Release Notes for Cisco Unified Communications Manager Release 8.6(2a)

March 10, 2015

Note

To view the release notes for previous versions of Cisco Unified Communications Manager, choose the Cisco Unified Communications Manager version from the following URL: http://www.cisco.com/en/US/products/sw/voicesw/ps556/prod_release_notes_list.html.

Note
Cisco is releasing Cisco Unified Communications Manager 8.6(2a) due to the resolution of the following Caveats: CSCtt09033, CSCtt05252, CSCts69270, CSCts32387, and CSCtq94673.

Table 1  Updates to Release Notes for Cisco Unified Communications Manager 8.6(2a)

<table>
<thead>
<tr>

</tr>
<tr>
<td>10-11-2013</td>
<td>Added Added description for For voice mail usage option in Add hunt list procedure, page 71 to Documentation Updates.</td>
</tr>
<tr>
<td>09-25-13</td>
<td>Added a note about externally-powered USB to the Upgrade section.</td>
</tr>
<tr>
<td>09-02-2013</td>
<td>Added Roll back cluster to a pre-8.0 release section update, page 76 to Documentation Updates.</td>
</tr>
<tr>
<td>08-16-13</td>
<td>Added CSCug84842 Installation fails with unrecoverable internal error, page 50 to Important Notes.</td>
</tr>
<tr>
<td>08-06-13</td>
<td>Added CSCui06050 Model is Not a Valid Device Field When Generation a Phone Report, page 72 to Documentation Updates.</td>
</tr>
<tr>
<td>08-01-13</td>
<td>Added Cisco Unified Real-Time Monitoring Tool Administration Guide, page 74 to Documentation Updates.</td>
</tr>
<tr>
<td>07-10-13</td>
<td>Added Missing Fields for IMS Feature to Documentation Updates.</td>
</tr>
</tbody>
</table>
Before you install or upgrade Cisco Unified Communications Manager (Unified CM), Cisco recommends that you review the “Upgrading to Unified CM 8.6(2a)” section on page 7, and the “Latest Software and Firmware Upgrades for Unified CM 8.6 on Cisco.com” section on page 27 for information pertinent to installing or upgrading, and the “Important Notes” section on page 28 for information about issues that may affect your system.
Introduction

Unified CM, the call-processing component of the Cisco Unified Communications System, extends enterprise telephony features and capabilities to IP phones, media processing devices, voice-over-IP (VoIP) gateways, mobile devices, and multimedia applications.

Note

In the past, export licenses, government regulations, and import restrictions have limited Cisco System’s ability to supply Unified CM worldwide. Cisco has obtained an unrestricted US export classification for Unified CM.

Be aware that after you install an unrestricted release, you can never upgrade to a restricted version. You are not even allowed to fresh install a restricted version on a system that contains an unrestricted version.

System Requirements

The following sections provide the system requirements for this release of Unified CM.

Server Support

Make sure that you install and configure Unified CM on a Cisco Media Convergence Server (MCS), a Cisco Unified Computing System (UCS) server, or a Cisco-approved HP server configuration or a Cisco-approved IBM server configuration.

To find which MCS and UCS servers are compatible with this release of Unified CM, refer to the Supported Servers for Unified CM Releases:

For supported Virtualization of Cisco Unified Communications Manager, see www.cisco.com/go/uc-virtualized.

Note

Make sure that the matrix shows that your server model supports Unified CM Release 8.6(2a).

Note

Be aware that some servers that are listed in the Cisco Unified Communications Manager Software Compatibility Matrix may require additional hardware support for Unified CM Release 8.6(2a). Make sure that your server meets the minimum hardware requirements, as indicated in the footnotes of the Cisco Unified Communications Manager Software Compatibility Matrix.
Uninterruptible Power Supply (UPS) Integration for Unified CM

Cisco recommends that you connect each Unified CM server to an uninterruptible power supply (UPS) to provide backup power and protect your system against a power failure.

Note

When the MCS-781x and MCS-782x servers are not connected to a UPS, they run a higher risk of file corruption during power outages, as the cached data is lost during a power outage on these servers with drive write cache enabled (and no battery backup). To prevent file system corruption, you must connect these servers to a UPS.

When Unified CM runs on one of the servers listed in Table 2, basic integration to the UPS model APC SmartUPS 1500VA USB and APC 750VA XL USB is supported.

Integration occurs via a single point-to-point USB connection. Serial and SNMP connectivity to UPS is not supported, and the USB connection must be point-to-point (in other words, no USB hubs). Single- and dual-USB UPS models get supported with the APC SmartUPS 1500VA USB and APC 750VA XL USB. The feature activates automatically during bootup if a connected UPS is detected.

Alternatively, you can execute the CLI command `show ups status` that shows the current status of the USB-connected APC smart-UPS device and starts the monitoring service if it is not already started. The CLI command also displays detected hardware, detected versions, current power draw, remaining battery runtime, and other relevant status information.

When the feature is activated, graceful shutdown will commence as soon as the low battery threshold is reached. Resumption or fluctuation of power will not interrupt or abort the shutdown, and administrators cannot stop the shutdown after the feature is activated.

For unsupported Unified CM releases, MCS models or UPS models, you can cause an external script to monitor the UPS. When low battery is detected, you can log in to Unified CM by using Secure Shell (SSH), access the CLI, and execute the `utils system shutdown` command.

Note

If your pre-8.0 Unified CM runs on a deprecated server, you can upgrade it by using the Bridge upgrade procedure.

Table 2 Supported Servers for UPS Integration

</tbody>
</table>
Note Be aware that the DL 380-G6 server is available only directly from HP; no equivalent HP OEM MCS-7835-H3 or MCS-7845-H3 servers exist.

Supported SFTP Servers

We recommend that you retest the DRS with your SFTP server after you upgrade your Unified Communications Manager, upgrade your SFTP server, or you switch to a different SFTP server. Perform this step to ensure that these components operate correctly together. As a best practice, perform a backup and restore on a standby or backup server.

Use the information in the following table to determine which SFTP server solution to use in your system.

<table>
<thead>
<tr>
<th>SFTP Server</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>SFTP Server from a Technology Partner</td>
<td>These servers are third party provided, third party tested, and jointly supported by TAC and the Cisco vendor. Version compatibility depends on the third party test. See the Technology Partner page if you upgrade their SFTP product and/or upgrade UCM for which versions compatible: <a href="https://marketplace.cisco.com">https://marketplace.cisco.com</a></td>
</tr>
<tr>
<td>SFTP Server from another Third Party</td>
<td>These servers are third party provided, have limited Cisco testing, and are not officially supported by Cisco TAC. Version compatibility is on a best effort basis to establish compatible SFTP versions and Unified Communications Manager versions. For a fully tested and supported SFTP solution, use Cisco Prime Collaboration Deployment or a Technology Partner.</td>

Caution

When you upgrade to Cisco Unified Communications Manager 8.6(2a), the system reboots several times as part of the upgrade process and the service outage period is longer than with traditional upgrades. Therefore, you may want to perform the upgrade during a scheduled down time for your organization to avoid service interruptions.

Caution

If you upgrade to the U.S. export unrestricted version of Cisco Unified Communications Manager, you will not be able to later upgrade or be able to perform a fresh install of the U.S. export restricted version of this software. Note that IP phone security configurations will be modified to disable signaling and media encryption (including encryption provided by the VPN phone feature).
Release Notes for Cisco Unified Communications Manager Release 8.6(2a)

Upgrading to Unified CM 8.6(2a)

Note
For Unified CM 8.6(2a), a non-bootable image is available for download from Cisco.com. This image may be downloaded to a network server (remote source) or burned to DVD (local source) and used for upgrades. Unified CM 8.6(2a) DVDs ordered from Cisco are bootable and may be used for fresh installs.

Caution
Be sure to back up your system data before starting the software upgrade process. For more information, see the Disaster Recovery System Administration Guide. If you are upgrading your software on HP 7825H3 or HP7828H3 hardware, there is no option to revert to the previous version of Cisco Unified Communications Manager. If you do not back up your system data before starting the software upgrade process your data will be lost if your upgrade fails for some reason. If you chose to revert to the prior version, you will need to install the prior version and restore your data from your DRS backup.

Note
If you are upgrading your software on HP 7825H3 or HP7828H3 hardware, there is no option to revert to the previous version of Cisco Unified Communications Manager. To perform an upgrade on one of these machines you must use an externally powered 16GB USB device to facilitate data migration from the old system to the new installation. For Unity Connection and Business Edition 5000, a 128GB external USB device is required. It is recommended to use an externally powered USB drive as other drives may not be recognized during the Refresh Upgrade sequence.

Software Version Number

These release notes are based on following software version:
- Unified CM: 8.6.2.20000-2

Pre-Upgrade Tasks

Before you begin the upgrade, perform the following tasks:
- Ensure that you have the necessary license files for the new release.
  For more information on obtaining and installing licenses, see the License File Upload chapter in the Cisco Unified Communications Manager Administration Guide.
- Before you begin the upgrade, back up your system. This is particularly important if you are upgrading software on HP7825H3 or HP7828H3 hardware as there is no option to revert to the previous version.
- If you are upgrading software on HP7825H3 or HP7828H3 hardware, use an externally powered 16GB USB device to migrate your data to the new system. For Unity Connection and Business Edition 5000, a 128GB external USB device is required. Cisco recommends that you use an externally powered USB drive as other drives may not be recognized during the Refresh Upgrade sequence.
- Disable the Cisco Extension Mobility service by navigating to Cisco Unified Serviceability > Tools > Service Activation. For more information, see the Cisco Unified Serviceability Administration Guide.
Note  Be aware that, when you deactivate the Cisco Extension Mobility service, Cisco Extension Mobility users cannot log in and log out of phones that support Cisco Extension Mobility.

Caution  Failure to deactivate the Cisco Extension Mobility service could cause the upgrade to fail.

- Do not install Cisco Unified Communications Manager in a large Class A or Class B subnet that contains a large number of devices. When you install Cisco Unified Communications Manager in a large subnet with a large number of devices in that subnet, the Address Resolution Protocol (ARP) table can fill up quickly (maximum 1024 entries, by default). When the ARP table gets full, Cisco Unified Communications Manager can have difficulty talking to endpoints and cannot add more phones.

- Before you upgrade to a later release, refer to the documentation for your currently installed COP files to identify any special considerations related to upgrading Cisco Unified Communications Manager.

Note  If you have the Nokia s60 COP file installed, you must install any newer version of it before you upgrade Cisco Unified Communications Manager.

- If you plan to use IPv6 with Cisco Unified Communications Manager Release 8.0(2) or later, you can provision your DNS server for IPv6 prior to upgrading to Release 8.0(2) or later. However, do not configure the DNS records for Cisco Unified Communications Manager for IPv6 until after you perform the upgrade.

Caution  Configuring the DNS records for Cisco Unified Communications Manager for IPv6 prior to upgrading to Release 8.0(2) or later causes the upgrade to fail.

- Before you upgrade a cluster, execute the `utils network ipv6 ping` CLI command to verify IPv6 networking on the first node (publisher server) and subsequent nodes (subscriber servers). If IPv6 is configured incorrectly on the subsequent nodes, load detection may take 20 minutes.

- Before you perform the Cisco Unified Communications Manager upgrade, ensure that the device name for the Cisco Unified Mobile Communicator device contains 15 or fewer characters. If the device name contains more than 15 characters for the Cisco Unified Mobile Communicator, the device does not migrate during the upgrade.

- After you complete the pre-upgrade tasks, review with the “Software Upgrade Considerations” section on page 9.

### Software Upgrade Considerations

This section contains the following topics:

- Overview of the Software Upgrade Process, page 10
- Making Configuration Changes During an Upgrade, page 12
- Supported Upgrades, page 14
Overview of the Software Upgrade Process

With this version of Cisco Unified Communications Manager, you cannot install upgrade software on your server while the system continues to operate.

Caution

If you are upgrading your software on HP 7825H3 or HP7828H3 hardware, there is no option to revert to the previous version of Cisco Unified Communications Manager. To perform an upgrade on one of these machines you must use an externally powered 16GB USB device to facilitate data migration from the old system to the new installation. For Unity Connection and Business Edition 5000, a 128GB external USB device is required. It is recommended to use an externally powered USB drive as other drives may not be recognized during the Refresh Upgrade sequence.

When you install 8.6 upgrade software, there will be a temporary server outage while the CUCM software is installed. Once you kick off the upgrade using either the command line or graphical user interface the data will be exported, and the system will be automatically rebooted at which point the server outage will begin. The duration of this outage will depend on your configuration and amount of data. During the upgrade, progress can be monitored via the console until such time that command line interface and graphical user interface access has been restored. Once restored, you can use the command line interface or graphical user interface to continue to monitor upgrade progress.

Note

If an administrator or a phone user makes changes during the upgrade process (export of data), that data could be lost after upgrade.

When you initiate the upgrade, you can indicate to activate the partition with the new upgrade software or return to using the partition with the previous version of the software at upgrade completion. With the exception of HP 7825H3 and HP7828H3 hardware upgrades, the previous software remains in the inactive partition until the next upgrade. Your configuration information migrates automatically to the upgraded version in the active partition.

When you upgrade a cluster, you start by upgrading the first node. Once the upgrade on the first node completes, you can begin upgrading subsequent nodes in parallel.

All servers in a cluster must run the same release of Cisco Unified Communications Manager. The only exception is during a cluster software upgrade, during which a temporary mismatch is allowed.

If for any reason you decide to back out of the upgrade, you can restart the system to the inactive partition that contains the older version of the software. However, any configuration changes that you made since you upgraded the software will get lost.

Note

You can only make changes to the database on the active partition. The database on the inactive partition does not get updated. If you make changes to the database after an upgrade, you must repeat those changes after switching the partition.

If the upgrade of a subsequent node fails after you upgrade the first node and switch it to the new version or fail to upgrade one of the subsequent nodes in your cluster during the upgrade cycle, you can do one of the following:

• Correct the errors that caused the upgrade failure on the subsequent node. You may want to check the network connectivity of the nodes in your cluster, reboot the subsequent node, ensure the server memory and CPU usage on the subsequent node are not too high. Upgrade the subsequent node again.
Make sure that the active partition of the first node runs the newest version of software installed on the server. Perform a fresh installation on the subsequent node using the same software version as that running on the active partition of the first node. If you are reinstalling the subsequent node, you should delete the server from Cisco Unified Communications Manager Administration and add the server again as described in the Cisco Unified Communications Manager Administration Guide.

You can upgrade from a DVD (local source) or from a network location (remote source) that the Cisco Unified Communications Manager server can access.

**Note**
Install the software during off-peak hours or during a maintenance window to avoid impact from interruptions.

**Note**
For a short period of time after you install Cisco Unified Communications Manager or switch over after upgrading to a different product version, settings changes made by phone users may be lost. Examples of phone user settings include call forwarding and message waiting indication light settings. This can occur because Cisco Unified Communications Manager synchronizes the database after an installation or upgrade, which can overwrite phone user settings changes.

**Caution**
After you install a new node in an existing cluster, all phones that are registered to the cluster are reset.

**Caution**
Be sure to back up your system data before starting the software upgrade process. For more information, see the Disaster Recovery System Administration Guide. If you are upgrading your software on HP 7825H3 or HP7828H3 hardware, there is no option to revert to the previous version of Cisco Unified Communications Manager. If you do not back up your system data before starting the software upgrade process your data will be lost if your upgrade fails for some reason. If you chose to revert to the prior version, you will need to install the prior version and restore your data from your DRS backup.

