config radius acct

To configure settings for a RADIUS accounting server for the Cisco wireless LAN controller, use the **config radius acct** command.

config radius acct { {add index IP addr port {ascii | hex} secret} | delete index | disable index | enable index | ipsec {authentication {hmac-md5 index | hmac-sha1 index } | disable index | enable index | encryption {256-aes | 3des | aes | des} index | ike {auth-mode {pre-shared-key index type shared_secret_key | certificate index } | dh-group { 2048bit-group-14 | group-1 | group-2 | group-5} index | lifetime seconds index | phase1 {aggressive | main} index } | { mac-delimiter { colon | hyphen | none | single-hyphen } } | { network index { disable | enable} } | { region { group | none | provincial } } | retransmit-timeout index seconds | realm {add | delete} index realm-string}

Syntax Description	add	Adds a RADIUS accounting server (IPv4 or IPv6).
	index	RADIUS server index (1 to 17).
	IP addr	RADIUS server IP address (IPv4 or IPv6).
	port	RADIUS server's UDP port number for the interface protocols.
	ascii	Specifies the RADIUS server's secret type: ascii.
	hex	Specifies the RADIUS server's secret type: hex.
	secret	RADIUS server's secret.
	enable	Enables a RADIUS accounting server.
	disable	Disables a RADIUS accounting server.
	delete	Deletes a RADIUS accounting server.
	ipsec	Enables or disables IPSec support for an accounting server.
		Note IPSec is not supported for IPv6.
	authentication	Configures IPSec Authentication.
	hmac-md5	Enables IPSec HMAC-MD5 authentication.
	hmac-sha1	Enables IPSec HMAC-SHA1 authentication.
	disable	Disables IPSec support for an accounting server.
	enable	Enables IPSec support for an accounting server.
	encryption	Configures IPSec encryption.
	256-aes	Enables IPSec AES-256 encryption.

3des	Enables IPSec 3DES encryption.
aes	Enables IPSec AES-128 encryption.
des	Enables IPSec DES encryption.
ike	Configures Internet Key Exchange (IKE).
auth-mode	Configures IKE authentication method.
pre-shared-key	Pre-shared key for authentication.
certificate	Certificate used for authentication.
dh-group	Configures IKE Diffie-Hellman group.
2048bit-group-14	Configures DH group 14 (2048 bits).
group-1	Configures DH group 1 (768 bits).
group-2	Configures DH group 2 (1024 bits).
group-5	Configures DH group 5 (1536 bits).
lifetime seconds	Configures IKE lifetime in seconds. The range is from 1800 to 57600 seconds and the default is 28800.
phase1	Configures IKE phase1 mode.
aggressive	Enables IKE aggressive mode.
main	Enables IKE main mode.
mac-delimiter	Configures MAC delimiter for caller station ID and calling station ID.
colon	Sets the delimiter to colon (For example: xx:xx:xx:xx:xx).
hyphen	Sets the delimiter to hyphen (For example: xx-xx-xx-xx).
none	Disables delimiters (For example: xxxxxxxx).
single-hyphen	Sets the delimiters to single hyphen (For example: xxxxx-xxxxxx).
network	Configures a default RADIUS server for network users.
group	Specifies RADIUS server type group.
none	Specifies RADIUS server type none.
provincial	Specifies RADIUS server type provincial.

	retransmit-timeout	Changes the default retransmit timeout for the server.
	seconds	The number of seconds between retransmissions.
	realm	Specifies radius acct realm.
	add	Adds radius acct realm.
	delete	Deletes radius acct realm.
Command Default	When adding a RADIUS server, t	the port number defaults to 1813 and the state is enabled .
Usage Guidelines	IPSec is not supported for IPv6.	
Command History	Release	Modification

7.6	This command was introduced in a release earlier than Release 7.6.
8.0	This command supports both IPv4 and IPv6 address formats.

The following example shows how to configure a priority 1 RADIUS accounting server at *10.10.10.10* using port *1813* with a login password of *admin*:

(Cisco Controller) > config radius acct add 1 10.10.10.10 1813 ascii admin

The following example shows how to configure a priority 1 RADIUS accounting server at 2001:9:6:40::623 using port 1813 with a login password of *admin*:

(Cisco Controller) > config radius acct add 1 2001:9:6:40::623 1813 ascii admin

config radius acct ipsec authentication

To configure IPsec authentication for the Cisco wireless LAN controller, use the **config radius acct ipsec authentication** command.

config radius acct ipsec authentication {**hmac-md5** | **hmac-sha1**} *index*

Syntax Description	hmac-md5	Enables IPsec HMAC-MD5 authentication.
	hmac-sha1	Enables IPsec HMAC-SHA1 authentication.
	index	RADIUS server index.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure the IPsec hmac-md5 authentication service on the RADIUS accounting server index 1:	
	(Cisco Controller) > config radius acct ipsec authentication hmac-md5 1	
Related Commands	show radius acct statistics	

config radius acct ipsec disable

To disable IPsec support for an accounting server for the Cisco wireless LAN controller, use the **config radius acct ipsec disable** command.

config radius acct ipsec disable index

Syntax Description	index	RADIUS server index.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows how to disable the IPsec support for RADIUS accounting server index 1:	

(Cisco Controller) > config radius acct ipsec disable 1

Related Commands show radius acct statistics

config radius acct ipsec enable

To enable IPsec support for an accounting server for the Cisco wireless LAN controller, use the **config radius acct ipsec enable** command.

config radius acct ipsec enable index

Syntax Description	index	RADIUS server index.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	Examples		
	The following example shows how to enable the IPsec support for RADIUS accounting server index 1:		
	(Cisco Controller) > c	onfig radius acct ipsec enable 1	

Related Commands show radius acct statistics

config radius acct ipsec encryption

To configure IPsec encryption for an accounting server for the Cisco wireless LAN controller, use the **config radius acct ipsec encryption** command.

config radius acct ipsec encryption {**3des** | **aes** | **des**} *index*

Syntax Description	256-aes	Enables IPSec AES-256 encryption.
	3des	Enables IPsec 3DES encryption.
	aes	Enables IPsec AES encryption.
	des	Enables IPsec DES encryption.
	index	RADIUS server index value of between 1 and 17.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the IPsec 3DES encryption for RADIUS server index value 3:

(Cisco Controller) > config radius acct ipsec encryption 3des 3

config radius acct ipsec ike

To configure Internet Key Exchange (IKE) for the controller, use the config radius acct ipsec ike command.

config radius acct ipsec ike dh-group {**group-1** | **group-2** | **group-5** | **group-14**} | **lifetime** *seconds* | **phase1** {**aggressive** | **main**} } *index*

Syntax Description	dh-group	Specifies the Dixie-Hellman (DH) group.	
	group-1	Configures the DH Group 1 (768 bits).	
	group-2	Configures the DH Group 2 (1024 bits).	
	group-5	Configures the DH Group 5 (1024 bits).	
	group-5	Configures the DH Group 14 (2048 bits).	
	lifetime	Configures the IKE lifetime. IKE lifetime in seconds.	
	seconds		
	phase1	Configures the IKE phase1 node.	
	aggressive main	Enables the aggressive mode. Enables the main mode.	
			index
	Command Default	None	
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure an IKE lifetime of 23 seconds for RADIUS server index 1:		
	(Cisco Controller) > config ra	dius acct ipsec ike lifetime 23 1	
Related Commands	show radius acct statistics		

config radius acct mac-delimiter

To specify the delimiter to be used in the MAC addresses that are sent to the RADIUS accounting server, use the **config radius acct mac-delimiter** command.

config radius acct mac-delimiter {colon | hyphen | single-hyphen | none} **Syntax Description** colon Sets the delimiter to a colon (for example, xx:xx:xx:xx:xx:xx). Sets the delimiter to a hyphen (for example, hyphen xx-xx-xx-xx-xx). single-hyphen Sets the delimiter to a single hyphen (for example, xxxxxx-xxxxxx). none Disables the delimiter (for example, xxxxxxxxx). The default delimiter is a hyphen. **Command Default Command History** Release Modification 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to set the delimiter hyphen to be used in the MAC addresses that are sent to the RADIUS accounting server for the network users: (Cisco Controller) > config radius acct mac-delimiter hyphen **Related Commands** show radius acct statistics

config radius acct network

To configure a default RADIUS server for network users, use the config radius acct network command.

	config radius acct network <i>index</i> { enable disable }		
Syntax Description	index	RADIUS server index.	
	enable	Enables the server as a network user's default RADIUS server.	
	disable	Disables the server as a network user's default RADIUS server.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure a default RADIUS accounting server for the network users with RADIUS server index1:		
	(Cisco Controller) > config radius acct network 1 enable		
Related Commands	show radius acct statistics		

config radius acct realm

To configure realm on RADIUS accounting server, use the config radius acct realm command.

config radius acct realm { **add** | **delete** } *radius_index realm_string*

add	Add realm to RADIUS accounting server.
delete	Delete realm from RADIUS accounting server.
realm_string	Unique string associated to RADIUS accounting realm.
None	
Release	Modification
8.0	This command was introduced.
	realm_string None Release

The following example shows how add realm to the RADIUS accounting server:

(Cisco Controller) > config radius acct realm add 3 test

config radius acct retransmit-timeout

To change the default transmission timeout for a RADIUS accounting server for the Cisco wireless LAN controller, use the **config radius acct retransmit-timeout** command.

config radius acct retransmit-timeout index timeout

Syntax Description	index	RADIUS server index.
	timeout	Number of seconds (from 2 to 30) between retransmissions.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure retransmission timeout value 5 seconds between the retransmission:	
	(Cisco Controller) > config radius acct retransmit-timeout 5	
Related Commands	show radius acct statistics	

config radius auth

To configure settings for a RADIUS authentication server for the Cisco wireless LAN controller, use the **config radius auth** command.

config radius auth {add index IP addr portascii/hexsecret} | | delete index | disable index |
enable index | framed-mtu mtu | { ipsec { authentication { hmac-md5 index | hmac-sha1 index
} | disable index | enable index | encryption { 256-aes | 3des | aes | des } index | ike
{ auth-mode { pre-shared-key index ascii/hex shared_secret | certificate index } | dh-group {
2048bit-group-14 | group-1 | group-2 | group-5} index | lifetime seconds index | phase1
{ aggressive | main} index } | | { keywrap{add ascii/hex kek mack index } | delete index
| disable | enable} } | { mac-delimiter { colon | hyphen | none | single-hyphen } } |
{ { management index { enable | disable} } | { mgmt-retransmit-timeout index Retransmit Timeout
} | { region { group | none | provincial } | { retransmit-timeout index Retransmit Timeout
} | { rfc3576 { enable | disable} index }

Syntax Description	enable	Enables a RADIUS authentication server.
	disable	Disables a RADIUS authentication server.
	delete	Deletes a RADIUS authentication server.
	index	RADIUS server index. The controller begins the search with 1. The server index range is from 1 to 17.
	add	Adds a RADIUS authentication server. See the "Defaults" section.
	IP addr	IP address (IPv4 or IPv6) of the RADIUS server.
	port	RADIUS server's UDP port number for the interface protocols.
	ascii/hex	Specifies RADIUS server's secret type: ascii or hex.
	secret	RADIUS server's secret.
	callStationIdType	Configures Called Station Id information sent in RADIUS authentication messages.
	framed-mtu	Configures the Framed-MTU for all the RADIUS servers. The framed-mtu range is from 64 to 1300 bytes.
	ipsec	Enables or disables IPSEC support for an authentication server.
		Note IPSec is not supported for IPv6.
	keywrap	Configures RADIUS keywrap.

L

ascii/hex	Specifies the input format of the keywrap keys.
kek	Enters the 16-byte key-encryption-key.
mack	Enters the 20-byte message-authenticator-code-key.
mac-delimiter	Configures MAC delimiter for caller station ID and calling station ID.
management	Configures a RADIUS Server for management users.
mgmt-retransmit-timeout	Changes the default management login retransmission timeout for the server.
network	Configures a default RADIUS server for network users.
realm	Configures radius auth realm.
region	Configures RADIUS region property.
retransmit-timeout	Changes the default network login retransmission timeout for the server.
rfc3576	Enables or disables RFC-3576 support for an authentication server.

Command Default When adding a RADIUS server, the port number defaults to 1812 and the state is **enabled**.

Usage Guidelines IPSec is not supported for IPv6.

Command History

Release	Modification
7.6	This command was introduced in a release earlier than Release 7.6.
8.0	This command supports both IPv4 and IPv6 address formats.

The following example shows how to configure a priority *3* RADIUS authentication server at *10.10.10* using port *1812* with a login password of *admin*:

(Cisco Controller) > config radius auth add 3 10.10.10.10 1812 ascii admin

The following example shows how to configure a priority *3* RADIUS authentication server at 2001:9:6:40::623 using port 1812 with a login password of *admin*:

(Cisco Controller) > config radius auth add 3 2001:9:6:40::623 1812 ascii admin

config radius auth callStationIdType

To configure the RADIUS authentication server, use the **config radius auth callStationIdType** command.

config radius auth callStationIdType {ap-ethmac-only | ap-ethmac-ssid | ap-group-name | ap-label-address | ap-label-address-ssid | ap-location | ap-mac-ssid-ap-group | ap-macaddr-only | ap-macaddr-ssid | ap-name | ap-name-ssid | flex-group-name | ipaddr | macaddr | vlan-id}

Syntax Description Configures the Call Station ID type to use the IP ipaddr address (only Layer 3). macaddr Configures the Call Station ID type to use the system's MAC address (Layers 2 and 3). Configures the Call Station ID type to use the access ap-macaddr-only point's MAC address (Layers 2 and 3). Configures the Call Station ID type to use the access ap-macaddr-ssid point's MAC address (Layers 2 and 3) in the format AP MAC address:SSID. ap-ethmac-only Configures the Called Station ID type to use the access point's Ethernet MAC address. Configures the Called Station ID type to use the access ap-ethmac-ssid point's Ethernet MAC address in the format AP Ethernet MAC address:SSID. Configures the Call Station ID type to use the AP ap-group-name group name. If the AP is not part of any AP group, default-group is taken as the AP group name. flex-group-name Configures the Call Station ID type to use the FlexConnect group name. If the FlexConnect AP is not part of any FlexConnect group, the system MAC address is taken as the Call Station ID. Configures the Call Station ID type to use the access ap-name point's name. Configures the Call Station ID type to use the access ap-name-ssid point's name in the format AP name:SSID ap-location Configures the Call Station ID type to use the access point's location. Sets Called Station ID type to the format <AP MAC ap-mac-ssid-ap-group address>:<SSID>:<AP Group> vlan-id Configures the Call Station ID type to use the system's VLAN-ID.

Command Default The MAC address of the system.

Usage Guidelines The controller sends the Called Station ID attribute to the RADIUS server in all authentication and accounting packets. The Called Station ID attribute can be used to classify users to different groups based on the attribute value. The command is applicable only for the Called Station and not for the Calling Station.

You cannot send only the SSID as the Called-Station-ID, you can only combine the SSID with either the access point MAC address or the access point name.

Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	7.6	The ap-ethmac-only and ap-ethmac-ssid keywords were added to support the access point's Ethernet MAC address.
		The ap-label-address and ap-label-address-ssid keywords were added.
	8.0	This command supports both IPv4 and IPv6 address formats.
	8.3	The ap-mac-ssid-ap-group keyword was added.

The following example shows how to configure the call station ID type to use the IP address:

(Cisco Controller) > config radius auth callStationIdType ipAddr

The following example shows how to configure the call station ID type to use the system's MAC address:

(Cisco Controller) > config radius auth callStationIdType macAddr

The following example shows how to configure the call station ID type to use the access point's MAC address:

(Cisco Controller) > config radius auth callStationIdType ap-macAddr

config radius auth framed-mtu

To configure the framed-mtu value for all RADIUS servers, use the config radius auth framed-mtu command.

config radius auth framed-mtu mtu

Syntax Description	mtu	Framed-MTU value range between 64 and 1300 bytes
		Note Controller does not use or fragment the framed MTU in the controller. This AV pair that is configurable on the controller is part of the authentication request packet to the RADIUS server and is used to allow the RADIUS server to fragment large packets during events such as 802.1x exchange.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced.

The following example shows how to set the framed-mtu value for a RADIUS authentication server:

(Cisco Controller) > config radius auth framed-mtu 500

config radius auth IPsec authentication

To configure IPsec support for an authentication server for the Cisco wireless LAN controller, use the **config radius auth IPsec authentication** command.

config radius auth IPsec authentication {**hmac-md5** | **hmac-sha1**} *index*

Syntax Description	hmac-md5	Enables IPsec HMAC-MD5 authentication.
	hmac-shal	Enables IPsec HMAC-SHA1 authentication.
	index	RADIUS server index.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure the IPsec hmac-md5 support for RADIUS authentication server index 1:	
	(Cisco Controller) > config radius auth IPsec authentication hmac-md5 1	
Related Commands	show radius acct statistics	

config radius auth ipsec disable

To disable IPsec support for an authentication server for the Cisco wireless LAN controller, use the **config radius auth IPsec disable** command.

config radius auth ipsec { **enable** | **disable** } *index*

Syntax Description	enable	Enables the IPsec support for an authentication server.	
	disable	Disables the IPsec support for an authentication server.	
	index	RADIUS server index.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	This example shows how to enable the IPsec support for RADIUS authentication server index 1:		
	(Cisco Controller) > config radius auth ipsec enable 1		
	This example shows how to disable the IPsec support for RADIUS authentication server index 1:		
	(Cisco Controller) > config radius auth ipsec disable 1		
Related Commands	show radius acct statistics		

config radius auth ipsec encryption

To configure IPsec encryption support for an authentication server for the Cisco wireless LAN controller, use the **config radius auth ipsec encryption** command.

config radius auth IPsec encryption {256-aes | 3des | aes | des} index

Syntax Description	256-aes	Enables the IPsec 256 AES encryption.	
	3des	Enables the IPsec 3DES encryption.	
	aes	Enables the IPsec AES encryption.	
	des	Enables the IPsec DES encryption.	
	index	RADIUS server index.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	8.0	The keyword 256-aes was added.	
	The following example shows how to configure IPsec 3dec encryption RADIUS authentication server index 3:		
	(Cisco Controller) > config radius auth ipsec encryption 3des 3		
Related Commands	show radius acct statistics		

Config Commands: r to z

config radius auth ipsec ike

To configure Internet Key Exchange (IKE) for the Cisco wireless LAN controller, use the **config radius auth IPsec ike** command.

config radius auth ipsec ike {auth-mode {pre-shared-keyindex {ascii | hex shared-secret} | certificate index } dh-group {2048bit-group-14 | group-1 | group-2 | group-5} | lifetime seconds | phase1 {aggressive | main } index

Configures the IKE authentication method.

Syntax Description auth-mode

Oyntax Description	auth-moue	Configures the IKE authentication method.
	pre-shared-key	Configures the preshared key for IKE authentication method.
	index	RADIUS server index between 1 and 17.
	ascii	Configures RADIUS IPsec IKE secret in an ASCII format.
	hex	Configures RADIUS IPsec IKE secret in a hexadecimal format.
	shared-secret	Configures the shared RADIUS IPsec secret.
	certificate	Configures the certificate for IKE authentication.
	dh-group	Configures the IKE Diffe-Hellman group.
	2048bit-group-14	Configures the DH Group14 (2048 bits).
	group-1	Configures the DH Group 1 (768 bits).
	group-2	Configures the DH Group 2 (1024 bits).
	group-5	Configures the DH Group 2 (1024 bits).
	lifetime	Configures the IKE lifetime.
	seconds	IKE lifetime in seconds. The range is from 1800 to 57600 seconds.
	phase1	Configures the IKE phase1 mode.
	aggressive	Enables the aggressive mode.
	main	Enables the main mode.
	index	RADIUS server index.

Command Default

By default, preshared key is used for IPsec sessions and IKE lifetime is 28800 seconds.

Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure IKE lifetime of 23 seconds for RADIUS authentication server index 1:	
	(Cisco Controller) > config radius auth ipsec ike lifetime 23 1	
Related Commands	- show radius acct statistics	

config radius auth keywrap

To enable and configure Advanced Encryption Standard (AES) key wrap, which makes the shared secret between the controller and the RADIUS server more secure, use the **config radius auth keywrap** command.

	config radius auth keywrap {enable disab	ble add { ascii hex } <i>kek mack</i> delete } <i>index</i>	
Syntax Description	enable	Enables AES key wrap.	
	disable	Disables AES key wrap.	
	add	Configures AES key wrap attributes.	
	ascii	Configures key wrap in an ASCII format.	
	hex	Configures key wrap in a hexadecimal format.	
	kek	16-byte Key Encryption Key (KEK).	
	mack	20-byte Message Authentication Code Key (MACK).	
	delete	Deletes AES key wrap attributes.	
	index	Index of the RADIUS authentication server on which to configure the AES key wrap.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to enable the AES key wrap for a RADIUS authentication server:		
	(Cisco Controller) > config radius auth k	ceywrap enable	
Related Commands	show radius auth statistics		

config radius auth mac-delimiter

To specify a delimiter to be used in the MAC addresses that are sent to the RADIUS authentication server, use the **config radius auth mac-delimiter** command.

config radius auth mac-delimiter {colon | hyphen | single-hyphen | none}

Syntax Description	colon	Sets a delimiter to a colon (for example, xx:xx:xx:xx:xx).
	hyphen	Sets a delimiter to a hyphen (for example, xx-xx-xx-xx-xx).
	single-hyphen	Sets a delimiter to a single hyphen (for example, xxxxxx-xxxxxx).
	none	Disables the delimiter (for example, xxxxxxxxxx)
Command Default	The default delimiter is a hyphen.	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows how to specify a delimiter hyphen to be used for a RADIUS authentication server:	
	(Cisco Controller) > config radius auth mac-delimiter hyphen	
	, j	

config radius auth management

To configure a default RADIUS server for management users, use the **config radius auth management** command.

config radius auth management *index* { **enable** | **disable** } **Syntax Description** RADIUS server index. index enable Enables the server as a management user's default RADIUS server. disable Disables the server as a management user's default RADIUS server. **Command Default** None **Command History** Release Modification 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to configure a RADIUS server for management users: (Cisco Controller) > config radius auth management 1 enable show radius acct statistics **Related Commands** config radius acct network

config radius auth mgmt-retransmit-timeout

Config Commands: r to z

config radius auth mgmt-retransmit-timeout

To configure a default RADIUS server retransmission timeout for management users, use the **config radius auth mgmt-retransmit-timeout** command.

config radius auth mgmt-retransmit-timeout index retransmit-timeout

Syntax Description	index	RADIUS server index.	
	retransmit-timeout	Timeout value. The range is from 1 to 30 seconds.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure a default RADIUS server retransmission timeout for management users:		
	(Cisco Controller) > config radius auth mgmt-retransmit-timeout 1 10		
Related Commands	config radius auth management		

I

config radius auth network

To configure a default RADIUS server for network users, use the config radius auth network command.

	config radius auth network <i>index</i> { enable disable }		
Syntax Description	index	RADIUS server index.	
	enable	Enables the server as a network user default RADIUS server.	
	disable	Disables the server as a network user default RADIUS server.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure a default RADIUS server for network users:		
	(Cisco Controller) > config radius auth network 1 enable		
Related Commands	show radius acct statistics		
	config radius acct network		

config radius auth realm

To configure realm on RADIUS authentication server, use the config radius auth realm command.

	config radius auth realm { add delet	e } radius_index realm_string
Syntax Description	radius_server	Radius server index. The range is from 1 to 17.
	add	Add realm to RADIUS authentication server.
	delete	Delete realm from RADIUS authentication server.
	realm_string	Unique string associated to RADIUS authentication realm.
Command Default	None	
Command History	Release	Modification
	8.0	This command was introduced.

The following example shows how add realm to the RADIUS authentication server:

(Cisco Controller) > config radius auth realm add 3 test

Config Commands: r to z

config radius auth retransmit-timeout

To change a default transmission timeout for a RADIUS authentication server for the Cisco wireless LAN controller, use the **config radius auth retransmit-timeout** command.

config radius auth retransmit-timeout index timeout

Syntax Description	index	RADIUS server index.	
	timeout	Number of seconds (from 2 to 30) between retransmissions.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure a retransmission timeout of 5 seconds for a RADIUS authentication server:		
	(Cisco Controller) > config radius auth retransmit-timeout 5		
Related Commands	show radius auth statistics		

config radius auth rfc3576

To configure RADIUS RFC-3576 support for the authentication server for the controller, use the **config radius auth rfc3576** command.

config radius auth rfc3576 { **enable** | **disable** } *index*

Syntax Description	enable	Enables RFC-3576 support for an authentication server.		
	disable	Disables RFC-3576 support for an authentication server.		
	index	RADIUS server index.		
Command Default	Disabled			
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
Usage Guidelines	 RFC 3576, which is an extension to the RADIUS protocol, allows dynamic changes to a user session. RFC 3576 includes support for disconnecting users and changing authorizations applicable to a user session. Disconnect messages cause a user session to be terminated immediately; CoA messages modify session authorization attributes such as data filters. 			
	The following example shows how to enable the RADIUS RFC-3576 support for a RADIUS authentication server:			
	(Cisco Controller) > config radius auth rfc3576 enable 2			
Related Commands	show radius auth statistics			
	show radius summary			
	show radius rfc3576			

config radius auth retransmit-timeout

To configure a retransmission timeout value for a RADIUS accounting server, use the **config radius auth server-timeout** command.

config radius auth retransmit-timeout index timeout

Syntax Description	index	RADIUS server index.	
	timeout	Timeout value. The range is from 2 to 30 seconds.	
Command Default	The default timeout is 2 second	ls.	
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure a server timeout value of 2 seconds for RADIUS authentication server index 10:		
	(Cisco Controller) > config radius auth retransmit-timeout 2 10		
Related Commands	show radius auth statistics		
	show radius summary		

config radius aggressive-failover disabled

To configure the controller to mark a RADIUS server as down (not responding) after the server does not reply to three consecutive clients, use the **config radius aggressive-failover disabled** command.

 config radius aggressive-failover disabled

 Syntax Description
 This command has no arguments or keywords.

