Configuring Local Policies

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring Local Policies

The policy map attributes supported on the controller are QoS, VLAN, session timeout, and ACL.

Related Topics

Information About Configuring Local Policies

Local policies can profile devices based on HTTP and DHCP to identify the end devices on the network. Users can configure device-based policies and enforce the policies per user or per device policy on the network.

Local policies allow profiling of mobile devices and basic onboarding of the profiled devices to a specific VLAN. They also assign ACL and QoS or configure session timeouts.

You can configure local policies as two separate components:

- Defining policy attributes as service templates specific to clients joining the network and applying policy match criteria.

- Applying match criteria to the policy.

The following policy match attributes are used for configuring local policies:

- Device—Defines the type of device. Windows-based computer, Smart phone, Apple devices such as iPad and iPhone.

- Username—Defines the username of the user.

- User role—Defines the user type or the user group the user belongs to, such as a student or employee.

- MAC—Defines the mac-address of the end point.

- MAC OUI—Defines the mac-address OUI.

Once the controller has a match corresponding to these parameters per end point, the policy can be added. Policy enforcement allows basic device on-boarding of mobile devices based on the following session attributes:

- VLAN

- QoS

- ACL

- Session timeout

You can configure these policies and enforce end points with specified policies. The wireless clients are profiled based on MAC OUI, DHCP, and HTTP user agent (valid Internet is required for successful HTTP profiling). The controller uses these attributes and predefined classification profiles to identify devices.

Replacing Default Profile Text File

If a new device is not classified, contact the Cisco support team with the device MAC address. The Cisco support team will provide a new **dc_default_profile.txt** file with the MAC address included in the file. You need to replace the **dc_default_profile.txt** file with the earlier file. Follow these steps to change the **dc_default_profile.txt** file:

1 Stop device classifier by entering this command:

controller**(config)# no device classifier**

2   Copy the file by entering this command:
controller**# device classifier profile location** *filepath*

3   Start the device classifier by entering this command:
controller**(config)# device classifier**

Disabling session monitor on trunk ports

On uplink trunk ports, you should not create any session monitoring. By default, session monitoring is enabled.
You should disable session monitoring.

1   Enter into global configuration mode by entering this command:
controller**# configure terminal**

2   Enter into interface configuration mode by entering this command:
controller**(config)# interface** *interface-id*

3   Disable session monitoring by entering this command:
controller**(config-if)# no access-session monitor**

How to Configure Local Policies

Configuring Local Policies (CLI)

To configure local policies, complete these procedures:

1   Create a service template.
2   Create a parameter map.
3   Create a policy map.
4   Apply a local policy on a WLAN.

Creating a Service Template (CLI)

DETAILED STEPS

	Command or Action	Purpose
Step 1	**configure terminal** **Example:** ControllerDevice# **configure terminal**	Enters global configuration mode.
Step 2	**service-template** *service-template-name* **Example:** ControllerDevice(config)# **service-template cisco-phone-template** ControllerDevice(config-service-template)#	Enters service template configuration mode.
Step 3	**access-group** *acl_list* **Example:** ControllerDevice(config-service-template)# **access-group foo-acl**	Specifies the access list to be applied.
Step 4	**vlan** *vlan_id* **Example:** ControllerDevice(config-service-template)# **vlan 100**	Specifies VLAN ID. You can specify a value from 1 to 4094.
Step 5	**absolute-timer** *seconds* **Example:** ControllerDevice(config-service-template)# **absolute-timer 20**	Specifies session timeout value for service template. You can specify a value from 1 to 65535.
Step 6	**service-policy qos** {**input** | **output**} **Example:** ControllerDevice(config-service-template)# **service-policy qos input foo-qos**	Configures QoS policies for the client.
Step 7	**end** **Example:** ControllerDevice(config)# **end**	Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

Creating a Parameter Map (CLI)

Parameter map is preferred to use than class map.

