Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Configuring MSDP

This section describes how to configure the Multicast Source Discovery Protocol (MSDP) on the switch. The MSDP connects multiple Protocol-Independent Multicast sparse-mode (PIM-SM) domains.

MSDP is not fully supported in this software release because of a lack of support for Multicast Border Gateway Protocol (MBGP), which works closely with MSDP. However, it is possible to create default peers that MSDP can operate with if MBGP is not running.

To use this feature, the active switch must be running the IP services feature set.

Understanding MSDP

MSDP allows multicast sources for a group to be known to all rendezvous points (RPs) in different domains. Each PIM-SM domain uses its own RPs and does not depend on RPs in other domains. An RP runs MSDP over the Transmission Control Protocol (TCP) to discover multicast sources in other domains.

An RP in a PIM-SM domain has an MSDP peering relationship with MSDP-enabled devices in another domain. The peering relationship occurs over a TCP connection, primarily exchanging a list of sources sending to multicast groups. The TCP connections between RPs are achieved by the underlying routing system. The receiving RP uses the source lists to establish a source path.

The purpose of this topology is to have domains discover multicast sources in other domains. If the multicast sources are of interest to a domain that has receivers, multicast data is delivered over the normal, source-tree building mechanism in PIM-SM. MSDP is also used to announce sources sending to a group. These announcements must originate at the domain's RP.

MSDP depends heavily on the Border Gateway Protocol (BGP) or MBGP for interdomain operation. We recommend that you run MSDP in RPs in your domain that are RPs for sources sending to global groups to be announced to the Internet.

MSDP Operation

When a source sends its first multicast packet, the first-hop router (*designated router* or RP) directly connected to the source sends a PIM register message to the RP. The RP uses the register message to register the active source and to forward the multicast packet down the shared tree in the local domain. With MSDP configured, the RP also forwards a source-active (SA) message to all MSDP peers. The SA message identifies the source, the group the source is sending to, and the address of the RP or the originator ID (the IP address of the interface used as the RP address), if configured.

Each MSDP peer receives and forwards the SA message away from the originating RP to achieve peer reverse-path flooding (RPF). The MSDP device examines the BGP or MBGP routing table to discover which peer is the next hop toward the originating RP of the SA message. Such a peer is called an *RPF peer* (reverse-path forwarding peer). The MSDP device forwards the message to all MSDP peers other than the RPF peer. For information on how to configure an MSDP peer when BGP and MBGP are not supported, see the [Configuring a Default MSDP Peer](#), on page 3.

If the MSDP peer receives the same SA message from a non-RPF peer toward the originating RP, it drops the message. Otherwise, it forwards the message to all its MSDP peers.

The RP for a domain receives the SA message from an MSDP peer. If the RP has any join requests for the group the SA message describes and if the (*,G) entry exists with a nonempty outgoing interface list, the domain is interested in the group, and the RP triggers an (S,G) join toward the source. After the (S,G) join reaches the source's DR, a branch of the source tree has been built from the source to the RP in the remote domain. Multicast traffic can now flow from the source across the source tree to the RP and then down the shared tree in the remote domain to the receiver.

MSDP Benefits

MSDP has these benefits:

- It breaks up the shared multicast distribution tree. You can make the shared tree local to your domain. Your local members join the local tree, and join messages for the shared tree never need to leave your domain.
- PIM sparse-mode domains can rely only on their own RPs, decreasing reliance on RPs in another domain. This increases security because you can prevent your sources from being known outside your domain.
- Domains with only receivers can receive data without globally advertising group membership.
- Global source multicast routing table state is not required, saving memory.

How to Configure MSDP

Default MSDP Configuration

MSDP is not enabled, and no default MSDP peer exists.

Configuring a Default MSDP Peer

In this software release, because BGP and MBGP are not supported, you cannot configure an MSDP peer on the local switch by using the **ip msdp peer** global configuration command. Instead, you define a default MSDP peer (by using the **ip msdp default-peer** global configuration command) from which to accept all SA messages for the switch. The default MSDP peer must be a previously configured MSDP peer. Configure a default MSDP peer when the switch is not BGP- or MBGP-peering with an MSDP peer. If a single MSDP peer is configured, the switch always accepts all SA messages from that peer.

