- [Install Cisco Jabber for Mac, page 25](#)

Install Cisco Jabber for Windows

Cisco Jabber for Windows provides an MSI installation package that you can use in the following ways:

- **Use the Command Line**—You can specify arguments in a command line window to set installation properties.
Choose this option if you plan to install multiple instances.
- **Run the MSI Manually**—Run the MSI manually on the file system of the client workstation and then specify connection properties when you start the client.
Choose this option if you plan to install a single instance for testing or evaluation purposes.
- **Create a Custom Installer**—Open the default installation package, specify the required installation properties, and then save a custom installation package.
Choose this option if you plan to distribute an installation package with the same installation properties.
- **Deploy with Group Policy**—Install the client on multiple computers in the same domain.

Before You Begin

You must be logged in with local administrative rights.

Administrative Rights

You must be logged in with local administrative rights to complete installation of Cisco Jabber for Windows.

Add Local Contacts from Microsoft Outlook

Cisco Jabber for Windows lets users search for and add local contacts in Microsoft Outlook. To enable this integration with Microsoft Outlook, you must enable Cached Exchange Mode on the Microsoft Exchange server.

To search for local contacts in Microsoft Outlook with the client, users must have profiles set in Microsoft Outlook. In addition, users must do the following:

- 1 Select **File > Options**.
- 2 Select the **Integration** tab.
- 3 Select either **None** or **Microsoft Outlook**.

To add local Microsoft Outlook contacts to contact lists in the client, local contacts must have instant message addresses in Microsoft Outlook.

To show contact photos in the client interface, local contacts in Microsoft Outlook must have instant message addresses.

To communicate with local contacts in Microsoft Outlook using the client, local contacts must have the relevant details. To send instant messages to contacts, local contacts must have an instant message address. To call contacts in Microsoft Outlook, local contacts must have phone numbers.

Enable Calendar Events from Microsoft Outlook

You must apply a setting in Microsoft Outlook so that calendar events display in Cisco Jabber for Windows.

Procedure

-
- Step 1** Open the email account settings in Microsoft Outlook, as in the following example:
 - a) Select **File > Account Settings**.
 - b) Select the **Email** tab on the **Account Settings** window.
 - Step 2** Double-click the server name.
In most cases, the server name is **Microsoft Exchange**.
 - Step 3** Select the **Use Cached Exchange Mode** checkbox.
 - Step 4** Apply the setting and then restart Microsoft Outlook.
-

When users create calendar events in Microsoft Outlook, those events display in the **Meetings** tab.

Enable Presence Integration with Microsoft Outlook

To enable integration with Microsoft Outlook, you specify `SIP:user@cupdomain` as the value of the `proxyAddresses` attribute in Microsoft Active Directory. Users can then share availability in Microsoft Outlook.

To modify the `proxyAddresses` attribute, you can:

Use an Active Directory administrative tool such as Active Directory User and Computers

The Active Directory User and Computers administrative tool allows you to edit attributes on Microsoft Windows Server 2008 or later.

Use the ADSchemaWizard.exe utility

The ADSchemaWizard.exe utility is available in the Cisco Jabber administration package. This utility generates an LDIF file that modifies your directory to add the `proxyAddresses` attribute to each user with the following value: `SIP:user@cupdomain`.

You should use the ADSchemaWizard.exe utility on servers that do not support the edit attribute feature in the Active Directory User and Computers administrative tool. You can use a tool such as ADSI Edit to verify the changes that you apply with the ADSchemaWizard.exe utility.

The ADSchemaWizard.exe utility requires Microsoft .NET Framework version 3.5 or later.

Create a script with Microsoft Windows PowerShell

Refer to the appropriate Microsoft documentation for creating a script to enable presence in Microsoft Outlook.

Enable Presence with the Active Directory User and Computers Tool

Complete the following steps to enable presence in Microsoft Outlook for individual users with the Active Directory User and Computers administrative tool:

Procedure

-
- Step 1** Start the Active Directory User and Computers administrative tool.
You must have administrator permissions to run the Active Directory User and Computers administrative tool.
 - Step 2** Select **View** in the menu bar and then select the **Advanced Features** option from the drop-down list.
 - Step 3** Navigate to the appropriate user in the Active Directory User and Computers administrative tool.
 - Step 4** Double click the user to open the **Properties** dialog box.
 - Step 5** Select the **Attribute Editor** tab.
 - Step 6** Locate and select the `proxyAddresses` attribute in the **Attributes** list box.
 - Step 7** Select **Edit** to open the **Multi-valued String Editor** dialog box.
 - Step 8** In the **Value to add** text box, specify the following value: `SIP:user@cupdomain`.
For example, `SIP:msmith@cisco.com`.

