

# iPXE

---

iPXE is an enhanced version of the Pre-boot eXecution Environment (PXE), which is an open standard for network booting. This module describes the iPXE feature and how to configure it.

- [Finding Feature Information, on page 1](#)
- [Information About iPXE, on page 1](#)
- [How to Configure iPXE, on page 8](#)
- [Configuration Examples for iPXE, on page 10](#)
- [Troubleshooting Tips for iPXE, on page 12](#)
- [Additional References for iPXE, on page 13](#)
- [Feature Information for iPXE, on page 14](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <https://cfng.cisco.com/>. An account on Cisco.com is not required.

## Information About iPXE

### About iPXE

iPXE is an enhanced version of the Pre-boot eXecution Environment (PXE), which is an open standard for network booting.

iPXE netboot provides:

- IPv4 and IPv6 protocols
- FTP/HTTP/TFTP boot image download
- Embedded scripts into the image

- Stateless address auto-configuration (SLAAC) and stateful IP auto-configuration variants for Dynamic Host Configuration Protocol Version 6 (DHCPv6), boot URI, and parameters for DHCPv6 options depending on the IPv6 router advertisement.

### Netboot Requirements

The following are the primary requirements for netbooting:

- DHCP server with proper configuration.
- Boot image available on the FTP/HTTP/TFTP server.
- Device configured to boot from a network-based source.

## iPXE Overview

Network bootloaders support booting from a network-based source. The bootloaders boot an image located on an HTTP, FTP, or TFTP server. A network boot source is detected automatically by using an iPXE-like solution.

iPXE enables network boot for a device that is offline. The following are the three types of iPXE boot modes:

- **iPXE Timeout**—Configures a timeout in seconds for iPXE network boot by using the `IPXE_TIMEOUT` rommon variable. When the timeout expires, device boot is activated.
- **iPXE Forever**—Boots through iPXE network boot. The device sends DHCP requests forever, when the **boot ipxe forever** command is configured. This is an iPXE-only boot (which means that the bootloader will not fall back to a device boot or a command prompt, because it will send DHCP requests forever until it receives a valid DHCP response.)
- **Device**—Boots using the local device `BOOT` line configured on it. When device boot is configured, the configured `IPXE_TIMEOUT` rommon variable is ignored. Device boot is the default boot mode.

---

**Note**

Manual boot is another term used in this document. Manual boot is a flag that determines whether to do a rommon reload or not. When the device is in rommon mode, you have to manually issue the **boot** command.

If manual boot is set to 1, the rommon or device prompt is activated. If manual boot is set to 0, the device is reloaded; but rommon mode is not activated.

---

The following section describes how an iPXE bootloader works:

Figure 1: iPXE Bootloader Workflow

1. Bootloader sends a DHCP request.
2. The DHCP response includes the IP address and boot file name. The boot file name indicates that the boot image is to be retrieved from a TFTP server (`tftp://server/filename`), FTP server (`ftp://userid:password@server/filename`), or an HTTP server (`http://server/filename`). Because the current iPXE implementation works only via the management port (GigabitEthernet0/0), DHCP requests sent through the front panel ports are not supported.
3. Bootloader downloads and boots the image from the network source.
4. If no DHCP response is received, the bootloader keeps sending DHCP requests forever or for a specified period of time, based on the boot mode configured. When a timeout occurs, the bootloader reverts to a device-based boot. The device sends DHCP requests forever only if the configured boot mode is **ipxe-forever**. If the **ipxe-timeout** boot mode command is configured, DHCP requests are sent for the specified amount of time, and when the timeout expires, device boot mode is activated.

When manual boot is disabled, the bootloader determines whether to execute a device boot or a network boot based on the configured value of the iPXE ROMMON variable. Irrespective of whether manual boot is enabled or disabled, the bootloader uses the BOOTMODE variable to determine whether to do a device boot or a network boot. Manual boot means that the user has to manually type the **boot manual switch** command to start the boot process. When manual boot is disabled, and when the device reloads, the boot process starts automatically.

When iPXE is disabled, the contents of the existing BOOT variable are used to determine how to boot the device. The BOOT variable may contain a network-based uniform resource identifier (URI) (for example, `http://`, `ftp://`, `tftp://`), and a network boot is initiated; however DHCP is not used to get the network image path. The device IP address is taken from the IP\_ADDR variable. The BOOT variable may also contain a device-based path, in which case, a device-based boot is initiated.

