the timeout parameter for calibrating clients is 1 to 3600 seconds, and the default value is 5 seconds.			
	The valid range for the timeout parameter for clients, rogue access points, and RFID tags is 5 to 3600 seconds, and the default value is 5 seconds.			

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to set the RSSI timeout value for wireless clients:

Device# configure terminal
Device(config)# location expiry client 1000

Device (config) # end

location notify-threshold

To configure the NMSP notification threshold for RSSI measurements, use the **location notify-threshold** command in global configuration mode. To remove the NMSP notification threshold for RSSI measurements, use the **no** form of this command.

location notify-threshold {client | rogue-aps | tags } db no location notify-threshold {client | rogue-aps | tags }

Syntax Description

client	Specifies the NMSP notification threshold (in dB) for clients and rogue clients.
	The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.
rogue-aps	Specifies the NMSP notification threshold (in dB) for rogue access points.
	The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.
tags	Specifies the NMSP notification threshold (in dB) for RFID tags.
	The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.
db	The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to configure the NMSP notification threshold to 10 dB for clients. A notification NMSP message is sent to MSE as soon as the client RSSI changes by 10 dB:

```
Device# configure terminal
Device(config)# location notify-threshold client 10
Device(config)# end
```

location plm calibrating

To configure path loss measurement (CCX S60) request for calibrating clients, use the **location plm calibrating** command in global configuration mode.

location	plm	calibrating	{multiband	uniband	}
----------	-----	-------------	------------	---------	---

Syntax Description	multiband	Specifies the path loss measurement request for calibrating clients on the associated 802.11a or 802.11b/g radio.
	uniband	Specifies the path loss measurement request for calibrating clients on the associated 802.11a/b/g radio.

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

The uniband is useful for single radio clients (even if the radio is a dual band and can operate in the 2.4-GHz and the 5-GHz bands). The multiband is useful for multiple radio clients.

This example shows how to configure the path loss measurement request for calibrating clients on the associated 802.11a/b/g radio:

Device# configure terminal
Device(config)# location plm calibrating uniband
Device(config)# end

location rfid

To configure RFID tag tracking for a location, use the **location rfid** command in global configuration mode. To remove a RFID tag tracking for a location, use the **no** form of this command.

location rfid { status | timeout seconds | vendor-name name} no location rfid { status | timeout seconds | vendor-name}

status	Enables location tracking for RFID tags. The no location rfid status command disables location tracking for tags.
timeout seconds	Specifies the location RFID timeout value.
	Determines the amount of time for which a detected RFID location information is considered as valid. Any RSSI change (below the RSSI threshold) in the configured interval do not result in a new location computation and a message is sent to the MSE. The valid timeout range is from 60 through 7200 seconds.
vendor-name name	Specifies the RFID tag vendor name.

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

The **no location rfid status** command disables location RFID status. The **no location rfid timeout** command returns to the default timeout value. The **no location rfid vendor-name** disables tracking for a particular vendor.

The example shows how to configure the static RFID tag data timeout:

Device# configure terminal
Device(config)# location rfid timeout 1000
Device(config)# end

location rssi-half-life

To configure the RSSI half life for various devices, use the **location rssi-half-life** command in global configuration mode. To remove a RSSI half life for various devices, use the **no** form of this command.

location rssi-half-life {calibrating-client | client | rogue-aps | tags } seconds no location rssi-half-life {calibrating-client | client | rogue-aps | tags }

Syntax Description

calibrating-client	Specifies the RSSI half life for calibrating clients.	
client	Specifies the RSSI half life for clients.	
rogue-aps	Specifies the RSSI half life for rogue access points.	
tags	Specifies the RSSI half life for RFID tags.	
seconds	The valid range for the half-life parameter is 0, 1, 2, 5, 10, 20, 30, 60, 90, 120, 180, or 300 seconds, and the default value is 0 seconds.	

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to configure the half life value for a client RSSI to 100 seconds:

```
Device# configure terminal
Device(config)# location rssi-half-life client 100
Device(config)# end
```

mac address-table move update

To enable the MAC address table move update feature, use the **mac address-table move update** command in global configuration mode on the switch stack or on a standalone switch. To return to the default setting, use the **no** form of this command.

mac address-table move update {receive | transmit} no mac address-table move update {receive | transmit}

Syntax Description

receive	Specifies that the switch processes MAC address-table move update messages.	
transmit	Specifies that the switch sends MAC address-table move update messages to other switches in the network if the primary link goes down and the standby link comes up.	

Command Default

By default, the MAC address-table move update feature is disabled.

Command Modes

Global configuration

Command History

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

The MAC address-table move update feature allows the switch to provide rapid bidirectional convergence if a primary (forwarding) link goes down and the standby link begins forwarding traffic.

You can configure the access switch to send the MAC address-table move update messages if the primary link goes down and the standby link comes up. You can configure the uplink switches to receive and process the MAC address-table move update messages.

Examples

This example shows how to configure an access switch to send MAC address-table move update messages:

```
Device# configure terminal
Device(config)# mac address-table move update transmit
Device(config)# end
```

This example shows how to configure an uplink switch to get and process MAC address-table move update messages:

Device# configure terminal
Device(config)# mac address-table move update receive
Device(config)# end

You can verify your setting by entering the **show mac address-table move update** privileged EXEC command.

mgmt_init

To initialize the Ethernet management port, use the **mgmt init** command in boot loader mode.

mgmt init

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Boot loader

Co	mm	anı	ΗЬ	ist	nrv

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

Use the mgmt_init command only during debugging of the Ethernet management port.

Examples

This example shows how to initialize the Ethernet management port:

Device: mgmt_init

mkdir

To create one or more directories on the specified file system, use the **mkdir** command in boot loader mode.

mkdir filesystem:/directory-url...

Syntax Description

filesystem:	Alias for a file system. Use usbflash0: for USB memory sticks.
/directory-url	Name of the directories to create. Separate each directory name with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

Directory names are case sensitive.

Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Example

This example shows how to make a directory called Saved Configs:

```
Device: mkdir usbflash0:Saved_Configs
Directory "usbflash0:Saved Configs" created
```

Related Topics

dir, on page 16 rmdir, on page 56

more

To display the contents of one or more files, use the **more** command in boot loader mode.

more filesystem:/file-url...

Syntax Description

filesystem: Alias for a file system. Use flash: for the system board flash device.

file-url... Path (directory) and name of the files to display. Separate each filename with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

Filenames and directory names are case sensitive.

If you specify a list of files, the contents of each file appears sequentially.

Examples

This example shows how to display the contents of a file:

Device: more flash:image_file_name version_suffix: universal-122-xx.SEx version_directory: image_file_name image system type id: 0x00000002

```
image_name: image_file_name.bin
ios_image_file_size: 8919552
total_image_file_size: 11592192
image_feature: IP|LAYER_3|PLUS|MIN_DRAM_MEG=128
image_family: family
stacking_number: 1.34
board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b
info end:
```

nmsp notification interval

To modify the Network Mobility Services Protocol (NMSP) notification interval value on the controller to address latency in the network, use the **nmsp notification interval** command in global configuration mode.

nmsp notification interval { attachment | location | rssi {clients | rfid | rogues {ap | client } } }

Syntax Description

attachment	Specifies the time used to aggregate attachment information.
location	Specifies the time used to aggregate location information.
rssi	Specifies the time used to aggregate RSSI information.
clients	Specifies the time interval for clients.
rfid	Specifies the time interval for rfid tags.
rogues	Specifies the time interval for rogue APs and rogue clients .
ap	Specifies the time used to aggregate rogue APs.
client	Specifies the time used to aggregate rogue clients.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to set the NMSP notification interval for the active RFID tags to 25 seconds:

```
Device# configure terminal
Device(config)# nmsp notification-interval rfid 25
Device(config)# end
```

This example shows how to modify NMSP notification intervals for device attachment (connecting to the network or disconnecting from the network) every 10 seconds:

```
Device# configure terminal
Device(config)# nmsp notification-interval attachment 10
Device(config)# end
```

This example shows how to configure NMSP notification intervals for location parameters (location change) every 20 seconds:

```
Device# configure terminal
Device(config)# nmsp notification-interval location 20
Device(config)# end
```

no debug all

To disable debugging on a switch, use the **no debug all** command in Privileged EXEC mode.

no debug all

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Release 16.1	This command was introduced.

Examples

This example shows how to disable debugging on a switch.

```
Device: no debug all All possible debugging has been turned off.
```

readrtc

To display the current value of the Real Time Clock (RTC) setting, use the **readrtc** command in boot loader mode.

readrtc

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Examples

This example shows how to display the current RTC setting:

Device: **readrtc**Wednesday 03-27-13
11:42:38

Related Topics

writertc, on page 112

rename

To rename a file, use the **rename** command in boot loader mode.

rename filesystem:/source-file-url filesystem:/destination-file-url

Syntax Description

filesystem:	Alias for a file system. Use usbflash0: for USB memory sticks.
/source-file-url	Original path (directory) and filename.
/destination-file-url	New path (directory) and filename.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

Filenames and directory names are case sensitive.