### Upgrading to Unified CM 8.6(2a) on a Virtual Server

If you run Cisco Unified Communications Manager on a virtual server, and are upgrading to the 8.6(2a) release, you must make sure that the virtual server’s Guest Operating System and RAM meet the requirements for the latest release.

To upgrade Cisco Unified Communications Manager on a virtual server, do the following:

1. **Step 1** Upgrade the virtual machine to the latest release. For information on installing or upgrading Cisco Unified Communications Manager on virtual servers, refer to the document Cisco Unified Communications Manager on Virtualized Servers.
2. **Step 2** After you finish the upgrade, shut down the virtual machine.
3. **Step 3** Change the Guest Operating System to Red-Hat Enterprise Linux 5 (32-bit).
4. **Step 4** Check the RAM on the virtual machine and make sure that it meets the minimum RAM requirements for this release. Refer to the readme file that accompanied this release’s OVA file for minimum RAM requirements at: Products\Voice and Unified Communications\IP Telephony\Call Control\Cisco Unified Communications Manager (CallManager)\Cisco Unified Communications Manager Version 8.6\Unified Communications Manager Virtual Machine Templates.
Upgrading to Unified CM 8.6(2a)

**Step 5**  Save changes.

**Step 6**  Restart the virtual machine.

---

**Making Configuration Changes During an Upgrade**

This section describes the restrictions that apply to the configuration and provisioning changes that you can make during an upgrade.

**Administration Changes**

The administrator must not make any configuration changes to Cisco Unified Communications Manager during an upgrade. Configuration changes include any changes that you make in Cisco Unified Communications Manager Administration, Cisco Unified Serviceability, and the User Option windows.

Any configuration changes that you make during an upgrade could get lost after the upgrade completes, and some configuration changes can cause the upgrade to fail.

If you are upgrading your system, you must complete the upgrade tasks in this section before you perform any configuration tasks.

⚠️ **Caution**

If you fail to follow these recommendations, unexpected behavior may occur; for example, ports may not initialize as expected.

**Upgrade Tasks**

To successfully complete the upgrade, perform the upgrade tasks in the following order before you begin making configuration changes.

---

**Note**

Cisco strongly recommends that you do not perform configuration tasks until the upgrade completes on all servers in the cluster, until you have switched the servers over to the upgraded partition, and until you have verified that database replication is functioning.

---

**Procedure**

**Step 1**  Stop all configuration tasks; that is, do not perform configuration tasks in the various Cisco Unified Communications Manager-related GUIs or the CLI (with the exception of performing the upgrade in the Cisco Unified Communications Operating System GUI).

**Step 2**  Upgrade the first node in the cluster (the publisher node).

**Step 3**  Upgrade the subsequent nodes in the cluster (the subscriber nodes).

---

**Note**

The switch version for the publisher will occur in step 4. However, if upgrading from Unified CM 8.5 or earlier, choose to run new version at the completion of the upgrade; step 4 is not required. The switch version for subscribers will occur in step 5. However, if upgrading from Unified CM 8.5 or earlier, choose to run new version at the completion of the upgrade; step 5 is not required.

**Step 4**  Switch over the first node to the upgraded partition.
Step 5  Switch over subsequent nodes to the upgraded partition.

Note  You can switch the subsequent nodes to the upgraded partition either all at once or one at a time, depending on your site requirements.

Step 6  Ensure that database replication is functioning between the first node and the subsequent nodes. You can check database replication status by using one of the following methods:

- In Cisco Unified Reporting, access the Unified CM Database Status report. Before you proceed, ensure the report indicates that you have a good database replication status with no errors. For more information about using Cisco Unified Reporting, see the Cisco Unified Reporting Administration Guide.

- In the Cisco Real Time Monitoring Tool, access the Database Summary service under the CallManager tab to monitor database replication status. The following list indicates the database replication status progress:
  - 0—Initializing.
  - 1—Replication setup script fired from this node.
  - 2—Good replication.
  - 3—Bad replication.
  - 4—Replication setup did not succeed.

Before you proceed, ensure that you have a good database replication status. For more information about using the Real Time Monitoring Tool, see the Cisco Unified Cisco Unified Real Time Monitoring Tool Administration Guide.

Step 7  When all other upgrade tasks are complete, you can perform any needed configuration tasks as required.

User Provisioning

For upgrades from Cisco Unified Communications Manager Release 8.x, changes that are made to the following user-facing features get preserved after the upgrade completes:

- Call Forward All (CFA)
- Message Waiting Indication (MWI)
- Privacy Enable/Disable
- Do Not Disturb Enable/Disable (DND)
- Extension Mobility Login (EM)
- Hunt Group Logout
- Device Mobility
- CTI CAPF status for end users and application users
- Credential hacking and authentication
- Recording enabling
- Single Number Reach enabling
Supported Upgrades

For information about supported upgrades, the Cisco Unified Communications Manager Compatibility Matrix at the following URL:

Obtaining the Upgrade File

Before you begin the upgrade process, you must obtain the appropriate upgrade file from Cisco.com. You can access the upgrade file during the installation process from either a local DVD or from a remote FTP or SFTP server. Be aware that directory names and filenames that you enter to access the upgrade file are case-sensitive.

Ordering the Upgrade Media

To upgrade to Unified CM Release 8.6(2a) from a release prior to 8.0(1), use the Product Upgrade Tool (PUT) to obtain a media kit and license or purchase the upgrade from Cisco Sales.

To use the PUT, you must enter your Cisco contract number (Smartnet, SASU or ESW) and request the DVD/DVD set. If you do not have a contract for Unified CM, you must purchase the upgrade from Cisco Sales.

For more information about supported Unified CM upgrades, see the Cisco Unified Communications Manager Software Compatibility Matrix at the following URL:

See the “Software Upgrades” chapter of the Cisco Unified Communications Operating System Administration Guide.

Software Upgrade Procedures

This section provides procedures for upgrading from either a local or a remote source and contains the following topics:

- Installing the COP File, page 14
- Upgrading to Restricted or Unrestricted Unified CM 8.6(2a), page 15
- Upgrading from a Local Source, page 16
- Upgrading from a Remote Source, page 17
- Supported SFTP Servers, page 17
- Bridge Upgrade, page 20

Installing the COP File

⚠️ Caution

For both restricted and unrestricted upgrades from an 8.5(x) or earlier release to an 8.6(x) release, this patch (COP file) must be applied prior to initiating the upgrade. Before you upgrade from compatible versions of Unified CM, install the COP file named `ciscocm.refresh_upgrade_v1.1.cop.sgn` that you
Upgrading to Restricted or Unrestricted Unified CM 8.6(2a)

If you are upgrading from 8.5(1) or earlier complete the “Installing the COP File” section on page 14.
If you are upgrading from 6.1(5) and the software is installed on an I1 or I2 server, perform a bridge upgrade. For information about this procedure, see Bridge Upgrade, page 20.

Note
The unrestricted version of Unified CM 8.6(2a) is available in limited markets only.

Be aware that after you install or upgrade to an unrestricted release, you can never upgrade to a restricted version. You are not even allowed to fresh install a restricted version on a system that contains an unrestricted version.

Upgrading from Unified CM 6.x or Later by Using the UCSInstall ISO File

Note
Release 6.x and 7.x customers can upgrade to this version, but the Cisco CallManager service will not run unless an 8.0 Software Feature License exists on the system.

Procedure

Step 1
From the Software Download page on Cisco.com, download the appropriate UCSInstall iso file.

For the restricted version:
UCSInstall_UCOS_8.6.2.20000-2.sgn.iso

For the unrestricted version:
UCSInstall_UCOS_UNRST_8.6.2.20000-2.sgn.iso

Note
Because the UCSInstall_UCOS_8.6.2.20000-2 build specifies a nonbootable ISO, the build proves useful only for upgrades. You cannot use this build for new installations.

Step 2
Use an md5sum utility to verify the MD5 sum of the final file.

For the restricted version:
15c7b1ea0d8bfd5fd01987f26f43e8c5 UCSInstall_UCOS_8.6.2.20000-2.sgn.iso

For the unrestricted version:
89d5de1bcb715d903673ad66bf0f9b3a1 UCSInstall_UCOS_UNRST_8.6.2.20000-2.sgn.iso

Step 3
Continue by following the instructions in Upgrading from a Local Source, page 16 or Upgrading from a Remote Source, page 17.
Upgrading from a Local Source

To upgrade the software from local DVD, follow this procedure:

Procedure

**Step 1** If upgrading from 8.5(1) or earlier complete the “Installing the COP File” section on page 14.

**Step 2** If you are upgrading software on HP7825H3 or HP7828H3 hardware insert the 16GB USB device to facilitate data migration from the old system to the new installation. For Unity Connection and Business Edition 5000, a 128GB external USB device is required.

**Caution** If you are upgrading your software on HP7825H3 or HP7828H3 hardware, there is no option to revert to the previous version of Cisco Unified Communications Manager. If you do not back up your system data before starting the software upgrade process your data will be lost if your upgrade fails for some reason. If you chose to revert to the prior version, you will need to install the prior version and restore your data from your DRS backup.

**Step 3** If you do not have a Cisco-provided upgrade disk, create an upgrade disk by burning the upgrade file that you downloaded onto a DVD as an ISO image.

**Note** Just copying the .iso file to the DVD will not work. Most commercial disk burning applications can create ISO image disks.

**Step 4** Insert the new DVD into the disc drive on the local server that is to be upgraded.

**Step 5** Log in to Cisco Unified Communications Operating System Administration.

**Step 6** Navigate to Software Upgrades > Install/Upgrade. The Software Installation/Upgrade window displays.

**Step 7** From the Source list, choose DVD.

**Step 8** Enter a slash (/) in the Directory field.

**Step 9** To use the Email Notification feature, enter your Email Destination and SMTP Server in the fields provided.

**Step 10** To continue the upgrade process, click Next.

**Step 11** Choose the upgrade version that you want to install and click Next.

**Step 12** In the next window, monitor the progress of the download.

**Step 13** If you want to run the upgraded software at the completion of the upgrade process and automatically reboot to the upgraded partition, choose Switch to new version after upgrade. The system restarts and is running the upgraded software. If you are upgrading your software on HP 7825H3 or HP7828H3 hardware, there is no option to revert to the previous version of Cisco Unified Communications Manager and you will not be able to choose Switch to new version after upgrade.

**Step 14** If you want to install the upgrade and then manually switch to the upgraded partition at a later time, do the following steps, choose Do not switch to new version after upgrade.
Step 15  Click Next. Depending on your configuration, the following text appears:

a. For non-HP7825H3/HP7828H3 hardware:
   A Refresh Upgrade requires that the server be rebooted during the upgrade. Services will be
   affected during the upgrade operation. Press OK to proceed with the upgrade.

b. For HP7825H3/HP7828H3 hardware:
   This server model requires a USB storage device in order to proceed with the upgrade. Please
   insert a USB storage device with at least 16GBytes of capacity. Note that any existing data on
   the USB device will be deleted.

Note  For Unity Connection and Business Edition the USB storage device must be 128 GBytes.

The Upgrade Status window displays the Upgrade log.

Step 16  When the installation completes, click Finish (not applicable for Refresh Upgrades).

Step 17  To restart the system and activate the upgrade, choose Settings > Version; then, click Switch Version.

The system restarts running the upgraded software (not applicable for Refresh Upgrades).

Upgrading from a Remote Source

Caution  If you are upgrading your software on HP7825H3 or HP7828H3 hardware, there is no option to revert
to the previous version of Cisco Unified Communications Manager. If you do not back up your system
data before starting the software upgrade process your data will be lost if your upgrade fails for some
reason. If you chose to revert to the prior version, you will need to install the prior version and restore
your data from your DRS backup.

Supported SFTP Servers

Cisco allows you to use any SFTP server product but recommends SFTP products that have been
certified with Cisco through the Cisco Technology Developer Partner program (CTDP). CTDP partners,
such as GlobalSCAPE, certify their products with specified versions of Cisco Unified Communications
Manager. For information on which vendors have certified their products with your version of Cisco
Unified Communications Manager, refer to the following URL:

http://developer.cisco.com/web/cdc/home

For information on using GlobalSCAPE with supported Cisco Unified Communications versions, refer
to the following URL:

http://www.globalscape.com/gsftps/cisco.aspx

Cisco uses the following servers for internal testing. You may use one of the servers, but you must
contact the vendor for support:

- Open SSH (refer to http://sshwindows.sourceforge.net/)
- Cygwin (refer to http://www.cygwin.com/)
- Titan (refer to http://www.titanftp.com/)

Cisco does not support using the SFTP product free FTDP. This is because of the 1GB file size limit on
this SFTP product.
For issues with third-party products that have not been certified through the CTDP process, contact the third-party vendor for support.

To upgrade the software from a network location or remote server, use the following procedure.

**Note**

Do not use the browser controls, such as Refresh/Reload, while you are accessing Cisco Unified Communications Operating System Administration. Instead, use the navigation controls that are provided by the interface.

**Procedure**

**Step 1** If upgrading from 8.5(1) or earlier complete the “Installing the COP File” section on page 14.

**Step 2** If you are upgrading software on HP7825H3 or HP7828H3 hardware insert the 16GB USB device to facilitate data migration from the old system to the new installation. For Unity Connection and Business Edition 5000, a 128GB external USB device is required.

**Step 3** Put the upgrade file on an FTP or SFTP server that the server that you are upgrading can access.

**Step 4** Log in to Cisco Unified Communications Operating System Administration.

**Step 5** Navigate to **Software Upgrades > Install/Upgrade**.

The Software Installation/Upgrade window displays.

**Step 6** From the **Source** list, choose **Remote Filesystem**.

**Step 7** In the **Directory** field, enter the path to the directory that contains the patch file on the remote system.
If the upgrade file is located on a Linux or Unix server, you must enter a forward slash at the beginning of the directory path. For example, if the upgrade file is in the patches directory, you must enter /patches.

If the upgrade file is located on a Windows server, remember that you are connecting to an FTP or SFTP server, so use the appropriate syntax, including:

- Begin the path with a forward slash (/) and use forward slashes throughout the path.
- The path must start from the FTP or SFTP root directory on the server, so you cannot enter a Windows absolute path, which starts with a drive letter (for example, C:).

**Step 8**
In the **Server** field, enter the server name or IP address.

**Step 9**
In the **User Name** field, enter your user name on the remote server.

**Step 10**
In the **User Password** field, enter your password on the remote server.

**Step 11**
Select the transfer protocol from the **Transfer Protocol** field.

**Step 12**
To use the Email Notification feature, enter your Email Destination and SMTP Server in the fields provided.

**Step 13**
To continue the upgrade process, click **Next**.

**Step 14**
Choose the upgrade version that you want to install and click **Next**.

**Step 15**
In the next window, monitor the progress of the download.

---

**Note**
If you lose your connection with the server or close your browser during the upgrade process, you may see the following message when you try to access the Software Upgrades menu again:

"Warning: Another session is installing software, click Assume Control to take over the installation."

If you are sure you want to take over the session, click **Assume Control**.

If Assume Control does not display, you can also monitor the upgrade with the Real Time Monitoring Tool.

---

**Step 16**
If you want to install the upgrade and automatically reboot to the upgraded partition, choose **Switch to new version after upgrade**. The system restarts and runs the upgraded software.

**Step 17**
If you want to install the upgrade and then manually switch to the upgraded partition at a later time, do the following steps, choose **Do not switch to new version after upgrade**.