This figure shows a network in which default MSDP peers might be used. A customer who owns Switch B is connected to the Internet through two Internet service providers (ISPs), one owning Router A and the other owning Router C. They are not running BGP or MBGP between them. To learn about sources in the ISP's domain or in other domains, Switch B at the customer site identifies Router A as its default MSDP peer. Switch B advertises SA messages to both Router A and Router C but accepts SA messages only from Router A or only from Router C. If Router A is first in the configuration file, it is used if it is running. If Router A is not running, only then does Switch B accept SA messages from Router C. This is the default behavior without a prefix list.

If you specify a prefix list, the peer is a default peer only for the prefixes in the list. You can have multiple active default peers when you have a prefix list associated with each. When you do not have any prefix lists, you can configure multiple default peers, but only the first one is the active default peer as long as the router has connectivity to this peer and the peer is alive. If the first configured peer fails or the connectivity to this peer fails, the second configured peer becomes the active default, and so on.

The ISP probably uses a prefix list to define which prefixes it accepts from the customer's router.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Router# configure terminal	Enters global configuration mode.
Step 2	ip msdp default-peer <i>ip-address</i> <i>name</i> [prefix-list <i>list</i>] Example: Router (config) # ip msdp default-peer	Defines a default peer from which to accept all MSDP SA messages. <ul style="list-style-type: none"> • For <i>ip-address</i> <i>name</i>, enter the IP address or Domain Name System (DNS) server name of the MSDP default peer. • (Optional) For prefix-list <i>list</i>, enter the list name that specifies the peer to be the default peer only for the listed prefixes. You can have

	Command or Action	Purpose
	<code>10.1.1.1 prefix-list site-a</code>	<p>multiple active default peers when you have a prefix list associated with each.</p> <p>When you enter multiple ip msdp default-peer commands with the prefix-list keyword, you use all the default peers at the same time for different RP prefixes. This syntax is typically used in a service provider cloud that connects stub site clouds.</p> <p>When you enter multiple ip msdp default-peer commands without the prefix-list keyword, a single active peer accepts all SA messages. If that peer fails, the next configured default peer accepts all SA messages. This syntax is typically used at a stub site.</p>
Step 3	<p>ip prefix-list <i>name</i> [description <i>string</i>] seq <i>number</i> {permit deny} <i>network length</i></p> <p>Example:</p> <pre>Router(config)# prefix-list site-a seq 3 permit 12 network length 128</pre>	<p>(Optional) Creates a prefix list using the name specified in Step 2.</p> <ul style="list-style-type: none"> • (Optional) For description <i>string</i>, enter a description of up to 80 characters to describe this prefix list. • For seq <i>number</i>, enter the sequence number of the entry. The range is 1 to 4294967294. • The deny keyword denies access to matching conditions. • The permit keyword permits access to matching conditions. • For <i>network length</i>, specify the network number and length (in bits) of the network mask that is permitted or denied.
Step 4	<p>ip msdp description {<i>peer-name</i> <i>peer-address</i>} <i>text</i></p> <p>Example:</p> <pre>Router(config)# ip msdp description peer-name site-b</pre>	<p>(Optional) Configures a description for the specified peer to make it easier to identify in a configuration or in show command output.</p> <p>By default, no description is associated with an MSDP peer.</p>
Step 5	<p>end</p> <p>Example:</p> <pre>Router(config)# end</pre>	Returns to privileged EXEC mode.
Step 6	<p>show running-config</p> <p>Example:</p> <pre>Router# show running-config</pre>	Verifies your entries.

	Command or Action	Purpose
Step 7	copy running-config startup-config Example: <pre>Router# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Caching Source-Active State

By default, the switch does not cache source/group pairs from received SA messages. When the switch forwards the MSDP SA information, it does not store it in memory. Therefore, if a member joins a group soon after a SA message is received by the local RP, that member needs to wait until the next SA message to hear about the source. This delay is known as join latency.

If you want to sacrifice some memory in exchange for reducing the latency of the source information, you can configure the switch to cache SA messages.