To identify the device on a remote DHCP server for booting purposes, use the chassis serial number (available in DHCP option 61), the Product ID (PID) (available in DHCP Option 60), or the device MAC Address. The **show inventory** and **show switch** commands also display these values on the device.

The following is sample output from the show inventory command:

```
Device# show inventory

NAME:"c38xx Stack", DESCR:"c38xx Stack"
PID:WS-3850-12X-48U-L, VID:V01 , SN:F0C1911V01A

NAME:"Switch 1", DESCR:"WS-C3850-12X48U-L"
PID:WS-C3850-12X48U-L, VID:V01 , SN:F0C1911V01A

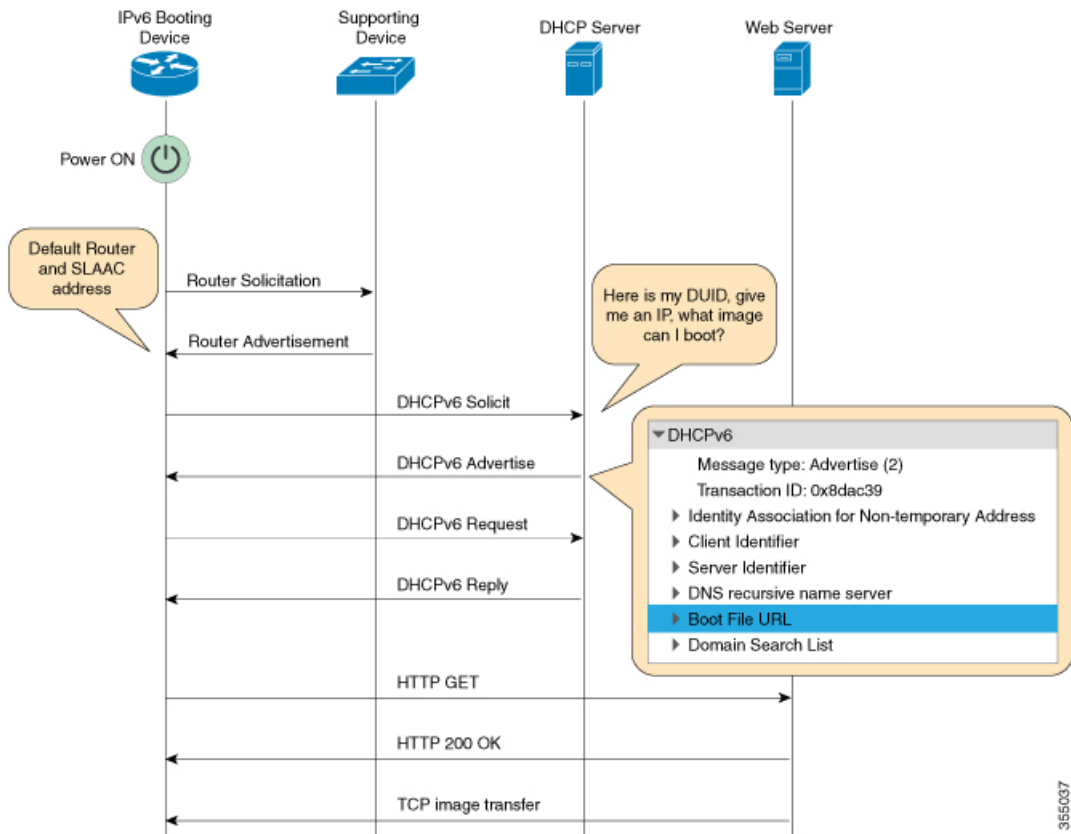

NAME:"Switch1 -Power Supply B", DESCR:"Switch1 -Power Supply B"
PID:PWR-C1-1100WAC, VID:V01, SN:LIT1847146Q
```

The following rommon variables should be configured for iPXE:

- BOOTMODE = ipxe-forever | ipxe-timeout | device
- IPXE\_TIMEOUT = seconds

## IPv6 iPXE Network Boot

This illustration displays how IPv6 iPXE network boot works on a Cisco device:

3E5037

The four elements in the above illustration are described below:

- IPv6 Booting Device—The device that is booting through iPXE boot.
- Supporting Device—A Cisco device that is configured with an IPv6 address to generate Router Advertisement (RA) messages.