**Step 18**
Click **Next**. Depending on your configuration, the following text appears:

a. For non-HP7825H3/HP7828H3 hardware:
   A Refresh Upgrade requires that the server be rebooted during the upgrade. Services will be affected during the upgrade operation. Press OK to proceed with the upgrade.

b. For HP7825H3/HP7828H3 hardware:
   This server model requires a USB storage device in order to proceed with the upgrade. Please insert a USB storage device with at least 16GBytes of capacity. Note that any existing data on the USB device will be deleted.

---

**Note**
For Unity Connection and Business Edition the USB storage device must be 128 GBytes.

The Upgrade Status window displays the Upgrade log.
Step 19  When the installation completes, click **Finish** (not applicable for Refresh Upgrades).

Step 20  To restart the system and activate the upgrade, choose **Settings > Version**; then, click **Switch Version**. The system restarts running the upgraded software (not applicable for Refresh Upgrades).

---

### Bridge Upgrade

The bridge upgrade provides a migration path for customers who want to migrate from discontinued Cisco Unified Communications Manager server to a server that supports the newest release of Cisco Unified Communications Manager.

Servers that are no longer supported, but are permitted to function as bridge upgrade servers, can upgrade and boot but will not allow Cisco Unified Communications Manager to function.

When you attempt to upgrade your Cisco Unified Communications Manager version on a discontinued server model, Cisco Unified Communications Manager inserts a message into the upgrade log. The upgrade log is displayed on the web browser when the upgrade is initiated through the Cisco Unified Communications Operating System Administration window, or you can view it through CLI if you used CLI to perform the upgrade. This message notes that you can only use the new version to obtain a DRS backup. The warning message in the log is followed by a delay that allows you to cancel the upgrade if you do not want to do a bridge upgrade.

When the system boots the new Cisco Unified Communications Manager version, a warning appears on the console that tells you that the only thing you can do with the new Cisco Unified Communications Manager version is to perform a DRS backup (“This hardware has limited functionality. Backup and Restore is the only supported functionality.”). Because of the restricted visibility of the console, the warning displays during both CLI and GUI sessions.

Use the following procedure to perform a bridge upgrade:

**Procedure**

---

Step 1  Perform an upgrade to the new Cisco Unified Communications Manager version on your discontinued first node (publisher) server. Refer to the preceding sections in this chapter that describe the kind of upgrade you want to do. Observe the warning on the console that tells you that the only thing you can do with the new Cisco Unified Communications Manager version is to perform a DRS backup (“This hardware has limited functionality. Backup and Restore is the only supported functionality.”).

Step 2  Perform an upgrade to the new Cisco Unified Communications Manager version on your subsequent node (subscriber) servers. Refer to the preceding sections in this chapter that describe the kind of upgrade you want to do.

Step 3  Verify database synchronization between all nodes. You can use the CLI commands `utils dbreplication runtime state` and `utils dbreplication status`. For more information, refer to the *Command Line Interface Reference Guide for Cisco Unified Communications Solutions*.

Step 4  Using the new Cisco Unified Communications Manager version on your discontinued first node server, perform a DRS backup. The DRS backups are encrypted using the cluster security password provided at install time. You must remember this security password as the “old” password, because you may be prompted to enter this “old” password at the time of restore. Refer to the *Disaster Recovery System Administration Guide*.

Step 5  Disconnect your discontinued server from the network.
Step 6  Install the new Cisco Unified Communications Manager version on your new supported first node server. You must obtain and install a new license on this server. Refer to the guide Installing Cisco Unified Communications Manager. You will be prompted to enter a “new” security password, a password that is different from the “old” password you noted in Step 4. The guide Installing Cisco Unified Communications Manager describes the requirements of a “new” security password that Cisco Unified Communications Manager will accept. You must remember this “new” security password.

Step 7  Using the new Cisco Unified Communications Manager version on your new supported first node server, perform the Disaster Recovery System Administration Guide procedure “Restoring the First Node only (Rebuilding the Publisher Alone)”. First, select only select the first node for restore. You can only select the subsequent nodes for restore after the completion of first node restore. Use the discontinued server’s backup file that you created in Step 4. You will be prompted for the “old” security password that you noted in Step 4. For further details, refer to the Disaster Recovery System Administration Guide.

Step 8  On your new supported first node server, reactivate all services that used to be active on your discontinued first node server before the bridge upgrade. Refer to the Administration Guide for Cisco Unity Connection Serviceability.

Step 9  Verify database synchronization between all nodes. You can use the CLI commands utils dbreplication runtime state and utils dbreplication status. For more information, refer to the Command Line Interface Reference Guide for Cisco Unified Communications Solutions.

Post-Upgrade Tasks

After the upgrade, perform the following tasks:

- Enable the Cisco Extension Mobility service by navigating to Cisco Unified Serviceability > Tools > Service Activation. For more information, see the Cisco Unified Serviceability Administration Guide.

  Note  If you do not enable the Cisco Extension Mobility service, Cisco Extension Mobility users cannot log in and log out of phones that support Cisco Extension Mobility.

- Verify phone functions by making the following types of calls:
  - Voice mail
  - Interoffice
  - Mobile phone
  - Local
  - National
  - International
  - Shared line

- Test the following phone features:
  - Conference
  - Barge
  - Transfer
  - C-Barge
- Ring on shared lines
- Do Not Disturb
- Privacy
- Presence
- CTI call control
- Busy Lamp Field

- If necessary, reinstall the Real Time Monitoring Tool.

---

**Note**

After you perform a switch version when you upgrade Unified CM, IP phones request a new configuration file. This request results in an automatic upgrade to the device firmware.

---

### Reverting to a Previous Version

After upgrading, you can revert to the software version that was running before the upgrade, by using the Switch Version option to switch the system to the software version on the inactive partition.

This section contains the following topics:

- Reverting the Publisher or Subscriber Nodes to a Previous Version, page 23
- Resetting Database Replication When Reverting to an Older Product Release, page 23

**Caution**

If you are upgrading your software on HP7825H3 or HP7828H3 hardware, there is no option to revert to the previous version of Cisco Unified Communications Manager. If you do not back up your system data before starting the software upgrade process your data will be lost if your upgrade fails for some reason. If you chose to revert to the prior version, you will need to install the prior version and restore your data from your DRS backup.

### Reverting a Cluster to a Previous Version

**Note**

If you downgrade a cluster to a nonsecure previous release of Cisco Unified Communications Manager (releases prior to Release 8.0), you must prepare the cluster for rollback before you switch versions. If you do not prepare the cluster for rollback before you revert to a previous release, you will have to manually delete the ITL file on each Cisco Unified IP Phone in the system. For more information, see Chapter 2, “Security by Default,” in the *Cisco Unified Communications Manager Security Guide*.

To revert a cluster to a previous version, follow these major steps:

<table>
<thead>
<tr>
<th>Task</th>
<th>For Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Revert the publisher node.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Revert all backup subscriber nodes.</td>
</tr>
</tbody>
</table>
Step 1
Open Cisco Unified Communications Operating System Administration directly by entering the following URL:
https://server-name/cmplatform
where server-name specifies the host name or IP address of the Cisco Unified Communications Manager server.

Step 2
Enter your Administrator user name and password.

Step 3
Choose Settings > Version.
The Version Settings window displays.

Step 4
Click the Switch Versions button.
After you verify that you want to restart the system, the system restarts, which might take up to 15 minutes.

Step 5
To verify that the version switch was successful, you can follow these steps:
a. Log in to Open Cisco Unified Communications Operating System Administration again.
b. Choose Settings > Version.
The Version Settings window displays.
c. Verify that the correct product version is now running on the active partition.
d. Verify that all activated services are running.
e. For the publisher node, log in to Cisco Unified Communications Manager Administration by entering the following URL and entering your user name and password:
https://server-name/ccmadmin
f. Verify that you can log in and that your configuration data exists.

Resetting Database Replication When Reverting to an Older Product Release

If you revert the servers in a cluster to run an older product release, you must manually reset database replication within the cluster. To reset database replication after you revert all the cluster servers to the older product release, enter the CLI command utils dbreplication reset all on the publisher server.

When you switch versions by using Cisco Unified Communications Operating System Administration or the CLI, you get a message that reminds you about the requirement to reset database replication if you are reverting to an older product release.
Installing COP Files, Dial Plans, and Locales

This section contains the following topics:

- COP File Installation, page 24
- Dial Plan Installation, page 24
- Locale Installation, page 24

COP File Installation

The following guidelines apply to installing COP files. If the documentation for a specific COP file contradicts these general guidelines, follow the COP file documentation:

- Install the COP file on every server in a cluster.
- After you install a COP file, you must restart the server.

**Note**

You must restart Cisco Unified Communications Manager to ensure that configuration changes that are made during the COP file installation get written into the database. Cisco recommends that you perform this restart during an off-peak period.

Dial Plan Installation

You can install dial plan files from either a local or a remote source by using the same process that is described earlier in this chapter for installing software upgrades. See the “Upgrading from a Local Source” section on page 16 for more information about this process.

After you install the dial plan files on the system, log in to Cisco Unified Communications Manager Administration and then navigate to Call Routing > Dial Plan Installer to complete installing the dial plans.

Locale Installation

Cisco provides locale-specific versions of the Cisco Unified Communications Manager Locale Installer on www.cisco.com. Installed by the system administrator, the locale installer allows the user to view/receive the chosen translated text or tones, if applicable, when a user works with supported interfaces.

**User Locales**

User locale files provide translated text and voice prompts, if available, for phone displays, user applications, and user web pages in the locale that the user chooses. User-only locale installers exist on the web.

**Network Locales**

Network locale files provide country-specific phone tones and gateway tones, if available. Network-only locale installers exist on the web.

Cisco may combine multiple network locales in a single locale installer.
The Cisco Media Convergence Server (MCS) or Cisco-approved, customer-provided server can support multiple locales. Installing multiple locale installers ensures that the user can choose from a multitude of locales.

Changes do not take effect until you reboot every server in the cluster. Cisco strongly recommends that you do not reboot the servers until you have installed all locales on all servers in the cluster. Minimize call-processing interruptions by rebooting the servers after regular business hours.

Installing Locales

You can install locale files from either a local or a remote source by using the same process that is described earlier in this chapter for installing software upgrades. See the “Upgrading from a Local Source” section on page 16 for more information about this process.

Note To activate the newly installed locales, you must restart the server.

See the “Cisco Unified Communications Manager Locale Files” section on page 25 for information on the Cisco Unified Communications Manager locale files that you must install. You can install more than one locale before you restart the server.

Cisco Unified Communications Manager Locale Files

When you are installing Cisco Unified Communications Manager locales, you must install the following files:

- User Locale files—Contain language information for a specific language and country and use the following convention:
  cm-locale-language-country-version.cop

- Combined Network Locale file—Contains country-specific files for all countries for various network items, including phone tones, annunciations, and gateway tones. The combined network locale file uses the following naming convention:
  cm-locale-combinednetworklocale-version.cop

Error Messages

See Table 3 for a description of the messages that can occur during Locale Installer activation. If an error occurs, you can view the messages in the installation log.

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[LOCALE] File not found: &lt;language&gt;_&lt;country&gt;_user_locale.csv, the user locale has not been added to the database.</td>
<td>This error occurs when the system cannot locate the CSV file, which contains user locale information to add to the database. This indicates an error with the build process.</td>
</tr>
<tr>
<td>[LOCALE] File not found: &lt;country&gt;_network_locale.csv, the network locale has not been added to the database.</td>
<td>This error occurs when the system cannot locate the CSV file, which contains network locale information to add to the database. This indicates an error with the build process.</td>
</tr>
</tbody>
</table>
Upgrading to Unified CM 8.6(2a)

Cisco Unified Communications Manager Locale Installers

For a list of downloadable Cisco Unified Communications Manager Locale Installers, see the following URL:

Table 3  Locale Installer Error Messages and Descriptions (continued)

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[LOCALE] Communications Manager CSV file installer installdb is not present or not executable</td>
<td>This error occurs because a Cisco Unified Communications Manager application called installdb must be present; it reads information that is contained in a CSV file and applies it correctly to the Cisco Unified Communications Manager database. If this application is not found, it either was not installed with Cisco Unified Communications Manager (very unlikely), has been deleted (more likely), or the server does not have Cisco Unified Communications Manager installed (most likely). Installation of the locale will terminate because locales will not work without the correct records that are held in the database.</td>
</tr>
<tr>
<td>[LOCALE] Could not create /usr/local/cm/application_locale/cmservices/ipma/com/cisco/ipma/client/locales/&lt;ll&gt;_&lt;CC&gt;.properties.Checksum.</td>
<td>These errors could occur when the system fails to create a checksum file; causes can include an absent Java executable, /usr/local/thirdparty/java/j2sdk/jre/bin/java, an absent or damaged Java archive file, /usr/local/cm/jar/cmutil.jar, or an absent or damaged Java class, com.cisco.ccm.util.Zipper. Even if these errors occur, the locale will continue to work correctly, with the exception of Cisco Unified Communications Manager Assistant, which cannot detect a change in localized Cisco Unified Communications Manager Assistant files.</td>
</tr>
<tr>
<td>[LOCALE] Could not find /usr/local/cm/application_locale/cmservices/ipma/LocaleMasterVersion.txt in order to update Unified CM Assistant locale information.</td>
<td>This error occurs when the file does not get found in the correct location, which is most likely due to an error in the build process.</td>
</tr>
<tr>
<td>[LOCALE] Addition of &lt;RPM-file-name&gt; to the Cisco Unified Communications Manager database has failed!</td>
<td>This error occurs because of the collective result of any failure that occurs when a locale is being installed; it indicates a terminal condition.</td>
</tr>
</tbody>
</table>
Latest Software and Firmware Upgrades for Unified CM 8.6 on Cisco.com

After you install or upgrade to this release of Unified CM, check to see if Cisco has released software upgrades, firmware upgrades, critical patches or Service Updates.

Firmware

Applying the latest comprehensive Firmware Upgrade CD (FWUCD) can prevent catastrophic failures and should be applied as soon as possible.

To check for the latest FWUCD from www.Cisco.com:

- select Support > Download Software
- Navigate to Products > Voice and Unified Communications > Communications Infrastructure > Voice Servers > Cisco 7800 Series Media Convergence Servers (or Cisco UCS B-Series Blade Servers) > (your server model).

Software

Service Updates (SUs), contain fixes that were unavailable at the time of the original release. They often include security fixes, firmware updates, or software fixes that could improve operation.

To check for software upgrades, Service Updates, critical patches, from www.Cisco.com:

- select Support > Download Software
- Navigate to the "Voice and Unified Communications" section and select IP Telephony > Call Control > Cisco Unified Communications Manager (CallManager) > the appropriate version of Cisco Communications Manager for your deployment.

Related Documentation

You can view documentation that supports this release of Unified CM at http://www.cisco.com/en/US/products/sw/voicesw/ps556/tsd_products_support_series_home.html

Limitations and Restrictions

A list of compatible software releases represents a major deliverable of Unified CM System testing. The recommendations, which are not exclusive, represent an addition to interoperability recommendations for each individual voice application or voice infrastructure product.

For a list of software and firmware versions of IP telephony components and contact center components that were tested for interoperability with Unified CM 8.6(2a) as part of Cisco Unified Communications System Release 8.x testing, see the following web page:

http://www.cisco.com/go/unified-techinfo
Be aware that the release of Cisco IP telephony products does not always coincide with Unified CM releases. If a product does not meet the compatibility testing requirements with Unified CM, you need to wait until a compatible version of the product becomes available before you can upgrade to Unified CM Release 8.6(2a). For the most current compatibility combinations and defects that are associated with other Unified CM products, refer to the documentation that is associated with those products.

Important Notes

The following section contains important information that may have been unavailable upon the initial release of documentation that supports Unified CM Release 8.6(2a).

