### What’s in This Guide

Revised: February 2013, OL-28614-01

- What’s New, page ix
- Before You Begin, page ix
- Related Documents, page xii
- Obtaining Documentation and Submitting a Service Request, page xiii

### What’s New

For a complete list of features for this release, see the following documentation on Cisco.com:

- *Release Notes for Cisco TelePresence System*

For supported software compatibility across all releases, see the following documentation:

- Cisco TelePresence Administration Software Compatibility

### Before You Begin

Before beginning the tasks in this guide, familiarize yourself with the following:

- Information About the Touch Device, page x
- Assembly and Wiring Guidelines, page x
- CTS Software Download Support, page xi
- Obtaining the MAC Address of Your System, page xi
- Network Time Protocol (NTP) Requirements, page xii
- Unified Communications Manager and COP File Download Support, page xii
- Unified Communications Manager and COP File Download Support, page xii
- Web Browser Support, page xii
Information About the Touch Device

For information about installing and configuring your Cisco TelePresence Touch 12 device, refer to the Installing and Configuring the Cisco TelePresence Touch 12 on Cisco.com.

Assembly and Wiring Guidelines

Make sure your CTS is properly assembled and wired according to the guidelines in the Cisco TelePresence System installation guides on cisco.com.

The installation documentation is at the following URLs:

Cisco TelePresence System 500-32 Assembly, Use & Care, and Field-Replaceable Unit Guide:

Cisco TelePresence System TX1300 47 Installation, First-Time Setup, and Field-Replaceable Unit Guide:

Cisco TelePresence System TX1310 65 Assembly, First-Time Setup, and Field Replaceable Unit Guide:

Cisco TelePresence System TX9000 and TX9200 Assembly, First-Time Setup, and Field-Replaceable Unit Guide:

To find additional hardware and software information for your product, perform one of the following actions:

- Log onto Cisco.com, Click Support, type the name of the product in the Product Support text box, and click Find.
- Navigate to the following URL on cisco.com:
  http://www.cisco.com/cisco/web/psa/default.html?mode=prod&level0=280789323
  Then, use one of the navigation paths to find your system:
  - Cisco TelePresence TX9200 Series
    - Cisco TelePresence TX9200
  - Cisco TelePresence TX9000 Series
    - Cisco TelePresence TX9000
  - Cisco TelePresence TX1300 Series
    - Cisco TelePresence TX 1300 47
    - Cisco TelePresence TX 1310 65

Products > TelePresence > TelePresence Endpoints - Immersive
CTS Software Download Support

To find and download the Cisco TelePresence software that is required for the correct operation of your system, complete the following steps:

**Step 1** Navigate to the area where your device software is located by completing one of the following actions:

- Log onto Cisco.com, Click **Support**, type the name of the product in the Product Support text box, and click **Find**.
- Manually navigate to your product by performing the following steps:
  a. Navigate to the following URL on cisco.com:
     
     http://www.cisco.com/cisco/web/psa/default.html?mode=prod&level0=280789323
  b. Use one of the navigation paths to find your system:

*Products > TelePresence > TelePresence Endpoints - Immersive*

  - Cisco TelePresence TX9200 Series
  - Cisco TelePresence TX9000 Series
  - Cisco TelePresence TX1300 Series

*Products > TelePresence > TelePresence Endpoints - Personal > TelePresence Office > Cisco TelePresence System 500 > Cisco TelePresence System 500-32*

For example:

*Products > TelePresence > TelePresence Endpoints - Immersive > Cisco TelePresence System TX9200 Series > TX9000 Series*

**Step 2** Click the **Download Software** link under the **Software Downloads, Release and General Information** heading.

**Step 3** Select your product in the navigation window.

The location choice displays on the right of the window.

**Step 4** Locate the software you require and either download it immediately by clicking the **Download** button, or download it later by clicking the **Add to Cart** button.

**Step 5** If you selected Add to Cart, click the **Download Cart** hypertext and click the **Download** button next to each software choice to download your software.

---

**Obtaining the MAC Address of Your System**

Make sure the MAC address of the device you are installing is known or available:

- The MAC address comprises a unique 12-character hexadecimal number that identifies your system.
- Locate the MAC address number on a label on the back of the Cisco TelePresence system primary codec (for example, 000B6A409C405). The MAC address is required to register your system in Unified CM.
The MAC address is also displayed on the CTS main display screen during boot-up.

**Note**  When entering the MAC address in Unified CM fields, do not use spaces or dashes, and do not include any other characters that may precede the MAC address on the label.

## Network Time Protocol (NTP) Requirements

NTP is required to synchronize the clocks on Cisco IP telephony servers. NTP must be configured properly on Unified CM to ensure that calendar events appear as expected.

See Table 5-5 in Chapter 5, “Configuring the Cisco TelePresence TX System” for more information about configuring NTP and other CTS system settings.

## Unified Communications Manager and COP File Download Support

See the “Managing Cisco Options Package (COP) Files on the Cisco TelePresence System” section in the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System* for detailed information about managing COP files.

## Web Browser Support

The Cisco TelePresence System Administration interface is supported on Internet Explorer (IE) versions 8 and 9, as well as the latest version of Firefox.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What’s New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at the following URL:

Subscribe to the What’s New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
CHAPTER 1

Using the Cisco TelePresence TX System Administration Interface

Revised: February 2013, OL-28614-01

Contents

This chapter contains the following sections:

- Overview, page 1-1
- System Status, page 1-2
- Navigation, page 1-5
- Where to Go Next, page 1-8

Overview

Administrators use the Cisco TelePresence System Administration interface to maintain the Cisco TelePresence System (CTS).

Note

No more than one administrator should access the CTS Administration interface at one time.

Administration tasks include the following:

- Viewing device information and detailed system status information
- Configuring system settings
- Monitoring the status of Cisco TelePresence system equipment
- Troubleshooting the system

For first-time setup instructions, refer to the Cisco TelePresence System Assembly Guide for your system on Cisco.com:

Cisco TelePresence System 500-32 Assembly, Use & Care, and Field-Replaceable Unit Guide:
Cisco TelePresence System TX1300 47 Installation, First-Time Setup, and Field-Replaceable Unit Guide:

Cisco TelePresence System TX1310 65 Assembly, First-Time Setup, and Field Replaceable Unit Guide:

Cisco TelePresence System TX9000 and TX9200 Assembly, First-Time Setup, and Field-Replaceable Unit Guide:

Figure 1-1 shows an example of the Cisco TelePresence System Administration window. Click the task name or the arrows in the left panel to navigate to tasks.

**Figure 1-1** Main Cisco TelePresence System Administration Window

System Status

This section contains the following system status information:

- System Status Window, page 1-3
- Device Status Indicators, page 1-4
- Cisco Unified Communications Manager Status, page 1-5
- In a Call Indicator, page 1-5
System Status Window

System status is always in view in the lower left corner of the Cisco TelePresence System Administration screen, as shown in Figure 1-2. The system administrator should closely monitor this area for changes in the status of the Cisco TelePresence system functions and equipment. The system status is updated every 60 seconds.

Note
Information provided in the System Information Details window is used by Cisco technical support personnel to assist in troubleshooting your system.

To view detailed status information in the System Status box:

Step 1 Move your mouse over the colored icons in the System Status box to display dialog boxes containing the state of each piece of equipment. For example, rolling your mouse over the green check-mark icons in Figure 1-2 will show the detailed state of the equipment.

Figure 1-2  System Status Window

<table>
<thead>
<tr>
<th>Camera:</th>
<th>Displays:</th>
<th>Doc Camera:</th>
<th>Presentation:</th>
<th>Touch:</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK</td>
<td>OK</td>
<td>OK</td>
<td>OK</td>
<td>OK</td>
</tr>
</tbody>
</table>

Or

Step 2 Click the magnifying glass icon in the upper right corner of the System Status box. A new window opens with the following two tabs:

- **System Information Details**—Lists detailed information about your CTS, including the camera, audio, and display.
- **Status Details**—Lists status details of CTS components and software, including the camera, or presentation display, and whether your Unified CM configuration is enabled and functional.

For more information, see Chapter 3, “Device Information.”
Device Status Indicators

CTS devices include the following:

- Cameras
- Displays
- Document Camera
- Presentation display (if present)
- Cisco Touch device

The System Status box shows the following icons for the camera, display, documentation camera, projector, and Cisco Touch device for the conditions indicated.

- Ellipses or Black Dot—Microphone is not expected or microphone is not connected.

- Green check mark—Device is configured and operational.

- Hourglass—Device status is unknown or is being determined.

- Question Mark—Microphone is not expected or microphone is not connected.

- Red X with a broken pipe—Device in inaccessible. This icon is seen if the primary codec cannot communicate with a secondary codec.

- Red X—Device is not connected or device is not configured:
  - Cameras—When the video cable is not connected or is loose, or when the Ethernet cable is not connected.
  - Displays—When the video cable is not connected or the display does not have power.
  - Projectors—If the video cable is unplugged or the unit does not have power.
  - Microphones—Offline.
  - If you have specified in Cisco Unified Communications Manager (Unified CM) that a projector/LCD is present and there is not one present.
Determining Device Status Using the Troubleshooting Interface

To determine individual microphone and speaker functionality, use the hardware troubleshooting interface for your system. To find troubleshooting information for your system, follow the steps in the “Troubleshooting Your TX and CTS System Components” section on page 5-24.

Cisco Unified Communications Manager Status

The Cisco Unified Communications Manager can be in the following states:
- Enabled and OK
- Inaccessible

In a Call Indicator

The Status box tracks when the meeting room is in a call and displays the security level of active calls. When in a call, the security level is determined between the two endpoints. There are five possible levels of security.
- Yes/Encrypted—Active call with both the signaling and the media encrypted.
- Yes/Authenticated—Active call with encryption on the call signaling only.
- Yes/Non-Secure—Active call with no authentication or encryption.
- Yes/Not Available—Active call but the security level of that call is unavailable.
- No—Not actively in a call.

Navigation

In the navigation pane at the left side of the Cisco TelePresence System Administration window, the Configuration, Troubleshooting, and Monitoring folders display lists of tasks. Lists of tasks are also displayed in the main content area of the window when you click any of the following topics in the navigation pane:
- Configuration
- Troubleshooting
- Monitoring

You can quickly access a task by clicking the highlighted name (IP Settings, for example). Figure 1-3 shows your choices for accessing system administration tasks.
The following sections describe objects, functions, and information that is displayed in the windows associated with the Cisco TelePresence System Administration interface:

- **Administration Window Header, page 1-7**
- **Content Area, page 1-7**
- **Typing and Selecting Information in Fields, page 1-7**
- **Validating Information in Fields, page 1-7**
- **Validating Information in Windows, page 1-7**
Administration Window Header

The header at the top of all Cisco TelePresence System Administration windows contains the name of the person currently logged in and provides links for the following functions:

- **Logout**—Click to log out of the system.
- **Help**—Click to display online help for using the Cisco TelePresence System Administration.
- **About**—Click to display software version and licensing information.

Content Area

The frame on the right is the content area, and the gray bar above the content area shows the navigational path so you can quickly identify where you are at any time.

Typing and Selecting Information in Fields

To modify information in fields, use the mouse to highlight and delete existing information. Type in new information. Some fields offer drop-down menus from which you choose settings.

Validating Information in Fields

Some Cisco TelePresence System Administration windows contain **Apply** and **Reset** buttons, which are initially disabled. Once you change or add settings in these windows, both buttons become enabled.

- Use the **Apply** button to apply new or modified information. When you click **Apply**, validation is performed for all fields in that window, and a message is displayed if there is invalid data in the fields.
- Use the **Reset** button to discard changes and restore the values shown when the window was first displayed.

Other Cisco TelePresence System Administration windows have fields containing information such as IP addresses, domain names, media port numbers (view only), and so on, that are validated when you exit the field. When information in a field is found to be invalid, a message describing the error is displayed.

---

**Note**

View only fields such as stop and start media port numbers can be configured by going to **Devices > Device Settings > SIP Profile** in the Cisco Unified CM Administration interface. See the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System* on Cisco.com for more information.

Validating Information in Windows

When you go to the navigation pane and click a task, the Cisco TelePresence System Administration software checks data in the current window and takes an action, as follows:

- If all changes are saved, the content area displays the requested window.
Where to Go Next

- If there are unsaved changes in the current window and data is valid, a message reminds you that there are unsaved changes. An OK button saves the changes, and a Cancel button allows you to continue modifying data.
- If there are unsaved changes and the data is not valid, a message explains what to do and provides OK and Cancel buttons to assist you.

Note
If you change settings and click Apply in the navigation pane, the request may take a few moments to take effect. Wait until the pending request is completed before clicking a new task.

Where to Go Next

Proceed to Chapter 3, “Device Information” to access the Cisco TelePresence System Administration interface. For a full description of the fields in the interface, proceed to the Chapter 2, “Understanding the Fields In the Cisco TelePresence TX System Administration Interface”.
CHAPTER 2

Understanding the Fields In the Cisco TelePresence TX System Administration Interface

Revised: February 2013, OL-28614-01

Contents

This chapter contains the following sections:

- Fields in the Troubleshooting Area, page 2-3

Fields in the Configuration Area

This section contains information about the fields that are in the Configuration area and contains the following topics:

- IP Settings, page 2-1
- Network Settings, page 2-2
- Call Control Settings, page 2-2
- Address Book, page 2-2
- Telephony Settings, page 2-2
- SNMP Settings, page 2-2
- System Settings, page 2-3
- Security Settings, page 2-3

IP Settings

The IP Settings window displays the CTS MAC address and hostname and you can view and manage the following:
• DHCP—Choose **Yes** if your network uses the Dynamic Host Configuration Protocol (DHCP) to dynamically assign a network address for your system. Choose **No** to assign a static address for your system if your network does not use DHCP.

• Domain name
• IP Address
• Default gateway
• DNS servers.

For more information about this field, see the **“IP Settings” section on page 5-8.**

### Network Settings

You can view or configure the following settings in the Network Settings window:

• Operational VLAN ID
• Administrative VLAN ID
• Syslog Address

For more information about this field, see the **“Network Settings” section on page 5-10.**

### Call Control Settings

Use this field to specify TFTP server locations and view a list of available settings for this Cisco TelePresence system. For more information about this field, see the **“Call Control Settings” section on page 5-11.**

### Address Book

The Address Book window displays read-only entries that have been set in Unified CM. You can create listings for up to 40 meeting rooms.

For more information about this field, see the **“Address Book” section on page 5-13.**

### Telephony Settings

The Telephony Settings window displays read-only information about the telephony settings for the Cisco TelePresence System that were set in Unified CM.

For more information about this field, see the **“Telephony Settings” section on page 5-14.**

### SNMP Settings

This field shows your SNMP settings. For more information about this field, see the **“SNMP Settings” section on page 5-16.**
System Settings

This field allows to view Unified CM configuration settings for your system. For more information, see the “System Settings” section on page 5-18.

Security Settings

To view the MIC or LSC certificates that are used for your system, click the Download button to download either the MIC Key or LSC Certificate in this field. A dimmed Download button indicates the lack of an available certificate. For more information, see the “Security Settings” section on page 5-21

Fields in the Troubleshooting Area

This section describes the fields that are available in the Troubleshooting area and contains the following topics:

- Hardware Setup, page 2-3
- Diagnostics, page 2-7
- Log Files, page 2-8
- Touch Screenshot, page 2-12
- Audio, page 2-12
- Network Connection, page 2-13
- Configuration Issues, page 2-13
- System Restart, page 2-13

Hardware Setup

Cisco TelePresence System Administration includes a diagnostics interface.

To access all available troubleshooting tasks, go to Troubleshooting > Hardware Setup.

If your GUI has tabs visible in this window, select one of the following tabs:

- Device Test: You can use the following Cisco TelePresence system troubleshooting features:
- CTX Tests (Not Available on All Systems): Test reverberation and noise levels for some systems.

Note

Not every system has the CTX test available; in this case, the tab is not visible.

Device Test

The Device Tests tab provides the traditional Hardware Setup troubleshooting tasks for the following Cisco TelePresence System peripherals:

- Displays
- Cameras
Fields in the Troubleshooting Area

- Speakers
- Microphones
- Presentation Devices
- Other Devices

Figure 2-1 shows the CTS device troubleshooting window.

**Figure 2-1  CTS Device Troubleshooting Window**

For more information about these tests, refer to the “First-Time Setup” chapter of the assembly guide for your system, listed at the following URLs.

*Cisco TelePresence System 500-32 Assembly, Use & Care, and Field-Replaceable Unit Guide:*

*Cisco TelePresence System TX1300 47 Installation, First-Time Setup, and Field-Replaceable Unit Guide:*

*Cisco TelePresence System TX1310 65 Assembly, First-Time Setup, and Field Replaceable Unit Guide:*
CTX Tests (Not Available on All Systems)

The CTX Tests tab provides the following troubleshooting tasks for the CTX:

- Reverberation
- Noise Level

Running a test will not end a call but may temporarily change what is shown on local and remote displays.

Because the test stops and then starts various services, if you decide to stop the test before it completes, it might take a few minutes before your system is usable. Do not perform any actions on the system while the test is running, and do not switch to another test while the test is running.

Figure 2-2 shows the CTX Tests window.

**Reverberation**

During this test, the Cisco TelePresence System collects sound pressure levels and noise criteria for each frequency. Once the test is completed, the results are shown in the Test Results.

Ensure that the room is silent while you perform these tests. Any external noise will interfere with the testing process.
Step 1  Select the Reverberation radio button and then click **Start**.