DETAILED STEPS

	Command or Action	Purpose
Step 1	**configure terminal** **Example:** `ControllerDevice# configure terminal`	Enters global configuration mode.
Step 2	**parameter-map type subscriber attribute-to-service** *parameter-map-name* **Example:** `ControllerDevice(config)# parameter-map type subscriber attribute-to-service Aironet-Policy-para`	Specifies the parameter map type and name.
Step 3	*map-index* **map** { **device-type** | **mac-address** | **oui** | **user-role** | **username**} {**eq** | **not-eq** | **regex** *filter-name* } **Example:** `ControllerDevice(config-parameter-map-filter)# 10 map device-type eq "WindowsXP-Workstation"`	Specifies parameter map attribute filter criteria.

Step 4	**service-template** *service-template-name*
	
	Example:
	`ControllerDevice(config-parameter-map-filter-submode)# service-template cisco-phone-template`
	`ControllerDevice(config-parameter-map-filter-submode)#`
		Enters service template configuration mode.

Step 5	**end** **Example:** `ControllerDevice(config)# end`	Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

Creating a Class Map (CLI)

DETAILED STEPS

	Command or Action	Purpose
Step 1	**configure terminal** **Example:** `ControllerDevice# configure terminal`	Enters global configuration mode.
Step 2	**class-map type control subscriber** *class-map-name* { **match-all** | **match-any** | **match-first** } **Example:** `ControllerDevice(config)# class-map type control subscriber CLASS_AC_1 match-all`	Specifies the class map type and name.
Step 3	**match** {**device-type** | **mac-address** | **oui** | **username** | **userrole**} *filter-type-name* **Example:** `ControllerDevice(config-class-map)# match device-type Cisco-IP-Phone-7961`	Specifies class map attribute filter criteria.
Step 4	**end** **Example:** `ControllerDevice(config)# end`	Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

Related Topics

Creating a Policy Map (CLI)

DETAILED STEPS

	Command or Action	**Purpose**
Step 1	**configure terminal** **Example:** ControllerDevice# **configure terminal**	Enters global configuration mode.
Step 2	**policy-map type control subscriber** *policy-map-name* **Example:** ControllerDevice(config)# **policy-map type control subscriber Aironet-Policy**	Specifies the policy map type.
Step 3	**event identity-update** {**match-all** | **match-first**} **Example:** ControllerDevice(config-policy-map)# **event identity-update match-all**	Specifies match criteria to the policy map.
Step 4	*class_number* **class** {*class_map_name* | **always** } {**do-all** | **do-until-failure** | **do-until-success**} **Example:** ControllerDevice(config-class-control-policymap)# **1 class local_policy1_class do-until-success**	Configures the local profiling policy class map number and specifies how to perform the action. The class map configuration mode includes the following command options: • **always**—Executes without doing any matching but return success. • **do-all**—Executes all the actions. • **do-until-failure**—Execute all the actions until any match failure is encountered. This is the default value. • **do-until-success**—Execute all the actions until any match success happens.
Step 5	*action-index* **map attribute-to-service table** *parameter-map-name* **Example:** ControllerDevice(config-policy-map)# **10 map attribute-to-service table Aironet-Policy-para**	Specifies parameter map table to be used.
Step 6	**end** **Example:** ControllerDevice(config)# **end**	Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

Applying a Local Policy for a Device on a WLAN (CLI)

Before You Begin

If the service policy contains any device type-based rules in the parameter map, ensure that the device classifier is already enabled.

DETAILED STEPS

	Command or Action	Purpose
Step 1	**configure terminal** **Example:** `ControllerDevice# configure terminal`	Enters global configuration mode.
Step 2	**wlan** *wlan-name* **Example:** `ControllerDevice(config)# wlan wlan1`	Enters WLAN configuration mode.
Step 3	**service-policy type control subscriber** *policymapname* **Example:** `ControllerDevice(config-wlan)# service-policy type control subscriber Aironet-Policy`	Applies local policy to WLAN.
Step 4	**profiling local http (optional)** **Example:** `ControllerDevice(config-wlan)# profiling local http`	Enables only profiling of devices based on HTTP protocol (optional).
Step 5	**profiling radius http (optional)** **Example:** `ControllerDevice(config-wlan)# profiling radius http`	Enables profiling of devices on ISE (optional).
Step 6	**no shutdown** **Example:** `ControllerDevice(config-wlan)# no shutdown`	Specifies not to shut down the WLAN.