Where the `user@cupdomain` value is the user's instant messaging address. `cupdomain` corresponds to the domain for Cisco Unified Presence or Cisco Unified Communications Manager IM and Presence Service.

Methods of Installation

Cisco Jabber for Windows provides an MSI installation package. You must be logged in as an administrator to complete installation. You can use this installation package in the following ways:

Use the Command Line

Specify arguments in a command line window to set installation properties.

Choose this option if you plan to install multiple instances.

Run the MSI Manually

Run the MSI manually on the file system of the client workstation and then specify connection properties when you start the client.

Choose this option if you plan to install a single instance for testing or evaluation purposes.

Create a Custom Installer

Open the default installation package, specify the required installation properties, and then save a custom installation package.

Choose this option if you plan to distribute an installation package with the same installation properties.

Deploy with Group Policy

Install the client on multiple computers in the same domain.

Use the Command Line

Specify installation arguments in a command line window.

Procedure

-
- | | |
|---------------|---|
| Step 1 | Open a command line window. |
| Step 2 | Enter the following command:
<code>msiexec.exe /i CiscoJabberSetup.msi</code> |
| Step 3 | Specify command line arguments as parameter=value pairs.
<code>msiexec.exe /i CiscoJabberSetup.msi argument=value</code> |
| Step 4 | Run the command to install Cisco Jabber for Windows. |
-

Example Installation Commands

Review examples of commands to install Cisco Jabber for Windows.

Cisco Unified Communications Manager, Release 9.x

```
msiexec.exe /i CiscoJabberSetup.msi /quiet CLEAR=1
```

Where:

CLEAR=1 — Deletes any existing bootstrap file.
/quiet — Specifies a silent installation.

Cisco Unified Communications Manager, Release 8.x in Default Mode

```
msiexec.exe /i CiscoJabberSetup.msi /quiet CLEAR=1 AUTHENTICATOR=CUP CUP_ADDRESS=1.2.3.4
```

Where:

CLEAR=1 — Deletes any existing bootstrap file.
AUTHENTICATOR=CUP — Sets Cisco Unified Presence as the authenticator.
CUP_ADDRESS=1.2.3.4 — Sets 1.2.3.4 as the IP address of the presence server.
/quiet — Specifies a silent installation.

Cisco Unified Communications Manager, Release 8.x in Phone Mode

If you are integrating with UDS when you are installing in phone mode, you must first define the *<PresenceDomain>Domain address of your Presence server</PresenceDomain>* parameter.

```
msiexec.exe /i CiscoJabberSetup.msi /quiet CLEAR=1 PRODUCT_MODE=Phone_Mode AUTHENTICATOR=CUCM  
TFTP=1.2.3.4 CTI=5.6.7.8
```

Where:

CLEAR=1 — Deletes any existing bootstrap file.
PRODUCT_MODE=Phone_Mode — Sets the client to phone mode.
AUTHENTICATOR=CUCM — Sets Cisco Unified Communications Manager as the authenticator.
TFTP=1.2.3.4 — Sets 1.2.3.4 as the IP address of the TFTP server that hosts the client configuration.
CTI=5.6.7.8 — Sets 5.6.7.8 as the IP address of the CTI server.
/quiet — Specifies a silent installation.

Cisco WebEx Messenger Service

```
msiexec.exe /i CiscoJabberSetup.msi /quiet CLEAR=1 AUTHENTICATOR=WEBEX
```

Where:

CLEAR=1 — Deletes any existing bootstrap file.
AUTHENTICATOR=WEBEX — Sets the Cisco WebEx Messenger service as the authenticator.
/quiet — Specifies a silent installation.

Cisco WebEx Messenger Service with SSO

```
msiexec.exe /i CiscoJabberSetup.msi /quiet CLEAR=1 AUTHENTICATOR=WEBEX  
SSO_ORG_DOMAIN=example.com
```

Where:

CLEAR=1 — Deletes any existing bootstrap file.
AUTHENTICATOR=WEBEX — Sets the Cisco WebEx Messenger service as the authenticator.
SSO_ORG_DOMAIN=example.com — Sets example.com as the single sign-on (SSO) domain.
/quiet — Specifies a silent installation.

Run the MSI Manually

You can run the installation program manually to install a single instance of the client and specify connection settings in the Advanced settings window.

Procedure

-
- Step 1** Launch `CiscoJabberSetup.msi`.
The installation program opens a window to guide you through the installation process.
 - Step 2** Follow the steps to complete the installation process.
 - Step 3** Start Cisco Jabber for Windows.
 - Step 4** Select **Manual setup and sign in**.
The Advanced settings window opens.
 - Step 5** Specify values for the connection settings properties.
 - Step 6** Select **Save**.
-

Create a Custom Installer

You can transform the default installation package to create a custom installer.

