### cts authorization list

To specify a list of authentication, authorization, and accounting (AAA) servers to be used by the TrustSec seed device, use the **cts authorization list** command on the Cisco TrustSec seed device in global configuration mode. Use the **no** form of the command to stop using the list during authentication.

```
cts authorization list server_list
```

	no cts authorization list server_list			
Syntax Description	server_list Cisco TrustSec AAA server group.			
Command Default	None			
Command Modes	Global configuration (config)			
	Supported User Roles			
	Administrator			
Command History	Release	Modification		
	Cisco IOS XE Denali 16.1.1	This command was introduced.		
Usage Guidelines	This command is only for the seed device. Non-seed device TrustSec authenticator peer as a component of their TrustSe			
	The following example displays an AAA configuration of a	TrustSec seed device:		
	Device# cts credentials id Device1 password Cisco123			
	De l'estil ses d'is se tesse i sella

Related Commands	Command	Description
	show cts server-list	Displays RADIUS server configurations.

### cts credentials

Use the **cts credentials** command in privileged EXEC mode to specify the TrustSec ID and password of the network device. Use the **clear cts credentials** command to delete the credentials.

	cts credentials id cts_id password cts_pwd	
Syntax Description	<b>credentials id</b> <i>cts_id</i> Specifies the Cisco TrustSec device ID for this device to use when authenticating with other Cisco TrustSec devices with EAP-FAST. The <i>cts-id</i> variable has a maximum length of 32 characters and is case sensitive.	

I

		es the password for this device to use when authenticating with other Cisco ec devices with EAP-FAST.
Command Default	None	
Command Modes	Privileged EXEC (#)	
	Supported User Roles

Related Commands	Command	Description
	clear cts credentials	Clears the Cisco TrustSec device ID and password.
	show cts credentials	Displays the state of the current Cisco TrustSec device ID and password.
	show cts keystore	Displays contents of the hardware and software keystores.

## cts refresh

To refresh the TrustSec peer authorization policy of all or specific Cisco TrustSec peers, or to refresh the SGACL policies downloaded to the device by the authentication server, use the **cts refresh** command in privileged EXEC mode.

Cuntov Description		
Syntax Description	environment-data	Refreshes environment data.
	peer Peer-ID	(Optional) If a peer-id is specified, only policies related to the specified peer connection are refreshed.
	<b>sgt</b> sgt_number	(Optional) Performs an immediate refresh of the SGACL policies from the authentication server.
		If an SGT number is specified, only policies related to that SGT are refreshed.
	default	(Optional) Refreshes the default SGACL policy.
	unknown	(Optional) Refreshes the unknown SGACL policy.
Command Default	None	
Command Modes	Privileged EXEC (	#)
	Supported User Ro	les
	Administrator	
Command History	Release	Modification
	Cisco IOS XE De	nali 16.1.1 This command was introduced.
Usage Guidelines	To refresh the Peer peer ID.	Authorization Policy on all TrustSec peers, enter <b>cts policy refresh</b> without specifying a

The peer authorization policy is initially downloaded from the Cisco ACS at the end of the EAP-FAST NDAC authentication success. The Cisco ACS is configured to refresh the peer authorization policy, but the **cts policy refresh** command can force immediate refresh of the policy before the Cisco ACS timer expires. This command is relevant only to TrustSec devices that can impose Security Group Tags (SGTs) and enforce Security Group Access Control Lists (SGACLs).

The following example shows how to refresh the TrustSec peer authorization policy of all peers:

```
Device# cts policy refresh
Policy refresh in progress
```

The following sample output displays the TrustSec peer authorization policy of all peers:

VSS-1# show cts policy peer

Related Commands	Command	Description
	clear cts policy	Clears all Cisco TrustSec policies, or by the peer ID or SGT.
	show cts policy peer	Displays peer authorization policy for all or specific TrustSec peers.

### cts rekey

To regenerate the Pairwise Master Key used by the Security Association Protocol (SAP), use the **cts rekey** privileged EXEC command.

cts rekey interface type slot/port

 Syntax Description
 interface type slot/port
 Specifies the Cisco TrustSec interface on which to regenerate the SAP key.

 Command Default
 None.

 Command Modes
 Privileged EXEC (#)

### Supported User Roles

Administrator

Command History	Release	Modification	
	Cisco IOS XE Denali 16.1.1	This command was introduced.	
Usage Guidelines	SAP Pair-wise Master Key key (PMK) refresh ordinarily network events and non-configurable internal timers relate refresh encryption keys is often part of network administr PMK refresh, use the <b>cts rekey</b> command.	ed to dot1X authentication. The ability to manually	
	TrustSec supports a manual configuration mode where dot1 encryption between switches. In this case, the PMK is ma link with the <b>sap pmk</b> Cisco TrustSec manual interface co	nually configured on devices on both ends of the	
	The following example shows how to regenerate the PMK on a specified interface:		
	Device# cts rekey interface gigabitEthernet 2/1		

<b>Related Commands</b>	Command	Description	
	sap mode-list (cts manual)	Configures Cisco TrustSec SAP for manual mode.	

### cts role-based enforcement

To enable role-based access control globally and on specific Layer 3 interfaces using Cisco TrustSec, use the **cts role-based enforcement** command in global configuration mode and interface configuration mode respectively. To disable the enforcement of role-based access control at an interface level, use the **no** form of this command.

cts role-based enforcement no cts role-based enforcement

Syntax Description	This command has no keywords or arguments.		
Command Default	Enforcement of role-based access control at an interface level is disabled globally.		
Command Modes	Global configuration (config)		
	Interface configuration (config-if)		
Command History	Release	Modification	-
	Cisco IOS XE Denali 16.1.1	This command was introduced.	-
Usage Guidelines	globally. Once role-based	access control is enabled globally,	uration mode enables role-based access control , it is automatically enabled on every Layer 3 on specific Layer 3 interfaces, use the <b>no</b> form

of the command in interface configuration mode. The **cts role-based enforcement** command in interface configuration mode enables enforcement of role-based access control on specific Layer 3 interfaces.