---

**Note** In this illustration, the IPv6 booting device, the supporting device, and the DHCP server are on the same subnet. However; if the supporting device and the DHCP server are on different subnets, then there must be a relay agent in the network.

---

- DHCP server—Any open source DHCP server.
- Web server—Any open source web server.

This section describes the IPv6 iPXE boot process:

1. The device sends a router solicitation Internet Control Message Protocol IPv6 (ICMPv6) type 133 packet to the IPv6 device on the local subnet.
2. The IPv6 device on the local subnet replies with an RA, ICMPv6 type 134 packet. The device that sent the router solicitation message, gets the default router and prefix information for Stateless Address AutoConfiguration (SLAAC) address completion from the RA packet.
3. The device sends a DHCPv6 solicit message to the multicast group address of ff02::1:2 for all DHCP agents.

The following sample displays the fields in a DHCPv6 solicit packet during iPXE boot:

```
DHCPv6
Message type: Solicit (1)
Transaction ID: 0x36f5f1
Client Identifier
Vendor Class
Identity Association for Non-Temporary Address
Option Request
User Class
Vendor-specific Information
```

The DHCPv6 solicit message contains the following information:

- DHCP Unique Identifier (DUID)—Identifies the client. iPXE supports DUID-EN. EN stands for Enterprise Number, and this DUID is based on the vendor-assigned unique identifier.
  - DHCPv6 Option 3
  - DHCPv6 Option 6
  - DHCPv6 Option 15
  - DHCPv6 Option 16
  - DHCPv6 Option 17
4. If the DHCPv6 server is configured, it responds with a DHCPv6 advertise packet that contains the 128 Bit IPv6 address, the boot file Uniform Resource Identifier (URI), the Domain Name System (DNS) server

and domain search list, and the client and server IDs. The client ID contains the DUID of the client (In this illustration, the IPv6 Booting Device), and the Server ID contains the DUID of the DHCPv6 server.

5. The client then sends a DHCPv6 request packet to the multicast group address ff02::1:2, requesting for advertised parameters.
6. The server responds with a unicast DHCPv6 reply to the Link Local (FE80::) IPv6 address of the client. The following sample displays the fields in a DHCPv6 reply packet:

```
DHCPv6
Message type: Reply (7)
Transaction ID: 0x790950
Identity Association for Non-Temporary Address
Client Identifier
Server Identifier
DNS recursive name server
Boot File URL
Domain Search List
```

7. The device then sends an HTTP GET request to the web server.
8. If the requested image is available at the specified path, the web server responds with an OK for the HTTP GET request.
9. The TCP image transfer copies the image, and the device boots up.

## IPv6 Address Assignment in ROMMON Mode

The DHCP client uses the following order-of-precedence to decide which IPv6 address to use in rommon mode:

1. DHCP Server-assigned address
2. Stateless Address Auto-Configuration (SLAAC) address
3. Link-local address
4. Site-local address

The device uses the DHCP server-assigned address to boot an image. If the DHCPv6 server fails to assign an address, the device tries to use the SLAAC address. If both the DHCP server-assigned address and the SLAAC address are not available, the device uses the link-local address. However, the remote FTP/HTTP/TFTP servers must be on the same local subnet as that of the device for the image copy to succeed.

If the first three addresses are not available, the device uses the automatically generated site-local address.

## iPXE-Supported DHCP Options

iPXE boot supports the following DHCPv4 and DHCPv6 options in rommon mode.

- DHCP Option 77—User Class Option. This option is added to a DHCP Discover packet, and contains the value equal to the string *iPXE*. This option helps to isolate iPXE DHCP clients looking for an image to boot from a DHCP server.