The system issues the following information:

“Test Running: Test is running. Please wait until the test completes; if you stop the test, no results will be recorded.”

The test takes a few minutes to complete. When complete, system reverberation information is displayed in the Test Results window, as shown in **Figure 2-3**.

**Figure 2-3  Reverberation Test Results**

<table>
<thead>
<tr>
<th>Test Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reverberation Test</td>
</tr>
<tr>
<td>M 125Hz 250Hz 500Hz 1000Hz 2000Hz 4000Hz</td>
</tr>
<tr>
<td>60.00 30.00 0.00 0.00 120.00 60.00</td>
</tr>
</tbody>
</table>

Step 2  If desired, click **Download Log**.

The system asks whether you want to open or save the .txt file. This completes the reverberation test.

---

**Noise Level**

During this test, the Cisco TelePresence System plays audio chirps and collects the average sound decays for each frequency. Once the test is completed, the results are shown in the text field.

**Tip**

Ensure that the room is silent while you perform these tests. Any external noise will interfere with the testing process.

---

Step 1  Select the Noise Level radio button and then click **Start**.

The system asks you if you want to continue with the test.

Step 2  Click **OK** in the dialog to begin the test.

The system issues the following information:

“Test Running: Test is running. Please wait until the test completes; if you stop the test, no results will be recorded.”

The test takes a few minutes to complete. When complete, system noise level information is displayed in the Test Results window, as shown in **Figure 2-4**. If you have already run a reverberation test, the noise level test will appear at the top of the window.
Step 3  If desired, click Download Log.

The system asks whether you want to open or save the .txt file. This completes the noise level test.

**Diagnostics**

The Diagnostics window contains choices to diagnose issues with either your display or camera and contains the following pull-downs:

- **Display**: Contains the following tests:
  - **Display OSD state**: Shows the state of the on-screen display (OSD) service. The OSD service controls the appearance of on-screen icons during meetings.
  - **Display On/Off**: Shows the power status of the display (on or off).
  - **Display Edid**: Provides the Extended Display Identification Data (EDID) for the display.
  - **Display Error Status**: If the system detected an error with the display, this field shows the status of the error and also provides status of the power supply for the display.
  - **Display Diagnostics**: Shows the diagnostic information for all system displays.
  - **Display Information**: Shows the following information about the display. This information is useful in troubleshooting problems:

    Center Display
    Main Tx:
    Port Address: 0x72.
    VENDOR_ID=0x01
    DEV_ID=0x9134
    DEV_REV=0x1
    Aux Tx:
    Port Address: 0x76.
    VENDOR_ID=0x01
    DEV_ID=0x9134
    DEV_REV=0x1
    Main Rx:
    Port Address: 0x60.

Chapter 2  Understanding the Fields In the Cisco TelePresence TX System Administration Interface

Fields in the Troubleshooting Area

VENDOR_ID=0x01
DEV_ID=0x9135
DEV_REV=0x4

- **Camera:** you can troubleshoot the camera using any of the following choices:
  - **Camera Cable Connectivity:** This checks the physical cable connections of the power and signal cables for the camera.
  - **Camera Reset:** Resets the cameras.

  **Note**  
  Resetting the cameras does not remove any changes you made to the auto brightness, luminance, auto color brightness, and flicker reduction settings to the cameras.

  - **Camera Settings:** Provides you with a list of the current camera settings. You cannot change these settings. The following are output examples:

    ```
    Center Camera
    flickerCompensation=false
    autoBrightness=false
    autoColorBalance=false
    focusDistance=4
    targetLuminance=35
    ```

    - **Camera Settings File:** Shows the setting as stored in the camera settings file.

      **Note**  
      The luminance values might differ between the settings shown here and the setting shown from the Camera Settings test; this is normal.

    ```
    Center Camera
    set gain 2.36205
    set gain_red 1.21544
    set gain_blue 1.80757
    set gain_green 1
    set roi_A_start_x 0
    set roi_A_start_y 0
    set roi_A_width 1919
    set roi_A_height 1079
    #autoBrightness=false
    set autogain off
    set autoIntegration off
    #flickerCompensation=false
    set integration 100
    #targetLuminance=35
    set target_luminance 60
    #autoColorBalance=false
    set whitebalance off
    ```

- **LCU:** Check the status of the Light Control Unit (LCU), if present on your system.

**Log Files**

The Log Files window contains three tabs:

- **Sysop logs:** Contains the System Operation (sysop) logs. For detailed explanations of each of the sysop logs, refer to the *Cisco TelePresence System Message Guide.*
• **Log files**: These are files that are generally used by Cisco Technical support when troubleshooting system issues. Use this choice if directed by your Cisco technical support representative.

• **SIP messages**: These messages are related to SIP negotiation when setting up and ending a call.

**Sysop Logs**

View system operation (sysop) messages, including call information, call statistics, and call errors for the Cisco TelePresence system from this selection. There can be up to 20 individual files saved on the CTS, and each file can contain up to 100,000 characters.

To download the sysop log files, click the Download Sysop Files button at the bottom of the page. CTS Administration software then prompts you to do one of the following:

- Open to view the sysop log files—The last 100,000 bytes of the log are shown. When you download Sysop files, all available Sysop files will be downloaded.
- Save the sysop log files.

**Log Files**

Use this selection to retrieve log files from the Cisco TelePresence system. Log files can be retrieved from the CTS or from the CTS Cisco Unified IP phone. You can also retrieve log files from the Cisco TelePresence Touch 12 by tapping **More > Status > Report Problem**.

To manage log files:

**Step 1** Navigate to **Troubleshooting > Log Files**.

**Step 2** Select the Log Files tab. The following fields are displayed:

- **Log Status**—Shows the status of the log capture, including the percentage completed.
- **Time Generated**—Shows the time of the most recent log file capture.
- **Problem**—Problem Type can be one of the following:
  - Audio (Speakers, Microphones)
  - Video (Displays, Cameras)
  - Projector, LCD, document camera
  - Phone
  - Recording
  - Other/Unknown

**Step 3** Choose from one of the following file download options:

- **Download existing log files**
- **Capture and download new log files**—The system will capture but not download the log files if your have pop-up blockers enabled for your system; to fix this problem, either disable pop-up blocker for your browser, or select **Capture and download new log files** and then selecting **download existing log files**.
- **None**—Default. No log files will be captured unless a download option is selected.

**Step 4** From the Select Problem Type drop-down menu, choose the type of problem you are experiencing:

- **Audio (speakers, microphones)**
Fields in the Troubleshooting Area

Chapter 2  Understanding the Fields In the Cisco TelePresence TX System Administration Interface

- Video (displays, cameras)
- Projector, LCD, document camera
- Phone
- Recording
- Other/Unknown

**Step 5**
Click the **Get Log Files** button. The following message appears:

*WinZip download will start within several minutes. Please wait...*

Or

*Collecting Cisco TelePresence system log files. This may take several minutes. Please wait...*

**Tip**
The Get Log Files button is deactivated while the system captures the requested log files and is reactivated when complete.

The File Download window appears prompting you to open or save the file. Click Save to send the gzip file to Cisco technicians to help solve the problem.

**SIP Messages**

Session Initiation Protocol (SIP) request and response methods are used to establish communications between components in the network and ultimately to establish a call or session between two or more endpoints. Table 4-7 and Table 4-8 describe the SIP requests and message types.

To manage SIP messages:

**Step 1**
Navigate to **Troubleshooting > Log Files** and click the Select the **SIP Messages** tab. The SIP Messages window appears.

**Step 2**
View a specific type of message in the SIP log file by performing one of the following actions:
- Enter the filter where the SIP Message Type is by typing the name in the field provided. The Filter button is activated.
- Select the message type from the drop-down menu and click the Filter button to view the SIP messages of the type you specified.

**Step 3**
Choose the number of messages to view at one time from the Rows Per Page drop-down menu. Use the First, Previous, Next, and Last buttons to navigate through the message list with the Navigating Long Lists option. You can also Generate Detailed Message Reports.

**Step 4**
To see additional details associated with a SIP message, perform one of the following actions:
- Double-click on a SIP message from the list to open the SIP Message Details dialog box. The SIP Message Details dialog box opens containing the message details and Related SIP Messages.
- Highlight the SIP message and click the Details button. The SIP Message Details dialog box opens containing the message details and Related SIP Messages.
Related SIP Messages

The bottom portion of the SIP Message Details window lists SIP messages that are related to the SIP message that was selected at the top of the window.

To view related SIP message details, Double-click a message in the Related SIP Messages window to see details for that message. SIP Requests and Methods and SIP Response Categories are explained in the following table.

Click Close to dismiss this window.

Use the information in the following sections to understand and navigate SIP requests and responses:

SIP Requests and Methods

SIP Response Categories

### SIP Requests and Methods

Table 2-1 summarizes the SIP requests and methods supported by the Cisco TelePresence System Administration software. The first column lists the RFC that describes the SIP request messages or method.

<table>
<thead>
<tr>
<th>RFC</th>
<th>Request/Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3261</td>
<td>ACK</td>
<td>Confirms that the client has received a final response to an INVITE request.</td>
</tr>
<tr>
<td>3261</td>
<td>BYE</td>
<td>Terminates a call. Can be sent by either the caller or the called party.</td>
</tr>
<tr>
<td>3261</td>
<td>CANCEL</td>
<td>Cancels any pending searches but does not terminate any call currently in progress.</td>
</tr>
<tr>
<td>2976</td>
<td>INFO</td>
<td>Allows session-related control information generated during a session to be carried along the SIP signaling path.</td>
</tr>
<tr>
<td>3261</td>
<td>INVITE</td>
<td>Indicates that a user or service is being invited to participate in a call session.</td>
</tr>
<tr>
<td>3265</td>
<td>NOTIFY</td>
<td>Immediately upon successful accepting or refreshing of a subscription, a NOTIFY message is sent to communicate the current resource state to the subscriber. This NOTIFY message is sent in the same dialog as that created by the SUBSCRIBE message.</td>
</tr>
<tr>
<td>3261</td>
<td>OPTIONS</td>
<td>Queries the capabilities of servers.</td>
</tr>
<tr>
<td>3262</td>
<td>PRACK</td>
<td>Provides reliability for 1xx type messages. See Table 2-2.</td>
</tr>
<tr>
<td>3515</td>
<td>REFER</td>
<td>Provides a mechanism allowing the party sending the REFER message to be notified of the outcome of the referenced request.</td>
</tr>
<tr>
<td>3261</td>
<td>REGISTER</td>
<td>Registers the address listed in the To header field with a SIP server.</td>
</tr>
<tr>
<td>3265</td>
<td>SUBSCRIBE</td>
<td>Requests current state and state updates from a remote node.</td>
</tr>
<tr>
<td>3311</td>
<td>UPDATE</td>
<td>Allows a client to update parameters of a session, but has no impact on the state of a dialog. This request can be sent before the initial INVITE has been completed, thereby making it useful for updating session parameters within early dialogs.</td>
</tr>
</tbody>
</table>

### SIP Response Categories

SIP replies to the requests in Table 2-1 using the response categories described in Table 2-2.
Navigating Long Lists

The log file can hold up to 2 MB worth of SIP messages. To navigate long lists:

- **Step 1**: Choose the number of rows that you wish to see on one page from the Rows Per Page drop-down menu.
- **Step 2**: Double click to select and open single message details. The SIP Message Details window appears.
- **Step 3**: If there are multiple pages listing log files, click the First, Previous, Next, or Last button to navigate to the desired page.
- **Step 4**: Click the radio button to the left of the table entry, and then click Clear to delete a single error message.
- **Step 5**: Click Clear All to delete all error messages displayed.

Related Information

For more information, refer to the following documentation:

- The Cisco TelePresence System Message Guide

Touch Screenshot

To take a screenshot of the current image on your CTS Touch device, navigate to Troubleshooting > Touch Screenshot and click Capture New Touch Screenshot. A screenshot of what is currently displaying on the Touch device for your system appears in the CTS administration GUI.

You can view this image or save it.

Audio

To take an audio recording of your CTS conference, navigate to Troubleshooting > Audio and click Start Recording Audio. The audio records for a maximum of two minutes or until you click Stop Audio Recording.

The recording is saved as a .tar file that contains an .mp4 file that can retrieve, unzip, open, and play. This option is useful to troubleshoot audio issues with your system.
**Network Connection**

To change the Ethernet parameters of your network connection, navigate to **Troubleshooting > Network Connection**. This window contains the following choices:

- **Auto Negotiation**: Enables or disables auto negotiation by clicking the **On** or **Off** radio button. Turning off auto negotiation might require you to specify the speed of your connection manually.

- **Duplex**: Changes the duplex method from full-duplex to half-duplex, or vice versa, by clicking the **Full** or **Half** radio button. Only active is Audio Negotiation is set to Off.

- **Speed**: Changes the speed of your Ethernet connection by choosing any of the radio buttons that appear.

**Configuration Issues**

Use this window to check the software images that are stored and running on your codec(s). You can also restart the system from the factory software image from this window:

This window contains the following information:

- **Unit** (only for systems with more than one codec): Shows the codec position (left, center, or right) as viewed from the table side of the system.

- **Hardware version**: Shows the hardware version of the codec(s).

- **Slot 1 image**: Shows the image that is stored on slot 1 of the system. The active image for the system is shown in bold, with an asterisk next to it.

- **Slot 2 image**: Shows the image that is stored on slot 2 of the codec(s).

- **Factory image**: Shows the image that was preloaded on the codec(s) from the factory.

To reload the codec from the factory image and restart the system, click the **Revert to Factory Configuration and use Cisco TelePresence image specified in Cisco Unified CallManager...and Restart TelePresence System...** button.

After the image reboots, it loads the system from the image that is in slot 0.

While the system is booting, an IP address display on the main display screen (the center display screen for three-screen systems). Make a note of the IP address to log into your system. After you log in to your system, you need to re-register to your Unified CM by navigating to **Configuration > Call Control Settings**, specifying the IP address of the Unified CM server, and clicking **Apply**.

**System Restart**

This If you reboot your system, the codec reboots from the active image.

To restart your system, click the **Restart Cisco TelePresence System...** button. Clicking this button reloads the codec from the image that is specified as the default image in Cisco Unified CM and restart the system. If there is no image specified in Unified CM, the system boots from the active image.

To see the active image, navigate to **Troubleshooting > Configuration Issues**. The active image displays in bold with an asterisk next to it.
Fields in the Monitoring Area

This section describes the fields that are available in the Monitoring area and includes the following topics:

- Call Statistics, page 2-14
- Network Statistics, page 2-16
- Services Statuses, page 2-17

Call Statistics

Use Call Statistics to view audio and video statistics collected by the codecs. The reports include descriptions to help you understand the type of information being collected.

To view call statistics, follow these steps:

**Step 1** Choose Monitoring > Call Statistics.

You can view the following Cisco TelePresence system statistics:

- **Real Time Call Statistics**—Lists details of an in-progress call, including the following:
  - Connection status
  - Registered to Cisco Unified CM
  - Local meeting number

- **Audio/Video Call**—Lists details about the audio and video of an in-progress call, including the following:
  - Call Start Time
  - Call Duration
  - Call Type
  - Remote meeting number
  - Call State
  - Actual Bit Rate
  - Negotiated Bit Rate

- **Historical Call Statistics (not including current call, if any)**—Lists historical information about calls including the following:
  - Call Statistics Clear Time
  - Last Call Start Time
  - Last Call Duration
  - Number of Calls Since System Setup
  - Time in Calls Since System Setup (seconds)
  - Number of Calls Since Last Reboot
  - Time in Calls Since Last Reboot (seconds)
  - Registered to Cisco Unified Communications Manager
Step 2  For more specific audio and video statistics, click the check-box next to the following selections:

Audio/Video Call: Audio Stream Statistics
a. Click once to select. Additional statistics fields appear.
   b. Click once to de-select. Additional fields are hidden.

Audio/Video Call: Video Stream Statistics
a. Click once to select. Additional statistics fields appear.
   b. Click once to de-select. Additional fields are hidden.

Audio-Only Call: Stream Statistics
a. Click once to select. Additional statistics fields appear.
   b. Click once to de-select. Additional fields are hidden.

Statistics are listed in columns labeled as if you were looking at the front of the system sitting at the conference table. For example, on a CTS 3000 or CTS 3200, the labels would indicate statistics from the left, center, and right codecs (and presentation codec, if installed), and from auxiliary devices (when connected).

When the additional statistics fields appear, the following status information is listed:
• Local
• Remote
• Average Latency (Call)
• Average Latency (Period)

Additional statistics are listed for the following:

Transmit
• Is Active
• Media Type
• Total Bytes
• Total Packets

Receive
• Is Active
• Media Type
• Total Bytes
• Total Packets
• Lost Packets
• Lost Packets % (Call)
• Lost Packets % (Period)
• Duplicate Packets
• Late Packets
• Failed SRTP Authentication Packets
Fields in the Monitoring Area

- Average Jitter (Call)
- Average Jitter (Period)

**Note**
For more information about jitter and packet loss, see the “Understanding Jitter and Packet Loss Reporting” section of the *Cisco TelePresence System Message Guide* on Cisco.com.

**Step 3**
Set an interval for updating these reports by choosing the time in minutes from the **Refresh** drop-down menu. Choices, in minutes, include the following:
- None (default)
- 1
- 2
- 5
- 10
- 13
- 60

**Step 4**
Click **Refresh** to update the statistics immediately.

---

**Network Statistics**

Use Network Statistics to view packet transmission statistics collected from the network. Statistics are listed in columns labeled as if you were looking at the back of the system. For example, on a CTS 3000 or CTS 3200, the labels would indicate statistics from the left, center, and right codecs.