The attribute-based access control list organizes and manages the Cisco TrustSec access control on a network device. The security group access control list (SGACL) is a Layer 3-4 access control list to filter access based on the value of the security group tag (SGT). The filtering usually occurs at an egress port of the Cisco TrustSec domain. The terms role-based access control list (RBACL) and SGACL can be used interchangeably, and they refer to a topology-independent ACL used in an attribute-based access control (ABAC) policy model.

The following example shows how to enable role-based access control on a Gigabit Ethernet interface:

```
Device> enable
Device# configure terminal
Device(config)# interface gigabitethernet 1/1/3
Device(config-if)# cts role-based enforcement
Device(config-if)# end
```

### cts role-based l2-vrf

To select a virtual routing and forwarding (VRF) instance for Layer 2 VLANs, use the **cts role-based l2-vrf** command in global configuration mode. To remove the configuration, use the **no** form of this command.

cts role-based l2-vrf *vrf-name* vlan-list {all *vlan-ID*} [{,}] [{-}] no cts role-based l2-vrf *vrf-name* vlan-list {all *vlan-ID*} [{,}] [{-}]

Syntax Description	vrf-name Name o				
	vlan-list Specifie	es the list of VLANs to be assigned to a VR	RF instance.		
	all Specifie	es all VLANs.			
	vlan-ID VLAN	<i>un-ID</i> VLAN ID. Valid values are from 1 to 4094.			
	, (Option	nal) Specifies another VLAN separated by a	a comma.		
	- (Optional) Specifies a range of VLANs separated by a hyphen.				
Command Default	VRF instances are n	VRF instances are not selected.			
Command Modes	Global configuration	n (config)			
Command History	Release	Modification			
	Cisco IOS XE Den 16.1.1	This command was introduced.			
Usage Guidelines	The <i>vlan-list</i> argume VLAN ID ranges.	ent can be a single VLAN ID, a list of comm	na-separated VLAN IDs, or hyphen-separated		
	•	equivalent to the full range of VLANs supp the nonvolatile generation (NVGEN) process	orted by the network device. The <b>all</b> keyword ss.		

If the **cts role-based l2-vrf** command is issued more than once for the same VRF, each successive command entered adds the VLAN IDs to the specified VRF.

The VRF assignments configured by the **cts role-based l2-vrf** command are active as long as a VLAN remains a Layer 2 VLAN. The IP–SGT bindings learned while a VRF assignment is active are also added to the Forwarding Information Base (FIB) table associated with the VRF and the IP protocol version. If an Switched Virtual Interface (SVI) becomes active for a VLAN, the VRF-to-VLAN assignment becomes inactive and all bindings learned on the VLAN are moved to the FIB table associated with the VRF of the SVI.

Use the **interface vlan** command to configure an SVI interface, and the **vrf forwarding** command to associate a VRF instance to the interface.

The VRF-to-VLAN assignment is retained even when the assignment becomes inactive. It is reactivated when the SVI is removed or when the SVI IP address is changed. When reactivated, the IP–SGT bindings are moved back from the FIB table associated with the VRF of the SVI to the FIB table associated with the VRF assigned by the **cts role-based l2-vrf** command.

The following example shows how to select a list of VLANS to be assigned to a VRF instance:

Device(config) # cts role-based 12-vrf vrf1 vlan-list 20

The following example shows how to configure an SVI interface and associate a VRF instance:

```
Device(config)# interface vlan 101
Device(config-if)# vrf forwarding vrf1
```

Related Commands	Command	Description
	interface vlan	Configures a VLAN interface.
	vrf forwarding	Associates a VRF instance or a virtual network with an interface or subinterface.
	show cts role-based permissions	Displays the SGACL permission list.

### cts role-based monitor

all

To enable role-based (security-group) access list monitoring, use the **cts role-based monitor** command in global configuration mode. To remove role-based access list monitoring, use the **no** form of this command.

cts role-based monitor {all | permissions {default [{ipv4 | ipv6}] | from {sgt | unknown} to {sgt | unknown} [{ipv4 | ipv6}]}
no cts role-based monitor {all | permissions {default [{ipv4 | ipv6}] | from {sgt | unknown} to {sgt | unknown} to {sgt | unknown} [{ipv4 | ipv6}]}

Syntax Description

Monitors permissions for all source tags to all destination tags.

**permissions** Monitors permissions from a source tags to a destination tags.

	default	<b>default</b> Monitors the default permission list.				
	ipv4	ipv4 (Optional) Specifies the IPv4 protocol.				
	ipv6	<b>pv6</b> (Optional) Specifies the IPv6 protocol.				
	from	rom Specifies the source group tag for filtered traffic.				
	sgt	Security Group Ta	g (SGT). Valid values are f	rom 2 to 65	5519.	
	unknown	<b>nknown</b> Specifies an unknown source or destination group tag (DST).				
Command Default	Role-based a	ccess control monitor	ing is not enabled.			
Command Modes	Global config	Global configuration (config)				
Command History	Release	Modi	fication			
	Cisco IOS X 16.1.1	E Denali This of	command was introduced.			
Usage Guidelines	all command		tput of the show cts role-ba		mode. If the <b>cts role-based monitor</b> issions command displays monitor	
	The following examples shows how to configure SGACL monitor from a source tag to a destination tag:					
	Device(config) # cts role-based monitor permissions from 10 to 11					
Related Commands	Command		Description			
	show cts role					

# cts role-based permissions

default category.

To enable permissions from a source group to a destination group, use the **cts role-based permissions** command in global configuration mode. To remove the permissions, use the **no** form of this command.

 cts role-based permissions {default | from {sgt | unknown}to {sgt | unknown}} {sgt | unknown}} {sgt | unknown}} {sgt | unknown} {sgt | unknown}} {sgt | unknown} {sgt | unknown

	from Specifies the source group tag of the filtered traffic.					
	<i>sgt</i> Security Group Tag (SGT). Valid values are from 2 to 65519.					
	unknown	Specifies an unknow	n source or destination gr	oup tag.		
	rbacl-name	<i>acl-name</i> Role-based access control list (RBACL) or SGACL name. Up to 16 SGACLs can be specified in the configuration.				
	ipv4	Specifies the IPv4 p	rotocol.			
	ipv6	Specifies the IPv6 p	rotocol.			
Command Default	Permissions	from a source group t	o a destination group is no	ot enabled.		
Command Modes	Global configuration (config)					
Command History	Release	Modi	fication			
	Cisco IOS XE Denali This command was introduced. 16.1.1					
Usage Guidelines	Use the <b>cts role-based permissions</b> command to define, replace, or delete the list of SGACLs for a given source group tag (SGT), destination group tag (DGT) pair. This policy is in effect as long as there is no dynamic policy for the same DGT or SGT.					
	The <b>cts role-based permissions default</b> command defines, replaces, or deletes the list of SGACLs of the default policy as long as there is no dynamic policy for the same DGT.					
	The following example shows how to enable permissions for a destination group:					
	Device(config)# cts role-based permissions from 6 to 6 mon_2					
Related Commands	Command		Description			

show cts role-based permissions Displays the SGACL permission list.