The following is sample DHCPv4 configuration from the ISC DHCP Server that displays the use of Option 77. The *if* condition in this sample implies that if Option 77 exists, and is equal to the string *iPXE*, then advertise the Boot File URI for the image.

```
host Switch2 {
    fixed-address 192.168.1.20 ;
    hardware ethernet CC:D8:C1:85:6F:11 ;
    #user-class = length of string + ASCII code for iPXE
    if exists user-class and option user-class = 04:68:50:58:45 {
        filename "http://192.168.1.146/test-image.bin"
    }
}
```

- DHCPv6 Option 15—User Class Option. This option is the IPv6 User Class option in a DHCPv6 solicit message. The following sample shows Option 15 defined in the ISC DHCP server:

```
option dhcp6.user-class code 15 = string ;
```

The following is a sample DHCP Server configuration that uses the DHCPv6 Option 15:

```
#Client-specific parameters
host switch1 {
    #assigning a fixed IPv6 address
    fixed-address6 2001:DB8::CAFE ;
    #Client DUID in hexadecimal format contains: DUID-type"2" + "EN=9" + "Chassis
serial number"
    host-identifier option dhcp6.client-id      00:02:00:00:00:09:46:4F:43:31:38:33:
31:58:31:41:53;
    #User class 00:04:69:50:58:45 is len 4 + "iPXE"
    if option dhcp6.user-class = 00:04:69:50:58:45 {
        option dhcp6.bootfile-url
        "http://[2001:DB8::461/platform-pxe/edi46/test-image.bin]";
    }
}
```

- DHCPv6 Option 16—Vendor Class Option. Contains the device product ID (PID). The PID can be determined from the output of the **show inventory** command or from the MODEL\_NUM rommon variable. Option 16 is not a default option in the ISC DHCP Server and can be defined as follows:

```
option dhcp6.vendor-class-data code 16 = string;
```

The following sample configuration illustrates the use of DHCPv6 Option 16:

```
# Source: dhcpd6ConfigPD
host host1-ipxe6-auto-host1 {
    fixed-address6 2001:DB8::1234;
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:46:4F:
43:31:38:33:31:58:31:41:53;
    if option dhcp6.vendor-class-data = 00:00:00:09:00:0E:57:53:2D:
43:33:38:35:30:2D:32:34:50:2D:4D {
        option dhcp6.bootfile-url
        "http://[2001:DB8::46]/platform-pxe/host1/17jan-polaris.bin";
    }
}
```

The table below describes the significant fields shown in the display.

Table 1: Sample Output Field Descriptions

Field	Description
dhcp6.client-id	DHCP Unique Identifier (DUID) to identify the client.
dhcp6.user-class	DHCPv6 Option 15, the User Class option
dhcp6.vendor-class-data	DHCPv6 Option 16, the Vendor Class option that contains the switch Product ID (PID).
N/A	DHCPv6 Option 3 to request for a non-temporary address.
N/A	DHCPv6 Option 17, the Vendor-Specific option that contains the reserved Enterprise ID 9 for Cisco Systems.
dhcp6.bootfile-url	DHCPv6 Option 6 to request for the Boot File URI

## DHCPv6 Unique Identifiers

There are three types of DHCPv6 Identifiers (DUIDs) defined by RFC 3315; these are:

- DUID-LLT—DUID Link Layer address plus time, this is the link layer address of the network interface connected to the DHCP device plus the time stamp at which it is generated.
- DUID-EN—EN stands for Enterprise Number, this DUID is based on vendor-assigned unique ID.
- DUID-LL—DUID formed using the Link Layer address of any network interface that is permanently connected to the DHCP (client/server) device.

Cisco devices use the DUID-EN (DUID Type 2) to identify the DHCP client (that is the device in the DHCPv6 Solicit packet).

## How to Configure iPXE

### Configuring iPXE

#### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<ul style="list-style-type: none"> <li>• <b>boot ipxe forever</b> <i>switch number</i></li> <li>• <b>boot ipxe timeout</b> <i>seconds switch number</i></li> </ul> <b>Example:</b> Device(config)# boot ipxe forever switch 2 <b>Example:</b> Device(config)# boot ipxe timeout 30 switch 2	Configures the BOOTMODE rommon variable. <ul style="list-style-type: none"> <li>• The <b>forever</b> keyword configures the BOOTMODE rommon variable as IPXE-FOREVER.</li> <li>• The <b>timeout</b> keyword configures the BOOTMODE rommon variable as IPXE-TIMEOUT.</li> </ul>
<b>Step 4</b>	<b>boot system</b> { <b>switch</b> <i>switch-number</i>   <b>all</b> } { <b>flash:</b>   <b>ftp:</b>   <b>http:</b>   <b>tftp:</b> } <b>Example:</b> Device(config)# boot system switch 1 http://192.0.2.42/image-filename or Device(config)# boot system switch 1 http://[2001:db8::1]/image-filename	Boots an image from the specified location. <ul style="list-style-type: none"> <li>• You can either use an IPv4 or an IPv6 address for the remote FTP/HTTP/TFTP servers.</li> <li>• You must enter the IPv6 address inside the square brackets (as per RFC 2732); if not the device will not boot.</li> </ul>
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