To detect problems in network statistics, follow these steps:

**Step 1**
Choose **Monitoring > Network Statistics**.

**Step 2**
Look for error counters that have been incremented since the last time you viewed these statistics. Statistic types include the following:
- False Carrier Sensor Errors
- Receiver Not Okay Errors
- Number of TxOctets
- Number of TxBroadcastPkts
- Number of TxMulticastPkts
- Number of TxUnicastPkts

**Step 3**
Set an interval for updating these reports by choosing the time from the **Refresh** drop-down menu. Choices, in minutes, include the following:
- None (default)
- 1
- 2
- 5
• 10
• 13
• 60

**Step 4** Click **Refresh** to update the statistics immediately.

**Services Statuses**

To check and, in some cases, restart network services, navigate to **Monitoring > Services Statuses**. You can restart the following services; to do so, click the **Restart** button next to the service to restart it:

- Dynamic Host Control Protocol (DHCP) server
- Simple Network Management Protocol (SNMP) server
- Calling Services
- The telephone server

**Where to Go Next**

Proceed to Chapter 3, “Device Information” to access the Cisco TelePresence System Administration interface.
Device Information

Contents

This chapter contains the following sections:

- Accessing the Device Information Window, page 3-1
- Fields in the Device Information Area, page 3-3
- Fields in the Hardware/Software Versions Area, page 3-3
- System Information and Status Details Tabs, page 3-4
- Where to Go Next, page 3-10

Accessing the Device Information Window

The Device Information window is the first thing you see when you log on to the Cisco TelePresence System Administration interface. It is from this window that you can access configuration, troubleshooting, and monitoring tasks for the Cisco TelePresence System (CTS) as well as view information about the devices installed on your system.

Before You Begin

To access the Cisco TelePresence System Administration interface for the first time, complete the steps in Logging into the Cisco Unified CM Administrator section of Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System.

To view information about the Cisco TelePresence devices on your system:

Step 1

Log in to the Cisco TelePresence System Administration interface by completing the following steps:

a. Open an Internet browser window, type the IP address of the system in the URL field, and click Enter. The Cisco TelePresence Administration Login Screen appears, as shown in Figure 3-1.

Note

If you need to obtain the IP address, tap the More button, then the Status and System Status buttons. The IP address displays under the Cisco TelePresence System column.
Chapter 3  Device Information

Accessing the Device Information Window

b. In the Admin field, type `admin`.

c. In the Password field, type `cisco`.

Note

You can change the default password in Unified CM. See the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System*.

d. Click Login.
e. Click Device Information.

The Device Information window appears, as shown in Figure 3-2.

Step 2  
View the information in the following sections within the Device Information window:

- Fields in the Device Information Area
- Fields in the Hardware/Software Versions Area
Fields in the Device Information Area

The Device Information area contains details about the settings that were configured in the CTS and the Unified CM. The information in Table 3-1 describes setting descriptions in the Device Information fields.

Table 3-1 Device Information Fields

<table>
<thead>
<tr>
<th>Field or Button</th>
<th>Setting or Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Model</td>
<td>The model of your Cisco TelePresence system.</td>
</tr>
<tr>
<td>System Configuration</td>
<td>Number of high-definition displays for this system.</td>
</tr>
<tr>
<td>Phone Number</td>
<td>Call pattern for the system as defined in Unified CM.</td>
</tr>
<tr>
<td>Meeting Room</td>
<td>Name of the meeting room in which this system located as defined in Unified CM.</td>
</tr>
<tr>
<td>TelePresence MAC Address</td>
<td>MAC address of the primary system codec.</td>
</tr>
<tr>
<td>TelePresence Host Name</td>
<td>Host name of the primary system codec.</td>
</tr>
<tr>
<td>TelePresence IP Address</td>
<td>IP address of the primary system codec.</td>
</tr>
<tr>
<td>Cisco TelePresence Touch MAC Address</td>
<td>MAC address of the Touch 12 device.</td>
</tr>
<tr>
<td>Cisco TelePresence Touch Software Version</td>
<td>Software version used by the Touch 12 device.</td>
</tr>
</tbody>
</table>

Fields in the Hardware/Software Versions Area

In the Hardware/Software Versions area in the Device Information window, data in bold blue text (with an asterisk “*”) indicates which software image is currently running. Table 3-2 describes the hardware and software versions information fields.

Table 3-2 Hardware/Software Information Fields

<table>
<thead>
<tr>

<td>Software that is pre-loaded at the factory and the software that will be loaded after a factory reset.</td>
</tr>
</tbody>
</table>
System Information and Status Details Tabs

Click the **System Information Details** button in the Device Information window to access this window. Information provided in this window is used by Cisco technical support personnel to assist in troubleshooting your system.

To obtain a detailed report about the system:

1. **Step 1** Log in to the Cisco TelePresence System Administration page. The Device Information window appears.
2. **Step 2** Click the **System Information Details** bar. A new window opens.
3. **Step 3** Click the following tabs in the new window:
   - **System Information Details**
   - **Status Details**
4. **Step 4** Click **Close** to close the window.

System Information Details

Detailed system information is displayed per codec:

- One codec—For systems with one codec, all information displayed is for the system’s single codec.
- Four codecs—For systems with four codecs, hardware and software information is displayed for left, center, and right codecs.

Table 3-3 describes the fields found in the System Information Details window.

<table>
<thead>

</table>

1. CTS 1300 displays information for Center, Left, and Right cameras.
2. The document camera is not available on the CTS 1300.
3. CTS devices are backward compatible up to two CTS Software Releases. Cisco recommends that you upgrade to the latest version software.

## Status Details

Detailed status information is displayed per codec:

- **One codec**—For systems with one codec, all information displayed is for the system’s single codec.
- **Four codecs**—For systems with four codecs, hardware and software information is displayed for those codecs.
You can also view this window by returning to the Device Information window and clicking the magnifying glass icon in the upper right corner of the Status pane, which is in the lower left corner of the screen. See Figure 3-3 for an example of the magnifying glass icon and the Status pane.

Table 3-4 contains descriptions of the Status Details fields. CTS displays a red X next to devices that are not operational or in error.
### Table 3-4  Detailed Status Information Fields

*Note* Further status information is located in the *Time Since Last Update* and *Microphone Status* sections at the bottom of the Status Details page.

**Time Since Last Update**

A running timer is located at the bottom of the Status Details page that displays elapsed time since last update.

**Microphone Status**

A roadmap of microphone status information icons is displayed at the bottom of the Status Details page.

- Ellipses—Not Expected / Not Connected.
- Green Check Mark—Connected.
- Question Mark—Not Expected / Not Connected.
- Red X—Not connected.

*Note* To determine individual microphone and speaker functionality, use the hardware troubleshooting interface for your system. See Where to Go Next to locate the troubleshooting support document for your Cisco TelePresence system.
Where to Go Next

Proceed to the following Cisco TelePresence system administration tasks from the Device Information window:

**Configure**
- Configuring the Cisco TelePresence TX System, page 5-1

**Troubleshoot**
- For troubleshooting information, see the “Troubleshooting Your TX and CTS System Components” section on page 5-24.

**Monitor**
- Monitoring the Cisco TelePresence TX System, page 6-1
TX Software Features

This chapter includes an overview of, and configuration information for, TX software features. This chapter includes information only about the features that require an overview or detailed configuration steps. For a description of all features that are introduced in a specific TX software release, see the Release Notes for that release.

Contents

- 1080p 60 Main Video, page 4-1
- High-Definition Presentation, page 4-7
- Video Bandwidth Allocation Weights, page 4-13
- 802.1X Authentication, page 4-15
- Adjusting the White Balance for Your System, page 4-22

1080p 60 Main Video

In software releases prior to TX release 6, a Cisco TelePresence endpoint can send and receive main video at a maximum frame rate of 30 frames per second (fps). Systems running TX software release 6 and above can send and receive video at 60 fps with 1080p quality (1080p 60).

Note

If your conferences appear darker after you start using 1080p 60 video, you might have to readjust the white balance for the system cameras. To perform this procedure, see the “Adjusting the White Balance for Your System” section on page 4-22.
Systems Supporting 1080p 60

The following systems running TX software can send and receive main video at 1080p 60 during a point-to-point call:

- Cisco TelePresence System TX1300 47
- Cisco TelePresence System TX1310 65
- Cisco TelePresence System TX9000
- Cisco TelePresence System TX9200

The following systems can send and receive main video at 1080p 60 with systems running TX software during a point-to-point call:

- Cisco TelePresence SX20
- Cisco TelePresence C60 and C90 with latest hardware

To determine if your system has the latest hardware, log in to the administration console for the system and navigate to the System Information window. If the system can support 1080p 60, the 1080p60 capable field is set to Yes, as shown in Figure 4-1.

Figure 4-1 Checking 1080p 60 Capability for C60 and C90 Codec-Based Systems

1080p 60 is currently supported only for point-to-point calls. 720p 60 is supported for point-to-point calls and multipoint calls that are placed through the Cisco TelePresence Server version 2.3.

For more information, refer to the Release Notes for TC6 software at the following URL:

tc_software_release_notes_tc6.pdf

The following systems can send and receive main video at a frame rate of 60 fps with 720p quality (720p 60) with systems running TX software during a point-to-point-call:

- All versions of the Cisco TelePresence C20, C40, C60, and C90
- Cisco TelePresence EX90 and EX60
Note

To support the 60 fps main video feature, the Cisco TelePresence endpoints listed above must use the camera(s) that originally ship with the endpoint. The 60 fps main video feature does not support third-party cameras.

Table 4-1 shows the send and receive main video resolution and frame rate of the 60 fps-capable Cisco TelePresence systems.

Table 4-1 Send/Receive Main Video Resolution and Frame Rate of 60 fps-Capable Cisco TelePresence Endpoints and Devices

1. Point-to-point calls only.

Benefits

The 60 fps main video feature provides the following benefits:

- **Video**
  - Improved clarity.
  - Sharper images and increased number of pixels, which create a perception that the video is of a higher resolution than it actually is.

- **Motion**
  - Smoother motion handling, less blurriness.
  - Reduced motion streaks.

Note

The bandwidth requirements for 1080p 60 is 1.5 times higher than that for 1080p 30. If bandwidth conservation is a concern for your Cisco TelePresence environment, you must carefully weigh the benefits of a better video experience against the increased bandwidth requirements of 60 fps and choose accordingly.

As an alternative, 720p 60 fps can provide a video experience comparable to 1080p 30 fps for approximately 5 to 15 percent less bandwidth. For more information about bandwidth requirements, see the “Understanding How Endpoints Determine fps and Video Quality” section on page 4-5.
Required Configuration

The following configuration is required to enable the 60 fps main video feature in your Cisco TelePresence environment:

- For the TX endpoints listed in the “Systems Supporting 1080p 60” section on page 4-2, make the following changes in Unified CM version 8.6(2a)SU2 or later:
  - Set Main Display Frames Per Second in the Phone Configuration page to “60 fps main”. (To access the Phone Configuration page, from Cisco Unified CM Administration, choose Device > Phone. Search for a device, then click on the device name, which brings up the Phone Configuration page.)
  - Set Video Bandwidth Allocation Weights in the Phone Configuration page appropriately. For more information about this parameter, see the “Video Bandwidth Allocation Weights” section on page 4-13.

- For the 60 fps-capable C and SX endpoints listed in the “Systems Supporting 1080p 60” section on page 4-2, make the following configuration changes:
  - Install a premium resolution option key on each endpoint.
  - Set the call rate to 6000 Kbps by logging into the administrative interface for your system and navigating to Configuration > System Configuration, clicking the Conference 1 choice in the left navigation bar, and verifying that the Rate setting in the DefaultCall area is set to 6000.
  - Set the camera for to 60 fps for the camera by logging into the administrative interface for your system and navigating to Configuration > System Configuration, clicking the Video choice in the left navigation bar, and verifying the following settings:
    In the Source 1 area, verify that Quality is set to Motion.
    In the Source 1 > Optimal Definition area, verify that Profile is set to High and Threshold60fps is set to 1280_720.

- For the Cisco TelePresence Server, make the following changes in the System Settings page of the Cisco TelePresence Server administration interface:
  - Click the Configuration tab and check the Enable 60 fps check box.
  - From the HD mode drop-down menu, choose Full HD.

After performing the required configuration, 60 fps-capable Cisco TelePresence endpoints can send and receive main video at a maximum frame rate of 60 fps. The actual usage of 60 fps for sending and receiving depends on the following factors:

- The setting of Video Bandwidth Allocation Weights in Unified CM.
- For point-to-point calls, the results of the call setup negotiation with the receiving endpoint.
- For multipoint calls, the results of the call setup negotiation with the Cisco TelePresence Server.
- Current network conditions (bandwidth).

For more information about the call setup negotiation and bandwidth, see the “Understanding How Endpoints Determine fps and Video Quality” section on page 4-5.

Lighting Considerations

To optimize your Cisco TelePresence environment for 60 fps main video, a lighting level of 250 lux is acceptable, but a lighting level of at least 350 lux is recommended.
Understanding How Endpoints Determine fps and Video Quality

During Cisco TelePresence call setup, the sending and receiving endpoints determine the fps (30 or 60 fps) and video quality (1080p or 720p) in which the video streams are sent and received.

The determination is made as a result of the following factors:

- The amount of Transport Independent Application Specific (TIAS) bandwidth that is negotiated between the sending and receiving endpoints.
  
  The minimum amount of bandwidth is determined by the settings of Main Display Frames Per Second and Quality (Per Display) in the Phone Configuration page of Unified CM. Figure 4-2 and Table 4-3 show the bandwidth requirements based on the Unified CM configuration for 30 fps and 60 fps calls.

- The maximum frame size that the network and system can accommodate.

- The negotiation of the video resolution and frame rate (in fps) by the sending and receiving endpoints.

- The maximum bit rate allowed in the Region settings for your device in Unified CM. These settings are applied to the Device Pool, which in turn are applied to your device.

  To find your region settings, log in to the Cisco Unified CM Administration GUI and navigate to **System > Region**. The maximum rate is the value shown in the Max Video Call Bit Rate (Includes Audio) field.

Table 4-2 shows the three criteria that are required in the first three columns of the table, and the resulting video stream that can be sent in the fourth column of the table.

If any of the factors do not meet the minimum requirements, the system attempts to send and receive video at the next lowest rate as shown in Table 4-4.

For example, if the system and network cannot meet the minimum requirements to send a video stream with the maximum video quality of 1080p 60, the system attempts to negotiate a video stream of 720p 60. If the system cannot meet the requirements to send a video stream of 720p 60, it attempts to negotiate a video stream of 720p 30 as shown in Table 4-4.

---

**Note**

720p Lite and other lower resolutions such as 360p do not support the 60 fps main video feature because of bandwidth restrictions.

If a call is put on hold, then resumed, the amount of bandwidth is re-negotiated using the same factors.

    - Good: 1000 k

Order of Preference
High-Definition Presentation

Under the following circumstances, the 60 fps-capable Cisco TelePresence endpoints and device send the main video stream at 30 fps:

- When in a call with an endpoint or device that supports a maximum frame rate of 30 fps.
- When in a call with a Cisco TelePresence endpoint that is registered with a Cisco Unified Communications Manager (Unified CM) version that does not support 60 fps as a setting for Main Display Frames Per Second in the Phone Configuration page.
- When in a call with a Cisco TelePresence endpoint that is registered with a Unified CM version that supports 60 fps but “30 fps main” is the setting for Main Display Frames Per Second in the Phone Configuration page.

### High-Definition Presentation

This section provides you with information about the supported presentation resolutions and presentation audio and video cables and includes the following sections:

- **HD Presentation Overview**, page 4-8
- **Available Presentation Cables, Supported Presentation Devices, and Tested Adapters**, page 4-9
- **Resolution Support For Digital and VGA Cables**, page 4-10
- **Connecting the Audio Cable to the Codec**, page 4-10
- **Required Configuration For HD Presentation**, page 4-11
HD Presentation Overview

Systems running TX software support high-definition (HD) presentation to a maximum of 1080p resolution at 30 frames per second (1080p 30). The following systems support the HD presentation feature:

- Cisco TelePresence System 500-32
- Cisco TelePresence System TX1300 47
- Cisco TelePresence System TX1310 65
- Cisco TelePresence System TX9000
- Cisco TelePresence System TX9200

Two presentation cable types are supported for systems running TX software:

- A digital cable with an attached audio cable that connects to the codec with an HDMI connector
- An analog cable with an attached audio cable that connects to the codec with a VGA connector.

For more information, see the “Available Presentation Cables, Supported Presentation Devices, and Tested Adapters” section on page 4-9. For information about the resolutions that are supported by each cable, see the “Resolution Support For Digital and VGA Cables” section on page 4-10.

The following Cisco TelePresence endpoints are tested and known to interoperate with the TX endpoints that can send an HD presentation video stream:

- C Series
- EX Series
- MX Series
- SX20

While these endpoints are supported, the received rate for that endpoints, and the quality of the HD presentation, depend on one or more of the following factors:

- The negotiated bandwidth for the call. See Table 4-8 for the bandwidth requirements for HD presentations.
- Any bandwidth and fps settings as set in Unified CM (for example, the Quality (per Display) setting for the CTS system) and/or on the endpoint itself (for example, the MainChannel Weight and PresentationChannel Weight settings for the Cisco TelePresence EX Series).
- The maximum received presentation resolution and frame rate that the other endpoint can receive. To determine the maximum received presentation resolution and frame rate that is supported for a particular system, consult the data sheet for that system.