Note

You use Microsoft Orca to create custom installers. Microsoft Orca is available as part of the Microsoft Windows SDK for Windows 7 and .NET Framework 4.

Download and install Microsoft Windows SDK for Windows 7 and .NET Framework 4 from the Microsoft website.

Related Topics

[Microsoft Windows SDK for Windows 7 and .NET Framework 4](#)

Get the Default Transform File

You must have the default transform file to modify the installation package with Microsoft Orca.

Procedure

-
- Step 1** Download the Cisco Jabber administration package from [cisco.com](#).
 - Step 2** Copy `CiscoJabberProperties.msi` from the Cisco Jabber administration package to your file system.
-

Related Topics

[Software Downloads](#)

Create Custom Transform Files

To create a custom installer, you use a transform file. Transform files contain installation properties that you apply to the installer.

The default transform file lets you specify values for properties when you transform the installer. You should use the default transform file if you are creating one custom installer.

You can optionally create custom transform files. You specify values for properties in a custom transform file and then apply it to the installer.

Create custom transform files if you require more than one custom installer with different property values. For example, create one transform file that sets the default language to French and another transform file that sets the default language to Spanish. You can then apply each transform file to the installation package separately. The result is that you create two installers, one for each language.

Procedure

-
- Step 1** Start Microsoft Orca.
 - Step 2** Open `CiscoJabberSetup.msi` and then apply `CiscoJabberProperties.msi`.
 - Step 3** Specify values for the appropriate installer properties.
 - Step 4** Generate and save the transform file.
 - a) Select **Transform > Generate Transform**.
 - b) Select a location on your file system to save the transform file.
 - c) Specify a name for the transform file and select **Save**.
-

The transform file you created is saved as `file_name.mst`. You can apply this transform file to modify the properties of `CiscoJabberSetup.msi`.

Transform the Installer

Apply a transform file to customize the installer.

Note Applying transform files will alter the digital signature of `CiscoJabberSetup.msi`. Attempts to modify or rename `CiscoJabberSetup.msi` will remove the signature entirely.

Procedure

-
- Step 1** Start Microsoft Orca.
 - Step 2** Open `CiscoJabberSetup.msi` in Microsoft Orca.

- a) Select **File > Open**.
- b) Browse to the location of `CiscoJabberSetup.msi` on your file system.
- c) Select `CiscoJabberSetup.msi` and then select **Open**.

The installation package opens in Microsoft Orca. The list of tables for the installer opens in the **Tables** pane.

Step 3 Remove all language codes except for 1033 (English).

Restriction You must remove all language codes from the custom installer except for 1033 (English).

Microsoft Orca does not retain any language files in custom installers except for the default, which is 1033. If you do not remove all language codes from the custom installer, you cannot run the installer on any operating system where the language is other than English.

- a) Select **View > Summary Information**.
The **Edit Summary Information** window displays.
- b) Locate the **Languages** field.
- c) Delete all language codes except for 1033.
- d) Select **OK**.

English is set as the language for your custom installer.

Step 4 Apply a transform file.

- a) Select **Transform > Apply Transform**.
- b) Browse to the location of the transform file on your file system.
- c) Select the transform file and then select **Open**.

Step 5 Select **Property** from the list of tables in the **Tables** pane.

The list of properties for `CiscoJabberSetup.msi` opens in the right panel of the application window.

Step 6 Specify values for the properties you require.

Step 7 Drop any properties that you do not require.

It is essential to drop any properties that are not being set, otherwise the properties being set will not take effect. Drop each property that is not needed one at a time.

- a) Right-click the property you want to drop.
- b) Select **Drop Row**.
- c) Select **OK** when Microsoft Orca prompts you to continue.

Step 8 Enable your custom installer to save embedded streams.

- a) Select **Tools > Options**.
- b) Select the **Database** tab.
- c) Select **Copy embedded streams during 'Save As'**.
- d) Select **Apply** and then **OK**.

Step 9 Save your custom installer.

- a) Select **File > Save Transformed As**.
- b) Select a location on your file system to save the installer.
- c) Specify a name for the installer and then select **Save**.

Deploy with Group Policy

Install Cisco Jabber for Windows with Group Policy using the Microsoft Group Policy Management Console (GPMC) on Microsoft Windows Server.

**Note**

To install Cisco Jabber for Windows with Group Policy, all computers or users to which you plan to deploy Cisco Jabber for Windows must be in the same domain.

Set a Language Code

Altering the installation language is not necessary in Group Policy deployment scenarios where the exact MSI file provided by Cisco will be used. The installation language will be determined from the Windows User Locale (Format) in these situations. You must use this procedure and set the Language field to 1033 only if the MSI is to be modified by Orca in any way.