Directory names are limited to 127 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Filenames are limited to 127 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Examples

This example shows a file named *config.text* being renamed to *config1.text*:

Device: rename usbflash0:config.text usbflash0:config1.text

You can verify that the file was renamed by entering the dir filesystem: boot loader command.

request platform software console attach switch

To start a session on a member switch, use the **request platform software console attach switch** command in privileged EXEC mode.

Note

On stacking switches (Catalyst 3650/3850/9300/9500 switches), this command can only be used to start a session on the standby console. You cannot start a session on member switches. By default, all consoles are already active, so a request to start a session on the active console will result in an error.

request platform software console attach switch { switch-number | active | standby } { 0/0 | R0 }

Syntax Description

switch-number	Specifies the switch number. The range is from 1 to 9.	
active	Specifies the active switch.	
standby	Specifies the standby switch.	
0/0	Specifies that the SPA-Inter-Processor slot is 0, and bay is 0.	
	Note	Do not use this option with stacking switches. It will result in an error.
R0	Specifies	s that the Route-Processor slot is 0.

Command Default

By default, all switches in the stack are active.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Denali 16.1.1	This command was introduced.

Usage Guidelines

To start a session on the standby switch, you must first enable it in the configuration.

Examples

This example shows how to session to the standby switch:

```
Device# configure terminal

request platform software package clean

To remove media files that are not required, use the **request platform software package clean** command in privileged EXEC mode.

request platform software package clean [{file $\mathit{URL} \mid \mathit{pattern} \; \mathit{URL} \mid \mathit{switch} \; \mathit{switch-ID} \; \{\mathit{file} \; \mathit{URL} \mid \; \mathit{pattern} \; \mathit{URL} \, \}\}]$

Syntax Description

file URL	(Optional) Specifies the URL to the file. The URL contains the file system, directories, and the filename.
pattern URL	(Optional) Specifies the pattern to clean one or more matching paths.
switch switch-ID	(Optional) Specifies the switch for provisioning.

Command Default

No default behavior or values

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Denali 16.1.1	This command was introduced.

Usage Guidelines

Example

The following example shows how to clean unused media files from the device:

Device# request platform software package clean

```
This operation may take several minutes...

Running command on switch 1

Cleaning up unnecessary package files

No path specified, will use booted path consolidated:packages.conf

Cleaning sw/isos

Scanning boot directory for packages ... done.

Preparing packages list to delete ...

cat3k_caa-guestshell.BLD_V168_THROTTLE_LATEST_20180925_154546_V16_8_1_191_2.SSA.pkg

File is in use, will not delete.

cat3k_caa-rpbase.BLD_V168_THROTTLE_LATEST_20180925_154546_V16_8_1_191_2.SSA.pkg

File is in use, will not delete.

cat3k_caa-rpcore.BLD_V168_THROTTLE_LATEST_20180925_154546_V16_8_1_191_2.SSA.pkg

File is in use, will not delete.

cat3k_caa-srdriver.BLD_V168_THROTTLE_LATEST_20180925_154546_V16_8_1_191_2.SSA.pkg

File is in use, will not delete.
```

```
cat3k_caa-webui.BLD_V168_THROTTLE_LATEST_20180925_154546_V16_8_1_191_2.SSA.pkg
   File is in use, will not delete.
packages.conf
   File is in use, will not delete.
done.
```

SUCCESS: No extra package or provisioning files found on media. Nothing to clean.

Related Commands

Command	Description
request platform software package install file	Upgrades a consolidated package or sub-package.
request platform software package install rollback	Rolls back a previous software upgrade.

request platform software package copy

To copy a Cisco IOS XE image file, use the **request platform software package copy** command in privileged EXEC mode.

request platform software package copy switch switch-ID file file-URL to file-URL

Syntax Description

switch switch-ID	Specifies the switch for provisioning.	
file file-URL	URL to the consolidated package or sub-package.	
to	Specifies the destination URL to where the files are to be copied.	

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Denali 16.1.1	This command was introduced.

Usage Guidelines

Example

The following example shows how to copy an image file to a destination directory:

Device# request platform software package copy switch all file tftp://10.10.11.250/cat3k_caa-universalk9.16.08.05.SPA.bin to ftp:cat3k_caa-universalk9.16.08.05.SPA.bin

Command	Description
request platform software package install file	Upgrades a consolidated package or sub-package.
request platform software package install rollback	Rolls back a previous software upgrade.

request platform software package describe file

To gather descriptive information about an individual module or a Cisco IOS-XE image file, use the **request platform software package describe file**command in privileged EXEC or diagnostic mode.

request platform software package describe file URL [detail] [verbose]

Syntax Description

URL	Specifies the URL to the file. The <i>URL</i> contains the file system, directories, and the filename.
detail	(Optional) Specifies detailed output.
verbose	(Optional) Displays verbose information, meaning that all information about the file is displayed on the console.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Denali 16.1.1	This command was introduced.

Usage Guidelines

This command can only be used to gather information on individual module and Cisco IOS-XE image files. Using this command to collect information on any other file will generate output, but the generated output is useless.

The output of this command can be used for the following functions:

- To confirm the individual module files that are part of a Cisco IOS-XE image.
- To confirm whether or not a file is bootable.
- To confirm the contexts in which a file must be reloaded or booted.
- To confirm whether or not a file is corrupted.
- To confirm file and header sizes, build dates, and various other general information.

Examples

In the following example, this command is entered to gather information about an individual SIP Base module file on the bootflash: file system.

Device# request platform software package describe file bootflash:cat3k caa-universalk9 universalk9.16.09.02.SPA.bin

```

Related Commands

Command	Description
request platform software package install file	Upgrades an individual package or a superpackage file.

request platform software package expand

Package is not bootable.

To extract the individual modules from a Cisco IOS-XE image, use the **request platform software package expand** command in privileged EXEC mode.

request platform software package expand {file source-URL | switch switch-ID file source-URL}[
to destination-URL] [auto-copy] [force] [overwrite] [retain-source-file] [verbose] [wipe]

Syntax Description

source-URL	Specifies the URL to the Cisco IOS-XE file that stores the contents that will be extracted.
switch switch-ID	Specifies the switch ID.
to destination-URL	(Optional) Specifies the destination URL where the files that were extracted from the Cisco IOS-XE file are left after the operation is complete.
	If this option is not entered, the Cisco IOS-XE image file contents are extracted onto the same directory where the Cisco IOS-XE image file is currently stored.
auto-copy	(Optional) Copies packages to provisioning directory.

force	(Optional) Specifies that the operation will be forced, meaning that the upgrade will proceed despite any warning messages.
over-write	(Optional) Overwrites non-identical packages and unused provisioning files.
retain-to-source	(Optional) Retains the source file after expansion.
verbose	(Optional) Displays verbose information, meaning all output that can be displayed on the console during the process will be displayed.
wipe	(Optional) Erases all content on the destination snapshot directory before extracting the files and placing them on the snapshot directory.

Command Default

No default behavior or values

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Denali 16.1.1	This command was introduced.

Usage Guidelines

This command only extracts individual module files and a provisioning file from the Cisco IOS-XE image. Additional configuration is needed to configure the router to boot using the provisioning files and run using the individual modules.

When this command is used, copies of each module and the provisioning file within the Cisco IOS-XE image are copied and placed on the destination directory. The Cisco IOS-XE image file is unchanged after the operation is complete.

If the **to** destination-URL option is not entered, the Cisco IOS-XE image contents will be extracted onto the same directory where the Cisco IOS-XE image is currently stored.

If this command is used to extract individual module files onto a directory that already contains individual module files, the files are extracted to an automatically created directory on the destination device.

Examples

The following example shows how to extract individual modules and the provisioning file from a Cisco IOS-XE image that has already been placed in the directory where the user wants to store the individual modules and the provisioning file.

Output of the directory before and after the extraction is given to confirm that files were extracted.

Device# dir bootflash:

```
Directory of bootflash:/

11 drwx 16384 Dec 4 2018 11:26:07 +00:00 lost+found

14401 drwx 4096 Dec 4 2018 11:27:41 +00:00 .installer

12 -rw- 218783948 Dec 4 2018 12:12:16 +00:00 cat3k caa-universalk9.16.09.02.SPA.bin
```

Device# request platform software package expand file bootflash:cat3k caa-universalk9.16.09.02.SPA.bin

Verifying parameters Validating package type Copying package files

Device# dir bootflash:

```
Directory of bootflash:/

928833536 bytes total (483700736 bytes free)
```

Related Commands

Command	Description
request platform software package install file	Upgrades an individual module or a Cisco IOS-XE file.

request platform software package install auto-upgrade

To initiate automatic upgrade of software on all incompatible switches, use the **request platform software package install auto-upgrade** command in privileged EXEC mode.

request platform software package install auto-upgrade

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Denali 16.1.1	This command was introduced.

Examples

The following example shows how to automatically upgrade the software:

Device# request platform software package install auto-upgrade

Related Commands

Command	Description
request platform software package install file	Upgrades a consolidated package or sub-package.
request platform software package install rollback	Rolls back a previous software upgrade.

request platform software package install commit

To cancel the rollback timer and commit a software upgrade, use the **request platform software package install commit** command in privileged EXEC mode.

request platform software package install switch switch-ID commit [verbose]

Syntax Description

switch switch-ID	Specifies the switch ID.
	(Optional) Displays verbose information, meaning all information that can be displayed on the console during the process will be displayed.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Release	Modification
Cisco IOS XE Denali 16.1.1	This command was introduced.

