

# CHAPTER 3

## Customer Profiles

---

**Revised: July 2010, OL-23039-01**

This chapter describes various configurations and combinations of the Cisco BTS 10200 Softswitch and the Cisco ITP that are built on top of the basic Shared Point Code and Mated STP-Pair configurations documented in [Chapter 1, “SS7 Basic Configurations,”](#) to form the following customer profiles:

- [Multiple Cisco BTS 10200 Softswitch Nodes per ITP](#)
- [Multiple OPCs on the Cisco BTS 10200 Softswitch](#)
- [Multiple Cisco BTS 10200 Softswitch Nodes Sharing the Same OPC](#)
- [Geographically Separated Mated STP Pair with SG Priority Routing](#)

### Multiple Cisco BTS 10200 Softswitch Nodes per ITP

This profile, illustrated in [Figure 3-1](#), is recommended for a customer who is setting up an all-IP telephony network based on Cisco BTS 10200 softswitches and has a long-term plan for network expansion. Each BTS has only one Origination Point Code (OPC), and this profile is appropriate when there is a requirement for high capacity traffic to each OPC.

A pair of high capacity Cisco 73XX or 7507 series ITP nodes are required to provide the necessary throughput. The topology between ITPs and Signal Transfer Point (STPs) forms a typical Signaling System 7 (SS7) STP quad. Global title translation (GTT) is supported on the Cisco ITP.

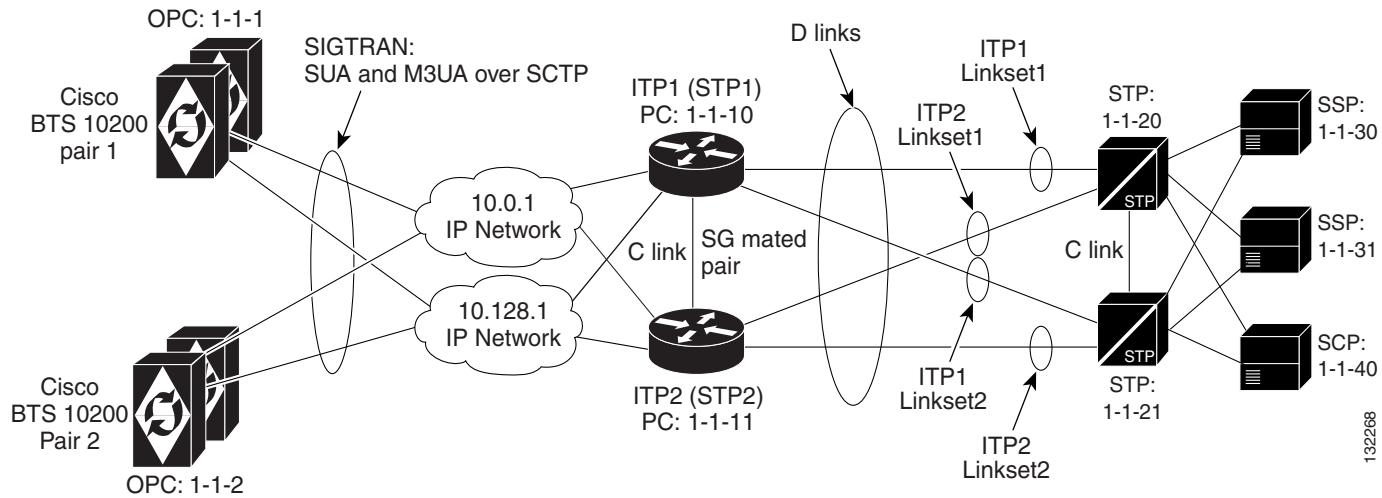

**Note** This profile is only available when connecting to the SS7 network via D-links. Therefore, a mated STP pair must be used.