Procedure

- Step 1** Start Microsoft Orca.
Microsoft Orca is available as part of the Microsoft Windows SDK for Windows 7 and .NET Framework 4 that you can download from the Microsoft website.
- Step 2** Open `CiscoJabberSetup.msi`.
 - a) Select **File > Open**.
 - b) Browse to the location of `CiscoJabberSetup.msi` on your file system.
 - c) Select `CiscoJabberSetup.msi` and then select **Open**.
- Step 3** Select **View > Summary Information**.
- Step 4** Locate the **Languages** field.
- Step 5** Set the **Languages** field to 1033.
- Step 6** Select **OK**.
- Step 7** Enable your custom installer to save embedded streams.
 - a) Select **Tools > Options**.
 - b) Select the **Database** tab.
 - c) Select **Copy embedded streams during 'Save As'**.
 - d) Select **Apply** and then **OK**.
- Step 8** Save your custom installer.
 - a) Select **File > Save Transformed As**.
 - b) Select a location on your file system to save the installer.
 - c) Specify a name for the installer and then select **Save**.

Deploy the Client with Group Policy

Complete the steps in this task to deploy Cisco Jabber for Windows with Group Policy.

Procedure

-
- Step 1** Copy the installation package to a software distribution point for deployment.
All computers or users to which you plan to deploy Cisco Jabber for Windows must be able to access the installation package on the distribution point.
- Step 2** Select **Start > Run** and then enter the following command:
`GPMC.msc`
 The **Group Policy Management** console opens.
- Step 3** Create a new group policy object.
- Right-click on the appropriate domain in the left pane.
 - Select **Create a GPO in this Domain, and Link it here**.
The **New GPO** window opens.
 - Enter a name for the group policy object in the **Name** field.
 - Leave the default value or select an appropriate option from the **Source Starter GPO** drop-down list and then select **OK**.
The new group policy displays in the list of group policies for the domain.
- Step 4** Set the scope of your deployment.
- Select the group policy object under the domain in the left pane.
The group policy object displays in the right pane.
 - Select **Add** in the **Security Filtering** section of the **Scope** tab.
The **Select User, Computer, or Group** window opens.
 - Specify the computers and users to which you want to deploy Cisco Jabber for Windows.
- Step 5** Specify the installation package.
- Right-click the group policy object in the left pane and then select **Edit**.
The **Group Policy Management Editor** opens.
 - Select **Computer Configuration** and then select **Policies > Software Settings**.
 - Right-click **Software Installation** and then select **New > Package**.
 - Enter the location of the installation package next to **File Name**; for example,
`\\server\software_distribution`.
- Important** You must enter a Uniform Naming Convention (UNC) path as the location of the installation package. If you do not enter a UNC path, Group Policy cannot deploy Cisco Jabber for Windows.
- Select the installation package and then select **Open**.

- f) In the **Deploy Software** dialog box, select **Assigned** and then **OK**.

Group Policy installs Cisco Jabber for Windows on each computer the next time each computer starts.

Command Line Arguments

Review the command line arguments you can specify when you install Cisco Jabber for Windows.

Override Argument

The following table describes the parameter you must specify to override any existing bootstrap files from previous installations:

Argument	Value	Description
CLEAR	1	<p>Specifies if the client overrides any existing bootstrap file from previous installations.</p> <p>The client saves the arguments and values you set during installation to a bootstrap file. The client then loads settings from the bootstrap file at startup.</p>

If you specify CLEAR, the following occurs during installation:

- 1 The client deletes any existing bootstrap file.
- 2 The client creates a new bootstrap file.

If you do not specify CLEAR, the client checks for existing bootstrap files during installation.

- If no bootstrap file exists, the client creates a bootstrap file during installation.
- If a bootstrap file exists, the client does not override that bootstrap file and preserves the existing settings.

Note

If you are reinstalling Cisco Jabber for Windows, you should consider the following:

- The client does not preserve settings from existing bootstrap files. If you specify CLEAR, you must also specify all other installation arguments as appropriate.
- The client does not save your installation arguments to an existing bootstrap file. If you want to change the values for installation arguments, or specify additional installation arguments, you must specify CLEAR to override the existing settings.

To override existing bootstrap files, specify CLEAR in the command line as follows:

```
msiexec.exe /i CiscoJabberSetup.msi CLEAR=1
```

Mode Type Argument

The following table describes the command line argument with which you specify the product mode:

Argument	Value	Description
PRODUCT_MODE	Phone_Mode	Specifies the product mode for the client. You can set the following value: <ul style="list-style-type: none"> Phone_Mode — Cisco Unified Communications Manager is the authenticator. Choose this value to provision users with audio devices as base functionality.