---

Note

Some presentation resolutions do not take up the full space of the presentation display area. For example, if a laptop that is sending the presentation is set to a resolution of 1600x900, and the presentation display is set to a resolution of 1920x1080, the image shown on the display is 1600x900 pixels with a black border around it to make a total pixel size of 1920x1080.
Available Presentation Cables, Supported Presentation Devices, and Tested Adapters

The following presentation cables are available to use with systems running TX 6 software:

- HDMI-to-HDMI (part number CTS-HDMIHDMI-A=) with audio cable attached
- DisplayPort-to-HDMI (part number CTS-CAB-DPHDMI-A=) with audio cable attached
- Mini DisplayPort-to-HDMI (part number MDPHDMI-A=) with audio cable attached

**Note** If you use any of the HDMI cables, connect the audio cable to the audio connector labeled “Aux” on the codec. For more information, see the “Connecting the Audio Cable to the Codec” section on page 4-10.

- VGA-to-VGA (part number CTS-CAB-VGA-A=) with audio cable attached

**Note** If you use the VGA cable, connect the audio cable to the audio connector with a PC icon on the codec. For more information, see the “Connecting the Audio Cable to the Codec” section on page 4-10.

The following presentation devices have been tested with the following cables:

- Laptop (PC) using an HDMI-to-HDMI cable and a DisplayPort-to-HDMI adapter
- MacBook Air and MacBook Pro using the following cables:
  - An HDMI-to-HDMI cable with a passive Mini DisplayPort-to-HDMI adapter
  - A DisplayPort-to-HDMI cable with a Mini DisplayPort-to-DisplayPort adapter
  - A Mini DisplayPort-to-HDMI cable

**Note** Some Apple devices showed flickering on the screen when being used for presentation sharing. If you encounter this issue, change the resolution quality to a lower resolution.

- iPad 3 using a proprietary cable available from Apple

If an adapter is required, Cisco recommends using a passive adapter, rather than an active adapter that changes or enhances the video signal. Active adapters can cause issues with the presentation being shared immediately after the adapter is connected to the presentation cable.

The following adapters have been tested with the HDMI-to-HDMI cable:

- Monoprice Mini DisplayPort/Thunderbolt-to-HDMI adapter
- Startech.com DisplayPort-to-HDMI adapter

The following adapter has been tested with the Mini DisplayPort-to-HDMI cable:

- Monoprice Mini DisplayPort to DisplayPort/DVI/HDMI multifunction adapter
Resolution Support For Digital and VGA Cables

In software releases prior to TX release 6, the proportional relationship between the width and height (also known as aspect ratio) of the presentation display was 4:3. For the HD presentation display, the aspect ratio is 16:9.

Table 4-5 outlines the common resolutions shared by the presentation devices, the corresponding aspect ratios, and the presentation cables that support the resolutions.

<table>
<thead>
<tr>
<th>Resolutions Shared By Presentation Device</th>
<th>Aspect Ratio</th>
<th>Supported Presentation Cable</th>
</tr>
</thead>
<tbody>
<tr>
<td>1920x1080 (1080p) @ 30 or 5 fps</td>
<td>16:9</td>
<td>HDMI cable only</td>
</tr>
<tr>
<td>1680x1050 (WSXGA+) @ 30 or 5 fps</td>
<td>8:5</td>
<td>VGA cable only</td>
</tr>
<tr>
<td>1440x900 (WXGA+) @ 30 or 5 fps</td>
<td>8:5</td>
<td>HDMI or VGA cable</td>
</tr>
<tr>
<td>1280x800 (WXGA) @ 30 or 5 fps</td>
<td>8:5</td>
<td>HDMI or VGA cable</td>
</tr>
<tr>
<td>1280x720 (720p) @ 30 or 5 fps</td>
<td>16:9</td>
<td>HDMI or VGA cable</td>
</tr>
<tr>
<td>1024x768 (XGA) @ 30, 5, or 1 fps</td>
<td>4:3</td>
<td>HDMI or VGA cable</td>
</tr>
<tr>
<td>800x600 (SVGA) @ 30, 5, or 1 fps</td>
<td>4:3</td>
<td>HDMI or VGA cable</td>
</tr>
<tr>
<td>640x480 (VGA) @ 30, 5, or 1 fps</td>
<td>4:3</td>
<td>HDMI or VGA cable</td>
</tr>
</tbody>
</table>

The actual size of the presentation display depends if the Swap Picture In Presentation (PIP) feature is disabled or enabled.

Connecting the Audio Cable to the Codec

Starting with TX software release 6, you connect the audio cable to different connections based on the type of cable.

- For HDMI cables, connect the audio cable to the AUDIO IN connector labeled “Aux” (callout 1 in Figure 4-3).
- For VGA cables, connect the audio cable to the AUDIO IN connector with a PC icon (callout 2 in Figure 4-3).

Note For the TX9000 and TX9200 systems, the audio connections plug into the TS1 codec, while the video connections plug into the TS4 codec. For more information, refer to the “Connecting and Routing the Cables” chapter of the Cisco TelePresence System TX9000 and TX9200 Assembly, First-Time Setup, and Field-Replaceable Unit Guide.
High-Definition Presentation

Figure 4-3  Audio Connections for the Presentation Cable

Required Configuration For HD Presentation

In software releases prior to TX release 6, if both Binary Floor Control Protocol (BFCP) and TelePresence Interoperability Protocol (TIP) are negotiated for a call, TIP takes precedence, and BFCP is not used to control presentation. BFCP is the preferred protocol for controlling the presentation for systems that run TX software.

To support HD presentation, Unified CM version 8.6(2a)SU2 and later is required.

Table 4-6 describes the Unified CM configuration that enables HD presentation to function on TX endpoints.

Table 4-6  Unified CM Configuration Required For Each TX Endpoint

<table>
<thead>
<tr>
<th>Unified CM Configuration</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>For each TX endpoint, use the Standard SIP Profile (not the Standard SIP BFCP Profile) for the SIP profile.</td>
<td>If using Unified CM 8.6(2a)SU2 and later (the recommended configuration), if you specify the Standard SIP BFCP profile, calls might be dropped and BFCP might not function properly.</td>
</tr>
<tr>
<td>When setting up your endpoint in Unified CM, make sure that you check the Allow Presentation Sharing Using BFCP check box in the Protocol Specific Information area of the Phone Configuration window.</td>
<td>For more information about configuring BFCP, refer to the “Configuring BFCP for Your Cisco TelePresence Device” section of the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System.</td>
</tr>
<tr>
<td>In the Phone configuration, the default value of Video Bandwidth Allocation Weights is 8 Main/2 Presentation. Adjust this setting if desired.</td>
<td>For more information about this parameter, see the “Video Bandwidth Allocation Weights” section on page 4-13.</td>
</tr>
</tbody>
</table>

For more details about the Unified CM configuration, see the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System.

No other configuration is required.
Scaling HD Presentation Video Resolution

For HD presentation, the system running TX software that is sharing content can automatically change resolutions for the content being shared, such as a slide presentation, document, or video. Table 4-7 outlines common presentation device display resolutions, and the higher or lower resolutions to which content can be scaled and sent by the TX endpoint.

In general, HD presentation supports the following scaling schemes:

- Scaling to a higher resolution is not supported except for 1280x720 (720p), which can be scaled to XGA.
- Scaling to lower resolutions of XGA, SVGA, and VGA is supported.

Scaling is done to accommodate lower network bandwidth. Before the system running TX software scales the presentation, it lowers the frame rate of the presentation, which preserves the video clarity.

**Table 4-7 Common Device Display Resolutions and Scaled Resolutions**

**Bandwidth Requirements for the HD Presentation Feature**

The resolutions and frame rates at which each type of video can be sent is based on the available bandwidth.

Table 4-3 on page 4-7 displays the bandwidth required for supported 60 fps main video send resolutions and frame rates, while Table 4-8 displays the bandwidth required for supported HD presentation send resolutions and frame rates.
Video Bandwidth Allocation Weights

The Video Bandwidth Allocation Weights parameter allows you to balance the bandwidth ratio for main video and presentation video during a conference.

Use this feature when the amount of session bandwidth that is used by a Cisco TelePresence endpoint to send audio, main video, and presentation video media streams exceeds the amount of available session bandwidth.

### Table 4-8  Bandwidth Required For Supported HD Presentation Send Resolutions and Frame Rates

</tbody>
</table>

1. These bandwidth rates are designed to avoid scaling when the receiving endpoint does not have sufficient bandwidth but is capable of receiving the sent resolution.
2. The sent frame rate of 1 fps is compatible only with 720p Lite.

For the single-single sample scenario described in “Sample Calculations For Single-Single Calls and Triple-Triple Calls” section on page 4-14, 4.74 Mbps of bandwidth is required for main video and 1.18 Mbps for presentation video. As a result, the endpoint can send the following:

- Main video at 1080p@60 fps, video quality = good, which requires 4.5 Mbps of bandwidth
- Presentation video at 1080p@5 fps, which requires 1 Mbps of bandwidth

After an endpoint calculates the main or presentation video bandwidth for a single-single or triple-triple call, if either video stream has more bandwidth than required, the excess bandwidth is applied to the other stream.

For example, in the single-single sample scenario, there is an extra 0.24 Mbps of bandwidth for the main video (4.75 Mbps - 4.5 Mbps). The extra 0.24 Mbps of bandwidth could be applied to the presentation video stream, which can result in the upgrade of the presentation video resolution and frame rate.

Conversely, the extra 0.18 Mbps of bandwidth for the presentation video (1.18 Mbps - 1 Mbps) could be applied to the main video bandwidth, which can result in the upgrade of the main video resolution and frame rate.

If, in a limited bandwidth scenario, you want to send a presentation with a higher fps but a lower resolution, you can change the resolution of the presentation at the source of the presentation. For example, given a maximum rate of 1000 Kbps, if you are sending a 1920x1080 presentation at 5 fps, you can instead send 640x480 at 30 fps by changing the resolution of your presentation to 640x480.
You add this value in the Bandwidth Allocation Weights field in the Product Specific Configuration Layout Area of the Unified CM administration console, version 8.6.2 and later.

The default value of this parameter is a weight of 8 for main video and a weight of 2 for presentation video (8 main / 2 presentation). The weight is always based on a total number of 10.

**Note**

Weighting is not used for calls that use the TelePresence Interoperability Protocol (TIP). For TIP calls, presentations are either sent at XGA resolution, either 30 fps or 5 fps (1 fps in the case of 720p Lite).

### Supported Systems and Parameters for the Bandwidth Allocation Feature

The following systems support the bandwidth allocation feature:

- Cisco TelePresence System 500-32
- Cisco TelePresence System TX1300 47
- Cisco TelePresence System TX1310 65
- Cisco TelePresence System TX9000
- Cisco TelePresence System TX9200

The following values are supported for this feature. The first value is the weight for main video, and the second value is the weight for the presentation video.

- 9 main / 1 presentation
- 8 main / 2 presentation (**default**)
- 6 main / 4 presentation
- 4 main / 6 presentation
- 3 main / 7 presentation

### Sample Calculations For Single-Single Calls and Triple-Triple Calls

The calculation formula depends on whether the call is between single-screen endpoints (single-single call) or triple-screen endpoints (triple-triple call).

**Note**

A call between a single-screen endpoint and a triple-screen endpoint is considered a single-single call because during this call, only the center screen of the triple-screen endpoint is used.

To provide an example for a Cisco TelePresence endpoint: during a call, the available session bandwidth is 6 Megabits per second (Mbps), while the endpoint attempts to use the following bandwidth for the send media streams:

**6 Mbps (main video) + 4 Mbps (presentation video) = 10 Mbps**

The actual session bandwidth for the send media streams exceeds the available session bandwidth by 4 Mbps.

To fit the available bandwidth, the endpoint performs calculations based on these general formulas, which include values from the Video Bandwidth Allocation Weights parameter:
Definitions:
Session Video Bandwidth (SVB) = Total session bandwidth - Audio bandwidth
Main Video Weight (Mwt) = Configured weight for main video stream
Total Weight for main video (T_Mwt) = Number of Streams x Main Video weight
Presentation Video Weight (Pwt) = Configured weight for presentation video stream
Total Weight for presentation video (T_Pwt) = Number of streams x Presentation video weight
Total Weight (TW) = T_Mwt + T_Pwt

Formula to allocate main video bandwidth:
SVB x (T_Mwt/ TW) = Mwt

Formula to allocate presentation video bandwidth:
SVB x (T_Pwt/ TW) = Pwt

Single-Single Call Calculation Example
T_Mwt = (1 (number of main video streams) x 8) (Mwt) = 8
T_Pwt = (1 (number of presentation video streams) x 2) (Pwt) = 2
TW = 10
Allocated main video bandwidth = 6 x (8 /10) = 4.8 Mbps
Allocated presentation bandwidth = 6 x (2/10) = 1.2 Mbps

Triple-Triple Call Calculation Example
T_Mwt = (3 (number of main video streams) x 8) (Mwt) = 24
T_Pwt = (1 (number of presentation video streams) x 2 ) (Pwt) = 2
TW = 26
Allocated main video bandwidth = 6 x (24/26) = 5.53 Mbps
Allocated presentation video bandwidth = 6 x (2/26) = 0.461 Mbps

802.1X Authentication

This chapter describes how to set up, monitor, and troubleshoot 802.1X authentication in the Cisco TelePresence System:
- IEEE 802.1X Authentication Overview, page 4-15
- Setting up 802.1X Authentication, page 4-17
- Checking the CTS 802.1x Authentication Status, page 4-18
- Troubleshooting 802.1x Authentication Issues, page 4-20

IEEE 802.1X Authentication Overview

802.1X is an IEEE standard for port-based network access control. It offers the capability to permit or deny network connectivity, control Virtual LAN (VLAN) access, and apply traffic policy, based on user or machine identity.
802.1X permits or denies device access to the network by using authentication. Ethernet switch ports can be enabled dynamically based on the identity of the device that connects to it. Devices which are not authenticated cannot gain access to the network.

### 802.1X Authentication Components

802.1X authentication involves the following three network devices:

- **A supplicant**: a client device (such as a laptop or endpoint) that attempts to access a LAN/Wireless LAN (WLAN), or the software that runs on this device and that provides credentials to the authenticator.

- **An authenticator**: a network device (such as an Ethernet switch or wireless access point) that acts as an access point to a protected network. For 802.1X authentication, the supplicant provides network credentials, such as user name, password, digital security certificate, or a combination of these, to the authenticator. The authenticator then forwards the credentials to the authentication server for verification.

- **An authentication server**: a server (such as Cisco Secure Access Control Server) that guards the protected network. For 802.1X authentication, the authentication server receives the supplicant’s network credentials from the authenticator and verifies the supplicant’s identity. Then the supplicant is able to access the resources located on the network.

### Authenticating Your System

Your Cisco TelePresence System is equipped to function as an 802.1X-compliant supplicant. 802.1X authentication is enabled by default.

---

**Note**

Cisco recommends that you configure your switch port (or authenticator) for multi-domain mode.
Setting up 802.1X Authentication

This section describes the steps you perform to set up 802.1x authentication, and includes the following topics:

- Authenticating the Cisco TelePresence System Using a Security Certificate (MIC or LSC), page 4-17
- Examining the Security Certificate in the Cisco TelePresence System, page 4-17

Note In order to complete 802.1X authentication, you must use a port that is not already enabled for 802.1X.

Authenticating the Cisco TelePresence System Using a Security Certificate (MIC or LSC)

When the Cisco TelePresence System receives an authentication challenge from an Authenticator, the system responds with either the Manufacturing Installed Certificate (MIC) or the Locally Significant Certificate (LSC). When both the MIC and LSC are installed, the system uses the LSC to authenticate. If the LSC is not installed, Cisco TelePresence System uses the MIC, as the MIC is built into the system by the manufacturer.

The LSC provides greater security because it creates a public key infrastructure (PKI) that is unique to each system. To authenticate the codec using the LSC, you must install it on your system manually by using the Certificate Authority Proxy Function (CAPF) in Cisco Unified Communication Manager (CUCM). For more information, see the “Installing the LSC” section on page 4-17.

Installing the LSC

To install the LSC, refer to the “Deploying Locally Significant Certificates” section found in the IP Telephony for 802.1X Design Guide.

Examining the Security Certificate in the Cisco TelePresence System

You may want to examine the security certificate (MIC or LSC) on an 802.1X-authenticated system in order to verify that the certificates are valid, not expired, and issued by the CAPF.