## Configuring Device Boot

You can either use the **no boot ipxe** or the **default boot ipxe** command to configure device boot.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<ul style="list-style-type: none"> <li>• <b>no boot ipxe</b></li> <li>• <b>default boot ipxe</b></li> </ul> <b>Example:</b>	Configures device boot. The default boot mode is device boot.  Enables default configuration on the device.

	Command or Action	Purpose
	Device(config)# no boot ipxe <b>Example:</b> Device(config)# default boot ipxe	
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# end	Exits global configuration mode and returns to privileged EXEC mode.

## Configuration Examples for iPXE

### Example: iPXE Configuration

The following example shows that iPXE is configured to send DHCP requests forever until the device boots with an image:

```
Device# configure terminal
Device(config)# boot ipxe forever switch 2
Device(config)# end
```

The following example shows how to configure the boot mode to ipxe-timeout. The configured timeout is 200 seconds. If an iPXE boot failure occurs after the configured timeout expires, the configured device boot is activated. In this example, the configured device boot is `http://[2001:db8::1]/image-filename`.

```
Device# configure terminal
Device(config)# boot ipxe timeout 200 switch 2
Device(config)# boot system http://[2001:db8::1]/image-filename
Device(config)# end
```

### Sample iPXE Boot Logs

The following are sample boot logs from a device in rommon mode. Here, manual boot using the `ipxe-timeout` command is configured:

```
switch: boot

pxemode:(ipxe-timeout) 60s timeout
00267.887 ipxe_get_booturl: Get URL from DHCP; timeout 60s
00267.953 ipxe_get_booturl: trying DHCPv6 (#1) for 10s
IPv4:
    ip addr 192.168.1.246
    netmask 255.255.255.0
    gateway 192.168.1.46

IPv6:
link-local addr fe80::ced8:c1ff:fe85:6f00
site-local addr fec0::ced8:c1ff:fe85:6f00
```

```

        DHCP addr 2001:db8::cafe
        router addr fe80::f29e:63ff:fe42:4756
        SLAAC addr 2001:db8::ced8:cliff:fe85:6f00 /64
Common:
        macaddr cc:d8:c1:85:6f:00
        dns 2001:db8::46
        bootfile
        http://[2001:DB8::461/platform-pxe/edi46/17jan-dev.bin--13103--2017-Feb28--13-54-50
        domain cisco.com
00269.321 ipxe_get_booturl: got URL

```

## Sample DHCPv6 Server Configuration for iPXE

The following is a sample DHCPv6 server configuration taken from an ISC DHCP Server for reference. The lines preceded by the character #, are comments that explain the configuration that follows.

```

Default-least-time 600;
max-lease-time-7200;
log-facility local7;

#Global configuration
#domain search list
option dhcp6.domain-search "cisco.com" ;
#User-defined options:new-name code new-code = definition ;
option dhcp6.user-class code 15 = string ;
option dhcp6.vendor-class-data code 16 = string;

subnet6 2001:db8::/64 {
    #subnet range for clients requiring an address
    range6 2001:db8:0000:0000::/64;

#DNS server options
option dhcp6.name-servers 2001:db8::46;

}
#Client-specific parameters
host switch1 {
    #assigning a fixed IPv6 address
    fixed-address6 2001:DB8::CAFE ;
    #Client DUID in hexadecimal that contains: DUID-type "2" + "EN=9" + "Chassis serial
number"
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:46:4F:43:31:38:33:
31:58:31:41:53;
    option dhcp6.bootfile-url "http://[2001:DB8::461/platform-pxe/edi46/test-image.bin";
}

```

For more information on DHCP server commands, see the [ISC DHCP Server](#) website.