When to Set the Product Mode

In phone mode deployments Cisco Unified Communications Manager is the authenticator. When the client gets the authenticator, it determines the product mode is phone mode. However, because the client always starts in the default product mode on the initial launch, users must restart the client to enter phone mode after sign in.

- Cisco Unified Communications Manager, Release 9.x and Later — You should not set PRODUCT_MODE during installation. The client gets the authenticator from the service profile. After the user signs in, the client requires a restart to enter phone mode.
- Cisco Unified Communications Manager, Release 8.x — You can specify phone mode during installation if you set Cisco Unified Communications Manager as the authenticator. The client reads the bootstrap file on the initial launch and determines it should start in phone mode. The client then gets Cisco Unified Communications Manager as the authenticator from the bootstrap file or manual settings. After the user signs in, the client does not require a restart.

Change Product Modes

To change the product mode, you must change the authenticator for the client. The client can then determine the product mode from the authenticator.

The method for changing from one product mode to another after installation, depends on your deployment.

Note

In all deployments, the user can manually set the authenticator in the Advanced settings window.

In this case, you must instruct the user to change the authenticator in the Advanced settings window to change the product mode. You cannot override the manual settings, even if you uninstall and then reinstall the client.

Change Product Modes with Cisco Unified Communications Manager Version 9.x and Later

To change product modes with Cisco Unified Communications Manager version 9.x and later, you change the authenticator in the service profile.

Procedure

Step 1 Change the authenticator in the service profiles for the appropriate users.

Change Default Mode > Phone Mode

Do not provision users with an IM and Presence service.

If the service profile does not contain an IM and presence service configuration, the authenticator is Cisco Unified Communications Manager.

Change Phone Mode > Default Mode

Provision users with an IM and Presence service.

If you set the value of the **Product type** field in the IM and Presence profile to:

- **Unified CM (IM and Presence)** the authenticator is Cisco Unified Presence or Cisco Unified Communications Manager IM and Presence Service.
- **WebEx (IM and Presence)** the authenticator is the Cisco WebEx Messenger service.

Step 2 Instruct users to sign out and then sign in again.

When users sign in to the client, it retrieves the changes in the service profile and signs the user in to the authenticator. The client then determines the product mode and prompts the user to restart the client.

After the user restarts the client, the product mode change is complete.

Change Product Modes with Cisco Unified Communications Manager Version 8.x

To change product modes with Cisco Unified Communications Manager version 8.x, you must reinstall Cisco Jabber for Windows to change the authenticator.

Change Default Mode > Phone Mode

Set the following arguments, at a minimum:

- CLEAR=1 to delete any existing bootstrap file.
- AUTHENTICATOR=CUCM to set the authenticator to Cisco Unified Communications Manager.
- PRODUCT_MODE=Phone_Mode to set phone mode as the product mode.

Change Phone Mode > Default Mode

Set the following arguments, at a minimum:

- CLEAR=1 to delete any existing bootstrap file.
- AUTHENTICATOR= one of the following:
 - CUP to set the authenticator to Cisco Unified Presence or Cisco Unified Communications Manager.
 - WEBEX to set the authenticator to the Cisco WebEx Messenger service.

Authentication Arguments

The following table describe the command line arguments you can set to specify the source of authentication:

Argument	Value	Description
AUTHENTICATOR	CUP CUCM WEBEX	<p>Specifies the source of authentication for the client. This value is used if Service Discovery fails. Set one of the following as the value:</p> <ul style="list-style-type: none"> • CUP — Cisco Unified Presence. On-premises deployments in the default product mode. The default product mode can be either full UC or IM only. • CUCM — Cisco Unified Communications Manager. On-premises deployments in phone mode. • WEBEX — Cisco WebEx Messenger Service. Cloud-based or hybrid cloud-based deployments. <p>In on-premises deployments with Cisco Unified Communications Manager version 9.x and later, you should deploy the <code>_cisco-uds</code> SRV record. The client can then automatically determine the authenticator.</p>
CUP_ADDRESS	IP address Hostname FQDN	<p>Specifies the address of Cisco Unified Presence or Cisco Unified Communications Manager IM and Presence Service. Set one of the following as the value:</p> <ul style="list-style-type: none"> • Hostname (<i>hostname</i>) • IP address (<i>123.45.254.1</i>) • FQDN (<i>hostname.domain.com</i>)