Beginning in privileged EXEC mode, follow these steps to enable the caching of source/group pairs. This procedure is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre># configure terminal</pre>	Enters global configuration mode.
Step 2	ip msdp cache-sa-state [list access-list-number] Example: <pre>(config)# ip msdp cache-sa-state 100</pre>	Enables the caching of source/group pairs (create an SA state). Those pairs that pass the access list are cached. For list access-list-number , the range is 100 to 199. Note An alternative to this command is the ip msdp sa-reques global configuration command, which causes the switch to send an SA request message to the MSDP peer when a new member for a group becomes active.
Step 3	access-list access-list-number {deny permit} protocol source source-wildcard destination destination-wildcard Example: <pre>(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0</pre>	Creates an IP extended access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> For access-list-number, the range is 100 to 199. Enter the same number created in Step 2. The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.

	Command or Action	Purpose
	0.0.255.255	<ul style="list-style-type: none"> • For <i>protocol</i>, enter ip as the protocol name. • For <i>source</i>, enter the number of the network or host from which the packet is being sent. • For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. • For <i>destination</i>, enter the number of the network or host to which the packet is being sent. • For <i>destination-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore. <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p>
Step 4	end Example: <pre>(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	show running-config Example: <pre># show running-config</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example: <pre># copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Requesting Source Information from an MSDP Peer

Local RPs can send SA requests and get immediate responses for all active sources for a given group. By default, the switch does not send any SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member waits to receive the next periodic SA message.

If you want a new member of a group to learn the active multicast sources in a connected PIM sparse-mode domain that are sending to a group, configure the switch to send SA request messages to the specified MSDP peer when a new member joins a group. The peer replies with the information in its SA cache. If the peer does

not have a cache configured, this command has no result. Configuring this feature reduces join latency but sacrifices memory.

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <code># configure terminal</code>	Enters global configuration mode.
Step 2	ip msdp sa-request <i>{ip-address name}</i> Example: <code>(config)# ip msdp sa-request 171.69.1.1</code>	Configure the switch to send SA request messages to the specified MSDP peer. For <i>ip-address name</i> , enter the IP address or name of the MSDP peer from which the local switch requests SA messages when a new member for a group becomes active. Repeat the command for each MSDP peer that you want to supply with SA messages.
Step 3	end Example: <code>(config)# end</code>	Returns to privileged EXEC mode.
Step 4	show running-config Example: <code># show running-config</code>	Verifies your entries.
Step 5	copy running-config startup-config Example: <code># copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Controlling Source Information that Your Switch Originates

You can control the multicast source information that originates with your switch:

- Sources you advertise (based on your sources)
- Receivers of source information (based on knowing the requestor)

For more information, see the [Redistributing Sources, on page 8](#) and the [Filtering Source-Active Request Messages, on page 9](#).

Redistributing Sources

SA messages originate on RPs to which sources have registered. By default, any source that registers with an RP is advertised. The *A flag* is set in the RP when a source is registered, which means the source is advertised in an SA unless it is filtered.

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>configure terminal</p> <p>Example:</p> <pre># configure terminal</pre>	Enters global configuration mode.
Step 2	<p>ip msdp redistribute [list <i>access-list-name</i>] [asn <i>aspath-access-list-number</i>] [route-map <i>map</i>]</p> <p>Example:</p> <pre>(config)# ip msdp redistribute list 21</pre>	<p>Configures which (S,G) entries from the multicast routing table are advertised in SA messages.</p> <p>By default, only sources within the local domain are advertised.</p> <ul style="list-style-type: none"> • (Optional) list <i>access-list-name</i>— Enters the name or number of an IP standard or extended access list. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists. The access list controls which local sources are advertised and to which groups they send. • (Optional) asn <i>aspath-access-list-number</i>—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the ip as-path access-list command. • (Optional) route-map <i>map</i>—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the ip as-path access-list command. <p>The switch advertises (S,G) pairs according to the access list or autonomous system path access list.</p>
Step 3	<p>Use one of the following:</p> <ul style="list-style-type: none"> • access-list<i>access-list-number</i> {deny permit} <i>source</i> [<i>source-wildcard</i>] • access-list<i>access-list-number</i> {deny permit} <i>protocol source source-wildcard destination destination-wildcard</i> 	<p>Creates an IP standard access list, repeating the command as many times as necessary.</p> <p>or</p> <p>Creates an IP extended access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> • <i>access-list-number</i>—Enters the same number created in Step 2. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists.