### cts role-based sgt-map

To manually map a source IP address to a Security Group Tag (SGT) on either a host or a VRF, use the **cts role-based sgt-map** command in global configuration mode. Use the **no** form of the command to remove the mapping.

cts role-based sgt-map {ipv4\_netaddress | ipv6\_netaddress | ipv4\_netaddress/prefix | ipv6\_netaddress/prefix} sgt sgt-number cts role-based sgt-map host {ipv4\_hostaddress | ipv6\_hostaddress} sgt sgt-number cts role-based sgt-map vlan-list [{vlan\_ids | all}] sgt sgt-number cts role-based sgt-map vrf instance\_name {ipv4\_netaddress | ipv6\_netaddress | ipv4\_netaddress/prefix | ipv6\_netaddress/prefix | host {ipv4\_hostaddress | ipv6\_hostaddress}} sgt sgt-number no cts role-based sgt-map

Syntax Description	ipv4_netaddress   ipv6_netaddress		Specifies the network to be associated with an SGT. Enter IPv4 address in dot decimal notation; IPv6 in colon hexadecimal notation.		
	ipv4_netaddress/prefix   ipv6_netaddress/prefix host {ipv4_hostaddress   ipv6_hostaddress}		Maps the SGT to all hosts of the specified subnet address (IPv4 or IPv6). IPv4 is specified in dot decimal CIDR notation, IPv6 in colon hexadecimal notation		
			Binds the specified host IP address with the SGT. Enter the IPv4 address in dot decimal notation; IPv6 in colon hexadecimal notation.		
	<b>vlan-list</b> { <i>vlan_ids</i>   <b>al</b>	]}	<ul> <li>Specifies VLAN IDs.</li> <li>(Optional) <i>vlan_ids</i>: Individual VLAN IDs are separated by commas, a range of IDs specified with a hyphen.</li> </ul>		
			• (Optional) all: Specifies all VLAN IDs.		
	vrf instance_name sgt sgt-number		Specifies a VRF instance, previously created on the device.Specifies the SGT number from 0 to 65,535.		
					Command Default
Command Modes	- Global configuration (conf	fig)			
Command History	Release	Modific	ation		
	Cisco IOS XE Denali This con 16.1.1		nmand was introduced.		
Usage Guidelines	If you do not have a Cisco Identity Services Engine, Cisco Secure ACS, dynamic Address Resolution Protocol (ARP) inspection, Dynamic Host Control Protocol (DHCP) snooping, or Host Tracking available on your device to automatically map SGTs to source IP addresses, you can manually map an SGT to the following with the <b>cts role-based sgt-map</b> command:				
	• A single host IPv4 or IPv6 address				
	• All hosts of an IPv4 or IPv6 network or subnetwork				
	• VRFs				
	• Single or multiple VI	LANs			

The **cts role-based sgt-map** command binds the specified SGT with packets that fall within the specified network address.

SXP exports an exhaustive expansion of all possible individual IP–SGT bindings within the specified network or subnetwork. IPv6 bindings and subnet bindings are exported only to SXP listener peers of SXP version 2 or later. The expansion does not include host bindings which are known individually or are configured or learnt from SXP for any nested subnet bindings.

The **cts role-based sgt-map host** command binds the specified SGT with incoming packets when the IP source address is matched by the specified host address. This IP-SGT binding has the lowest priority and is ignored in the presence of any other dynamically discovered bindings from other sources (such as, SXP or locally authenticated hosts). The binding is used locally on the device for SGT imposition and SGACL enforcement. It is exported to SXP peers if it is the only binding known for the specified host IP address.

The **vrf** keyword specifies a virtual routing and forwarding table previously defined with the vrf definition global configuration command. The IP-SGT binding specified with the **cts role-based sgt-map vrf** global configuration command is entered into the IP-SGT table associated with the specified VRF and the IP protocol version which is implied by the type of IP address entered.

The **cts role-based sgt-map vlan-list** command binds an SGT with a specified VLAN or a set of VLANs. The keyword **all** is equivalent to the full range of VLANs supported by the device and is not preserved in the nonvolatile generation (NVGEN) process. The specified SGT is bound to incoming packets received in any of the specified VLANs. The system uses discovery methods such as DHCP and/or ARP snooping (a.k.a. IP device tracking) to discover active hosts in any of the VLANs mapped by this command. Alternatively, the system could map the subnet associated with the SVI of each VLAN to the specified SGT. SXP exports the resulting bindings as appropriate for the type of binding.

### **Examples** The following example shows how to manually map a source IP address to an SGT:

Device (config) # cts role-based sgt-map 10.10.1.1 sgt 77

In the following example, a device binds host IP address 10.1.2.1 to SGT 3 and 10.1.2.2 to SGT 4. These bindings are forwarded by SXP to an SGACL enforcement device.

Device(config) # cts role-based sgt-map host 10.1.2.1 sgt 3
Device(config) # cts role-based sgt-map host 10.1.2.2 sgt 4

Related Commands	Command	Description
	show cts role-based sgt-map	Displays role-based access control information.