 Command Default
 None

 Command History
 Release

 7.6
 This command was introduced in a release earlier than Release 7.6.

 The following example shows how to configure the controller to mark a RADIUS server as down:

 (Cisco Controller) > config radius aggressive-failover disabled

Related Commands show radius summary

config radius backward compatibility

To configure RADIUS backward compatibility for the controller, use the **config radius backward compatibility** command.

config radius backward compatibility { enable | disable }

Syntax Description	enable	Enables RADIUS vendor ID backward compatibility.
	disable	Disables RADIUS vendor ID backward compatibility.
Command Default	Enabled.	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) > config radius backward compatibility disable

Related Commands show radius summary

config radius callStationIdCase

To configure callStationIdCase information sent in RADIUS messages for the controller, use the **config radius** callStationIdCase command.

config radius callStationIdCase { legacy | lower | upper }

Syntax Description	legacy	Configures Call Station IDs for Layer 2 authentication
		to RADIUS in uppercase.
	lower	Configures all Call Station IDs to RADIUS in lowercase.
	upper	Configures all Call Station IDs to RADIUS in uppercase.
Command Default	Enabled.	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than

Related Commands show radius summary

config radius callStationIdType

To configure the Called Station ID type information sent in RADIUS accounting messages for the Cisco wireless LAN controller, use the **config radius callStationIdType** command.

config radius callStationIdType {ap-ethmac-only | ap-ethmac-ssid | ap-group-name | ap-label-address | ap-label-address-ssid | ap-location | ap-mac-ssid-ap-group | ap-macaddr-only | ap-macaddr-ssid | ap-name | ap-name-ssid | flex-group-name | ipaddr | macaddr | vlan-id}

Syntax Description	ipaddr	Configures the Call Station ID type to use the IP address (only Layer 3).
	macaddr	Configures the Call Station ID type to use the system's MAC address (Layers 2 and 3).
	ap-macaddr-only	Configures the Call Station ID type to use the access point's MAC address (Layers 2 and 3).
	ap-macaddr-ssid	Configures the Call Station ID type to use the access point's MAC address (Layers 2 and 3) in the format <i>AP MAC address:SSID</i> .
	ap-ethmac-only	Configures the Called Station ID type to use the access point's Ethernet MAC address.
	ap-ethmac-ssid	Configures the Called Station ID type to use the access point's Ethernet MAC address in the format <i>AP Ethernet MAC address:SSID</i> .
	ap-group-name	Configures the Call Station ID type to use the AP group name. If the AP is not part of any AP group, default-group is taken as the AP group name.
	flex-group-name	Configures the Call Station ID type to use the FlexConnect group name. If the FlexConnect AP is not part of any FlexConnect group, the system MAC address is taken as the Call Station ID.
	ap-name	Configures the Call Station ID type to use the access point's name.
	ap-name-ssid	Configures the Call Station ID type to use the access point's name in the format <i>AP name:SSID</i>
	ap-location	Configures the Call Station ID type to use the access point's location.
	ap-mac-ssid-ap-group	Sets Called Station ID type to the format <ap address="" mac="">:<ssid>:<ap group=""></ap></ssid></ap>
	vlan-id	Configures the Call Station ID type to use the system's VLAN-ID.

Command Default The IP address of the system.

Usage Guidelines The controller sends the Called Station ID attribute to the RADIUS server in all authentication and accounting packets. The Called Station ID attribute can be used to classify users to different groups based on the attribute value. The command is applicable only for the Called Station and not for the Calling Station.

You cannot send only the SSID as the Called-Station-ID, you can only combine the SSID with either the access point MAC address or the access point name.

Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	7.6	The ap-ethmac-only and ap-ethmac-ssid keywords were added to support the access point's Ethernet MAC address.
		The ap-label-address and ap-label-address-ssid keywords were added.
	8.0	This command supports both IPv4 and IPv6 address formats.
	8.3	The ap-mac-ssid-ap-group keyword was added.

The following example shows how to configure the call station ID type to use the IP address:

(Cisco Controller) > config radius callStationIdType ipaddr

The following example shows how to configure the call station ID type to use the system's MAC address:

(Cisco Controller) > config radius callStationIdType macaddr

The following example shows how to configure the call station ID type to use the access point's MAC address:

(Cisco Controller) > config radius callStationIdType ap-macaddr-only

config radius dns

To retrieve the RADIUS IP information from a DNS server, use the config radius dns command.

config radius dns { **global** port { ascii | hex } secret | **query** url timeout | **serverip** ip_address | **disable** | **enable** }

Syntax Description	global	Configures the global port and secret to retrieve the RADIUS IP information from a DNS server.			
	port	Port number for authentication. The range is from 1 to 65535. All the DNS servers should u the same authentication port.			
	ascii	Format of the shared secret that you should set to ASCII.			
	hex	Format of the shared secret that you should set to hexadecimal.			
	secret	RADIUS server login secret.			
	query	Configures the fully qualified domain name (FQDN) of the RADIUS server and DNS timeour			
	url	FQDN of the RADIUS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.			
	timeout	Maximum time that the controller waits for, in days, before timing out the request and resending it. The range is from 1 to 180.			
	serverip	Configures the DNS server IP address.			
	ip_address	DNS server IP address.			
	disable	Disables the RADIUS DNS feature. By default, this feature is disabled.			
	enable	Enables the controller to retrieve the RADIUS IP information from a DNS server.			
		When you enable a DNS query, the static configurations are overridden, that is, the DNS list overrides the static AAA list.			
Command Default	You cannot o	configure the global port and secret to retrieve the RADIUS IP information.			
Command History	Release Mo	odification			
	7.5 Th	is command was introduced.			
Usage Guidelines	The account	ing port is derived from the authentication port. All the DNS servers should use the same secret			
		ng example shows how to enable the RADIUS DNS feature on the controller: troller) > config radius dns enable			

config radius fallback-test

To configure the RADIUS server fallback behavior, use the config radius fallback-test command.

config radius fallback-test mode {**off** | **passive** | **active**} | **username** *username*} | {**interval**} *interval*}

Syntax Description	mode	Specifies the mode.	
	off	Disables RADIUS server fallback.	
	passive	Causes the controller to revert to a preferable server (with a lower server index) from the available backup servers without using extraneous probe messages. The controller ignores all inactive servers for a time period and retries later when a RADIUS message needs to be sent.	
	active	Causes the controller to revert to a preferable serve (with a lower server index) from the available backu servers by using RADIUS probe messages to proactively determine whether a server that has bee marked inactive is back online. The controller ignore all inactive servers for all active RADIUS requests.	
	username	Specifies the username. Username. The username can be up to 16 alphanumeric characters. Specifies the probe interval value.	
	username		
	interval		
	interval	Probe interval. The range is 180 to 3600.	
Command Default	The default probe interval is 300.		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to disable the RADIUS accounting server fallback behavior:		
	(Cisco Controller) > config radius fallback-test mode off		
	The following example shows how to configure the controller to revert to a preferable server from the available backup servers without using the extraneous probe messages:		
	(Cisco Controller) > config rac	dius fallback-test mode passive	

The following example shows how to configure the controller to revert to a preferable server from the available backup servers by using RADIUS probe messages:

(Cisco Controller) > config radius fallback-test mode active

show radius acct statistics

config radius ext-source-ports

To configure support for extended source ports in the RADIUS servers, use the **config radius ext-source-ports** command.

	config ra	adius ext-source-ports { enable o	disable	}
Syntax Description	enable	Enables Radius source port support.	-	
	disable	Disables Radius source port support.	_	
Command Default	None			
Command Modes	Config			
Command History	Release	Modification		
	8.1	This command was introduced.		

The following example shows how to enable the extended source ports in the RADIUS servers: config radius ext-source-ports enable

config radius acct retransmit-timeout

To change the default transmission timeout for a RADIUS accounting server for the Cisco wireless LAN controller, use the **config radius acct retransmit-timeout** command.

config radius acct retransmit-timeout index timeout

Syntax Description	index	RADIUS server index.	
	timeout	Number of seconds (from 2 to 30) between retransmissions.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure retransmission timeout value 5 seconds between the retransmission:		
	(Cisco Controller) > config radius acct retransmit-timeout 5		
Related Commands	show radius acct statistics		

config radius auth mgmt-retransmit-timeout

To configure a default RADIUS server retransmission timeout for management users, use the **config radius auth mgmt-retransmit-timeout** command.

config radius auth mgmt-retransmit-timeout index retransmit-timeout

Syntax Description	index	RADIUS server index.
	retransmit-timeout	Timeout value. The range is from 1 to 30 seconds.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows how the formanagement users:	to configure a default RADIUS server retransmission timeout
	(Cisco Controller) > config ra	dius auth mgmt-retransmit-timeout 1 10
Related Commands	config radius auth management	

config radius auth retransmit-timeout

To change a default transmission timeout for a RADIUS authentication server for the Cisco wireless LAN controller, use the **config radius auth retransmit-timeout** command.

config radius auth retransmit-timeout index timeout

Syntax Description	index	RADIUS server index.
	timeout	Number of seconds (from 2 to 30) between retransmissions.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows h authentication server:	now to configure a retransmission timeout of 5 seconds for a RADIUS
	(Cisco Controller) > confi	g radius auth retransmit-timeout 5
Related Commands	show radius auth statistics	

config radius auth retransmit-timeout

To configure a retransmission timeout value for a RADIUS accounting server, use the **config radius auth server-timeout** command.

config radius auth retransmit-timeout index timeout

Syntax Description	index	RADIUS server index.
	timeout	Timeout value. The range is from 2 to 30 seconds.
Command Default	The default timeout is 2 second	S.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows h authentication server index 10:	now to configure a server timeout value of 2 seconds for RADIUS
	(Cisco Controller) > confi	g radius auth retransmit-timeout 2 10
Related Commands	show radius auth statistics	
	show radius summary	

config redundancy interface address peer-service-port

To configure the service port IP and netmask of the peer or standby controller, use the **config redundancy interface address peer-service-port** command.

	config redu	ndancy interface address peer-servi	ce-port ip_address netmask
Syntax Description	ip_address	IP address of the peer service port.	
	netmask	Netmask of the peer service port.	
Command Default	None		
Command History	Release		Modification
	7.6		This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	configuration	e ,	ctive controller. For the HA feature, the service port ose these configurations if you change the mode from HA
	The followin controller:	g example shows how to configure the	service port IP and netmask of the peer or standby
	(Cisco Cont	troller) >config redundancy inte	erface address peer-service-port 11.22.44.55

config redundancy mobilitymac

To configure the High Availability mobility MAC address to be used as an identifier, use the **config redundancy mobilitymac** command.

config redundancy mobilitymac mac_address

Syntax Description	mac_address MAC addres	ss that is an identifier for the active and standby controller pair.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	configuration. Therefore, if y	ards, mobility MAC configuration is no longer present in the uploaded you download this configuration file back to the controller, you must add the ymac mac_addresscommand in the config file before download.
Examples	0 1	ys how to configure the High Availability mobility MAC address:

I

config redundancy mode

To enable or disable redundancy or High Availability (HA), use the config redundancy mode command.

	config redunda	ncy mode { sso none }
Syntax Description	sso Enables	a stateful switch over (SSO) or hot standby redundancy mode.
	none Disable	s redundancy mode.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	You must config	gure local and peer redundancy management IP addresses before you configure redundancy.
	The following e	xample shows how to enable redundancy:
	(Cisco Control	ller) >config redundancy mode sso

config redundancy peer-route

To configure the route configurations of the peer or standby controller, use the **config redundancy peer-route** command.

config redundancy peer-route {**add** | **delete**} *network_ip_address netmask gateway*

Syntax Description	add	Adds a network route.	
	delete	Deletes a network route specific to standby controller.	
	network_ip_address	Network IP address.	
	netmask	Subnet mask of the network.	
	gateway	IP address of the gateway for the route network.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was in Release 7.6.	ntroduced in a release earlier than
Usage Guidelines	Ũ	his command only from the Active controller. For the H hade per controller. You will lose these configurations if oversa.	, I
	The following exam	ple shows how to configure route configurations of a pe	er or standby controller.
	(Cisco Controller) >config redundancy peer-route add 10.1.1.0 2	55.255.255.0 10.1.1.1

config redundancy timer keep-alive-timer

To configure the keep-alive timeout value, use the config redundancy timer keep-alive-timer command.

	config redunda	ncy timer keep-alive-timer milliseconds
Syntax Description	milliseconds	Keep-alive timeout value in milliseconds. The range is from 100 to 400 milliseconds.
Command Default	The default keep	p-alive timeout value is 100 milliseconds.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the keep-alive timeout value:

(Cisco Controller) >config redundancy timer keep-alive-timer 200

config redundancy timer peer-search-timer

To configure the peer search timer, use the config redundancy timer peer-search-timer command.

	config redundancy timer	peer-search-timer seconds
Syntax Description	seconds Value of the pe	er search timer in seconds. The range is from 60 to 180 secs.
Command Default	The default value of the p	eer search timer is 120 seconds.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	You can use this command	to configure the boot up role negotiation timeout value in seconds.
	The following example sh	ows how to configure the redundancy peer search timer:
	(Cisco Controller) > cc	nfig redundancy timer peer-search-timer 100

I

config redundancy unit

To configure a controller as a primary or secondary controller, use the config redundancy unit command.

	config redu	ndancy unit { primary secondary }	
Syntax Description	primary	Configures the controller as the primary controller.	_
	secondary	Configures the controller as the secondary controlle	 r
Command Default	The default	state is as the primary controller.	
Command History	Release	Modificati	on
	7.6	This comm Release 7.	hand was introduced in a release earlier than 6.
Usage Guidelines	5	onfigure a controller as the secondary controller, it be out any valid AP licenses.	comes the High Availability Stackable Unit
	The following	ng example shows how to configure a controller as th	e primary controller:
	(Cisco Con	troller) >config redundancy unit primary	

config remote-lan

	To configure a ren	note LAN, use the config remote-lan command.
	config remote-lar	{enable disable} {remote-lan-id all}
Syntax Description	enable	Enables a remote LAN.
	disable	Disables a remote LAN.
	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	all	Configures all wireless LANs.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config remote-lan enable 2

config remote-lan aaa-override

To configure user policy override through AAA on a remote LAN, use the **config remote-lan aaa-override** command.

config remote-lan aaa-override {**enable** | **disable**} *remote-lan-id*

Syntax Description	enable	Enables user policy override through AAA on a remote LAN.
	disable	Disables user policy override through AAA on a remote LAN.
	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
Command Default	None	
Command Default Command History	None Release	Modification

The following example shows how to enable user policy override through AAA on a remote LAN where the remote LAN ID is 2:

(Cisco Controller) >config remote-lan aaa-override enable 2

config remote-lan acl

To specify an access control list (ACL) for a remote LAN, use the config remote-lan acl command.

config remote-lan acl remote-lan-id acl_name

Syntax Description	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.		
	acl_name ACL name.			
		Note Use the show acl summary command to know the ACLs available.		
	None			
command Default	ivone			
Command Default	Release	Modification		

config remote-lan apgroup

To add an access point (AP) group to remote LAN IEEE 802.1X, use the config remote-lan apgroup command.

config remote-lan apgroup add apgroup-name description

Syntax Description	add		Creates a new AP group.
	apgroup	p-name	Name of an AP group to configure.
	descrip	tion	(Optional) Description of the AP group.
Command Default	None		
Command Modes	Controll	er Confi	guration
Command History	Release	Modific	ation
	8.4	This con introduc	mmand was ced.
Usage Guidelines	-		

Example

The following example shows how to add an AP group to remote LAN IEEE 802.1X:

(Cisco Controller) > config remote-lan apgroup add testap

config remote-lan create

To configure a new remote LAN connection, use the config remote-lan create command.

config remote-lan create remote-lan-id name

Syntax Description	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	name	Remote LAN name. Valid values are up to 32 alphanumeric characters.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure a new remote LAN, MyRemoteLAN, with the LAN ID as 3:

(Cisco Controller) >config remote-lan create 3 MyRemoteLAN

config remote-lan custom-web

To configure web authentication for a remote LAN, use the config remote-lan custom-web command.

config remote-lan custom-web {ext-webauth-url *URL* } | **global {enable | disable} | login-page** *page-name* | **loginfailure-page** {*page-name* | **none**} | **logout-page** {*page-name* | **none**} | **webauth-type** {**internal | customized | external**} } *remote-lan-id*

Syntax Description	ext-webauth-url	Configures an external web authentication URL.		
	URL	Web authentication URL for the Login page.		
	global	Configures the global status for the remote LAN.		
	enable	Enables the global status for the remote LAN.		
	disable	Disables the global status for the remote LAN.		
	login-page	Configures a login page.		
	page-name	Login page name.		
	none	Configures no login page.		
	logout-page	Configures a logout page.		
	none	Configures no logout page.		
	webauth-type	Configures the web authentication type for the remote LAN.		
	internal	Displays the default login page.		
	customized	Displays a downloaded login page.		
	external	Displays a login page that is on an external server.		
	name	Remote LAN name. Valid values are up to 32 alphanumeric characters.		
	remote-lan-id	Remote LAN identifier. Valid values are from 1 to 512.		
Command Default	None			
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
Usage Guidelines	Follow these guidel	ines when you use the config remote-lan custom-web command:		
Ū	• When you configure the external Web-Auth URL, do the following:			
	the config	at Web-Auth or Web-Passthrough Security is in enabled state. To enable Web-Auth, use g remote-lan security web-auth enable command. To enable Web-Passthrough, use the mote-lan security web-passthrough enable command.		

- Ensure that the global status of the remote LAN is in disabled state. To enable the global status of the remote LAN, use the **config remote-lan custom-web global disable** command.
- Ensure that the remote LAN is in disabled state. To disable a remote LAN, use the **config remote-lan disable** command.
- When you configure the Web-Auth type for the remote LAN, do the following:
 - When you configure a customized login page, ensure that you have a login page configured. To configure a login page, use the **config remote-lan custom-web login-page** command.
 - When you configure an external login page, ensure that you have configured preauthentication ACL for external web authentication to function.

The following example shows how to configure an external web authentication URL for a remote LAN with ID 3:

(Cisco Controller) >config remote-lan custom-web ext-webauth-url http://www.AuthorizationURL.com/ 3

The following example shows how to enable the global status of a remote LAN with ID 3:

(Cisco Controller) >config remote-lan custom-web global enable 3

The following example shows how to configure the login page for a remote LAN with ID 3:

(Cisco Controller) >config remote-lan custom-web login-page custompage1 3

The following example shows how to configure a web authentication type with the default login page for a remote LAN with ID 3:

(Cisco Controller) >config remote-lan custom-web webauth-type internal 3

config remote-lan delete

To delete a remote LAN connection, use the **config remote-lan delete** command.

config remote-lan delete remote-lan-id

Syntax Description	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	

The following example shows how to delete a remote LAN with ID 3:

(Cisco Controller) >config remote-lan delete 3

config remote-lan dhcp_server

To configure a dynamic host configuration protocol (DHCP) server for a remote LAN, use the **config remote-lan dhcp_server** command.

config remote-lan dhcp_server remote-lan-id ip_address

Syntax Description	<i>remote-lan-id</i> Remote LAN identifier. Valid values are between 1 and 512.	
	ip_addr	IPv4 address of the override DHCP server.
Command Default	0.0.0.0 is set as the	e default interface value.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

Related Commands show remote-lan

Config Commands: r to z

config remote-lan exclusionlist

To configure the exclusion list timeout on a remote LAN, use the config remote-lan exclusionlist command.

config remote-lan exclusionlist *remote-lan-id* {*seconds* | **disabled** | **enabled**}

Syntax Description	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	seconds	Exclusion list timeout in seconds. A value of 0 requires an administrator override.
	disabled	Disables exclusion listing.
	enabled	Enables exclusion listing.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the exclusion list timeout to 20 seconds on a remote LAN with ID 3:

(Cisco Controller) >config remote-lan exclusionlist 3 20

config remote-lan host-mode

To configure a host mode for remote LAN IEEE 802.1X, use the config remote-lan host-mode command.

config remote-lan host-mode { singlehost | multihost } remote-lan-id

Syntax Description	singlehost	Configures the remote LAN single-host mode.
	multihost	Configures the remote LAN multi-host mode.
	remote-lan-id	WLAN identifier. The range is from 1 to 512.
Command Default	None	
Command Modes	Controller Cont	figuration
Command History	Release Modifi	cation
	8.4 This c	ommand was

introduced.

Example

The following example shows how to configure the host mode as single for remote LAN IEEE 802.1X:

(Cisco Controller) > config remote-lan host-mode singlehost 1

config remote-lan interface

To configure an interface for a remote LAN, use the config remote-lan interface command.

config remote-lan interface remote-lan-id interface_name

ace_name	Interface Note	name. Interface name should not be in upper case characters.
	Note	Interface name should not be in upper case characters.
Release Modification		
	This comman	d was introduced in a release earlier than Release 7.6.

config remote-lan Idap

To configure a remote LAN's LDAP servers, use the config remote-lan ldap command.

coming remote-tail luap {aut utility remote-tail-tail the	config remote-lan ldap	{ add	delete }	remote-lan-id inde
---	------------------------	-------	----------	--------------------

Syntax Description	add	Adds a link to a configured LDAP server (maximum of three).
	delete	Deletes a link to a configured LDAP server.
	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	index	LDAP server index.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to add an LDAP server with the index number 10 for a remote LAN with ID 3:

(Cisco Controller) >config remote-lan ldap add 3 10

config remote-lan mac-filtering

To configure MAC filtering on a remote LAN, use the config remote-lan mac-filtering command.

	config remote-lar	n mac-filtering {enable disable} remote-lan-id
Syntax Description	enable	Enables MAC filtering on a remote LAN.
	disable	Disables MAC filtering on a remote LAN.
	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
Command Default	MAC filtering on	a remote LAN is enabled.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to disable MAC filtering on a remote LAN with ID 3:

(Cisco Controller) >config remote-lan mac-filtering disable 3

config remote-lan mab

To configure MAC Authentication Bypass (MAB) authentication support for AP Port LAN clients, use the **config remote-lan mab** command.

	config r	emote-lan mab{enable disable} remote-lan-id
Syntax Description	enable	Enables MAB authentication support.
	disable	Disables MAB authentication support.
	remote-l	<i>lan-id</i> WLAN Identifier. The valid range is between 1 and 512.
Command Default	None	
Command Modes	Controll	ler Configuration
Command History	Release	Modification
	8.4	This command was introduced.

Example

The following example shows how to enable MAB authentication support for AP Port LAN clients:

(Cisco Controller) >config remote-lan mab enable 8

7.6

config remote-lan max-associated-clients

To configure the maximum number of client connections on a remote LAN, use the **config remote-lan max-associated-clients** command.

config remote-lan max-associated-clients remote-lan-id max-clients

Syntax Description	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	max-clients	Configures the maximum number of client connections on a remote LAN.
Command Default	None	
Command History	Release	Modification

The following example shows how to configure 10 client connections on a remote LAN with ID 3:

This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config remote-lan max-associated-clients 3 10

config remote-lan pre-auth

To configure a preauthentication VLAN for RLAN IEEE 802.1X, use the **config remote-lan pre-auth** command.

config remote-lan pre-auth { **enable** | **disable** } *remote-lan-id* **vlan** *vlan-id*

enable	Enables RLAN preauthentication.
disable	Disables RLAN preauthentication.
remote-lan-id	WLAN identifier. The range is from 1 to 512.
vlan	Configures preauthentication VLAN for RLAN IEEE 802.1X.
vlan-id	Remote LAN preauthentication VLAN identifier.
None	
(Controller Con	nfiguration)
Release Modifi	ication
8.4 This c	command was
	disable remote-lan-id vlan vlan-id None (Controller Con Release Modif

Example

The following example shows how to enable preauthentication VLAN for remote LAN IEEE 802.1X: (Cisco Controller) > config remote-lan pre-auth enable 1 vlan vlan1

config remote-lan radius_server

To configure the RADIUS servers on a remote LAN, use the **config remote-lan radius_server** command.

config remote-lan radius_server { acct { {add | delete } server-index | { enable | disable } | interim-update { interval | enable | disable } } | auth { {add | delete } server-index | { enable | disable } } | overwrite-interface { enable | disable } } remote-lan-id

Syntax Description	acct	Configures a RADIUS accounting server.
	add	Adds a link to a configured RADIUS server.
	delete	Deletes a link to a configured RADIUS server.
	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	server-index	RADIUS server index.
	enable	Enables RADIUS accounting for this remote LAN.
	disable	Disables RADIUS accounting for this remote LAN.
	interim-update	Enables RADIUS accounting for this remote LAN.
	interval	Accounting interim interval. The range is from 180 to 3600 seconds.
	enable	Enables accounting interim update.
	disable	Disables accounting interim update.
	auth	Configures a RADIUS authentication server.
	enable	Enables RADIUS authentication for this remote LAN.
	disable	Disables RADIUS authentication for this remote LAN.
	overwrite-interface	Configures a RADIUS dynamic interface for the remote LAN.
	enable	Enables a RADIUS dynamic interface for the remote LAN.
	disable	Disables a RADIUS dynamic interface for the remote LAN.
Command Default	The interim update interval is set	t to 600 seconds.