	Command or Action	Purpose
	<p>Example:</p> <pre>(config)# access list 21 permit 194.1.22.0</pre> <p>OR</p> <pre>(config)# access list 21 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</pre>	<ul style="list-style-type: none"> • deny—Denies access if the conditions are matched. The permit keyword permits access if the conditions are matched. • <i>protocol</i>—Enters ip as the protocol name. • <i>source</i>—Enters the number of the network or host from which the packet is being sent. • <i>source-wildcard</i>—Enters the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. • <i>destination</i>—Enters the number of the network or host to which the packet is being sent. • <i>destination-wildcard</i>—Enters the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore. <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p>
Step 4	<p>end</p> <p>Example:</p> <pre>(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	<p>show running-config</p> <p>Example:</p> <pre># show running-config</pre>	Verifies your entries.
Step 6	<p>copy running-config startup-config</p> <p>Example:</p> <pre># copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Filtering Source-Active Request Messages

By default, only switches that are caching SA information can respond to SA requests. By default, such a switch honors all SA request messages from its MSDP peers and supplies the IP addresses of the active sources.

However, you can configure the switch to ignore all SA requests from an MSDP peer. You can also honor only those SA request messages from a peer for groups described by a standard access list. If the groups in

the access list pass, SA request messages are accepted. All other such messages from the peer for other groups are ignored.

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre># configure terminal</pre>	Enters global configuration mode.
Step 2	Use one of the following: <ul style="list-style-type: none"> • ip msdp filter-sa-request {ip-address name} • ip msdp filter-sa-request {ip-address name} list access-list-number Example: <pre>(config)# ip msdp filter sa-request 171.69.2.2</pre>	Filters all SA request messages from the specified MSDP peer. or Filters SA request messages from the specified MSDP peer for groups that pass the standard access list. The access list describes a multicast group address. The range for the access-list-number is 1 to 99.
Step 3	access-list access-list-number {deny permit} <i>source</i> [<i>source-wildcard</i>] Example: <pre>(config)# access-list 1 permit 192.4.22.0 0.0.0.255</pre>	Creates an IP standard access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> • For <i>access-list-number</i>, the range is 1 to 99. • The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched. • For <i>source</i>, enter the number of the network or host from which the packet is being sent. • (Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. Recall that the access list is always terminated by an implicit deny statement for everything.
Step 4	end Example: <pre>(config)# end</pre>	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 5	show running-config Example: <pre># show running-config</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example: <pre># copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Controlling Source Information that Your Switch Forwards

By default, the switch forwards all SA messages it receives to all its MSDP peers. However, you can prevent outgoing messages from being forwarded to a peer by using a filter or by setting a time-to-live (TTL) value.

Using a Filter

By creating a filter, you can perform one of these actions:

- Filter all source/group pairs
- Specify an IP extended access list to pass only certain source/group pairs
- Filter based on match criteria in a route map

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre># configure terminal</pre>	Enters global configuration mode.
Step 2	Use one of the following: <ul style="list-style-type: none"> • ip msdp sa-filter out <pre>{ip-address name}</pre> 	<ul style="list-style-type: none"> • Filters all SA messages to the specified MSDP peer. • Passes only those SA messages that pass the IP extended access list to the specified peer. The range for the extended <i>access-list-number</i> is 100 to 199.

	Command or Action	Purpose
	<ul style="list-style-type: none"> • ip msdp sa-filter out <code>{ip-address name}</code> list access-list-number • ip msdp sa-filter out <code>{ip-address name}</code> route-map map-tag <p>Example: <pre>(config)# ip msdp sa-filter out switch.cisco.com</pre> OR <pre>(config)# ip msdp sa-filter out list 100</pre> OR <pre>(config)# ip msdp sa-filter out switch.cisco.com route-map 22</pre></p>	<p>If both the list and the route-map keywords are used, all conditions must be true to pass any (S,G) pair in outgoing SA messages.</p> <ul style="list-style-type: none"> • Passes only those SA messages that meet the match criteria in the route map <i>map-tag</i> to the specified MSDP peer. <p>If all match criteria are true, a permit from the route map passes routes through the filter. A deny filters routes.</p>
Step 3	<p>access-list <i>access-list-number</i> {deny permit} <i>protocol source source-wildcard destination destination-wildcard</i></p> <p>Example: <pre>(config)# access list 100 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</pre></p>	<p>(Optional) Creates an IP extended access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> • For <i>access-list-number</i>, enter the number specified in Step 2. • The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched. • For <i>protocol</i>, enter ip as the protocol name. • For <i>source</i>, enter the number of the network or host from which the packet is being sent. • For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. • For <i>destination</i>, enter the number of the network or host to which the packet is being sent. • For <i>destination-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore. <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p>