Usage Guidelines

This command is entered after the **request platform software package install switch** *switch-ID* **file auto-rollback** command is used to begin an individual sub-package or a consolidated package upgrade. When the **auto-rollback** *minutes* option is used, a rollback timer that cancels the upgrade after the number of specified *minutes* cancels the upgrade if the **request platform software package install switch** *switch-ID* **commit** command is not entered to commit the upgrade.

The rollback timer expires and the upgrade does not complete; and the device continues running the previous sub-package or consolidated package.

Examples

The following example shows how to commit an upgrade:

Device# request platform software package install switch all commit

Related Commands

Command	Description
request platform software package install file	Upgrades a consolidated package or sub-package.
request platform software package install rollback	Rolls back a previous software upgrade.

request platform software package install file

To upgrade a consolidated package or an individual sub-package, use the **request platform software package install file** command in privileged EXEC mode.

request platform software package install switch switch-ID file file-URL [auto-rollback minutes] [interface-module-delay seconds] [provisioning-file provisioning-file-URL] [slot slot-number] [bay bay-number] [auto-copy] [force] [ignore-compact-check] [mdr] [new] [on-reboot] [retain-source-file] [verbose]

Syntax Description

switch switch-ID	Specifies the switch for provisioning.
file-URL	URL to the consolidated package or sub-package.
auto-rollback minutes	(Optional) Specifies the setting of a rollback timer, and sets the number of minutes on the rollback timer before the rollback timer expires.

interface-module-delay seconds	(Optional) Specifies the interface module restart timeout delay.
provisioning-file provisioning-file-URL	(Optional) Specifies the URL to the provisioning file. A provisioning file is used for booting only when a device is booted using individual sub-packages.
slot slot-number	(Optional) Specifies the device slot number where a shared port adapter interface processor (SIP) can be installed.
bay bay-number	(Optional) Specifies the shared port adapter (SPA) bay number within a SIP.
auto-copy	(Optional) Specifies that the device will automatically copy packages to provisioning directory.
force	(Optional) Specifies that the operation will be forced, meaning that the upgrade will proceed despite any warning messages.
ignore-compact-check	(Optional) Specifies that the compatibility check is ignored.
mdr	(Optional) Specifies that minimal disruptive restart is used.
new	(Optional) Creates a new package provisioning file.
on-reboot	(Optional) Specifies that the installation will not be completed until the next RP reboot.
retain-source-file	(Optional) Retains the source file after installation.
verbose	(Optional) Displays verbose information, meaning all output that can be displayed on the console during the process will be displayed.

Command Default

If you do not enter the **request platform software package install file** command, the consolidated or sub package upgrades are not initiated on the device.

Command Modes

Privileged EXEC (#)

Command History

•	Release	Modification
	Cisco IOS XE Denali 16.1.1	This command was introduced.

Usage Guidelines

This command is used to upgrade consolidated packages and individual sub-packages.

When the **auto-rollback** *minutes* option is used, the **request platform software package install switch** *switch-ID* **commit** command must be entered before the rollback timer expires to complete the upgrade. If this command is not entered, the device rolls back to the previous software version. The rollback timer expires after the number of specified *minutes*. If the **auto-rollback** *minutes* option is not used, the upgrade automatically happens.

In the following example, the **request platform software package install** command is used to upgrade a consolidated package. The **force** option, which forces the upgrade past any prompt (such as, already having the same consolidated package installed), is used in this example.

```
Device# request platform software package install rp 0 file bootflash:cat3k caa-universalk9.16.03.05.SPA.bin force
```

Related Commands

Command	Description
request platform software package install commit	Cancels the rollback timer and commits a software upgrade.
request platform software package install rollback	Rolls back a previous software upgrade.
request platform software package install snapshot	Creates a snapshot directory that will contain all the files extracted from a consolidated package.

request platform software package install rollback

To roll back a previous software upgrade, use the **request platform software package install rollback** command in privileged EXEC mode.

request platform software package install switch switch-ID rollback [{as-booted | provisioning-file provisioning-file-URL}] [auto-copy] [force] [ignore-compact-check] [new] [on-reboot] [retain-source-file] [verbose]

Syntax Description

switch switch-ID	Specifies the switch for provisioning.
as-booted	(Optional) Specifies that the software update will not occur, and that the device will instead boot using the same procedure that it used during the last reboot.
provisioning-file provisioning-file-URL	(Optional) Specifies that the software update will not occur, and that the device will instead boot using the specified provisioning file.
auto-copy	(Optional) Specifies that the device will automatically copy packages to provisioning directory.
force	(Optional) Specifies that the operation will be forced, meaning that the upgrade will proceed despite any warning messages.
ignore-compact-check	(Optional) Specifies that the compatibility check is ignored.
new	(Optional) Creates a new package provisioning file.
on-reboot	(Optional) Specifies that the installation will not be completed until the next reboot.
retain-source-file	(Optional) Retains the source file after installation,
verbose	(Optional) Displays verbose information, meaning all output that can be displayed on the console during the process will be displayed.

Command Default

No default behavior or values

Command Modes

Privileged EXEC (#)

Command History

-	Release	Modification
	Cisco IOS XE Everest 16.1.1	This command was introduced.

Usage Guidelines

This command rolls back a configuration that has an active rollback timer. Active rollback timers are used when the **auto-rollback** option is entered when software is being upgraded using the **request platform software package install file**command.

Examples

The following example shows that an upgrade using a rollback timer is rolled back to the previous configuration:

Device# request platform software package install switch all rollback

Related Commands

Command	Description
request platform software package install commit	Cancel the rollback timer and commits a software upgrade.
request platform software package install file	Upgrades a consolidated package or an individual sub-package.

request platform software package install snapshot

To create a snapshot directory that contains all the files extracted from a consolidated package, use the **request platform software package install snapshot** command in privileged EXEC mode.

request platform software package install switch switch-ID snapshot to URL [as snapshot-provisioning-filename] [force] [verbose] [wipe]

Syntax Description

switch switch-ID	Specifies the switch for provisioning.
snapshot to URL	Creates a directory and extracts all files from the consolidated package into that directory. The directory is named in the command-line as part of the <i>URL_FS</i> .
	If the <i>URL_FS</i> is specified as a file system, the files in the consolidated package will be extracted onto the file system and not a directory on the file system.
as	(Optional) Renames the provisioning file in the snapshot directory.
snapshot-provisioning-filename	If this option is not used, the existing provisioning filename of the provisioning file in the consolidated package is used.
wipe	(Optional) Erases all content on the destination snapshot directory before extracting files and placing them on the snapshot directory.

force	(Optional) Specifies that the operation will be forced; meaning that the upgrade will proceed despite any warning messages.
verbose	(Optional) Displays verbose information, meaning all output is displayed on the console during the provisioning process.

Command Default

No default behavior or values

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Everest 16.1.1	This command was introduced.

Usage Guidelines

This command is used to create a directory at the destination device and extract the individual sub-packages in a consolidated package to that directory.

The **request platform software package expand** command is the only other command that can be used to extract individual sub-packages from a consolidated package.

Examples

In the following example, a snapshot directory named snapdir1_snap is created in the bootflash: file system, and the individual sub-package files from the consolidated package are extracted into the snapshot directory.

The second portion of the example first sets up the router to reboot using the files in the snapshot directory (deletes all previous boot system commands, configures the configuration register, then enters a boot system command to boot using the extracted provisioning file), saves the new configuration, then reboots so the device will boot using the extracted provisioning file, which allows the router to run using the extracted individual sub-package files.

Device# request platform software package install switch all snapshot to bootflash:snapdir1_snap

```
--- Starting active image file snapshot --- Validating snapshot parameters Creating destination directory
Copying files to destination media
    Copied provisioning file as packages.conf
Moving files into final location Finished active image file snapshot
Device(config)# no boot system
Device(config)# config-register 0x1
Device(config)# boot system harddisk:snapdirl_snap/packages.conf
Device(config)# exit
*May 11 01:31:04.815: %SYS-5-CONFIG_I: Configured from console by con
Device# write memory

Building configuration...
[OK]

Device# reload
```

Related Commands

Command	Description
	Upgrades a consolidated package or an individual sub-package.

request platform software package verify

To verify the In-Service Software Upgrade (ISSU) software package compatibility, use the **requestplatform software package verify** command in privileged EXEC mode.

request platform software package verify switch switch-ID file file-URL [bay bay-number] [slot slot-number] [auto-copy] [force] [mdr]

Syntax Description

switch switch-ID	Specifies the switch for provisioning.
file-URL	URL to the consolidated package or sub-package.
bay bay-number	(Optional) Specifies the shared port adapter (SPA) bay number within a SIP.
slot slot-number	(Optional) Specifies the device slot number where a shared port adapter interface processor (SIP) can be installed.
auto-copy	(Optional) Specifies that the device will automatically copy packages to provisioning directory.
force	(Optional) Specifies that the operation will be forced, meaning that the upgrade will proceed despite any warning messages.
mdr	(Optional) Specifies that minimal disruptive restart is used.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification
Cisco IOS XE Denali 16.1.1	This command was introduced.