### cts sxp connection peer

To enter the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) peer IP address, to specify if a password is used for the peer connection, to specify the global hold-time period for a listener or speaker device, and to specify if the connection is bidirectional, use the **cts sxp connection peer** command in global configuration mode. To remove these configurations for a peer connection, use the **no** form of this command.

cts sxp connection peer *ipv4-address* {source | password} {default | none} mode {local | peer} [{[[{listener | speaker}] [{hold-time minimum-time maximum-time | vrf vrf-name}]] | both [vrf vrf-name]}]

cts sxp connection peer *ipv4-address* {source | password} {default | none} mode {local | peer} [{[[{listener | speaker}] [{hold-time minimum-time maximum-time | vrf vrf-name}]] | both [vrf vrf-name]}]

Syntax Description	ipv4-address	SXP peer IPv4 address.		
	source	Specifies the source IPv4 address.		
	password	Specifies that an SXP password is used for the peer connection.		
	default	Specifies that the default SXP password is used.		
	none	Specifies no password is used.		
	mode	Specifies either the local or peer SXP connection mode.		
	local	Specifies that the SXP connection mode refers to the local device.		
	peer	Specifies that the SXP connection mode refers to the peer device.		
	listener	(Optional) Specifies that the device is the listener in the connection.		
	speaker	(Optional) Specifies that the device is the speaker in the connection.		
	<b>hold-time</b> <i>minimum-time maximum-time</i>	(Optional) Specifies the hold-time period, in seconds, for the device. The range for minimum and maximum time is from 0 to 65535.		
		A <i>maximum-time</i> value is required only when you use the following keywords: <b>peer speaker</b> and <b>local listener</b> . In other instances, only a <i>minimum-time</i> value is required.		
		<b>Note</b> If both minimum and maximum times are required, the <i>maximum-time</i> value must be greater than or equal to the <i>minimum-time</i> value.		
	vrf-name         (Optional) Specifies the virtual routing and forwarding (VRF) instance to the peer.			
	both	(Optional) Specifies that the device is both the speaker and the listener in the bidirectional SXP connection.		
Command Default	-	ss is not configured and no CTS-SXP peer password is used for the peer connection. S-SXP connection password is <b>none</b> .		
	-			
Command Modes	Global configuration (confi	g)		
Command History	Release	Modification		
	Cisco IOS XE Denali 16.1.1	This command was introduced.		
	10.1.1			

#### **Usage Guidelines**

When a CTS-SXP connection to a peer is configured with the **cts sxp connection peer** command, only the connection mode can be changed. The **vrf** keyword is optional. If a VRF name is not provided or a VRF name is provided with the **default** keyword, then the connection is set up in the default routing or forwarding domain.

A hold-time *maximum-period* value is required only when you use the following keywords: **peer speaker** and **local listener**. In other instances, only a **hold-time** *minimum-period* value is required.

**Note** The *maximum-period* value must be greater than or equal to the *minimum-period* value.

Use the **both** keyword to configure a bidirectional SXP connection. With the support for bidirectional SXP configuration, a peer can act as both a speaker and a listener and propagate SXP bindings in both directions using a single connection.

#### Examples

The following example shows how to enable CTS-SXP and configure the CTS-SXP peer connection on Device A, a speaker, for connection to Device B, a listener:

```
Device_A> enable
Device_A# configure terminal
Device_A# (config) # cts sxp enable
Device_A# (config) # cts sxp default password Ciscol23
Device_A# (config) # cts sxp default source-ip 10.10.1.1
Device_A# (config) # cts sxp connection peer 10.20.2.2 password default mode local speaker
```

The following example shows how to configure the CTS-SXP peer connection on Device\_B, a listener, for connection to Device\_A, a speaker:

```
Device_B> enable
Device_B# configure terminal
Device_B(config) # cts sxp enable
Device_B(config) # cts sxp default password Ciscol23
Device_B(config) # cts sxp default source-ip 10.20.2.2
Device B(config) # cts sxp connection peer 10.10.1.1 password default mode local listener
```

You can also configure both peer and source IP addresses for an SXP connection. The source IP address specified in the **cts sxp connection** command overwrites the default value.

Device\_B(config) # cts sxp connection peer 51.51.51.2 source 51.51.51.1 password none mode local listener

The following example shows how to enable bidirectional CTS-SXP and configure the SXP peer connection on Device\_A to connect to Device\_B:

```
Device_A> enable
Device_A# configure terminal
Device_A# (config) # cts sxp enable
Device_A# (config) # cts sxp default password Cisco123
Device_A# (config) # cts sxp default source-ip 10.10.1.1
Device_A# (config) # cts sxp connection peer 10.20.2.2 password default mode local both
```

Related Commands	Command	Description
	cts sxp default password	Configures the Cisco TrustSec SXP default password.
	cts sxp default source-ip	Configures the Cisco TrustSec SXP source IPv4 address.
	cts sxp enable	Enables Cisco TrustSec SXP on a device.
	cts sxp log	Enables logging for IP-to-SGT binding changes.
	cts sxp reconciliation	Changes the Cisco TrustSec SXP reconciliation period.
	cts sxp retry	Changes the Cisco TrustSec SXP retry period timer.
	cts sxp speaker hold-time	Configures the global hold-time period of a speaker device in a Cisco TrustSec SGT SXPv4 network.
	cts sxp listener hold-time	Configures the global hold-time period of a listener device in a Cisco TrustSec SGT SXPv4 network.
	show cts sxp	Displays the status of all Cisco TrustSec SXP configurations.

### cts sxp default password

To specify the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) default password, use the **cts sxp default password** command in global configuration mode. To remove the CTS-SXP default password, use the **no** form of this command.

cts sxp default password {0 unencrypted-pwd | 6 encrypted-key | 7 encrypted-keycleartext-pwd} no cts sxp default password {0 unencrypted-pwd | 6 encrypted-key | 7 encrypted-keycleartext-pwd}

Syntax Description	<b>0</b> unencrypted-pwd	Specifies that an unencrypted CTS-SXP default password follows. The maximum password length is 32 characters.
6 encrypted-ke		Specifies that a 6 encryption type password is used as the CTS-SXP default password. The maximum password length is 32 characters.
	7 encrypted-key	Specifies that a 7 encryption type password is used as the CTS-SXP default password. The maximum password length is 32 characters.
	cleartext-pwd	Specifies a cleartext CTS-SXP default password. The maximum password length is 32 characters.

