Information About the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software bundles and configuration files. The default flash file system on the switch is named flash:.

As viewed from the active switch, or any stack member, flash: refers to the local flash device, which is the device attached to the same switch on which the file system is being viewed. In a switch stack, each of the flash devices from the various stack members can be viewed from the active switch. The names of these flash file systems include the corresponding switch member numbers. For example, flash-3:, as viewed from the active switch, refers to the same file system as does flash: on stack member 3. Use the **show file systems** privileged EXEC command to list all file systems, including the flash file systems in the switch stack.

Only one user at a time can manage the software bundles and configuration files for a switch stack .

Displaying Available File Systems

To display the available file systems on your switch, use the **show file systems** privileged EXEC command as shown in this example for a standalone switch:

```
Switch# show file systems
```

```

File Systems:
  Size (b)      Free (b)      Type      Flags      Prefixes
* 15998976     5135872      flash    rw         flash:
  -             -             opaque   rw         bs:
  -             -             opaque   rw         vb:
  524288       520138      nvram    rw         nvram:
  -             -             network  rw         tftp:
  -             -             opaque   rw         null:
  -             -             opaque   rw         system:
  -             -             opaque   ro         xmodem:
  -             -             opaque   ro         ymodem:

```

This example shows a switch stack. In this example, the active switch is stack member 1; the file system on stack member 2 is displayed as flash-2:, the file system on stack member 3 is displayed as flash-3: and so on up to stack member 9, displayed as flash-9: for a 9-member stack. The example also shows the crashinfo directories and a USB flash drive plugged into the active switch:

```

Switch# show file systems
File Systems:
  Size (b)      Free (b)      Type      Flags      Prefixes
145898496     5479424      disk     rw         crashinfo:crashinfo-1:

```

Table 1: show file systems Field Descriptions

| Field | Value |
|--------------|--|
| Size(b) | Amount of memory in the file system in bytes. |
| Free(b) | Amount of free memory in the file system in bytes. |
| Type | Type of file system. disk —The file system is for a flash memory device, USB flash, and crashinfo file. network —The file system for network devices; for example, an FTP server or and HTTP server. nvr am—The file system is for a NVRAM device. opaque —The file system is a locally generated pseudo file system (for example, the system) or a download interface, such as brimux. unknown —The file system is an unknown type. |
| Flags | Permission for file system. ro —read-only. rw —read/write. wo —write-only. |

| Field | Value |
|----------|--|
| Prefixes | <p>Alias for file system.</p> <p>crashinfo:—Crashinfo file.</p> <p>flash:—Flash file system.</p> <p>ftp:—FTP server.</p> <p>http:—HTTP server.</p> <p>https:—Secure HTTP server.</p> <p>nvr:—NVRAM.</p> <p>null:—Null destination for copies. You can copy a remote file to null to find its size.</p> <p>rpx:—Remote Copy Protocol (RCP) server.</p> <p>scp:—Session Control Protocol (SCP) server.</p> <p>system:—Contains the system memory, including the running configuration.</p> <p>tftp:—TFTP network server.</p> <p>usbflash0:—USB flash memory.</p> <p>xmodem:—Obtain the file from a network machine by using the Xmodem protocol.</p> <p>ymodem:—Obtain the file from a network machine by using the Ymodem protocol.</p> |

Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the **cd** *filesystem:* privileged EXEC command. You can set the default file system to omit the *filesystem:* argument from related commands. For example, for all privileged EXEC commands that have the optional *filesystem:* argument, the system uses the file system specified by the **cd** command.

By default, the default file system is *flash:*.

You can display the current default file system as specified by the **cd** command by using the **pwd** privileged EXEC command.

Displaying Information About Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command. To display information about files on a file system, use one of the privileged EXEC commands listed in the following table.

Table 2: Commands for Displaying Information About Files

| Command | Description |
|--|---|
| dir [/all] [filesystem:filename] | Displays a list of files on a file system. |
| show file systems | Displays more information about each of the files on a file system. |
| show file information file-url | Displays information about a specific file. |
| show file descriptors | Displays a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open. |

For example, to display a list of all files in a file system, use the **dir** privileged EXEC command:

```
switch# dir flash:
Directory of flash:/
7386  -rwx      2097152 Jan 23 2013 14:06:49 +00:00 nvram_config
7378  drwx         4096 Jan 23 2013 09:35:11 +00:00 mnt
7385  -rw-      221775876 Jan 23 2013 14:15:13 +00:00
cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
7389  -rwx         556 Jan 21 2013 20:47:30 +00:00 vlan.dat
712413184 bytes total (445063168 bytes free)
switch#
```

Changing Directories and Displaying the Working Directory (CLI)

Follow these steps to change directories and to display the working directory:

SUMMARY STEPS

1. **enable**
2. **dir filesystem:**
3. **cd directory_name**
4. **pwd**
5. **cd**