## Cisco ITP Configuration Example

The Cisco ITP configuration information for this customer profile is similar to the basic Mated STP-Pair configuration described in [Chapter 2, “Provisioning Basic SS7 Configurations.”](#)<sup>1</sup> However, in this profile, extra Application Server Process (ASP) configuration information is necessary to communicate with the second Cisco BTS 10200. There is also extra information in the application server (AS) configuration section for routing to each of the BTS nodes based on Destination Point Code (DPC) (BTS OPC value).

The following example provisions ASP and AS configuration elements for ITP1:

**ITP1 Configuration** — It is important to note that ITP2 will have the same ASP and AS configuration information that is shown below for ITP1.

## Cisco BTS 10200 Softswitch Configuration Example

Provisioning the Cisco BTS 10200 for this profile is essentially the same as the basic Mated STP-Pair profile given in [Chapter 1, “SS7 Basic Configurations.”](#)<sup>1</sup> However, the following provisioning script is necessary for the secondary BTS:

### CA Configuration

```
add ca-config type=MGCP-INIT-TERMS;value=160;datatype=integer;
add ca-config type=MGCP-INIT-DURATION;value=5;datatype=integer;
add ca-config type=MGCP-ICMP-PING-RETRANSMIT-DURATION;value=5;datatype=integer;
add ca-config type=MGCP-ICMP-PING-RETRY-COUNT;value=5;datatype=integer;
add ca-config type=MGCP-MAX-UNREACH-COUNT;value=5;datatype=integer;
add ca-config type=MGCP-MAX-FAULT-COUNT;value=5;datatype=integer;
add ca-config type=MGCP-ADM-RESP-TIME;value=300;datatype=integer;
add ca-config type=MGCP-SIG-TOS-LOWDELAY;value=Y;datatype=boolean;
add ca-config type=MGCP-SIG-TOS-PRECEDENCE;value=1;datatype=integer;
add ca-config type=MGCP-SIG-TOS-RELIABILITY;value=Y;datatype=boolean;
add ca-config type=MGCP-SIG-TOS-THROUGHPUT;value=Y;datatype=boolean;
```

**CA & FS**—The CA147 and FSAIN206 ids are different than on BTS1.

```
add call-agent id=CA147; tsap-addr-sidea=hrn11ca; mgw-monitoring-enabled=N;
add feature-server id=FSAIN206; tsap-addr-sidea=hrn11ca:11205; type=AIN;
```

### SIGTRAN components

```
add user-part-variant id=ANSIIS7_GR317;

add sg id=sg1; description=Signaling gateway 1;
add sg id=sg2; description=Signaling gateway 2;

add sg-grp id=sg-grp1; sg1-id=sg1; sg2-id=sg2 description=SG group 1;

add sgp id=sg1-sgp1 ; sg-id=sg1; description=SG process 1 for sg1;
add sgp id=sg2-sgp1 ; sg-id=sg2; description=SG process 1 for sg2;
```

### OPC value for BTS2 is 1-1-2

```
add opc id=opc1; point-code=1-1-2; description=OPC; point-code-type=ANSI_CHINA;
add dpc id=dpc1; point-code=1-1-30; description=DPC 1; point-code-type=ANSI_CHINA;
add dpc id=dpc2; point-code=1-1-31; description=DPC 2; point-code-type=ANSI_CHINA;
```

**ISUP routing keys**—A unique rc value was needed when defining the routing-key. It must match the rc value that is defined in the associated AS/routing-key definition in the ITPs. This routing key has a different OPC value than defined for BTS1.

```
add routing-key id=rk1; opc-id=opc1; sg-grp-id=sg-grp1; si=ISUP; rc=2; platform-id=CA147;
add call-ctrl-route id=dpc1-route1; dpc-id=dpc1; routing-key-id=rk1; si=isup;
user-part-variant-id= ANSIIS7_GR317
add call-ctrl-route id=dpc2-route1; dpc-id=dpc2; routing-key-id=rk1; si=isup;
user-part-variant-id= ANSIIS7_GR317;
add sctp-assoc-profile id=sctp-prof;
```