CU.	d	IU	υ	d	u	

n i

Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable RADIUS accounting for a remote LAN with ID 3: (Cisco Controller) >config remote-lan radius_server acct enable 3

config remote-lan security

To configure security policy for a remote LAN, use the **config remote-lan security** command.

config remote-lan security { {web-auth {enable | disable | acl | server-precedence} remote-lan-id | {web-passthrough {enable | disable | acl | email-input} remote-lan-id } }

Syntax Description	web-auth	Specifies web authentication.
	enable	Enables the web authentication settings.
	disable	Disables the web authentication settings.
	acl	Configures an access control list.
	server-precedence	Configures the authentication server precedence order for web authentication users.
	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	email-input	Configures the web captive portal using an e-mail address.
	web-passthrough	Specifies the web captive portal with no authentication required.
Command Default	None	
Command History	Release	Nodification

У	Kelease	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	8.4	The 802.1X keyword was added.

The following example shows how to configure the security web authentication policy for remote LAN ID 1:

(Cisco Controller) >config remote-lan security web-auth enable 1

config remote-lan session-timeout

To configure client session timeout, use the config remote-lan session-timeout command.

config remote-lan session-timeout remote-lan-id seconds

Syntax Description	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	seconds	Timeout or session duration in seconds. A value of zero is equivalent to no timeout.
Command Default	None	
Command Default Command History	None Release	Modification

The following example shows how to configure the client session timeout to 6000 seconds for a remote LAN with ID 1:

(Cisco Controller) >config remote-lan session-timeout 1 6000

config remote-lan violation-mode

To configure the violation mode for remote LAN IEEE 802.1X, use the **config remote-lan violation-mode** command.

config remote-lan violation-mode {protect | replace | shutdown} remote-lan-id

Syntax Description	protect	t	Configures the remote LAN protect mode.
	replace	e	Configures the remote LAN replace mode.
	shutdo	wn	Configures the remote LAN shutdown mode.
	remote	-lan-id	WLAN identifier. The range is from 1 to 512.
Command Default	None		
Command Modes	Control	ler Con	figuration
Command History	Release	Modifi	ication
	8.4	This controduction	ommand was uced.

Usage Guidelines

Example

The following example shows how to configure the violation mode as protect for remote LAN IEEE 802.1X:

(Cisco Controller) > config remote-lan violation-mode protect 1

config remote-lan webauth-exclude

To configure web authentication exclusion on a remote LAN, use the **config remote-lan webauth-exclude** command.

config remote-lan webauth-exclude *remote-lan-id* {**enable** | **disable**}

Syntax Description	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	enable	Enables web authentication exclusion on the remote LAN.
	disable	Disables web authentication exclusion on the remote LAN.
Command Default	None	
Command Default Command History	None Release	Modification

(Cisco Controller) >config remote-lan webauth-exclude 1 enable

config rf-profile band-select

To configure the RF profile band selection parameters, use the config rf-profile band-select command.

config rf-profile band-select { **client-rssi** *rssi* | **cycle-count** *cycles* | **cycle-threshold** *value* | **expire** { **dual-band** *value* | **suppression** *value* } | **probe-response** { **enable** | **disable** } } *profile_name*

Syntax Description	client-rssi	Configures the client Received Signal Strength Indicator (RSSI) threshold for the RF profile.		
	rssi	Minimum RSSI for a client to respond to a probe. The range is from -20 to -90 dBm.		
	cycle-count	Configures the probe cycle count for the RF profile. The cycle count sets the number of suppression cycles for a new client.		
	cycles	Value of the cycle count. The range is from 1 to 10.		
	cycle-threshold	Configures the time threshold for a new scanning RF Profile band select cycle period. This setting determines the time threshold during which new probe requests from a client come in a new scanning cycle.		
	value	Value of the cycle threshold for the RF profile. The range is from 1 to 1000 milliseconds.		
	expire	Configures the expiration time of clients for band select.		
	dual-band	Configures the expiration time for pruning previously known dual-band clients. After this time elapses, clients become new and are subject to probe response suppression.		
	value	Value for a dual band. The range is from 10 to 300 seconds.		
	suppression	Configures the expiration time for pruning previously known 802.11b/g clients. After this time elapses, clients become new and are subject to probe response suppression.		
	value	Value for suppression. The range is from 10 to 200 seconds.		
	probe-response	Configures the probe response for a RF profile.		
	enable	Enables probe response suppression on clients operating in the 2.4-GHz band for a RF profile.		
	disable	Disables probe response suppression on clients operating in the 2.4-GHz band for a RF profile.		
	profile name	Name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.		
Command Default	The default value for client RSSI is –80 dBm.			
	The default cycle count is 2.			
	The default cycle threshold is 200 milliseconds.			
	The default value for dual-band expiration is 60 seconds.			

I

The default value for suppression expiration is 20 seconds.

Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	the dual band cl the 2.4-GHz rac the 2.4-GHz an	ble band select on a WLAN, the access point suppresses client probes on 2.4-GHz and moves lients to the 5-GHz spectrum. The band-selection algorithm directs dual-band clients only from dio to the 5-GHz radio of the same access point, and it only runs on an access point when both d 5-GHz radios are up and running. Band selection can be used only with Cisco Aironet 1040, series and the 3500 series access points.
	The following	example shows how to configure the client RSSI:

config rf-profile client-trap-threshold

To configure the threshold value of the number of clients that associate with an access point, after which an SNMP trap is sent to the controller, use the **config rf-profile client-trap-threshold** command.

config rf-profile client-trap-threshold threshold profile_name

Syntax Description	threshold	Threshold value of the number of clients that associate with an access point, after which an SNMP trap is sent to the controller. The range is from 0 to 200. Traps are disabled if the threshold value is configured as zero.
	profile_name	Name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the threshold value of the number of clients that associate with an access point:

(Cisco Controller) >config rf-profile client-trap-threshold 150

config rf-profile create

To create a RF profile, use the **config rf-profile create** command.

config rf-profile create {802.11a | 802.11b/g} profile-name

Syntax Description	802.11a	Configures the RF profile for the 2.4GHz band.
	802.11b/g	Configures the RF profile for the 5GHz band.
profile-name N		Name of the RF profile.

Command Default None

Command History

Release	Modification
7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to create a new RF profile:

(Cisco Controller) >config rf-profile create 802.11a RFtestgroup1

config rf-profile fra client-aware

	To configure the	ne RF profile client-aware FRA feature, use the config rf-profile fra client-aware command.
	U .	le fra client-aware { client-reset <i>percent rf-profile-name</i> client-select <i>percent rf-profile-name rofile-name</i> enable <i>rf-profile-name</i> }
Syntax Description	client-reset	Configures the RF profile AP utilization threshold for radio to switch back to Monitor mode.
	percent	Utilization percentage value ranges from 0 to 100. The default is 5%.
	rf-profile-name	Name of the RF Profile.
	client-select	Configures the RF profile utilization threshold for radio to switch to 5GHz.
	percent	Utilization percentage value ranges from 0 to 100. The default is 50%.
	disable	Disables the RF profile client-aware FRA feature.
	enable	Enables the RF profile client-aware FRA feature.
Command Default	The default per	rcent value for client-select and client-reset is 50% and 5% respectively.
Command History	Release	Modification
	8.5	This command was introduced.
	dual-band radi	example shows how to configure the RF profile utilization threshold for redundant os to switch back from 5GHz client-serving role to Monitor mode:
	(Cisco Contr	oller) >config rf-profile fra client-aware client-reset 15 profile1

The following example shows how to configure the RF profile utilization threshold for redundant dual-band radios to switch from Monitor mode to 5GHz client-serving role:

(Cisco Controller) >config rf-profile fra client-aware client-select 20 profile1

The following example shows how to disable the RF profile client-aware FRA feature:

(Cisco Controller) >config rf-profile fra client-aware disable profile1

The following example shows how to enable the RF profile client-aware FRA feature:

(Cisco Controller) >config rf-profile fra client-aware enable profile1

config rf-profile data-rates

To configure the data rate on a RF profile, use the config rf-profile data-rates command.

config rf-profile data-rates {**802.11a** | **802.11b** } {**disabled** | **mandatory** | **supported**} *data-rate profile-name*

Syntax Description	802.11a	Specifies 802.11a as the radio policy of the RF profile.	
	802.11b	Specifies 802.11b as the radio policy of the RF profile.	
	disabled	Disables a rate.	
	mandatory	Sets a rate to mandatory.	
	supported	Sets a rate to supported.	
	data-rate	802.11 operational rates, which are 1*, 2*, 5.5*, 6, 9, 11*, 12, 18, 24, 36, 48 and 54, where * denotes 802.11b only rates.	
	profile-name	Name of the RF profile.	
Command Default	configurations.	es for RF profiles are derived from the controller system defaults, the global data rate For example, if the RF profile's radio policy is mapped to 802.11a then the global 802.11a opied into the RF profiles at the time of creation.	
	The data rates set with this command are negotiated between the client and the Cisco wireless LAN controller. If the data rate is set to mandatory, the client must support it in order to use the network. If a data rate is set as supported by the Cisco wireless LAN controller, any associated client that also supports that rate may communicate with the Cisco lightweight access point using that rate. It is not required that a client is able to use all the rates marked supported in order to associate.		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following e rate at 12 Mbps	example shows how to set the 802.11b transmission of an RF profile at a mandatory	

(Cisco Controller) >config rf-profile 802.11b data-rates mandatory 12 RFGroup1

config rf-profile delete

To delete a RF profile, use the **config rf-profile delete** command.

config rf-profile delete profile-name

Syntax Description	ription <i>profile-name</i> Name of the RF profile.	
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to delete a RF profile:

(Cisco Controller) >config rf-profile delete RFGroup1

config rf-profile description

To provide a description to a RF profile, use the config rf-profile description command.

config rf-profile description description profile-name

Syntax Description	description	Description of the RF profile.
	profile-name	Name of the RF profile.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to add a description to a RF profile:

(Cisco Controller) >config rf-profile description This is a demo desciption RFGroup1

config rf-profile fra client-aware

	To configure th	RF profile client-aware FRA feature, use the config rf-profile fra client-aware command.
		e fra client-aware { client-reset <i>percent rf-profile-name</i> client-select <i>percent rf-profile-name rofile-name</i> enable <i>rf-profile-name</i> }
Syntax Description	client-reset	Configures the RF profile AP utilization threshold for radio to switch back to Monitor mode.
	percent	Utilization percentage value ranges from 0 to 100. The default is 5%.
	rf-profile-name	Name of the RF Profile.
	client-select	Configures the RF profile utilization threshold for radio to switch to 5GHz.
	percent	Utilization percentage value ranges from 0 to 100. The default is 50%.
	disable	Disables the RF profile client-aware FRA feature.
	enable	Enables the RF profile client-aware FRA feature.
Command Default	The default per	ccent value for client-select and client-reset is 50% and 5% respectively.
Command History	Release	Modification
	8.5	This command was introduced.
	dual-band radio	example shows how to configure the RF profile utilization threshold for redundant os to switch back from 5GHz client-serving role to Monitor mode:

(Cisco Controller) >config rf-profile fra client-aware client-reset 15 profile1

The following example shows how to configure the RF profile utilization threshold for redundant dual-band radios to switch from Monitor mode to 5GHz client-serving role:

(Cisco Controller) >config rf-profile fra client-aware client-select 20 profile1

The following example shows how to disable the RF profile client-aware FRA feature:

(Cisco Controller) >config rf-profile fra client-aware disable profile1

The following example shows how to enable the RF profile client-aware FRA feature:

(Cisco Controller) >config rf-profile fra client-aware enable profile1

config rf-profile load-balancing

To configure load balancing on an RF profile, use the config rf-profile load-balancing command.

config rf-profile load-balancing { **window** *clients* | **denial** *value* } *profile_name*

Syntax Description	window	Configures the client window for load balancing of an RF profile.
	clients	Client window size that limits the number of client associations with an access point. The range is from 0 to 20. The default value is 5.
		The window size is part of the algorithm that determines whether an access point is too heavily loaded to accept more client associations:
		load-balancing window + client associations on AP with lightest load = load-balancing threshold
		Access points with more client associations than this threshold are considered busy, and clients can associate only to access points with client counts lower than the threshold. This window also helps to disassociate sticky clients.
	denial	Configures the client denial count for load balancing of an RF profile.
	value	Maximum number of association denials during load balancing. The range is from 1 to 10. The default value is 3.
		When a client tries to associate on a wireless network, it sends an association request to the access point. If the access point is overloaded and load balancing is enabled on the controller, the access point sends a denial to the association request. If there are no other access points in the range of the client, the client tries to associate the same access point again. After the maximum denial count is reached, the client is able to associate. Association attempts on an access point from any client before associating any AP is called a sequence of association. The default is 3.
	profile_name	Name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following	example shows how to configure the client window size for an RF profile:

(Cisco Controller) >config rf-profile load-balancing window 15

config rf-profile max-clients

To configure the maximum number of client connections per access point of an RF profile, use the **config rf-profile max-clients** commands.

config rf-profile max-clients clients

Syntax Description	<i>clients</i> Maxim 200.	mum number of client connections per access point of an RF profile. The range is from 1 to
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines		s command to configure the maximum number of clients on access points that are in client serving high bandwidth video or mission critical voice applications.
	The following e	example shows how to set the maximum number of clients at 50:
	(Cisco Contro	ller) >config rf-profile max-clients 50

config rf-profile multicast data-rate

To configure the minimum RF profile multicast data rate, use the **config rf-profile multicast data-rate** command.

config rf-profile multicast data-rate value profile_name

Syntax Description	value	Minimum RF profile multicast data rate. The options are 6, 9, 12, 18, 24, 36, 48, 54. Enter 0 to specify that access points will dynamically adjust the data rate.
	profile_name	Name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.
Command Default	The minimum	RF profile multicast data rate is 0.
Command History	 Release	Modification
Command History	nereuse	Mounication

The following example shows how to set the multicast data rate for an RF profile:

(Cisco Controller) >config rf-profile multicast data-rate 24

config rf-profile out-of-box

To create an out-of-box AP group consisting of newly installed access points, use the **config rf-profile out-of-box** command.

config rf-profile out-of-box {enable | disable}

Syntax Description	enable	Enables the creation of an out-of-box AP group. When you enable this command, the following occurs:
		• Newly installed access points that are part of the default AP group will be part of the out-of-box AP group and their radios will be switched off, which eliminates any RF instability caused by the new access points.
		• All access points that do not have a group name become part of the out-of-box AP group.
		• Special RF profiles are created per 802.11 band. These RF profiles have default-settings for all the existing RF parameters and additional new configurations.
	disable	Disables the out-of-box AP group. When you disable this feature, only the subscription of new APs to the out-of-box AP group stops. All APs that are subscribed to the out-of-box AP group remain in this AP group. You can move APs to the default group or a custom AP group upon network convergence.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	group and	out-of-box AP associates with the controller for the first time, it will be redirected to a special AP d the RF profiles applicable to this AP Group will control the radio admin state configuration of the can move APs to the default group or a custom group upon network convergence.
	The follo	wing example shows how to enable the creation of an out-of-box AP group:
	(Cisco C	Controller) >config rf-profile out-of-box enable

config rf-profile rx-sop threshold

To configure high, medium or low Rx SOP threshold values for each 802.11 band, use the **config rf-profile rx-sop threshold** command.

config rf-profile rx-sop threshold { **high** | **medium** | **low** | **auto** } *profile_name*

Syntax Description	high	Configures the high Rx SOP threshold value for an RF profile.
	medium	Configures the medium Rx SOP threshold value for an RF profile.
	low	Configures the low Rx SOP threshold value for an RF profile.
	auto	Configures an auto Rx SOP threshold value for an RF profile. When you choose auto, the access point determines the best Rx SOP threshold value.
	profile_name	RF profile on which the Rx SOP threshold value will be configured.
Command Default	The default Rx	SOP threshold option is auto.
Command History	Release Modi	fication
	8.0 This	command was introduced.

The following example shows how to configure the high Rx SOP threshold value on an RF profile:

(Cisco Controller) > config 802.11 rx-sop threshold high T1a

config rf-profile tx-power-control-thresh-v1

To configure Transmit Power Control version1 (TPCv1) to an RF profile, use the **config rf-profile tx-power-control-thresh-v1** command.

config rf-profile tx-power-control-thresh-v1 tpc-threshold profile_name

Syntax Description	tpc-threshold	TPC threshold.
	profile-name	Name of the RF profile.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure TPCv1 on an RF profile:

(Cisco Controller) >config rf-profile tx-power-control-thresh-v1 RFGroup1

config rf-profile tx-power-control-thresh-v2

To configure Transmit Power Control version 2 (TPCv2) to an RF profile, use the **config rf-profile tx-power-control-thresh-v2** command.

config rf-profile tx-power-control-thresh-v2 tpc-threshold profile-name

Syntax Description	tpc-threshold	TPC threshold.
	profile-name	Name of the RF profile.
Command Default	None	
Command History	Release	Modification

The following example shows how to configure TPCv2 on an RF profile:

(Cisco Controller) >config rf-profile tx-power-control-thresh-v2 RFGroup1

config rf-profile tx-power-max

To configure maximum auto-rf to an RF profile, use the config rf-profile tx-power-max command.

config rf-profile tx-power-max profile-name

Syntax Description	tx-power-max	Maximum auto-rf tx power.
	profile-name	Name of the RF profile.
Command Default	None	
Command History	Release	Modification

The following example shows how to configure tx-power-max on an RF profile:

(Cisco Controller) >config rf-profile tx-power-max RFGroup1

config rf-profile tx-power-min

To configure minimum auto-rf to an RF profile, use the config rf-profile tx-power-min command.

config rf-profile tx-power-min tx-power-min profile-name

Syntax Description	tx-power-min	Minimum auto-rf tx power.
	profile-name	Name of the RF profile.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure tx-power-min on an RF profile:

(Cisco Controller) >config rf-profile tx-power-min RFGroup1

config rogue ap timeout

To specify the number of seconds after which the rogue access point and client entries expire and are removed from the list, use the **config rogue ap timeout** command.

config rogue ap timeout seconds

Syntax Description	seconds	Value of 240 to 3600 seconds (inclusive), with a default value of 1200 seconds.		
Command Default	The default number of seconds	after which the rogue access point and client entries expire is 1200 seconds.		
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
	The following example shows h client list to 2400 seconds:	now to set an expiration time for entries in the rogue access point and		
	(Cisco Controller) > confi	g rogue ap timeout 2400

config rogue adhoc

To globally or individually configure the status of an Independent Basic Service Set (IBSS or *ad-hoc*) rogue access point, use the **config rogue adhoc** command.

config rogue adhoc { **enable** | **disable** | **external** *rogue_MAC* | **alert** { *rogue_MAC* | **all**} | **auto-contain** [*monitor_ap*] | **contain** *rogue_MAC* 1234_aps| }

config rogue adhoc {delete {all | mac-address mac-address} | classify {friendly state {external | internal} mac-address | malicious state {alert | contain} mac-address | unclassified state {alert | contain } mac-address}

Syntax Description	enable	Globally enables detection and reporting of ad-hoc
		rogues.
	disable	Globally disables detection and reporting of ad-hoc rogues.
	external	Configure external state on the rogue access point that is outside the network and poses no threat to WLAN security. The controller acknowledges the presence of this rogue access point.
	rogue_MAC	MAC address of the ad-hoc rogue access point.
	alert	Generates an SMNP trap upon detection of the ad-hoc rogue, and generates an immediate alert to the system administrator for further action.
	all	Enables alerts for all ad-hoc rogue access points.
	auto-contain	Contains all wired ad-hoc rogues detected by the controller.
	monitor_ap	(Optional) IP address of the ad-hoc rogue access point.
	contain	Contains the offending device so that its signals no longer interfere with authorized clients.
	1234_aps	Maximum number of Cisco access points assigned to actively contain the ad-hoc rogue access point (1 through 4, inclusive).
	delete	Deletes ad-hoc rogue access points.
	all	Deletes all ad-hoc rogue access points.
	mac-address	Deletes ad-hoc rogue access point with the specified MAC address.
	mac-address	MAC address of the ad-hoc rogue access point.

I

	classify	Configures ad-hoc rogue access point classification.
	friendly state	Classifies ad-hoc rogue access points as friendly.
	internal	Configures alert state on rogue access point that is inside the network and poses no threat to WLAN security. The controller trusts this rogue access point.
	malicious state	Classifies ad-hoc rogue access points as malicious.
	alert	Configures alert state on the rogue access point that is not in the neighbor list or in the user configured friendly MAC list. The controller forwards an immediate alert to the system administrator for further action.
	contain	Configures contain state on the rogue access point. Controller contains the offending device so that its signals no longer interfere with authorized clients.
	unclassified state	Classifies ad-hoc rogue access points as unclassified.
Command Default	The default for this command is enable	d and is set to alert . The default for auto-containment is disabled .
Command History	Release	Modification

config rogue ap rldp

To enable, disable, or initiate the Rogue Location Discovery Protocol (RLDP), use the **config rogue ap rldp** command. **config rogue ap rldp enable** { **alarm-only** | **auto-contain** } [monitor_ap_only] **config rogue ap rldp initiate** rogue_mac_address config rogue ap rldp disable Syntax Description alarm-only When entered without the optional argument monitor_ap_only, enables RLDP on all access points. auto-contain When entered without the optional argument monitor_ap_only, automatically contains all rogue access points. monitor_ap_only (Optional) RLDP is enabled (when used with alarm-only keyword), or automatically contained (when used with auto-contain keyword) is enabled only on the designated monitor access point. initiate Initiates RLDP on a specific rogue access point. rogue_mac_address MAC address of specific rogue access point. disable Disables RLDP on all access points. None **Command Default Command History** Release Modification 7.6 This command was introduced in a release earlier than Release 7.6. When you enter any of the containment commands, the following warning appears: "Using this feature may **Usage Guidelines** have legal consequences. Do you want to continue?" The 2.4- and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party's network could have legal consequences. The following example shows how to enable RLDP on all access points: (Cisco Controller) > config rogue ap rldp enable alarm-only The following example shows how to enable RLDP on monitor-mode access point ap_1: (Cisco Controller) > config rogue ap rldp enable alarm-only ap_1

The following example shows how to start RLDP on the rogue access point with MAC address 123.456.789.000:

(Cisco Controller) > config rogue ap rldp initiate 123.456.789.000

The following example shows how to disable RLDP on all access points:

(Cisco Controller) > config rogue ap rldp disable

config rogue ap ssid

To generate an alarm only, or to automatically contain a rogue access point that is advertising your network's service set identifier (SSID), use the **config rogue ap ssid** command.

config rogue ap ssid { alarm | auto-contain }

Syntax Description	alarm	Generates only an alarm when a rogue access point is discovered to be advertising your network's SSID.			
	auto-contain Automatically contains the rogue according your network's SSID.				
Command Default	None				
Command History	Release	Modification			
	7.6	This command was introduced in a release earlier than Release 7.6.			
Usage Guidelines	When you enter any of the containment commands, the following warning appears: "Using this feature may have legal consequences. Do you want to continue?" The 2.4- and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party's network could have legal consequences.

config rogue ap timeout

To specify the number of seconds after which the rogue access point and client entries expire and are removed from the list, use the **config rogue ap timeout** command.

config rogue ap timeout seconds

Syntax Description	<i>seconds</i> Value of 240 to 3600 seconds (inclusive), wi default value of 1200 seconds.			
Command Default	The default number of seconds	number of seconds after which the rogue access point and client entries expire is 1200 seconds.		
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
	The following example shows how to set an expiration time for entries in the rogue access point and client list to 2400 seconds:			
	(Cisco Controller) > confi	g rogue ap timeout 2400

config rogue auto-contain level

To configure rogue the auto-containment level, use the config rogue auto-contain level command.

config rogue auto-contain level level [monitor_ap_only]

Syntax Description	level		You can automati containn number	Rogue auto-containment level in the range of 1 to 4. You can enter a value of 0 to enable the controller to automatically select the number of APs used for auto containment. The controller chooses the required number of APs based on the RSSI for effective containment.	
			Note	Up to four APs can be used to auto-contain when a rogue AP is moved to contained state through any of the auto-containment policies.	
	monitor_ap_only (Optional) Configures auto-conta monitor AP mode.		al) Configures auto-containment using only AP mode.		
Command Default	The default auto-conta	inment level is 1.			
Command History	Release		Modifica	Modification	
	7.6		This con Release	nmand was introduced in a release earlier than 7.6.	
Usage Guidelines	information on rogue a any of the configured autocontainment are ro	access points and clients. V auto-containment policies	Vhen the contro to start autocor ough RLDP or	and automatically discovers and collects roller discovers a rogue access point, it uses ntainment. 	2 -75 to -55 dBm				
	3	-85 to -75 dBm			
	4	Less than –85 dBm	4 Less than –85 dBm		

config rogue ap valid-client

To generate an alarm only, or to automatically contain a rogue access point to which a trusted client is associated, use the **config rogue ap valid-client** command.

config rogue ap valid-client {alarm | auto-contain}

Syntax Description	alarm	Generates only an alarm when a rogue access point is discovered to be associated with a valid client.		
	auto-contain	Automatically contains a rogue access point to which a trusted client is associated.		
Command Default	None			
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
Usage Guidelines	When you enter any of the containment commands, the following warning appears: "Using this feature may have legal consequences. Do you want to continue?" The 2.4- and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party's network could have legal consequences.

config rogue client

To configure rogue clients, use the config rogue client command.

config rogue client {aaa {enable | disable} | alert ap_mac | contain client_mac | delete {state
{alert | any | contained | contained-pending} | all | mac-address client_mac} | mse{enable
| disable} }

Syntax Description	aaa	Configures AAA server or local database to validate whether rogue clients are valid clients. The default is
		disabled.
	enable	Enables the AAA server or local database to check rogue client MAC addresses for validity.
	disable	Disables the AAA server or local database to check rogue client MAC addresses for validity.
	alert	Configures the controller to forward an immediate alert to the system administrator for further action.
	ap_mac	Access point MAC address.
	contain	Configures the controller to contain the offending device so that its signals no longer interfere with authorized clients.
	client_mac	MAC address of the rogue client.
	delete	Deletes the rogue client.
	state	Deletes the rogue clients according to their state.
	alert	Deletes the rogue clients in alert state.
	any	Deletes the rogue clients in any state.
	contained	Deletes all rogue clients that are in contained state.
	contained-pending	Deletes all rogue clients that are in contained pending state.
	all	Deletes all rogue clients.
	mac-address	Deletes a rogue client with the configured MAC address.
	mse	Validates if the rogue clients are valid clients using MSE. The default is disabled.