### Command Default Type 0 (cleartext)

#### **Command Modes**

Global configuration (config)

Command History	Release	Modification			
	Cisco IOS XE Denali 16.1.1	This command was introduced.			
Usage Guidelines	The <b>cts sxp default password</b> command sets the CTS-SXP default password to be optionally used for all CTS-SXP connections configured on the device. The CTS-SXP password can be cleartext, or encrypted with the <b>0</b> , <b>7</b> , <b>6</b> encryption type keywords. If the encryption type is 0, then an unencrypted cleartext password follows.				
Examples	The following example shows how to enable CTS-SXP and configure the CTS-SXP peer connection on Device_A, a speaker, for connection to Device_B, a listener:				
	Device_A# configure terminal Device_A#(config)# cts sxp enable Device_A#(config)# cts sxp default password Cisco123 Device_A#(config)# cts sxp default source-ip 10.10.1.1 Device_A#(config)# cts sxp connection peer 10.20.2.2 password default mode local speaker				
	The following example shows how to configure the CTS-SXP peer connection on Device_B, a listener, for connection to Device_A, a speaker:				
	Device B(config)# cts	<pre>sxp enable sxp default password Ciscol23 sxp default source-ip 10.20.2</pre>	2.2 . password default mode local listener		
Related Commands	Command	Description			

Enters the CTS-SXP peer IP address and specifies if a password is used for the peer connection.
Configures the CTS-SXP source IPv4 address.
Enables CTS-SXP on a device.
Enables logging for IP-to-SGT binding changes.
Changes the CTS-SXP reconciliation period.
Changes the CTS-SXP retry period timer.
Displays the status of all SXP configurations.

## cts sxp default source-ip

To configure the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) source IPv4 address, use the **cts sxp default source-ip** command in global configuration mode. To remove the CTS-SXP default source IP address, use the **no** form of this command.

	cts sxp default source-ip <i>ipv4-address</i> no cts sxp default source-ip <i>ipv4-address</i>			
Syntax Description	ip-address	Default source	CTS-SXP IPv4 address.	
Command Default	The CTS-SXP source IP address is not configured.			
Command Modes	Global configuration (config)			
Command History	Delesse		Madification	

Command History	Release	Modification
	Cisco IOS XE Denali 16.1.1	This command was introduced.

#### **Usage Guidelines**

The cts sxp default source-ip command sets the default source IP address that CTS-SXP uses for all new TCP connections where a source IP address is not specified. Preexisting TCP connections are not affected when this command is entered. CTS-SXP connections are governed by three timers:

- Retry timer
- · Delete Hold Down timer
- Reconciliation timer

#### **Examples**

The following example shows how to enable CTS-SXP and configure the CTS-SXP peer connection on Device\_A, a speaker, for connection to Device\_B, a listener:

```
Device A# configure terminal
Device A#(config)# cts sxp enable
Device A#(config)# cts sxp default password Cisco123
Device_A#(config)# cts sxp default source-ip 10.10.1.1
Device_A#(config)# cts sxp connection peer 10.20.2.2 password default mode local speaker
```

The following example shows how to configure the CTS-SXP peer connection on Device B, a listener, for connection to Device A, a speaker:

```
Device_B# configure terminal
Device B(config) # cts sxp enable
Device B(config) # cts sxp default password Cisco123
Device_B(config) # cts sxp default source-ip 10.20.2.2
Device B(config) # cts sxp connection peer 10.10.1.1 password default mode local listener
```

Related Commands	Command	Description
	cts sxp connectionpeer	Enters the CTS-SXP peer IP address and specifies if a password is used for the peer connection.
	cts sxp default password	Configures the CTS-SXP default password.
	cts sxp enable	Enables CTS-SXP on a device.

Command	Description	
cts sxp log	Enables logging for IP-to-SGT binding changes.	
cts sxp reconciliationChanges the CTS-SXP reconciliation period.		
cts sxp retryChanges the CTS-SXP retry period timer.		
show cts sxpDisplays the status of all SXP configurations.		

### cts sxp filter-enable

To enable filtering after creating filter lists and filter groups, use the **cts sxp filter-enable** command in global configuration mode. To disable filtering, use the **no** form of the command.

cts sxp filter-enable

no cts sxp filter-enable

Syntax Description	This command has no keywords or arguments.		
Command Modes	Global configuration (con	nfig)	
Command History	Release	Modification	
	Cisco IOS XE Denali 16.1.1	This command was introduced.	
Usage Guidelines	This command can be used at any time to enable or disable filtering. Configured filter lists and filter group can be used to implement filtering only after filtering is enabled. The filter action will only filter bindings that are exchanged after filtering is enabled; there won't be any effect on the bindings that were exchanged befor filtering was enabled.		

**Examples** Device (config) # cts sxp filter-enable

Related Commands	Command	Description
	cts sxp filter-list	Creates a SXP filter list to filter IP-SGT bindings based on IP prefixes, SGT or a combination of both.
	cts sxp filter-group	Creates a filter group for grouping a set of peers and applying a filter list to them.
	show cts sxp filter-group	Displays information about the configured filter groups
	show cts sxp filter-list	Displays information about the configured filter lists.
	debug cts sxp filter events	Logs events related to the creation, deletion and update of filter-lists and filter-groups

### cts sxp filter-group

To create a filter group for grouping a set of peers and applying a filter list to them, use the **cts sxp filter-group** command in global configuration mode. To delete a filter group, use the **no** form of this command.

**cts sxp filter-group** {**listener** | **speaker**} {*filter-group-name* | **global** *filter-list-name*} **no cts sxp filter-group** {**listener** | **speaker**} {*filter-group-name* | **global** *filter-list-name*}

Syntax Description	listener	Creates a filter group for a set of listeners.
	speaker	Creates a filter group for a set of speakers.
	global	Groups all speakers or listeners on the device.
	filter-group-name	Name of the filter group.
	filter-list-name	Name of the filter list.

#### **Command Modes**

Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Denali 16.1.1	This command was introduced.

**Usage Guidelines** Issuing this command, places the device in the filter group configuration mode. From this mode, you can specify the devices to be grouped and apply a filter list to the filter group.

The command format to add devices or peers to the group is a follows:

#### peer ipv4 peer-IP

In a single command, you can add one peer. To add more peers, repeat the command as many times as required.

The command format to apply a filter list to the group is as follows:

#### filter filter-list-name

You cannot specify a peer list for the global listener and global speaker filter-group options because in this case the filter is applied to all SXP connections.