## SCTP associations

```
add sctp-assoc id=sg1-sgp1-sctp; sgp-id=sg1-sgp1; sctp-assoc-profile-id=sctp-prof;
platform-id=CA147; remote-port=2905; remote-tsap-addr1=10.0.1.54;
remote-tsap-addr2=10.128.1.239; ip-tos-precedence=ROUTINE;

add sctp-assoc id=sg2-sgp1-sctp; sgp-id=sg2-sgp1; sctp-assoc-profile-id=sctp-prof;
platform-id=CA147; remote-port=2905; remote-tsap-addr1=10.0.1.55;
remote-tsap-addr2=10.128.1.240; ip-tos-precedence=ROUTINE;
```

## Dial plan profile

```
add digman-profile id=pretrans;
add digman id=pretrans; rule=1; match-string=^*; replace-string=&; match-noa=any;
replace-noa=VSC;
add digman id=pretrans; rule=2; match-string=^#; replace-string=&; match-noa=any;

mgw-profile-id=as5300-prof; type=TG;
```

## SS7 terminations and trunks

```
add termination prefix=S3/DS1-4/; port-start=1; port-end=31; type=trunk;
mgw-id=va-5350-23;
add termination prefix=S3/DS1-5/; port-start=1; port-end=31; type=trunk;

## Multiple OPCs on the Cisco BTS 10200 Softswitch

This customer profile, illustrated in [Figure 3-2](#), is based on the Mated STP-Pair profile. It is recommended for the customer who wants to emulate multiple legacy SS7 switches with one high-capacity Cisco BTS 10200 Softswitch.

A similar A-link profile can also be implemented. However, the A-link profile requires a separate ITP-Group for each OPC on the Cisco BTS 10200 Softswitch.

**Figure 3-2** *Multiple OPCs on the Cisco BTS 10200 Softswitch*

The Cisco BTS 10200 Softswitch also supports up to 30 OPCs when the SIGTRAN signaling gateway supports Single User Account (SUA) and MTP3 User Adaptation Layer (M3UA) in a D-link configuration.

## Configuration Requirements for Supporting 30 OPCs

The user must complete the following tasks to configure the Cisco BTS 10200 Softswitch to support 30 OPCs:

The following tasks include examples of CLI commands that illustrate how to configure the feature. Most of these tables have additional tokens that are not included in the examples.

- Subsystem\_grp Table:

```
add subsystem_grp id=CNAM; platform_id=FSPTC235; tcap_version=ANS-92;
```

- Subsystem Table:

```
add subsystem id=CNAM; opc-id=opc_tx; local-ssn=232; remote-ssn=232; sccp-nw-id=1;
SCCP_VERSION=ANS92; application-version=IN1;
```

```
add subsystem id=CNAM; opc-id=opc_nc; local-ssn=232; remote-ssn=232; sccp-nw-id=1;
SCCP_VERSION=ANS92; application-version=IN1;
```

- SLHR Table:

```
add slhr id=slhr_cnam; opc-id=opc_tx; dpc-id=stp1; subsystem-grp-id=CNAM; gtt-req=Y; tt=5;
GTT_ADDR_TYPE=CLGN; GTT_ADDR=3;
```

- SCCP\_Route Table

```
add sccp-route opc-id=opc_tx; dpc-id=stp1; subsystem-grp-id=CNAM; rk-id=rk_cnam_tx;
```

- Routing\_Key Table

```
add routing-key id=rk_cnam_tx; opc-id=opc_tx; sg-grp-id=sg_grp; si=SCCP; rc=204;
PLATFORM_ID=FSPTC325; subsystem-grp-id=CNAM;
```

- Controlling the Subsystem Group In or Out of Service

The Subsystem Group table has a status associated with it. The operator can control a subsystem group in or out of service. Controlling the subsystem group out of service has the same affect as controlling all the subsystems in the subsystem group out of service. Controlling the subsystem group in service puts all subsystems in the group in service.

The following CLI command controls both subsystem/OPC combinations out of service:

```
control subsystem_grp id=CNAM; mode=forced; target_state=UOS;
```

```
SUBSYSTEM GRP ID -> CNAM
INITIAL STATE -> User in service
RESULT STATE -> User out of service
REQUEST STATE -> User out of service
FAIL REASON -> ADM found no failure
REASON -> ADM executed successfully
RESULT -> ADM configure result in success
Reply : Success: CLI change successful
```

**Note** For a complete list of all CLI tables and tokens, refer to the *Cisco BTS 10200 Softswitch CLI Database*.

## Alternate Base Profiles

Although this profile is based on the Mated STP-Pair configuration, a similar Shared Point Code configuration can be implemented. However, it requires a separate ITP Group for each OPC on the Cisco BTS 10200.

## ITP Configuration

The ITP configuration for this profile is essentially identical to the one for the Mated STP-Pair configuration documented in [Chapter 1, “SS7 Basic Configurations.”](#)<sup>1</sup> However, there is an extra AS configuration for the added OPC on BTS1. This additional AS configuration information is shown here:

## Cisco BTS 10200 Softswitch Configuration Example

The Cisco BTS 10200 provisioning information is the same as the basic Mated STP-Pair configuration given in [Chapter 1, “SS7 Basic Configurations,”](#) with additional objects based on the provisioning of a second OPC, OPC 1.1.2. The BTS configuration is shown here.

## ■ Multiple Cisco BTS 10200 Softswitch Nodes Sharing the Same OPC

# Multiple Cisco BTS 10200 Softswitch Nodes Sharing the Same OPC

This profile, illustrated in [Figure 3-3](#), is used when a customer wants to share a single OPC among multiple BTS nodes. When this feature is utilized, traffic is divided in one of two ways:

1. Traffic can be split between the BTS nodes based on a per call control route basis. In this case, the BTS nodes will not be provisioned with the same DPC. This means that only one of the BTS nodes will send traffic to and receive traffic from the associated DPC in the service provider network.
2. Traffic can also be split on a per call control route/Carrier Identification Code (CIC) range basis. In this case, the same DPC (and call control route) can be provisioned for multiple BTS nodes, but the associated trunk group will be provisioned with a CIC range that differs on each BTS node.

This customer profile is subject to the following limitations:

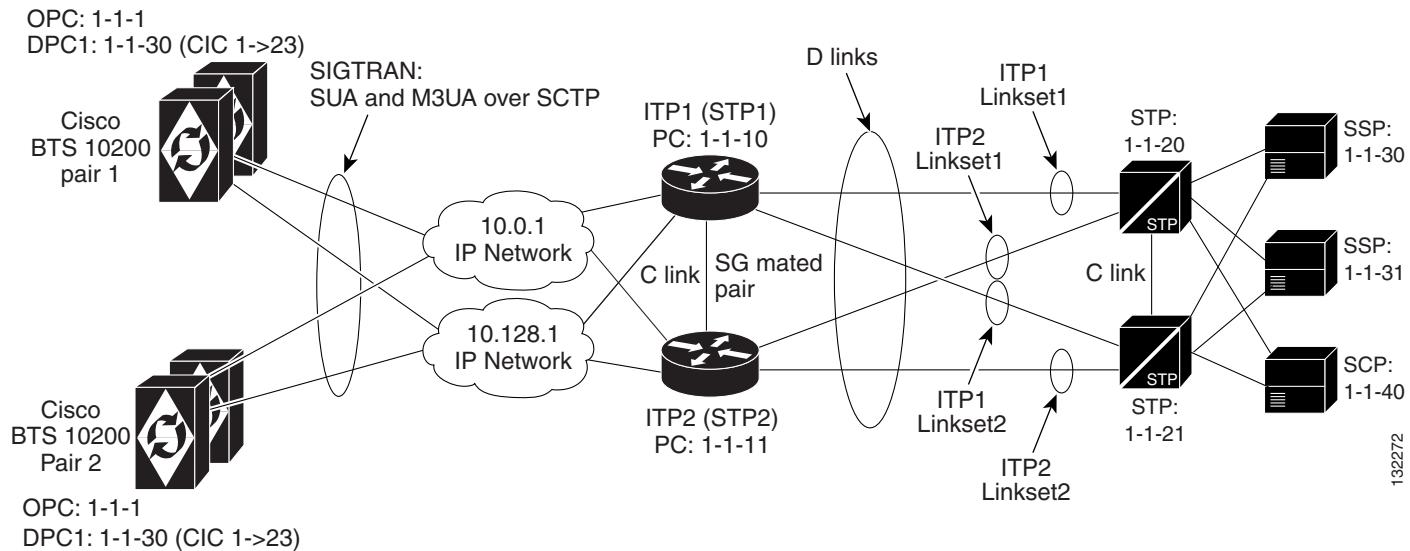

- Multiple Cisco BTS 10200 nodes sharing a single point code is only valid for ISUP. If TCAP queries are needed, a separate TCAP OPC will be needed for each Cisco BTS 10200.
- If a provisioned DPC on one BTS is also provisioned on any other BTS, then load must be divided between the BTS nodes based on CIC range.
- When provisioning call control routes on the BTS, you cannot provision two different call control routes that have the same routing key and DPC information.

### Note

This customer profile is valid for Mated STP Pair and Shared Point Code topologies. For the Shared Point Code topologies that connect via A, F, and E-links, the point code of the ITP Group is shared by the BTS.

**Figure 3-3**    **Multiple BTS Nodes Sharing the Same Point Code**

## Cisco ITP Configuration Example

This example shows an AS and ASP configuration and is only for M3UA. For a default Mated STP-Pair configuration, which includes SUA, refer to [Chapter 1, “SS7 Basic Configurations.”](#)<sup>1</sup>

For additional ITP configuration information, refer to the *Cisco ITP Configuration Guide*

**Note**

---

When debugging the ITP, the version of the ITP should be noted so the associated ITP manual can be consulted.

---

This configuration information is similar to a basic Mated STP-Pair configuration, except that in this example there will be extra ASP configuration information for communicating to the second (CA)(BTS2). Also, there is extra information in the AS configuration section for routing to each of the Cisco BTS 10200 nodes, based on CIC range. Shown below are the ASP and AS configuration elements for ITP1.

**Note**

---

ITP2 will have the same ASP and AS configuration information that is shown below for ITP1.

Note that additional AS configurations will be needed for other DPCs (such as 1-1-31).

## Cisco BTS 10200 Softswitch Provisioning Example

### BTS1 Provisioning

The following example documents BTS1 provisioning for routing key/CIC based routing. It is important to note that, unlike the ITP, the BTS does not configure CIC ranges within the routing key. Instead, the CIC ranges on the BTS are provisioned as part of the trunk object.