Command Default

Config Commands: r to z

None

I

Command History	Release	Modification		
	7.6This command was introduced in a release Release 7.6.			
Usage Guidelines	You cannot validate rogue clients against MSE and AAA at the same time.			
	The following example shows how to enable the AAA server or local database to check MAC addresses:			
	(Cisco Controller) > config rogue client aaa enable			
	The following example shows how to disable the AAA server or local database from checking MAC addresses:			
	(Cisco Controller) > config r	rogue client aaa disable		
Related Commands	config rogue rule			
	config trapflags rogueap			
	show rogue ap clients			
	show rogue ap detailed			
	show rogue client summary			
	show rogue ignore-list			
	show rogue rule detailed			
	show rogue rule summary			

config rogue containment

	To configure rogue containment, use the config rogue containment command.				
	config rogue containment { flexconnect auto-rate } { enable disable }				
Syntax Description	flexconnect Configures rogue containment for standalone FlexConnect APs.				
	auto-rate Configures automatic rate selection for rogue containment.				
	enable	enable Enables the rogue containment.			
	disable	Disables the rogue containment.			
Command Default	None				
Command History	Release Modification				
	7.5 This	command was introduced.			
Usage Guidelines	-	table lists the rogue containment automatic rate sele	ction details.		
	RSSI (dBm)	802.11b/g Tx Rate (Mbps)	802.11a Tx Rate (Mbps)		
	-74	1	6		
	-70	2	12		
	-55	5.5	12		
	<-40	5.5	18		

The following example shows how to enable automatic rate selection for rogue containment:

(Cisco Controller) > config rogue containment auto-rate enable

config rogue detection

To enable or disable rogue detection, use the **config rogue detection** command.

	Note If an AP itself is configured with that is with the keyword all .	the keyword all , the all access points case takes precedence over the AP	
	config rogue detection {enable	disable } { cisco_ap all }	
Syntax Description	enable	Enables rogue detection on this access point.	
	disable	Disables rogue detection on this access point.	
	cisco_ap	Cisco access point.	
	all	Specifies all access points.	
Command Default	The default rogue detection value is en	nabled.	
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	Rogue detection is enabled by default for all access points joined to the controller except for OfficeExtend access points. OfficeExtend access points are deployed in a home environment and are likely to detect a large number of rogue devices.		
	The following example shows how to	enable rogue detection on the access point Cisco_AP:	
	(Cisco Controller) > config rogu	e detection enable Cisco_AP	
Related Commands	config rogue rule		
	config trapflags rogueap		
	show rogue client detailed		
	show rogue client summary		
	show rogue ignore-list		
	show rogue rule detailed		
	show rogue rule summary		

config rogue detection client-threshold

To configure the rogue client threshold for access points, use the **config rogue detection client-threshold** command.

config rogue detection client-threshold value

Syntax Description	<i>value</i> Threshold rogue client count on an access point after which a trap is sent from the controller. The range is from 1 to 256. Enter 0 to disable the feature.	
Command Default	The default rogue client threshold is 0.	
Command History	Release Modification	
	7.5 This command was introduced.	

The following example shows how to configure the rogue client threshold:

(Cisco Controller) >config rogue detection client-threshold 200

config rogue detection min-rssi

To configure the minimum Received Signal Strength Indicator (RSSI) value at which APs can detect rogues and create a rogue entry in the controller, use the **config rogue detection min-rssi** command.

config rogue detection min-rssi rssi-in-dBm

Syntax Description	rssi-in-dBm	Minimum RSSI value. The valid range is from -70 dBm to -128 dBm, and the default value is -128 dBm.		
Command Default	The default RSSI value to detect rogues in APs is -128 dBm.			
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
Usage Guidelines	This feature is applicable to all the AP modes.			
	There can be many rogues with very weak RSSI values that do not provide any valuable information in rogue analysis. Therefore, you can use this option to filter rogues by specifying the minimum RSSI value at which APs should detect rogues.			
	The following example shows how to configure the minimum RSSI value:			
	(Cisco Controller) > config rogue detection min-rssi -80			
Related Commands	config rogue detection			
	show rogue ap clients			
	config rogue rule			
	config trapflags rogueap			
	show rogue client detailed			
	show rogue client summary			
	show rogue ignore-list			
	show rogue rule detailed			
	show rogue rule summary			

config rogue detection monitor-ap

To configure the rogue report interval for all monitor mode Cisco APs, use the **config rogue detection monitor-ap** command.

config rogue detection monitor-ap {report-interval | transient-rogue-interval} time-in-seconds

Syntax Description	report-interval	Specifies the interval at which rogue reports are sent.				
	transient-rogue-interval	Specifies the interval at which rogues are consistently scanned for by APs after the first time the rogues are scanned.				
	time-in-seconds	Time in seconds. The valid range is as follows:				
		• 10 to 300 for report-interval				
		• 120 to 1800 for transient-rogue-interval				
Command History	Release	Modification				
	7.6	This command was introduced in a release earlier than Release 7.6.				
Usage Guidelines	This feature is applicable to APs that are in monitor mode only.					
	Using the transient interval values, you can control the time interval at which APs should scan for rogues. APs can also filter the rogues based on their transient interval values.					
	This feature has the following advantages:					
	• Rogue reports from APs to the controller are shorter.					
	• Transient rogue entries are avoided in the controller.					
	• Unnecessary memory allocation for transient rogues are avoided.					
	The following example shows how to configure the rogue report interval to 60 seconds:					
	(Cisco Controller) > config rogue detection monitor-ap report-interval 60					
	The following example shows how to configure the transient rogue interval to 300 seconds:					
	(Cisco Controller) > config rogue detection monitor-ap transient-rogue-interval 300					
Related Commands	config rogue detection					
	config rogue detection min-rssi					
	config rogue rule					
	config tranflags roquean					

config trapflags rogueap

show rogue ap clients show rogue client detailed show rogue client summary show rogue ignore-list show rogue rule detailed show rogue rule summary

config rogue detection report-interval

To configure the rogue detection report interval, use the config rogue detection report-interval command.

config rogue detection report-interval time

 Syntax Description
 time
 Time interval, in seconds, at which the access points send the rogue detection report to the controller. The range is from 10 to 300.

 Command Default
 The default rogue detection report interval is 10 seconds.

 Command History
 Release Modification 7.5 This command was introduced.

 Usage Guidelines
 This feature is applicable only to the access points that are in the monitor mode. The following example shows how to configure the rogue detection report interval: (Cisco Controller) >config rogue detection report-interval 60

config rogue detection security-level

To configure the rogue detection security level, use the config rogue detection security-level command.

config rogue detection security-level {critical | custom | high | low}

Syntax Description	critical	Configures the rogue detection security level to critical.
	custom	Configures the rogue detection security level to custom, and allows you to configure the rogue policy parameters.
	high	Configures the rogue detection security level to high. This security level configures basic rogue detection and auto containment for medium-scale or less critical deployments. The Rogue Location Discovery Protocol (RLDP) is disabled for this security level.
	low	Configures the rogue detection security level to low. This security level configures basic rogue detection for small-scale deployments. Auto containment is not supported for this security level.
Command Default	The defa	ult rogue detection security level is custom.
Command History	Release	Modification
	7.5	This command was introduced.

The following example shows how to configure the rogue detection security level to high:

(Cisco Controller) > config rogue detection security-level high

Syntax

config rogue detection transient-rogue-interval

To configure the rogue-detection transient interval, use the **config rogue detection transient-rogue-interval** command.

config rogue detection transient-rogue-interval time

Description	time	Time interval, in seconds, at which a rogue should be consistently scanned by the access point after
		the rogue is scanned for the first time. The range is from 120 to 1800.

Command Default The default rogue-detection transient interval for each security level is as follows:

- Low—120 seconds
 - High—300 seconds
 - Critical—600 seconds

Command History	Release	Modification
	7.5	This command was introduced

Usage Guidelines This feature applies only to the access points that are in the monitor mode.

After the rogue is scanned consistently, updates are sent periodically to the controller. The access points filter the active transient rogues for a very short period and are then silent.

The following example shows how to configure the rogue detection transient interval:

(Cisco Controller) > config rogue detection transient-rogue-interval 200

config rogue rule

To add and configure rogue classification rules, use the config rogue rule command.

config rogue rule {add ap priority priority classify {custom severity-score classification-name | friendly
| malicious } notify {all | global | none | local } state {alert | contain | delete | internal |
external } rule_name | classify {custom severity-score classification-name | friendly | malicious }
rule_name | condition ap {set | delete } condition_type condition_value rule_name | {enable |
delete | disable } {all | rule_name } | match {all | any } | priority priority | notify {all |
global | none | local } rule_name | state {alert | contain | internal |
external } rule_name }

Syntax Description	add ap priority	Adds a rule with match any criteria and the priority that you specify.
	priority	Priority of this rule within the list of rules.
	classify	Specifies the classification of a rule.
	custom	Classifies devices matching the rule as custom.
	severity-score	Custom classification severity score of the rule. The range is from 1 to 100.
	classification-name	Custom classification name. The name can be up to 32 case-sensitive, alphanumeric characters.
	friendly	Classifies a rule as friendly.
	malicious	Classifies a rule as malicious.
	notify	Configures type of notification upon rule match.
	all	Notifies the controller and a trap receiver such as Cisco Prime Infrastructure.
	global	Notifies only a trap receiver such as Cisco Prime Infrastructure.
	local	Notifies only the controller.
	none	Notifies neither the controller nor a trap receiver such as Cisco Prime Infrastructure.
	state	Configures state of the rogue access point after a rule match.
	alert	Configures alert state on the rogue access point that is not in the neighbor list or in the user configured friendly MAC list. The controller forwards an immediate alert to the system administrator for further action.

I

contain	Configures contain state on the rogue access point. Controller contains the offending device so that its signals no longer interfere with authorized clients.
delete	Configures delete state on the rogue access point.
external	Configures external state on the rogue access point that is outside the network and poses no threat to WLAN security. The controller acknowledges the presence of this rogue access point.
internal	Configures alert state on rogue access point that is inside the network and poses no threat to WLAN security. The controller trusts this rogue access point.
rule_name	Rule to which the command applies, or the name of a new rule.
condition ap	Specifies the conditions for a rule that the rogue access point must meet.
set	Adds conditions to a rule that the rogue access point must meet.
delete	Removes conditions to a rule that the rogue access point must meet.
condition_type	Type of the condition to be configured. The condition types are listed below:
	• client-count—Requires that a minimum number of clients be associated to a rogue access point. The valid range is 1 to 10 (inclusive).
	• duration—Requires that a rogue access point be detected for a minimum period of time. The valid range is 0 to 3600 seconds (inclusive).
	 managed-ssid—Requires that a rogue access point's SSID be known to the controller.
	 no-encryption—Requires that a rogue access point's advertised WLAN does not have encryption enabled.
	 rssi—Requires that a rogue access point have a minimum RSSI value. The range is from -95 to -50 dBm (inclusive).
	 ssid—Requires that a rogue access point have a specific SSID.
	• substring-ssid—Requires that a rogue access point have a substring of a user-configured SSID.

	condition_value	Value of the condition. This value is dependent upon the condition_type. For instance, if the condition type is ssid, then the condition value is either the SSID name or all.
	enable	Enables all rules or a single specific rule.
	delete	Deletes all rules or a single specific rule.
	disable	Deletes all rules or a single specific rule.
	match	Specifies whether a detected rogue access point must meet all or any of the conditions specified by the rule in order for the rule to be matched and the rogue access point to adopt the classification type of the rule.
	all	Specifies all rules defined.
	any	Specifies any rule meeting certain criteria.
	priority	Changes the priority of a specific rule and shifts others in the list accordingly.
Command Default	No rogue rules are configured.	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	For your changes to be effective, y	ou must enable the rule. You can configure up to 64 rules.
-	changes more than +/- 2 dBm of th custom rogue rules. Rules are appl	ording to the RSSI condition of the rogue rule occurs only when the RSSI the configured RSSI value. Manual and automatic classification override ied to manually changed rogues if their class type changes to unclassified ogues are classified and do not go to the pending state. You can have up
	The following example shows how as friendly.	to create a rule called rule_1 with a priority of 1 and a classification
	(Cisco Controller) > config r	ogue rule add ap priority 1 classify friendly rule_1
	The following example shows how	to enable rule_1.
	(Cisco Controller) > config r	ogue rule enable rule_1
	The following example shows how	v to change the priority of the last command.

(Cisco Controller) > config rogue rule priority 2 rule_1

The following example shows how to change the classification of the last command.

(Cisco Controller) > config rogue rule classify malicious rule_1

The following example shows how to disable the last command.

(Cisco Controller) > config rogue rule disable rule_1

The following example shows how to delete SSID_2 from the user-configured SSID list in rule-5.

(Cisco Controller) > config rogue rule condition ap delete ssid ssid_2 rule-5

The following example shows how to create a custom rogue rule.

(Cisco Controller) > config rogue rule classify custom 1 VeryMalicious rule6

config rogue rule condition ap

To configure a condition of a rogue rule for rogue access points, use the **config rogue rule condition ap** command.

 config rogue rule condition ap
 { set { client-count count | duration time | managed-ssid |

 no-encryption | rssi rssi | ssid ssid | substring-ssid substring-ssid} | delete { all | client-count |

 | duration | managed-ssid | no-encryption | rssi | ssid | substring-ssid } rule_name

Syntax Description	set	Configures conditions to a rule that the rogue access point must meet.
	client-count	Enables a minimum number of clients to be associated to the rogue access point.
	count	Minimum number of clients to be associated to the rogue access point. The range is from 1 to 10 (inclusive). For example, if the number of clients associated to a rogue access point is greater than or equal to the configured value, the access point is classified as malicious.
	duration	Enables a rogue access point to be detected for a minimum period of time.
	time	Minimum time period, in seconds, to detect the rogue access point. The range is from 0 to 3600.
	managed-ssid	Enables a rogue access point's SSID to be known to the controller.
	no-encryption	Enables a rogue access point's advertised WLAN to not have encryption enabled. If a rogue access point has encryption disabled, it is likely that more clients will try to associate to it.
	rssi	Enables a rogue access point to have a minimum Received Signal Strength Indicator (RSSI) value.
	rssi	Minimum RSSI value, in dBm, required for the access point. The range is from -95 to -50 (inclusive). For example, if the rogue access point has an RSSI that is greater than the configured value, the access point is classified as malicious.
	ssid	Enables a rogue access point have a specific SSID.
	ssid	SSID of the rogue access point.
	substring-ssid	Enables a rogue access point to have a substring of a user-configured SSID.
	substring-ssid	Substring of a user-configured SSID. For example, if you have an SSID as ABCDE, you can specify the substring as ABCD or ABC. You can classify multiple SSIDs with matching patterns.
	delete	Removes the conditions to a rule that a rogue access point must comply with.
	all	Deletes all the rogue rule conditions.
	rule_name	Rogue rule to which the command applies.

Command Default

The default value for RSSI is 0 dBm.

I

The default value for duration is 0 seconds.

The default value for client count is 0.

Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	You can configure up to 25 SSI	Os per rogue rule. You can configure up to 25 SSID substrings per rogue rule.	
	The following example shows how to configure the RSSI rogue rule condition:		
	(Cisco Controller) > confi	g rogue rule condition ap set rssi -50	

config remote-lan session-timeout

To configure client session timeout, use the config remote-lan session-timeout command.

config remote-lan session-timeout remote-lan-id seconds

Syntax Description	remote-lan-id	Remote LAN identifier. Valid values are between 1 and 512.
	seconds	Timeout or session duration in seconds. A value of zero is equivalent to no timeout.
Command Default	None	
Command Default Command History	None Release	Modification

The following example shows how to configure the client session timeout to 6000 seconds for a remote LAN with ID 1:

(Cisco Controller) >config remote-lan session-timeout 1 6000

config rfid auto-timeout

To configure an automatic timeout of radio frequency identification (RFID) tags, use the **config rfid auto-timeout** command.

config rfid auto-timeout { enable | disable } **Syntax Description** enable Enables an automatic timeout. disable Disables an automatic timeout. None **Command Default Command History Release Modification** 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to enable an automatic timeout of RFID tags: (Cisco Controller) > config rfid auto-timeout enable show rfid summary **Related Commands** config rfid status config rfid timeout

config rfid status

To configure radio frequency identification (RFID) tag data tracking, use the config rfid status command.

config rfid status {enable | disable}

Syntax Description	enable Enables RFID tag tracking.
	disable Enables RFID tag tracking.
Command Default	None
Command History	Release Modification
	7.6 This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure RFID tag tracking settings:
	(Cisco Controller) > config rfid status enable
Related Commands	show rfid summary
	config rfid auto-timeout
	config rfid timeout

config rfid timeout

To configure a static radio frequency identification (RFID) tag data timeout, use the **config rfid timeout** command.

config rfid timeout seconds

Syntax Description	seconds Timeout in seconds (from 60 to 7200).
Command Default	None
Command History	Release Modification
	7.6 This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure a static RFID tag data timeout of 60 seconds:
	(Cisco Controller) > config rfid timeout 60
Related Commands	show rfid summary
	config rfid statistics

config rogue ap timeout

To specify the number of seconds after which the rogue access point and client entries expire and are removed from the list, use the **config rogue ap timeout** command.

config rogue ap timeout seconds

Syntax Description	seconds	Value of 240 to 3600 seconds (inclusive), with a default value of 1200 seconds.
Command Default	The default number of seconds	after which the rogue access point and client entries expire is 1200 seconds.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows h client list to 2400 seconds:	now to set an expiration time for entries in the rogue access point and
	(Cisco Controller) > confi	g rogue ap timeout 2400
Related Commands	config rogue ap classify	
	config rogue ap friendly	
	config rogue ap rldp	
	config rogue ap ssid	
	config rogue rule	
	config trapflags rogueap	
	show rogue ap clients	
	show rogue ap detailed	
	show rogue ap summary	
	show rogue ap friendly summ	ary
	show rogue ap malicious sum	mary
	show rogue ap unclassified su	mmary
	show rogue ignore-list	
	show rogue rule detailed	
	show rogue rule summary	

config route add

To configure a network route from the service port to a dedicated workstation IP address range, use the **config route add** command.

config route add *ip_address netmask gateway*

Syntax Description	ip_address	Network IP address.
	netmask	Subnet mask for the network.
	gateway	IP address of the gateway for the route network.
	None	
Command Default	1 tone	
Command Default Usage Guidelines	As on release 7.6, <i>IP_address</i> sup	ports only IPv4 addresses.
Usage Guidelines		ports only IPv4 addresses. Modification
	As on release 7.6, <i>IP_address</i> sup	

The following example shows how to configure a network route to a dedicated workstation IP address 10.1.1.0, subnet mask 255.255.255.0, and gateway 10.1.1.1:

(Cisco Controller) > config route add 10.1.1.0 255.255.255.0 10.1.1.1

config route delete

To remove a network route from the service port, use the config route delete command.

config route delete *ip_address*

Syntax Description	ip_address	Network IP address.			
Command Default	- None				
Usage Guidelines	As on release 7.6, <i>IP_address</i> supports only IPv4 addresses.				
Command History	Release	Modification			
	7.6	This command was introduced in a release earlier than Release 7.6.			
	8.0	This command supports only IPv6 address format.			

The following example shows how to delete a route from the network IP address 10.1.1.0:

(Cisco Controller) > config route delete 10.1.1.0

config serial baudrate

To set the serial port baud rate, use the config serial baudrate command.

	config serial baudrate {1200 2400 480	00 9600 19200 38400 57600}	
Syntax Description	1200	Specifies the supported connection speeds to 1200.	
	2400	Specifies the supported connection speeds to 2400.	
	4800	Specifies the supported connection speeds to 4800.	
	9600	Specifies the supported connection speeds to 9600.	
	19200	Specifies the supported connection speeds to 19200.	
	38400	Specifies the supported connection speeds to 38400.	
	57600	Specifies the supported connection speeds to 57600.	
Command Default	The default serial port baud rate is 9600.		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	

The following example shows how to configure a serial baud rate with the default connection speed of 9600:

(Cisco Controller) > config serial baudrate 9600

config serial timeout

To set the timeout of a serial port session, use the **config serial timeout** command.

config serial timeout minutes

Syntax Description	minutes	Timeout in minutes from 0 to 160. A value of 0 indicates no timeout.	
Command Default	0 (no timeout)		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	Use this command to set the timeout for a serial connection to the front of the Cisco wireless LAN controller from 0 to 160 minutes where 0 is no timeout.		
	The following example shows how to configure the timeout of a serial port session to 10 minutes:		

(Cisco Controller) > config serial timeout 10

config service timestamps

To enable or disable time stamps in message logs, use the **config service timestamps** command.

Syntax Description	debug	Configures time stamps in debug messages.	
	log	Configures time stamps in log messages. Specifies to time-stamp message logs with the standard date and time.	
	datetime		
	disable	Specifies to prevent message logs being time-stamped.	
Command Default	By default, the time stamps in message logs are disabled.		
Command History	Release Modification		
	7.6 This command was introduced in a release earlier than Release 7.6.		
	The following example shows how to configure time-stamp message logs with the standard date and time:		
	(Cisco Controller) > config service timestamps log datetime		
	The following example shows how to prevent message logs being time-stamped:		
	(Cisco Controller) > config service timestamps debug disable		
Related Commands	show logging		

config sessions maxsessions

To configure the number of Telnet CLI sessions allowed by the controller, use the **config sessions maxsessions** command.

config sessions maxsessions session_num **Syntax Description** Number of sessions from 0 to 5. session_num The default number of Telnet CLI sessions allowed by the controller is 5. **Command Default Command History Release Modification** 7.6 This command was introduced in a release earlier than Release 7.6. Up to five sessions are possible while a setting of zero prohibits any Telnet CLI sessions. **Usage Guidelines** The following example shows how to configure the number of allowed CLI sessions to 2: (Cisco Controller) > config sessions maxsessions 2 show sessions **Related Commands**

config sessions timeout

To configure the inactivity timeout for Telnet CLI sessions, use the config sessions timeout command.

config sessions timeout timeout **Syntax Description** Timeout of Telnet session in minutes (from 0 to 160). A value of 0 indicates no timeout timeout. The default inactivity timeout for Telnet CLI sessions is 5 minutes. **Command Default Command History Release Modification** 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to configure the inactivity timeout for Telnet sessions to 20 minutes: (Cisco Controller) > config sessions timeout 20 show sessions **Related Commands**

config slot

To configure various slot parameters, use the **config slot** command.

config slot *slot_id* {**enable** | **disable** | **channel ap** | **chan_width** | **txpower ap** | **antenna extAntGain** *antenna_gain* | **rts**} *cisco_ap*

	_	
Syntax Description	slot_id	Slot downlink radio to which the channel is assigned. Beginning in Release 7.5 and later releases, you can configure 802.11a on slot 1 and 802.11ac on slot 2.
	enable	Enables the slot.
	disable	Disables the slot.
	channel	Configures the channel for the slot.
	ар	Configures one 802.11a Cisco access point.
	chan_width	Configures channel width for the slot.
	txpower	Configures Tx power for the slot.
	antenna	Configures the 802.11a antenna.
	extAntGain	Configures the 802.11a external antenna gain.
	antenna_gain	External antenna gain value in .5 dBi units (such as $2.5 \text{ dBi} = 5$).
	rts	Configures RTS/CTS for an access point.
	cisco_ap	Name of the Cisco access point on which the channel is configured.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following exa	mple shows how to enable slot 3 for the access point abc:
	(Cisco Controll	er) >config slot 3 enable abc

The following example shows how to configure RTS for the access point abc:

(Cisco Controller) >config slot 2 rts abc

config switchconfig boot-break

To enable or disable the breaking into boot prompt by pressing the Esc key at system startup, use the **config switchconfig boot-break** command.

config switchconfig boot-break {enable | disable}

Syntax Description	enable	Enables the breaking into boot prompt by pressing the Esc key at system startup.
	disable	Disables the breaking into boot prompt by pressing the Esc key at system startup.
Command Default	By default, the br	eaking into boot prompt by pressing the Esc key at system startup is disabled.
Usage Guidelines		the features that are prerequisites for the Federal Information Processing Standard (FIPS) bling or disabling the breaking into boot prompt.
	The following exact at system startup:	ample shows how to enable the breaking into boot prompt by pressing the Esc key
	(Cisco Controll	ler) > config switchconfig boot-break enable
Related Commands		ig
	config switchcon	fig flowcontrol
	config switchcon	fig mode
	config switchcon	fig secret-obfuscation
	config switchcon	fig fips-prerequisite
	config switchcon	fig strong-pwd

config switchconfig fips-prerequisite

To enable or disable the features that are prerequisites for the Federal Information Processing Standard (FIPS) mode, use the **config switchconfig fips-prerequisite** command.

config switchconfig fips-prerequisite {enable | disable}

enable	Enables the features that are prerequisites for the FIPS mode.
disable	Disables the features that are prerequisites for the FIPS mode.
By default, the fea	atures that are prerequisites for the FIPS mode are disabled.
You must configu features.	re the FIPS authorization secret before you can enable or disable the FIPS prerequisite
The following exa	ample shows how to enable the features that are prerequisites for the FIPS mode:
(Cisco Controll	er) > config switchconfig fips-prerequisite enable
show switchconfi	ig
config switchcon	fig flowcontrol
config switchcon	fig mode
config switchcon	fig secret-obfuscation
config switchcon	fig boot-break
config switchcon	fig strong-pwd
	disable By default, the fea You must configu features. The following exa (Cisco Controll show switchconfi config switchcon config switchcon

config switchconfig ucapl

To configure US Department of Defense (DoD) Unified Capabilities Approved Product List (APL) certification on the controller, use the **config switchconfig wlance** command.

config switchconfig ucapl {enable | disable}

Syntax Description	enable	Enables UCAPL on the controller.
	disable	Disables UCAPL on the controller.
Command Default	None	
Command History	Release	Modification
	8.0	This command was introduced.