**Perfect Forward Secrecy is not Supported in IPsec Configuration**

This information applies to CSCuu74346.
Perfect Forward Secrecy (PFS) security service is not supported in IPsec configuration between Cisco Unified Communications Manager and Voice Gateway.

**CSCug28060 Connected Line ID Presentation sets to Allowed**

If a call that originates from an IP phone on Cisco Unified Communications Manager encounters a device, such as trunk, gateway, or route pattern, that has the Connected Line ID Presentation set to Default, the presentation value is automatically set to Allowed.

**CSCug36365 Call Park Display Timer restriction**

If you entered a Call Park Reversion Timer value that is less than the Call Park Display Timer, Call Park numbers may not display on the phone.

**CSCuf57901 Video resolution support for SIP phones**

Cisco Unified Communications Manager supports the imageattr line in the SDP portion of the SIP header for higher resolution video calls. Cisco SIP phones that support w360p (640 x 360), such as the 9951, 9971, and 8961, automatically select the best resolution for video calls depending on the following criteria:

- If the session level bandwidth is greater than 800Kb/s and the imageattr[640 x 480] line in the SDP exists, then VGA is used.
- If the session level bandwidth is greater than 800Kb/s and the imageattr[640 x 480] line in the SDP does not exist, then w360p is used.
- If the session level bandwidth is less than 800Kb/s but greater than 480 bits per second and the imageattr[640 x 480] line exists, then VGA 15 frames per second is used.

**Note**

If you currently have a Cisco IP Phone model 9951, 9971, or 8961 that supports w360p (640 x 360) video resolution and are upgrading to Cisco Unified Communications Manager release 8.5(1) or later, you may notice changes in the resolution of video calls. The w360p resolution was introduced at phone load 9.2(1).

The following video call flow is between two 9951 phones (Phone A and Phone B) without imageattr line support (for example, using Cisco Unified Communications Manager releases 8.0(1) and earlier):

1. Phone A sends a SIP message with an imageattr line in the SDP.
2. Cisco Unified Communications Manager deletes the imageattr line in the SDP and then sends the modified SIP message to Phone B.
3. Phone B attempts to send video with the w360p resolution because there is no imageattr line in the SDP portion of the SIP header.

The following video call flow is between two 9951 phones (Phone A and Phone B) with imageattr line support (for example, using Cisco Unified Communications Manager releases 8.5(1) and later):

1. Phone A sends a SIP message with the imageattr line in the SDP.
2. Cisco Unified Communications Manager does not delete the imageattr line and sends the SIP message to Phone B unchanged.
3. Phone B attempts to send video with the VGA resolution.

**CSCub12922 Adding a new subscriber causes device reset**

When you add a new node to an existing cluster, all phones that are registered to the cluster are reset.

**CSCue04792 EMCC Logout Limitation**

In the visiting cluster, the current Phone Configuration window has a Log Out button for intracluster EM. This button is also used by the visiting cluster administrator to logout an EMCC phone. Because the EMCC phone is not currently registered with the visiting Cisco Unified Communications Manager, this operation is equivalent to a DB cleanup in the visiting cluster. The EMCC phone will remain registered with the home Cisco Unified Communications Manager until it comes back to the visiting cluster due to a reset or a logout from the home cluster by other means.

**CSCtu18692 CallProcessingNodeCpuPegging Alerts During DRF/BAT**

Cisco Unified Communications Manager VMware installations can experience high CPU usage spikes while performing tasks such as DRF backups and Bulk Administration Tool exports. The processes that are commonly responsible for CPU usage spikes are gzip and DRFLocal.

If your system is generating CallProcessingNodeCpuPegging alarms, add an additional vCPU for the support of 7500 Cisco Unified Communications Manager users following the Open Virtualization Archives (OVA) template specifications.

During CPU usage spikes, other alarms that may be issued in addition to the CallProcessingNodeCpuPegging alert include: CoreDumpFound, CriticalServiceDown, SDLLinkOutOfService, and NumberOfRegisteredPhonesDropped alarms.

**CSCuc39511 Expansion module field missing from certain device profiles**

The expansion module field is not listed on the Device Profile Configuration window for Cisco Unified IP Phone models 8961, 9951, and 9971. No manual selection is required. The lines from the Phone Button Template are applied to the physical device no matter which expansion modules these phones use.

Skip step 9 in the procedure to “Create the device profile for a user” as documented for Cisco Extension Mobility configuration in the *Cisco Unified Communications Manager Features and Services Guide*.

**Step 6**

If the phone type supports Cisco Unified IP Phone Expansion Modules, Cisco Unified Communications Manager displays expansion module field. At the Module 1 drop-down list box and at the Module 2 drop-down list box, choose the appropriate expansion module.
CSCtb31860 Transcoding G.711 to All Codecs Supported

The transcoder supports transcoding between G.711 and all codecs, including G.711, when functioning as a transcoder and when providing MTP/TRP functionality.

CSCuc30279 Cannot Disassociate Devices From End Users Using BAT

The Bulk Administration Tool (BAT) cannot be used to disassociate devices that are already associated to an end user.

If you manually delete a controlled device from an exported end user record and then insert the modified user record back in to the Cisco Unified Communications Manager database as a custom CSV data file, the insertion appears as successful when you check the job results using Bulk Administration > Job Scheduler; however, the controlled device is still listed on the end-user page.

CSCtr78911 Answer Too Late Timer

In Cisco Unified Communications Manager Administration, use the Device > Remote Destination menu path to configure remote destinations.

Answer Too Late Timer
Enter the maximum time in milliseconds that Cisco Unified Communications Manager allows for the mobile phone to answer. If this value is reached, Cisco Unified Communications Manager stops ringing the mobile phone and pulls the call back to the enterprise.

Range: 0 and 10,000 - 300,000 milliseconds
Default: 19,000 milliseconds
If the value is set to zero, the timer is not started.

CSCts83374 Remote Destination Configuration Settings for Single Number Reach and Reroute Remote Destination Calls to Enterprise Number

In Cisco Unified Communications Manager Administration, use the Device > Remote Destination menu path to configure remote destinations.

Single Number Reach
You can configure all of the Remote Destination Configuration Settings for Single Number Reach.

Reroute Remote Destination Calls to Enterprise Number
For the Reroute Remote Destination Calls to Enterprise Number, you can configure:

- Answer Too Soon Timer
- Answer Too Late Timer

For the Reroute Remote Destination Calls to Enterprise Number, you can not configure:

- Delay Before Ringing Timer
- Enable Mobile Connect
CSCt057498 Upgrading to Cisco Unified Communications Manager Release 8.x from Release 7.x

To upgrade your cluster from Release 7.x to Release 8.x, follow this procedure:

Procedure

Step 1  Follow the normal procedure for upgrading a cluster.

Tip  After you finish upgrading all nodes in the cluster to Cisco Unified Communications Manager Release 8.x, you must also follow all the steps in this procedure to ensure that your Cisco Unified IP Phones register with the system.

Step 2  If you are running one of the following releases in mixed mode, you must run the CTL client:

- **Cisco Unified Communications Manager Release 7.1(2)**
  - All regular releases of 7.1(2)
  - All ES releases of 712 prior to 007.001(002.32016.001)

- **Cisco Unified Communications Manager Release 7.1(3)**
  - All regular releases of 713 prior to 007.001(003.21900.003) = 7.1(3a)su1a
  - All ES releases of 713 prior to 007.001(003.21005.001)

Note  For more information about running the CTL client, see Chapter 4, “Configuring the CTL Client,” in the Cisco Unified Communications Manager Security Guide.

 Restart the Cisco TFTP Service on the TFTP Servers

Step 3  From Cisco Unified Serviceability, choose **Tools > Control Center - Feature Services.**

The Control Center - Feature Services window displays.

Step 4  Restart the Cisco TFTP service on each node on which it is active.

Step 5  Wait five minutes for TFTP to rebuild the files.

Reset all Cisco Unified IP Phones

Note  You must reset all the Cisco Unified IP Phones in the cluster to ensure that the phones have the most current configuration.

Step 6  From Cisco Unified Communications Manager Administration, choose **System > Enterprise Parameters.**

The Enterprise Parameters Configuration window displays.

Step 7  Click **Reset.**
**Important Notes**

**Step 8** Wait ten minutes for the Cisco Unified IP Phones to register with Cisco Unified Communications Manager.

**Back Up Your Cluster**

**Caution** You must back up your cluster using the Disaster Recovery System (DRS) to be able to recover the cluster.

**Step 9** To backup your cluster using DRS, see the *Disaster Recovery System Administration Guide*.

---

**CSCtd69640 Downtime when upgrading Publisher server until all Subscriber servers are updated**

When upgrading the publisher node, there will be a temporary server outage until all subscriber nodes get upgraded to the new software version.

**CSCtk68384 Disable ICH10 onboard SATA controller on EX/ESXi servers during Unified CM installation**

If the server is running VMware EX/ESXi and the motherboard has an ICH10 onboard SATA controller, you must disable the SATA controller in the BIOS. The ICH10 onboard SATA controller is not supported by EX/ESXi. Perform the following steps to disable the SATA controller in the BIOS as a pre-installation task when installing the Cisco Unified Communications Manager.

1. Boot the server and press F2 when prompted during bootup.
2. Select Advanced tab.
4. Set the Onboard SATA Controller to Disabled.

**CSCub10861 Call waiting behavior with MLPP Preemption correction**

When a Routine precedence call is offered to a destination station that already has active calls that are configured with call waiting, normal call waiting is activated if the existing call count is less than the busy trigger.

When a non-routine precedence call is offered to a destination station that already has an active call that is configured with call waiting, precedence call waiting is activated if the existing call count is less than the busy trigger and any of the following conditions exist:

- The device supports visual call appearances and has an open appearance.
- The device supports two non-visual call appearances and has an open appearance, and the precedence of the new call is equal to or lower than the existing call.
- The device has an open appearance (visual or non-visual) and the device is non-preemptable.
When a non-routine precedence call is offered to a destination station that already has an active call that is configured with call waiting, an existing lower-precedence call is preempted if the existing call count is equal to or greater than the busy trigger.

**CSCua01779 Cisco Unified Communications Manager Locale Installer locale file for Belgium**

Since the primary language spoken in Belgium is Dutch, you can download the Dutch (Netherlands) locale file, for example, cm-locale-nl_NL-8.5.1.21000-1.cop.sgn (Cisco Unified Communications Locale Installer 8.5.1.21000-1 Dutch (Netherlands)). Secondary languages commonly spoken in Belgium are French and German.

**CSCtz88812 Cisco IP Phones and Cisco Unity Connection support for IPv6**

For information about IPv6 support for your IP phone or Unity Connection, see the Cisco Unified IP Phone Administration Guide that supports your phone model or the Cisco Unity Connection documentation.

**CSCte39796 Increase database replication timeout when upgrading large clusters**

Use the `utils dbreplication setrepltimeout` CLI command to increase the database replication timeout value when upgrading large clusters so that more subscriber servers have sufficient time to request replication. When the timer expires, the first subscriber server, plus all other subscriber servers that requested replication within that time period, begin a batch data replication with the publisher server. The default database replication timeout value is 300 (5 minutes). Restore the timeout to the default value after the entire cluster upgrades and the subscriber servers have successfully set up replication. For more information, see the *Command Line Interface Guide for Cisco Unified Communications Solutions*.

**CSCsy57492 Hold Reversion Notification Interval for SCCP and SIP phones**

SCCP phones support a minimum Hold Reversion Notification Interval (HRNI) of 5 seconds, whereas SIP phones support a minimum of 10 seconds. SCCP phones set for the minimum HRNI of 5 seconds may experience a Hold Reversion Notification ring delay of 10 seconds when handling calls involving SIP phones.

**New License Required when Replacing Motherboard (CSCtz12589 and CSCtz12651)**

A new license file is required if you are installing a replacement motherboard in publisher servers or single servers that are not part of a cluster.
Important Notes

Internet Protocol Multimedia Subsystem IMS Service Control Interface Support

The Internet Protocol Multimedia Subsystem IMS Service Control Interface is not supported in Cisco Unified Communications Manager 8.6(2a).

H.323 Client Device Name

You must give an H.323 client a device name between 1 and 50 characters. The name may consist of upper and lower case letters; numbers (0-9); periods (.) ; underscores (_); or dashes (-).

Please avoid any other special characters in an H.323 device name, otherwise the error message "unmapped Exception null" is displayed.

Disaster Recovery System Enhancements

Estimating The Size of The Backup Tar

Follow this procedure to estimate the size of the backup tar performed on an SFTP device.

Note

Be aware that the calculated size is not an exact value but an estimated size of the backup tar. Size is calculated based on the actual backup size of a previous successful backup and may vary if the configuration changed since the last backup. Also, this procedure does not estimate the size of a backup performed on a tape device.

Procedure

Step 1 Sign in to Cisco Unified Communications Manager Administration, choose Cisco Unified Communications Manager from the Navigation menu in the upper right corner and click Go. The Disaster Recovery System Sign-In window appears.

Step 2 Sign in to the Disaster Recovery System by using the same administrator username and password that you use for Cisco Unified Communications Operating System Administration.

Step 4 In the Select Features area, select the features to back up.

Step 5 To get the estimated size of backup for the selected features, click Estimate Size.

Caution

Be aware that if no backup history exists for one or more of the selected features, Cisco Unified Communications Manager cannot estimate the size of the backup tar.
Starting A Manual Backup

**Caution**

Be aware that error messages such as “no space in remote server” or “network transfer rate is very slow” may appear. If the backup tar size does not increase for 15 minutes, the backup process fails. Address the problem that caused the backup to fail and then start a fresh backup.

Command Line Interface

**Table 4**  
*Disaster Recovery System Command Line Interface*

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>utils disaster_recovery</td>
<td>Displays estimated size of backup tar from SFTP/Local device and requires one parameter for feature list</td>
</tr>
</tbody>
</table>

Auto Update Statistics (AUS)

In earlier releases of Cisco Unified Communications Manager, the Cisco Database Layer Monitor service parameters Maintenance Throttling for Tables and Maintenance Throttling for Stored Procedures controlled the process for updating statistics about indexes. Now, Cisco Unified Communications Manager 8.6(2a) uses Automatic Update Statistics, an intelligent statistics update feature that monitors the changes made in the database tables and updates only tables that need statistic updates. This feature saves considerable bandwidth, especially on VMware deployments of Unified CM. Automatic Update Statistics is now the default indexing method.

Cluster-Wide Call Park

Cisco Unified Communications Manager 8.6(2a) allows you to enable call parking for cluster-wide configurations. The following changes are introduced with this feature:

- Park codes for all nodes in a Cisco Unified Communications Manager cluster are now allocated from a single entity, the lowest active node in the cluster. Therefore, Unified CM ignores the Cisco Unified Communications Manager field on the Call Park Configuration web page.
- The single entity allocates park codes from a pool of all configured park codes, regardless of which Unified CM is assigned.
- Unified CM allocates park codes through strict enforcement of the partition order in the Calling Search Space (CSS) of the parking party. This update provides a predictable behavior that is easy for administrators to understand.
- The parked calls limit is no longer 100 calls per cluster. Available park codes and system resources determine the number of parked calls.
- CTI monitoring of parked call Directory Numbers (DNs) is unavailable. This function will be restored in Unified CM Release 9.0.

CallPark Softkey

After the called party presses the CallPark softkey to park a call, Unified CM 8.6(2a) takes the following actions to allocate a park code:
• The unique Unified CM node with the active CallParkCodeManager process allocates a park code.
• Unified CM checks the partition list of the CSS of the parking party for available park codes by searching each partition in order. If Unified CM finds a code, the system allocates the code and marks it as unavailable. If Unified CM does not find an available code in any of the partitions, the call park attempt fails.