```

add opc id=opc1; point-code=1-1-1; point-code-type=ANSI_CHINA;
add dpc id=dpc1; point-code=1-1-30; point-code-type=ANSI_CHINA;
add dpc id=dpc2; point-code=1-1-31; point-code-type=ANSI_CHINA;
add sg id=sg1; priority=1;
add sg id=sg2; priority=1;
add sg-grp id=sg-grp1; sg1-id=sg1; sg2-id=sg2;
add sgp id=sg1-sgp1; sg-id=sg1;
add sgp id=sg2-sgp2; sg-id=sg2;
add sctp-assoc-profile id=sctp-profil1;

add sctp-assoc id=sg1-sgp1-sctp; sgp-id=sgp1; sctp-assoc-profile-id=sctp-profil1;
platform-id=CA146; remote-port=2905; remote-tsap-addr1=10.89.225.235;
remote-tsap-addr2=10.89.226.235; dip-tos-precedence=ROUTINE;

add sctp-assoc id=sg2-sgp2-sctp; sgp-id=sgp2; sctp-assoc-profile-id=sctp-profil1;
platform-id=CA146; remote-port=2905; remote-tsap-addr1=10.89.225.236;
remote-tsap-addr2=10.89.226.236; ip-tos-precedence=ROUTINE;

add user-part-variant id=ANSISS7_GR317;

```

### The RC VALUE IN BTS CONFIG MATCHES RC VALUE IN ITP CONFIG