Example

The following example shows how to verify Cisco IOS XE image:

Device# request platform software package verify switch all file bootflash:cat3k caa-universalk9.16.03.05.SPA.bin

Related Commands

The state of the s	Cancels the rollback timer and commits a software upgrade.

Command	Description
request platform software package install rollback	Rolls back a previous software upgrade.
request platform software package install snapshot	Creates a snapshot directory that will contain all the files extracted from a consolidated package.

request platform software package uninstall

To uninstall a software package, use the **request platform software package uninstall** command in privileged EXEC mode.

request platform software package uninstall switch switch-ID file file-URL [bay bay-number [slot slot-number] [auto-copy] [force] [mdr]

Syntax Description

switch switch-ID	Specifies the switch for provisioning.
file-URL	URL to the consolidated package or sub-package.
bay bay-number	(Optional) Specifies the shared port adapter (SPA) bay number within a SIP.
slot slot-number	(Optional) Specifies the device slot number where a shared port adapter interface processor (SIP) can be installed.
auto-copy	(Optional) Specifies that the device will automatically copy packages to provisioning directory.
force	(Optional) Specifies that the operation will be forced, meaning that the upgrade will proceed despite any warning messages.
mdr	(Optional) Specifies that minimal disruptive restart is used.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC (#)

Command History

Release	Modification	
Cisco IOS XE Denali 16.1.1	This command was introduced.	

Example

The following example shows how to uninstall a software package:

Device# request platform software package uninstall

Related Commands

Command	Description	
request platform software package install commit	Cancels the rollback timer and commits a software upgrade.	
request platform software package install rollback	Rolls back a previous software upgrade.	
request platform software package install snapshot	Creates a snapshot directory that will contain all the files extracted from a consolidated package.	

reset

To perform a hard reset on the system, use the **reset** command in boot loader mode. A hard reset is similar to power-cycling the device; it clears the processor, registers, and memory.

reset

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release	Modification
Cisco IOS XE 3 2SECisco IOS XE 3 3SECisco IOS XE 3 3SE	This command was introduced

Examples

This example shows how to reset the system:

```
Device: reset Are you sure you want to reset the system (y/n)? {\bf y} System resetting...
```

Related Topics

```
set, on page 58
unset, on page 102
```

rmdir

To remove one or more empty directories from the specified file system, use the **rmdir** command in boot loader mode.

rmdir filesystem:/directory-url...

Syntax Description

filesystem: Alias for a file system. Use **usbflash0**: for USB memory sticks.

/directory-url... Path (directory) and name of the empty directories to remove. Separate each directory name with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release	Modification
Cisco IOS XE 3 2SECisco IOS XE 3 3SECisco IOS XE 3 3SE	This command was introduced

Usage Guidelines

Directory names are case sensitive and limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Before removing a directory, you must first delete all of the files in the directory.

The device prompts you for confirmation before deleting each directory.

Example

This example shows how to remove a directory:

Device: rmdir usbflash0:Test

You can verify that the directory was deleted by entering the dir filesystem: boot loader command.

Related Topics

dir, on page 16 mkdir, on page 32

sdm prefer

To specify the SDM template for use on the switch, use the **sdm prefer** command in global configuration mode.

sdm prefer {advanced}

Syntax Description

advanced Supports advanced features such as NetFlow.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Kelease	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

In a device stack, all stack members must use the same SDM template that is stored on the active device.

When a new device is added to a stack, the SDM configuration that is stored on the active device overrides the template configured on an individual device.

Example

This example shows how to configure the advanced template:

```
Device(config)# sdm prefer advanced
Device(config)# exit
Device# reload
```

Related Topics

show sdm prefer, on page 75

set

To set or display environment variables, use the **set** command in boot loader mode. Environment variables can be used to control the boot loader or any other software running on the device.

set variable value

Syntax Description

variable value Use one of the following keywords for *variable* and the appropriate value for *value*:

MANUAL BOOT—Decides whether the device automatically or manually boots.

Valid values are 1/Yes and 0/No. If it is set to 0 or No, the boot loader attempts to automatically boot the system. If it is set to anything else, you must manually boot the device from the boot loader mode.

BOOT *filesystem:/file-url*—Identifies a semicolon-separated list of executable files to try to load and execute when automatically booting.

If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash: file system.

ENABLE_BREAK—Allows the automatic boot process to be interrupted when the user presses the **Break** key on the console.

Valid values are 1, Yes, On, 0, No, and Off. If set to 1, Yes, or On, you can interrupt the automatic boot process by pressing the **Break** key on the console after the flash: file system has initialized.

HELPER *filesystem:/file-url*—Identifies a semicolon-separated list of loadable files to dynamically load during the boot loader initialization. Helper files extend or patch the functionality of the boot loader.

PS1 *prompt*—Specifies a string that is used as the command-line prompt in boot loader mode.

CONFIG_FILE flash: /file-url—Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.

BAUD *rate*—Specifies the number of bits per second (b/s) that is used for the baud rate for the console. The Cisco IOS software inherits the baud rate setting from the boot loader and continues to use this value unless the configuration file specifies another setting. The range is from 0 to 128000 b/s. Valid values are 50, 75, 110, 150, 300, 600, 1200, 1800, 2000, 2400, 3600, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 56000, 57600, 115200, and 128000.

The most commonly used values are 300, 1200, 2400, 9600, 19200, 57600, and 115200.

SWITCH NUMBER *stack-member-number*—Changes the member number of a stack member.

SWITCH_PRIORITY *priority-number*—Changes the priority value of a stack member.

Command Default

The environment variables have these default values:

MANUAL BOOT: No (0)

BOOT: Null string

ENABLE_BREAK: No (Off or 0) (the automatic boot process cannot be interrupted by pressing the **Break**

key on the console).

HELPER: No default value (helper files are not automatically loaded).

PS1 device:

CONFIG FILE: config.text

BAUD: 9600 b/s

SWITCH_NUMBER: 1 SWITCH_PRIORITY: 1

Note

Environment variables that have values are stored in the flash: file system in various files. Each line in the files contains an environment variable name and an equal sign followed by the value of the variable.

A variable has no value if it is not listed in these files; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, "") is a variable with a value.

Many environment variables are predefined and have default values.

Command Modes

Boot loader

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

Environment variables are case sensitive and must be entered as documented.

Environment variables that have values are stored in flash memory outside of the flash: file system.

Under typical circumstances, it is not necessary to alter the setting of the environment variables.

The MANUAL_BOOT environment variable can also be set by using the **boot manual** global configuration command.

The BOOT environment variable can also be set by using the **boot system** *filesystem:/file-url* global configuration command.

The ENABLE_BREAK environment variable can also be set by using the **boot enable-break** global configuration command.

The HELPER environment variable can also be set by using the **boot helper** *filesystem:* / *file-url* global configuration command.

The CONFIG_FILE environment variable can also be set by using the **boot config-file flash:** /file-url global configuration command.

The SWITCH_NUMBER environment variable can also be set by using the **switch** *current-stack-member-number* **renumber** *new-stack-member-number* global configuration command.

The SWITCH_PRIORITY environment variable can also be set by using the device *stack-member-number* **priority** *priority-number* global configuration command.

The boot loader prompt string (PS1) can be up to 120 printable characters not including the equal sign (=).

Example

This example shows how to set the SWITCH PRIORITY environment variable:

```
Device: set SWITCH_PRIORITY 2
```

You can verify your setting by using the **set** boot loader command.

show cable-diagnostics tdr

To display the Time Domain Reflector (TDR) results, use the **show cable-diagnostics tdr** command in privileged EXEC mode.

show cable-diagnostics tdr interface interface-id

Syntax Description

interface-id Specifies the interface on which TDR is run.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and small form-factor pluggable (SFP) module ports.

Examples

This example shows the output from the **show cable-diagnostics tdr interface** *interface-id* command on a device:

${\tt Device\#\ show\ cable-diagnostics\ tdr\ interface\ gigabitethernet1/0/23}$

			Local pair			Remote pair	Pair status
Gi	i1/0/23	1000M	Pair B Pair C	1 1	+/- 1 meters +/- 1 meters +/- 1 meters +/- 1 meters	Pair B Pair C	Normal Normal Normal Normal

Table 2: Field Descriptions for the show cable-diagnostics tdr Command Output

Field	Description		
Interface	The interface on which TDR is run.		
Speed	The speed of connection.		
Local pair	The name of the pair of wires that TDR is testing on the local interface.		
Pair length	The location of the problem on the cable, with respect to your device. TDR can only find the location in one of these cases:		
	 The cable is properly connected, the link is up, and the interface speed is 1000 Mb/s. The cable is open. 		
	The cable has a short.		
Remote pair	The name of the pair of wires to which the local pair is connected. TDR can learn about the remote pair only when the cable is properly connected and the link is up.		
Pair status	The status of the pair of wires on which TDR is running:		
	Normal—The pair of wires is properly connected.		
	Not completed—The test is running and is not completed.		
	Not supported—The interface does not support TDR.		
• Open—The pair of wires is open.			
	• Shorted—The pair of wires is shorted.		
	• ImpedanceMis—The impedance is mismatched.		
	 Short/Impedance Mismatched—The impedance mismatched or the cable is short. InProgress—The diagnostic test is in progress. 		