	Command or Action	Purpose
Step 7	**end** **Example:** `ControllerDevice(config)# end`	Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

Configuring Local Policies (GUI)

To configure local policies, complete these procedures:

1. Create a service template.
2. Create a policy map.
3. Apply a local policy that you have created to a WLAN.

Creating a Service Template (GUI)

Step 1   Choose **Configuration** > **Security** > **Local Policies** > **Service Template** to open the **Service Template** page.

Step 2   Create a new template as follows:

     a) Click **New** to open the **Service Template > New** page.

     b) In the Service Template name text box, enter the new service template name.

     c) In the VLAN ID text box, enter the VLAN identifier that has to be associated with the policy. The value ranges from 1 to 4094.

     d) In the Session timeout text box, enter the maximum amount of time, in seconds, after which a client is forced to reauthenticate. The value ranges from 1 to 65535 seconds.

     e) From the Access control list drop-down list, choose the access control list to be mapped to the policy.

     f) From the Ingress QoS drop-down list, choose the ingress QoS policy to be applied.

     g) From the Egress QoS drop-down list, choose the egress QoS policy to be applied.

     h) Click **Apply** to save the configuration.

Step 3   Edit a service template as follows:

     a) From the **Service Template** page, click the service template to open the **Service Template > Edit** page.

     b) In the VLAN ID text box, enter the VLAN identifier that has to be associated with the policy. The value ranges from 1 to 4094.

c) In the Session timeout text box, enter the maximum amount of time, in seconds, after which a client is forced to reauthenticate. The value ranges from 1 to 65535 seconds.

d) From the Access control list drop-down list, choose the access control list to be mapped to the policy.

e) From the Ingress QoS drop-down list, choose the ingress QoS policy to be applied.

f) From the Egress QoS drop-down list, choose the egress QoS policy to be applied.

g) Click **Apply** to save the configuration.

Step 4 Remove a service template as follows:

a) From the **Service Template** page, select the service template.

b) Click **Remove**.

c) Click **Apply** to save the configuration.

Related Topics

Creating a Policy Map (GUI)

Step 1 Choose **Configuration** > **Security** > **Local Policies** > **Policy Map** to open the **Policy Map** page.

Step 2 Create a new policy map as follows:

a) Click **New** to open the **Policy Map > New** page.

b) In the Policy Map name text box, enter the new policy map name.

c) Click **Add** to open the Match Criteria area.

d) From the Device Type drop-down list, choose the device type. The match criteria for the device type can be eq, not-eq, or regex with respect to the device type you are choosing.

e) From the User Role drop-down list, select the match criteria as eq, not-eq, or regex and enter the user type or user group of the user, for example, student, teacher, and so on.

f) From the Service Template drop-down list, choose the service template to be mapped to the policy.

g) Click **Add**. The match criteria is added to the Match Criteria Lists.

h) In the Match Criteria Lists area, click **Add** to add the match criteria to the policy.

i) Click **Apply** to save the configuration.

Step 3 Edit a policy map as follows:

a) In the **Policy Map** page, select the policy map that you want to edit, and click **Edit** to open the **Policy Map > Edit** page.

b) In the Match Criteria area, choose the device type from the Device Type drop-down list. The match criteria for the device type can be eq, not-eq, or regex with respect to the device type you are choosing.

c) In the Match Criteria area, choose the user role from the User Role drop-down list. Select the match criteria as eq, not-eq, or regex and enter the user type or user group of the user

d) From the Service Template drop-down list, choose the service template to be mapped to the policy.

e) Click **Ok** to save the configuration or **Cancel** to discard the configuration.

f) Click **Add** to add more match criteria based on device type, user role, and service template to the policy.

g) In the Match Criteria Lists area, select the match criteria and click **Move to** to move the match criteria with respect to a value entered in the row text box.

h) Select the match criteria and click **Move up** to move the match criteria up in the list.

i) Select the match criteria and click **Move down** to move the match criteria down in the list.

j) Select the match criteria and click **Remove** to remove the match criteria from the policy map list.

k) Click **Apply** to save the configuration.