Previous Call Park Behavior

In previous releases of Unified CM, the following actions occurred:
• The Unified CM node where the call originates (any node in the cluster) allocated a park code from the pool of codes that were assigned to that Unified CM node.
• Unified CM checked the list of available park codes, regardless of their partition order, to detect whether these codes existed in the CSS of the parking party. If Unified CM found an available code, the system allocated the code and marked it as unavailable. If Unified CM found no available code on the partitions, the call park attempt failed.

New Call Park Behavior

With these new Call Park behaviors, centralized Unified CM deployments that host multiple locations on a single cluster (such as retail stores and bank branches) can now place the park codes for each location into the partitions that are devoted to those locations. This placement prevents parties at one store from retrieving calls parked at another store. Also, the new Call Park behaviors reduce the difficulty of administering the feature, because administrators no longer need to place park codes in the CSS of each inbound trunk.

Finally, this behavior follows the partition order of a CSS when searching for objects, which aligns with the search behaviors of other Unified CM features described in the SRND. This behavior makes Call Park easier to understand, because administrators no longer need to assign park codes to every Unified CM node on the side where a call originates.

Enabling Cluster-Wide Call Park

To enable Cluster-Wide Call Park, perform the following steps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>From Cisco Unified Communications Manager Administration, select Advanced Service Parameters &gt; Global Features</td>
</tr>
<tr>
<td>Step 2</td>
<td>Set the Enable Clusterwide CallPark Number/Ranges service parameter to True.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Restart all Unified CM services.</td>
</tr>
</tbody>
</table>

Verify RAID Status Prior To Upgrade on 7825H3 and 7828H3 Servers

Prior to an L2 upgrade, execute the following CLI command to ensure that test-raid has passed:

```
utils diagnose module raid
```
Disaster Recovery System Caution

The Disaster Recovery System (DRS), which can be invoked from Cisco Unified Communications Manager Administration, provides full data backup and restore capabilities for all servers in a Cisco Unified Communications Manager cluster. The Disaster Recovery System allows you to perform regularly scheduled automatic or user-invoked data backups.

The Disaster Recovery System performs a cluster-level backup, which means that it collects backups for all servers in a Cisco Unified Communications Manager cluster to a central location and archives the backup data to physical storage device.

DRS restores its own settings (backup device settings and schedule settings) as part of the platform backup/restore. DRS backs up and restores drfDevice.xml and drfSchedule.xml files. When the server is restored with these files, you do not need to re-configure the DRS backup device and schedule.

When you restore your data, the hostname, server IP address, DNS configuration, version and the deployment type must be the same as it was during the backup. DRS does not restore across different hostnames, IP addresses, DNS configurations, and products or product suites installed (Cisco Unified Call Manager, Cisco Unified Connection, Cisco Unified Communications Manager Business Edition 5000, etc).

EMCC Login Affects Settings in Product-Specific Configuration Layout of Phone Configuration Window

When a user uses a phone in a visiting cluster to log into the user Extension Mobility profile, the phone inherits the default provisioning, network, and security settings (specifically, the configuration in the Product Specific Configuration Layout section of the Phone Configuration window) from the home cluster. This behavior may override local security and network settings that are in place in the visiting cluster. Some of the parameters have firmware defaults that the system administrator cannot change until a fix is provided.

Video Conferencing with Cisco Integrated Services Routers Generation 2

Cisco Integrated Services Routers Generation 2 (ISR G2) can be enabled to act as IOS-based conference bridges that support ad hoc and meet-me audio and video conferencing. To enable conferencing, a PVDM3 DSP module must be installed on the ISR G2. The ISR G2 includes the following series:

- Cisco 2900 Series
- Cisco 3900 Series

For ad hoc video conferencing, the ISR G2 router supports up to eight participants. For meet-me video conferencing, support is provided for up to 16 participants. For video conferences, the resolution, bit rate and frame rates vary depending on which video format is used, but the ISR G2 can support a frame rate of up to 30 frames per second, a stream bit rate up to 2 Mb/s, and video resolution of up to 704 x 568 pixels. For a detailed breakdown of the codecs, frame rates, bit rates, and video resolution for each video format, see the document Configuring Video Conferences and Video Transcoding.

Within Cisco Unified Communications Manager, the ISR G2 can be configured as one of three conference bridge types:
• Cisco IOS Homogeneous Video Conference Bridge—All the conference participants connect to a conference bridge with phones that support the same video format attributes. All the video phones support the same video format and the conference bridge sends the same data stream format to all the video participants.

• Cisco IOS Heterogeneous Video Conference Bridge—All the conference participants connect to the conference bridge with phones that use different video format attributes. Transcoding and transcoding features are required from the DSP in order to convert the signal from one video format to another.

• Cisco IOS Guaranteed Audio Video Conference Bridge—If DSP resources are limited, you can reserve DSP resources for just the audio conference bridge. The DSP resources for the audio conference bridge are reserved, but video service is not guaranteed. Callers on video phones may have video service if DSP resources are available at the start of the conference. Otherwise, the callers are connected to the conference as audio participants.

For more detailed information about video conferencing with ISR G2 routers, see the document Configuring Video Conferences and Video Transcoding.

Interoperability with a Cisco TelePresence Video Communications Server

Cisco Unified Communications Manager release 8.6.(x) is interoperable with a Cisco TelePresence Video Communication Server (VCS) X6.1 and above using a Session Initiation Protocol (SIP) Trunk. To make the two systems compatible, a SIP normalization script must be configured on the trunk that connects Cisco Unified Communications Manager to the VCS.

In release 8.5(x) of Cisco Unified Communications Manager, the script had to be manually created/imported into Cisco Unified Communications Manager, but Release 8.6(1) and above includes the script and does not need to be manually created/imported. The name of the script included in release 8.6(1) and above is vcs-interop.

Refer to the following sections for details on how to handle upgrades from earlier versions and how to configure VCS interoperability in Release 8.6(2a).

• VCS Interoperability SIP Normalization Script Issues for Upgrades to Release 8.6(2a), page 40
• Configuring VCS Interoperability SIP Normalization Script in Release 8.6(2a), page 41

VCS Interoperability SIP Normalization Script Issues for Upgrades to Release 8.6(2a)

If you are upgrading to Cisco Unified Communications Manager 8.6.2 from a 8.5(x) release, and you had previously created/imported a SIP Normalization Script for VCS interoperability, the upgrade to 8.6(2a) will fail if the name of the SIP Normalization Script used in your previous release is vcs-interop. In this case, you must rename the old script prior to completing the upgrade.

To ensure that the upgrade succeeds, complete the following steps before you upgrade to Release 8.6(2a):

Note

Renaming the existing script is not required for upgrades from release 8.6(1) to 8.6(2a). It is only required for upgrades from a 8.5(x) release to release 8.6(1) and above.

Step 1

From Cisco Unified Communications Manager Administration, select Device > Device Settings > SIP Normalization Script.
Step 2  In the SIP Normalization Script Configuration window, click **Find** to list all the SIP Normalization Scripts.

Step 3  Check to see if a script with the precise name *vcs-interop* appears. If a normalization script with this exact name appears, it will create a conflict with the *vcs-interop* script included in the 8.6 release. You must rename the old script before proceeding with the upgrade. To rename the script:

a. Click on the script to open the SIP Normalization Script Configuration window.

b. In the Name field, rename the script to anything other than *vcs-interop*. For example, you may want to rename it to *vcs-interop-old* or *vcs-interop-8.5*.

Step 4  Proceed with the upgrade.

---

After upgrading to 8.6(2a), complete Configuring VCS Interoperability SIP Normalization Script in Release 8.6(2a), page 41 to configure VCS interoperability SIP Normalization Script in Release 8.6(2a).

### Configuring VCS Interoperability SIP Normalization Script in Release 8.6(2a)

After installing or upgrading to Cisco Unified Communications Manager 8.6(2a), perform the following steps to configure Cisco Unified Communications Manager to use the new *vcs-interop* script for all existing SIP trunks to/from Cisco TelePresence Video Communications Server:

---

**Step 1**  In Cisco Unified Communications Manager Administration, select **Device > Device Settings > SIP Profile**.

**Step 2**  Select the SIP Profile for the trunk that connects Cisco Unified Communications Manager to the VCS.

**Step 3**  On the SIP Profile Configuration window, check the **Use Fully Qualified Domain Name** check box.

**Step 4**  Click **Save** and **Reset**.

**Step 5**  In Cisco Unified Communications Manager Administration, select **Device > Trunk**.

**Step 6**  Select the SIP Trunk that connects Cisco Unified Communications Manager to the VCS.

**Step 7**  In the Normalization Script area, select *vcs-interop* from the SIP Normalization drop-down menu.

**Step 8**  Leave the Parameter Name and Parameter Value fields empty. If these fields are already completed, delete the field contents. These fields are not used if the Use Fully Qualified Domain Name check box on the SIP Profile Configuration window is checked.

**Step 9**  Click **Save** and **Reset**.

---

### Configuring a SIP Trunk between CUCM and VCS

The following describes how to configure a SIP Trunk between Cisco Unified Communications Manager and VCS. The SIP Trunk configuration spans the following pages in Cisco Unified Communications Manager Administration:

- SIP Trunk Security Profile
- SIP Profile
- SIP Trunk
Important Notes

• Enterprise Parameters
• Service Parameters

SIP Trunk Security Profile (System > Security > SIP Trunk Security Profile)

The following fields in the SIP Trunk Security Profile Configuration page should be configured as shown in Table 5. For more information on the definition and use of each field, refer to the online help in Cisco Unified Communications Manager Administration (Help > This Page).

Table 5  SIP Trunk Security Profile configuration for VCS

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>
**Enterprise Parameters (System > Enterprise Parameters)**

The Organization Top Level Domain parameter should be set according to your organization domain name (e.g. company.com). This parameter is then used by the SIP Profile > Use Fully Qualified Domain Name in SIP Requests parameter when processing calls to and from VCS.

**Service Parameters (System > Service Parameters > Cisco CallManager > Advanced)**

The SIP Max Incoming Message Size parameter should be set to 11000 bytes to ensure successful negotiation of secure RTP (sRTP) between CUCM and VCS devices. In release 8.6(2a) the default value of this parameter was increased from 5000 to 11000. Verify that the parameter is set to 11000. For more information, see the Cisco TelePresence Video Communication Server Cisco Unified Communications Manager Deployment Guide (CUCM 6.1,7,8 and X7) which is available at http://www.cisco.com/en/US/docs/telepresence/infrastructural/vcs/config_guide/Cisco_VCS_Cisco_Unified_Communications_Manager_Deployment_Guide_CUCM_6-1_7_8_and_X7-0.pdf

**CSCts13972 Must re-run CTL Client when the Domain Name Changes**

When a domain name is added or changed on a Cisco Unified Communications Manager cluster in mixed mode, you must re-run the CTL Client or changes to the phone configuration files do not take effect.

**CSCts35326 "KERNEL: assertion (!sk->sk_forward_alloc) failed at net/ipv4/af_inet.c (152)" Displayed on Console Screen**

This may display on the console screen when running IMS calls due to an issue with RedHat (case 00522987). It does not cause any IMS call failures. These messages can be ignored if they are not causing any issue on the system.

**Deploying the SAF Call Control Discovery Feature**

If you are considering deploying the SAF Call Control Discovery feature, do not clone publishers and use the new identity feature to build out multiple clusters. The new identity feature does not currently support regenerating a unique id for the cluster, and SAF Call Control Discovery will not function properly without unique cluster identification.
**CSCt54150 Mobile Voice Access over SIP trunks and H.323 Gateways**

When you use Mobile Voice Access over SIP trunks or H.323 gateways, you must enable the following settings on the trunk or gateway in Cisco Unified Communications Manager Administration:

- For SIP trunks, you must check the **Redirecting Diversion Header Delivery - Inbound** check box in the Trunk Configuration window.
- For H.323 gateways, you must check the **Redirecting Number IE Delivery - Inbound** check box in the Gateway Configuration window.

**CSCts21965 Troubleshooting When You Lose Both Security Tokens (Etoken)**

*Tip*
Perform the following procedure during a scheduled maintenance window because you must reboot all servers in the cluster for the changes to take effect.

If you lose the security tokens and you need to update the CTL file, perform the following procedure:

**Procedure**

1. **Step 1** On every Cisco Unified CallManager, Cisco TFTP, or alternate TFTP server, verify that CTLFile.tlv exists using the CLI command `file list tftp CTLFile.tlv`.
2. **Step 2** Delete CTLFile.tlv using the CLI command `file delete tftp CTLFile.tlv`.
3. **Step 3** Repeat **Step 1** and **Step 2** for every Cisco Unified CallManager, Cisco TFTP, and alternate TFTP server.
4. **Step 4** Obtain at least two new security tokens.
5. **Step 5** Use the Cisco CTL client to create the CTL File. (For information on creating a CTL file, see *Cisco Unified Communications Manager Security Guide*.)

*Tip*
If the clusterwide security mode exists in mixed mode, the Cisco CTL client displays the message, “No CTL File exists on the server but the CallManager Cluster Security Mode is in Mixed Mode. For the system to function, you must create the CTL File and set CallManager Cluster to Mixed Mode. Click OK; then, choose **Set CallManager Cluster to Mixed Mode** and complete the CTL file configuration.

1. **Step 6** After you create the CTL file on all the servers, delete the CTL file from the phone. (For information on deleting a CTL file, see *Cisco Unified Communications Manager Security Guide*.)
2. **Step 7** Reboot all the servers in the cluster.

**CSCtr07539 MDCX Sendonly Message Suppressed for MGCP Calls**

For all MGCP calls, Cisco Unified Communications Manager suppresses the media layer from sending any MDCX (M:sendonly) messages to the MGCP gateway. This is done to prevent one-way audio scenarios.
**CSCtf48747 DTMF Suppressed When G.Clear is Advertised**

Cisco Unified Communications Manager suppresses DTMF configuration settings for all calls on which G.Clear is advertised in the list of codecs, irrespective of whether G.Clear is chosen as the codec for the call.

**CSCtw25693 MoH Does Not Support DTMF**

Music on Hold (MoH) servers do not use or negotiate DTMF.

**CSCte44108 Call Control Discovery Limitation**

The following information is missing from the “Call Control Discovery” chapter in the *Cisco Unified Communications Manager Features and Services Guide*.

CCD has a limitation with three clusters (A, B and C), when C learns the advertisements of A and B. In this scenario, when two clusters (A and B) are present, both of them advertise the same pattern, and cluster B advertises later than cluster A. This behavior overwrites the PSTN failover rule for cluster A which cluster C adopts. If your IP connection is lost, calls from cluster C are always redirected to cluster B via PSTN.

After you delete the cluster B advertisement, the PSTN failover rule still points back to A. If your IP connection is lost, calls from cluster C are redirected to cluster A via PSTN.

**CSCte43366 Japanese characters displayed as "_" in Music On Hold File**

Japanese characters are displayed as "_" when you upload a wav. file as a Music On Hold File.

**CSCtx00678 Do not use Voicemail for Alerting Name or ASCII Alerting Name**

Do not use the word “Voicemail” anywhere in the Alerting Name or ASCII Alerting Name fields in the Directory Number Configuration window. If you use the word "Voicemail" Cisco Unity Connection may process the call as a direct call rather than as a forwarded call.

**CSCtx86215 Database Replication**

This section of the Cisco Unified Communications Manager System Issues chapter in the *Troubleshooting Guide for Cisco Unified Communications Manager* requires this addition:

Extension Mobility does not work when database replication breaks between the Unified CM node running Extension Mobility and the Unified CM node to which the phone is registered.
CSCtr82936 Not able to add an IPSEC Policy Group Name or a Policy Name with two hyphens

When you are creating a name for Policy Group Name or Policy Name in Cisco Unified Communications Manager OS Administration under Security -> IPSEC Policy configuration, and enter a name with two hyphens you get an error that the name is invalid. Do not use more than one hyphen when creating the Policy Group Name or Policy Name.

CSCth80282 Update regenerate certificate in Unified CM Operating System Guide

Certificate regeneration or upload of a third party signed certificate should be performed during maintenance.

If intracluster communication is enabled using EMCC complete the following steps during certificate regeneration.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Navigate to Advanced Features &gt; EMCC&gt; Intercluster Service Profile and deactivate EMCC Service.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Logout all remotely logged in devices from Device &gt; Related Link &gt; Remotely Logged In Device.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Regenerate certificates.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Perform the Bulk Certification operation.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Activate the EMCC Service.</td>
</tr>
</tbody>
</table>

Presentation Sharing when using a Cisco TelePresence MCU

Cisco Unified Communications Manager supports presentation sharing with the Binary Floor Control Protocol between Unified CM and a Cisco TelePresence MCU.

CSCtc71174 Call Park and Directed Call Park Restriction

The following call flow shows a limitation with the Call Park and Directed Call Park features.

1. Phone A calls Phone B.
2. Phone B parks the call. Phone A is now connected to MOH.
3. Phone A presses Hold (Mutual Hold).
4. Phone C dials the parked number through a H323 Trunk.
5. No audio is produced and the call fails after 12 sec (MXTimeout).

In this call flow, when you retrieve a parked call across an H323 ICT that is also on hold, the call fails. By the time phone C tries to retrieve the parked call, the parked party is on hold and Unified CM cannot cut through media.
**CSCub16565 No CMR support for SIP endpoints & trunks**

There are no CMR records generated when calls are made from SIP endpoints, or when calls pass through a SIP trunk.

**CSCuc10415 Tip for Adding a New Server**

The following tip needs to be added to the “Server settings” topic in the *Cisco Unified Communications Manager Administration Guide*.

To avoid errors, Cisco recommends that you add a server to the system with a name that has less than 47 characters. Then, update the server name to the target length.

**CSCuc77135 Port Information for UDS**

The *Cisco Unified Communications Manager TCP and UDP Port Usage* document does not mention port usage information for Cisco User Data Services. Endpoints can make a TCP connection to Cisco Unified Communications Manager port 8443 for Cisco User Data Services requests.

**CSCuc79185 Device Mobility Calling Search Space is Used When Device CSS is <none>**

The following note is missing from the “Phone Settings” topic in the *Cisco Unified Communications Manager Administration Guide*:

When set to <none>, Unified CM uses the device mobility calling search space, which is configured on the device pool.

**CSCtw44980 Missing Exceptions for Voice-Mail Pilot**

The following information is missing for the Voice-Mail Pilot Name field description in the “Voice-Mail Pilot Settings” topic in the *Cisco Unified Communications Manager Administration Guide*:

Allowed characters are numeric (0-9), plus (+), asterisk (*), and pound (#).

**CSCud34740 Application User AXL Password Must Not Contain Special Characters**

The following note is missing from the Application User Settings topic in the Cisco Unified Communications Manager Administration Online Help:

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not use special characters when you create an AXL password for an application user.</td>
</tr>
</tbody>
</table>
CSCud57169 CTL file size limit of 32 kilobytes should be 64 kilobytes

The *Cisco Unified Communications Manager Security Guide* states that “The Cisco CTL Client limits the file size of a CTL file to 32 kilobytes because the phones cannot accept a larger CTL file.”

The file limit should state 64 kilobytes.

CSCud70447 Missing Etoken Recovery Steps in Troubleshooting Guide

The *Cisco Unified Communications Manager Troubleshooting Guide* is missing the following procedure for troubleshooting if you lose all security tokens (etokens):

Perform the following procedure if you lose the security tokens and you need to update the CTL file.

<table>
<thead>
<tr>
<th>Tip</th>
<th>Perform the following procedure during a scheduled maintenance window, because you must reboot all servers in the cluster for the changes to take effect.</th>
</tr>
</thead>
</table>

**Step 1**
On every Cisco Unified CallManager, Cisco TFTP, or alternate TFTP server, verify that CTLFile.tlv exists from the OS SSH command line.

`file list tftp CTLFile.tlv`

**Step 2**
Delete CTLFile.tlv.

`file delete tftp CTLFile.tlv`

**Step 3**
Repeat step 1 and step 2 for every Cisco Unified CallManager, Cisco TFTP, and alternate TFTP server.

**Step 4**
Obtain at least two new security tokens.

**Step 5**
By using the Cisco CTL client, create the CTL File, as described in “Installing the Cisco CTL Client” and “Configuring the Cisco CTL Client”.

<table>
<thead>
<tr>
<th>Tip</th>
<th>If the clusterwide security mode is in mixed mode, the Cisco CTL client displays the message No CTL File exists on the server but the CallManager Cluster Security Mode is in Mixed Mode. For the system to function, you must create the CTL File and set CallManager Cluster to Mixed Mode. Click OK; then, choose Set CallManager Cluster to Mixed Mode and complete the CTL file configuration.</th>
</tr>
</thead>
</table>

**Step 6**
Reboot all the servers in the cluster.

**Step 7**
After you create the CTL file on all the servers and reboot all servers in the cluster, delete the CTL file from the phone, as described in “Deleting the CTL File on the Cisco Unified IP Phone”.

CSCue76945 Unable to change country information after installation

When you install Cisco Unified Communications Manager, you must enter information for the security certificate, including the country. This information is used to create the Certificate Signing Request. After you complete the installation, you cannot change the country using the `set web-security` command; ensure that you enter a valid country code during the installation.
**CSCug84842 Installation fails with unrecoverable internal error**

When you install Cisco Unified Communications Manager, you must enter an Application User name and password. You use the Application User name and password to access applications that are installed on the system, including the following areas:

- Cisco Unified Communications Manager Administration
- Cisco Unified Serviceability
- Real Time Monitoring Tool
- Cisco Unified Reporting

To specify the Application User name and password, follow these guidelines:

- **Application User name** - The Application User name must start with an alphabetic character and can contain alphanumeric characters, hyphens and underscores.
- **Application User password** - The Application User password must be at least six characters long and can contain alphanumeric characters, hyphens, and underscores.

---

**Caution**

Do not use the system application name as the Application User name. Using a system application name will cause the installation to fail with an unrecoverable error during the installation of the database. System application names are:

- CCMSysUser
- WDSysUser
- CCMQRTSysUser
- IPMASysUser
- WDSecureSysUser
- CCMQRTSecureSysUser
- IPMASecureSysUser
- TabSyncSysUser
- CUCService

You can change the Application User name and password by using the command line interface. For more information, see the *Command Line Interface Reference Guide for Cisco Unified Communications Solutions*.

---

**CSCun32117- Bulk Certificate Import May Cause Phones To Restart**

The following note has been added to the Bulk certificate export section in the Cisco Unified Communications Manager Security Guide and the Configure EMCC section in the Cisco Unified Communications Manager Features and Services Guide.

---

**Note**

When you use the Bulk Certificate Management tool to import certificates, it will cause an automatic restart of the phones on the cluster on which you imported the certificate.

---

**CSCuo13148 Cisco ATA 187 Analog Telephone Adaptor Compatibility**
The Cisco ATA 187 Analog Telephone Adaptor is compatible with Cisco Unified Communications Manager 8.0(3) and higher. For Cisco Unified Communications Manager 8.0(3), you must install the device pack cmterm-devicepack8.0.3.23038-1.cop.sgn for Cisco ATA 187 to be supported.

**CSCuo10697 Updated List of LDAP Supported Directories**

You can add users from your corporate directory to the Cisco Unified Communications Manager database by synchronizing the user data to the database. Cisco Unified Communications Manager allows synchronization from the following directories to the database:

- Microsoft Active Directory 2003 R1 & R2 (32-bit)
- Microsoft Active Directory 2008 R1 (32-bit)
- Microsoft Active Directory Application Mode 2003 R1 & R2 (32-bit)
- Microsoft Lightweight Directory Services 2008 R1 (32-bit)
- Planet 5.1 & Sun ONE Directory Server 5.2
- Sun ONE Directory Server 6.x
- Sun Directory Services 7.0
- Oracle Directory Server Enterprise Edition 11gR1 (v11.1.1.5.0)
- OpenLDAP 2.3.39
- OpenLDAP 2.4

**CSCup04321 Call Pickup Group Visual Notification does not Support Localization**

The following limitation is applicable to Call Pickup:

Localization support is not available for call pickup group visual notification, as it uses ASCII for alerting name.

**CSCtd43582 Remote Destination and Auto Answer**

A remote destination call does not work when Auto Answer is enabled.

**CSCup71020 MaxReturnedDevices in Serviceability XML**

The Cisco Unified Communications Manager XML Developers Guide, Release 8.6 incorrectly specifies the maximum number of devices (MaxReturnedDevices) for which information can be returned in a search as 1000. The correct maximum number of devices is 200.
New and Changed Information

The New and Changed Information for Cisco Unified Communications Manager 8.6(2) provides information about new and changed features for release 8.6(2a).

To obtain this document, go to the following URL:

Caveats

The following sections contain information on how to obtain the latest resolved caveat information and descriptions of open caveats of severity levels 1, 2, and 3.

Caveats describe unexpected behavior on a Cisco Unified Communications server. Severity 1 caveats represent the most serious caveats, severity 2 caveats represent less serious caveats, and severity 3 caveats represent moderate caveats.

Resolved Caveats

You can find the latest resolved caveat information for Unified CM Release 8.6(2a) by using Bug Toolkit, which is an online tool that is available for customers to query defects according to their own needs.

Tip

You need an account with Cisco.com (Cisco Connection Online) to use the Bug Toolkit to find open and resolved caveats of any severity for any release.

To access the Bug Toolkit, log on to http://tools.cisco.com/Support/BugToolKit.

Using Bug Toolkit

The system grades known problems (bugs) according to severity level. These release notes contain descriptions of the following bug levels:

- All severity level 1 or 2 bugs.
- Significant severity level 3 bugs.

You can search for problems by using the Cisco Software Bug Toolkit.

To access Bug Toolkit, you need the following items:

- Internet connection
- Web browser
- Cisco.com user ID and password

To use the Software Bug Toolkit, follow these steps:

Procedure

Step 2 Log in with your Cisco.com user ID and password.
Step 3  If you are looking for information about a specific problem, enter the bug ID number in the “Search for Bug ID” field, and click Go.

Tip  Click Help on the Bug Toolkit page for information about how to search for bugs, create saved searches, create bug groups, and so on.

Open Caveats

Open Caveats for Unified CM Release 8.6(2a) as of October 10, 2011 describe possible unexpected behaviors in Unified CM Release 8.6(2a), which are sorted by component.

Tip  For more information about an individual defect, click the associated Identifier in the “Open Caveats for Unified CM Release 8.6(2a) as of October 10, 2011” section on page 54 to access the online record for that defect, including workarounds.

Understanding the Fixed-in Version Field in the Online Defect Record

When you open the online record for a defect, you will see data in the “First Fixed-in Version” field. The information that displays in this field identifies the list of Unified CM interim versions in which the defect was fixed. These interim versions then get integrated into Unified CM releases.

Some more clearly defined versions include identification for Engineering Specials (ES) or Service Releases (SR); for example 03.3(04)ES29 and 04.0(02a)SR1. However, the version information that displays for the Unified CM maintenance releases may not be as clearly identified.

The following examples show how you can decode the maintenance release interim version information. These examples show you the format of the interim version along with the corresponding Unified CM release that includes that interim version. You can use these examples as guidance to better understand the presentation of information in these fields.

- 8.0(2.40000-x) = Cisco Unified Communications Manager 8.0(2c)
- 7.1(5.10000-x) = Cisco Unified Communications Manager 7.1(5)
- 7.1(3.30000-x) = Cisco Unified Communications Manager 7.1(3b)
- 7.1(3.20000-x) = Cisco Unified Communications Manager 7.1(3a)
- 7.1(3.10000-x) = Cisco Unified Communications Manager 7.1(3)
- 7.1(2.30000-x) = Cisco Unified Communications Manager 7.1(2b)
- 7.1(2.20000-x) = Cisco Unified Communications Manager 7.1(2a)
- 7.1(2.10000-x) = Cisco Unified Communications Manager 7.1(2)

Note  Because defect status continually changes, be aware that the “Open Caveats for Unified CM Release 8.6(2a) as of October 10, 2011” section on page 54 reflects a snapshot of the defects that were open at the time this report was compiled. For an updated view of open defects, access Bug Toolkit and follow the instructions as described in the “Using Bug Toolkit” section on page 52.
Bug Toolkit requires that you have an account with Cisco.com (Cisco Connection Online). By using the Bug Toolkit, you can find caveats of any severity for any release. Bug Toolkit may also provide a more current listing than this document provides. To access the Bug Toolkit, log in to http://www.cisco.com/cgi-bin/Support/Bugtool/launch_bugtool.pl.

Open Caveats for Unified CM Release 8.6(2a) as of October 10, 2011

Online Help for Cisco Unified Communications Manager

The following changes exist for the Unified CM online help system:

- Online Help for Called Party Tracing Window Is Missing, page 59
- Device Name and Description fields need to be updated, page 59

Online Help for Called Party Tracing Window Is Missing

The online help for the Called Party Tracing window is missing in Cisco Unified Communications Manager Administration. The error can be located by clicking Advanced Features > Called Party Tracing; then, by clicking Help > This Page.