This example shows the output from the **show interface** *interface-id* command when TDR is running:

```
Device# show interface gigabitethernet1/0/2 gigabitethernet1/0/2 is up, line protocol is up (connected: TDR in Progress)
```

This example shows the output from the **show cable-diagnostics tdr interface** *interface-id* command when TDR is not running:

```
Device# show cable-diagnostics tdr interface gigabitethernet1/0/2 \% TDR test was never issued on gigabitethernet1/0/2
```

If an interface does not support TDR, this message appears:

```
% TDR test is not supported on device 1
```

show ap hyperlocation

To view a summary or detailed information about the hyperlocation configuration, use the **show ap hyperlocation** command.

show ap hyperlocation {summary | detail}

Syntax Description

summary	Shows the overall configuration and operational values.
detail	Shows the overall configuration and operation values as well as detailed information about each AP.

Command Default

None

Command History

Release	Modification
Cisco IOS XE Denali 16.2.1	This command was introduced.
Cisco IOS XE Denali 16.3.1	This command was modified. The ble-beacon keyword was added.

Usage Guidelines

For hyperlocation to be operational, the following conditions must be met:

- At least one Cisco Connected Mobile Experiences (CMX) must be present with hyperlocation enabled.
- The hyperlocation admin state should be operational.
- Either AP Network Time Protocol (NTP) or IOS NTP should be configured.

Example

This example shows how to view a summary of the hyperlocation configuration:

Device# show ap hyperlocation summary

```
Hyperlocation operational status: Up
Hyperlocation NTP server currently used: 9.0.0.4
Hyperlocation admin status: Enabled
Hyperlocation detection threshold: -100 dBm
Hyperlocation trigger threshold: 10
Hyperlocation reset threshold: 8
```

This example shows how to view detailed information about hyperlocation configuration:

Device# show ap hyperlocation detail

Hyperlocation operational status: Up
Hyperlocation NTP server currently used: 9.0.0.4
Hyperlocation admin status: Enabled
Hyperlocation detection threshold: -100 dBm
Hyperlocation trigger threshold: 10
Hyperlocation reset threshold: 8

AP Name	Radio MAC	Method	Hyperlocation
AP84b8.0252.b930	84b8.0216.c721	HALO	Enabled
AP84b8.0265.5540	84b8.0243.8796	WSM	Enabled
APf07f.0635.2d40	f07f.0676.3b89	WSM	Enabled
APf4cf.e272.4ed0	f4cf.e223.ba31	HALO	Enabled

show debug

To display all the debug commands available on a switch, use the **show debug** command in Privileged EXEC mode.

show debug

show debug condition Condition identifier | All conditions

Syntax Description

Condition identifier Sets the value of the condition identifier to be used. Range is between 1 and 1000.

All conditions Shows all conditional debugging options available.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE Release 16.1	This command was introduced.

Usage Guidelines

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

Examples

This example shows the output of a **show debug** command:

Device# show debug condition all

To disable debugging, use the **no debug all** command.

show env

To display fan, temperature, and power information for the switch (standalone switch, stack master, or stack member), use the **show env** command in EXEC modes.

show env { all | fan | power [all | switch [switch-number]] | stack [stack-number] |
temperature [status] }

Syntax Description

all	Displays fan, temperature and power environmental status.
fan	Displays the switch fan status.
power	Displays the power supply status.
all	(Optional) Displays the status for all power supplies.
switch switch-number	(Optional) Displays the power supply status for a specific switch.
stack switch-number	(Optional) Displays all environmental status for each switch in the stack or for a specified switch. The range is 1 to 9, depending on the switch member numbers in the stack.
temperature	Displays the switch temperature status.
status	(Optional) Displays the temperature status and threshold values.

Command Default

No default behavior or values.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

Use the **show env stack** [switch-number] command to display information about any switch in the stack from any member switch.

Use the **show env temperature status** command to display the switch temperature states and threshold levels.

Examples

This example shows how to display information about stack member 1 from the master switch:

Device> show env stack 1
Device 1:
Device Fan 1 is OK
Device Fan 2 is OK
Device Fan 3 is OK
FAN-PS1 is OK

```
FAN-PS2 is NOT PRESENT
Device 1: SYSTEM TEMPERATURE is OK
Temperature Value: 32 Degree Celsius
Temperature State: GREEN
Yellow Threshold: 41 Degree Celsius
Red Threshold: 56 Degree Celsius
Device>
```

This example shows how to display temperature value, state, and threshold values:

```
Device> show env temperature status
Temperature Value: 32 Degree Celsius
Temperature State: GREEN
Yellow Threshold: 41 Degree Celsius
Red Threshold: 56 Degree Celsius
Device>
```

Table 3: States in the show env temperature status Command Output

State	Description
Green	The switch temperature is in the <i>normal</i> operating range.
Yellow	The temperature is in the <i>warning</i> range. You should check the external temperature around the switch.
Red	The temperature is in the <i>critical</i> range. The switch might not run properly if the temperature is in this range.

show flow monitor

To display the status and statistics for a flow monitor, use the **show flow monitor** command in privileged EXEC mode.

Syntax Description

name	(Optional) Specifies the name of a flow monitor.
monitor-name	(Optional) Name of a flow monitor that was previously configured.
cache	(Optional) Displays the contents of the cache for the flow monitor.
format	(Optional) Specifies the use of one of the format options for formatting the display output.
csv	(Optional) Displays the flow monitor cache contents in comma-separated variables (CSV) format.
record	(Optional) Displays the flow monitor cache contents in record format.
table	(Optional) Displays the flow monitor cache contents in table format.

statistics (Opt	tional) Displays the statistics for the flow monitor.

Command History

Release		Modification	
	Cisco IOS XE 3.2SECisco IOS XE 3.3SE	This command was introduced.	

Usage Guidelines

The cache keyword uses the record format by default.

The uppercase field names in the display output of the **show flowmonitor** *monitor-name* **cache** command are key fields that uses to differentiate flows. The lowercase field names in the display output of the **show flow monitor** *monitor-name* **cache** command are nonkey fields from which collects values as additional data for the cache.

Examples

The following example displays the status for a flow monitor:

Device# show flow monitor FLOW-MONITOR-1

This table describes the significant fields shown in the display.

Table 4: show flow monitor monitor-name Field Descriptions

Field	Description	
Flow Monitor	Name of the flow monitor that you configured.	
Description	Description that you configured or the monitor, or the default description User defined.	
Flow Record	Flow record assigned to the flow monitor.	
Flow Exporter	Exporters that are assigned to the flow monitor.	
Cache	Information about the cache for the flow monitor.	
Туре	Flow monitor cache type. The value is always normal, as it is the only supported cache type.	

Field	Description	
Status	Status of the flow monitor cache.	
	The possible values are:	
	• allocated—The cache is allocated.	
• being deleted—The cache is being deleted.		
	• not allocated—The cache is not allocated.	
Size	Current cache size.	
Inactive Timeout Current value for the inactive timeout in seconds.		
Active Timeout	Current value for the active timeout in seconds.	

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1:

This table describes the significant fields shown in the display.

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-1 in a table format:

The following example displays the status, statistics, and data for the flow monitor named FLOW-MONITOR-IPv6 (the cache contains IPv6 data) in record format:

The following example displays the status and statistics for a flow monitor:

show license right-to-use

To display detailed information for apcount adder licenses installed on the device, use the **show license right-to-use** command in EXEC modes.

show license right-to-use {default | detail | eula | mismatch | slot | summary | usage}

Syntax Description

default	Displays the default license information.	
detail	Displays details of all the licenses in the stack.	
eula	Displays the EULA text.	
mismatch	Displays mismatch license information.	
slot	Specifies the switch number.	
summary	Displays consolidated stack-wide license information.	
usage	Displays the usage details of all licenses.	

Command Default

No default behavior or values.

Command Modes

User EXEC

Privileged EXEC

Command History

Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

The following is sample output from the **show license right-to-use usage** command and displays all the detailed information:

Device# show license right-to-use usage

Slot#	License Name	Туре	usage-duration(y:m:d)	In-Use	EULA
1	ipservices	permanent	0 :0 :1	yes	yes
1	ipbase	permanent	0:0:0	no	no
1	ipbase	evaluation	0:0:0	no	no
1	lanbase	permanent	0 :0 :7	no	yes
1	apcount	evaluation	0:0:0	no	no
1	apcount	base	0:0:0	no	no
1	apcount	adder	0:0:0	no	yes
1	apcount	adder	0:0:0	no	yes
1	apcount	adder	0:0:0	no	yes
1	apcount	adder	0:0:0	no	yes
1	apcount	adder	0:0:0	no	yes

Device#

The following is sample output from the **show license right-to-use detail** command and displays the detailed information of licenses:

Device# show license right-to-use detail

```
Index 1: License Name: apcount
Period left: 16
License Type: evaluation
License State: Not Activated
License Count: 1000
License Location: Slot 1

Index 2: License Name: apcount
Period left: Lifetime
License Type: adder
License State: Active, In use
License Count: 125
License Location: Slot 1
```

The following is sample output from the **show license right-to-use summary** command when the evaluation license is active:

Evaluation AP-Count: Enabled Total AP Count Licenses: 1000 AP Count Licenses In-use: 100 AP Count Licenses Remaining: 900

AP Count Licenses Remaining: 25

The following is sample output from the **show license right-to-use summary** command when the adder licenses are active:

show location

To display location information, use the **show location** command in privileged EXEC mode.

show location $\{\text{detail } mac\text{-}addr \mid \text{plm} \mid \text{statistics} \mid \text{summary rfid} \mid \text{rfid } \{\text{client} \mid \text{config} \mid \text{detail } MAC\text{-}addr \mid \text{summary}\}\}$

Syntax Description

detail mac-addr	Displays detailed location information with the RSSI table for a particular client.	
plm	Displays location path loss measurement (CCX S60) configuration.	
statistics	Displays location-based system statistics.	
summary	Displays location-based system summary information.	
rfid	Displays the RFID tag tracking information.	
client	Displays the summary of RFID tags that are clients.	
config	Displays the configuration options for RFID tag tracking.	
detail MAC-addr	Displays the detailed information for one rfid tag.	
summary	Displays summary information for all known rfid tags.	

