

Configuring VideoStream GUI

- [Configuring VideoStream \(GUI\), page 1](#)

Configuring VideoStream (GUI)

Complete the following steps to configure VideoStream using GUI.

Step 1

Configure the multicast feature by following these steps:

- Choose **Wireless > MediaStream > General**.
- Select or unselect the **Multicast Direct feature** check box. The default value is disabled.
Note Enabling the multicast direct feature does not automatically reset the existing client state. The wireless clients must rejoin the multicast stream after enabling the multicast direct feature on the controller.
- In the **Session Message Config** area, select **Session announcement State** check box to enable the session announcement mechanism. If the session announcement state is enabled, clients are informed each time a controller is not able to serve the multicast direct data to the client.
- In the **Session announcement URL** text box, enter the URL where the client can find more information when an error occurs during the multicast media stream transmission.
- In the **Session announcement e-mail** text box, enter the e-mail address of the person who can be contacted.
- In the **Session announcement Phone** text box, enter the phone number of the person who can be contacted.
- In the **Session announcement Note** text box, enter a reason as to why a particular client cannot be served with a multicast media.
- Click **Apply**.

Step 2

Add a media stream by following these steps:

- Choose **Wireless > Media Stream > Streams** to open the Media Stream page.
- Click **Add New** to configure a new media stream. The **Media Stream > New page** appears.
Note The Stream Name, Multicast Destination Start IP Address (IPv4 or IPv6), and Multicast Destination End IP Address (IPv4 or IPv6) text boxes are mandatory. You must enter information in these text boxes.
- In the **Stream Name** text box, enter the media stream name. The stream name can be up to 64 characters.
- In the **Multicast Destination Start IP Address (IPv4 or IPv6)** text box, enter the start (IPv4 or IPv6) address of the multicast media stream.
- In the **Multicast Destination End IP Address (IPv4 or IPv6)** text box, enter the end (IPv4 or IPv6) address of the multicast media stream.

Example:

Note Ensure that the Multicast Destination Start and End IP addresses are of the same type, that is both addresses should be of either IPv4 or IPv6 type.

- f) In the **Maximum Expected Bandwidth** text box, enter the maximum expected bandwidth that you want to assign to the media stream. The values can range between 1 to 35000 kbps.

Example:

Note We recommend that you use a template to add a media stream to the controller.

- g) From the Select from Predefined Templates drop-down list under Resource Reservation Control (RRC) Parameters, choose one of the following options to specify the details about the resource reservation control:

- Very Coarse (below 300 kbps)
- Coarse (below 500 kbps)
- Ordinary (below 750 kbps)
- Low (below 1 Mbps)
- Medium (below 3 Mbps)
- High (below 5 Mbps)

Note When you select a predefined template from the drop-down list, the following text boxes under the Resource Reservation Control (RRC) Parameters list their default values that are assigned with the template.

- Average Packet Size (100-1500 bytes)—Specifies the average packet size. The value can be in the range of 100 to 1500 bytes. The default value is 1200.
- RRC Periodic update—Enables the RRC (Resource Reservation Control Check) Periodic update. By default, this option is enabled. RRC periodically updates the admission decision on the admitted stream according to the correct channel load. As a result, it may deny certain low priority admitted stream requests.
- RRC Priority (1-8)—Specifies the priority bit set in the media stream. The priority can be any number between 1 and 8. The larger the value means the higher the priority is. For example, a priority of 1 is the lowest value and a value of 8 is the highest value. The default priority is 4. The low priority stream may be denied in the RRC periodic update.
- Traffic Profile Violation—Specifies the action to perform in case of a violation after a re-RRC. Choose an action from the drop-down list. The possible values are as follows:

Drop—Specifies that a stream is dropped on periodic reevaluation.

Fallback—Specifies that a stream is demoted to Best Effort class on periodic reevaluation.

The default value is **drop**.

- h) Click **Apply**.

Step 3

Enable the media stream for multicast-direct by following these steps:

- a) Choose **WLANS > WLAN ID** to open the **WLANS > Edit** page.
- b) Click the **QoS** tab and select Gold (Video) from the Quality of Service (QoS) drop-down list.

- c) Click **Apply**.

Step 4 Set the EDCA parameters to voice and video optimized (optional) by following these steps:

- a) Choose **Wireless > 802.11a/n/ac** or **802.11b/g/n > EDCA Parameters**.
- b) From the **EDCA Profile** drop-down list, choose the Voice and Video Optimized option.
- c) Click **Apply**.