```

add routing-key id=rk1; opc-id=opc1; sg-grp-id=sg-grp1; si=ISUP; rc=1; platform-id=CA146;

add call-ctrl-route id=dpc1-route; dpc-id=dpc1; routing-key-id=rk1; si=ISUP;
user-part-variant-id=ANSISS7_GR317;
add call-ctrl-route id=dpc2-route; dpc-id=dpc2; routing-key-id=rk2; si=ISUP;
user-part-variant-id=ANSISS7_GR317;
add mgw-profile id=as5300-prof; mgw-type=AS5300; mgcp-version=MGCP_1_0;
add mgw id=as5300-1; mgw-profile-id=as5300-prof; call-agent-id=CA146;
tsap-addr=as5300-1.cisco.com; type=TGW;
add termination prefix=S1/DS1-0/; port-start=1; port-end=23 or 31; type=trunk;
mgw-id=as5300-1;

add ss7-ansi-tg-profile id=ss7-profil1;
add trunk-grp id=1; call-agent-id=CA146; tg-type=SS7; tg-profile=ss7-profil1;
call-ctrl-route-id=dpc1-route;

```

The CIC range in the BTS trunk matches the one in the ITP as rkey configuration. Also the CIC range is not defined in the routing-key for the BTS. It is defined as part of the trunk object. It is however possible to define the DPC in this routing key, but it is not necessary and was not done here.

```

add trunk cic-start=1; cic-end=23; type=trunk; mgw-id=as5300-1;
termination-prefix=S1/DS1-0/; tgn-id=1; termination-port-start=1; termination-port-end=23;

add route id=dpc1-route; tg-selection=RR; tgn1-id=1;

add route-guide id=dpc1-rg; policy-type=ROUTE; policy-id=dpc1-route;

add destination id=dpc1-dest; route-type=ROUTE; route-guide-id=dpc1-rg;

```

## BTS2 Provisioning

The following example documents BTS2 provisioning for routing key/CIC based routing.

```

add opc id=opc1; point-code=3-10-3; point-code-type=ANSI_CHINA;
add dpc id=dpc1; point-code=3-50-3; point-code-type=ANSI_CHINA;
add dpc id=dpc2; point-code=3-51-3; point-code-type=ANSI_CHINA;
add sg id=sg1; priority=1;
add sg id=sg2; priority=1;
add sg-grp id=sg-grp1; sg1-id=sg1; sg2-id=sg2;
add sgp id=sgp1; sg-id=sg1;
add sgp id=sgp2; sg-id=sg2;
add sctp-assoc-profile id=sctp-profil;

add sctp-assoc id=ca-sgp1-sctp; sgp-id=sgp1; sctp-assoc-profile-id=sctp-profil;
platform-id=CA147; remote-port=2905; remote-tsap-addr1=10.89.225.235;
remote-tsap-addr2=10.89.226.235; ip-tos-precedence=ROUTINE;

add sctp-assoc id=ca-sgp2-sctp; sgp-id=sgp2; sctp-assoc-profile-id=sctp-profil;
platform-id=CA147; remote-port=2905; remote-tsap-addr1=10.89.225.236;
remote-tsap-addr2=10.89.226.236; ip-tos-precedence=ROUTINE;

add user-part-variant id=ANSIIS7_GR317;

```

The RC value in the BTS configuration matches the RC value in the ITP configuration. Also the CIC range is not defined in the routing key for the BTS. It is defined as part of the trunk object. It is, however, possible to define the DPC in this routing key, but it is not necessary and was not done here.

```

add routing-key id=rk3; opc-id=opc1; sg-grp-id=sg-grp1; si=ISUP; rc=2; platform-id=CA146;

add call-ctrl-route id=dpc1-route; dpc-id=dpc1; routing-key-id=rk3; si=ISUP;
user-part-variant-id=ANSIIS7_GR317;
add call-ctrl-route id=dpc2-route; dpc-id=dpc2; routing-key-id=rk4; si=ISUP;
user-part-variant-id=ANSIIS7_GR317;
add mgw-profile id=as5300-prof; mgw-type=AS5300; mgcp-version=MGCP_1_0;
add mgw id=as5300-1; mgw-profile-id=as5300-prof; call-agent-id=CA146;
tsap-addr=as5300-1.cisco.com; type=TGW;
add termination prefix=S1/DS1-0/; port-start=1; port-end=23 ; type=trunk; mgw-id=as5300-2;
add ss7-ansi-tg-profile id=ss7-profil;

add trunk-grp id=1; call-agent-id=CA147; tg-type=SS7; tg-profile=ss7-profil;
call-ctrl-route-id=dpc1-route;

```

The CIC range in the BTS trunk matches the one in the ITP AS routing key configuration.

```

add trunk cic-start=24; cic-end=46; type=trunk; mgw-id=as5300-2;
termination-prefix=S1/DS1-0/; tgn1-id=1; termination-port-start=1; termination-port-end=23;

add route id=dpc1-route; tg-selection=RR; tgn1-id=1;
add route-guide id=dpc1-rg; policy-type=ROUTE; policy-id=dpc1-route;
add destination id=dpc1-dest; route-type=ROUTE; route-guide-id=dpc1-rg;

```

## Geographically Separated Mated STP Pair with SG Priority Routing

# Geographically Separated Mated STP Pair with SG Priority Routing

This customer profile, illustrated in [Figure 3-4](#), is recommended for the customer who operates two different geographically separated telephony networks using geographically separated BTS and ITP nodes. In this example, BTS1 and ITP1 are located in Dallas, and BTS2 and ITP2 are in Washington, DC.

The topology between ITPs and STPs is an SS7 STP quad. The SG Mated Pair could be connected to an STP, a service provider's STP mated pair, or the gateway STPs provided by the local service provider. The ITP pair can be collocated with the BTS in the customer's network or collocated with the STP pair in the service provider's network.

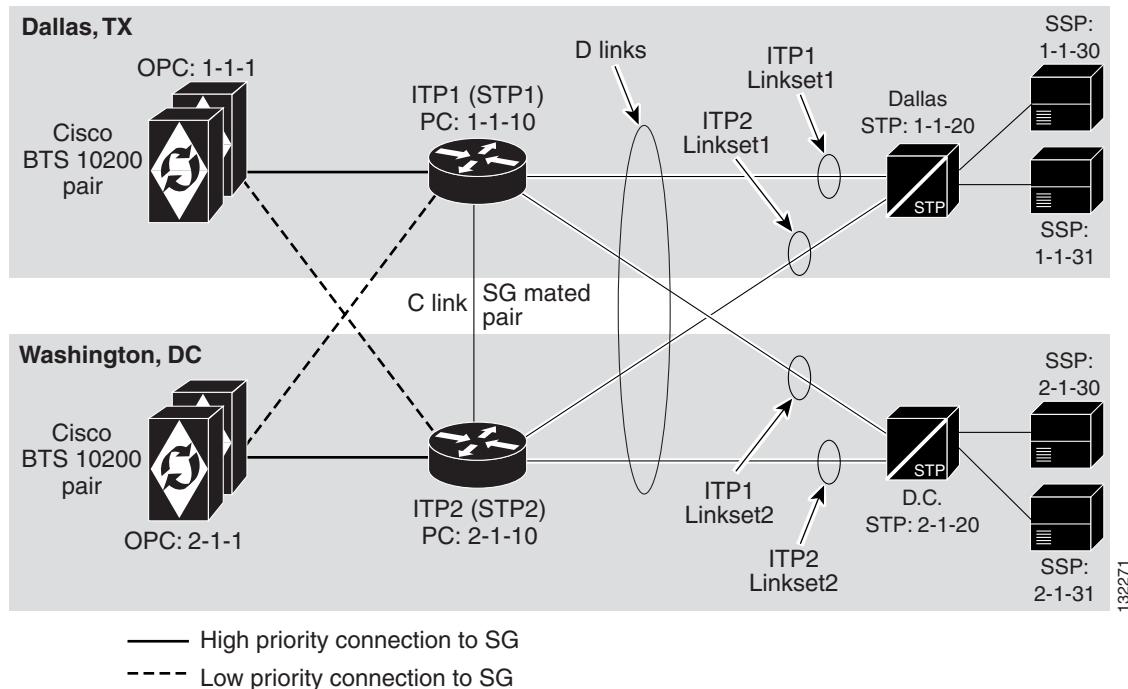

A key component of this profile is the use of SG priority routing, which provides the ability to choose which SG in the SG-Group has priority when sending towards the destinations. In this example, BTS1 will primarily send toward the DPCs (Switching Systems Protocol [SSP]) in the Dallas network via ITP1, and it will only route through ITP2 for these endpoints at a lower priority. This is useful for cost reduction if, for example, BTS1 has a point of presence (POP) in Dallas and BTS2 has a POP in Washington, DC.

This customer profile is valid only for the D-link configuration.

**Note** [Figure 3-4](#) only shows one STP in each city. However, each city would probably contain two network STPs.

**Figure 3-4 Geographically Distributed Mated STP Pair Configuration with SG Priority Routing**

## Cisco ITP Configuration Example

The ITP configuration in this example is similar to the one in the [ITP1 Configuration, page 2-6](#), with the following exceptions:

- In [Figure 3-4](#), only one STP is shown as a route towards each SSP.
- The routes through STP1 and STP2 lead towards different endpoints.

The following is the configuration example for the cs7 linksets and routes:

**SS7 Linkset definitions**—The number after 'link' represents SLC.