Command Default

No default behavior or values.

Release		Modification	
	Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.	

The following is sample output from the **show location plm** command:

Device# show location plm

Location Path Loss Configuration

Calbration client : Disabled, Radio: Multiband Normal clients : Disabled

Burst interval : 60

show location ap-detect

To display the location information detected by specified access point, use the show location ap-detect command in privileged EXEC mode.

show location ap-detect {all | client | rfid | rogue-ap | rogue-client} ap-name

Syntax Description

all	Displays information of the client, RFID, rogue access point, and rogue client.	
client	Displays the client information.	
rfid	Displays RFID information.	
rogue-ap	Displays rogue access point information.	
rogue-client	Displays rogue client information.	
ар-пате	Specified access point name.	

Command Default

No default behavior or values.

show mac address-table move update

To display the MAC address-table move update information on the device, use the **show mac address-table move update** command in EXEC mode.

show mac address-table move update

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

User EXEC

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Example

This example shows the output from the **show mac address-table move update** command:

Device# show mac address-table move update

Switch-ID: 010b.4630.1780

Dst mac-address: 0180.c200.0010

Vlans/Macs supported: 1023/8320

Default/Current settings: Rcv Off/On, Xmt Off/On
Max packets per min: Rcv 40, Xmt 60

Rcv packet count: 10

```
Rcv conforming packet count : 5
Rcv invalid packet count : 0
Rcv packet count this min : 0
Rcv threshold exceed count : 0
Rcv last sequence# this min : 0
Rcv last interface : Po2
Rcv last src-mac-address : 0003.fd6a.8701
Rcv last switch-ID : 0303.fd63.7600
Xmt packet count : 0
Xmt packet count this min : 0
Xmt threshold exceed count : 0
Xmt pak buf unavail cnt : 0
Xmt last interface : None
```

show nmsp

To display the Network Mobility Services Protocol (NMSP) configuration settings, use the **show nmsp** command.

show nmsp {attachment | {suppress interfaces} | capability | notification interval | statistics {connection | summary} | status | subscription | detail [ip-addr] | summary}

Syntax Description

attachment suppress interfaces	Displays attachment suppress interfaces.
capability	Displays NMSP capabilities.
notification interval	Displays the NMSP notification interval.
statistics connection	Displays all connection-specific counters.
statistics summary	Displays the NMSP counters.
status	Displays status of active NMSP connections.
subscription detail ip-addr	The details are only for the NMSP services subscribed to by a specific IP address.
subscription summary	Displays details for all of the NMSP services to which the controller is subscribed. The details are only for the NMSP services subscribed to by a specific IP address.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

The following is sample output from the **show nmsp notification interval** command:

Rogue AP : 2 sec
Rogue Client : 2 sec
Attachment Interval : 30 sec
Location Interval : 30 sec

show sdm prefer

To display information about the templates that can be used to maximize system resources for a particular feature, use the **show sdm prefer** command in privileged EXEC mode. To display the current template, use the command without a keyword.

show sdm prefer [advanced]

•	_	
Svntax	Descri	ıntınn

advanced (Optional) Displays information on the advanced template.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS VE 3 2SECisco IOS VE 3 3SECisco IOS VE 3 3SE	This command was introduced

Usage Guidelines

If you did not reload the switch after entering the **sdm prefer** global configuration command, the **show sdm prefer** privileged EXEC command displays the template currently in use and not the newly configured template.

The numbers displayed for each template represent an approximate maximum number for each feature resource. The actual number might vary, depending on the actual number of other features configured. For example, in the default template if your device had more than 16 routed interfaces (subnet VLANs), the number of possible unicast MAC addresses might be less than 6000.

Example

The following is sample output from the **show sdm prefer** command:

```
Device# show sdm prefer

Showing SDM Template Info

This is the Advanced template.

Number of VLANs: 4094
```

Unicast MAC addresses: 32768 Overflow Unicast MAC addresses: 512 IGMP and Multicast groups: 8192 Overflow IGMP and Multicast groups: 512 32768 Directly connected routes: Indirect routes: 7680 Security Access Control Entries: 3072 QoS Access Control Entries: 3072 1024 Policy Based Routing ACEs: Netflow ACEs: 1024 Input Microflow policer ACEs: 2.56 Output Microflow policer ACEs: 256 Flow SPAN ACEs: 256 Tunnels: 256 Control Plane Entries: 512 Input Netflow flows: 8192 Output Netflow flows: 16384 SGT/DGT entries: 4096 SGT/DGT Overflow entries: 512 These numbers are typical for L2 and IPv4 features. Some features such as IPv6, use up double the entry size; so only half as many entries can be created.

show wireless detail

To display the details of the wireless parameters configured, use the **show wireless detail** command in privileged EXEC mode.

show wireless detail

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

The following parameters are displayed:

- The wireless user idle timeout
- The controller configured RF group name
- Fast SSID change

The following is sample output from the **show wireless detail** command:

Device# show wireless detail User Timeout : 300 RF network : default Fast SSID : Disabled

show wireless dtls connections

To display the Datagram Transport Layer Security (DTLS) server status, use the **show wireless dtls connections** command in privileged EXEC mode.

show wireless dtls connections

Syntax Description

This command has no arguments or keywords.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

shutdown

To shut down VLAN switching, use the **shutdown** command in global configuration mode. To disable the configuration set, use the **no** form of this command.

shutdown [vlan vlan-id] no shutdown

Syntax		

vlan vlan-id

VLAN ID of VLAN to shutdown.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was
	introduced

Examples

This example shows how to shutdown a VLAN:

```
Device(config) # vlan open1
Device(config-wlan) # shutdown
```

This example shows that the access point is not shut down:

```
Device# configure terminal
Device(config)# ap name 3602a no shutdown
```

system env temperature threshold yellow

To configure the difference between the yellow and red temperature thresholds that determines the value of yellow threshold, use the **system env temperature threshold yellow** command in global configuration mode. To return to the default value, use the **no** form of this command.

system env temperature threshold yellow value no system env temperature threshold yellow value

Syntax Description

value Specifies the difference between the yellow and red threshold values (in Celsius). The range is 10 to 25.

Command Default

These are the default values

Table 5: Default Values for the Temperature Thresholds

Device	Difference between Yellow and Red	Red ¹
Catalyst 3650	14°C	60°C

¹ You cannot configure the red temperature threshold.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

You cannot configure the green and red thresholds but can configure the yellow threshold. Use the **system env temperature threshold yellow** *value* global configuration command to specify the difference between the yellow and red thresholds and to configure the yellow threshold. For example, if the red threshold is 66 degrees C and you want to configure the yellow threshold as 51 degrees C, set the difference between the thresholds as 15 by using the **system env temperature threshold yellow 15** command. For example, if the red threshold is 60 degrees C and you want to configure the yellow threshold as 51 degrees C, set the difference between the thresholds as 15 by using the **system env temperature threshold yellow 9** command.

Note

The internal temperature sensor in the device measures the internal system temperature and might vary ± 5 degrees C.

Examples

This example sets 15 as the difference between the yellow and red thresholds:

```
Device(config)# system env temperature threshold yellow 15
Device(config)#
```

test cable-diagnostics tdr

To run the Time Domain Reflector (TDR) feature on an interface, use the **test cable-diagnostics tdr** command in privileged EXEC mode.

test cable-diagnostics tdr interface interface-id

Syntax Description

interface-id The interface on which to run TDR.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports or small form-factor pluggable (SFP) module ports.

After you run TDR by using the **test cable-diagnostics tdr interface** *interface-id* command, use the **show cable-diagnostics tdr interface** *interface-id* privileged EXEC command to display the results.