The following example shows how to enable UCAPL on the controller:

(Cisco Controller) > config switchconfig ucapl enable

config switchconfig wlancc

To configure WLAN Common Criteria (CC) on the controller, use the config switchconfig wlance command.

	config switchconfig wl	lancc {enable disable}
Syntax Description	enable	Enables WLAN CC on the controller.
	disable	Disables WLAN CC on the controller.
Command Default	None	
Command History	Release	Modification
	8.0	This command was introduced.

The following example shows how to enable WLAN CC on the controller:

(Cisco Controller) > config switchconfig wlancc enable

config switchconfig strong-pwd

To enable or disable your controller to check the strength of newly created passwords, use the **config switchconfig strong-pwd** command.

config switchconfig strong-pwd { case-check | consecutive-check | default-check |
username-check | position-check | case-digit-check | minimum { upper-case | lower-case
| digits | special-chars } no._of_characters | min-length | password_length | lockout {
mgmtuser | snmpv3user | time | attempts } | lifetime { mgmtuser | snmpv3user }
lifetime | all-checks } { enable | disable }

Syntax Description	case-check	Checks at least three combinations: lowercase characters, uppercase characters, digits, or special characters.		
	consecutive-check	Checks the occurrence of the same character three times.		
	default-check	Checks for default values or use of their variants.		
	username-check	Checks whether the username is specified or not.		
	position-check	Checks whether the password has a four-character change from the old password.		
	case-digit-check	Checks whether the password has all the four combinations: lower, upper, digits, or special characters.		
	minimum	Checks whether the password has a minimum number of upper case and lower case characters, digits, or special characters.		
	upper-case	Checks whether the password has a minimum number of upper case characters.		
	lower-case	Checks whether the password has a minimum number of lower case characters.		
	digits	Checks whether the password has a minimum number of digits.		
	special-chars	Checks whether the password has a minimum number of special characters.		
	min-length	Configures the minimum length for the password.		
	password_length	Minimum length for the password. The range is from 3 to 24 case-sensitive characters.		

Command Default

Command History

lockout	Configures the lockout feature for a management use or Simple Network Management Protocol version 3 (SNMPv3) user.
mgmtuser	Locks out a management user when the number of successive failed attempts exceed the management user lockout attempts.
snmpv3user	Locks out a SNMPv3 user when the number of successive failed attempts exceeds the SNMPv3 use lockout attempts.
time	Configures the time duration after the lockout attempt when the management user or SNMPv3 user is locked
attempts	Configures the number of successive incorrect password attempts after which the management user or SNMPv3 user is locked.
lifetime	Configures the number of days before the management user or SNMPv3 user requires a change of password due to the age of the password.
mgmtuser	Configures the number of days before the management user requires a change of password due to the passwor age.
snmpv3user	Configures the number of days before the SNMPv3 user requires a change of password due to the age of the password.
lifetime	Number of days before the management user or SNMPv3 user requir <i>lifetimees</i> a change of password due to the age of the password.
all-checks	Checks all the cases.
enable	Enables a strong password check for the access poir and controller.
disable	Disables a strong password check for the access poir and controller.
None	
Release Modification	
7.6 This command was intro	duced in a release earlier than Release 7.6.

The following example shows how to enable the Strong Password Check feature:

(Cisco Controller) > config switchconfig strong-pwd case-check enable

Related Commands show switchconfig

config switchconfig flowcontrol config switchconfig mode config switchconfig secret-obfuscation config switchconfig fips-prerequisite config switchconfig boot-break

config switchconfig flowcontrol

To enable or disable 802.3x flow control, use the config switchconfig flowcontrol command.

	config switchcon	fig flowcontrol {enable disable}
Syntax Description	enable	Enables 802.3x flow control.
	disable	Disables 802.3x flow control.
Command Default	By default, 802.3	x flow control is disabled.
	The following exa parameters:	ample shows how to enable 802.3x flow control on Cisco wireless LAN controller
	(Cisco Controll	er) > config switchconfig flowcontrol enable
Related Commands	show switchconfi	ig

I

config switchconfig mode

To configure Lightweight Access Port Protocol (LWAPP) transport mode for Layer 2 or Layer 3, use the **config switchconfig mode** command.

config switchconfig mode $\{L2 \mid L3\}$

Syntax Description	L2 Specifies Layer 2 as the transport mode.
	L3 Specifies Layer 3 as the transport mode.
Command Default	The default transport mode is L3.
Command History	Release Modification
	7.6 This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure LWAPP transport mode to Layer 3:
	(Cisco Controller) > config switchconfig mode L3
Related Commands	show switchconfig

config switchconfig secret-obfuscation

To enable or disable secret obfuscation, use the **config switchconfig secret-obfuscation** command.

	config switchconfig secret-obfuscation {enable disable}
Syntax Description	enable Enables secret obfuscation.
	disable Disables secret obfuscation.
Command Default	Secrets and user passwords are obfuscated in the exported XML configuration file.
Command History	Release Modification
	7.6 This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	To keep the secret contents of your configuration file secure, do not disable secret obfuscation. To further enhance the security of the configuration file, enable configuration file encryption.
	The following example shows how to enable secret obfuscation:
	(Cisco Controller) > config switchconfig secret-obfuscation enable
Related Commands	show switchconfig

I

config sysname

To set the Cisco wireless LAN controller system name, use the config sysname command.

	config sysname name
Syntax Description	<i>name</i> System name. The name can contain up to 24 alphanumeric characters.
Command Default	None
Command History	Release Modification
	7.6 This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure the system named Ent_01:
	(Cisco Controller) > config sysname Ent_01
Related Commands	show sysinfo

config snmp community accessmode

To modify the access mode (read only or read/write) of an SNMP community, use the **config snmp community accessmode** command.

config snmp community accessmode {**ro** | **rw**} *name*

Syntax Description	ro	Specifies a read-	only mode.			
	rw	Specifies a read/	write mode.			
	name	SNMP communi	ty name.			
Command Default	Two communities are provided by default with the following settings:					
	SNMP Community Name	Client IP Address	Client IP Mask	Access Mode	Status	
	public private	0.0.0.0 0.0.0.0	0.0.0.0 0.0.0.0	Read Only Read/Write	Enable Enable	
		Release Modification				
Command History	Release Modification					
Command History		d was introduced in a	release earlier than	Release 7.6.		
	7.6 This command The following example (Cisco Controller)	shows how to config	ure read/write acces	ss mode for SN	MP community:

I

config snmp community create

To create a new SNMP community, use the config snmp community create command.

config snmp community create name

Syntax Description	<i>name</i> SNMP community name of up to 16 characters.
Command Default	None
Command History	Release Modification
	7.6 This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	Use this command to create a new community with the default configuration.
	The following example shows how to create a new SNMP community named test:
	(Cisco Controller) > config snmp community create test
Related Commands	show snmp community
	config snmp community mode
	config snmp community accessmode
	config snmp community delete
	config snmp community ipaddr

config snmp community delete

To delete an SNMP community, use the **config snmp community delete** command.

config snmp community delete name

Syntax Description	name SNMP community name.			
Command Default	None			
Command History	Release Modification			
	7.6 This command was introduced in a release earlier than Release 7.6.			
	The following example shows how to delete an SNMP community named test: (Cisco Controller) > config snmp community delete test			
Related Commands	show snmp community			
	config snmp community mode			
	config snmp community accessmode			
	config snmp community create			
	config snmp community ipaddr			

config snmp community ipaddr

To configure the IPv4 or IPv6 address of an SNMP community, use the **config snmp community ipaddr** command.

config snmp community ipaddr IP addr IPv4 mask/IPv6 Prefix lengthname

Syntax Description	IP addr	SNMP community IPv4 or IPv6 address.	
	IPv4 mask/IPv6 Prefix length	SNMP community IP mask (IPv4 mask or IPv6 Prefix length). The IPv6 prefix length is from 0 to 128.	
	name	SNMP community name.	
Command Default	None		
Command History	Release Modification		
	7.6 This command	was introduced in a release earlier than Release 7.6.	
	8.0 This command	supports both IPv4 and IPv6 address formats.	
Usage Guidelines	• This command is ap	plicable for both IPv4 and IPv6 addresses.	
	• This command is not applicable for default SNMP community (public, private).		
	e 1	hows how to configure an SNMP community with the IPv4 address 255.255.255.0, and SNMP community named comaccess:	
	(Cisco Controller) > config snmp community ipaddr 10.10.10.10 255.255.255.0 comaccess		
	The following example shows how to configure an SNMP community with the IPv6 address 2001:9:2:16::1, IPv6 prefix length 64, and SNMP community named comaccess:		
	(Cisco Controller) >	config snmp community ipaddr 2001:9:2:16::1 64 comaccess	

config snmp community mode

To enable or disable an SNMP community, use the config snmp community mode command.

	config snmp community mode { enable disable } name		
Syntax Description	enable Enables the community.		
	disable Disables the community.		
	name SNMP community name.		
Command Default	None		
Command History	Release Modification		
	7.6 This command was introduced in a release earlier than Release 7.6.		
	The following example shows how to enable the SNMP community named public:		
	(Cisco Controller) > config snmp community mode disable public		
Related Commands	show snmp community		
	config snmp community delete		
	config snmp community accessmode		
	config snmp community create		
	config snmp community ipaddr		

config snmp engineID

To configure the SNMP engine ID, use the config snmp engineID command.

config snmp engineID { *engine_id* | **default** }

Syntax Description	engine_id	Engine ID in hexadecimal characters (a minimum of 10 and a maximum of 24 characters are allowed).
	default	Restores the default engine ID.
Command Default	None	
Command History	Release Modificat	tion
	7.6 This com	mand was introduced in a release earlier than Release 7.6.
Usage Guidelines	to specify an engine	ID is a unique string used to identify the device for administration purposes. You do need e ID for the device because a default string is automatically generated using Cisco's and the MAC address of the first interface on the device.
	If you change the e	engine ID, then a reboot is required for the change to take effect.
	line is converted to This digest is based Because of this del	nge the value of the SNMP engine ID, then the password of the user entered on the command an MD5 (Message-Digest algorithm 5) or SHA (Secure Hash Algorithm) security digest on both the password and the local engine ID. The command line password is then deleted etion, if the local value of the engine ID changes, the security digests of the SNMP users d, and the users will have to be reconfigured.
	The following exar	nple shows how to configure the SNMP engine ID with the value ffffffffffffffffffffffffffffffffffff
	(Cisco Controlle	er) > config snmp engineID ffffffffff
Related Commands		ID

Related Commands show snmpengineID

config snmp syscontact

To set the SNMP system contact name, use the config snmp syscontact command.

config snmp syscontact contact

Syntax Description	<i>contact</i> SNMP system contact name. Valid value can be up to 255 printable c		up to 255 printable characters.
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	-
		owing example shows how to set the SMNP system contact named C _administrator:	Cisco WLAN

(Cisco Controller) > config snmp syscontact Cisco WLAN Solution_administrator

config snmp syslocation

To configure the SNMP system location name, use the config snmp syslocation command.

config snmp syslocation location

Syntax Description	<i>location</i> SNMP system location name. Valid value can be up to 255 printable character		p to 255 printable characters.
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	

The following example shows how to configure the SNMP system location name to Building_2a:

(Cisco Controller) > config snmp syslocation Building_2a

config snmp trapreceiver create

To configure a server to receive SNMP traps, use the **config snmp trapreceiver create** command.

config snmp trapreceiver create name IP addr

	_
Syntax Description	<i>name</i> SNMP community name. The name contain up to 31 characters.
	<i>IP addr</i> Configure the IPv4 or IPv6 address of where to send SNMP traps.
Command Default	None
Command History	Release Modification
	7.6 This command was introduced in a release earlier than Release 7.6.
	8.0 This command supports both IPv4 and IPv6 address formats.
Usage Guidelines	The IPv4 or IPv6 address must be valid for the command to add the new server.
	The following example shows how to add a new SNMP trap receiver with the SNMP trap receiver named test and IP address 10.1.1.1:
	(Cisco Controller) > config snmp trapreceiver create test 10.1.1.1
	The following example shows how to add a new SNMP trap receiver with the SNMP trap receiver named test and IP address 2001:10:1:1:1:
	(Cisco Controller) > config snmp trapreceiver create test 2001:10:1:1:1:1

config snmp trapreceiver delete

To delete a server from the trap receiver list, use the config snmp trapreceiver delete command.

config snmp trapreceiver delete name

Syntax Description	<i>name</i> SNMP community name. The name can contain up to 16 characters.
Command Default	None
Command History	Release Modification
	7.6 This command was introduced in a release earlier than Release 7.6.
	The following example shows how to delete a server named test from the SNMP trap receiver list:
	(Cisco Controller) > config snmp trapreceiver delete test
Related Commands	show snmp trap

config snmp trapreceiver mode

To send or disable sending traps to a selected server, use the config snmp trapreceiver mode command.

	config snmp trapreceiver mode { enable disable } name		
Syntax Description	enable	Enables an SNMP trap receiver.	
	disable	Disables an SNMP trap receiver.	
	name	SNMP community name.	
Command Default	None		
Command History	Release Modifica	tion	
	7.6 This com	mand was introduced in a release earlier than Release 7.6.	
Usage Guidelines	This command ena server.	ables or disables the Cisco wireless LAN controller from sending the traps to the selected

config snmp v3user create

To create a version 3 SNMP user, use the **config snmp v3user create** command.

config snmp v3user create username {ro | rw} {none | hmacmd5 | hmacsha} {none | des
| aescfb128} [auth_key] [encrypt_key]

Syntax Description	username	Version 3 SNMP username.	
	ro	Specifies a read-only user privilege.	
	rw	Specifies a read-write user privilege.	
	none	Specifies if no authentication is required.	
	hmacmd5	Specifies Hashed Message Authentication Coding Message Digest 5 (HMAC-MD5) for authentication.Specifies Hashed Message Authentication Coding-Secure Hashing Algorithm (HMAC-SHA) for authentication.Specifies if no encryption is required.	
	hmacsha		
	none		
	des	Specifies to use Cipher Block Chaining-Digital Encryption Standard (CBC-DES) encryption.	
	aescfb128	Specifies to use Cipher Feedback Mode-Advanced Encryption Standard-128 (CFB-AES-128) encryption.	
	auth_key	(Optional) Authentication key for the HMAC-MD5 or HMAC-SHA authentication protocol.	
Command Default	encrypt_key	(Optional) Encryption key for the CBC-DES or CFB-AES-128 encryption protocol.	
	SNMP v3 username AccessMode Authentication Encry	/ption	
	default Read/Write HMAC-SHA	CFB-AES	
Command History	Release Modification		
	7.6 This command was introduced in a release earl	. 1 D 1 7 (

The following example shows how to add an SNMP username named test with read-only privileges and no encryption or authentication:

(Cisco Controller) > config snmp v3user create test ro none none

Related Commands show snmpv3user

config snmp v3user delete

To delete a version 3 SNMP user, use the **config snmp v3user delete** command.

 Syntax Description
 username

 Username
 Username to delete.

 Command Default
 None

 Command History
 Release Modification

 7.6
 This command was introduced in a release earlier than Release 7.6.

 The following example shows how to remove an SNMP user named test:

 (Cisco Controller) > config snmp v3user delete test

 Related Commands
 show snmp v3user

config snmp version

To enable or disable selected SNMP versions, use the **config snmp version** command.

	$ config \ snmp \ version \ \{ v1 \ \ v2 \ \ v3 \} \ \{ enable \ \ disable \} $		
Syntax Description	v1	Specifies an SNMP version to enable or disable.	
	v2	Specifies an SNMP version to enable or disable.	
	v3	Specifies an SNMP version to enable or disable.	
	enable	Enables a specified version.	
	disable	Disables a specified version.	
Command Default	By default, all the SNMP versions are enabled. Release Modification		
Command History	Release Modific	ation	
	7.6 This cor	nmand was introduced in a release earlier than Release 7.6.	
	The following example shows how to enable SNMP version v1:		
	(Cisco Controller) > config snmp version v1 enable		
Related Commands	show snmpversion		

config tacacs acct

To configure TACACS+ accounting server settings, use the config tacacs acct command.

config tacacs acct { add1-3 IP addr port ascii/hex secret | delete 1-3 | disable 1-3 | enable 1-3 | server-timeout 1-3 seconds}

Syntax Description	add	Adds a new TACACS+ accounting server.
	1-3	Specifies TACACS+ accounting server index from 1 to 3.
	IP addr	Specifies IPv4 or IPv6 address of the TACACS+ accounting server.
	port	Specifies TACACS+ Server's TCP port.
	ascii/hex	Specifies type of TACACS+ server's secret being used (ASCII or HEX).
	secret	Specifies secret key in ASCII or hexadecimal characters.
	delete	Deletes a TACACS+ server.
	disable	Disables a TACACS+ server.
	enable	Enables a TACACS+ server.
	server-timeout	Changes the default server timeout for the TACACS+ server.
	seconds	Specifies the number of seconds before the TACACS+ server times out. The server timeout range is from 5 to 30 seconds.
Command Default	- None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	8.0	This command supports both IPv4 and IPv6 address formats.

address 10.0.0, port number 49, and secret key 12345678 in ASCII:

(Cisco Controller) > config tacacs acct add 1 10.0.0.0 10 ascii 12345678

The following example shows how to add a new TACACS+ accounting server index 1 with the IPv6 address 2001:9:6:40::623, port number 49, and secret key 12345678 in ASCII:

(Cisco Controller) > config tacacs acct add 1 2001:9:6:40::623 10 ascii 12345678

The following example shows how to configure the server timeout of 5 seconds for the TACACS+ accounting server:

(Cisco Controller) > config tacacs acct server-timeout 1 5

config tacacs auth

To configure TACACS+ authentication server settings, use the **config tacacs auth** command.

config tacacs auth{ **add***1-3 IP addr port ascii/hex secret* | **delete** *1-3* | **disable** *1-3* | **enable** *1-3* | **mgmt-server-timeout** *1-3 seconds* | **server-timeout** *1-3seconds*}

Syntax Description	add	Adds a new TACACS+ accounting server.
	1-3	TACACS+ accounting server index from 1 to 3.
	IP addr	IP address for the TACACS+ accounting server.
	port	Controller port used for the TACACS+ accounting server.
	ascii/hex	Type of secret key being used (ASCII or HEX).
	secret	Secret key in ASCII or hexadecimal characters.
	delete	Deletes a TACACS+ server.
	disable	Disables a TACACS+ server.
	enable	Enables a TACACS+ server.
	mgmt-server-timeout 1-3 seconds	Changes the default management login server timeout for the server. The number of seconds before server times out is from 1 to 30 seconds.
	server-timeout 1-3 seconds	Changes the default network login server timeout for the server. The number of seconds before server times out is from 5 to 30 seconds.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	8.0	This command supports both IPv4 and IPv6 address

(Cisco Controller) > config tacacs auth add 1 10.0.0.3 49 ascii 12345678

The following example shows how to add a new TACACS+ authentication server index 1 with the IPv6 address 2001:9:6:40::623, port number 49, and secret key 12345678 in ASCII:

(Cisco Controller) > config tacacs auth add 1 2001:9:6:40::623 49 ascii 12345678

The following example shows how to configure the server timeout for TACACS+ authentication server:

(Cisco Controller) > config tacacs auth server-timeout 1 5

config tacacs auth mgmt-server-timeout

To configure a default TACACS+ authentication server timeout for management users, use the **config tacacs auth mgmt-server-timeout** command.

config tacacs auth mgmt-server-timeout index timeout

Syntax Description	index	TACACS+ authentication server index.	
	timeout	Timeout value. The range is 1 to 30 seconds.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure a default TACACS+ authentication server timeout for management users:		
	(Cisco Controller) > config tacacs auth mgmt-server-timeout 1 10		
Palated Commanda	 config tacacs auth		

Related Commands config tacacs auth

config tacacs dns

To retrieve the TACACS IP information from a DNS server, use the config radius dns command.

config radius dns { **global** port { ascii | hex } secret | **query** url timeout | **serverip** ip_address | **disable** | **enable** }

Configures the global port and secret to retrieve the TACACS IP information from a DNS server.Port number for authentication. The range is from 1 to 65535. All the DNS servers should use the same authentication port.Format of the shared secret that you should set to ASCII.Format of the shared secret that you should set to hexadecimal.TACACS server login secret.Configures the fully qualified domain name (FQDN) of the TACACS server and DNS timeout.FQDN of the TACACS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.the Maximum time that the controller waits for, in days, before timing out a request and resending		
the same authentication port. Format of the shared secret that you should set to ASCII. Format of the shared secret that you should set to hexadecimal. TACACS server login secret. Configures the fully qualified domain name (FQDN) of the TACACS server and DNS timeout. FQDN of the TACACS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.		
Format of the shared secret that you should set to hexadecimal. TACACS server login secret. Configures the fully qualified domain name (FQDN) of the TACACS server and DNS timeout. FQDN of the TACACS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.		
TACACS server login secret. Configures the fully qualified domain name (FQDN) of the TACACS server and DNS timeout. FQDN of the TACACS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.		
Configures the fully qualified domain name (FQDN) of the TACACS server and DNS timeout. FQDN of the TACACS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.		
FQDN of the TACACS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.		
characters.		
<i>t</i> Maximum time that the controller waits for, in days, before timing out a request and resending		
it. The range is from 1 to 180.		
ip Configures the DNS server IP address.		
dress DNS server IP address.		
e Disables the TACACS DNS feature. The default is disabled.		
Enables the controller to retrieve the TACACS IP information from a DNS server.		
nnot retrieve the TACACS IP information from a DNS server.		
se Modification		
This command was introduced in a release earlier than Release 7.6.		
The accounting port is derived from the authentication port. All the DNS servers should use the same secret. When you enable a DNS query, the static configurations will be overridden. The DNS list overrides the static AAA list.		
lowing example shows how to enable the TACACS DNS feature on the controller:		
Controller) > config tacacs dns enable		

config tacacs fallback-test interval

To configure TACACS+ probing interval, use the config tacacs fallback-test interval command.

config tacacs fallback-test interval { *seconds* }

 Syntax Description
 seconds
 TACACS+ probing interval in seconds. Disable is 0, Range from 180 to 3600 seconds.

 Command Default
 None
 Modification

 Release
 Modification

 8.2
 This command was introduced in this release.

The following example shows how to configure TACACS+ probing interval:

(Cisco Controller) > config tacacs fallback-test interval 200

config time manual

To set the system time, use the **config time manual** command. config time manual $MM \mid DD \mid YY HH: MM: SS$ **Syntax Description** MM/DD/YY Date. HH:MM:SS Time. None **Command Default Command History Release Modification** 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to configure the system date to 04/04/2010 and time to 15:29:00: (Cisco Controller) > config time manual 04/04/2010 15:29:00 show time **Related Commands**

config time ntp

To set the Network Time Protocol (NTP), use the config time ntp command.

config time ntp { **auth** { **enable** *server-index key-index* | **disable** *server-index* } | **interval** *interval* | **key-auth** { **add** *key-index* **md5** { **ascii** | **hex** } *key* } | **delete** *key-index* } | **server** *index IP Address* }

Syntax Description	auth	Configures the NTP authentication.		
	enable	Enables the NTP authentication.		
	server-index	NTP server index.		
	key-index	Key index between 1 and 4294967295.		
	disable	Disables the NTP authentication.		
	interval	Configures the NTP version 3 polling interval.		
	interval	NTP polling interval in seconds. The range is from 3600 and 604800 seconds.		
	key-auth	Configures the NTP authentication key.		
	add	Adds an NTP authentication key. Specifies the authentication protocol.		
	md5			
	ascii	Specifies the ASCII key type.		
	hex	Specifies the hexadecimal key type.		
	key	Specifies the ASCII key format with a maximum of 16 characters or the hexadecimal key format with a maximum of 32 digits.		
	delete	Deletes an NTP server.		
	server	Configures the NTP servers.		
	IP Address	NTP server's IP address. Use 0.0.0.0 or :: to delete entry.		
Command Default	None			
Command History	 Release Modificati	 on		
	7.6 This command was introduced in a release earlier than Release 7.6.			
	8.0 This command supports both IPv4 and IPv6 address formats.			
	- To odd the NTI	Description to the controller use the config time at a conversion doe ID Address command		
Usage Guidelines		P server to the controller, use the config time ntp server <i>index IP Address</i> command. ITP server (IPv4) from the controller, use the config time ntp server <i>index</i> 0.0.0.0		
	command.			

To delete the NTP server (IPv6) from the controller, use the **config time ntp server** index :: command.