Step 5 Enable the admission control on a band for video (optional) by following these steps:

Note Keep the voice bandwidth allocation to a minimum for better performance.

- a) Choose **Wireless > 802.11a/n/ac** or **802.11b/g/n > Media** to open the 802.11a/n (5 GHz) or 802.11b/g/n > Media page.
- b) Click the **Video** tab.
- c) Select the **Admission Control (ACM)** check box to enable bandwidth-based CAC for this radio band. The default value is disabled.
- d) Click **Apply**

Step 6 Configure the video bandwidth by following these steps:

Note The template bandwidth that is configured for a media stream should be more than the bandwidth for the source media stream. The voice configuration is optional. Keep the voice bandwidth allocation to a minimum for better performance.

- a) Disable all WMM WLANs.
- b) Choose **Wireless > 802.11a/n/ac** or **802.11b/g/n > Media** to open the 802.11a/n/ac (5 GHz) or 802.11b/g/n > Media page.
- c) Click the **Video** tab.
- d) Select the **Admission Control (ACM)** check box to enable the video CAC for this radio band. The default value is disabled.
- e) In the Max RF Bandwidth field, enter the percentage of the maximum bandwidth allocated to clients for video applications on this radio band. Once the client reaches the value specified, the access point rejects new requests on this radio band.
The range is 5 to 85%. The default value is 9%.
- f) Click **Apply**.
- g) Reenable all WMM WLANs and click **Apply**.

Step 7 Configure the media bandwidth by following these steps:

- a) Choose **Wireless > 802.11a/n/ac** or **802.11b/g/n > Media** to open the 802.11a (or 802.11b) > Media > Parameters page.
- b) Click the **Media** tab to open the Media page.
- c) Select the **Unicast Video Redirect** check box to enable Unicast Video Redirect. The default value is disabled.
- d) In the **Maximum Media Bandwidth (0-85%)** text box, enter the percentage of the maximum bandwidth to be allocated for media applications on this radio band. Once the client reaches a specified value, the access point rejects new calls on this radio band.
The default value is 85%; valid values are from 0% to 85%.
- e) In the **Client Minimum Phy Rate** text box, enter the minimum transmission data rate to the client. If the transmission data rate is below the phy rate, either the video will not start or the client may be classified as a bad client. The bad client video can be demoted for better effort QoS or subject to denial.
- f) In the **Maximum Retry Percent (0-100%)** text box, enter the percentage of maximum retries that are allowed. The default value is 80. If it exceeds 80, either the video will not start or the client might be classified as a bad client. The bad client video can be demoted for better effort QoS or subject to denial.

- g) Select the **Multicast Direct Enable** check box to enable the Multicast Direct Enable field. The default value is enabled.
- h) From the **Max Streams per Radio** drop-down list, choose the maximum number of streams allowed per radio from the range 0 to 20. The default value is set to No-limit. If you choose No-limit, there is no limit set for the number of client subscriptions.
- i) From the **Max Streams per Client** drop-down list, choose the maximum number of streams allowed per client from the range 0 to 20. The default value is set to No-limit. If you choose No-limit, there is no limit set for the number of client subscriptions.
- j) Select the **Best Effort QoS Admission** check box to enable best-effort QoS admission.
- k) Click **Apply**.

Step 8 Enable a WLAN by following these steps:

- a) Choose **WLANS > WLAN ID**. The **WLANS > Edit** page appears.
- b) Select the **Status** check box.
- c) Click **Apply**.

Step 9 Enable the 802.11 a/n/ac or 802.11 b/g/n network by following these steps:

- a) Choose **Wireless > 802.11a/n/ac** or **802.11b/g/n > Network**.
- b) Select the **802.11a** or **802.11b/g Network Status** check box to enable the network status.
- c) Click **Apply**.

Step 10 Verify that the clients are associated with the multicast groups and group IDs by following these steps:

- a) Choose **Monitor > Clients**. The **Clients** page appears.
 - b) Check if the 802.11a/n/ac or 802.11b/g/n network clients have the associated access points.
 - c) Choose **Monitor > Multicast**. The **Multicast Groups** page appears.
 - d) Select the **MGID** check box for the VideoStream to the clients.
 - e) Click **MGID**. The **Multicast Group Detail** page appears. Check the Multicast Status details.
-