This example shows how to run TDR on an interface:

```
Device# test cable-diagnostics tdr interface gigabitethernet1/0/2 TDR test started on interface Gi1/0/2 A TDR test can take a few seconds to run on an interface Use 'show cable-diagnostics tdr' to read the TDR results
```

If you enter the **test cable-diagnostics tdr interface** *interface-id* command on an interface that has an link up status and a speed of 10 or 100 Mb/s, these messages appear:

```
Device# test cable-diagnostics tdr interface gigabitethernet1/0/3 TDR test on Gi1/0/9 will affect link state and traffic TDR test started on interface Gi1/0/3 A TDR test can take a few seconds to run on an interface Use 'show cable-diagnostics tdr' to read the TDR results.
```

traceroute mac

To display the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address, use the **traceroute mac** command in privileged EXEC mode.

traceroute mac [interface interface-id] source-mac-address [interface interface-id] destination-mac-address [vlan vlan-id] [detail]

Syntax Description

interface interface-id	(Optional) Specifies an interface on the source or destination device.
source-mac-address	The MAC address of the source device in hexadecimal format.
destination-mac-address	The MAC address of the destination device in hexadecimal format.
vlan vlan-id	(Optional) Specifies the VLAN on which to trace the Layer 2 path that the packets take from the source device to the destination device. Valid VLAN IDs are 1 to 4094.
detail	(Optional) Specifies that detailed information appears.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

R	elease	Modification
(Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

For Layer 2 traceroute to function properly, Cisco Discovery Protocol (CDP) must be enabled on all of the devicees in the network. Do not disable CDP.

When the device detects a device in the Layer 2 path that does not support Layer 2 traceroute, the device continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.

Layer 2 traceroute supports only unicast traffic. If you specify a multicast source or destination MAC address, the physical path is not identified, and an error message appears.

The **traceroute mac** command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN.

If you specify source and destination addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong.

If the VLAN is not specified, the path is not identified, and an error message appears.

The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port).

When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

```
Device# traceroute mac 0000.0201.0601 0000.0201.0201

Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6)

con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3

con5 (2.2.5.5 ) : Gi0/0/3 => Gi0/0/1

con1 (2.2.1.1 ) : Gi0/0/1 => Gi0/0/2

con2 (2.2.2.2 ) : Gi0/0/2 => Gi0/0/1

Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)

Layer 2 trace completed
```

This example shows how to display the Layer 2 path by using the **detail** keyword:

Device# traceroute mac 0000.0201.0601 0000.0201.0201 detail

```
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6) con6 / WS-C3750E-24PD / 2.2.6.6 : Gi0/0/2 [auto, auto] => Gi0/0/3 [auto, auto] con5 / WS-C2950G-24-EI / 2.2.5.5 : Fa0/3 [auto, auto] => Gi0/1 [auto, auto] con1 / WS-C3550-12G / 2.2.1.1 : Gi0/1 [auto, auto] => Gi0/2 [auto, auto] con2 / WS-C3550-24 / 2.2.2.2 : Gi0/2 [auto, auto] => Fa0/1 [auto, auto] Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2) Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the interfaces on the source and destination devicees:

Device# traceroute mac interface fastethernet0/1 0000.0201.0601 interface fastethernet0/3 0000.0201.0201

```
Source 0000.0201.0601 found on con6[WS-C3750E-24PD] (2.2.6.6) con6 (2.2.6.6) :Gi0/0/1 \Rightarrow Gi0/0/3 con5 (2.2.5.5 ) : Gi0/0/3 \Rightarrow Gi0/0/1 con1 (2.2.1.1 ) : Gi0/0/1 \Rightarrow Gi0/0/2 con2 (2.2.2.2 ) : Gi0/0/2 \Rightarrow Gi0/0/1 Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2) Layer 2 trace completed
```

This example shows the Layer 2 path when the device is not connected to the source device:

```
Device# traceroute mac 0000.0201.0501 0000.0201.0201 detail
   Source not directly connected, tracing source .....
   Source 0000.0201.0501 found on con5[WS-C3750E-24TD] (2.2.5.5)
   con5 / WS-C3750E-24TD / 2.2.5.5 :
        Gi0/0/1 [auto, auto] => Gi0/0/3 [auto, auto]
   con1 / WS-C3550-12G / 2.2.1.1 :
        Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
   con2 / WS-C3550-24 / 2.2.2.2 :
        Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
   Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
   Layer 2 trace completed.
```

This example shows the Layer 2 path when the device cannot find the destination port for the source MAC address:

```
Device# traceroute mac 0000.0011.1111 0000.0201.0201
Error:Source Mac address not found.
Layer2 trace aborted.
```

This example shows the Layer 2 path when the source and destination devices are in different VLANs:

```
Device# traceroute mac 0000.0201.0601 0000.0301.0201
Error:Source and destination macs are on different vlans.
Layer2 trace aborted.
```

This example shows the Layer 2 path when the destination MAC address is a multicast address:

Device# traceroute mac 0000.0201.0601 0100.0201.0201
Invalid destination mac address

This example shows the Layer 2 path when source and destination devicees belong to multiple VLANs:

Device# traceroute mac 0000.0201.0601 0000.0201.0201 Error:Mac found on multiple vlans. Layer2 trace aborted.

Related Topics

traceroute mac ip, on page 98

traceroute mac ip

To display the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname, use the **traceroute mac ip** command in privileged EXEC mode.

traceroute mac ip {source-ip-address source-hostname} {destination-ip-address destination-hostname} [detail]

Syntax Description

source-ip-address	The IP address of the source device as a 32-bit quantity in dotted-decimal format.
source-hostname	The IP hostname of the source device.
destination-ip-address	The IP address of the destination device as a 32-bit quantity in dotted-decimal format.
destination-hostname	The IP hostname of the destination device.
detail	(Optional) Specifies that detailed information appears.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

For Layer 2 traceroute to function properly, Cisco Discovery Protocol (CDP) must be enabled on each device in the network. Do not disable CDP.

When the device detects a device in the Layer 2 path that does not support Layer 2 traceroute, the device continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.

The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet.

When you specify the IP addresses, the device uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the device uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the device sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and an error message appears.

The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port).

When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

Examples

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the **detail** keyword:

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

```
Device# traceroute mac ip con6 con2

Translating IP to mac .....

2.2.66.66 => 0000.0201.0601

2.2.22.22 => 0000.0201.0201

Source 0000.0201.0601 found on con6

con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3

con5 (2.2.5.5 ): Gi0/0/3 => Gi0/1

con1 (2.2.1.1 ): Gi0/0/1 => Gi0/2

con2 (2.2.2.2 ): Gi0/0/2 => Fa0/1

Destination 0000.0201.0201 found on con2
```

```
Layer 2 trace completed
```

This example shows the Layer 2 path when ARP cannot associate the source IP address with the corresponding MAC address:

```
Device# traceroute mac ip 2.2.66.66 2.2.77.77 Arp failed for destination 2.2.77.77. Layer2 trace aborted.
```

```

trapflags client

To enable the sending of client-related DOT11 traps, use the **trapflags client** command in privileged EXEC mode. To disable the sending of client-related DOT11 traps, use the **no** form of this command.

trapflags client [{dot11 {associate | authfail | deauthenticate | disassociate} | excluded}]

no trapflags client [{dot11 {associate | authfail | deauthenticate | disassociate} | excluded}]

Syntax Description

dot11	Client-related DOT11 traps.
assocfail	Enables the sending of Dot11 association fail traps to clients.
associate	Enables the sending of Dot11 association traps to clients.
authfail	Enables the sending of Dot11 authentication fail traps to clients.
deauthenticate	Enables the sending of Dot11 deauthentication traps to clients.
disassociate	Enables the sending of Dot11 disassociation traps to clients.
excluded	Enables the sending of excluded trap to clients.

Command Default

No default behavior or values.

Command Modes

Privileged EXEC

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to enable the sending of Dot11 disassociation trap to clients:

Device# configure terminal
Device(config)# trapflags client dot11 disassociate
Device(config)# end

type

To display the contents of one or more files, use the **type** command in boot loader mode.

type filesystem:/file-url...

Syntax Description

filesystem: Alias for a file system. Use **flash:** for the system board flash device; use **usbflash0:** for USB memory sticks.

/file-url... Path (directory) and name of the files to display. Separate each filename with a space.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release Modification

Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

Filenames and directory names are case sensitive.

If you specify a list of files, the contents of each file appear sequentially.

Examples

This example shows how to display the contents of a file:

Device: type flash: image_file_name
version_suffix: universal-122-xx.SEx
version_directory: image_file_name
image_system_type_id: 0x00000002
image_name: image_file_name.bin
ios_image_file_size: 8919552
total_image_file_size: 11592192
image_feature: IP|LAYER_3|PLUS|MIN_DRAM_MEG=128
image_family: family
stacking_number: 1.34
board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b
info_end:

unset

To reset one or more environment variables, use the **unset** command in boot loader mode.

unset variable...

Syntax Description

variable Use one of these keywords for variable:

MANUAL_BOOT—Specifies whether the device automatically or manually boots.

BOOT—Resets the list of executable files to try to load and execute when automatically booting. If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot the first bootable file that it can find in the flash: file system.

ENABLE_BREAK—Specifies whether the automatic boot process can be interrupted by using the **Break** key on the console after the flash: file system has been initialized.

HELPER—Identifies the semicolon-separated list of loadable files to dynamically load during the boot loader initialization. Helper files extend or patch the functionality of the boot loader.

PS1—Specifies the string that is used as the command-line prompt in boot loader mode.

CONFIG_FILE—Resets the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.

BAUD—Resets the rate in bits per second (b/s) used for the console. The Cisco IOS software inherits the baud rate setting from the boot loader and continues to use this value unless the configuration file specifies another setting.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release	Modification
Cisco IOS XE 3 2SECisco IOS XE 3 3SECisco IOS XE 3 3SE	This command was introduced

Usage Guidelines

Under typical circumstances, it is not necessary to alter the setting of the environment variables.