Argument	Value	Description
TFTP	IP address Hostname FQDN	<p>Specifies the address of your TFTP server. Set one of the following as the value:</p> <ul style="list-style-type: none"> • Hostname (<i>hostname</i>) • IP address (<i>123.45.254.1</i>) • FQDN (<i>hostname.domain.com</i>) <p>You should specify this argument if you set Cisco Unified Communications Manager as the authenticator.</p> <p>If you deploy:</p> <ul style="list-style-type: none"> • In phone mode, you should specify the address of the TFTP server that hosts the client configuration. • In default mode, you can specify the address of the Cisco Unified Communications Manager TFTP service that hosts the device configuration.
CTI	IP address Hostname FQDN	<p>Sets the address of your CTI server.</p> <p>Specify this argument if:</p> <ul style="list-style-type: none"> • You set Cisco Unified Communications Manager as the authenticator. • Users have desk phone devices and require a CTI server.
CCMCIP	IP address Hostname FQDN	<p>Sets the address of your CCMCIP server.</p> <p>Specify this argument if:</p> <ul style="list-style-type: none"> • You set Cisco Unified Communications Manager as the authenticator. • The address of your CCMCIP server is not the same as the TFTP server address. <p>The client can locate the CCMCIP server with the TFTP server address if both addresses are the same.</p>

Argument	Value	Description
SERVICES_DOMAIN	Domain	<p>Sets the value of the domain where the DNS SRV records for Service Discovery reside.</p> <p>This argument can be set to a domain where no DNS SRV records reside if you want the client to use installer settings or manual configuration for this information. If this argument is not specified and Service Discovery fails, the user will be prompted for services domain information.</p>
VOICE_SERVICES_DOMAIN	Domain	<p>In Hybrid Deployments the domain required to discover Webex via CAS lookup may be a different domain than where the DNS records are deployed. If this is the case then set the SERVICES_DOMAIN to be the domain used for Webex discovery (or let the user enter an email address) and set the VOICE_SERVICES_DOMAIN to be the domain where DNS records are deployed. If this setting is specified, the client will use the value of VOICE_SERVICES_DOMAIN to lookup the following DNS records for the purposes of Service Discovery and Edge Detection:</p> <ul style="list-style-type: none"> • <code>_cisco-uds</code> • <code>_cuplogin</code> • <code>_collab-edge</code> <p>This setting is optional and if not specified, the DNS records are queried on the Services Domain which is obtained from the SERVICES_DOMAIN, email address input by the user, or cached user configuration.</p>

Argument	Value	Description
EXCLUDED_SERVICES	One or more of: <ul style="list-style-type: none"> • CUP • WEBEX • CUCM 	<p>Lists the services that you want Jabber to exclude from Service Discovery. For example, you may have done a trial with WebEx which means that your company domain is registered on WebEx, but you do not want Jabber users to authenticate using WebEx. You want Jabber to authenticate with an on-premises CUP server. In this case set:</p> <ul style="list-style-type: none"> • EXCLUDED_SERVICES=WEBEX <p>Possible values are CUP, CUCM, WEBEX.</p> <p>To exclude more than one service, use comma separated values. For example, to exclude CUP and CUCM, specify: EXCLUDED_SERVICES=CUP,CUCM. To exclude all services, specify: EXCLUDED_SERVICES=CUP,CUCM,WEBEX</p> <p>If you exclude all services, you need to use manual configuration or bootstrap configuration to configure the Jabber client.</p>
UPN_DISCOVERY_ENABLED	true false	<p>Allows you to define whether the client uses the User Principal Name (UPN) of a Windows session to get the domain for a user when discovering services.</p> <ul style="list-style-type: none"> • true (default) - The UPN is used to find the domain of the user, which is used during service discovery. • false - The UPN is not used to find the domain of the user. The user is prompted to enter credentials to find the domain for service discovery. <p>Example installation command: <code>msiexec.exe /i CiscoJabberSetup.msi /quiet UPN_DISCOVERY_ENABLED=false</code></p>

TFTP Server Address

Cisco Jabber for Windows retrieves two different configuration files from the TFTP server:

- Client configuration files that you create.
- Device configuration files that reside on the Cisco Unified Communications Manager TFTP service when you provision users with devices.

To minimize effort, you should host your client configuration files on the Cisco Unified Communications Manager TFTP service. You then have only one TFTP server address for all configuration files and can specify that address as required.

You can, however, host your client configuration on a different TFTP server to the one that contains the device configuration. In this case, you have two different TFTP server addresses, one address for the TFTP server that hosts device configuration and another address for the TFTP server that hosts client configuration files.

Default Deployments

This section describes how you should handle two different TFTP server addresses in deployments that have a presence server.

You should do the following:

- 1 Specify the address of the TFTP server that hosts the client configuration on the presence server.
- 2 During installation, specify the address of the Cisco Unified Communications Manager TFTP service with the TFTP argument.

When the client starts for the first time, it:

- 1 Retrieves the address of the Cisco Unified Communications Manager TFTP service from the bootstrap file.
- 2 Gets device configuration from the Cisco Unified Communications Manager TFTP service.
- 3 Connects to the presence server.
- 4 Retrieves the address of the TFTP service that hosts the client configuration from the presence server.
- 5 Gets client configuration from the TFTP server.