To examine the security certificate in your Cisco TelePresence System, you may download a copy of the certificate to your own system by using either of two methods:

- Downloading the Security Certificate Using the CLI, page 4-17
- Downloading the Security Certificate Using the GUI, page 4-18

Downloading the Security Certificate Using the CLI

To download the MIC or LSC using the CLI, complete the following steps:

Step 1 Log in to the CLI.
Step 2 Enter the following command:

```
file get cert {cert-type} {SCP-user} {SCP-password} {IP-address-or-hostname} {file-save-location}
```

See Table 4-9 for syntax descriptions.
802.1X Authentication

**Step 3**
Go to the designated file-save location, and click the file to view the certificate.

**Table 4-9 Syntax Descriptions**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cert-type</td>
<td>Type of certificate to retrieve (either MIC or LSC)</td>
</tr>
<tr>
<td>SCP-user</td>
<td>Username of Secure Copy (SCP) user</td>
</tr>
<tr>
<td>SCP-password</td>
<td>Password for SCP user</td>
</tr>
<tr>
<td>IP-address-or-hostname</td>
<td>Hostname or IP address of target system</td>
</tr>
<tr>
<td>file-save-location</td>
<td>Location to save file on target system</td>
</tr>
</tbody>
</table>

After entering the command, the security certificate will save on the target system in the designated file-save location:

```
file get cert MIC username password 10.1.1.1 /home/user
Uploading MIC to 10.1.1.1...DONE
```

If you select the LSC as the type of certificate to retrieve, but the LSC is not installed on the Cisco TelePresence System, the command line will read as follows:

```
admin:file get cert LSC username password 10.1.1.1 /home/user
Uploading LSC to 10.1.1.1...LSC does not exist
Executed command unsuccessfully
```

If the LSC command is unsuccessful, you need to install the LSC on the codec. See the “Installing the LSC” section on page 4-17. If the command is successful, continue to the next step.

**Downloading the Security Certificate Using the GUI**

To download the MIC/LSC from the GUI, complete the following steps:

**Step 1**
Log into the GUI and navigate to **Configuration > Security Settings**.

**Step 2**
Click **Download** to download and view a certificate. A dimmed Download button indicates the lack of a given certificate.

**Checking the CTS 802.1x Authentication Status**

To check 802.1X authentication status in the Cisco TelePresence System, use either of the following options:

- View the CTS primary display screen during system bootup (see the “Checking the 802.1X Authentication Status on the Primary Display Screen” section on page 4-19)
- Enter the CLI command `show dot1x status` (see the “Checking the 802.1X Authentication Status with a CLI Command” section on page 4-20)
Checking the 802.1X Authentication Status on the Primary Display Screen

To check the 802.1X authentication status on the Cisco TelePresence System primary display screen, complete the following steps:

**Step 1**
Power off the Cisco TelePresence System.

**Step 2**
Power on the Cisco TelePresence System.

**Step 3**
View the bottom right of the primary display screen. In a three-screen system, view the bottom-right of the center screen. Text will display to indicate whether 802.1X is authenticated, not authenticated, or not required on your system.

Example:

802.1X: Connecting...
802.1X: Not Authenticated

This text, as viewed on the Cisco TelePresence System primary display screen, indicates the success or failure of 802.1X authentication on that system. If the status line reads “Not Required,” 802.1X authentication is not required for that system.

See Table 4-10 for a summary of 802.1X authentication status displays for enabled and non-enabled networks.

<table>
<thead>
<tr>
<th>Status</th>
<th>802.1X-Enabled Network</th>
<th>Non-802.1X-Enabled Network</th>
</tr>
</thead>
<tbody>
<tr>
<td>In Progress</td>
<td>Connecting / Authenticating</td>
<td>Connecting</td>
</tr>
</tbody>
</table>
Chapter 4  TX Software Features

802.1X Authentication

Table 4-10  802.1X Authentication Status Display Summary

<table>
<thead>
<tr>
<th>Status</th>
<th>802.1X-Enabled Network</th>
<th>Non-802.1X-Enabled Network</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>Authenticated</td>
<td>Not Required</td>
</tr>
<tr>
<td>Failure</td>
<td>Not Authenticated</td>
<td>Not Required</td>
</tr>
</tbody>
</table>

Note
The 802.1X authentication status can only be viewed on your Cisco TelePresence System primary screen, not on a secondary screen (e.g., a presentation screen, or in a three-screen system, the left or right screen). If the 802.1X authentication status does not show on the primary screen, follow the steps below listed under the “Checking the 802.1X Authentication Status with a CLI Command” section on page 4-20.

Checking the 802.1X Authentication Status with a CLI Command

To check the 802.1X authentication status with a CLI command, complete the following steps:

Step 1  Log into the CLI.
Step 2  Input the following command: `show dot1x status`
Step 3  View resulting text. Text will display indicating whether 802.1X is authenticated, not authenticated, or not required on your system.

Example:

```
admin:show dot1x status
Authenticated
```

Troubleshooting Issues in 802.1X Authentication

When 802.1X does not authenticate properly, review the following sections:

- Troubleshooting Issues in 802.1X Authentication, page 4-20
- Viewing the Security Certificate, page 4-22

Troubleshooting Issues in 802.1X Authentication

Table 4-11 summarizes some issues that may appear during 802.1X authentication, as well as potential resolutions.
Table 4-11 Troubleshooting Issues in 802.1X Authentication

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Root Causes</th>
<th>Resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Secure ACS authentication server rejects security certificate from the Cisco TelePresence System supplicant.</td>
<td>The security certificate is invalid, expired, or not issued by CAPF.</td>
<td>Install a valid, non-expired security certificate using the CAPF. See Viewing the Security Certificate.</td>
</tr>
<tr>

</tr>
<tr>
<td>After moving to a different CAPF and Unified CM, Cisco TelePresence System fails 802.1X authentication.</td>
<td>The LSC no longer supports 802.1X authentication, since it was installed from the previous CAPF and Unified CM. Moving the Cisco TelePresence System to a different CAPF and Unified CM requires reinstalling the LSC and upgrading the system.</td>
<td>Reinstall the LSC from Cisco Unified CM and upgrade the Cisco TelePresence System. See Installing the LSC.</td>
</tr>
</tbody>
</table>
Adjusting the White Balance for Your System

To adjust the white balance settings for your cameras, complete the following steps:

**Step 1** Prepare the camera targets for the white balance by completing the following actions:
If you need to order a camera target kit, including the mounting hardware for the target, order CTS-CAM-TOOL= for the Cisco TelePresence System TX9000 and TX9200, and CTS-CAM-TOOL-G2= for the Cisco TelePresence TX1310 65 or Cisco TelePresence TX1300 47.

- If your system is a Cisco TelePresence System TX9000 or Cisco TelePresence System TX9200, prepare your camera targets by completing the following steps:
  a. Assemble the large camera target, using Figure 4-6 as a guide.

When you slide the Camera target into the frame, make sure the target is centered in the frame between the vertical lines at the top and bottom of the target.

### Table 4-12 Parts List for the Camera Target

<table>
<thead>
<tr>

Adjusting the White Balance for Your System

Figure 4-6 Camera Target Assembly

b. Attach the large target to the underside of the left table section by placing the round pads on the underside of the clamps into recesses that are drilled under the table, with the white part of the target facing the camera.
• If your system is a Cisco TelePresence TX1310 65 or Cisco TelePresence TX1300 47, prepare your camera targets by performing the following actions:
  a. Remove the easel, large camera target, and small camera target from their packaging.
  b. Unlock and slide the telescoping legs of the easel until the legs are at their full height.
  c. Separate the three legs.
  d. Raise the front legs until they are 29 inches (74 cm) high.
  e. Raise the rear leg until it is 31 inches (79 cm) high.
  f. Lock the legs into place using the leg locks.
  g. Attach the large camera target to the clip on top of the easel.
  h. Raise the target supports on the front legs until they touch the lower part of the large camera target.
  i. Raise and lower the front legs until the bottom of the camera target is 32 inches (81 cm) above the ground.
  j. Place the camera target and easel behind the left camera segment.
Adjusting the White Balance for Your System

Figure 4-7  Easel and Target After Assembly

Step 2  Using a supported browser, log in to the Cisco TelePresence Administration GUI for your system.

Step 3  Navigate to Troubleshooting > Hardware Setup and click the Cameras radio button.

Step 4  Click Start in the Testing area.

Note  Make sure that the left camera shows only the target. If other parts of the room can be seen, reposition the target.

Step 5  Click the Setup button underneath the left display in the GUI.

Step 6  Click Auto Adjust.

The auto adjust procedure automatically adjusts the white balance for your system.

Step 7  Click Close to close the Auto Adjust pop-up window.
Step 8  Click **Done**.
Step 9  Position the target for the center segment.
Step 10  Click the **Setup** button underneath the center display and click **Auto Adjust**.  
The auto adjust procedure automatically adjusts the white balance for your system.
Step 11  Click **Close** to close the Auto Adjust pop-up window, then click **Done**.
Step 12  Position the target for the right segment.
Step 13  Complete **Step 10** and **Step 11**, substituting the right segment for the center segment.
Step 14  Click **Stop** to stop the testing procedure.
Configuring Cisco TelePresence TX System

Configuring Cisco Unified Communications Manager for Your Cisco TelePresence System

Before you can use your system, you need to configure your system in Cisco Unified Communications Manager (Unified CM).
You can configure your system and complete all steps in this chapter prior to configuring your device in Unified CM, but you will not be able to complete any of the following actions until you register your device:

- The Touch device cannot download its software from Unified CM and you receive an error in the logs.
- The Cisco TelePresence device cannot place or receive calls.
- The device appears as either a Cisco TelePresence System 500-32 or a Cisco TelePresence System 1000 in the Cisco TelePresence Administration GUI.

To configure your device in Unified CM, complete the following steps:

**Step 1**  
Load the Cisco TelePresence Administration Software image on the Unified CM server.

**Note**  
The Cisco TelePresence TX9000 and TX9200 systems require a minimum version of CTS administration software 1.9.0 to run. If your Unified CM is already running the required minimum software, you can skip this step.

For more information, refer to the following sections in the *Cisco Telepresence Touch 12 Installation Guide*:

- If you are upgrading from a software version that prior to 1.7.4, follow the steps in the “Upgrading the CTS Software for Systems That Are Running Cisco TelePresence Software Versions Prior to 1.7.4” section.
- If you are upgrading from a software version that is 1.7.4 or later, follow the steps in the “Upgrading the CTS Software for Systems That Are Running Cisco TelePresence Software Versions 1.7.4 and Above” section.

**Step 2**  
Register your system as a device in Unified CM. For more information, refer to the “Configuring a Cisco TelePresence Device” section in the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System*.

**Step 3**  
Add the TFTP server for your Unified CM server to your system using the Cisco TelePresence Administration Software GUI. For more information, refer to the “Cisco Unified Communications Manager Settings” of the *Cisco TelePresence System Administration Guide* for your software release.

For more information about configuring Unified CM with your Cisco TelePresence device, refer to the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System*.

**First Time Setup Wizard for the CTS 500-32**

Because the CTS 500-32 uses a first-time setup wizard, the configuration process is somewhat different than other CTS models. See First Time Setup section of the following documentation for complete instructions:

- *Cisco TelePresence System 500-32 Assembly, Use & Care, and Field-Replaceable Unit Guide*
First Time Setup for All Other TX Models

To set up your Cisco TelePresence System for the first time, you must first load the Cisco TelePresence Administration software and bootup the system.

This section contains the following information:

- Powering on the System and Enabling the Cisco TelePresence Administration Software GUI, page 5-3
- Setting Up a System That Uses a Static Network Address, page 5-6
- Setting Up a System That Uses a Static Network Address, page 5-6

Powering on the System and Enabling the Cisco TelePresence Administration Software GUI

To load the CTS Administration Software, complete the following steps:

**Step 1**

Power on all codecs in your system.

---

**Note**

If your system has multiple codecs, power on all codecs within 30 seconds to avoid power on detection failure.

---

After you turn on the codec(s), the display associated with each codec becomes active. CTS displays green check marks on all displays to show bootup progress. Bootup is complete when the system displays six check marks as shown in Figure 5-1.

---

**Tip**

If you have not registered the system to Unified CM, make a note of the MAC address that appears during the bootup process. The MAC address is required to register the system to Unified CM.
Figure 5-1 Bootup Screen

If all six check marks do not display, use the following list to attempt to troubleshoot the problem:

- If the fourth check mark does not display, your system might not have network connectivity. Check the network port and/or the Ethernet cable going to the network port. If your system does not use the Dynamic Network Host Protocol (DHCP) to automatically assign an IP address, you need to configure a static IP address as described in the “Setting Up a System That Uses a Static Network Address” section on page 5-6.

Step 2 Watch the Cisco TelePresence Touch 12 (Touch) device (the call control device for your system) as the system is booting.

A series of circled numbers appear on the display of the Touch device. These numbers change to check marks as the Touch device components become active.

Tip If the circled numbers do not change to check marks or you receive a message on the Touch device that it could not register to the codec, disconnect the Touch device, wait 5 minutes, then reconnect it. If you continue to see errors or the device does not become active, refer to the “Troubleshooting Software Installation Issues” chapter of the Cisco TelePresence Touch 12 Installation Guide for troubleshooting steps.

Step 3 After bootup completes, make a note of the IP address that displays on the center of the screen as shown in Figure 5-2. You use that information to log in to the Cisco TelePresence System Administration. This IP address displays until you log in to Cisco TelePresence System Administration GUI or use Secure Shell (SSH) to log in to the TX9000 and TX9200.
Chapter 5  Configuring the Cisco TelePresence TX System

First Time Setup for All Other TX Models

Figure 5-2  System IP Address

Note  If the IP address that displays is 192.168.100.2, the system could not contact the DHCP server or your network does not use DHCP; in this case, set a static IP address for your system as described in the “Setting Up a System That Uses a Static Network Address” section on page 5-6.

Step 4  If you have not already done so, configure Cisco Unified Communications Manager for your system. For detailed instructions to configure Cisco Unified Communications Manager, refer to the Cisco Unified Communications Manager Installation Guide for the Cisco TelePresence System for your software release.

Step 5  Open a browser on a computer that is connected to your network.

Step 6  In the URL field, type the IP address that you obtained in Step 3 and press Enter. The browser launches Cisco TelePresence System Administration.

Tip  If you did not make a note of the IP address and it no longer appears on the display, either power-cycle the system, or follow the instructions in Step 5 and Step 6 in the “Setting Up a System That Uses a Static Network Address” section on page 5-6 to retrieve it.

Step 7  Log in to the system by entering the following information:

- Username: admin (case sensitive)
- Password: cisco (case sensitive)
Setting Up a System That Uses a Static Network Address

If your system does not use the Dynamic Host Configuration Protocol (DHCP) to obtain an address and uses a statically-assigned IP address, use the following procedure to assign the static address to the system.

Step 1  Make sure that the system is disconnected from the network.

Step 2  Wait for the system to finish booting and for the 192.168.x.x address to appear on the center display.

Step 3  Make a note of the IP address that displays.

Step 4  (TX9000 and TX9200 systems only) Disconnect the auxiliary camera port connection on TS1 (the primary codec).

Step 5  Connect a DHCP-enabled PC to the auxiliary camera port of the primary codec. The connection on the port is the Ethernet port labeled “Aux” with a camera icon next to it. The port is on the far lower right in Figure 5-3.

Figure 5-3  Aux Camera Port Location

Step 6  Find the IP address that the Cisco TelePresence system provided for your network session and make a note of it.

Tip  If your PC is Windows-based, find the session IP address by clicking typing cmd in the Search box (or clicking Start > Run and typing cmd) to open a terminal window, and then typing ipconfig.

Step 7  Set the network address using either CLI commands or the Cisco TelePresence Administrative GUI using one of the following methods:

- **To set the address using the Cisco TelePresence Administrative GUI:**
  a. Using a supported Internet browser, log in to the Cisco TelePresence system GUI using the IP address xxx.xxx.xxx.1,
     
     Where:
     
     xxx.xxx.xxx is the first three octets of the session IP address.
     
     For example, if your determine that your session IP address is 10.0.4.2, use the IP address 10.0.4.1.
  b. Enter the user name and password when you are prompted to do so. By default, the user name is admin and the password is cisco.
  c. The First-Time Setup wizard screen displays.
  d. If the CTS Admin UI button displays, click this button to open the Cisco TelePresence Administrative GUI.
  e. Navigate to **Configuration > IP Settings**.
  f. Change the DHCP Enabled setting to No.
  g. Enter a static IP address, subnet mask, and IP gateway for your system into the fields. Optionally, enter DNS server(s) and the network domain name.
To set the address using CLI commands:

a. Using a Secure Shell (SSH) or other secure host client, log in to the Cisco TelePresence system GUI using the IP address \texttt{xxx.xxx.xxx.1},

Where:
\texttt{xxx.xxx.xxx} is the first three octets of the session IP address.

For example, if your determine that your session IP address is 10.0.4.2, use the IP address 10.0.4.1.

b. Enter the following command to configure a static network IP address:

\texttt{set network IP static ip-address ip-subnet ip-gateway \[dns-address1\] [dns-address2\] [domain-name]}

Where:
\texttt{ip-address} is the IP address of the system
\texttt{ip-subnet} is the IP subnet mask of the system
\texttt{ip-gateway} is the IP gateway of the system
  - \texttt{dns-address1} is the IP address of DNS server 1 (Optional)
  - \texttt{dns-address2} is the IP address of DNS server 2 (Optional)
  - \texttt{domain-name} is the domain name for the network (Optional)

Command Example

The following example gives the Cisco TelePresence system an IP address of 10.0.0.2, a subnet of 255.255.255.0, a gateway of 10.0.0.1, a DNS server of 172.16.1.5, and a domain name of cisco.com:

\texttt{admin: set network IP static 10.0.0.2 255.255.255.0 10.0.0.1 172.16.1.5 cisco.com}

\texttt{ip address successfully set}

\texttt{system restarting...}

Your system saves the changes and restarts.

Step 8
Manually specify the IP address of your Cisco Unified Communications Server by completing the following steps:

a. Navigate to Configuration > Call Control Settings.

b. In the Use Configuration TFTP Server area, click Specify.

c. In the TFTP Server 1 area, specify the IP address of the Unified CM server.

d. (Optional) If the system uses any additional Unified CM servers, specify those in the TFTP Server 2 through TFTP Server 4 area.

e. Click Apply.

Step 9
Navigate to the following sections to continue configuring your system:

- **IP Settings**, page 5-8
- **Network Settings**, page 5-10
- **Call Control Settings**, page 5-11
- **Address Book**, page 5-13
- **Telephony Settings**, page 5-14
- **SNMP Settings**, page 5-16
The IP Settings window displays the Cisco TelePresence System (CTS) MAC address and hostname and you can view and manage the following:

- **DHCP**—Select **Yes** if your network uses DHCP. Select **No** if your system does not use DHCP.
- Domain name
- IP Address
- Default gateway
- DNS servers.

To view and manage IP settings:

**Step 1** Choose **Configuration > IP Settings**. The IP Settings window appears, as shown in Figure 5-4 (DHCP Enabled) and Figure 5-4 (DHCP Not Enabled).
**Step 2** Configure settings for the Cisco TelePresence System uplink to your network using the information in Table 5-1 as a guide. The Cisco TelePresence System can be configured in the following ways:

- Pure dynamic—Uses DHCP for everything.
- Pure static—Uses static settings for everything.
- Hybrid—Uses static settings for the IP Address, Netmask and gateway, but uses DHCP for name servers and other options like Option 150 for the Unified CM TFTP servers.

**Tip**
When you make a change in any of the Configuration > IP Settings fields, the Apply and Reset buttons are activated.

**Step 3** Click Apply to register new or modified settings.

**Step 4** Click Reset to restore the original settings.

**Note**
All codecs on the system must be connected and enabled for the reset to complete. To register a device, see the “Optional Hardware” section of the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System.

---

**Table 5-1 IP Settings**

<table>
<thead>
<tr>
<th>Field or Button</th>
<th>Setting</th>
</tr>

</tr>
</tbody>
</table>
Network Settings

You can view or configure the following settings in the Network Settings window:

- Operational VLAN ID, page 5-10
- Administrative VLAN ID, page 5-10
- Syslog Address, page 5-11

Operational VLAN ID

This field shows a display-only VLAN ID.

Administrative VLAN ID

The CTS must have a VLAN membership ID before it can proceed with a DHCP request for an IP address.

To view or configure the administrative VLAN ID:

2. Enter an administrative VLAN ID for Cisco TelePresence in this field.
3. Click Apply to register a new or modified setting.

Note

The Apply and Reset buttons become active when a value is entered in this field.
Step 4 Click Reset to restore the administrative VLAN ID setting displayed when you opened this window.

### Syslog Address

This field shows the display-only syslog address, as shown in Figure 5-6.

*Figure 5-6 Network Settings Syslog Address*

![Configuration > Network Settings](network_settings.png)

**Note** You must also configure the External Syslog Address in the Product Specific Configuration Layout field for your CTS. See the *Cisco Unified Communications Configuration Guide for the Cisco TelePresence System*.

### Call Control Settings

To specify TFTP server locations and view a list of available settings for this Cisco TelePresence system:

**Step 1** Choose Configuration > Call Control Settings. The Cisco Unified Communications Manager Settings window appears, as shown in Figure 5-7.

*Figure 5-7 Cisco Unified Communications Manager Settings*
Configure Unified CM settings using the information in Table 5-2.

**Note**
If you enter a new value for the TFTP Server field(s), and the change does not persist, delete the Certificate Trust List (CTL) by clicking the Delete CTL button and re-enter the TFTP server information.

The Apply and Reset buttons become active when a value is entered in this field.

### Table 5-2  Cisco Unified Communications Manager Settings

<table>
<thead>
<tr>
<th>Field</th>
<th>Settings</th>
</tr>
</thead>
</table>
| Use Configuration TFTP Server        | • Click Automatic to set the default condition, which is that the TFTP server will reply to DHCP requests for option 150, or for a list of TFTP servers that point to endpoints in the network where the Unified CM configuration files are located for your system.  
• Click Specify to manually supply IP addresses of the Unified CM servers. |
| TFTP Server 1 through 5              | Click Specify at Use Configuration TFTP Server to activate interactive fields that are provided for entering TFTP server IP addresses. |
| Cisco Unified Communications Manager 1 through 5 | Display-only report that shows the names of up to five Cisco Unified Communications Managers. |
| CAPF Authentication String           | Enter the Certificate Authority Proxy Function authentication string. The characters entered in this field must match the CAPF Authentication string entered in Unified CM. |
| Certificate Trust List (CTL)         | The Delete CTL button becomes active when the CTS is provided with a CTL by a Unified CM configured in mixed authentication mode.  
Click Delete CTL to delete all entries on the CTL. |

**Step 3**  
Click Apply to register new or modified settings.

**Step 4**  
Click Reset to restore the original settings.

**Note**  
All codecs on the system must be connected and enabled for the reset to complete. To register a device, see the “Optional Hardware” and “Troubleshooting the Cisco TelePresence Configuration” sections of the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System.

### Related Information

See the following documentation for more information about Unified CM:

- Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System
Address Book

The Address Book window displays read-only entries that have been set during Cisco Unified Communications Manager (Unified CM) configuration. You can create listings for up to 40 favorites.

To view the phone list of Cisco TelePresence system-enabled meeting rooms:

**Step 1** Choose Configuration > Address Book. The Address Book window appears, as shown in Figure 5-8.

**Figure 5-8 CTS Address Book**

<table>

Step 3 Use Unified CM to make changes to Telephony Settings. See the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System.*
SNMP Settings

The Simple Network Management Protocol (SNMP) Settings window displays read-only information about the SNMP settings for the Cisco TelePresence System that were set in Unified CM configuration.

To view SNMP settings:

**Step 1** Choose Configuration > SNMP Settings. The SNMP Settings window appears, as shown in Figure 5-10.

**Figure 5-10 Verify SNMP Settings**

![Figure 5-10 Verify SNMP Settings](image)

**Step 2** View the SNMP settings fields described in Table 5-4.
**Step 3**

Use Unified CM to make changes to the SNMP settings. For more information, refer to the “SNMP Configuration Parameters Area” and “SNMP Trap Parameters Area” sections of the “Configuring Cisco Unified Communications Manager for the Cisco TelePresence System” chapter in the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System*.

---

**Related Information**

For more information about configuring SNMP with your Cisco TelePresence system, refer to the “MIBs, RFCs, and SNMP Trap Messages for the Cisco TelePresence System” chapter of the *Cisco TelePresence System Message Guide*. 

---

### Table 5-4 SNMP Settings

### System Settings

**Overall System Quality**

This field displays the system bandwidth and screen resolution. The bandwidth is the maximum negotiated video bandwidth for a CTS call. A higher bandwidth increases video quality.

Choose from the following:

- Highest Detail, Best Motion: 4Mbps 1080p (default)
- Highest Detail, Better Motion: 3.5Mbps, 1080p
- Highest Detail, Good Motion: 3Mbps, 1080p
- High Detail, Best Motion: 3Mbps, 720p
- High Detail, Better Motion: 2Mbps, 720p
- High Detail, Good Motion: 1Mbps, 720p
- High Detail, Limited Motion: 720p (Lite)

**Locale Configuration**

**Time Zone**

Displays the configured time zone for your area of the world from the drop-down menu.

**Language**

Displays the configured language for CTS.

*Note* TX software releases support additional languages. These languages change the text that is shown on the Cisco TelePresence Touch 12 device and also affect some on-screen messages. For more information, refer to the “Installing Language Versions” section of the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System*. 

**Cisco TelePresence System Configuration**

**System Type**

Identifies the CTS model. Choose from the following:

- Cisco TelePresence 500 Series
- Cisco TelePresence 1000
- Cisco TelePresence 1100
- Cisco TelePresence 1300 Series
- Cisco TelePresence 3000
- Cisco TelePresence 3010
- Cisco TelePresence 3200
- Cisco TelePresence 3210

*Note* You must select the CTS device type specifically to upgrade your CTS software.

**Days Display Not Active**

Specifies the days of the week that the Cisco TelePresence system display remains off by default. Choose Monday through Sunday. Default is Sunday and Saturday.

---

System Settings

Step 3

Use Unified CM to make changes to the system settings. See the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System for more information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description or Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display On Time</td>
<td>Specifies the time of day that the Cisco TelePresence system display(s) will remain on after being turned on, if CCM is configured. Times are displayed in a 24-hour format where 00:00 indicates 12:00 midnight and 23:59 indicates 11:59 pm. Default is 07:30. If you clear the default value so that the field is blank, the display(s) will turn off after the completion of each call.</td>
</tr>
<tr>
<td>Display On Duration</td>
<td>Specifies the length of time the Cisco TelePresence system display(s) will remain on if a “Display On Time” value is defined. Times are displayed in a 24-hour format, where 1:30 indicates one hour and thirty minutes; the maximum value is 24:00 (24 hours). Default is 10:30. If you clear the default value so that the field is blank, then the display will turn off at 11:59 pm.</td>
</tr>
</tbody>
</table>

Note: If your version of Unified CM does not allow you to configure values for Days Display Not Active, Display On Time or Display On Duration, the system uses the default values for these features.

NTP Servers

| NTP Server 1 through 5 | Required. Network Time Protocol (NTP) is used to synchronize the clocks on Cisco IP telephony servers with an external network time server that uses NTP. You can have up to five IP addresses for Network Time Protocol servers. NTP must be configured properly to ensure that calendar events appear as expected. |

Note

Enabling or Disabling the Audio Auxiliary Output

In the System Settings window, you can disable or re-enable the audio auxiliary output. Either operation entails restarting the calling services, which can take up to a few minutes. During the restart, be aware of the following:

- The functionality of the system is impacted. You cannot place or receive calls.
- You must refrain from performing any additional tasks in the Administration interface.

To enable or disable the audio auxiliary output:

Step 1 Choose Configuration > System Settings. The System Settings window appears.

Step 2 To disable or re-enable the audio output, click Disable or Enable as appropriate. The system displays a message, asking to proceed with the operation, which entails restarting the calling services.

Step 3 To proceed, click OK.
Step 4 While waiting for the calling services to restart, refrain from performing additional tasks using the Administration interface. After the operation is complete, the button changes to “Disable” if you just finished enabling the audio output or “Enable” if you finished disabling the output.

Security Settings

The Security Settings window enables you to download a Manufacturing Installed Certificate (MIC) key or Locally Significant Certificate (LSC) certificate for 802.1X authentication. For more information about 802.1X authentication, see the “802.1X Authentication” section on page 4-15.

To download a MIC key or LSC certificate:

Step 1 Choose Configuration > Security Settings. The Security Settings window appears, as shown in Figure 5-12.

![Figure 5-12 Security Settings](image)

Step 2 To download a certificate, click the Download button next to it.

Note If a certificate is not present in the system, the Download button next to it is dimmed.

Step 3 Save the certificate to your hard disk.

Troubleshooting Your Configuration

For information about troubleshooting your configuration, refer to the “Troubleshooting Your Configuration” section of the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System.

Upgrading CTS Codec Firmware

Note Upgrades should only be performed at night or during minimal Cisco TelePresence usage times. An upgrade takes up to 30 minutes to complete.
The procedure to upgrade CTS firmware is the same as the firmware upgrade procedure for the Cisco Unified IP phones. See the Uploading Files to the Cisco Unified CM TFTP Directory section of the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System for complete instructions.

To download CTS firmware:

**Step 1** Log into the Download Software Select a Product page on Cisco.com:
http://www.cisco.com/cisco/software/navigator.html

The Tools & Resources Download Software appears.

**Step 2** Expand the Cisco TelePresence System folder and open the Cisco TelePresence System sub folder. A list of CTS devices appears.

**Step 3** Select your CTS device

**Step 4** Upload the firmware file to the TFTP directory of your Unified CM TFTP server.

**Step 5** Restart the TFTP server.

**Step 6** Change the firmware filename for the system(s) that you want to upgrade (either via the Device Defaults page, or on a per system basis) in the Cisco Unified CM Administration interface.

**Step 7** Click the Restart button in Unified CM for the device(s) that you want to upgrade.

---

### Upgrading Software for Cisco TelePresence Touch 12

See the following important software upgrade information in the Upgrading From a Cisco Unified IP Phone to a Cisco TelePresence Touch 12 document at the following URL:

This section contains the following information about managing and troubleshooting password issues on the Cisco TelePresence System (CTS):

- **Resetting Your CTS Codec Password, page 5-22**

---

### Resetting Your CTS Codec Password

**Note** You must be in the Cisco TelePresence room to read the newly requested passcode that shows on the main display.

At each point where the pvrecovery account requires input, the program will wait up to 60 seconds. If nothing is entered, the system will inform you that the entry took too long and will exit.

If you encounter any difficulty, open a case with Technical Assistance Center (TAC) via the Internet at http://tools.cisco.com/ServiceRequestTool/create/, or contact your Cisco technical support representative and provide the representative with the information you have gathered about the problem.
Before You Begin
Make sure that the CTS is not in a call, and that there is only one instance of someone trying to reset the password, otherwise the session will abort.

Procedure
To reset your CTS codec password:

Step 1  SSH into the codec from your laptop.
Step 2  Login with the following:
   • Username: pwrecovery
   • Password: pwreset

The following message appears in the SSH client window:

Example 5-1  Welcome to Password Reset

dhcp-249:~ $ ssh pwrecovery@10.00.00.100
pwrecovery@10.00.00.100's password:
**********************************************************************************************
**  **
** Welcome to password reset  **
**
**********************************************************************************************

Do you want to continue ? (y/n):y
Preparing the system...
Please enter the passcode:

Step 3  The system will ask whether you want to continue. Type Y then return to continue

Note  If desired, type any other key then return to exit.

This system will now prepare for password reset and prompt you for a passcode. The new passcode is displayed on the CTS main display, as shown in the following example:

Password reset is now being run
Passcode: 919175

Note  The passcode is a randomly generated number and will be different for each login attempt. If you enter the wrong passcode, the system will inform you that the passcode was incorrect and will exit, as shown in the following example. If this happens, repeat Step 1 and Step 2.

Example 5-2  Invalid Password Reset Request

Do you want to continue ? (y/n):y
Preparing the system...
Please enter the passcode:12345
Sorry that was an invalid passcode...
Logging off
Connection to 10.00.00.100 closed.
dhcp-249:~ $
When you enter the correct passcode, the CTS will then reset the administration account name and password to the system defaults.

**Note**
The top right of the screen could still show the previous, non-default user name. Do not use this user name, and continue to use the default user name and password.

The following example shows successful password reset information:

*Example 5-3   Successful Password Reset Request*

Please enter the passcode:507530
resetting admin name and password
stopping any existing admin session
admin account and password reset to default
success in applying security rules
Logging off
Connection to 10.00.00.100 closed.
dhcp-249:- $

**Note**
If you are using the CTS with a Cisco Unified Communications Manager, the next time you perform a “Refresh” or “Reset” from the Unified CM, the administration account name and password will be reconfigured to the values specified in the Unified CM device page.

---

**Troubleshooting Your TX and CTS System Components**

For information about troubleshooting your TX and CTS system components, refer to the associated installation manual on the cisco.com website and find the First Time Setup chapter. Troubleshooting information is in this chapter.

To find the installation manual for your system, complete the following task:

**Step 1**
Enter the following URL in a browser to navigate to the cisco.com support web site:

http://www.cisco.com/cisco/web/psa/default.html?mode=prod&level0=280789323

The product support navigator displays.

**Step 2**
Open the following installation document that corresponds with your CTS or TX system:

*Cisco TelePresence System 500-32 Assembly, Use & Care, and Field-Replaceable Unit Guide:*

*Cisco TelePresence System TX1300 47 Installation, First-Time Setup, and Field-Replaceable Unit Guide:*

Cisco TelePresence System TX1310 65 Assembly, First-Time Setup, and Field Replaceable Unit Guide:

Cisco TelePresence System TX9000 and TX9200 Assembly, First-Time Setup, and Field-Replaceable Unit Guide:

**Step 3** Find the chapter entitled **First-Time Setup**.

Troubleshooting Information for your system components is listed in that chapter.
Monitoring the Cisco TelePresence TX System

Revised: February 2013, OL-28614-01

Contents

This chapter contains the following sections:

- Call Statistics, page 6-2
- Network Statistics, page 6-5
- Using SNMP Traps to Monitor the Cisco TelePresence System, page 6-6

Figure 6-1 shows the tools that are available in the Monitoring window:

![Monitoring Window](image)

You can view the following Cisco TelePresence system statistics:

- **Call Statistics**: View historical and real-time call statistics: configured and negotiated bit rates, call counts, start times, durations.
- **Network Statistics**: View statistics for transmitted and received packets.
- **Services Statuses**: View statistics of the statuses for system services.
Call Statistics

Use the Call Statistics window to view audio and video statistics collected by the codecs. The reports include descriptions to help you understand the type of information that is being collected.

Special Note for Statistics for HD Presentations

If you are sharing an HD presentation, the call statistics will appear in different places depending on whether the call is a point-to-point or multipoint call.

- For a point-to-point call, view the presentation statistics under Monitoring > Call Statistics > Content.
- For a multipoint call, view the presentation statistics under Monitoring > Call Statistics > Audio/Video Call: Audio Stream Statistics.

Viewing Call Statistics

To view call statistics:

**Step 1** Choose Monitoring > Call Statistics.

You can view the following Cisco TelePresence system statistics:

- **Real Time Call Statistics**—Lists details of an in-progress call.
- **Audio/Video Call: Audio Stream Statistics**—Lists details about the audio and video of an in-progress call.
- **Historical Call Statistics (not including current call, if any)**—Lists historical information about calls.

**Step 2** For more specific audio and video statistics, click the check-box next to the following selections:

- **Audio/Video Call: Audio Stream Statistics**
- **Audio/Video Call: Video Stream Statistics**
- **Audio-Only Call: Stream Statistics**

**Audio/Video Call: Audio Stream Statistics**

a. Click once to select. Additional statistics fields appear.
b. Click once to de-select. Additional fields are hidden.

See Figure 6-2.

**Audio/Video Call: Video Stream Statistics**

a. Click once to select. Additional statistics fields appear.
b. Click once to de-select. Additional fields are hidden.

**Audio-Only Call: Stream Statistics**

a. Click once to select. Additional statistics fields appear.
b. Click once to de-select. Additional fields are hidden.
Statistics are listed in columns labeled as if you were looking at the front of the system sitting at the conference table.

When you select one of the choices above, additional statistics fields appear with the following status information listed, as shown in Figure 6-2:

- Local
- Remote
- Average Latency (Call)
- Average Latency (Period)

**Figure 6-2**  Audio/Video Call: Audio Stream Statistics

Additional statistics are listed for the following, as shown in Figure 6-3:

- Transmit
- Receive

**Transmit**

- Is Active
- Media Type
- Total Bytes
- Total Packets

**Receive**

- Is Active
- Media Type
- Total Bytes
- Total Packets
• Lost Packets
• Lost Packets % (Call)
• Lost Packets % (Period)
• Duplicate Packets
• Late Packets
• Failed SRTP Authentication Packets
• Average Jitter (Call) (see jitter call)
• Average Jitter (Period) (see jitter period)

Note
For more information about jitter and packet loss, see the Understanding Jitter and Packet Loss Reporting section of the Cisco TelePresence System Message Guide on Cisco.com.

Figure 6-3  Call Statistics - Transmit and Receive

Step 3  Set an interval for updating these reports by choosing the time from the Refresh drop-down menu. Choices, in minutes, include the following:
• None (default)
• 1
• 2
• 5
• 10
• 13
• 60

Step 4  Click Refresh to update the statistics immediately.
Network Statistics

Use Network Statistics to view packet transmission statistics collected from the network. Statistics are listed in columns labeled as if you were looking at the back of the system. For example, on a CTS 3000 or CTS 3200, the labels would indicate statistics from the left, center, and right codecs.

To monitor network statistics:

**Step 1** Choose Monitoring > Network Statistics. Statistics for your system appear, as shown in Figure 6-4.

**Figure 6-4 Network Statistics Window**

<table>
<thead>
<tr>
<th>Monitoring &gt; Network Statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>False Carrier Sensor Errors</td>
</tr>
<tr>
<td>Receiver Not Okay Errors</td>
</tr>
<tr>
<td>TxOctets</td>
</tr>
<tr>
<td>TxBroadcastPktS</td>
</tr>
<tr>
<td>TxMulticastPktS</td>
</tr>
<tr>
<td>TxUnicastPktS</td>
</tr>
</tbody>
</table>

Last Updated: 1 min 29 sec

**Step 2** Look for error counters that have been incremented since the last time you viewed these statistics. Statistic types include the following:

- False Carrier Sensor Errors
- Receiver Not Okay Errors
- Number of TxOctets
- Number of TxBroadcastPktS
- Number of TxMulticastPktS
- Number of TxUnicastPktS

**Step 3** Set an interval for updating these reports by choosing the time from the Refresh drop-down menu. Choices, in minutes, include the following:

- None (default)
- 1
- 2
- 5
- 10
- 13
- 60

**Step 4** Click Refresh to update the statistics immediately.
Using SNMP Traps to Monitor the Cisco TelePresence System

Cisco provides you with management information bases (MIB) files that are designed to monitor your system using the Simple Network Management Protocol (SNMP). For more information, refer to the “MIBs, RFCs, and SNMP Trap Messages for the Cisco TelePresence System” chapter of the Cisco TelePresence System Message Guide.

Where to Go Next

For more information about system statistics and messages, including System Operations (Sysop) Log messages see the Cisco TelePresence System Message Guide on Cisco.com.
Satellite Licenses for the Cisco TelePresence TX System

Contents

The information in this appendix explains how to order satellite licenses and how to configure both Cisco Unified Communications Manager (Unified CM) and Cisco TelePresence System (CTS) to support satellite functionality. This appendix contains the following sections:

- Cisco TelePresence over Satellite Networks, page A-1
- Ordering a Satellite License, page A-3
- Loading a Satellite License, page A-3
- Identifying the CTS Satellite Endpoints, page A-4
- Enabling the Satellite Feature, page A-4
- Additional Licensing Information, page A-4

Note

The Cisco TelePresence System 500-32 is the only system that is supported as the remote endpoint in a satellite network. Other endpoint models have not been qualified to work on the remote side of a satellite link because the bandwidth needed for these systems quickly becomes cost-prohibitive to run over satellite networks. Any Cisco TelePresence endpoint or mix of endpoints (for a multipoint call) can be used on the terrestrial side of the satellite link.

Cisco TelePresence over Satellite Networks

The Cisco TelePresence over Satellite Networks solution extends the reach of Cisco TelePresence to remote, tactical locations where terrestrial bandwidth is not available. This solution incorporates existing Cisco TelePresence endpoint and infrastructure products with new software releases designed to function more effectively on poor, high-delay networks.

The following features and benefits are supported:

- Relaxed latency, jitter, and packet-loss thresholds allow the Cisco TelePresence meeting application to function effectively over poor, high-delay, real-world satellite networks.
Appendix A
Satellite Licenses for the Cisco TelePresence TX System

Cisco TelePresence over Satellite Networks

- Qualification and testing of Type 1 encryption devices with the Cisco TelePresence application enable military-grade security for Cisco TelePresence calls.
- New network and environment recommendations provide guidance for remote, tactical, and even mobile deployments of the Cisco TelePresence System (CTS).

This section contains the following information:
- Supported CTS Software, page A-2
- Supported Satellite Bandwidth, page A-2

**Supported CTS Software**

You must be running CTS software version 1.5 or a later release on all Cisco TelePresence endpoints, Cisco TelePresence Multipoint Switches, and Cisco TelePresence Managers within your network to participate in a satellite call.

**Supported Satellite Bandwidth**

You will need a minimum of 3-MB bandwidth (at 720p, good motion handling) in a single-channel-per-carrier (SCPC) configuration over a single-hop satellite link.

**Note**

Because the Cisco TelePresence video and audio are traveling up to the satellite and back down to an earth station, significant (500 ms or more) latency is introduced into the signal. The result is noticeable delay in the conversation. In addition, atmospheric conditions or other interference may impact satellite-link performance and introduce jitter or packet loss into the call. The result may be noticeable degradation of the video quality.

CTS software release 1.5 and later releases support satellite deployment configurations that significantly raise the thresholds for network warning messages and call termination. When a satellite endpoint joins a call (point-to-point or multipoint), all other endpoints in the call negotiate the new threshold setting, so no one in the call gets warning messages or gets dropped just because a satellite-based endpoint joins the call.

**Satellite Security**

The Cisco TelePresence application supports Transport Layer Security (TLS) and Secure Real-Time Transport Protocol (SRTP) encryption for signaling and media paths.
Ordering a Satellite License

You can order satellite licenses when you initially order your CTS, or you can purchase separate satellite licenses to upgrade an existing CTS. Note the following details when you order a satellite license:

- The product authorization key (PAK) will either be physically delivered to your location or electronically delivered via E-mail.
- Product Number:
  - Physical: CTS-SATELLITE=
  - Electronic: L-CTS-SATELLITE=

Loading a Satellite License

After you have received the satellite license, load it on Unified CM by following these steps:

⚠️ Caution

Do not edit or change the contents of the license or it will become invalid.

---

**Step 1**

Load the license file into the Cisco Unified CM TFTP directory by following the steps in the “Uploading Files to the Cisco Unified CM TFTP Directory” in the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System*.

**Step 2**

After making sure that the license is available on your computer, log in to the Cisco Unified CM Administration page and follow these steps:

a. From the Navigation drop-down menu in the upper right corner, select **Cisco Unified OS Administration** and click **Go**.

b. Log in to Cisco Unified OS Administration.

c. From the Software Upgrades drop-down menu, select **TFTP File Management** and click the **Upload File** button. A dialog box appears.

d. Browse to find the appropriate license and upload the license. Leave the Directory field blank.

**Step 3**

Restart the Cisco Unified CM TFTP server and complete these steps:

a. From the Navigation drop-down menu, select **Cisco Unified Serviceability** and click **Go**.

b. Log into Cisco Unified Serviceability.

c. From the Tools drop-down menu, select **Control Center - Feature Services**.

d. In the Select Server box, select the TFTP server from the drop-down menu and click **Go**.

e. In the CM Services box, select the **Cisco TFTP** radio button.

f. Click **Restart**.

g. Repeat Step c through Step e for all TFTP servers.
Identifying the CTS Satellite Endpoints

After you have loaded the satellite license on Unified CM, identify the CTS satellite endpoints so that they can retrieve the satellite licenses.

To identify the CTS satellite endpoints using the Cisco Unified CM Administration interface:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Log in to the Cisco Unified CM Administration page.</td>
</tr>
<tr>
<td>2</td>
<td>From the Device drop-down menu, select Phone.</td>
</tr>
<tr>
<td>3</td>
<td>Using the Find search fields, locate the CTS that will be used as a satellite endpoint.</td>
</tr>
<tr>
<td>4</td>
<td>Click Reset to bring up a new dialog box, and then click Restart.</td>
</tr>
<tr>
<td>5</td>
<td>Repeat Step 2 through Step 4 for each CTS satellite endpoint.</td>
</tr>
</tbody>
</table>

Enabling the Satellite Feature

After the satellite license has been loaded on Unified CM, and the CTS satellite endpoints have been identified, you are ready to enable the satellite feature using CTS command-line interface (CLI) commands. For information about using CTS CLI commands, see the Cisco TelePresence System Command-Line Interface Reference Guide.

To enable the satellite feature:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Check to see that the satellite license is available. From the CTS CLI admin command prompt, enter the following command:</td>
</tr>
<tr>
<td></td>
<td>admin:show license status</td>
</tr>
<tr>
<td></td>
<td>License feature status</td>
</tr>
<tr>
<td></td>
<td>satellite:</td>
</tr>
<tr>
<td></td>
<td>Valid license found</td>
</tr>
<tr>
<td></td>
<td>License feature is disabled</td>
</tr>
<tr>
<td></td>
<td>Feature is currently not running</td>
</tr>
<tr>
<td>2</td>
<td>Enable the satellite feature using the following command:</td>
</tr>
<tr>
<td></td>
<td>admin:set license satellite enable</td>
</tr>
<tr>
<td></td>
<td>License for satellite feature changed to enabled</td>
</tr>
<tr>
<td>3</td>
<td>Restart the calling services using the following command:</td>
</tr>
<tr>
<td></td>
<td>admin:utils service restart Calling</td>
</tr>
<tr>
<td></td>
<td>Calling_Services   Restarting...done</td>
</tr>
</tbody>
</table>

Additional Licensing Information

See the Cisco TelePresence Administration Software Licensing Information page on Cisco.com.
GLOSSARY

A

ACU  Auxiliary Control Unit. Provides the ability to conserve energy by powering the lights, projector, and optional peripherals for Cisco TelePresence systems on and off.

ad hoc meeting  Non-scheduled, administrator-initiated, dial-out meeting. A meeting scheduler or administrator initiates the meeting through the Cisco TelePresence Multipoint Switch (CTMS) administration interface by listing the telephone number of the rooms which will participate in the multipoint meeting. See static meeting.

Auto Answer  A phone set to automatically answer an inbound call. Use the Auto Answer feature in Cisco Unified Communications Manager. Activating this option or button causes the speaker phone to go off hook automatically when an incoming call is received.

Auto Collaborate  Cisco TelePresence supports simple information sharing using a powerful “Auto Collaborate” feature that allows any object, document, or PC application to be displayed in a plug-and-play fashion. Auto Collaborate enables you to share images instantly in multiple locations by plugging in a laptop computer or high-definition ceiling document camera. The Cisco TelePresence 3000 Series built-in projector automatically displays images from the most recently activated device.

Ceiling cameras are perfect for capturing images of objects that are too valuable to ship, or cannot easily be copied or sent electronically. Cisco recommends and supports document cameras made by WolfVision, specifically the WolfVision Visualizer. This is a special live-camera system designed for picking up any object on a working surface with perfect illumination and depth of focus. All types of objects (e.g., photos, books, brochures, transparencies, slides, or three-dimensional objects) can be picked up quickly and easily, and meeting participants can use a wireless remote to control light, zoom, or focus.

Cisco TelePresence 3000 and 1000 systems support the Auto Collaborate capability, and meeting organizers can project content in multiple locations, including above or below displays, or on the side of a room.

A/V Expansion Box  Audio/video extension unit. Required if your system uses an Auxiliary Control Unit (ACU).

B

bit rate  Speed at which bits are transmitted, usually expressed in bits per second.

black screen codes  System status information messages that appear on the main display screen before your meeting starts and while the screen is still black. For example, “Please wait, you are the first meeting participant.”

For more information, see the Cisco TelePresence System User Guide.
C

call control device  External device that controls the Cisco TelePresence System: Cisco Unified IP Phone, and the Cisco TelePresence Touch.

CCP  The Conference Control Protocol (CCP) is an interface between the CTS and the CTMS that controls the elements of a Cisco TelePresence meeting.

CIF  Common Intermediate Format. A video standard that provides 352x288 pixels, or picture elements, of video resolution.

Cisco CTI Manager  CTI Manager is required in a cluster for applications that use TAPI or JTAPI Computer Telephony Integration (CTI). The CTI Manager acts as a broker between the CTI application and the Cisco Unified Communications Manager Service. It provides authentication of the application and enables control or monitoring of authorized devices. The CTI application communicates with a primary CTI Manager and, in the event of a failure, will switch to a backup CTI Manager. The CTI Manager should be enabled only on call processing subscribers, thus allowing for a maximum of eight CTI Managers in a cluster. Cisco recommends that you load-balance CTI applications across the various CTI Managers in the cluster to provide maximum resilience, performance, and redundancy.

Cisco TelePresence T Series  The Cisco TelePresence T Series high-definition presentation capabilities and simple controls on a touch display help make your meeting as immersive and natural as possible. See Immersive Telepresence Endpoints.

Cisco TelePresence Touch 12  A touch-panel LCD device that enables you to conduct telepresence meetings without the Cisco Unified IP phone.

Cisco Unified Communications Manager  Unified CM. Application that extends enterprise telephony features and capabilities to packet telephony network devices such as IP phones and multimedia applications. Open telephony application interfaces make possible services such as multimedia conferencing and interactive multimedia response systems. See also CUCM.

See the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System for more information.

codec  The “brain” of the CTS. The primary codec connects with the network and Cisco Unified Communications Manager (Unified CM) to perform call management functions for the system. The secondary codec performs processing for the system elements that are attached to them. The optional presentation codec supports the document camera (if present), auxiliary displays, and works with an auxiliary control unit and audio extension unit for additional audio/video applications. The number and type of codecs your system uses depends on which CTS device you are using.

CTRS  Cisco TelePresence Recording Server. Providing HD studio recording capabilities in existing Cisco TelePresence rooms. Recordings can be archived automatically on a schedule or transferred to a digital content management system. The CTRS can deliver Cisco TelePresence recordings to any video-enabled device including PCs, smart phones, and digital signs. CTRS runs on the same reliable Media Convergence Server platform as Cisco TelePresence Multipoint Switch and Cisco TelePresence Manager.
**CTS device** Cisco TelePresence System (CTS) device: CTS 500, CTS 1000, CTS 1100, CTS 1300, CTS 3000, CTS 3200, CTS 3010, and CTS 3210.

**CTS-Manager** Cisco TelePresence Manager. Software application that schedules and manages Cisco TelePresence calls using common enterprise groupware such as Microsoft Exchange and Lotus Notes.

**CTS Manager PreQualification Assistant** The CTS-Man PreQualification Assistant ensures that your pre-configuration set-up is performed correctly. The data that is entered into the Tool Test Configuration forms that are used to verify connections to the servers and to get data from them to be used to configure CTS-Man.

**CUCM** Cisco Unified Communications Manager. (Unified CM) The phone that controls the CTS is configured and maintained through the Cisco Unified CM Administration interface.

See the *Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System* for more information.

---

**D**

**default gateway** A router on a computer network that serves as an access point to another network.

**DHCP** Dynamic Host Configuration Protocol is a network application protocol used by devices (DHCP clients) to obtain configuration information for operation in an Internet Protocol network. This protocol reduces system administration workload, allowing devices to be added to the network with little or no manual intervention.

**display screen animation** System information icons that may be displayed on the Cisco TelePresence System (CTS) main display screen. System information includes call connection status alerts, meeting alerts, and maintenance alerts. These alerts fade from one state to another to show the status of the system.

**display screen icon** System information icons that may be displayed on the Cisco TelePresence System (CTS) display screen. System information includes call connection status alerts, meeting alerts, and maintenance alerts.