The MANUAL_BOOT environment variable can also be reset by using the **no boot manual** global configuration command.

The BOOT environment variable can also be reset by using the **no boot system** global configuration command.

The ENABLE_BREAK environment variable can also be reset by using the **no boot enable-break** global configuration command.

The HELPER environment variable can also be reset by using the **no boot helper** global configuration command.

The CONFIG_FILE environment variable can also be reset by using the **no boot config-file** global configuration command.

Example

This example shows how to unset the SWITCH_PRIORITY environment variable:

Device: unset SWITCH PRIORITY

wireless client

To configure client parameters, use the wireless client command in global configuration mode.

wireless client {association limit assoc-number interval interval | band-select {client-rssi rssi | cycle-count count | cycle-threshold | threshold | expire dual-band timeout | expire suppression timeout} | max-user-login | max-user-login | timers auth-timeout seconds | user-timeout user-timeout}

Syntax Description

Enables association request limit per access point slot at a given interval and configures the association request limit interval.	
You can configure number of association request per access point slot at a given interval from one through 100.	
You can configure client association request limit interval from 100 through 10000 milliseconds.	
Configures band select options for the client.	
Sets the client received signal strength indicator (RSSI) threshold for band select.	
Minimum dBm of a client RSSI to respond to probe between -90 and -20.	
Sets the band select probe cycle count.	
You can configure the cycle count from one through 10.	
Sets the time threshold for a new scanning cycle.	
You can configure the cycle threshold from one through 1000 milliseconds.	

expire dual-band timeout	Sets the timeout before stopping to try to push a given client to the 5-GHz band.	
	You can configure the timeout from 10 through 300 seconds, and the default value is 60 seconds.	
expire suppression timeout	Sets the expiration time for pruning previously known dual-band clients.	
	You can configure the suppression from 10 through 200 seconds, and the default timeout value is 20 seconds.	
max-user-login max-user-login	Configures the maximum number of login sessions for a user.	
timers auth-timeout seconds	Configures client timers.	
user-timeout user-timeout	Configures the idle client timeout.	

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to set the proble cycle count for band select to 8:

```
Device# configure terminal
Device(config)# wireless client band-select cycle-count 8
Device(config)# end
```

This example shows how to set the time threshold for a new scanning cycle with threshold value of 700 milliseconds:

```
Device# configure terminal
Device(config)# wireless client band-select cycle-threshold 700
Device(config)# end
```

This example shows how to suppress dual-band clients from the dual-band database after 70 seconds:

```
Device# configure terminal
Device(config)# wireless client band-select expire suppression 70
Device(config)# end
```

wireless client mac-address deauthenticate

To disconnect a wireless client, use the wireless client mac-address deauthenticate command in global configuration mode.

wirelessclientmac-address mac-addrdeauthenticate

Syntax Description

mac-address mac-addr Wireless client MAC address.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

This example shows how to disconnect a wireless client:

Device# configure terminal
Device(config)# wireless client mac-address 00:1f:ca:cf:b6:60 deauthenticate
Device(config)# end

wireless client mac-address

To configure the wireless client settings, use the **wireless client mac-address** command in global configuration mode.

wireless client mac-address mac-addr ccx {clear-reports | clear-results | default-gw-ping | dhcp-test | dns-ping | dns-resolve hostname host-name | get-client-capability | get-manufacturer-info | get-operating-parameters | get-profiles | log-request {roam | rsna | syslog} | send-message message-id | stats-request measurement-duration {dot11 | security} | test-abort | test-association ssid bssid dot11 channel | test-dot1x [profile-id] bssid dot11 channel | test-profile {anyprofile-id}}

Syntax Description

mac-addr	MAC address of the client.
ccx	Cisco client extension (CCX).
clear-reports	Clears the client reporting information.
clear-results	Clears the test results on the controller.
default-gw-ping	Sends a request to the client to perform the default gateway ping test.

dhcp-test	Sends a request to the client to perform the DHCP test.
dns-ping	Sends a request to the client to perform the Domain Name System (DNS) server IP address ping test.
dns-resolve hostname host-name	Sends a request to the client to perform the Domain Name System (DNS) resolution test to the specified hostname.
get-client-capability	Sends a request to the client to send its capability information.
get-manufacturer-info	Sends a request to the client to send the manufacturer's information.
get-operating-parameters	Sends a request to the client to send its current operating parameters.
get-profiles	Sends a request to the client to send its profiles.
log-request	Configures a CCX log request for a specified client device.
roam	(Optional) Specifies the request to specify the client CCX roaming log
rsna	(Optional) Specifies the request to specify the client CCX RSNA log.
syslog	(Optional) Specifies the request to specify the client CCX system log.

wireless client mac-address

send-message message-id

Sends a message to the client.

Message type that involves one of the following:

- 1—The SSID is invalid
- 2—The network settings are invalid.
- 3—There is a WLAN credibility mismatch.
- 4—The user credentials are incorrect.
- 5—Please call support.
- 6—The problem is resolved.
- 7—The problem has not been resolved.
- 8—Please try again later.
- 9—Please correct the indicated problem.
- 10—Troubleshooting is refused by the network.
- 11—Retrieving client reports.
- 12—Retrieving client logs.
- 13—Retrieval complete.
- 14—Beginning association test.
- 15—Beginning DHCP test.
- 16—Beginning network connectivity test.
- 17—Beginning DNS ping test.
- 18—Beginning name resolution test.
- 19—Beginning 802.1X authentication test.
- 20—Redirecting client to a specific profile.
- 21—Test complete.
- 22—Test passed.
- 23—Test failed.
- 24—Cancel diagnostic channel operation or select a WLAN profile to resume normal operation.
- 25—Log retrieval refused by the client.
- 26—Client report retrieval refused by the client.
- 27—Test request refused by the client.
- 28—Invalid network (IP) setting.
- 29—There is a known outage or problem with the network.

- 30—Scheduled maintenance period.
- 31—The WLAN security method is not correct.
- 32—The WLAN encryption method is not correct.
- 33—The WLAN authentication method is not correct.

· · · · · · · · · · · · · · · · · · ·	profile-id	Test profile name.	
chefit reporting is enabled.		Note	The profile ID should be from one of the client profiles for which client reporting is enabled.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

The **default-gw-ping** test does not require the client to use the diagnostic channel.

This example shows how to clear the reporting information of the client MAC address 00:1f:ca:cf:b6:60:

Device# configure terminal

```
Device(config) # wireless client mac-address 00:1f:ca:cf:b6:60 ccx clear-reports Device(config) # end
```

wireless load-balancing

To globally configure aggressive load balancing on the controller, use the **wireless load-balancing** command in global configuration mode.

wireless load-balancing {denial denial-count | window client-count}

and the default value is 5.

Syntax Description	denial denial-count	Specifies the number of association denials during load balancing.
		Maximum number of association denials during load balancing is from 1 to 10 and the default value is 3.
	window client-count	Specifies the aggressive load balancing client window, with the number of clients needed to trigger aggressive load balancing on a given access point.
		Aggressive load balancing client window with the number of clients is from 0 to 20

Command Default

Disabled.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines

Load-balancing-enabled WLANs do not support time-sensitive applications like voice and video because of roaming delays.

When you use Cisco 7921 and 7920 Wireless IP Phones with controllers, make sure that aggressive load balancing is disabled on the voice WLANs for each controller. Otherwise, the initial roam attempt by the phone might fail, causing a disruption in the audio path.

This example shows how to configure association denials during load balancing:

```
Device# configure terminal
Device(config)# wireless load-balancing denial 5
Device(config)# end
```

wireless sip preferred-call-no

To add a new preferred call or configure voice prioritization, use the **wireless sip preferred-call-no** command in global configuration mode. To remove a preferred call, use the **no** form of this command.

wireless sip preferred-call-no callIndex call-no no wireless sip preferred-call-no callIndex

Syntax Description

callIndex	Call index with valid values between 1 and 6.
call-no	Preferred call number that can contain up to 27 characters.

Command Default

No default behavior or values.

Command Modes

Global configuration

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3	SE This command was introduced.

Usage Guidelines

Before you configure voice prioritization, you must complete the following prerequisites:

- Set WLAN QoS to allow voice calls to pass through.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.

This example shows how to add a new preferred call or configure voice prioritization:

```
Device# configure terminal
Device(config)# wireless sip preferred-call-no 2 0123456789
Device(config)# end
```

writertc

To update the value of the Real Time Clock (RTC) setting, use the writertc command in boot loader mode.

writertc { $year(0-99) \mid month(1-12) \mid date(1-31) \mid hour(0-23) \mid min(0-59) \mid sec(0-59) \mid dayofweek(1-7)$ }

Syntax Description

year(0-99) 0 to 99. Century value is not used.

month(1-12)	1 to 12. 1 is January.
date(1-31	1 to 31.
hour(0-23)	0 to 23.
min(0-59)	0 to 59.
sec(0-59)	0 to 59.
dayofweek(1-7)	1 to 7. 1 is Monday.

Command Default

No default behavior or values.

Command Modes

Boot loader

Command History

Release	Modification
Cisco IOS XE 3.2SECisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Examples

This example shows how to set the current RTC setting as Wednesday 27th August 2013 at 11:45:10:
