Troubleshooting Voice Recognition in Cisco Unity Connection 8.x

See the following sections for information on troubleshooting problems with the voice recognition conversation:

- Users Hear the Phone Keypad Conversation Rather Than the Voice-Recognition Conversation in Cisco Unity Connection 8.x, page 24-72
- Voice Commands Are Recognized, But Names Are Not in Cisco Unity Connection 8.x, page 24-73
- Voice Commands Are Not Recognized in Cisco Unity Connection 8.x, page 24-74
- Diagnostic Tools for Troubleshooting Voice Recognition Problems in Cisco Unity Connection 8.x, page 24-75

Users Hear the Phone Keypad Conversation Rather Than the Voice-Recognition Conversation in Cisco Unity Connection 8.x

Use the following questions to determine the source of the problem and to correct it:

1. Does this problem occur for all users whose accounts are configured for voice recognition? If so, do the following sub-tasks:
   a. Confirm that the class of service (COS) is configured to enable voice recognition. On the Class of Service page, under Licensed Features, check the Allow Access to Advanced Features check box, then check the Allow Users to Use Voice Recognition check box.
   b. Confirm that the affected users are associated with the correct COS.

2. Does this problem occur only for a single user whose account is configured for voice recognition? If so, do the following sub-tasks:
   a. Confirm that the affected user is associated with the correct class of service.
   b. Confirm that the phone menu input style is set to voice recognition. The input style can be set either in the Messaging Assistant web tool or in Cisco Unity Connection Administration.

3. Do users hear a prompt indicating that voice-recognition services are not available when they first sign in?
   If so, see the “Error Prompt: “There Are Not Enough Voice-Recognition Resources”” section on page 24-73.

4. Is the correct codec being used?
Voice recognition does not work if the Connection server or the phone system is using G.729a, if the G.729a prompts are installed, or if greetings and names were recorded in an audio format other than G.711 Mu-Law.

**Error Prompt: “There Are Not Enough Voice-Recognition Resources”**

When a user hears the error prompt “There are not enough voice-recognition resources at this time. You will need to use the standard touchtones for the duration of this call,” do the following tasks in the order presented:

1. Confirm that the Connection Voice Recognizer service is running on the Tools > Service Management page in Cisco Unity Connection Serviceability.

2. Check the Cisco Unity Connection license on the System Settings > Licenses page in Cisco Unity Connection Administration. It may be that all licensed voice-recognition sessions are being used. If users report that the error occurs frequently, it is likely that voice-recognition usage has outgrown current licensing capacity on your Connection server.

3. Check for errors generated by the Connection Voice Recognizer service. You can use the Real-Time Monitoring Tool (RTMT) to view errors in the diagnostic logs that are generated with the default traces turned on. The trace log filenames are in the format diag_NSSserver_*.uc.

**Voice Commands Are Recognized, But Names Are Not in Cisco Unity Connection 8.x**

When administrators add or change names on the Cisco Unity Connection system, the names are not recognized by the voice-recognition conversation until they are compiled in the grammars. The timing of the grammar compilation can therefore affect name recognition. In other cases, there may be a search scope problem, or the names may not be pronounced the way they are spelled. Use the following troubleshooting steps to determine the source of problem and to correct it:

- Check to make sure that the name is found in the search scope of the user or directory handler, depending on where the recognition problem occurs. The search scope of a user who has signed in is defined on the User Basics page in Cisco Unity Connection Administration. The search scope of a directory handler is defined on the Edit Directory Handler Basics page.

- Check the Voice Recognition Update schedule on the System Settings > Schedules page in Connection Administration; if names have been added during inactive periods in this schedule, they are not recognized until the schedule is active, at which time Connection automatically updates the name grammars.
Chapter 24  Troubleshooting Voice Recognition in Cisco Unity Connection 8.x

Voice Commands Are Not Recognized in Cisco Unity Connection 8.x

When users encounter issues with poor recognition of voice commands, the problem may stem from many sources—the wrong command being used, issues with pronunciation or foreign accent recognition, a poor phone connection, jitter in the network, and so on. Use the following troubleshooting steps to narrow down the source of the problem and to correct it:

1. Determine the nature of the problem.
   a. If the user is having a problem with a single command, see the “Voice Commands” section in the “Cisco Unity Connection Phone Menus and Voice Commands” chapter of the User Guide for the Cisco Unity Connection Phone Interface (Release 8.x) for a table of preferred voice commands. (The guide is available at http://www.cisco.com/en/US/docs/voice_ip_comm/connection/8x/user/guide/phone/b_8xcucu
Although the voice-recognition grammar files contain many synonyms for the preferred commands, it is not possible for them to contain every word or phrase a user might say. For the best performance, encourage users to use the preferred commands.

b. If the user is having a problem with Connection taking unintended actions without prompting for confirmation, or if Connection is prompting for confirmation too frequently, check the Voice Recognition Confirmation Confidence Threshold setting. See the “Checking the Voice Recognition Confirmation Confidence Setting” section on page 24-75.

2. Try to reproduce the problem while running the Remote Port Status Monitor to determine which voice commands Connection thinks are being uttered. See the “Using the Remote Port Status Monitor” section on page 24-77.