DETAILED STEPS

| | Command or Action | Purpose |
|---------------|---|---|
| Step 1 | enable Example: Switch> enable | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | dir filesystem: Example: Switch# dir flash: | Displays the directories on the specified file system. For <i>filesystem:</i> , use flash: for the system board flash device. To access flash partitions of switch members in a stack, use flash- <i>n</i> where <i>n</i> is the stack member number. For example, flash-4. |
| Step 3 | cd directory_name Example: Switch# cd new_configs | Navigates to the specified directory. The command example shows how to navigate to the directory named <i>new_configs</i> . |
| Step 4 | pwd Example: Switch# pwd | Displays the working directory. |
| Step 5 | cd Example: Switch# cd | Navigates to the default directory. |

Creating Directories (CLI)

Beginning in privileged EXEC mode, follow these steps to create a directory:

SUMMARY STEPS

1. **dir filesystem:**
2. **mkdir directory_name**
3. **dir filesystem:**

DETAILED STEPS

| | Command or Action | Purpose |
|--------|--|---|
| Step 1 | dir <i>filesystem:</i> Example: Switch# dir flash: | Displays the directories on the specified file system. For <i>filesystem:</i> , use flash: for the system board flash device. |
| Step 2 | mkdir <i>directory_name</i> Example: Switch# mkdir new_configs | Creates a new directory. Directory names are case sensitive and are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, slashes, quotes, semicolons, or colons. |
| Step 3 | dir <i>filesystem:</i> Example: Switch# dir flash: | Verifies your entry. |

Removing Directories

To remove a directory with all its files and subdirectories, use the **delete /force /recursive** *filesystem:/file-url* privileged EXEC command.

Use the **/recursive** keyword to delete the named directory and all subdirectories and the files contained in it. Use the **/force** keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process.

For *filesystem*, use **flash:** for the system board flash device. For *file-url*, enter the name of the directory to be deleted. All of the files in the directory and the directory are removed.

Caution

When directories are deleted, their contents cannot be recovered.

Copying Files

To copy a file from a source to a destination, use the **copy** *source-url destination-url* privileged EXEC command. For the source and destination URLs, you can use **running-config** and **startup-config** keyword shortcuts. For example, the **copy running-config startup-config** command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (**xmodem:**, **ymodem:**) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include ftp:, rcp:, and tftp: and have these syntaxes:

- FTP—ftp:[[/username [:password]@location]/directory]/filename
- RCP—rcp:[[/username@location]/directory]/filename
- TFTP—tftp:[[/location]/directory]/filename

Local writable file systems include flash:.

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the **copy flash: flash:** command is invalid)

Copying Files from One Switch in a Stack to Another Switch in the Same Stack

To copy a file from one switch in a stack to another switch in the same stack, use the **flash-X:** notation, where **X** is the switch number.

To view all switches in a stack, use the **show switch** command in privileged EXEC mode, as in the following example of a 9-member switch stack:

```
Switch# show switch
Switch/Stack Mac Address : 0006.f6b9.b580 - Local Mac Address Mac persistency wait time:
Indefinite
```

| Switch# | Role | Mac Address | Priority | H/W Version | Current State |
|---------|---------|----------------|----------|-------------|---------------|
| *1 | Active | 0006.f6b9.b580 | 15 | P3B | Ready |
| 2 | Standby | 0006.f6ba.0c80 | 14 | P3B | Ready |
| 3 | Member | 0006.f6ba.3300 | 7 | P3B | Ready |
| 4 | Member | 0006.f6b9.df80 | 6 | P3B | Ready |
| 5 | Member | 0006.f6ba.3880 | 13 | P1A | Ready |
| 6 | Member | 1ce6.c7b6.ef00 | 4 | PP | Ready |
| 7 | Member | 2037.06ce.2580 | 3 | P2A | Ready |
| 8 | Member | 2037.0653.7e00 | 2 | P5A | Ready |
| 9 | Member | 2037.0653.9280 | 1 | P5B | Ready |

To view all file systems available to copy on a specific switch, use the **copy** command as in the following example of a 5-member stack:

```
Switch# copy flash: ?
crashinfo-1: Copy to crashinfo-1: file system
crashinfo-2: Copy to crashinfo-2: file system
crashinfo-3: Copy to crashinfo-3: file system
crashinfo-4: Copy to crashinfo-4: file system
crashinfo-5: Copy to crashinfo-5: file system
crashinfo: Copy to crashinfo: file system
flash-1: Copy to flash-1: file system
flash-2: Copy to flash-2: file system
flash-3: Copy to flash-3: file system
flash-4: Copy to flash-4: file system
flash-5: Copy to flash-5: file system
flash: Copy to flash: file system
ftp: Copy to ftp: file system
http: Copy to http: file system
https: Copy to https: file system
null: Copy to null: file system
nvram: Copy to nvram: file system
rcp: Copy to rcp: file system
revrcsf: Copy to revrcsf: file system
```

```

running-config  Update (merge with) current system configuration
scp:            Copy to scp: file system
startup-config  Copy to startup configuration
stby-crashinfo: Copy to stby-crashinfo: file system
stby-flash:    Copy to stby-flash: file system
stby-nvram:    Copy to stby-nvram: file system
stby-rcsf:     Copy to stby-rcsf: file system
stby-usbflash0: Copy to stby-usbflash0: file system
syslog:        Copy to syslog: file system
system:        Copy to system: file system
tftp:          Copy to tftp: file system
tmpsys:        Copy to tmpsys: file system
usbflash0-1:   Copy to usbflash0-1: file system
usbflash0-2:   Copy to usbflash0-2: file system
usbflash0-3:   Copy to usbflash0-3: file system
usbflash0-4:   Copy to usbflash0-4: file system
usbflash0-5:   Copy to usbflash0-5: file system
usbflash0:     Copy to usbflash0: file system