• To display configured NTP server on the controller, use the show time command.

The following example shows how to configure the NTP polling interval to 7000 seconds:

(Cisco Controller) > config time ntp interval 7000

The following example shows how to enable NTP authentication where the server index is 4 and the key index is 1:

(Cisco Controller) > config time ntp auth enable 4 1

The following example shows how to add an NTP authentication key of value ff where the key format is in hexadecimal characters and the key index is 1:

(Cisco Controller) > config time ntp key-auth add 1 md5 hex ff

The following example shows how to add an NTP authentication key of value ff where the key format is in ASCII characters and the key index is 1:

(Cisco Controller) > config time ntp key-auth add 1 md5 ascii ciscokey

The following example shows how to add NTP servers and display the servers configured to controllers:

```
(Cisco Controller) > config time ntp server 1 10.92.125.52
(Cisco Controller) > config time ntp server 2 2001:9:6:40::623
(Cisco Controller) > show time
Time..... Fri May 23 12:04:18 2014

_____ ____
         1 10.92.125.52 AUTH SUCCESS
1
             2001:9:6:40::623 AUTH SUCCESS
2
         1
```

The following example shows how to delete NTP servers and verify that the servers are deleted removed from the NTP server list:

```
(Cisco Controller) > config time ntp server 1 0.0.0.0
(Cisco Controller) > config time ntp server 2 ::
(Cisco Controller) > show time
Time..... Fri May 23 12:04:18 2014
Timezone delta..... 0:0
Timezone location...... (GMT +5:30) Colombo, New Delhi, Chennai,
```

config time timezone

To configure the system time zone, use the **config time timezone** command.

	config time timezone { enable disable } <i>delta_hours delta_mins</i>			
Syntax Description	enable	Enables daylight saving time.		
	disable	Disables daylight saving time.		
	delta_hours	Local hour difference from the Universal Coordinated Time (UCT).		
	delta_mins	Local minute difference from UCT.		
Command Default	None			
Command History	Release Modification			
	7.6 This command was introduced in a release earlier than Release 7.6.			
	The following example shows how to enable the daylight saving time:			
	(Cisco Controlle	r) > config time timezone enable 2 0		
Related Commands	show time			

config time timezone location

To set the location of the time zone in order to have daylight saving time set automatically when it occurs, use the **config time timezone location** command.

config time timezone location location_index

I

config trapflags ap

To enable or disable the sending of Cisco lightweight access point traps, use the **config trapflags ap** command.

config trapflags ap {register | interfaceUp} {enable | disable}

Syntax Description	register	Enables sending a trap when a Cisco lightweight access point registers with Cisco switch.	
	interfaceUp Enables sending a trap when a Cisco lightweight access point introduced comes up.		
	enable	Enables sending access point-related traps.	
	disable	Disables sending access point-related traps.	
Command Default	By default, the send	ing of Cisco lightweight access point traps is enabled.	
······		hand was introduced in a release earlier than Release 7.6.	
	The following example shows how to prevent traps from sending access point-related traps:		
	(Cisco Controller	config trapflags ap register disable	
Related Commands	show trapflags		

config trapflags authentication

To enable or disable sending traps with invalid SNMP access, use the **config trapflags authentication** command.

config trapflags authentication {enable | disable}

Syntax Description	enable Enables sending traps with invalid SNMP access.		
	disable	Disables sending traps with invalid SNMP access.	
Command Default	By default, the sen	ding traps with invalid SNMP access is enabled.	
Command History	Release Modification		
	7.6 This com	mand was introduced in a release earlier than Release 7.6.	
	The following example shows how to prevent sending traps on invalid SNMP access:		
	(Cisco Controller) > config trapflags authentication disable		
Related Commands	show trapflags		

Config Commands: r to z

config trapflags client

To enable or disable the sending of client-related DOT11 traps, use the **config trapflags client** command.

config trapflags client {802.11-associate 802.11-disassociate | 802.11-deauthenticate | 802.11-authfail | 802.11-associal | authentication | excluded } {enable | disable } **Syntax Description** 802.11-associate Enables the sending of Dot11 association traps to clients. 802.11-disassociate Enables the sending of Dot11 disassociation traps to clients. 802.11-deauthenticate Enables the sending of Dot11 deauthentication traps to clients. 802.11-authfail Enables the sending of Dot11 authentication fail traps to clients. 802.11-assocfail Enables the sending of Dot11 association fail traps to clients. authentication Enables the sending of authentication success traps to clients. excluded Enables the sending of excluded trap to clients. enable Enables sending of client-related DOT11 traps. disable Disables sending of client-related DOT11 traps. By default, the sending of client-related DOT11 traps is disabled. **Command Default Command History Release Modification** 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to enable the sending of Dot11 disassociation trap to clients: (Cisco Controller) > config trapflags client 802.11-disassociate enable

Related Commands show trapflags

config trapflags client max-warning-threshold

To configure the threshold value of the number of clients that associate with the controller, after which an SNMP trap and a syslog message is sent to the controller, use the config trapflags client max-warning-threshold command.

config trapflags client max-warning-threshold { threshold | enable | disable }

Syntax Description	threshold	Configures the threshold percentage value of the number of clients that associate with the controller, after which an SNMP trap and a syslog message is sent to the controller. The range is from 80 to 100.			
		The minimum interval betw	ween two warnings is 10 mins You canno	ot configure this interval.	
	enable	Enables the generation of t	he traps and syslog messages.		
	disable	Disables the generation of	the traps and syslog messages.		
Command Default	The default	threshold value of the numbe	er of clients that associate with the control	oller is 90 %.	
Command History	Release Mo	odification

config trapflags multiusers

To enable or disable the sending of traps when multiple logins are active, use the **config trapflags multiusers** command.

config trapflags multiusers { enable | disable }

Syntax Description	enable Enables the sending of traps when multiple logins are active.		
	disable Disables the sending of traps when multiple logins are active.		
Command Default	By default, the sending of traps when multiple logins are active is enabled.		
Command History	Release Modification		
	7.6 This command was introduced in a release earlier than Release 7.6.		
	The following example shows how to disable the sending of traps when multiple logins ar	e active:	
	(Cisco Controller) > config trapflags multiusers disable		
	- share two afters		

Related Commands show trapflags

config trapflags rfid

To configure the threshold value of the maximum number of radio frequency identification (RFID) tags, after which an SNMP trap and a syslog message is sent to the controller, use the **config trapflags rfid** command.

config trapflags rfid { threshold enable disable }			able disable }			
Syntax Description	threshold	Configures the threshold percentage value of the maximum number of RFID tags, after which an SNMP trap and a syslog message is sent to the controller. The range is from 80 to 100.				
		The traps and syslog messages are generated every 10 minutes. You cannot configure th interval.				
	enable	Enables the generation of t	he traps and syslog messages.			
	disable	Disables the generation of the traps and syslog messages.				
Command Default	The default threshold value of the maximum number of RFID tags is 90 %.					
Command History	Release Mo	odification				
	7.6 Th					
-		num Number of RFID Tags Supported	I	1		
	Controller		Maximum Number of Supported Clients			
	Cisco 5500 Series Controllers		5000

config trapflags rrm-params

To enable or disable the sending of Radio Resource Management (RRM) parameters traps, use the **config trapflags rrm-params** command.

config trapflags rrm-params {tx-power | channel | antenna} {enable | disable}

Syntax Description	tx-power	Enables trap sending when the RF manager automatically changes the tx-power level for the Cisco lightweight access point interface.
	channel	Enables trap sending when the RF manager automatically changes the channel for the Cisco lightweight access point interface.
	antenna	Enables trap sending when the RF manager automatically changes the antenna for the Cisco lightweight access point interface.
	enable	Enables the sending of RRM parameter-related traps.
	disable	Disables the sending of RRM parameter-related traps.
Command Default	By default, the sen	ding of RRM parameters traps is enabled.
Command History	Release Modifica	tion
	7.6 This com	mand was introduced in a release earlier than Release 7.6.
	The following example	mple shows how to enable the sending of RRM parameter-related traps:
	(Cisco Controlle	er) > config trapflags rrm-params tx-power enable
Related Commands	show trapflags	

config trapflags rrm-profile

To enable or disable the sending of Radio Resource Management (RRM) profile-related traps, use the **config trapflags rrm-profile** command.

config trapflags rrm-profile {load | noise | interference | coverage} {enable | disable}

Syntax Description	load	Enables trap sending when the load profile maintained by the RF manager fails.
	noise	Enables trap sending when the noise profile maintained by the RF manager fails.
	interference	Enables trap sending when the interference profile maintained by the RF manager fails.
	coverage	Enables trap sending when the coverage profile maintained by the RF manager fails.
	enable	Enables the sending of RRM profile-related traps.
	disable	Disables the sending of RRM profile-related traps.
Command Default	By default, the send	ing of RRM profile-related traps is enabled.
Command History	Release Modificati	on
	7.6 This comm	and was introduced in a release earlier than Release 7.6.

config trapflags wps

To enable or disable Wireless Protection System (WPS) trap sending, use the config trapflags wps command.

config trapflags wps {enable | disable} **Syntax Description** enable Enables WPS trap sending. disable Disables WPS trap sending. By default, the WPS trap sending is enabled. **Command Default Command History Release Modification** 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to disable the WPS traps sending: (Cisco Controller) > config trapflags wps disable show trapflags **Related Commands**

config tunnel eogre heart-beat

To configure the keep alive ping interval duration, use the **config tunnel eogre** command.

	config tunnel eogre heart-beat	{ interval max-skip-count } <i>number-value</i>
Syntax Description	interval number-value	Time interval between echo request message in seconds.
	max-skip-count number-value	Maximum number of retries before the member is considered non functional.
Command Default		<i>terval</i> is 60 seconds. Range is between 10 to 600 seconds. <i>bax-skip-count</i> is 3 retries. Range is between 3 to 10 retries.
Command History	Release Modification	
	8.1 This command was intro	oduced.
	The following example shows ho	ow to set the heart-beat interval value '45 seconds' :
	config tunnel eogre heart-be	eat interval 45

config tunnel eogre gateway

To configure the Ethernet over GRE gateway IPv4 address, use the config tunnel eogre gateway command.

config tunnel eogre gateway { { { add | modify } gateway-name { **ipv4-address** | **ipv6-address** } gateway-ip-address } | { **delete** gateway-name } }

Syntax Description	add Adds new gateway.		
	delete Removes a gateway.		
	modify Modifies an existing gateway.		
	ipv4-address To enter the IPv4 address of the gateway.		
	ipv6-address To enter the IPv6 address of the gateway.		
	gateway-ip-address IPv4 or IPv6 address of the gateway.		
	gateway-name Tunnel gateway name.		
Command Default	None		
Command History	Release Modification		
	8.1 This command was introduced.		
	8.3 The IPv6 address format option for the tunnel gateway was added.		
	• IPv4 address example config tunnel eogre gateway add hurricane ipv4 192.168.10.1		
	• IPv6 address example		

config tunnel eogre gateway add hurricane ipv6 2001:DB8::1

config tunnel eogre domain

To perform tunnel gateway domain configuration, use the config tunnel eogre domain command.

config tunnel eogre domain {{**create** | **delete**}*domain-name*} {**add** | **remove**}*domain-name gateway-name*

Syntax Description	create	Creates new gateway domain name.
	delete	Deletes gateway domain.
	add	Add gateway name to domain
	remove	Remove gateway name from domain
	domain-name	Domain name
	gateway-name	Gateway name
Command Default	None	
Command History	Release Modification	
	8.1 This co	ommand was introduced.

config tunnel eogre domain create web.com data

Config Commands: r to z

config tunnel eogre domain primary

To add primary or secondary gateway name to a domain, use the **config tunnel eogre domain primary** command.

config tunnel eogre domain primary domain-name gateway-name

Syntax Description	<i>domain-name</i> Enter the domain name	
	gateway-name Enter the gateway name to be added to the domain	
Usage Guidelines	In a domain, the primary gateway is active by default. When the primary gateway is not operational, the secondary gateway becomes the active gateway. Clients will have to associate again with the secondary gateway. During and after failover, controller continues to ping the primary gateway. When the primary gateway is operational again, the primary gateway becomes the active gateway. Clients then fall back to the primary gateway. The same option is available for the TGW from FlexConnect in local switched mode. EoGR tunnels can be DTLS encrypted CAPWAP IPv4 or IPv6. This feature is supported on all Wave 1 and Wave 2 APs that are supported in this release.	
Command History	Release Modification	

8.5 This command was introduced.

config tunnel profile

To create, copy, or delete a profile, use the **config tunnel profile** command.

	config tu	unnel profile {copy create	delete } profile-name
Syntax Description	сору	Copies an existing profile.	
	create	Creates a new profile.	
	delete	Deletes an existing profile.	
Command Default	None		
Command History	Release	Modification	-
	8.1	This command was introduced.	-
		owing example shows how to cre tunnel profile create floo	

config tunnel profile_rule

To add or modify a rule in a profile, use the **config tunnel profile** command.

	0	unnel profile rule { add -domain-name	modify } profile-name realm-filter realm-string eogre vlan vlan-id
Syntax Description	add	Adds a new rule.	
	modify	Modifies an existing rule.	
Command Default	None		
Command History	Release	Modification	
	8.1	This command was introd	uced.

The following example shows how to add a rule to a profile:

config tunnel profile add table realm filter 5 eogre vlan 3 web.com

config tunnel profile_rule-delete

To delete a rule from a profile, use the **config tunnel profile** command.

config tunnel profile ruledelete profile-name realm-filter realm-string

Syntax Description	delete	Deletes an existing rule from a profi
Command Default	None	
Command History	Release	Modification
	8.1	This command was introduced.

The following example shows how to delete a rule from a profile: config tunnel profile delete table realm filter 5

config tunnel profile eogre-DHCP82

To enable or disable the DHCP option 82 parameter, use the **config tunnel profile** command.

 config tunnel profile eogre profile-name DHCP-Opt-82 {enable | disable}

 Syntax Description

 enable
 Enables DHCP option 82 parameter in the system.

 disable
 Disables DHCP option 82 parameter in the system.

 Command Default
 None

 Release
 Modification

 8.1
 This command was introduced.

The following example shows how to enable the DHCP option 82 parameter: config tunnel profile eogre test dhcp-opt-82 enable

config tunnel profile eogre-gateway-radius-proxy

To enable or disable the gateway-radius-proxy, use the config tunnel profile command.

config tunnel profile eogre *profile-name* gateway-radius-proxy { enable | disable }

Syntax Description	enable	Enables Gateway as Radius Proxy.
	disable	Disables Gateway as Radius Proxy.
Command Default	None	
Command History	Release	Modification

8.1 This command was introduced.

The following example shows how to enable the gateway proxy:

config tunnel profile eogre test gateway-radius-proxy enable

config tunnel profile eogre-gateway-radius-proxy-accounting

To enable or disable the gateway as accounting radius-proxy, use the **config tunnel profile** command.

config tunnel profile eogre *profile-name* gateway-radius-proxy accounting {enable | disable}

Syntax Description	enable	Enables Gateway as accounting Radius Proxy.
	disable	Disables Gateway as accounting Radius Proxy.

Command Default	None		
Command History	Release	Modification	
	8.1	This command was introduced.	

The following example shows how to disable the gateway as accounting radius proxy: config tunnel profile eogre test gateway-radius-proxy accounting disable

config tunnel profile eogre-DHCP82

To enable or disable the DHCP option 82 parameter, use the config tunnel profile command.

coming to	innel prome eogre profile-name	DHCP-Opt-62 {er	nable	disable }
enable	Enables DHCP option 82 param	neter in the system.		
disable	Disables DHCP option 82 parar	neter in the system.		
None				
Release	Modification			
8.1	This command was introduced.			
	enable disable None Release	enable Enables DHCP option 82 paran disable Disables DHCP option 82 paran None Release Modification	enable Enables DHCP option 82 parameter in the system. disable Disables DHCP option 82 parameter in the system. None Release Modification	disable Disables DHCP option 82 parameter in the system. None Release Modification

The following example shows how to enable the DHCP option 82 parameter: config tunnel profile eogre test dhcp-opt-82 enable

config tunnel profile eogre-DHCP82-circuit-id

To set format for circuit-id field in DHCP option 82 parameter, use the config tunnel profile command.

config tunnel profile eogre profile-name DHCP-Opt-82 circuit-id parameter-id

Syntax Description	circuit-	id	Sets the format for the Circuit-ID field in DHCP option 82
	parame	ter-id	List of supported parameters:
			• ap-mac
			• ap-ethmac
			• ap-name
			• ap-group-name
			• flex-group-name
			• ap-location
			• vlan-id
			• SSID-name
			• SSID-TYPE
			• Client-mac
Command Default	None		
Command History	Release	Modi	fication
	8.1	This c	command was introduced.

The following example shows how to set the format for circuit-id in the DHCP option 82 parameter: config tunnel profile eogre test dhcp-opt-82 circuit-id access1bldg

config tunnel profile eogre-DHCP82-delimiter

To set the delimiter for the DHCP option 82 parameter, use the config tunnel profile command.

config tunnel profile eogre profile-name DHCP-Opt-82 delimiter delimiter character

Syntax Description	delimiter	Sets the delimiter for the DHCP option 82 parameter in the system.
	delimiter character	Delimiter is used to separate the DHCP option 82 parameter.
Command Default	None	
Command History	Release Modification	Dn
	8.1 This comm	and was introduced.

The following example shows how to delimit the DHCP option 82 parameter: config tunnel profile eogre test dhcp-opt-82 delimiter -

config tunnel profile eogre-DHCP82-format

To set the required format for DCHP option 82, use the config tunnel profile command.

config tunnel profile eogre *profile-name* dhcp-opt-82 format {binary | ascii}

Syntax Description	binary	Set Format for DHCP option 82 as Binary
	ascii	Set Format for DHCP option 82 as Ascii
Command Default	None	
Command History	Release	Modification

8.1 This command was introduced.

The following example shows how to set 'binary' format to the DHCP option 82 parameter: config tunnel profile eogre test dhcp-opt-82 format binary

config tunnel profile eogre-DHCP82-remote-id

To set format for remote-id field in DHC P option 82 parameter, use the config tunnel profile command.

config tunnel profile eogre profile-name DHCP-Opt-82 remote-id parameter-id

Syntax Description	remote-i	d Sets the format for the Remote-ID field in DHCP option 82
	paramete	er-id List of supported parameters:
		• ap-mac
		• ap-ethmac
		• ap-name
		• ap-group-name
		• flex-group-name
		• ap-location
		• vlan-id
		• SSID-name
		• SSID-TYPE
		• Client-mac
Command Default	None	
Command History	Release	Modification
	8.1	This command was introduced.

The following example shows how to set the format for remote-id in the DHCP option 82 parameter: config tunnel profile eogre test dhcp-opt-82 remote-id accesslflr

config watchlist add

To add a watchlist entry for a wireless LAN, use the **config watchlist add** command.

	config watchlist add	config watchlist add { mac <i>MAC</i> username <i>username</i> }		
Syntax Description	mac MAC	Specifies the MAC address of the wireless LAN.		
	username username	Specifies the name of the user to watch.		
Command Default	None			
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		

The following example shows how to add a watchlist entry for the MAC address a5:6b:ac:10:01:6b:

(Cisco Controller) >config watchlist add mac a5:6b:ac:10:01:6b

config watchlist delete

To delete a watchlist entry for a wireless LAN, use the config watchlist delete command.

Syntax Description	mac MAC	Specifies the MAC address of the wireless LAN to delete from the list.
	username username	Specifies the name of the user to delete from the list.
	None	
Command Default		
Command Default Command History	Release	Modification

The following example shows how to delete a watchlist entry for the MAC address a5:6b:ac:10:01:6b:

(Cisco Controller) >config watchlist delete mac a5:6b:ac:10:01:6b

config watchlist disable

To disable the client watchlist, use the config watchlist disable command.

	config watchlis	st disable
Syntax Description	This command	has no arguments or keywords.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to disable the client watchlist:

(Cisco Controller) >config watchlist disable

config watchlist enable

To enable a watchlist entry for a wireless LAN, use the config watchlist enable command.

	config watchlis	st enable
Syntax Description	This command	has no arguments or keywords.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable a watchlist entry:

(Cisco Controller) >config watchlist enable

I

config wgb vlan

To configure the Workgroup Bridge (WGB) VLAN client support, use the config wgb vlan command.

	config wgb vlan {	enable disable }
Syntax Description	enable	Enables wired clients behind a WGB to connect to an anchor controller in a Data Management Zone (DMZ).
	disable	Disables wired clients behind a WGB from connecting to an anchor controller in a DMZ.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable WGB VLAN client support:

(Cisco Controller) >config wgb vlan enable

config wlan

To create, delete, enable, or disable a wireless LAN, use the **config wlan** command.

Syntax Description	enable		Enables a wireless LAN.	
	disable		Disables a wireless LAN.	
	create		Creates a wireless LAN.	
	delete		Deletes a wireless LAN.	
	wlan_id		Wireless LAN identifier between 1 and 512.	
	name		(Optional) WLAN profile name up to 32 alphanumeric characters.	
	foreignAp		(Optional) Specifies the third-party access point settings.	
	ssid		SSID (network name) up to 32 alphanumeric characters.	
	all		(Optional) Specifies all wireless LANs.	
Command Default	None			
Command History	Release	Modification		
	7.6	This command was intro	duced in a release earlier than Release 7.6.	
Usage Guidelines	When you create a new WLAN using the config wlan create command, it is created in disabled mode. Leave it disabled until you have finished configuring it.			
	If you do not specify an SSID, the profile <i>name</i> parameter is used for both the profile name and the SSID.			
	If the management and AP-manager interfaces are mapped to the same port and are members of the same VLAN, you must disable the WLAN before making a port-mapping change to either interface. If the management and AP-manager interfaces are assigned to different VLANs, you do not need to disable the WLAN.			
	An error message appears if you try to delete a WLAN that is assigned to an access point group. If you proceed the WLAN is removed from the access point group and from the access point's radio.			
	The following example shows how to enable wireless LAN identifier 16:			
	(Cisco Controller) > config wlan enable 16			

I

config wlan 7920-support

To configure support for phones, use the config wlan 7920-support command.

	config wlan 7920-s	upport {client-cac-limit ap-cac-limit} {enable disable} wlan_id
Syntax Description	ap-cac-limit	Supports phones that require client-controlled Call Admission Control (CAC) that expect the Cisco vendor-specific information element (IE).
	client-cac-limit	Supports phones that require access point-controlled CAC that expect the IEEE 802.11e Draft 6 QBSS-load.
	enable	Enables phone support.
	disable	Disables phone support.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	You cannot enable b	both WMM mode and client-controlled CAC mode on the same WLAN.
	The following exam with wireless LAN	uple shows how to enable the phone support that requires client-controlled CAC ID 8:
	(Cisco Controlle)	c) >config wlan 7920-support ap-cac-limit enable 8

config wlan 802.11e

To configure 802.11e support on a wireless LAN, use the **config wlan 802.11e** command.

	config wlan 802.11e {allow disable require} wlan_id		
Syntax Description	allow	Allows 802.11e-enabled clients on the wireless LAN.	
	disable	Disables 802.11e on the wireless LAN.	
	require	Requires 802.11e-enabled clients on the wireless LAN.	
	wlan_id	Wireless LAN identifier between 1 and 512.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	802.11e provides quality of service (QoS) support for LAN applications, which are critical for delay sensitivapplications such as Voice over Wireless IP (VoWIP).		
	multiple access such as voice a	ces the 802.11 Media Access Control layer (MAC layer) with a coordinated time division s (TDMA) construct, and adds error-correcting mechanisms for delay sensitive applications and video. The 802.11e specification provides seamless interoperability and is especially well n networks that include a multimedia capability.	
	The following	example shows how to allow 802.11e on the wireless LAN with LAN ID 1:	
	(Cisco Contro	oller) >config wlan 802.11e allow 1	

Config Commands: r to z

config wlan aaa-override

To configure a user policy override via AAA on a wireless LAN, use the config wlan aaa-override command.

	config wlan aaa-override {enable disable} {wlan_id foreignAp}			
Syntax Description	enable	Enables a policy override.		
	disable	Disables a policy override.		
	wlan_id	Wireless LAN identifier between 1 and 512.		
	foreignAp	Specifies third-party access points.		
Command Default	AAA is disabled	1.		
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
Usage Guidelines	LAN authenticat authentication, the returned by the <i>A</i> for MAC filterin DSCP, 802.1p pr	rride is enabled and a client has conflicting AAA and Cisco wireless LAN controller wireless tion parameters, client authentication is performed by the AAA server. As part of this he operating system will move clients from the default Cisco wireless LAN VLAN to a VLAN AAA server and predefined in the controller interface configuration (only when configured ng, 802.1X, and/or WPA operation). In all cases, the operating system will also use QoS, riority tag values, and ACLs provided by the AAA server, as long as they are predefined in terface configuration. (This VLAN switching by AAA override is also referred to as Identity		
	If the corporate wireless LAN uses a management interface assigned to VLAN 2, and if AAA override returns a redirect to VLAN 100, the operating system redirects all client transmissions to VLAN 100, regardless of the physical port to which VLAN 100 is assigned.			
	settings, and aut	When AAA override is disabled, all client authentication defaults to the controller authentication parameter settings, and authentication is performed by the AAA server if the controller wireless LAN does not contain any client-specific authentication parameters.		
	The AAA override values might come from a RADIUS server.			
	The following example shows how to configure user policy override via AAA on WLAN ID 1:			

(Cisco Controller) >config wlan aaa-override enable 1

config wlan acl

To configure a wireless LAN access control list (ACL), use the config wlan acl command.

config wlan acl [*acl_name* | **none**]

Syntax Description	wlan_id	Wireless LAN identifier (1 to 512).
	acl_name	(Optional) ACL name.
	none	(Optional) Clears the ACL settings for the specified wireless LAN
Command Default	None	
Command Default Command History	None Release	Modification

The following example shows how to configure a WLAN access control list with WLAN ID 1 and ACL named office_1:

(Cisco Controller) >config wlan acl 1 office_1

config wlan apgroup

To manage access point group VLAN features, use the **config wlan apgroup** command.

config wlan apgroup {add apgroup_name [description] | delete apgroup_name | description apgroup_name description | interface-mapping {add | delete} apgroup_name wlan_id interface_name | nac-snmp {enable | disable} apgroup_name wlan_id | nasid NAS-ID apgroup_name | profile-mapping {add | delete} apgroup_name profile_name | wlan-radio-policy apgroup_name wlan-id {802.11a-only | 802.11bg | 802.11g-only | all} | hotspot {venue {type apgroup_name group_codetype_code | name apgroup_name language_codevenue_name } | operating-class {add | delete } apgroup_name operating_class_value}}

Syntax Description	add	Creates a new access point group (AP group).
	apgroup_name	Access point group name.
	wlan_id	Wireless LAN identifier from 1 to 512.
	delete	Removes a wireless LAN from an AP group.
	description	Describes an AP group.
	description	Description of the AP group.
	interface-mapping	(Optional) Assigns or removes a Wireless LAN fro
	interface_name	(Optional) Interface to which you want to map an A
	nac-snmp	Configures NAC SNMP functionality on given AP disables Network Admission Control (NAC) out-o access point group.
	enable	Enables NAC out-of-band support on an AP group
	disable	Disables NAC out-of-band support on an AP group
	NAS-ID	Network Access Server identifier (NAS-ID) for the . is sent to the RADIUS server by the controller (as a the authentication request, which is used to classify u You can enter up to 32 alphanumeric characters. Be and later releases, you can configure the NAS-ID or or an access point group. The order of priority is A WLAN NAS-ID > Interface NAS-ID.
	none	Configures the controller system name as the NAS
	profile-mapping	Configures RF profile mapping on an AP group.
	profile_name	RF profile name for a specified AP group.
	wlan-radio-policy	Configures WLAN radio policy on an AP group.