Step 4 Remove a policy map as follows:

a) From the **Policy Map** page, select the policy map.

b) Click **Remove**.

c) Click **Apply** to save the configuration.

Applying Local Policies to WLAN (GUI)

Step 1 Choose **Configuration** > **Wireless** > **WLAN** to open the **WLANs** page.

Step 2 Click the corresponding WLAN profile. The **WLANs > Edit** page is displayed.

Step 3 Click the **Policy-Mapping** tab.

Step 4 Check the **Device Classification** check box to enable classification based on device type.

Step 5 From the Local Subscriber Policy drop-down list, choose the policy that has to be applied for the WLAN.

Step 6 Select **Local HTTP Profiling** to enable profiling on devices based on HTTP (optional).

Step 7 Select **Radius HTTP Profiling** to enable profiling on devices based on RADIUS (optional).

Step 8 Click **Apply** to save the configuration.

Monitoring Local Policies

The following commands can be used to monitor local policies configured on the controller.

Table 1: Monitoring Local Policies Command

Command	Purpose
show access-session	Displays the summary of access session with authorization status, method and domain for each client or MAC address displayed.
show access-session cache	Displays the latest classification for the client.
show device classifier attached detail	Displays the latest classification for the client based on parameters such as Mac, DHCP, or HTTP.
show access-session mac *mac-address* **details**	Displays the policy mapped, service template used, and attributes for the client.
show access-session mac *mac-address* **policy**	Displays the policy mapped, service template used, and attributes for the client. In addition, you can view the **Resultant Policy** that displays the following information: • The final attributes applied to the session when the session has locally configured attributes. • Attributes applied from the server.

Examples: Local Policies Configuration

This example shows how to create service template:

```
ControllerDevice(config)# service-template test3
ControllerDevice(config-service-template)# access-group josephacl
ControllerDevice(config-service-template)# vlan 137
ControllerDevice(config-service-template)# absolute-timer 500
ControllerDevice(config-service-template)#  service-policy qos input qosingress
ControllerDevice(config-service-template)# end
```

This example shows how to create parameter map:

```
ControllerDevice(config)# parameter-map type subscriber attribute-to-service apple-tsim-param
ControllerDevice(config-parameter-map)# 1 map device-type eq "Apple-Device"
ControllerDevice(config-parameter-map)# 1 service-template test1
ControllerDevice(config-parameter-map)# 2 map device-type eq "Apple-Ipad"
ControllerDevice(config-parameter-map)# 1 service-template test2
ControllerDevice(config-parameter-map)# 3 map device-type eq "Android"
ControllerDevice(config-parameter-map)# 1 service-template test3
ControllerDevice(config-parameter-map)# end
```

This example shows how to create policy map:

```
ControllerDevice(config)# policy-map type control subscriber apple-tsim
ControllerDevice(config-policy-map)# event identity-update match-all
ControllerDevice(config-policy-map)# 1 class always do-until-failure
ControllerDevice(config-policy-map)# 1 map attribute-to-service table apple-tsim-param
ControllerDevice(config-policy-map)# end
```

This example shows how to apply policy to a device on a WLAN:

```
ControllerDevice(config)# wlan wlan1
ControllerDevice(config-wlan)# client vlan VLAN0054
ControllerDevice(config-wlan)# profiling local http
ControllerDevice(config-wlan)# service-policy type control subscriber apple-tsim
ControllerDevice(config-wlan)# no shutdown
ControllerDevice# end
```