**DMP** Digital Media Player. Cisco Digital Media Players are highly-reliable, IP-based endpoints that can play high-definition live and on-demand video, motion graphics, web pages, and dynamic content on digital displays, usually an LCD Professional Series display or any other directly attached television screen, monitor, or projector (analog or digital, standard-definition or high-definition) that shows media to an audience. There is an extra input connector for the Digital Media Player (DMP) on your Cisco TelePresence device. See the Cisco Digital Media Players home page on Cisco.com.

See also LCD.

**DN** Directory number.

**DNS** Domain Name System. System used on the Internet for translating names of network nodes into addresses.
**DSCP**
Differentiated Services Code Point. A field in the header of IP packets for packet classification purposes. DSCP for TelePresence Calls field description: This parameter specifies the DSCP value for Cisco TelePresence calls. This parameter is set to the default value unless a Cisco support engineer instructs otherwise. This is a required field, if present on your system. Default: CS4(precedence 4) DSCP (100000) and is selectable per device.

**DVI**
DVI cables are used for direct digital connections between source video (namely, video cards) and LCD monitors.

**E**

**endpoint**
Cisco TelePresence System (CTS) endpoint. The combination of hardware and software that comprise a Cisco TelePresence System. The hardware for an endpoint includes a Cisco Unified IP 7900 Series telephone, one or more large-screen meeting displays, plus presentation devices, cameras, microphones, speakers, and in some models, lighting systems.

**EWS**
Exchange Web Services. Managed API that provides an intuitive interface for developing client applications that use Exchange Web Services. The EWS Managed API provides unified access to Microsoft Exchange Server resources, while using Microsoft Office Outlook–compatible business logic. The EWS Managed API communicates with the Exchange Client Access server by means of EWS SOAP messages.

**extranet**
An extranet is a private network that uses Internet protocols and network connectivity. An extranet can be viewed as part of a company's intranet that is extended to users outside the company, usually via the Internet. It has also been described as a “state of mind” in which the Internet is perceived as a way to do business with a selected set of other companies (business-to-business, B2B), in isolation from all other Internet users. In contrast, business-to-consumer (B2C) models involve known servers of one or more companies, communicating with previously unknown consumer users.

An extranet can be understood as an intranet mapped onto the public Internet or some other transmission system not accessible to the general public, but managed by more than one company's administrator(s). For example, military networks of different security levels may map onto a common military radio transmission system that never connects to the Internet. Any private network mapped onto a public one is a virtual private network (VPN), often using special security protocols.

**F**

**fluorescent lamp**
A lamp that uses electricity to excite mercury vapor in a gas that results in an energy that produces short-wave ultraviolet light. This light then causes a phosphor to fluoresce, producing visible light. Sources of light in most rooms are either incandescent light bulbs that use tungsten filaments or fluorescent lights. Each of these light sources, and the amount of light in terms of lumens or watts, produces a different color temperature. This color temperature is sometimes expressed using terms such cool, warm, or daylight, but can be expressed more precisely in kelvins (K) as a numeric value. When adjusting the images on the display screens for the Cisco TelePresence system, you must take the color temperature of the ambient light in the room into consideration.

**full duplex mode**
Transmission of data in two directions simultaneously.
G

gzip

GNU zip. Software application used for file compression.

H

H.264/MPEG-4 AVC

A standard for video compression. See also MPEG-4 AVC and IDR.

half duplex mode

Transmission of data in one direction at a time.

HD

High definition display.

HDMI

Document camera input and cable.

I

IAB

Internet Architecture Board. The IAB is chartered both as a committee of the Internet Engineering Task Force (IETF) and as an advisory body of the Internet Society (ISOC). Its responsibilities include architectural oversight of IETF activities, Internet Standards Process oversight and appeal, and the appointment of the RFC Editor. The IAB is also responsible for the management of the IETF protocol parameter registries.

IDR

An IDR frame is a special kind of I frame used in MPEG-4 AVC encoding. IDR frames can be used to create Advanced Video Coding (AVC) streams, which can be easily edited.

Immersive Telepresence Endpoints

CTS 3210, CTS 1300, Cisco TelePresence T3. Provides an immersive, interactive in-person experience. See also personal system.

incandescent lamp

A lamp that allows an electric current to pass through a thin filament, heating it and causing it to emit light. Sources of light in most rooms are either incandescent light bulbs that use tungsten filaments or fluorescent lights. Each of these light sources, and the amount of light in terms of lumens or watts, produces a different color temperature. This color temperature is sometimes expressed using terms such cool, warm, or daylight, but can be expressed more precisely in kelvins (K) as a numeric value. When adjusting the images on the display screens for the Cisco TelePresence system, you must take the color temperature of the ambient light in the room into consideration.

Internet model (free path)

The Internet model is an unsecured “free path” model of packet delivery: Packets are delivered in any way possible and each uncontrolled router on the way to the destination handles how to deliver the packet to the next stop. See VPN model (fixed path).

IP address

A device identifier on a TCP/IP network.
**J**

**jitter**

Variation in packet transit delay caused by queuing, contention, and serialization effects on the path through the network. In general, higher levels of jitter are more likely to occur on either slow or heavily congested links.

**jitter call**

Jitter call is the average jitter measurement per call. Shown in the Jitter/Call output field as part of Per Call Jitter and Packet Loss Reporting.

**jitter period**

Jitter period is the interval between two times of maximum effect (or minimum effect) of a signal characteristic that varies regularly with time. Jitter frequency, the more commonly quoted figure, is its inverse.

The CTS measures jitter every 10 seconds. The Jitter/Period field reports the jitter measurement for the last 10-second period.

The CTS calculates jitter as the sum of the maximum deviation (both late and early) from the expected arrival time as given by the frame period. CMA computes frame jitter based on the arrival time of the last packet of a frame.

**L**

**LCD**

Liquid crystal display. The LCD display is an accessory for the Cisco Digital Media Player (DMP) for use in your digital signage network or your enterprise TV network. It is used for displaying video, images, or computer data during a Cisco TelePresence meeting. See the Cisco LCD Professional Series Displays home page on Cisco.com for more information.

See also DMP.

**LED**

Light-emitting diode. Indicators on the CTS that determine whether the user is sitting within camera range.

**light temperature**

A theoretical means of describing visible light that is determined by comparing its hue with a heated black-body radiator. The lamp’s color temperature is the temperature in kelvins at which the heated black-body radiator matches the hue of the lamp.

**Live Desk**

The Live Desk is a person who has been assigned to a Cisco TelePresence endpoint to assist you with problems that may occur during a meeting. To connect to Live Desk, press the Live Desk softkey. If a Live Desk has not been assigned to your Cisco TelePresence endpoint, the following message is displayed on your phone screen: “There is no Live Desk number configured”

Live Desk is configured in the Configure > Live Desks Window of the CTS-Manager Administration interface. See the Cisco TelePresence Manager Installation and Configuration Guide on Cisco.com.

**LTRP**

Long Term Reference Picture.

**M**

**MAC address**

Media Access Control. A hardware address that uniquely identifies each node of a network.
MIDlets Mobile Information Device Profile (MIDP). A Java application designed to run on resource-constrained devices such as phones, PDAs, intelligent appliances, and the like. A MIDlet (in J2ME) is similar to a Java Applet (in J2SE), but more specialized, efficient, and optimized for limited devices. MIDlets supports graphics and animation, multimedia, touchscreen, networking, persistent data storage, and provides excellent Look And Feel (LAF) integration with the host platform.

The Cisco Unified IP Phone uses MIDlets as part of the Cisco TelePresence System Enhanced Phone User Interface: MIDlets support CTS Cisco Unified IP phone features. Configure MIDlets in the Cisco Unified CM Administration interface for Cisco TelePresence.

See the Cisco Unified Communications Manager Configuration Guide for the Cisco TelePresence System for more information.

MPEG-4 AVC A patented collection of methods defining compression of audio and visual (AV) digital data. See also H.264/MPEG-4 AVC and IDR.

Multipoint meeting Multipoint is where you are able to connect more than two sites in one video conference. This normally requires a bridge, although some video conference units are also able to connect multiple sites.

MXE Media eXperience Engine. The Cisco Media Experience Engine is a modular media processing system that provides interoperability between Cisco TelePresence and video conferencing devices, extending the reach of collaboration and communication within organizations. MXE provides 720p interoperability with video conferencing.

Configure MXE in CTS-Manager. See also Cisco TelePresence Firewall and Access List Considerations for support information for Cisco TelePresence.

N

nonce A nonce value (a random number that supports digest authentication) is used to calculate the MD5 hash of the digest authentication password.

Non-permitted User Cisco WebEx user role configured in the CTS Manager Administration interface. These users are not permitted to request Cisco WebEx; no Cisco WebEx meeting options are available to these users. See Permitted User.
**O**

**One-Button-to-Push**
Allows you to press the meeting that is listed on the in-room CTS Cisco Unified IP phone to start a Cisco TelePresence meeting.

**Option 150**
Recommended during Dynamic Host Configuration Protocol (DHCP) Server configuration so that Windows 2000 can work with the Cisco IP Telephony solution. Unified CM devices boot up and request an IP address. When you create a new scope in the DHCP server and add a TFTP option to the scope, you are prompted to add the default gateway and the TFTP Server IP Address (Option 150). Option 150 can contain more than one IP address, which can be used for TFTP redundancy.

**P**

**PoE**
Power over Ethernet.

**P-frame**
An easily compressible video frame type. A video frame is compressed using different algorithms that allow varied amounts of data compression. These different algorithms for video frames are called picture types or frame types. The three major picture types used in the different video algorithms are I, P, and B.

**Permitted User**
Cisco WebEx user role configured in the CTS Manager Administration interface. These users are permitted to request Cisco WebEx for specific meetings using CTS Manager. See Non-permitted User.

**personal system**
Personal Cisco TelePresence System. The virtual, in-person experience of Cisco TelePresence directly into the private office. The CTS 500 and CTS 1000 are considered to be personal systems. See also Immersive Telepresence Endpoints.

**PiP**
Presentation-in-Picture. Data or graphics content sharing through an external monitor known as presentation-in-picture (PiP) format for space-constrained offices. Using the PiPCtrl softkey and options in the PiP control screen on your CTS Cisco Unified IP phone, you can toggle the position of the PiP between center, left, or right locations on the screen or change its size in relation to the meeting participant video input during a meeting.

**PoE**
Power over Ethernet.

**point-to-point meeting**
The direct connection of two sites in a video conference. This only works if both sites use the same type of connection (either IP or ISDN).

**Premium User**
Cisco WebEx user role configured in the CTS Manager Administration interface: Cisco WebEx is always on. Controlled on the CTS Manager LDAP configuration page.

**Presenter**
Cisco WebEx user role configured in the CTS Manager Administration interface: A Presenter shares presentations, specific applications, or the entire desktop. The Presenter controls the annotation tools and can grant and revoke remote control over the shared applications and desktop to individual Attendees.
primary codec

The primary codec is the primary unit; it communicates with secondary units, sends and receives packets on the uplink network. It contains an onboard Gigabit Ethernet switch. For example, in a CTS 3000 or CTS 3200 system, the primary codec controls two secondary codecs as well as many system components and the graphical user interfaces. In a Cisco TelePresence 1000, it controls all system functions.

PCB

Printed circuit board.

RFC

Request for Comments. Document series used as the primary means for communicating information about the Internet. Some RFCs are designated by the IAB as Internet standards.

scheduled meeting

Multipoint TelePresence meetings are scheduled by end users using Microsoft Exchange or IBM Domino clients in the same manner that a point-to-point meeting is scheduled. Scheduled meetings require no CTMS administrator interaction. CTS Manager is a required component for scheduled meetings. It provides the interface between Microsoft Exchange or Lotus Domino and the CTMS, allowing the appropriate resources on the CTMS to be reserved for the multipoint meeting.

group resolution

The fineness of detail that can be presented in the image on the CTS main display screen. Recommended screen resolution for Cisco TelePresence is 1024 x 768.

SD

Standard definition display.

secondary codec

Codecs that assist the primary codec in the large Cisco TelePresence 3000/3200 systems. Secondary codecs process audio and video signals and send them to the primary codec, which multiplexes the signals into separate, single RTP streams.

Self View

Enables you to see yourself on the main display before your meeting starts.

single system

A Cisco TelePresence System featuring a single display screen.

SHA

Secure Hash Algorithm. A set of cryptographic hash functions designed by the National Security Agency (NSA) and published by the NIST as a U.S. Federal Information Processing Standard. The three SHA algorithms are structured differently and are distinguished as SHA-0, SHA-1, and SHA-2.

SIP

Session Initiation Protocol. Protocol designed to signal the setup of voice and multimedia calls over IP networks.

SNMP

SOAP

Simple Object Access Protocol. XML-based protocol to let applications exchange information over HTTP.

spirit level

Spirit level or bubble level is an instrument designed to indicate whether a surface is level or plumb. A spirit level is included with the CTS 1300 camera kit.
**SSCD**  
System Status Collection Daemon. The daemon gathers statistics about the system it is running on and stores this information. Those statistics can then be used to find current performance bottlenecks (performance analysis, for example) and predict future system load (capacity planning, for example).

**static meeting**  
Non-scheduled meetings configured on the Cisco TelePresence Multipoint Switch (CTMS) through the administration interface. A meeting scheduler or administrator, who sets up the static meeting, manually assigns a meeting access number that is used to access the meeting. See [ad hoc meeting](#).

**supported Internet browser**  
Cisco administration interfaces support Internet Explorer version 6. You can use Internet Explorer versions 6, 7, or 8, or Firefox version 3.x with the CTS 500 32”.

**switching mode**  
CTS Manager configuration. CTS 3000 and CTS 3200 endpoints only.

- **Auto-Assign**—Switching mode is determined by the default CTMS policy, which is configured in System Configuration > Policy Management page of your CTMS setup.
- **Room**—All the participant displays of the endpoint are switched each time the meeting participant who is speaking changes to a meeting participant at a different endpoint.
- **Speaker**—Only the corresponding participant display (left, center, or right) is switched; the remaining participant displays are not switched. Using the speaker switching mode provides the ability to view up to three different remote endpoints at the same time.

**Sysop**  
System Operation (sysop) Logs. Sysop messages describe system activity. Some messages can help you identify and resolve system operation problems. These messages are available to the user from the CTS Administration interface. See the “Managing Log Files” section of the troubleshooting chapter for your CTS device.

**Syslog**  
System Logs (syslog). Debugging logs that are collected from your system and used by Cisco technical response to diagnose and resolve issues. These messages are not ordinarily seen by the user.

**T**

**TFTP**  
Trivial File Transfer Protocol. Simplified version of FTP that allows files to be transferred from one computer to another over a network, usually without the use of client authentication (for example, username and password).
**TIP**
Telepresence Interoperability Protocol. The TIP Specification provides a protocol for interoperability between videoconferencing products, including streaming of audio, video, and data to and from videoconferencing products.

This feature adds TIP 7 support to the CTS and CTMS 1.7 release. The main purpose of the feature is for CTS and CTMS to operate in a strict TIP V7 mode when communicating with devices advertising TIP V7 support. This feature adds the ability to differentiate between MUX and TIP modes of operation to help with the strict adherence to the TIP V7 specifications as well as improving debugging and other operational processes. This feature adds the ability for the CTS to be configured for operation in a TIP-only mode and configured with a set of media features typically not used in Cisco-only deployments. This helps the CTS and CTMS inter-operate with third-party TIP devices.

TIP allows only endpoints with Restricted media settings to join Cisco TelePresence meetings. TIP endpoints are expected to be able to send restricted media and to drop endpoints that can only transmit un-restricted media. See the Telepresence Interoperability Protocol for Developers home page on Cisco.com.

**trap**
A Simple Network Management Protocol (SNMP) trap is a message which is initiated by a network element and sent to the network management system. See the Cisco TelePresence System Message Guide.

**triple system**
A Cisco TelePresence System featuring three display screens.

---

**U**

**UDI**
Unique device identification.

---

**V**

**VGA**
Video Graphics Array port and cable for Cisco TelePresence. A CTS endpoint initiates a presentation at any point by plugging the VGA Auxiliary cable into the CTS endpoint presenter's laptop, which automatically shares from the presenter’s laptop. The last participant in the meeting to plug in their laptop with the VGA cable shares their presentation using PiP. See the Cisco TelePresence System User Guide for more information about sharing presentations.

**virtual machine**
A virtual machine (VM) is a software implementation of a machine (a computer, for example) that executes programs like a physical machine does. A system virtual machine provides a complete system platform which supports the execution of a complete operating system (OS). See the Cisco TelePresence System Commercial Express Installation Guide on Cisco.com for more information.

**VLAN ID**
The identification of the virtual LAN, which is used by the standard IEEE 802.1Q. Being on 12 bits, it allows the identification of 4096 VLANs.

**VPN model (fixed path)**
The VPN model uses a fixed, more secure path for packet delivery. VPNs only allow authorized personnel to gain access to their network. See also Internet model (free path).
WebDAV
Web-based Distributed Authoring and Versioning (WebDAV) is a set of methods based on the Hypertext Transfer Protocol (HTTP) that facilitates collaboration between users in editing and managing documents and files stored on World Wide Web servers. WebDAV was defined in RFC 4918 by a working group of the Internet Engineering Task Force (IETF).

WebEx
Cisco WebEx collaboration tools combine real-time desktop sharing with phone conferencing. See the Cisco TelePresence WebEx OneTouch Configuration Guide for the Cisco TelePresence System for first-time setup information.