3. Capture and listen to user utterance files to determine if the problem is related to audio quality or accent recognition. See the “Using the Utterance Capture Trace to Review User Utterances” section on page 24-76.

4. Enable diagnostic traces and try to reproduce the problem. See the “Using Diagnostic Traces for Voice Recognition” section on page 24-75.

Checking the Voice Recognition Confirmation Confidence Setting

You can use the Voice Recognition Confirmation Confidence setting to adjust the likelihood that Cisco Unity Connection prompts the voice recognition user to verify certain user intentions. For example, if users complain that the system mistakenly hears them say “cancel” or “hang up,” you can try increasing the value of this setting to prevent users from accidentally committing actions they did not intend. Alternatively, if users complain that the system prompts for confirmation too frequently, try adjusting this setting to a lower value.

Voice Recognition Confirmation Confidence is set on a systemwide basis on the System Settings > Advanced > Conversations page in Cisco Unity Connection Administration. The setting also can be changed on a per-user basis on the Phone Menu page for an individual user.

A realistic range of values for this setting is 30 to 90. The default value of 60 should reliably filter out most errors and provide confirmation when necessary for most systems.

Diagnostic Tools for Troubleshooting Voice Recognition Problems in Cisco Unity Connection 8.x

There are diagnostic tools available to help you troubleshoot voice-recognition problems. See the following sections:

- Using Diagnostic Traces for Voice Recognition, page 24-75
- Using the Utterance Capture Trace to Review User Utterances, page 24-76
- Using the Remote Port Status Monitor, page 24-77

Using Diagnostic Traces for Voice Recognition

Cisco Unity Connection Serviceability offers diagnostic micro traces and macro traces for help in troubleshooting voice-recognition issues. For detailed instructions on enabling the traces and viewing the trace logs, see the “Diagnostic Traces in Cisco Unity Connection 8.x” chapter.
Micro Traces
- Conversation Development Environment (CDE)
  - 10 State Machine Trace
  - 22 Speech Recognition Grammar
- Media: Input/Output (MiuIO)
  - 25 ASR and MRCP
- Subscriber Conversation (ConvSub)
  - 03 Named Properties Access
  - 05 Call Progress
- Phrase Server
  - 10 Speech Recognition

Macro Traces
Set the Voice User Interface/Speech Recognition Traces.

Note
Use this macro trace only if you have first tried to diagnose the problem by using the recommended micro traces. The macro trace generates a large amount of diagnostic information which can be difficult to sort through.

Using the Utterance Capture Trace to Review User Utterances

When you enable the VUI micro trace level 05 (Capture Utterances), Cisco Unity Connection saves user utterances as WAV files in CCITT (u-law) 8-kHz mono format. The files are stored on the file system, with one folder created for each MRCP session. (You can view MRCP session information for a call in the diagnostic logs by enabling the MiuIO level 25 micro trace for ASR and MRCP.)

You can access the utterance files by using the Real-Time Monitoring Tool (RTMT). Do the following procedure:

Caution
Enabling the utterance capture micro trace can affect system performance. Consider doing so only when the system is not under heavy load, and be sure to disable the trace when you are done collecting the desired utterances.

To Enable and View Utterance Capture Traces by Using RTMT

Step 1 In Cisco Unity Connection Serviceability, on the Trace menu, select Micro Traces.
Step 2 On the Micro Traces page, in the Server field, select the name of the Connection server and select Go.
Step 3 In the Micro Trace field, select VUI and select Go.
Step 4 Check the Capture Utterances check box (level 05) and select Save.
Step 5 Reproduce the problem.
Step 6 To access the utterance files, launch Real-Time Monitoring Tool (RTMT). For details, see the “Working with Trace and Log Central” chapter of the Cisco Unified Real-Time Monitoring Tool Administration Guide, Release 8.0(1).
Using the Remote Port Status Monitor

The Remote Port Status Monitor tool is useful for troubleshooting voice-recognition problems because it displays the conversation flow for a call in real time, including speech input and confidence scores, system interpretations of utterances, and changes to the search scope that can affect name and digit interpretation during the course of the call. To use the tool, do the following procedures in order.

To Download the Remote Port Status Monitor

Step 1 In a web browser, go to the Cisco Unity Tools website at http://www.ciscounitytools.com.
Step 2 In the Tool Update Log section, select Port Status Monitor.
Step 3 On the Cisco Unified Communication Tools page for the Port Status Monitor, select Download Now.
Step 4 Follow the on-screen instructions to download the Remote Port Status Monitor tool.

To Configure Cisco Unity Connection for the Remote Port Status Monitor

Step 1 In Cisco Unity Connection Administration, expand System Settings, then select Advanced > Conversations.
Step 2 On the Conversation Configuration page, check the Enable Remote Port Status Monitor Output check box.
Step 3  In the IP Addresses Allowed to Connect for Remote Port Status Monitor Output field, enter the IP addresses of your workstations.

Note that you can enter up to 70 IP addresses. Each IP address must be separated from the following IP address by a comma.

Step 4  Select Save.