When both the global filter group and peer-based filter groups are applied, the global filter takes priority. If only a global listener or global speaker filter group is configured, then the global filtering takes precendence only in that specific direction. For the other direction, the peer-based filter group is implemented.

#### **Examples**

The following example shows how to create a listener group called **group\_1**, and assign peers and a filter list to this group:

```
Device# configure terminal
Device(config)# cts sxp filter-group listener group_1
Device(config-filter-group)# filter filter 1
```

```
Device(config-filter-group)# peer ipv4 10.0.0.1
Device(config-filter-group)# peer ipv4 10.10.10.1
```

The following example shows how to create a global listener group called **group 2**:

```
Device# configure terminal
Device(config)# cts sxp filter-group listener global group_2
```

Related	Commands
---------	----------

Command	Description
cts sxp filter-list	Creates a SXP filter list to filter IP-SGT bindings based on IP prefixes, SGT or a combination of both.
cts sxp filter-enable	Enables filtering.
show cts sxp filter-group	Displays information about the configured filter groups.
show cts sxp filter-list	Displays information about the configured filter lists.
debug cts sxp filter events	Logs events related to the creation, deletion and update of filter-lists and filter-groups

### cts sxp filter-list

To create a SXP filter list to hold a set of filter rules for filtering IP-SGT bindings, use the **cts sxp filter-list** command in global configuration mode. To delete a filter list, use the **no** form of the command.

cts sxp filter-list filter-list-name no cts sxp filter-list filter-list-name

Syntax Description	filter-list-name Name of t	he filter-list.	
Command Modes	- Global configuration (con	fig)	
Command History	Release	Modification	
	Cisco IOS XE Denali 16.1.1	This command was introduced.	
Usage Guidelines	- Issuing this command, pla rules for the filter lists.	ces the device in the filter list confi	guration mode. From this mode, you can specify
	A filter rule can be based	on SGT or IP Prefixes or a combin	ation of both SGT and IP Prefixes.
	The command format to a	dd rules to the group is a follows:	
	sequence-number action	(permit/deny) filter-type(ipv4/ip	<b>v6/sgt)</b> value/values
	For example, to permit SC	GT-IP bindings whose SGT value i	s 20, the rule is as follows:
	30 permit sgt 20		
	50 permit Sgt 20		

Related Commands	Command	Command Description		
	Device# configure terminal Device(config)# cts sxp filter-list filter_1 Device (config-filter-list)# 10 deny ipv4 10.0.0.1/24 permit sgt 100 Device(config-filter-list)# 20 permit sgt 60 61 62 63			
Examples	The following example shows how to create a filter list and add some rules to the list:			
	Device(config-filter-list)# 10 deny 10.0.0.1/24 permit sgt 30 20			
	Similarly, in the rule below the binding with the sgt value 20 will be permitted even if the sgt of the IP prefix 10.0.0.1 is 20, and the first action does not permit the binding.			
	Device(config-filter-li	.st)# 10 permit sgt 30 20 deny 10.0.0.1/24		
	In a SGT and IP prefix combination rule, if there is a match for the binding in both the parts of the rule, then the action specified in the second part of the rule takes precedence. For example, in the following rule, if the SGT value of the IP prefix 10.0.0.1 is 20, the corresponding binding will be denied even if the first part of the rule permits the binding.			
	The range of valid SGT values is between 2 and 65519. To provide multiple SGT values in a rule, seperate the values using a space. A maximum of 8 SGT values are allowed in a rule.			
	Note that the sequence number is optional. If you do not specify a sequence number, it is generated by the system. Sequence numbers are automatically incremented by a value of 10 from the last used/configured sequence number. A new rule can be inserted by specifying a sequence number in between two existing rules.			

Related Commands	Command	Description
	cts sxp filter-enable	Enable SXP IP-prefix and SGT-based filtering.
	cts sxp filter-group	Creates a filter group for grouping a set of peers and applying a filter list to them.

	show cts sxp filter-list	Displays information about the configured filter lists.
	debug cts sxp filter events	Logs events related to the creation, deletion and update of filter-lists and filter-groups.

### cts sxp log binding-changes

To enable logging for IP-to-Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) binding changes, use the **cts sxp log binding-changes** command in global configuration mode. To disable logging, use the **no** form of this command.

cts sxp log binding-changes no cts sxp log binding-changes

**Command Default** Logging is disabled.

Command Modes	- Global configuration (confi	g)		
Command History	Release	Modification		
	Cisco IOS XE Denali 16.1.1	This command was introduced.		
Usage Guidelines		whenever IP address-to-SGT bind	for IP-to-SGT binding changes. SXP syslogs ling occurs (add, delete, change). These changes	
Related Commands	Command	Description		
	cts sxp connectionpeer	eer Enters the CTS-SXP peer IP address and specifies if a password is used peer connection

### cts sxp reconciliation period

To change the Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) reconciliation period, use the **cts sxp reconciliation period** command in global configuration mode. To return the CTS-SXP reconciliation period to its default value, use the **no** form of this command.

cts sxp reconciliation period seconds no cts sxp reconciliation period seconds

Syntax Description	seconds CTS-SXP reconciliation timer in seconds. The range is from 0 to 64000. The default is 120.		
Command Default	120 seconds (2 minutes)		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Denali 16.1.1	This command was introduced.	

#### Usage Guidelines

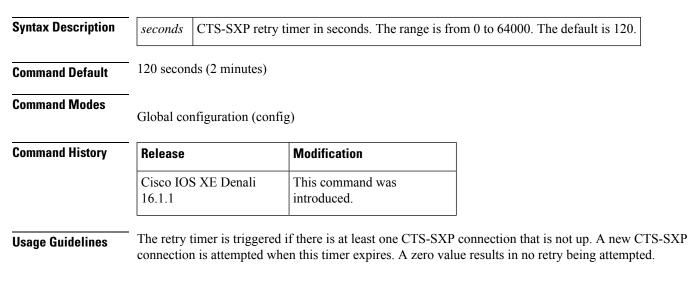

After a peer terminates a CTS-SXP connection, an internal delete hold-down timer starts. If the peer reconnects before the delete hold-down timer expires, then the CTS-SXP reconciliation timer starts. While the CTS-SXP reconciliation period timer is active, the CTS-SXP software retains the SGT mapping entries learned from the previous connection and removes invalid entries. Setting the SXP reconciliation period to 0 seconds disables the timer and causes all entries from the previous connection to be removed.