802.11a-only	Configures WLAN radio policy on an AP grou
802.11bg	Configures WLAN radio policy on an AP grou
802.11g-only	Configures WLAN radio policy on an AP grou
all	Configures WLAN radio policy on an AP grou
hotspot	Configures a HotSpot on an AP group.
venue	Configures venue information for an AP group
type	Configures the type of venue for an AP group.
group_code	Venue group information for an AP group.
	The following options are available:
	• 0 : UNSPECIFIED
	• 1 : ASSEMBLY
	• 2 : BUSINESS
	• 3 : EDUCATIONAL
	• 4 : FACTORY-INDUSTRIAL
	• 5 : INSTITUTIONAL
	• 6 : MERCANTILE
	• 7 : RESIDENTIAL
	• 8 : STORAGE
	• 9 : UTILITY-MISC
	• 10 : VEHICULAR
	• 11 : OUTDOOR

type_code

Venue type information for an AP group.

For venue group 1 (ASSEMBLY), the followin

- 0 : UNSPECIFIED ASSEMBLY
- 1 : ARENA
- 2 : STADIUM
- 3 : PASSENGER TERMINAL
- 4 : AMPHITHEATER
- 5 : AMUSEMENT PARK
- 6 : PLACE OF WORSHIP
- 7 : CONVENTION CENTER
- 8 : LIBRARY
- 9 : MUSEUM
- 10 : RESTAURANT
- 11 : THEATER
- 12 : BAR
- 13 : COFFEE SHOP
- 14 : ZOO OR AQUARIUM
- 15 : EMERGENCY COORDINATION C

For venue group 2 (BUSINESS), the following

- 0 : UNSPECIFIED BUSINESS
- 1 : DOCTOR OR DENTIST OFFICE
- 2 : BANK
- 3 : FIRE STATION
- 4 : POLICE STATION
- 6 : POST OFFICE
- 7 : PROFESSIONAL OFFICE
- 8 : RESEARCH AND DEVELOPMENT
- 9 : ATTORNEY OFFICE

For venue group 3 (EDUCATIONAL), the follo

- 0 : UNSPECIFIED EDUCATIONAL
- 1 : PRIMARY SCHOOL
- 2 : SECONDARY SCHOOL

• 3 : UNIVERSITY OR COLLEGE

For venue group 4 (FACTORY-INDUSTRIAL), the available:

- 0 : UNSPECIFIED FACTORY AND INDUS
- 1 : FACTORY

For venue group 5 (INSTITUTIONAL), the following

- 0 : UNSPECIFIED INSTITUTIONAL
- 1 : HOSPITAL
- 2 : LONG-TERM CARE FACILITY
- 3 : ALCOHOL AND DRUG RE-HABILITAT
- 4 : GROUP HOME
- 5 : PRISON OR JAIL

For venue group 6 (MERCANTILE), the following

- 0 : UNSPECIFIED MERCANTILE
- 1 : RETAIL STORE
- 2 : GROCERY MARKET
- 3 : AUTOMOTIVE SERVICE STATION
- 4 : SHOPPING MALL
- 5 : GAS STATION

For venue group 7 (RESIDENTIAL), the following

- 0 : UNSPECIFIED RESIDENTIAL
- 1 : PRIVATE RESIDENCE
- 2 : HOTEL OR MOTEL
- 3 : DORMITORY
- 4 : BOARDING HOUSE

For venue group 8 (STORAGE), the following opt

• 0 : UNSPECIFIED STORAGE

For venue group 9 (UTILITY-MISC), the followin

0 : UNSPECIFIED UTILITY AND MISCELI

	For venue group 10 (VEHICULAR), the follo
	• 0 : UNSPECIFIED VEHICULAR
	• 1 : AUTOMOBILE OR TRUCK
	• 2 : AIRPLANE
	• 3 : BUS
	• 4 : FERRY
	• 5 : SHIP OR BOAT
	• 6 : TRAIN
	• 7 : MOTOR BIKE
	For venue group 11 (OUTDOOR), the follow
	• 0 : UNSPECIFIED OUTDOOR
	• 1 : MINI-MESH NETWORK
	• 2 : CITY PARK
	• 3 : REST AREA
	• 4 : TRAFFIC CONTROL
	• 5 : BUS STOP
	• 6 : KIOSK
name	Configures the name of venue for an AP grou
language_code	An ISO-639 encoded string defining the lang string is a three character language code. For for English.
venue_name	Venue name for this AP group. This name is service set (BSS) and is used in cases where enough information about the venue. The ven can be up to 252 alphanumeric characters.
add	Adds an operating class for an AP group.
delete	Deletes an operating class for an AP group.
operating_class_value	Operating class for an AP group. The availal 83, 84, 112, 113, 115, 116, 117, 118, 119, 12 126, 127.

Command Default AP Group VLAN is disabled.

Command History

ReleaseModification7.6This command was introduced in a release earlier than Release 7.6.

Usage Guidelines

An error message appears if you try to delete an access point group that is used by at least one access point. Before you can delete an AP group in controller software release 6.0, move all APs in this group to another group. The access points are not moved to the default-group access point group as in previous releases. To see the APs, enter the **show wlan apgroups** command. To move APs, enter the **config ap group-name** *groupname cisco_ap* command.

The NAS-ID configured on the controller for AP group or WLAN or interface is used for authentication. The NAS-ID is not propagated across controllers.

The following example shows how to enable the NAC out-of band support on access point group 4:

(Cisco Controller) >config wlan apgroup nac enable apgroup 4

config wlan apgroup atf 802.11

Configure Cisco Airtime Fairness at an AP group level by using the config wlan apgroup atf 802.11 command.

config wlan apgroups atf 802.11 {a | b} {mode {disable | monitor | enforce-policy}
ap-group-name} | {optimization {enable | disable}}

Syntax Description	a	Specifies the 802.11a network settings
	b	Specifies the 802.11b/g network settings
	mode	Configures the granularity of Cisco ATF enforcement
	disable	Disables Cisco ATF
	monitor	Configures Cisco ATF in monitor mode
	enforce-policy	Configures Cisco ATF in enforcement mode
	ap-group-name	AP group name that you must specify
	optimization	Configures airtime optimization
	enable	Enables airtime optimization
	disable	Disabled airtime optimization

Command History

Release Modification

8.1 This command was introduced

To configure Cisco ATF in enforcement mode on an 802.11a network, for an AP group *my-ap-group*, enter the following command:

(Cisco Controller) >config wlan apgroup atf 802.11a mode enforce-policy my-ap-group

config wlan apgroup atf 802.11 policy

To configure AP group-level override for Cisco ATF policy on a WLAN by using this command:

config wlan apgroup atf 802.11 {a | b} policy ap-group-name wlan-id policy-name override {enable | disable}

Syntax Description	а	Specifies the 802.11a network settings
	b	Specifies the 802.11b network settings
	policy	Specifies the Cisco ATF policy
	ap-group-name	Name of the AP group that you must specify
	wlan-id	WLAN ID or Remote LAN ID that you must specify
	policy-name	Cisco ATF policy name that you must specify
	override	Configures ATF policy override for a WLAN in the AP group
	enable	Enables ATF policy override for a WLAN in the AP group
	disable	Disables ATF policy override for a WLAN in the AP group

Command History

Release Modification

8.1 This command was introduced

config wlan apgroup opendns-profile

To configure an open Domain Name System (DNS) profile to an access point (AP) group wireless LAN (WLAN), use the **config wlan apgroup opendns-profile** command.

config wlan apgroup opendns-profilewlan-id site-name profile-name enable

Syntax Description	wlan-id	WLAN identifier.
	site-name	Name of the AP group to configure.
	profile-name	OpenDNS profile name used for tracking this profile.
	enable	Enables OpenDNS identity.
	disable	Disables OpenDNS identity.
Command Default	The OpenDNS	S profile for an AP group WLAN is not created.
Command Modes	(Controller Co	onfiguration) >
Command History	Release Mod	ification
	8.4 This	command was introduced.
Usage Guidelines	None	

Example

The following example shows how to configure an openDNS profile to an AP group WLAN:

(Cisco Controller) > config wlan apgroup opendns-profile wlan1 site1 user1

config wlan apgroup qinq

To configure 802.1Q-in-Q VLAN tagging of traffic for an AP group, use the **config wlan apgroup qinq** command.

config wlan apgroup qinq {tagging {client-traffic | dhcp-v4 | eap-sim-aka} *apgroup_name* {**enable | disable**} | **service-vlan** *apgroup_name vlan_id*}

Syntax Description	tagging	Configures 802.1Q-in-Q VLAN tagging of traffic.	
	client-traffic	Configures 802.1Q-in-Q tagging of client traffic for an AP group.	
	dhcp-v4	Configures 802.1Q-in-Q tagging of DHCPv4 traffic for an AP group.	
	eap-sim-aka	Configures 802.1Q-in-Q tagging of Extensible Authentication Protocol for Authentication and Key Agreement (EAP-AKA) and EAP for Global System for Mobile Communications Subscriber Identity Module (EAP-SIM) traffic for an AP group.Enables 802.1Q-in-Q tagging of traffic.Disables 802.1Q-in-Q tagging of traffic.Configures service VLAN for an AP group.Name of the access point group.	
	enable		
	disable		
	service-vlan		
	apgroup_name		
	vlan_id	VLAN identifier.	
Command Default		VLAN identifier.	
Command Default Command History		Q-in-Q tagging of client and DHCPv4 traffic for an AP group is disabled.

config wlan assisted-roaming

To configure assisted roaming on a WLAN, use the config wlan assisted-roaming command.

	config wlan ass	sisted-roaming {neighbor-list dual-list prediction} {enable disable} wlan_id
Syntax Description	neighbor-list	Configures an 802.11k neighbor list for a WLAN.
	dual-list	Configures a dual band 802.11k neighbor list for a WLAN. The default is the band that the client is currently associated with.
	prediction	Configures an assisted roaming optimization prediction for a WLAN.
	enable	Enables the configuration on the WLAN.
	disable	Disables the configuration on the WLAN.
	wlan_id	Wireless LAN identifier between 1 and 512 (inclusive).
Command Default	The 802.11k ne	sighbor list is enabled for all WLANs.
	By default, dua	l band list is enabled if the neighbor list feature is enabled for the WLAN.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	•	ble the assisted roaming prediction list, a warning appears and load balancing is disabled for oad balancing is already enabled on the WLAN.
	The following of	example shows how to enable an 802.11k neighbor list for a WLAN:
	(Cisco Contro	oller) >config wlan assisted-roaming neighbor-list enable 1

config wlan atf

Map a WLAN to a Cisco ATF policy using the config wlan atf command.config wlan atf wlan-id policy policy-idSyntax Descriptionwlan-id WLAN ID that you must specify to which the Cisco ATF policy has to be mapped.policySpecifies the Cisco ATF policypolicy-idCisco ATF policy ID that you must specifyCommand HistoryRelease Modification8.1This command was introduced

config wlan avc

To configure Application Visibility and Control (AVC) on a WLAN, use the config wlan avc command.

config wlan avc *wlan_id* { **profile** *profile_name* | **visibility** } { **enable** | **disable** }

Syntax Description	wlan_id	Wireless LAN identifier from 1 to 512.	
	profile	Associates or removes an AVC profile from a WLAN.	
	profile_name	Name of the AVC profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.	
	visibility	Configures application visibility on a WLAN.	
	enable	Enables application visibility on a WLAN. You can view the classification of applications based on the Network Based Application Recognition (NBAR) deep packet inspection technology.	
		Use the show avc statistics client command to view the client AVC statistics.	
	disable	Disables application visibility on a WLAN.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	You can configure only one AVC profile per WLAN and each AVC profile can have up to 32 rules. Each rule states a Mark or Drop action for an application, which allows you to configure up to 32 application actions per WLAN. You can configure up to 16 AVC profiles on a controller and associate an AVC profile with multiple WLANs.		
	The following	example shows how to associate an AVC profile with a WLAN:	

config wlan band-select allow

To configure band selection on a WLAN, use the config wlan band-select allow command.

	config wl	an band-select allow {enable disable}	wlan_id
Syntax Description	enable	Enables band selection on a WLAN.	
	disable	Disables band selection on a WLAN.	
	wlan_id	Wireless LAN identifier between 1 and 512.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced i	n a release earlier than Release 7.6.
Usage Guidelines	the dual b the 2.4-G the 2.4-G	and clients to the 5-Ghz spectrum. The band-s Hz radio to the 5-GHz radio of the same acces	point suppresses client probes on 2.4-GHz and moves selection algorithm directs dual-band clients only from ss point, and it only runs on an access point when both d selection can be used only with Cisco Aironet 1040, s.
	The follow	wing example shows how to enable band sele	ection on a WLAN:
	(Cisco C	ontroller) >config wlan band-select al	llow enable 6

config wlan broadcast-ssid

To configure an Service Set Identifier (SSID) broadcast on a wireless LAN, use the **config wlan broadcast-ssid** command.

Syntax Description	enable	Enables SSID broadcasts on a wireless LAN.
	disable	Disables SSID broadcasts on a wireless LAN.
	wlan_id	Wireless LAN identifier between 1 and 512.
ommand Dafault	Broadcasting of	SSID is disabled
ommand Default ommand History	Broadcasting of Release	Modification

(Cisco Controller) >config wlan broadcast-ssid enable 1

config wlan call-snoop

To enable or disable Voice-over-IP (VoIP) snooping for a particular WLAN, use the **config wlan call-snoop** command.

config wlan call-snoop { **enable** | **disable** } *wlan_id* **Syntax Description** enable Enables VoIP snooping on a wireless LAN. disable Disables VoIP snooping on a wireless LAN. Wireless LAN identifier between 1 and 512. wlan_id None **Command Default Command History** Release Modification 7.6 This command was introduced in a release earlier than Release 7.6. WLAN should be with Platinum QoS and it needs to be disabled while invoking this CLI **Usage Guidelines** The following example shows how to enable VoIP snooping for WLAN 3: (Cisco Controller) >config wlan call-snoop 3 enable

config wlan chd

To enable or disable Coverage Hole Detection (CHD) for a wireless LAN, use the config wlan chd command.

config wlan chd *wlan_id* {**enable** | **disable**}

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	enable	Enables SSID broadcasts on a wireless LAN.
	disable	Disables SSID broadcasts on a wireless LAN.
Command Default	None	

Command History

ReleaseModification7.6This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable CHD for WLAN 3:

(Cisco Controller) >config wlan chd 3 enable

config wlan ccx aironet-ie

To enable or disable Aironet information elements (IEs) for a WLAN, use the **config wlan ccx aironet-ie** command.

config wlan ccx aironet-ie {enable | disable}

Syntax Description	enable	Enables the Aironet information elements.
	disable	Disables the Aironet information elements.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable Aironet information elements for a WLAN:

(Cisco Controller) >config wlan ccx aironet-ie enable

config wlan channel-scan defer-priority

To configure the controller to defer priority markings for packets that can defer off channel scanning, use the **config wlan channel-scan defer-priority** command.

config wlan channel-scan defer-priority [**enable** | **disable**] *wlan_id*

Syntax Description	priority	User priority value (0 to 7).
	enable	(Optional) Enables packet at given priority to defer off channel scanning.
	disable	(Optional) Disables packet at gven priority to defer off channel scanning.
	wlan_id	Wireless LAN identifier (1 to 512).
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	The priority va	lue should be set to 6 on the client and on the WLAN.
	e	example shows how to enable the controller to defer priority markings that can defer nning with user priority value 6 and WLAN id 30:
	(Cisco Contro	oller) >config wlan channel-scan defer-priority 6 enable 30

config wlan channel-scan defer-time

To assign the channel scan defer time in milliseconds, use the config wlan channel-scan defer-time command.

config wlan	channel-scan	defer-time	msecs	wlan_	id

Syntax Description	msecs	Deferral time in milliseconds (0 to 60000 milliseconds).
	wlan_id	Wireless LAN identifier from 1 to 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	The time value	in milliseconds should match the requirements of the equipment on your WLAN.
	The following of ID 50:	example shows how to assign the scan defer time to 40 milliseconds for WLAN with

(Cisco Controller) >config wlan channel-scan defer-time 40 50

config wlan custom-web

To configure the web authentication page for a WLAN, use the **config wlan custom-web** command.

config wlan custom-web { { ext-webauth-url ext-webauth-url wlan_id } | { global { enable | disable }} | { ms-open { enable | disable | url }} | { login-page page-name } | { loginfailure-page { page-name | none }} | { logout-page { page-name | none }} | { sleep-client { enable | disable } wlan_id timeout duration } | { webauth-type { internal | customized | external } wlan_id }}

Syntax Description	ext-webauth-url	Configures an external web authentication URL.
	ext-webauth-url	External web authentication URL.
	wlan_id	WLAN identifier. Default range is from 1 to 512.
	global	Configures the global status for a WLAN.
	enable	Enables the global status for a WLAN.
	disable	Disables the global status for a WLAN.
	ms-open	Configures the ms-open feature on the WLAN.
	enable	Enables the ms-open feature on the WLAN.
	disable	Disables the ms-open feature on the WLAN.
	url	Configures ms-open URL.
	login-page	Configures the name of the login page for an external web authentication URL.
	page-name	Login page name for an external web authentication URL.
	loginfailure-page	Configures the name of the login failure page for an external web authentication URL.
	none	Does not configure a login failure page for an external web authentication URL.
	logout-page	Configures the name of the logout page for an external web authentication URL.
	sleep-client	Configures the sleep client feature on the WLAN.
	timeout	Configures the sleep client timeout on the WLAN.
	duration	Maximum amount of time after the idle timeout, in hours, before a sleeping client is forced to reauthenticate. The range is from 1 to 720. The default is 12. When the sleep client feature is enabled, the clients need not provide the login credentials when they move from one controller to another (if the controllers are in the same mobility group) between the sleep and wake-up times.
	webauth-type	Configures the type of web authentication for the WLAN.
	internal	Displays the default login page.

8.2

	customized	Displays a customized login page.
	external	Displays a login page on an external web server.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

This command was modified and the ms-open parameters were added.

The following example shows how to configure web authentication type in the WLAN.

Cisco Controller config wlan custom-web webauth-type external

config wlan dhcp_server

To configure the internal DHCP server for a wireless LAN, use the **config wlan dhcp_server** command.

config wlan dhcp_server {*wlan_id* | **foreignAp**} *ip_address* [**required**]

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
	ip_address	IP address of the internal DHCP server (this parameter is required).
	required	(Optional) Specifies whether DHCP address assignment is required.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	interface instead	ethod for configuring DHCP is to use the primary DHCP address assigned to a particular of the DHCP server override. If you enable the override, you can use the show wlan command e DHCP server has been assigned to the WLAN.
	The following ex for wireless LAN	cample shows how to configure an IP address 10.10.2.1 of the internal DHCP server N ID 16:
	(Cisco Control	ller) >config wlan dhcp_server 16 10.10.2.1

config wlan diag-channel

To enable the diagnostic channel troubleshooting on a particular WLAN, use the **config wlan diag-channel** command.

Syntax Description	enable	(Optional) Enables the wireless LAN diagnostic channel.
	disable	(Optional) Disables the wireless LAN diagnostic channel.
	wlan_id	Wireless LAN identifier (1 to 512).
ommand Default	None	
ommand History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config wlan diag-channel enable 1

config wlan dtim

To configure a Delivery Traffic Indicator Message (DTIM) for 802.11 radio network **config wlan dtim** command.

config wlan dtim {802.11a | 802.11b} dtim wlan_id

Syntax Description	802.11a	Configures DTIM for the 802.11a radio network.
	802.11b	Configures DTIM for the 802.11b radio network.
	dtim	Value for DTIM (between 1 to 255 inclusive).
	wlan_id	Number of the WLAN to be configured.
Command Default	The default is I	DTIM 1.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure DTIM for 802.11a radio network with DTIM value 128 and WLAN ID 1:

(Cisco Controller) >config wlan dtim 802.11a 128 1

config wlan exclusionlist

To configure the wireless LAN exclusion list, use the config wlan exclusionlist command.

config wlan exclusionlist {*wlan_id* [**enabled** | **disabled** | *time*] | **foreignAp** [**enabled** | **disabled** | *time*] }

Syntax Description	wlan_id	Wireless LAN identifier (1 to 512).			
	enabled	(Optional) Enables the exclusion list for the specified wireless LAN or foreign access point.			
	disabled	(Optional) Disables the exclusion list for the specified wireless LAN or a foreign access point.			
	time	(Optional) Exclusion list timeout in seconds. A value of zero (0) specifies infinite time.			
	foreignAp	Specifies a third-party access point.			
Command Default	None				
Command History	Release	Modification			
	7.6	This command was introduced in a release earlier than Release 7.6.			
Usage Guidelines	This command replaces the config wlan blacklist command.				
	The following ex	xample shows how to enable the exclusion list for WLAN ID 1:			
	(Cisco Control	ller) >config wlan exclusionlist 1 enabled			

config wlan fabric

To enable or disable fabric on a WLAN, use the config wlan fabric command.

	config wlan fabric { enable disable } <i>wlan-id</i>
Syntax Description	enable Enables fabric on a WLAN.
	disable Disables fabric on a WLAN.
	wlan-id WLAN identifier.
Command Default	-
Command Modes	
Command History	Release Modification
	8.5 This command was introduced.
Usage Guidelines	Non-fabric APs are not configured with fabric WLAN.
	Example
	The following example shows how to enable fabric on a WLAN:

config wlan fabric enable wlan1

config wlan fabric acl

To configure access control list (ACL) name for the fabric WLAN, use the config wlan fabric acl command.

config wlan fabric acl flex-acl-name wlan-id

Syntax Description	flex-acl-name	e ACL name.	
	wlan-id	WLAN identifier.	
Command Default	_		
Command Modes	-		
Command History	Release Mod	ification	
		command was duced.	
Usage Guidelines	The ACL to b	e used comes from the	Flex ACL table.
Examples	The following	example shows how t	o configure an ACL name for the fabric WLAN:
	(Cisco Conti	coller) >config wla	n fabric acl flexACL wlan1

config wlan fabric avc-policy

To configure an Application Visibility and Control (AVC) profile name for the fabric WLAN, use the config wlan fabric avc-policy command.

config wlan fabric avc-policy flex-avc-policy-name wlan-id

Syntax Description	flex-av	c-policy-name	AVC policy name.
	wlan-ia	ł	WLAN identifier
Command Default	None		
Command History	Release	Modification	
	8.5	This command introduced.	l was
Examples	The foll	owing example	shows how to con

C profile name for the fabric WLAN:

(Cisco Controller) >config wlan fabric acl AVCpolicy wlan1

config wlan fabric encap vxlan

To map a Virtual Extensible LAN (VXLAN) network identifier (VNID) to a WLAN, use the **config wlan fabric encap vxlan** command.

config wlan fabric encap vxlanwlan-id

Syntax Description	wlan-id	WLAN identifier.	
Command Default	None		
Command History	Release	Modification	
	8.5	This command was introduced.	
Examples	The foll	owing example shows how	to map a VNID to a WLAN:

(Cisco Controller) >config wlan fabric encap vxlan wlan1

config wlan fabric switch-ip

To configure the IP address of the Fabric Switch that is used for the AP VXLAN tunnel, use the **config wlan fabric switch-ip** command.