Device Name and Description fields need to be updated

In the Unified CM Administration menu Device > Trunk, the Device Name and Description fields should read as follows:
### Documentation Updates

#### Cisco Unified Communications Manager Call Detail Records Administration Guide

The following changes exist for the Call Detail Records Administration documentation:

- **Missing Fields for IMS Feature**, page 60
- **Codec Types**, page 62
- **CDR Field Descriptions**, page 62
- **Incorrect CDR Field Description for destCallTerminationOnBehalfOf**, page 65
- **FAC and CMC Code is not Captured in CDR**, page 66

### Missing Fields for IMS Feature

The following CDR fields for IMS are missing from the Call Detail Records Administration Guide:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Name</td>
<td>Enter a unique identifier for the trunk. The device name can include up to 50 alphanumeric characters: A-Z, a-z, numbers, hyphens (-) and underscores (_) only.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a descriptive name for the trunk. The description can include up to 114 characters in any language, but it cannot include double-quotes (&quot;), percentage sign (%), ampersand (&amp;), back-slash (), or angle brackets (&lt;&gt;).</td>
</tr>
<tr>
<td>Field</td>
<td>Range of Values</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>IncomingICID</td>
<td>Text String</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>IncomingOrigIOI</td>
<td>Text String</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>IncomingTermIOI</td>
<td>Text String</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>OutgoingICID</td>
<td>Text String</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Codec Types

The Codec Types table in Chapter 6 of the Cisco Unified Communications Manager Call Detail Records Administration Guide is missing the entries in the following table.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>97</td>
<td>AMR Codec</td>
</tr>
<tr>
<td>98</td>
<td>AMR-WB Codec</td>
</tr>
</tbody>
</table>

CDR Field Descriptions

The CDR Field Descriptions table in the Cisco Call Detail Records Field Descriptions chapter contains errors and omissions relating to video codecs and video resolution fields. The following table shows the corrections:

<table>
<thead>
<tr>
<th>Field</th>
<th>Range of Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OutgoingOrigIO</td>
<td>Text String</td>
<td>Alphanumeric string up to 50 characters&lt;br&gt;This field is populated with the originating Interoperator Identifier(IOI) from the P-Charging Vector at the outgoing call leg of the call. This field will be empty when the call leg has no IMS or SIP trunk with P-Charging-Vector enabled. Default = Empty String “ “</td>
</tr>
<tr>
<td>OutgoingTermIOI</td>
<td>Text String</td>
<td>Alphanumeric string up to 50 characters&lt;br&gt;This field is populated with the terminating Interoperator Identifier(IOI) from the P-Charging Vector at the outgoing call leg of the call. This field will be empty when the call leg has no IMS or SIP trunk with P-Charging-Vector enabled. Default = Empty String “ “</td>
</tr>
<tr>
<td>Field</td>
<td>Range of Values</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>origVideoCap_Codec</td>
<td>0, 100 = H.261, 101 = H.263, 103 = H.264</td>
<td>This field identifies the codec type that the originator uses to transmit video (H.261, H.263, or H.264.) Default - 0. If media is not established, this field stays 0.</td>
</tr>
<tr>
<td>origVideoCap_Resolution</td>
<td>0, 1 = SQCIF, 2 = QCIF, 3 = CIF, 4 = CIF4, 5 = CIF16, 6 = H263 custom resolution, 7 = W360P, 8 = VGA, 9 = W448P, 10 = HD720P, 11 = HD1080P, 12 = CIF2</td>
<td>This field indicates the transmitting resolution. In the case of H.264 codec or SIP device, this field refers to the max transmitting resolution the device can transmit for this call. Default - 0. If media is not established, this field stays 0.</td>
</tr>
<tr>
<td>destVideoCap_Codec</td>
<td>0, 100 = H.261, 101 = H.263, 103 = H.264</td>
<td>This field identifies the codec type that the terminating party uses to transmit video (H.261, H.263, or H.264). Default - 0. If the destination cannot be reached, this field stays 0.</td>
</tr>
<tr>
<td>destVideoCap_Resolution</td>
<td>0, 1 = SQCIF, 2 = QCIF, 3 = CIF, 4 = CIF4, 5 = CIF16, 6 = H263 custom resolution, 7 = W360P, 8 = VGA, 9 = W448P, 10 = HD720P, 11 = HD1080P, 12 = CIF2</td>
<td>This field indicates the transmitting resolution. In the case of H.264 codec or SIP device, this field refers to the max transmitting resolution the device can transmit for this call. Default - 0. If media is not established, this field stays 0.</td>
</tr>
<tr>

</tr>
<tr>
<td>origVideoCap_Codec_Channel2</td>
<td>0, 100 = H.261, 101 = H.263, 103 = H.264</td>
<td>This field identifies the codec type that the originator uses to transmit video (H.261, H.263, or H.264) for the second video channel. Default - 0. If media does not get established, this field displays 0. Also, if H.239 is not supported, this field displays 0.</td>
</tr>
<tr>
<td>origVideoCap_Resolution_Channel 2</td>
<td>0, 1 = SQCIF, 2 = QCIF, 3 = CIF, 4 = CIF4, 5 = CIF16, 6 = H263 custom resolution, 7 = W360P, 8 = VGA, 9 = W448P, 10 = HD720P, 11 = HD1080P, 12 = CIF2</td>
<td>This field indicates the transmitting resolution for the second video channel. In the case of H.264 codec or SIP device, this field refers to the maximum transmitting resolution the device can transmit for this call. Default - 0. If media is not established, this field stays 0. Also, if H.239 is not supported, this field displays 0.</td>
</tr>
</tbody>
</table>
Incorrect CDR Field Description for destCallTerminationOnBehalfOf

The description for the destCallTerminationOnBehalfOf field erroneously states “For example, if the originator of the call hangs up the phone, the OnBehalfOf code shows ‘12’ for Device. If the call terminates because of a transfer, the OnBehalfOf code shows ‘10’ for Transfer.” The term “originator” should read “destination.”

Incorrect Order of CDR and CMR Fields

Some CDR and CMR fields are in the wrong order. See the following tables for the order in the document and the corrected order:

Table 11  CDR Fields Order Corrections

<table>
<thead>
<tr>
<th>Order in Document</th>
<th>Corrected Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>callIdentifier</td>
<td>directoryNumber</td>
</tr>
<tr>
<td>directoryNumber</td>
<td>callIdentifier</td>
</tr>
</tbody>
</table>

Table 12  CMR Fields Order Corrections
Documentation Updates

FAC and CMC Code is not Captured in CDR

This documentation update resolves CSCus91749.

The following information about CDR entry for FAC and CMC calls is omitted in the Forced authorization code (FAC) and Client Matter Code (CMC) topic in the Cisco Unified Communications Manager Call Detail Records Administration Guide.

**FAC**

CDR will now be written for a setup call leg for all the unanswered calls before the call is redirected to another caller if FAC is used to setup the call.

### Note

This call will not have any connect time since media is not connected for this call. The CDR will be logged regardless of the service parameter `CdrLogCallsWithZeroDurationFlag` if FAC is present in the call.

**FAC Example 2**

Blind conference using FAC:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Call from 136201 to 136111.</td>
</tr>
<tr>
<td>Step 2</td>
<td>136111 answers and speaks for a few seconds.</td>
</tr>
<tr>
<td>Step 3</td>
<td>136201 presses the <strong>Conference</strong> softkey and dials 136203.</td>
</tr>
<tr>
<td>Step 4</td>
<td>The user is prompted to enter the FAC code and the user enters 124. FAC code 124 is configured as level 1 and given a name as <strong>Forward_FAC</strong>.</td>
</tr>
<tr>
<td>Step 5</td>
<td>While 136203 is ringing, 136201 presses the <strong>Conference</strong> softkey to complete the conference.</td>
</tr>
<tr>
<td>Step 6</td>
<td>136203 answers the call.</td>
</tr>
<tr>
<td>Step 7</td>
<td>The three members in the conference talk for sometime.</td>
</tr>
<tr>
<td>Step 8</td>
<td>136111 hangs up, leaving 136201 and 136203 in the conference. Since there are only two participants in the conference, the conference feature will join these two directly together and they talk for a few seconds.</td>
</tr>
</tbody>
</table>

### FieldNames

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
### CMC Example 2

Blind conference using CMC:

**Step 1**
Call from 136201 to 136111.

**Step 2**
136111 answers and speaks for a few seconds.

**Step 3**
136201 presses the **Conference** softkey and dials 136203.

**Step 4**
The user is prompted to enter the CMC code and the user enters 125. CMC code 125 is configured as level 1 and is given a name as `Forward_CMC`.

**Step 5**
While 136203 is ringing, 136201 presses the **Conference** softkey to complete the conference.

**Step 6**
136203 answers the call.

**Step 7**
The three members in the conference talk for sometime.

---

The setup call CDR for this example is generated even though it is of zero duration since FAC is used for this call.

Note
The setup call CDR for this example is generated even though it is of zero duration since CMC is used for this call.

Cisco Unified Communications Manager Features and Services Guide

The following changes exist for the Cisco Unified Communications Manager Features and Services Guide:

- Block Offnet to Offnet Transfer Information is Missing, page 69
- Remote Cluster Menu Path is Incorrect, page 69
- Configure BLF Call Pickup, page 69
- Configuring OpenAM Section, page 69
Block Offnet to Offnet Transfer Information is Missing

The following text is missing from the “External Call Transfer Restrictions” chapter in Cisco Unified Communications Manager Features and Services Guide.

When you enable the service parameter Block Offnet to Offnet Transfer and make a blind transfer with Cisco Unity Connection, the Q.931 SETUP message which Cisco Unified Communications Manager sends to the PSTN gateway for an outbound PRI call still reaches the gateway. This transfer results in a dropped call.

Remote Cluster Menu Path is Incorrect

In the Remote Cluster Configuration section of the “EMCC Configuration” chapter of Cisco Unified Communications Manager Features and Services Guide, the menu path Advanced Features > EMCC > EMCC Remote Cluster is incorrect and should be Advanced Features > Cluster View.

Configure BLF Call Pickup

Step 10 of the Configure BLF Call Pickup is an optional step that instructs users on how to configure the Cisco Support Use 1 enterprise parameter. This step and this enterprise parameter are no longer needed to configure BLF call pickup.

Configuring OpenAM Section

The following content is missing from the “Configure OpenAM” section of “Single Sign-On” chapter:

After you install the OpenAM server, you must ensure that a default account is created so that you can enable and configure the SSO-based authentication successfully on Cisco Unified Communications Manager applications. The default account consists of a “demo” username and a password. To enable Agent Flow SSO on Unified Communications applications, the system uses this default account to validate the following that are provisioned on OpenAM:
The following content is missing from the “Configure OpenAM” section of “Single Sign-On” chapter:

- Login module
- J2EE agent

To verify if the “demo” user is configured or not, perform the following procedure:

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Log in to the OpenAM server. The OpenAM administration window appears.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Select the Access Control tab. A list of one or more access control realms appears.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Top Level Realm.</td>
</tr>
</tbody>
</table>

Note

The top level realm appears in the list when you deploy the OpenAM server. This realm contains the OpenAM configuration data.

An additional set of configuration tabs appears.
Step 4  Select the **Subjects** tab.

Step 5  Click **New**.
       A list of fields containing user details appears.

Step 6  Enter data for the following fields:
       - **ID**: demo
       - **First Name**: demo
       - **Last Name**: demo
       - **Full Name**: demo
       - **Password**: changeit
       - **Password (confirm)**: changeit

**Note**
Do not change this default password.

- **User Status**: Select the **Active** radio button.

Step 7  Click **OK**.
The system creates a “demo” user successfully.

---

## Cisco Unified Communications Manager Administration Guide

The following changes exist for Cisco Unified Communications Manager Administration Guide:

- **Correction in Software Conference Bridge Maximum Audio Streams**, page 70
- **Missing Field in E & M Port Configuration Settings**, page 71
- **Removed field Call Stats from SIP Profile configuration**, page 71
- **Relabel of Use Personal Preferences field**, page 71
- **CSCuh62299 Note added to the Service Name field**, page 71
- **Added description for For voice mail usage option in Add hunt list procedure**, page 71
- **CSCtg36487 T1/E1 external clocks must be synchronized on Volaris**, page 71
- **Transmit UTF8 for Calling Party Name Field Correction**, page 72
- **Incorrect Note about User Locales**, page 72

### Correction in Software Conference Bridge Maximum Audio Streams

This documentation update resolves CSCuu44805.

The maximum audio streams per software conference bridge is incorrectly listed as 128 in the “Software Conference Devices” section of the Cisco Unified Communications Manager Administration Guide. The correct value is 256.
Missing Field in E & M Port Configuration Settings

The E & M Port Configurations section of the Gateway Configuration chapter in the Cisco Unified Communications Manager Administration Guide is missing the Unattended Port field description. Users should check the Unattended Port check box to indicate the device is attached to an unattended port, such as a voice mail port.

Removed field Call Stats from SIP Profile configuration

In the “SIP profile settings” section, the field “Call Stats” is not available under Device > Device Settings > SIP Profile on the Cisco Unified Communications Administration page. The Call Stats field is enabled, by default.

Relabel of Use Personal Preferences field

In the Call Routing > Route/Hunt > Hunt Pilot setup window, the Use Personal Preferences option has been renamed to Use Forward Settings of Line Group Member.

CSCuh62299 Note added to the Service Name field

The following note is added to the Service Name field under IP phone service settings table in the Cisco Unified Communications Manager Administration Guide.

Note
When the service URL points to an external customized URL, you cannot localize the service name as per the device locale of the phone. The service name gets displayed in English alphabets only.

Added description for For voice mail usage option in Add hunt list procedure

The following description about For voice mail usage option has been added to the Add hunt list procedure in step 6:

“If you check the For Voice Mail Usage check box, the route list control process keeps a count of the setups that are being served to the hunt list, and will not allow more setups than the number of available devices. As a result, each device in the hunt list is treated as if it has a Busy Trigger and related Maximum Number of Calls of one”.

“For example, if the hunt list contains five devices, and if busy trigger is two for each member, with the For Voice Mail Usage checkbox unchecked, it can process up to ten setups. For the same number of hunt list devices with a busy trigger of two for each member, with the For Voice Mail Usage checkbox checked, it can process only five setups and the next immediate setup after five gets rejected”.

CSCtg36487 T1/E1 external clocks must be synchronized on Volaris

The following note is added in Cisco Voice Gateways in the Cisco Unified Communications Manager Administration Guide.

Note
Ensure that external clocks are mutually synchronized when both T1/E1 ports are configured with external clocks.
Transmit UTF8 for Calling Party Name Field Correction

This documentation update resolves CSCup45037.

The Cisco Unified Communications Manager Administration Guide specifies that the SIP-trunk field Transmit UTF-8 for Calling Party Name is defined as using the user locale setting of the device pool in determining what to send in the Calling Party Name field. However, the device pool does not have a user locale field, it has a network locale field, and both the Common Device Configuration record and the Phone record itself have user locale fields.

The following is the process that the SIP trunk uses to obtain the user locale:

If the Transmit UTF-8 for Calling Party Name is checked to obtain the locale, the SIP trunk attempts to obtain the locale from the device. If that fails, the SIP trunk attempts to obtain the user locale from the Common Device Configuration and if that fails, the SIP trunk obtains the user locale that is used for the Enterprise Parameters.

Incorrect Note about User Locales

This documentation update resolves CSCuq42434.

The note about user locales in the Cisco Unified IP Phone settings section of the Administration Guide incorrectly states that Cisco Unified Communications Manager uses the user locale that is association with the device pool. The following is the correct note:

**Note**

If no user locale is specified, Cisco Unified Communications Manager uses the user locale that is associated with the common device configurations.

Cisco Unified Communications Manager Bulk Administration Guide

CSCui06050 Model is Not a Valid Device Field When Generation a Phone Report

The Phone Reports section mentions Model as one of the fields. However, this field is not available in the Bulk Administration Tool GUI.

CSCul78860 BAT User Template Only Accepts Hexadecimal Characters for Digest Credentials

The table in “End user digest credential settings” sub section of “Digest authentication for SIP phones setup” section states that Digest Credentials accepts alphanumeric characters, which is wrong. The Digest Credentials accepts only hexadecimal characters for BAT User Template.

Cisco Unified Communications Manager System Guide

The following changes exist for Cisco Unified Communications Manager System Guide:

- SMDI Voice Mail Integration, page 73
- CSCue75498 Understanding Cisco Unified Communications Manager Trunk Types, page 73
- Updates to section Phones that Support International Escape Character +, page 73
SMDI Voice Mail Integration

These updates apply to the SMDI Voice Mail Integration section in *Cisco Unified Communications Manager System Guide*.

To connect the EIA/TIA-232 cable to Cisco Unified Communications Manager, use a ATEN USB Serial Converter UC-232A adapter.

For SMDI integration, the FXS port must be configured as a POTS line. If you are not able to configure it in the Route Group, follow the below configuration steps:

1. Configure the Line Group with the FXS port. See “Line Group Configuration” in *Cisco Unified Communications Manager Administration Guide* for more detailed information.

3. Configure the Hunt Pilot with the voicemail number. See “Hunt Pilot Configuration” in *Cisco Unified Communications Manager Administration Guide* for more detailed information.