Phone Mode Deployments

This section describes how you should handle two different TFTP server addresses in phone mode deployments.

You should do the following:

- 1 During installation, specify the address of the TFTP server that hosts the client configuration with the TFTP argument.
- 2 Specify the address of the TFTP server that hosts the device configuration in your client configuration file with the following parameter: `TftpServer1`.
- 3 Host the client configuration file on the TFTP server.

When the client starts for the first time, it:

- 1 Retrieves the address of the TFTP server from the bootstrap file.
- 2 Gets client configuration from the TFTP server.
- 3 Retrieves the address of the Cisco Unified Communications Manager TFTP service from the client configuration.
- 4 Gets device configuration from the Cisco Unified Communications Manager TFTP service.

Common Installation Arguments

The following table describes command line arguments that are common to all deployments:

Argument	Value	Description
LANGUAGE	LCID in decimal	<p>Defines the Locale ID (LCID), in decimal, of the language that Cisco Jabber for Windows uses. The value must be an LCID in decimal that corresponds to a supported language.</p> <p>For example, you can specify one of the following:</p> <ul style="list-style-type: none"> • 1033 specifies English. • 1036 specifies French. <p>This argument is optional. If you do not specify a value, Cisco Jabber for Windows uses the system locale language as the default.</p> <p>See the <i>Supported Languages</i> topic for a full list of the languages you can specify.</p>
FORGOT_PASSWORD_URL	URL	<p>Specifies the URL where users can reset lost or forgotten passwords.</p> <p>This argument is optional but recommended.</p> <p>Note In cloud-based deployments, you can specify a forgot password URL using the webEx Administration Tool. However, the client cannot retrieve that forgot password URL until users sign in.</p>
TFTP_FILE_NAME	Filename	<p>Specifies the unique name of a group configuration file.</p> <p>You can specify either an unqualified or fully qualified filename as the value. The filename you specify as the value for this argument takes priority over any other configuration file on your TFTP server.</p> <p>This argument is optional.</p> <p>Remember You can specify group configuration files in the Cisco Support Field on the CSF device configuration on Cisco Unified Communications Manager.</p>

Argument	Value	Description
LOGIN_RESOURCE	WBX MUT	<p>Controls user sign in to multiple client instances.</p> <p>By default, users can sign in to multiple instances of Cisco Jabber at the same time. Set one of the following values to change the default behavior:</p> <ul style="list-style-type: none"> • WBX — Users can sign in to one instance of Cisco Jabber for Windows at a time. Cisco Jabber for Windows appends the <code>wbxconnect</code> suffix to the user's JID. Users cannot sign in to any other Cisco Jabber client that uses the <code>wbxconnect</code> suffix. • MUT — Users can sign in to one instance of Cisco Jabber for Windows at a time, but can sign in to other Cisco Jabber clients at the same time. Each instance of Cisco Jabber for Windows appends the user's JID with a unique suffix.
LOG_DIRECTORY	Absolute path on the local filesystem	<p>Defines the directory where the client writes log files.</p> <p>Use quotation marks to escape space characters in the path, as in the following example:</p> <pre>"C:\my_directory\Log Directory"</pre> <p>The path you specify must not contain Windows invalid characters.</p> <p>The default value is <code>%USER_PROFILE%\AppData\Local\Cisco\Unified Communications\Jabber\CSF\Logs</code></p>
CLICK2X	DISABLE	<p>Disables click-to-x functionality with Cisco Jabber.</p> <p>If you specify this argument during installation,</p> <ul style="list-style-type: none"> • The client does not register as a handler for click-to-x functionality with the operating system. In effect, this argument prevents the client from writing to the Microsoft Windows registry during installation. • You must re-install the client and omit this argument to enable click-to-x functionality with the client after installation.

Argument	Value	Description
Telemetry_Enabled	true false	<p>Specifies whether analytics data is gathered. The default value is true.</p> <p>To improve your experience and product performance, Cisco Jabber may collect and send non-personally identifiable usage and performance data to Cisco. The aggregated data is used by Cisco to understand trends in how Jabber clients are being used and how they are performing.</p> <p>Full details on what analytics data Cisco Jabber does and does not collect can be found in the Cisco Jabber Supplement to Cisco's On-Line Privacy Policy at http://www.cisco.com/web/siteassets/legal/privacy_02Jun10.html.</p>

SSO Arguments

This section describes the command line arguments you can use to deploy Cisco Jabber for Windows with single sign on (SSO) capabilities.