	Command or Action	Purpose
Step 4	end Example: <pre>(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	show running-config Example: <pre># show running-config</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example: <pre># copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Using TTL to Limit the Multicast Data Sent in SA Messages

You can use a TTL value to control what data is encapsulated in the first SA message for every source. Only multicast packets with an IP-header TTL greater than or equal to the *tll* argument are sent to the specified MSDP peer. For example, you can limit internal traffic to a TTL of 8. If you want other groups to go to external locations, you must send those packets with a TTL greater than 8.

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre># configure terminal</pre>	Enters global configuration mode.
Step 2	ip msdp ttl-threshold {ip-address name} ttl Example: <pre>(config)# ip msdp ttl-threshold switch.cisco.com 0</pre>	Limits which multicast data is encapsulated in the first SA message to the specified MSDP peer. <ul style="list-style-type: none"> • For <i>ip-address name</i>, enter the IP address or name of the MSDP peer to which the TTL limitation applies. • For <i>tll</i>, enter the TTL value. The default is 0, which means all multicast data packets are forwarded to the peer until the TTL is exhausted. The range is 0 to 255.

	Command or Action	Purpose
Step 3	end Example: <pre>(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	show running-config Example: <pre># show running-config</pre>	Verifies your entries.
Step 5	copy running-config startup-config Example: <pre># copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Controlling Source Information that Your Switch Receives

By default, the switch receives all SA messages that its MSDP RPF peers send to it. However, you can control the source information that you receive from MSDP peers by filtering incoming SA messages. In other words, you can configure the switch to not accept them.

You can perform one of these actions:

- Filter all incoming SA messages from an MSDP peer
- Specify an IP extended access list to pass certain source/group pairs
- Filter based on match criteria in a route map

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre># configure terminal</pre>	Enters global configuration mode.
Step 2	Use one of the following:	<ul style="list-style-type: none"> • Filters all SA messages to the specified MSDP peer.

	Command or Action	Purpose
	<ul style="list-style-type: none"> • ip msdp sa-filter in <i>{ip-address name}</i> • ip msdp sa-filter in <i>{ip-address name}</i> list <i>access-list-number</i> • ip msdp sa-filter in <i>{ip-address name}</i> route-map <i>map-tag</i> <p>Example: <pre>(config)# ip msdp sa-filter in switch.cisco.com</pre> OR <pre>(config)# ip msdp sa-filter in list 100</pre> OR <pre>(config)# ip msdp sa-filter in switch.cisco.com route-map 22</pre></p>	<ul style="list-style-type: none"> • Passes only those SA messages from the specified peer that pass the IP extended access list. The range for the extended <i>access-list-number</i> is 100 to 199. If both the list and the route-map keywords are used, all conditions must be true to pass any (S,G) pair in outgoing SA messages. • Passes only those SA messages from the specified MSDP peer that meet the match criteria in the route map <i>map-tag</i>. If all match criteria are true, a permit from the route map passes routes through the filter. A deny filters routes.
Step 3	<p>access-list <i>access-list-number</i> {deny permit} <i>protocol source source-wildcard destination destination-wildcard</i></p> <p>Example: <pre>(config)# access list 100 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</pre></p>	<p>(Optional) Creates an IP extended access list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> • <i>access-list-number</i>, enter the number specified in Step 2. • The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched. • For <i>protocol</i>, enter ip as the protocol name. • For <i>source</i>, enter the number of the network or host from which the packet is being sent. • For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. • For <i>destination</i>, enter the number of the network or host to which the packet is being sent. • For <i>destination-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.

	Command or Action	Purpose
		Recall that the access list is always terminated by an implicit deny statement for everything.
Step 4	end Example: <code>(config)# end</code>	Returns to privileged EXEC mode.
Step 5	show running-config Example: <code># show running-config</code>	Verifies your entries.
Step 6	copy running-config startup-config Example: <code># copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring an MSDP Mesh Group

An MSDP mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity among one another. Any SA messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group. Thus, you reduce SA message flooding and simplify peer-RPF flooding. Use the **ip msdp mesh-group** global configuration command when there are multiple RPs within a domain. It is especially used to send SA messages across a domain. You can configure multiple mesh groups (with different names) in a single switch.