```
cs7 linkset lset1chn 1.1.20
  link 0 Serial0/0:0
!
cs7 linkset lset2chn 2.1.20
  link 0 Serial0/1:0
```

**SS7 Route definitions**

```
cs7 route-table system
  update route 1.1.30 255.255.255 linkset lset1chn priority 1
  update route 1.1.31 255.255.255 linkset lset1chn priority 1
  update route 2.1.30 255.255.255 linkset lset2chn priority 1
  update route 2.1.31 255.255.255 linkset lset2chn priority 1
```

## Cisco BTS 10200 Softswitch Provisioning Example

In this BTS provisioning script, each BTS assigns one of the SGs of the SG-Group as a priority 1 SG route while the other BTS assigns it as a priority 2 SG route. In the BTS1 provisioning script, SG1 has a priority of 1 while SG2 has a priority of 2. In the BTS2 provisioning script, SG2 has a priority of 1 while SG1 has a priority of 2.

The following is a provisioning example for configuring SG priorities.

### BTS1 Provisioning

SG configuration for BTS1. The priority is provisioned opposite of what will be done on BTS2 (as shown in the following subsection).

```
add sg id=sg1; description=Signaling gateway 1 of SG GRP 1; priority 1
add sg id=sg2; description=Signaling gateway 2 of SG GRP 1; priority 2
```

#### SG-GRP configuration for BTS1

```
add sg-grp id=sg-grp1; sg1-id=sg1; sg2-id=sg2 description=SG group 1;
```

**Geographically Separated Mated STP Pair with SG Priority Routing**

## BTS2 Provisioning

**SG configuration for BTS2**—The priority is provisioned opposite of what it is for BTS1.

```
add sg id=sg1; description=Signaling gateway 1 of SG GRP 1; priority 2  
add sg id=sg2; description=Signaling gateway 2 of SG GRP 1; priority 1
```

**SG-GRP configuration for BTS2**

```
add sg-grp id=sg-grp1; sg1-id=sg1; sg2-id=sg2 description=SG group 1;
```