In this sample configuration, the `dhcp6.client-id` option identifies the switch, and it is followed by the Enterprise Client DUID. The client DUID can be broken down for understanding as `00:02 + 00:00:00:09` + chassis serial number in hexadecimal format, where 2 refers to the Enterprise Client DUID Type, 9 refers to the reserved code for Cisco's Enterprise DUID, followed by the ASCII code for the Chassis serial number in hexadecimal format. The chassis serial number for the switch in this sample is FOC1831X1AS.

The Boot File URI is advertised to the switch only using the specified DUID.

The DHCPv6 Vendor Class Option 16 can also be used to identify the switch on the DHCP Server. By default, this DHCP option is not supported by the ISC DHCP Server, and to define it as a user-defined option, configure the following:

```
option dhcp6.vendor-class-data code 16 = string;
```

The following is a sample DHCP server configuration that identifies the switch based on the DHCPv6 Vendor Class Option 16 that is formed by using the switch Product ID:

```
# Source: dhcp6ConfigPID

host edi-46-ipxe6-auto-edi46 {
    fixed-address6 2001:DB8::1234;
    host-identifier option dhcp6.client-id 00:02:00:00:00:09:
    46:4F:43:31:38:33:31:58:31:58:31:41:53;
    if option dhcp6.vendor-class-data = 00:00:00:09:00:0E:57:
    53:2D:43:33:38:35:30:2D:32:34:50:2D:4C {
        option dhcp6.bootfile-url "http://\[2001:DB8::461/platform-pxe/edi46/17jan-dev.bin";
    }
}
```

In this sample configuration, the `dhcp6.vendor-class-data` option refers to the DHCPv6 Option 16. In the `dhcp6.vendor-class-data`, `00:00:00:09` is Cisco's Enterprise DUID, `0E` is the length of the PID, and the rest is the PID in hexadecimal format. The PID can also be found from the output of the **show inventory** command or from the `CFG_MODEL_NUM` rommon variable. The PID used in this sample configuration is WS-C3850-24P-L.

DHCPv6 options and DUIDs in the server configuration must be specified in the hexadecimal format, as per the ISC DHCP server guidelines.

## Troubleshooting Tips for iPXE

This section provides troubleshooting tips.

- When iPXE boot is enabled on power up, the device first attempts to send a DHCPv6 Solicit message, followed by a DHCPv4 Discover message. If boot mode is **ipxe-forever** the device keeps iterating between the two forever.
- If the boot-mode is iPXE timeout, the device first sends a DHCPv6 Solicit message, and then a DHCPv4 Discover message, and the device falls back to device boot after the timeout expires.
- To interrupt iPXE boot, send a serial break to the console.

When using a UNIX telnet client, type CTRL-] and then send break. When you are using a different TELNET client, or you are directly attached to a serial port, sending a break may be triggered by a different keystroke or command.

- If the DHCP server responds with an image, but the DNS server cannot resolve the hostname, enable DNS debugs.
- To test the HTTP server connectivity, use HTTP copy to copy a small sample file from your HTTP server to your device. For example, at the rommon prompt, enter **copy http://192.168.1.1/test null:** (the flash is normally locked and you need to use the null device for testing) or **http://[2001:db8::99]/test**.
- When manual boot is enabled, and boot mode is ipxe-timeout, the device will not automatically boot on power up. Issue the **boot** command in rommon mode. To automate the boot process on power up, disable manual boot.
- Use the **net6-show** command to display the current IPv6 parameters, including IPv6 addresses and the default router in rommon mode
- Use the **net-dhcp** or the **net6-dhcp** commands based on your configuration, The **net-dhcp** command is a test command for DHCPv4 and the **net6-dhcp** command is for DHCPv6.
- Use the **dig** command to resolve names.
- Enable HTTP debug logs to view the HTTP response code from the web server.
- If SLAAC addresses are not generated, there is no router that is providing IPv6 RA messages. iPXE boot for IPv6 can still work but only with link or site-local addresses.

For more information about iPXE commands, see the

- Catalust 3650 Command Reference
- Catalust 3850 Command Reference

## Feature Information for iPXE

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 2: Feature Information for iPXE**

Feature Name	Release	Feature Information
iPXE		Network Bootloaders support booting from a device-based or network-based source. A network boot source must be detected automatically by using an iPXE-like solution.