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <code># configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 2	ip msdp mesh-group <i>name</i> { <i>ip-address</i> <i>name</i> } Example: <pre>(config)# ip msdp mesh-group 2 switch.cisco.com</pre>	Configures an MSDP mesh group, and specifies the MSDP peer belonging to that mesh group. By default, the MSDP peers do not belong to a mesh group. <ul style="list-style-type: none"> • For <i>name</i>, enter the name of the mesh group. • For <i>ip-address</i> <i>name</i>, enter the IP address or name of the MSDP peer to be a member of the mesh group. Repeat this procedure on each MSDP peer in the group.
Step 3	end Example: <pre>(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	show running-config Example: <pre># show running-config</pre>	Verifies your entries.
Step 5	copy running-config startup-config Example: <pre># copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Shutting Down an MSDP Peer

If you want to configure many MSDP commands for the same peer and you do not want the peer to become active, you can shut down the peer, configure it, and later bring it up. When a peer is shut down, the TCP connection is terminated and is not restarted. You can also shut down an MSDP session without losing configuration information for the peer.

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre># configure terminal</pre>	Enters global configuration mode.
Step 2	ip msdp shutdown { <i>peer-name</i> <i>peer address</i> } Example: <pre>(config)# ip msdp shutdown switch.cisco.com</pre>	Shuts down the specified MSDP peer without losing configuration information. For <i>peer-name</i> <i>peer address</i> , enter the IP address or name of the MSDP peer to shut down.
Step 3	end Example: <pre>(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	show running-config Example: <pre># show running-config</pre>	Verifies your entries.
Step 5	copy running-config startup-config Example: <pre># copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Including a Bordering PIM Dense-Mode Region in MSDP

You can configure MSDP on a switch that borders a PIM sparse-mode region with a dense-mode region. By default, active sources in the dense-mode region do not participate in MSDP.

Note

We do not recommend using the **ip msdp border sa-address** global configuration command. It is better to configure the border router in the sparse-mode domain to proxy-register sources in the dense-mode domain to the RP of the sparse-mode domain and have the sparse-mode domain use standard MSDP procedures to advertise these sources.

The **ip msdp originator-id** global configuration command also identifies an interface to be used as the RP address. If both the **ip msdp border sa-address** and the **ip msdp originator-id** global configuration commands are configured, the address derived from the **ip msdp originator-id** command specifies the RP address.

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <code># configure terminal</code>	Enters global configuration mode.
Step 2	ip msdp border sa-address <i>interface-id</i> Example: <code>(config)# ip msdp border sa-address 0/1</code>	Configures the switch on the border between a dense-mode and sparse-mode region to send SA messages about active sources in the dense-mode region. For <i>interface-id</i> , specifies the interface from which the IP address is derived and used as the RP address in SA messages. The IP address of the interface is used as the Originator-ID, which is the RP field in the SA message.
Step 3	ip msdp redistribute [list <i>access-list-name</i>] [asn <i>aspath-access-list-number</i>] [route-map <i>map</i>] Example: <code>(config)# ip msdp redistribute list 100</code>	Configures which (S,G) entries from the multicast routing table are advertised in SA messages. For more information, see the Redistributing Sources , on page 8.
Step 4	end Example: <code>(config)# end</code>	Returns to privileged EXEC mode.
Step 5	show running-config Example: <code># show running-config</code>	Verifies your entries.
Step 6	copy running-config startup-config Example: <code># copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Configuring an Originating Address other than the RP Address

You can allow an MSDP speaker that originates an SA message to use the IP address of the interface as the RP address in the SA message by changing the Originator ID. You might change the Originator ID in one of these cases:

- If you configure a logical RP on multiple switches in an MSDP mesh group.
- If you have a switch that borders a PIM sparse-mode domain and a dense-mode domain. If a switch borders a dense-mode domain for a site, and sparse-mode is being used externally, you might want dense-mode sources to be known to the outside world. Because this switch is not an RP, it would not have an RP address to use in an SA message. Therefore, this command provides the RP address by specifying the address of the interface.