Related Commands	Command	Description
	cts sxp connection peer	Enters the CTS-SXP peer IP address and specifies if a password is used for the peer connection.
	cts sxp default password	Configures the CTS-SXP default password.

	cts sxp log	Enables logging for IP-to-SGT binding changes.
	cts sxp reconciliation	Changes the CTS-SXP reconciliation period.
	show cts sxp	Displays the status of all CTS-SXP configurations.

### propagate sgt (cts manual)

To enable Security Group Tag (SGT) propagation at Layer 2 on Cisco TrustSec Security (CTS) interfaces, use the **propagate sgt** command in interface configuration mode. To disable SGT propagation, use the **no** form of this command.

	propagate sgt				
Syntax Description	This command has no arguments or keywords.				
Command Default	SGT processing propagat	SGT processing propagation is enabled.			
Command Modes	CTS manual interface cor	nfiguration mode (config-if-cts-mar	uual)		
Command History	Release	Release Modification			
	Cisco IOS XE Denali 16.1.1	This command was introduced.			
Usage Guidelines	SGT processing propagation allows a CTS-capable interface to accept and transmit a CTS Meta Data (CMD) based L2 SGT tag. The <b>no propagate sgt</b> command can be used to disable SGT propagation on an interface in situations where a peer device is not capable of receiving an SGT, and as a result, the SGT tag cannot be put in the L2 header.				
Examples	The following example shows how to disable SGT propagation on a manually-configured TrustSec-capable interface:				
	Device# <b>configure terminal</b> Device(config)# <b>interface gigabitethernet 0</b> Device(config-if)# <b>cts manual</b> Device(config-if-cts-manual)# <b>no propagate sgt</b>				
	The following example shows that SGT propagation is disabled on Gigabit Ethernet interface 0:				

```
Device#show cts interface brief

Global Dot1x feature is Disabled

Interface GigabitEthernet0:

CTS is enabled, mode: MANUAL

IFC state: OPEN

Authentication Status: NOT APPLICABLE

Peer identity: "unknown"

Peer's advertised capabilities: ""

```

Related Commands	Command	Description
	cts manual	Enables an interface for CTS.
	show cts interface	Displays Cisco TrustSec states and statistics per interface.

### show cts credentials

To display the Cisco TrustSec (CTS) device ID, use the **show cts credentials** command in EXEC or privileged EXEC mode.

#### show cts credentials

**Syntax Description** This command has no commands or keywords.

**Command Modes** 

Privileged EXEC (#) User EXEC (>)

Command History	Release	Modification
	Cisco IOS XE Denali 16.1.1	This command was introduced.

**Examples** The following example displays output:

```
Device# show cts credentials
```

CTS password is defined in keystore, device-id = r4

Related Commands	Command	Description	
	cts credentials	Specifies the TrustSec ID and password.	

### show cts interface

To display Cisco TrustSec (CTS) configuration statistics for an interface(s), use the **show cts interface** command in EXEC or privileged EXEC mode.

**show cts interface** [{**GigabitEthernet** *port* | **Vlan** *number* | **brief** | **summary**}]

Syntax Description	port	<i>rt</i> (Optional) Gigabit Ethernet interface number. A verbose status output for this interface is returned.			
	number	(Optional) V	LAN interface number f	from 1 to 4095.	
	brief	(Optional) D	isplays abbreviated statu	tus for all CTS interfaces.	
	summary	(Optional) Displays a tabular summary of all CTS interfaces with 4 or 5 key status fields for each interface.			
Command Default	None				
Command Modes	EXEC (>) Privileged l	EXEC (#)			
Command History	Release		Modification		
	Cisco IOS 16.1.1	XE Denali	This command was i	introduced.	
Usage Guidelines	Use the sho	w cts interfac	e command without key	eywords to display verbose status for all CTS interfaces.	
Examples	The followi	ng example dis	plays output without usin	ing a keyword (verbose status for all CTS interfaces):	
	Device# show cts interface				
	<pre>Global Dot1x feature is Disabled Interface GigabitEthernet0/1/0: CTS is enabled, mode: MANUAL IFC state: OPEN Interface Active for 00:00:18.232 Authentication Status: NOT APPLICABLE Peer identity: "unknown" Peer's advertised capabilities: "" Authorization Status: NOT APPLICABLE SAP Status: NOT APPLICABLE Configured pairwise ciphers: gcm-encrypt null</pre>				
	Replay protection: enabled Replay protection mode: STRICT

The following example displays output using the **brief** keyword:

Device# show cts interface brief Global Dot1x feature is Disabled Interface GigabitEthernet0/1/0: CTS is enabled, mode: MANUAL IFC state: OPEN Interface Active for 00:00:40.386 Authentication Status: NOT APPLICABLE Peer identity: "unknown" Peer's advertised capabilities: "" Authorization Status: NOT APPLICABLE SAP Status: NOT APPLICABLE Propagate SGT: Enabled Cache Info: Cache applied to link : NONE

Related Commands	Command	Description
	cts manual	Enables an interface for CTS.
	<b>cts sxp enable</b> Configures SXP on a network device.	
	propagate sgt	Enables Security Group Tag (SGT) propagation at Layer 2 on Cisco TrustSec Security (CTS) interfaces.