```

Switch#

This example shows how to copy a config file stored in the flash partition of switch 2 to the flash partition of switch 4. It assumes that switch 2 and switch 4 are in the same stack.

```
Switch# copy flash-2:config.txt flash-4:config.txt
```

Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the **delete** [**force**] [**recursive**] [*filesystem:*]/*file-url* privileged EXEC command.

Use the **/recursive** keyword for deleting a directory and all subdirectories and the files contained in it. Use the **/force** keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the **/force** and **/recursive** keywords for deleting old software images that were installed by using the **archive download-sw** command but are no longer needed.

If you omit the *filesystem:* option, the switch uses the default device specified by the **cd** command. For *file-url*, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

Caution

When files are deleted, their contents cannot be recovered.

This example shows how to delete the file *myconfig* from the default flash memory device:

```
Switch# delete myconfig
```

Creating, Displaying and Extracting Files (CLI)

You can create a file and write files into it, list the files in a file, and extract the files from a file as described in the next sections.

Beginning in privileged EXEC mode, follow these steps to create a file, display the contents, and extract it:

SUMMARY STEPS

1. **archive tar /create** *destination-url* **flash:** */file-url*
2. **archive tar /table** *source-url*
3. **archive tar /xtract** *source-url* **flash:***/file-url* [*dir/file...*]
4. **more** [*/ascii* | */binary* | */ebcdic*] */file-url*

DETAILED STEPS

| | Command or Action | Purpose |
|--------|---|---|
| Step 1 | <p>archive tar /create <i>destination-url</i> flash: <i>/file-url</i></p> <p>Example:</p> <pre>switch# archive tar /create tftp:172.20.10.30/saved. flash:/new-configs</pre> | <p>Creates a file and adds files to it.</p> <p>For <i>destination-url</i>, specify the destination URL alias for the local or network file system and the name of the file to create:</p> <ul style="list-style-type: none"> • Local flash file system syntax: flash: • FTP syntax: ftp:<i>[[//username[:password]@location]/directory]/-filename.</i> • RCP syntax: rcp:<i>[[//username@location]/directory]/-filename.</i> • TFTP syntax: tftp:<i>[[//location]/directory]/-filename.</i> <p>For flash:<i>/file-url</i>, specify the location on the local flash file system in which the new file is created. You can also specify an optional list of files or directories within the source directory to add to the new file. If none are specified, all files and directories at this level are written to the newly created file.</p> |
| Step 2 | <p>archive tar /table <i>source-url</i></p> <p>Example:</p> <pre>switch# archive tar /table flash: /new_configs</pre> | <p>Displays the contents of a file.</p> <p>For <i>source-url</i>, specify the source URL alias for the local or network file system. The <i>-filename.</i> is the file to display. These options are supported:</p> <ul style="list-style-type: none"> • Local flash file system syntax: flash: • FTP syntax: ftp:<i>[[//username[:password]@location]/directory]/-filename.</i> • RCP syntax: rcp:<i>[[//username@location]/directory]/-filename.</i> • TFTP syntax: tftp:<i>[[//location]/directory]/-filename.</i> |

| | Command or Action | Purpose |
|---------------|--|--|
| | | You can also limit the file displays by specifying a list of files or directories after the file. Only those files appear. If none are specified, all files and directories appear. |
| Step 3 | archive tar /xtract <i>source-url</i> flash: <i>/file-url [dir/file...]</i> Example: <pre>switch# archive tar /xtract tftp:/172.20.10.30/saved. flash:/new-configs</pre> | <p>Extracts a file into a directory on the flash file system.</p> <p>For <i>source-url</i>, specify the source URL alias for the local file system. The <i>-filename</i> is the file from which to extract files. These options are supported:</p> <ul style="list-style-type: none"> Local flash file system syntax: flash: FTP syntax: ftp:<i>[[/username[:password]@location]/directory]/-filename.</i> RCP syntax: rnp:<i>[[/username@location]/directory]/-filename.</i> TFTP syntax: tftp:<i>[[/location]/directory]/-filename.</i> <p>For flash:<i>/file-url [dir/file...]</i>, specify the location on the local flash file system from which the file is extracted. Use the <i>dir/file...</i> option to specify a list of files or directories within the file to be extracted. If none are specified, all files and directories are extracted.</p> |
| Step 4 | more [/ascii /binary /ebcdic] <i>/file-url</i> Example: <pre>switch# more flash:/new-configs</pre> | Displays the contents of any readable file, including a file on a remote file system. |