If both the **ip msdp border sa-address** and the **ip msdp originator-id** global configuration commands are configured, the address derived from the **ip msdp originator-id** command specifies the address of the RP.

This task is optional.

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre># configure terminal</pre>	Enters global configuration mode.
Step 2	ip msdp originator-id interface-id Example: <pre>(config)# ip msdp originator-id 0/1</pre>	Configures the RP address in SA messages to be the address of the originating device interface. For <i>interface-id</i> , specify the interface on the local switch.
Step 3	end Example: <pre>(config)# end</pre>	Returns to privileged EXEC mode.
Step 4	show running-config Example: <pre># show running-config</pre>	Verifies your entries.

	Command or Action	Purpose
Step 5	<p><code>copy running-config startup-config</code></p> <p>Example:</p> <pre># copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Monitoring and Maintaining MSDP

Commands that monitor MSDP SA messages, peers, state, and peer status:

Table 1: Commands for Monitoring and Maintaining MSDP

Command	Purpose
<code>debug ip msdp [peer-address name] [detail] [routes]</code>	Debugs an MSDP activity.
<code>debug ip msdp resets</code>	Debugs MSDP peer reset reasons.
<code>show ip msdp count [autonomous-system-number]</code>	Displays the number of sources and groups originated in SA messages from each autonomous system. The <code>ip msdp cache-sa-state</code> command must be configured for this command to produce any output.
<code>show ip msdp peer [peer-address name]</code>	Displays detailed information about an MSDP peer.
<code>show ip msdp sa-cache [group-address source-address group-name source-name] [autonomous-system-number]</code>	Displays (S,G) state learned from MSDP peers.
<code>show ip msdp summary</code>	Displays MSDP peer status and SA message counts.

Commands that clear MSDP connections, statistics, and SA cache entries:

Table 2: Commands for Clearing MSDP Connections, Statistics, or SA Cache Entries

Command	Purpose
<code>clear ip msdp peer peer-address name</code>	Clears the TCP connection to the specified MSDP peer, resetting all MSDP message counters.
<code>clear ip msdp statistics [peer-address name]</code>	Clears statistics counters for one or all the MSDP peers without resetting the sessions.

Command	Purpose
<code>clear ip msdp sa-cache [group-address name]</code>	Clears the SA cache entries for all entries, all sources for a specific group, or all entries for a specific source/group pair.

Configuration Examples for Configuring MSDP

Configuring a Default MSDP Peer: Example

This example shows a partial configuration of Router A and Router C in . Each of these ISPs have more than one customer (like the customer in) who use default peering (no BGP or MBGP). In that case, they might have similar configurations. That is, they accept SAs only from a default peer if the SA is permitted by the corresponding prefix list.

Router A

```
Router(config)# ip msdp default-peer 10.1.1.1
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Router(config)# ip prefix-list site-b permit 10.0.0.0/1
```

Router C

```
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Router(config)# ip prefix-list site-b permit 10.0.0.0/1
```

Caching Source-Active State: Example

This example shows how to enable the cache state for all sources in 171.69.0.0/16 sending to groups 224.2.0.0/16:

```
(config)# ip msdp cache-sa-state 100
(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255
```

Requesting Source Information from an MSDP Peer: Example

This example shows how to configure the switch to send SA request messages to the MSDP peer at 171.69.1.1:

```
(config)# ip msdp sa-request 171.69.1.1
```

Controlling Source Information that Your Switch Originates: Example

This example shows how to configure the switch to filter SA request messages from the MSDP peer at 171.69.2.2. SA request messages from sources on network 192.4.22.0 pass access list 1 and are accepted; all others are ignored.

```
(config)# ip msdp filter sa-request 171.69.2.2 list 1
(config)# access-list 1 permit 192.4.22.0 0.0.0.255
```

Controlling Source Information that Your Switch Forwards: Example

This example shows how to allow only (S,G) pairs that pass access list 100 to be forwarded in an SA message to the peer named *switch.cisco.com*:

```
(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
(config)# ip msdp sa-filter out switch.cisco.com list 100
(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.20 0 0.0.255.255
```

Controlling Source Information that Your Switch Receives: Example

This example shows how to filter all SA messages from the peer named *switch.cisco.com*:

```
(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
(config)# ip msdp sa-filter in switch.cisco.com
```