CSCue75498 Understanding Cisco Unified Communications Manager Trunk Types

Step 10 of the Trunk Configuration Checklist in the Cisco Unified Communications Manager System Guide states “When you enable Send send-receive SDP in mid-call INVITE for an early offer SIP trunk in tandem mode, Cisco Unified Communications Manager inserts MTP to provide sendrecv SDP when a SIP device sends offer SDP with a=inactive or sendonly or recvonly in audio media line.” This statement incorrectly qualifies the situation as occurring in tandem mode only. This situation can occur for all clusters.

Updates to section Phones that Support International Escape Character +

The up-to-date list of phones that support International Escape Character is as follows:

- Cisco Unified SIP Phones 3900 Series (3905, 3911)
- Cisco Unified IP Phones 6900 Series (6921, 6941, 6961, 6945)
- Cisco Unified IP Phones 7900 Series (7942, 7945, 7962, 7965, 7975, 7931)
- Cisco Unified IP Phones 8800 Series (8831)
- Cisco Unified IP Phones 8900 Series (8941, 8945, 8961)
- Cisco Unified IP Phones 9900 Series (9951, 9971)
- EX60, EX90, MX200, MX300

Cisco Unified Communications Manager TCP and UDP Port Usage Guide

- Missing TCP Port Description, page 74
- Incorrect LDAP Port Information, page 74
- Missing Information about TCP Port 22, page 74
Documentation Updates

Missing TCP Port Description

The following TCP port description is missing from the Port Descriptions table in *Cisco Unified Communications Manager TCP and UDP Port Usage*:

<table>
<thead>
<tr>
<th>From (Sender)</th>
<th>To (Listener)</th>
<th>Destination Port</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unified CM (Tomcat)</td>
<td>Unified CM (Tomcat)</td>
<td>8080 / TCP</td>
<td>Communication between servers used for diagnostic tests</td>
</tr>
</tbody>
</table>

Incorrect LDAP Port Information

This guide incorrectly lists the destination port from Unified Communications Manager to External Directory as Ephemeral.

Unified Communications Manager to External Directory is 389 LDAP, 636 for secure LDAP, or 3269 for global catalog. External Directory to Unified Communications Manager is Ephemeral.

The following table shows the correct ports between Unified Communications Manager and LDAP directory.

<table>
<thead>
<tr>
<th>From (Sender)</th>
<th>To (Listener)</th>
<th>Destination Port</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Directory</td>
<td>Unified CM</td>
<td>Ephemeral</td>
<td></td>
</tr>
</tbody>
</table>

Missing Information about TCP Port 22

This documentation update resolves CSCus05634.

The following entry is omitted from the ‘Intracluster Ports Between Cisco Unified Communications Manager Servers’ table in the *TCP and UDP Port Usage Guide for Cisco Unified Communications Manager*:

<table>
<thead>
<tr>
<th>From (Sender)</th>
<th>To (Listener)</th>
<th>Destination Port</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unified Communications Manager Publisher</td>
<td>Unified Communications Manager Subscriber</td>
<td>22 / TCP</td>
<td>Cisco SFTP service. You must open this port when installing a new subscriber.</td>
</tr>
</tbody>
</table>

Cisco Unified Real-Time Monitoring Tool Administration Guide

The following alerts have been removed from Unified CM but are still listed in the *Cisco Unified Real Time Monitoring Tool Administration Guide*:

LowAttendantConsoleServerHeartbeatRate
LowCallManagerHeartbeatRate
LowTFTPServerHeartbeatRate

Incorrect Default Value for LogPartitionLowWaterMarkExceeded Alert

This documentation update resolves CSCuq39087

The default threshold value for LogPartitionLowWaterMarkExceeded alert is incorrectly described as 95% in the “Alerts” chapter. The following table contains the correct value.

<table>
<thead>
<tr>
<th>Value</th>
<th>Default Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Threshold</td>
<td>Trigger alert when following condition is met:</td>
</tr>
<tr>
<td></td>
<td>Log Partition Used Disk Space Exceeds Low Water Mark (90%)</td>
</tr>
</tbody>
</table>

Cisco Unified Serviceability Administration Guide

The Cisco Unified Serviceability Administration Guide contains the following updates:

- CSCud87708 Audit Log Severity Levels, page 75
- CSCun47221 Note added to the CDR Repository Manager section, page 75
- Missing Information about the Platform Administrative Web Service, page 76

CSCud87708 Audit Log Severity Levels

The following table displays descriptions for audit log severity levels. Audit logs are accessed in Cisco Unified Serviceability.

<table>
<thead>
<tr>
<th>Severity Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Emergency: system is unusable</td>
</tr>
<tr>
<td>1</td>
<td>Alert: action must be taken immediately</td>
</tr>
<tr>
<td>2</td>
<td>Critical: critical condition</td>
</tr>
<tr>
<td>3</td>
<td>Error: error conditions</td>
</tr>
<tr>
<td>4</td>
<td>Warning: warning conditions</td>
</tr>
<tr>
<td>5</td>
<td>Notice: normal but significat condition</td>
</tr>
<tr>
<td>6</td>
<td>Informational: informational messages</td>
</tr>
<tr>
<td>7</td>
<td>Debug: debug-level messages</td>
</tr>
</tbody>
</table>

CSCun47221 Note added to the CDR Repository Manager section

The following note has been added to the 'CDR Repository Manager' section:
Note
When FIPS mode is enabled, CDR files are unable to transfer successfully from subscriber nodes to the publisher node. For assistance in resolving this problem, contact Cisco Technical Assistance Center (TAC).

Missing Information about the Platform Administrative Web Service

This documentation update resolves CSCup84833
The following information is omitted from the Platform Services Section of the Cisco Unified Serviceability Administration Guide:
The Platform Administrative Web Service is a Simple Object Access Protocol (SOAP) API that can be activated on Cisco Unified Communications Manager, IM and Presence Service, and Cisco Unity Connection systems to allow the PAWS-M server to upgrade the system.

Note
Do not activate the Platform Administrative Web Service on the PAWS-M server.

Cisco Unified Communications Manager Security Guide

The Cisco Unified Communications Manager Security Guide contains the following updates:
- Roll back cluster to a pre-8.0 release section update, page 76
- Refresh Upgrade update, page 76
- CSCuj71412 Secure Call Monitoring and Recording Update, page 77
- CSCuo01831 Phone Models Supporting Encrypted Configuration File, page 77
- CSCus63274 Devices Reset After Certificate Regeneration, page 78
- Incorrect Configuration Example for ASA Router, page 78

Roll back cluster to a pre-8.0 release section update

The note in step 1 of “Roll back cluster to a pre-8.0 release” section incorrectly stated “pre-8.6”. This is now changed to “pre-8.0”.

Refresh Upgrade update

The following information is missing from the “Refresh upgrade from Cisco Unified Communications Manager Release 7.x to Release 8.6 or later” section in Cisco Unified Communications Manager Security Guide:

Once the publisher is up after the upgrade, do not reboot until the CAR migration completes. You are not allowed to switch to old version or perform a DRS backup in this phase. You can monitor the CAR migration status by navigating to Cisco Unified Serviceability > Tools > CDR Analysis and Reporting.
CSCuj71412 Secure Call Monitoring and Recording Update

The note in the “About secure call monitoring and recording setup” section is updated to remove the word “Secure” as the system does not support recording on authenticated phones.

Note
The system does not support recording on authenticated phone.

CSCuo01831 Phone Models Supporting Encrypted Configuration File

The phone models support table is missing entries. The following table lists all support phone models:
You can encrypt the phone configuration file for the following Cisco Unified IP Phones.

<table>
<thead>
<tr>
<th>Phone Model and Support</th>
<th>Encryption Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Unified IP Phone 7905G or 7912G (SIP only)</td>
<td>Manual key distribution—Encryption algorithm: RC4Key size: 256 bits File signing support: No</td>
</tr>
<tr>
<td>Cisco Unified IP Phone 7940G or 7960G (SIP only)</td>
<td>Manual key distribution—Encryption algorithm: Advanced Encryption Standard (AES) 128Key size: 128 bits File signing support: These phones that are running SIP receive signed, encrypted configuration files but ignore the signing information.</td>
</tr>
<tr>
<td>Cisco Unified IP Phone 6901, 6911, 6921, 6941, 6945, and 6961</td>
<td>Symmetric key encryption with phone public key (PKI encryption)—Encryption algorithm: AES 128Key size: 128 bits File signing support: Yes</td>
</tr>
<tr>
<td>Cisco Unified IP Phone 7970G, 7971G, or 7975G; Cisco Unified IP Phone 7961G, 7962G, or 7965G;Cisco Unified IP Phone 7941G, 7942G, or 7945G;Cisco Unified IP Phone 7911G; Cisco Unified IP Phone 7906G</td>
<td></td>
</tr>
<tr>
<td>Cisco Unified IP Phone 7971G-GE, 7961G-GE, 7941G-GE</td>
<td></td>
</tr>
<tr>
<td>Cisco Unified IP Phone 7931G, 7921G, 7925G, 7926G (SCCP only)</td>
<td></td>
</tr>
<tr>
<td>Cisco Unified IP Phone 8941 and 8945</td>
<td></td>
</tr>
<tr>
<td>Cisco Unified IP Phone 8961, 9951, and 9971</td>
<td></td>
</tr>
</tbody>
</table>
CSCus63274 Devices Reset After Certificate Regeneration

**Note**
All the devices (phones) reset when you regenerate TVS/CCM/CAPF client application certificates.

Incorrect Configuration Example for ASA Router

This documentation update resolves CSCuv20903.

The “Set up ASA for VPN Client on IP Phone” procedure in the “VPN Client” chapter provides an example to configure an IOS router instead of an ASA router.

The following procedure contains the correct example.

**Procedure**

**Step 1**
Complete the local configuration.

a. Configure network interface.
   - Example:
     ```
     ciscoasa(config)# interface Ethernet0/0
     ciscoasa(config-if)# nameif outside
     ciscoasa(config-if)# ip address 10.89.79.135 255.255.255.0
     ciscoasa(config-if)# duplex auto
     ciscoasa(config-if)# speed auto
     ciscoasa(config-if)# no shutdown
     ciscoasa# show interface ip brief (shows interfaces summary)
     ```

b. Configure static routes and default routes.
   - Example:
     ```
     ciscoasa(config)# route outside 0.0.0.0 0.0.0.0 10.89.79.129
     ```

c. Configure DNS.
   - Example:
     ```
     ciscoasa(config)# dns domain-lookup inside
     ciscoasa(config)# dns server-group DefaultDNS
     ciscoasa(config-dns-server-group)# name-server 10.1.1.5 192.168.1.67209.165.201.6
     ```

**Step 2**
Generate and register the necessary certificates for Cisco Unified Communications Manager and ASA. Import the following certificates from the Cisco Unified Communications Manager.

- CallManager - Authenticating the Cisco UCM during TLS handshake (Only required for mixed-mode clusters).
- Cisco_Manufacturing_CA - Authenticating IP phones with a Manufacturer Installed Certificate (MIC).
• CAPF - Authenticating IP phones with an LSC.

To import these Cisco Unified Communications Manager certificates, do the following:

a. From the Cisco Unified OS Administration, choose Security > Certificate Management.

b. Locate the certificates Cisco_Manufacturing_CA and CAPF. Download the .pem file and save as a .txt file.

c. Create trustpoint on the ASA.

Example:

```cisco
Ciscoasa(config)# crypto ca trustpoint trustpoint_name
Ciscoasa(ca-trustpoint)# enrollment terminal
Ciscoasa(config)# crypto ca authenticate trustpoint_name
```

When prompted for base 64 encoded CA Certificate, copy-paste the text in the downloaded .pem file along with the BEGIN and END lines. Repeat the procedure for the other certificates.

d. Generate the following ASA self-signed certificates and register them with Cisco Unified Communications Manager, or replace with a certificate that you import from a CA.

   - Generate a self-signed certificate.

      Example:

```
ciscoasa> enable

ciscoasa# configure terminal

Ciscoasa(config)# crypto key generate rsa general-keys label <name>

Ciscoasa(config)# crypto ca trustpoint <name>

Ciscoasa(ca-trustpoint)# enrollment self

Ciscoasa(ca-trustpoint)# keypair <name>

Ciscoasa(config)# crypto ca enroll <name>

ciscoasa(config)# end
```

   - Generate a self-signed certificate with Host-id check enabled on the VPN profile in Cisco Unified Communications Manager.

      Example:

```
ciscoasa> enable

ciscoasa# configure terminal

Ciscoasa(config)# crypto key generate rsa general-keys label <name>

Ciscoasa(config)# crypto ca trustpoint <name>

Ciscoasa(ca-trustpoint)# enrollment self

Ciscoasa(ca-trustpoint)# fqdn <full domain name>
```
ciscoasa(config-ca-trustpoint)# subject-name CN=<full domain name>,CN=<IP>
ciscoasa(config)# crypto ca enroll <name>
ciscoasa(config)# end

- Register the generated certificate with Cisco Unified Communications Manager.
  Example:
  ciscoasa(config)# crypto ca export <name> identity-certificate

Copy the text from the terminal and save it as a .pem file and upload it to the Cisco Unified Communications Manager.

**Step 3** Configure the VPN feature. You can use the Sample ASA configuration summary below to guide you with the configuration.

**Note** To use the phone with both certificate and password authentication, create a user with the phone MAC address. Username matching is case sensitive. For example:

  ciscoasa(config)# username CP-7975G-SEP001AE2BC16CB password k1kLGQIoxyCO4ti9 encrypted
  ciscoasa(config)# username CP-7975G-SEP001AE2BC16CB attributes
  ciscoasa(config-username)# vpn-group-policy GroupPhoneWebvpn
  ciscoasa(config-username)# service-type remote-access

### Command Line Interface Reference Guide

The Command Line Interface Reference Guide contains the following updates:

- run cuc dbquery (Cisco Unity Connection), page 80
- show perf query counter Command Output, page 80

### run cuc dbquery (Cisco Unity Connection)

Starting with 8.6(2) release, you can also use the run cuc dbquery command with the csp_ConfigurationModify procedure on the unitydirdb database, which configures the Wait for Blind Transfer Ringing timer. The command usage for this timer is as follows:

  run cuc dbquery unitydirdb execute procedure csp_ConfigurationModify(pFullName='System.Telephony.WaitForBlindTransferLongTimeoutMs',pvaluelong="new value")

where, new value specifies the value of the Wait for Blind Transfer Ringing Timer parameter. The default and minimum value of this parameter is 500ms. The maximum value of this parameter is 5000ms.

### show perf query counter Command Output

This documentation update resolves CSCuo70238.
The following note is omitted from the show perf query counter command section in the *Cisco Unified Communications Command Line Interface Guide*.

**Note**
The output that this command returns depends on the number of endpoints that is configured in the Route Groups in Cisco Unified Communications Manager.

### Disaster Recovery System Administration Guide for Cisco Unified Communications Manager

The Disaster Recovery System Administration Guide contains the following updates:

- **Updated Caution to include DNS and Domain Name prior to restore, page 81**

### Updated Caution to include DNS and Domain Name prior to restore

The following caution is updated to include DNS and domain name prior to performing a restore:

**Caution**
Before you restore Cisco Unified Communications Manager, ensure that the hostname, IP address, DNS configuration, domain name, version, and deployment type of the restore matches the hostname, IP address, DNS configuration, domain name, version, and deployment type of the backup file that you want to restore.

### Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What’s New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at

Subscribe to the *What’s New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop by using a reader application. Be aware that the RSS feeds are a free service, and Cisco currently supports RSS version 2.0.