Cloud-Based SSO Arguments

The arguments in the following table apply to cloud-based deployments only:

Argument	Value	Description
SSO_ORG_DOMAIN	Domain name	<p>Specifies the domain name for the Cisco WebEx Org that contains the URL for the SSO service.</p> <p>Cisco Jabber for Windows uses this argument to retrieve the URL of the SSO service from the Org. When Cisco Jabber for Windows gets the SSO service URL, it can request login tokens to authenticate with Cisco WebEx Messenger.</p> <p>Note You specify the URL for the SSO service as the value of the Customer SSO Service Login URL in the Cisco WebEx Administration Tool.</p>

Installer Properties

The following are the properties you can modify in a custom installer:

- CLEAR
- PRODUCT_MODE

- AUTHENTICATOR
- CUP_ADDRESS
- TFTP
- CTI
- CCMCIP
- LANGUAGE
- TFTP_FILE_NAME
- FORGOT_PASSWORD_URL
- SSO_ORG_DOMAIN
- LOGIN_RESOURCE
- LOG_DIRECTORY
- CLICK2X
- SERVICES_DOMAIN

These properties correspond to the installation arguments and have the same values.

Supported Languages

The following table lists the languages that Cisco Jabber for Windows supports. You can change the language that your client uses by changing the language setting in your operating system Control Panel. After you select the language, restart your computer, and the Cisco Jabber client will automatically update its language settings to match your system language selection.

Arabic	French	Romanian
Bulgarian	Hebrew	Russian
Catalan	Hungarian	Serbian
Croatian	Italian	Slovak
Czech	Japanese	Slovenian
Danish	Korean	Swedish
German	Norwegian	Thai
Greek	Dutch	Turkish
English	Polish	Chinese - China
Spanish	Portuguese - Brazil	Chinese - Taiwan
Finnish	Portuguese - Portugal	

Note

Cisco Jabber for Windows does not support Locale IDs for all sub-languages. For example, if you specify French - Canada, Cisco Jabber for Windows uses French - France.

See the following documentation for more information about Locale IDs:

- *Microsoft Windows Locale Code Identifier (LCID) Reference*
- *Locale IDs Assigned by Microsoft*

Cisco Media Services Interface

Cisco Jabber for Windows supports Cisco Media Services Interface version 4.1.2 for Microsoft Windows 7 and later.

Desk Phone Video Capabilities

You must install Cisco Media Services Interface to enable desk phone video capabilities. Cisco Media Services Interface provides a driver that enables Cisco Jabber for Windows to do the following:

- Discover the desk phone device.
- Establish and maintain a connection to the desk phone device using the CAST protocol.

Install Cisco Media Services Interface

Procedure

-
- | | |
|---------------|--|
| Step 1 | Download the Cisco Media Services Interface installation program from the download site on cisco.com. |
| Step 2 | Install Cisco Media Services Interface on each computer on which you install Cisco Jabber. See the appropriate Cisco Medianet documentation for installing Cisco Media Services Interface. |

Uninstall Cisco Jabber for Windows

You can uninstall Cisco Jabber for Windows using either the command line or the Microsoft Windows control panel. This document describes how to uninstall Cisco Jabber for Windows using the command line.

Use the Installer

If the installer is available on the file system, use it to remove Cisco Jabber for Windows.

Procedure

Step 1 Open a command line window.

Step 2 Enter the following command:

```
msiexec.exe /x path_to_CiscoJabberSetup.msi
```

For example,

```
msiexec.exe /x C:\Windows\Installer\CiscoJabberSetup.msi /quiet
```

Where `/quiet` specifies a silent uninstall.

The command removes Cisco Jabber for Windows from the computer.

Use the Product Code

If the installer is not available on the file system, use the product code to remove Cisco Jabber for Windows.

Procedure

Step 1 Find the product code.

- a) Open the Microsoft Windows registry editor.
- b) Locate the following registry key: `HKEY_CLASSES_ROOT\Installer\Products`
- c) Select **Edit > Find**.
- d) Enter Cisco Jabber in the **Find what** text box in the **Find** window and select **Find Next**.
- e) Find the value of the **ProductIcon** key.

The product code is the value of the **ProductIcon** key, for example,

```
C:\Windows\Installer\{product_code}\ARPPRODUCTICON.exe.
```

Note The product code changes with each version of Cisco Jabber for Windows.

Step 2 Open a command line window.

Step 3 Enter the following command:

```
msiexec.exe /x product_code
```

For example,

```
msiexec.exe /x 45992224-D2DE-49BB-B085-6524845321C7 /quiet
```

Where `/quiet` specifies a silent uninstall.

The command removes Cisco Jabber for Windows from the computer.

Install Cisco Jabber for Mac

Distribute the Cisco Jabber for Mac client

Visit the [Cisco Software Center](#) to download the Cisco Jabber for Mac client.

Upgrading in the Mac OS X environment is performed automatically by the application, with permission from the user.