### show cts role-based permissions

To display the role-based (security group) access control permission list, use the **show cts role-based permissions** command in privileged EXEC mode.

show cts role-based permissions [{default [{details | ipv4 [details] | ipv6 [details]}] | from {{sgt | unknown }[{ipv4 | ipv6 | to {{sgt | unknown}[{details | ipv4 [details] | ipv6 [details]}]}] | ipv4 | ipv6 | platform | to {sgt | unknown}[{ipv4 | ipv6}]}]

Syntax Description	default	(Optional) Displays information about the default permission list.		
-	details	(Optional) Displays attached access control list (ACL) details.		
-	ipv4	(Optional) Displays information about the IPv4 protocol.		
-	ipv6	(Optional) Displays information about the IPv6 protocol.		
-	from	(Optional) Displays information about the source group.		
-	sgt	(Optional) Security Group Tag. Valid values are from 2 to 65519.		
-	to	(Optional) Displays information about the destination group.		
-	unknown	(Optional) Displays information about unknown source and destination groups.		
-	platform	(Optional) Displays information about the platform.		
Command Modes F	Privileged I	EXE (#)

    mon_1
IPv4 Role-based permissions from group 10 to group 11 (configured):
    mon_2
RBACL Monitor All for Dynamic Policies : FALSE
RBACL Monitor All for Configured Policies : FALSE
```

Related Commands	Command	Description
	cts role-based permissions	Enables permissions from a source group to a destination group.
	cts role-based monitor	Enables role-based access list monitoring.

### show cts server-list

To display the list of RADIUS servers available to Cisco TrustSec (CTS) seed and nonseed devices, use the **show cts server-list** command in user EXEC or privileged EXEC mode.

show cts server-list

**Syntax Description** This command has no commands or keywords.

**Command Modes** 

Privileged EXEC (#) User EXEC (>)

Command History	Release	Modification
	Cisco IOS XE Denali 16.1.1	This command was introduced.

**Usage Guidelines** This command is useful for gathering CTS RADIUS server address and status information.

```
Examples
```

The following example displays the CTS RADIUS server list:

```
Device> show cts server-list
CTS Server Radius Load Balance = DISABLED
Server Group Deadtime = 20 secs (default)
Global Server Liveness Automated Test Deadtime = 20 secs
Global Server Liveness Automated Test Idle Time = 60 mins
Global Server Liveness Automated Test = ENABLED (default)
Preferred list, 1 server(s):
 *Server: 10.0.1.6, port 1812, A-ID 1100E046659D4275B644BF946EFA49CD
Status = ALIVE
auto-test = TRUE, idle-time = 60 mins, deadtime = 20 secs
```

Installed	list: ACSSer	verLis	st1-000	)1, 1	serv	ver(s):				
*Server:	101.0.2.61,	port 1	L812, A	A-ID	1100E	046659	D4275B644	BF946	EFA49C	D
	Status = ALI	VE								
	auto-test =	TRUE,	idle-t	ime	= 60	mins,	deadtime	= 20	secs	

### **Related Commands**

s	Command	Description	
	<b>.</b>	Configures the RADIUS server accounting and authentication parameters for PAC provisioning.	
	pac key	Specifies the PAC encryption key.	

### show cts sxp

To display Cisco TrustSec Security Group Tag (SGT) Exchange Protocol (CTS-SXP) connection or source IP-to-SGT mapping information, use the **show cts sxp** command in user EXEC or privileged EXEC mode.

show cts sxp {connections [{brief | vrf instance-name}] | filter-group [{detailed | global | listener
| speaker }] | filter-list filter-list-name | sgt-map [{brief | vrf instance-name}]} [{brief | vrf
instance-name}]

Syntax Description	connections	Displays Cisco TrustSec SXP connections information.		
	brief	(Optional) Displays an abbreviation of the SXP information.		
	vrf instance-name	(Optional) Displays the SXP information for the specified Virtual Routing and Forwarding (VRF) instance name.		
	filter-group {detailed   global   listener   speaker }	(Optional) Displays filter group information.		
	filter-list filter-list-name	(Optional) Displays filter list information.		
	sgt-map	(Optional) Displays the IP-to-SGT mappings received through SXP.		

**Command Default** None

#### **Command Modes**

User EXEC (>) Privileged EXEC (#)

<b>Command History</b>	Release	Modification		
	Cisco IOS XE Denali 16.1.1	This command was introduced.		

#### Examples

The following example displays the SXP connections using the **brief** keyword:

#### Device# show cts sxp connection brief SXP : Enabled Default Password : Set Default Source IP: Not Set Connection retry open period: 10 secs Reconcile period: 120 secs Retry open timer is not running \_\_\_\_\_ \_\_\_\_\_ Peer\_IP Source\_IP Conn Status Duration \_\_\_\_\_ 10.10.10.1 10.10.10.2 On 10.10.2.1 10.10.2.2 On 0:00:02:14 (dd:hr:mm:sec) 0:00:02:14 (dd:hr:mm:sec) Total num of SXP Connections = 2

The following example displays the CTS-SXP connections:

```
Device# show cts sxp connections
```

: Enabled Default Password : Set Default Source IP: Not Set Connection retry open period: 10 secs Reconcile period: 120 secs Retry open timer is not running \_\_\_\_\_ Peer IP : 10.10.10.1 Source IP : 10.10.10.2 Source IP : Peer Set up Conn status : On Connection mode : SXP Listener Connection inst# : 1 TCP conn fd : 1 TCP conn password: not set (using default SXP password) Duration since last state change: 0:00:01:25 (dd:hr:mm:sec) \_\_\_\_\_ Peer IP : 10.10.2.1 Source IP : 10.10.2.2 : Peer Set up Conn status : On Connection mode : SXP Listener TCP conn fd : 2 TCP conn password: not set (using default SXP password) Duration since last state change: 0:00:01:25 (dd:hr:mm:sec) Total num of SXP Connections = 2

The following example displays the CTS-SXP connections for a bi-directional connection when the device is both the speaker and listener:

Device# show cts sxp connections

```
Source IP : 1.0.0.2
Conn status : On (Speaker) :: On (Listener)
Conn version : 4
Local mode : Both
Connection inst# : 1
TCP conn fd : 1(Speaker) 3(Listener)
TCP conn password: default SXP password
Duration since last state change: 1:03:38:03 (dd:hr:mm:sec) :: 0:00:00:46 (dd:hr:mm:sec)
```

The following example displays output from a CTS-SXP listener with a torn down connection to the SXP speaker. Source IP-to-SGT mappings are held for 120 seconds, the default value of the delete hold down timer.

```
Device# show cts sxp connections
```

```
SXP
                : Enabled
Default Password : Set
Default Source IP: Not Set
Connection retry open period: 10 secs
Reconcile period: 120 secs
Retry open timer is not running
_____
Peer TP
              : 10.10.10.1
             : 10.10.10.2