config wlan fabric switch-ip ip-address wlan-id

Syntax Description	<i>ip-address</i> IP address of the switch.
	wlan-id WLAN identifier.
Command Default	
Command Modes	
Command History	Release Modification
	8.5 This command was introduced.
Usage Guidelines	This command is optional for the fabric configuration, and is mainly used for guest AP tunnel. If fabric is enabled, the Switch IP where AP is connected is searched by default. You can set IP as 0.0.0.0 to disable the configuration and revert to the default configuration.
Examples	The following example shows how to configure the IP address of the Fabric Switch that is used for the AP VXLAN tunnel:
	(Cisco Controller) >config wlan fabric switch-ip 209.165.200.224 wlan1

I

config wlan fabric tag

To configure security group tag (SGT) on a WLAN, use the config wlan fabric tag command.

config wlan fabric tag sgt wlan-id

Syntax Description	<i>tag.</i> Security group
	vlan-id WLAN identifier.
Command Default	lone
Command History	Release Modification
	3.5 This command was introduced.
Usage Guidelines	o disable SGT on a WLAN, use zero at the <i>sgt</i> variable.
	deally SGT should be acquired during authentication from the RADIUS server. For guests, this value can be onfigured. The default value is 0.
Examples	the following example shows how to configure SGT on a WLAN:
	Cisco Controller) > config wlan fabric tag sgt1 wlan1
	the following example shows how to disable SGT from a WLAN:
	Cisco Controller) > config wlan fabric tag 0 wlan1

config wlan fabric vnid

To configure Virtual Extensible LAN (VXLAN) network identifier (VNID) on a fabric WLAN, use the **config** wlan fabric vnid command.

	config w	lan fabric vnid vnid wlan-id	1
Syntax Description	vnid	VXLAN network identifier.	
	wlan-id	WLAN identifier.	
Command Default	None		
Command History	Release	Modification	-
	8.5	This command was introduced.	-
Usage Guidelines	To remo	ve VXLAN mapping from a W	/LAN, use zero at the <i>vnid</i> variable.
	The inter	face or VLAN mapping on the	e WLAN will be done on the switch.
Examples	The follo	owing example shows how to o	config VNID on a fabric WLAN:
	(Cisco	Controller) > config wlan :	fabric vnid1 wlan1
	The follo	owing example shows how to r	remove VNID mapping from a fabric WLAN:
	(Cisco	Controller) > config wlan :	fabric 0 wlan1

config wlan flexconnect ap-auth

To configure local authentication of clients associated with FlexConnect on a locally switched WLAN, use the **config wlan flexconnect ap-auth** command.

config wlan flexconnect ap-auth wlan_id	d {ena	ble	disable }	
---	--------	-----	-----------	--

Syntax Description	ap-auth	Configures local authentication of clients associated with an FlexConnect on a locally switched WLAN.
	wlan_id	Wireless LAN identifier between 1 and 512.
	enable	Enables AP authentication on a WLAN.
	disable	Disables AP authentication on a WLAN.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	Local switchin associated with	g must be enabled on the WLAN where you want to configure local authentication of clients a FlexConnect.
	The following on a specified	example shows how to enable authentication of clients associated with FlexConnect WLAN:
	(Cisco Contro	oller) >config wlan flexconnect ap-auth 6 enable

config wlan flexconnect central-assoc

To configure client reassociation and security key caching on the controller, use the **config wlan flexconnect central-assoc** command.

config wlan flexconnect central-assoc *wlan-id* { enable | disable }

Syntax Description	wlan-id	ID of the WLAN	
	enable	Enables client reassociation and security key caching on the controller	
	disable	Disables client reassociation and security key caching on the controller	
Command Default	Client reassociation and security key caching on the controller is in t	he disabled state.	
Command History	Release Modification		
	8.0 This command was introduced.		
Usage Guidelines	A use case for this configuration is a large-scale deployment with fas	st roaming.	
	Configuration of central association with local authentication is not supported for the WLAN. After the PMIPv6 tunnel is set up, all data traffic from the PMIPv6 clients are forwarded from the Cisco AP to the local mobility anchor (LMA) in the Generic Routing Encapsulation (GRE) tunnel. If the connectivity between the Cisco AP and the controller is lost, the data traffic for the existing PMIPv6 clients continues to flow until the connectivity between the Cisco AP and the client is lost. When the AP is in stand-alone mode, no new client associations are accepted on the PMIPv6-enabled WLAN.		
	The following example shows how to enable client reassociation and controller for a WLAN whose ID is 2:	l security key caching on the	
	(Cisco Controller) >config wlan flexconnect central-assoc	2 enable	

config wlan flexconnect learn-ipaddr

To enable or disable client IP address learning for the Cisco WLAN controller, use the **config wlan flexconnect learn-ipaddr** command.

config wlan flexconnect learn-ipaddr *wlan_id* {**enable** | **disable**}

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	enable	Enables client IPv4 address learning on a wireless LAN.
	disable	Disables client IPv4 address learning on a wireless LAN.

Command DefaultDisabled when the config wlan flexconnect local-switching command is disabled. Enabled when the config
wlan flexconnect local-switching command is enabled.

Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	8.0	This command supports only IPv4 address format.

Usage Guidelines If the client is configured with Layer 2 encryption, the controller cannot learn the client IP address, and the controller will periodically drop the client. Disable this option to keep the client connection without waiting to learn the client IP address.

Note This command is valid only for IPv4.

Note The ability to disable IP address learning is not supported with FlexConnect central switching.

The following example shows how to disable client IP address learning for WLAN 6:

(Cisco Controller) >config wlan flexconnect learn-ipaddr disable 6

 Note
 This command is valid only for IPv4.

Note The ability to disable IP address learning is not supported with FlexConnect central switching.

The following example shows how to enable WLAN 6 for local switching and enable central DHCP and NAT-PAT:

(Cisco Controller) >config wlan flexconnect local-switching 6 enable central-dhcp enable nat-pat enable

The following example shows how to enable the override DNS option on WLAN 6:

(Cisco Controller) >config wlan flexconnect local-switching 6 override option dns enable

config wlan flexconnect vlan-central-switching

To configure central switching on a locally switched WLAN, use the **config wlan flexconnect vlan-central-switching** command.

config wlan flexconnect vlan-central-switching wlan_id { enable | disable }

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.	
	enable	Enables central switching on a locally switched wireless LAN.	
	disable Disables central switching on a locally switched wireless LAN.		
Command Default	Central switching	ng is disabled.	
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	central switchin 802.1Q link. If t	le Flexconnect local switching to enable VLAN central switching. When you enable WLAN ng, the access point bridges the traffic locally if the WLAN is configured on the local IEEE the VLAN is not configured on the access point, the AP tunnels the traffic back to the controller ler bridges the traffic to the corresponding VLAN.	
	WLAN central switching does not support:		
	FlexConnect local authentication.		
	• Layer 3 ro	aming of local switching client.	
	The following e	example shows how to enable WLAN 6 for central switching:	

(Cisco Controller) >config wlan flexconnect vlan-central-switching 6 enable

config wlan flow

To associate a NetFlow monitor with a WLAN, use the **config wlan flow** command.

config wlan flow *wlan_id* **monitor** *monitor_name* { **enable** | **disable** }

Syntax Description	wlan_id	Wireless LAN identifier from 1 to 512 (inclusive).
	monitor	Configures a NetFlow monitor.
	monitor_name	Name of the NetFlow monitor. The monitor name can be up to 32 case-sensitive, alphanumeric characters. You cannot include spaces for a monitor name.
	enable	Associates a NetFlow monitor with a WLAN.
	disable	Dissociates a NetFlow monitor from a WLAN.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Jsage Guidelines	You can use the	config flow command to create a new NetFlow monitor.
	The following ex	xample shows how to associate a NetFlow monitor with a WLAN:
	(Cisco Control	ler) >config wlan flow 5 monitor monitor1 enable

config wlan hotspot

To configure a HotSpot on a WLAN, use the **config wlan hotspot** command.

Syntax Description	clear-all	Clears the HotSpot configurations on a WLAN.
	wlan_id	Wireless LAN identifier from 1 to 512.
	dot11u	Configures an 802.11u HotSpot on a WLAN.
	hs2	Configures HotSpot2 on a WLAN.
	msap	Configures the Mobility Services Advertisement Protocol (MSAP) on a WLAN
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
sage Guidelines		This command was introduced in a release earlier than Release 7.6.
Jsage Guidelines	You can co	

config wlan hotspot dot11u

To configure an 802.11u HotSpot on a WLAN, use the config wlan hotspot dot11u command.

config wlan hotspot dot11u {3gpp-info | auth-type | enable | disable | domain | hessid | ipaddr-type | nai-realm | network-type | roam-oi}

Syntax Description	3gpp-info	Configures 3GPP cellular network information.
	auth-type	Configures the network authentication type.
	disable	Disables 802.11u on the HotSpot profile.
	domain	Configures a domain.
	enable	Enables 802.11u on the HotSpot profile. IEEE 802.11u enables automatic WLAN offload for 802.1X devices at the HotSpot of mobile or roaming partners.
	hessid	Configures the Homogenous Extended Service Set Identifier (HESSID). The HESSID is a 6-octet MAC address that uniquely identifies the network.
	ipaddr-type	Configures the IPv4 address availability type.
	nai-realm	Configures a realm for 802.11u enabled WLANs.
	network-type	Configures the 802.11u network type and Internet access.
	roam-oi	Configures the roaming consortium Organizational Identifier (OI) list.
Command Default	None.	

Command HistoryReleaseModification7.6This command was introduced in a release earlier than Release 7.6.8.0This command supports only IPv4 address format.

The following example shows how to enable 802.11u on a HotSpot profile:

(Cisco Controller) >config wlan hotspot dotllu enable 6

config wlan hotspot dot11u 3gpp-info

To configure 3GPP cellular network information on an 802.11u HotSpot WLAN, use the **config wlan hotspot dot11u 3gpp-info** command.

config wlan hotspot dot11u 3gpp-info {**add** | **delete**} *index country_code network_code wlan_id*

Syntax Description	add	Adds mobile cellular network information.
	delete	Deletes mobile cellular network information.
	index	Cellular index. The range is from 1 to 32.
	country_code	Mobile Country Code (MCC) in Binary Coded Decimal (BCD) format. The country code can be up to 3 characters. For example, the MCC for USA is 310.
	network_code	Mobile Network Code (MNC) in BCD format. An MNC is used in combination with a Mobile Country Code (MCC) to uniquely identify a mobile phone operator or carrier. The network code can be up to 3 characters. For example, the MNC for T- Mobile is 026.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	Number of mob	ile network codes supported is 32 per WLAN.
	The following e	xample shows how to configure 3GPP cellular network information on a WLAN:
	(Cisco Contro	ller) >config wlan hotspot dot11u 3gpp-info add

config wlan hotspot dot11u auth-type

To configure the network authentication type on an 802.11u HotSpot WLAN, use the **config wlan hotspot dot11u auth-type** command.

	config wlan ho	tspot dot11u auth-type network-auth wlan_id
Syntax Description	network-auth	Network authentication that you would like to configure on the WLAN. The available values are as follows:
		• 0—Acceptance of terms and conditions
		• 1—On-line enrollment
		• 2—HTTP/HTTPS redirection
		• 3—DNS Redirection
		• 4—Not Applicable
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	The DNS redire	ection option is not supported in Release 7.3.
	-	example shows how to configure HTTP/HTTPS redirection as the network type on an 802.11u HotSpot WLAN:

(Cisco Controller) >config wlan hotspot dotllu auth-type 2 1

config wlan hotspot dot11u disable

To disable an 802.11u HotSpot on a WLAN, use the config wlan hotspot dot11u disable command.

	config wlan ho	otspot dot11u disable wlan_id
Syntax Description	wlan_id Wir	eless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to disable an 802.11u HotSpot on a WLAN:

(Cisco Controller) >config wlan hotspot dot11u disable 6

config wlan hotspot dot11u domain

To configure a domain operating in the 802.11 access network, use the **config wlan hotspot dot11u domain** command.

config wlan hotspot dot11u domain { **add** *wlan_id domain-index domain_name* | **delete** *wlan_id domain-index* | **modify** *wlan_id domain-index domain_name* }

Syntax Description	add	Adds a domain.
	wlan_id	Wireless LAN identifier between 1 and 512.
	domain-index	Domain index in the range 1 to 32.
	domain_name	Domain name. The domain name is case sensitive and can be up to 255 alphanumeric characters.
	delete	Deletes a domain.
	modify	Modifies a domain.
Command Default	None	
Command History	Release	Modification

nand History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to add a domain in the 802.11 access network:

(Cisco Controller) >config wlan hotspot dotllu domain add 6 30 domain1

config wlan hotspot dot11u enable

To enable an 802.11u HotSpot on a WLAN, use the config wlan hotspot dot11u enable command.

	config wlan h	otspot dot11u enable wlan_id
Syntax Description	wlan_id Wi	reless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable an 802.11u HotSpot on a WLAN:

(Cisco Controller) >config wlan hotspot dotllu enable 6

config wlan hotspot dot11u hessid

To configure a Homogenous Extended Service Set Identifier (HESSID) on an 802.11u HotSpot WLAN, use the **config wlan hotspot dot11u hessid** command.

config wlan hotspot dot11u hessid hessid wlan_id

Syntax Description	hessid	MAC address that can be configured as an HESSID. The HESSID is a 6-octet MAC address that uniquely identifies the network. For example, Basic Service Set Identification (BSSID) of the WLAN can be used as the HESSID.		
	wlan_id	Wireless LAN identifier between 1 and 512.		
Command Default	None			
command Default	rione			
Command History	Release	Modification		

The following example shows how to configure an HESSID on an 802.11u HotSpot WLAN:

(Cisco Controller) >config wlan hotspot dotllu hessid 00:21:1b:ea:36:60 6

config wlan hotspot dot11u ipaddr-type

To configure the type of IP address available on an 802.11u HotSpot WLAN, use the **config wlan hotspot dot11u ipaddr-type** command.

config wlan hotspot dot11u ipaddr-type *IPv4Type* {0 - 7} *IPv6Type* {0 - 2}*wlan_id*

ntax Description	IPv4Type	IPv4 type address. Enter one of the following values:
		0—IPv4 address not available.
		1—Public IPv4 address available.
		2—Port restricted IPv4 address available.
		3—Single NAT enabled private IPv4 address available.
		4—Double NAT enabled private IPv4 address available.
		5-Port restricted IPv4 address and single NAT enabled IPv4 address available.
		6-Port restricted IPv4 address and double NAT enabled IPv4 address available.
		7— Availability of the IPv4 address is not known.
	IPv6Type	IPv6 type address. Enter one of the following values:
		0—IPv6 address not available.
		1—IPv6 address available.
		2—Availability of the IPv6 address is not known.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default The default values for 1		t values for IPv4 type address is 1.
ommand History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	8.0	This command supports only IPv4 address format.
	The followi WLAN:	ing example shows how to configure the IP address availability type on an 802.11u H
	(Cisco Co	ntroller) >config wlan hotspot dotl1u ipaddr-type 6 2 6
Related Commands		

config wlan hotspot dot11u nai-realm

To configure realms for an 802.11u HotSpot WLANs, use the **config wlan hotspot dot11u nai-realm** command.

config wlan hotspot dot11u nai-realm {**add** | **delete** | **modify**} {**auth-method** *wlan_id realm-index eap-index auth-index auth-method auth-parameter* | **eap-method** *wlan_id realm-index eap-index eap-method* | **realm-name** *wlan_id realm-index realm*}

add	Adds a realm.				
delete	Deletes a realm.				
modify	Modifies a realm.				
auth-method	Specifies the authentication method used.				
wlan_id	Wireless LAN identifier from 1 to 512.				
realm-index	Realm index. The range is from 1 to 32.				
eap-index	EAP index. The range is from 1 to 4.				
auth-index	Authentication index value. The range is from 1 to 10.				
auth-method	Authentication method to be used. The range is from 1 to 4. The following options are available:

(Cisco Controller) >config wlan hotspot dotllu nai-realm add auth-method 4 10 3 5 4 6

config wlan hotspot dot11u network-type

To configure the network type and internet availability on an 802.11u HotSpot WLAN, use the **config wlan** hotspot dot11u network-type command.

config wlan hotspot dot11u network-type wlan_id network-type internet-access

Syntax Description	wlan_id	Wireless LAN identifier from 1 to 512.
	network-type	Network type. The available options are as follows:
		• 0—Private Network
		1—Private Network with Guest Access
		• 2—Chargeable Public Network
		• 3—Free Public Network
		4—Personal Device Network
		5—Emergency Services Only Network
		• 14—Test or Experimental
		• 15—Wildcard
	internet-access	Internet availability status. A value of zero indicates no Internet availability and 1 indicates Internet availability.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

802.11u HotSpot WLAN:

(Cisco Controller) >config wlan hotspot dot11u network-type 2 1

config wlan hotspot dot11u roam-oi

To configure a roaming consortium Organizational Identifier (OI) list on a 802.11u HotSpot WLAN, use the **config wlan hotspot dot11u roam-oi** command.

config wlan hotspot dot11u roam-oi { **add** *wlan_id oi-index oi is-beacon* | **modify** *wlan_id oi-index oi is-beacon* | **delete** *wlan_id oi-index* }

	_	
Syntax Description	add	Adds an OI.
	wlan-id	Wireless LAN identifier from 1 to 512.
	oi-index	Index in the range 1 to 32.
	oi	Number that must be a valid 6 digit hexadecimal number and 6 bytes in length. For example, 004096 or AABBDF.
	is-beacon	Beacon flag used to add an OI to the beacon. 0 indicates disable and 1 indicates enable. You can add a maximum of 3 OIs for a WLAN with this flag set.
	modify	Modifies an OI.
	delete	Deletes an OI.
Command Default	None.	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the roaming consortium OI list:

(Cisco Controller) >config wlan hotspot dotllu roam-oi add 4 10 004096 1

config wlan hotspot hs2

To configure the HotSpot2 parameters, use the config wlan hotspot hs2 command.

config wlan hotspot hs2 {**disable** *wlan_id* | **enable** *wlan_id* | **operator-name** {**add** *wlan_id index operator_name language-code* | **delete** *wlan_id index* | **modify** *wlan_id index operator-name language-code* } | **port-config** {**add** *wlan_id port_config_index ip-protocol port-number status* | **delete** *wlan_id port-config-index* | **modify** *wlan_id port-config-index ip-protocol port-number status* | **delete** *wlan_id index ip-protocol port-number status* | **delete** *wlan_id port-config-index* | **modify** *wlan_id port-config-index ip-protocol port-number status* } | **wan-metrics** *wlan_id link-status symet-link downlink-speed uplink-speed* }

Syntax Description	disable	Disables HotSpot2.	
	wlan-id	Wireless LAN identifier from 1 to 512.	
	enable	Enables HotSpot2.	
	operator-name	Specifies the name of the 802.11 operator.	
	add	Adds the operator name, port configuration, or WAN metrics parameters to the WLAN configuration.	
	index	Index of the operator. The range is from 1 to 32.	
	operator-name	Name of the operator.	
	language-code	Language used. An ISO-14962-1997 encoded string that defin language. This string is a three character language code. Ente first three letters of the language in English. For example, eng English.	
	delete	Deletes the operator name, port configuration, or WAN metric parameters from the WLAN.	
	modify	Modifies the operator name, port configuration, or WAN metroparameters of the WLAN.	
	port-config	Configures the port configuration values.	
	port_config_index	Port configuration index. The range is from 1 to 32. The defa value is 1.	
	ip-protocol	Protocol to use. This parameter provides information on the connection status of the most commonly used communication protocols and ports. The following options are available:	
		1—ICMP	
		6—FTP/SSH/TLS/PPTP-VPN/VoIP	
		17—IKEv2 (IPSec-VPN/VoIP/ESP)	
		50—ESP (IPSec-VPN)	

port-number	Port number. The following options are available:
	0—ICMP/ESP (IPSec-VPN)
	20—FTP
	22—SSH
	443—TLS-VPN
	500—IKEv2
	1723—PPTP-VPN
	4500—IKEv2
	5060—VoIP
status	Status of the IP port. The following options are available:
	0—Closed
	1—Open
	2—Unknown
wan-metrics	Configures the WAN metrics.
link-status	Link status. The following options are available:
	• 0—Unknown
	• 1—Link up
	• 2—Link down
	• 3—Link in test state
symet-link	Symmetric link status. The following options are available:
	• 0—Link speed is different for uplink and downlink. For example: ADSL
	• 1—Link speed is the same for uplink and downlink. For example: DS1
downlink-speed	Downlink speed of the WAN backhaul link in kbps. Maximum v is 4,194,304 kbps.
uplink-speed	Uplink speed of the WAN backhaul link in kbps. The maximum value is 4,194,304 kbps.
None	
Release	Modification
7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the WAN metrics parameters:

Command Default

Command History

(Cisco Controller) >config wlan hotspot hs2 wan-metrics add 345 1 0 3333

config wlan hotspot hs2 domain-id

To configure a domain ID, use the **config wlan hotspot hs2 domain-id** command in WLAN configuration mode.

config wlan hotspot hs2 domain-id wlan-id domain-id

Syntax Description	wlan-id	WLAN identification number.	Enter a value between 1 and 512.
	domain-id	Domain ID. Enter a value betw	veen 0 to 65535.
Command Default	The domain	n ID is not configured.	
Command Modes	WLAN con	figuration	
Command History	Release	Modification	
	Release 8.2	This command was introduced.	

This example shows how to configure a domain ID:

Cisco Controller > config wlan hotspot hs2 domain-id 12 2

config wlan hotspot hs2 osu legacy-ssid

To configure Online Sign Up (OSU) Service Set Identifier (SSID) name, use the **config wlan hotspot hs2 osu legacy-ssid** command in WLAN configuration mode.

config wlan hotspot hs2 osu legacy-ssid wlan-id ssid-name

wlan-id	WLAN identification number. H	Enter a value between 1 and 512.
ssid-name	SSID name.	
OSU SSID	name is not configured.	
WLAN con	figuration	
Release	Modification	
Release 8.2	This command was introduced.	
	ssid-name OSU SSID WLAN con Release Release	ssid-name SSID name. OSU SSID name is not configured. WLAN configuration Release Modification Release This command was introduced.

This example shows how to configure an OSU SSID name:

Cisco Controller > config wlan hotspot hs2 osu legacy-ssid 12 cisco

config wlan hotspot hs2 osu sp create

To create the Online Sign Up (OSU) service provider name, use the **config wlan hotspot hs2 osu sp create** command in WLAN configuration node.

config wlan hotspot hs2 osu sp create *wlan-id osu-index lang-code* **ascii/hex** *friendly-name* [*description*]

wlan-id	WLAN identification number. Enter a value between 1 and 512.				
osu-index	OSU index. Enter a value between 1 and 16.				
lang-code	Language code. Enter 2 or 3 letters from ISO-639, for example, eng for English.				
ascii/hex	Specifies the text format, whether ASCII or Hex.				
friendly-nam	<i>ndly-name</i> Service provider name. The maximum limit is 252 characters.				
description	(Optional) Server description. The maximum limit is 252 characters.				
The OSU serv	vice provider name is not configured.				
WLAN config	guration				
Release I	Modification				
Release 8.2	This command was introduced.				
	osu-index lang-code ascii/hex friendly-nam description The OSU ser WLAN confi Release Release				

This example shows how to configure an OSU service provider name:

Cisco Controller > config wlan hotspot hs2 osu sp create 12 2 eng ascii cisco server-1

config wlan hotspot hs2 osu sp delete

To delete the Online Sign Up (OSU) service provider, use the config wlan hotspot hs2 osu sp delete command.

config wlan hotspot hs2 osu sp delete wlan-idosu-index lang-code

2.
, eng for English.

This example shows how to delete an OSU service provider:

Cisco Controller > config wlan hotspot hs2 osu sp delete 12 2 eng

config wlan hotspot hs2 osu sp icon-file add

To configure an Online Sign Up (OSU) icon file on a particular WLAN, use the **config wlan hotspot hs2 osu sp icon-file add** command in WLAN configuration mode.

config wlan hotspot hs2 osu sp icon-file add wlan-idosu-index icon-filename

Syntax Description	wlan-id	WLAN identification number. Enter a value between 1 and 512.
	osu-index	OSU index. Enter a value between 1 and 16.
	icon-filenam	<i>e</i> Filename of the icon.
Command Default	The OSU ico	n file is not configured.
Command Modes	WLAN confi	guration
Command History	Release	Modification
	Release 8.2	This command was introduced.
	0.2	
Usage Guidelines		this command, configure icon parameters using the config icon <i>file-info</i> command.
Usage Guidelines	Before using	this command, configure icon parameters using the config icon <i>file-info</i> command.

config wlan hotspot hs2 osu sp icon-file delete

To delete an Online Sign Up (OSU) icon file from a WLAN, use the **config wlan hotspot hs2 osu sp icon-file delete** command in WLAN configuration mode.

config wlan hotspot hs2 osu sp icon-file delete wlan-idosu-index icon-filename

Syntax Description	wlan-id	WLAN identification number. Enter a value between 1 and 512.
	osu-index	OSU index. Enter a value between 1 and 16.
	icon-filenam	<i>e</i> Filename of the icon.
Command Default	The OSU icon	n file is configured.
Command Modes	WLAN config	guration
Command History	Release M	Nodification
	Release 7 8.2	This command was introduced.

This example shows how to delete an OSU icon file from a WLAN:

Cisco Controller > config wlan hotspot hs2 osu sp icon-file delete 12 2 test-icon

config wlan hotspot hs2 osu sp method add

To configure an Online Sign Up (OSU) method list, use the **config wlan hotspot hs2 osu sp method add** command in WLAN configuration mode.

config wlan hotspot hs2 osu sp method add wlan-id osu-index method-primary method-secondary

wlan-id	WLAN identification n	umber. Enter a value between 1 and 512.
osu-index	OSU index. Enter a val	ue between 1 and 16.
method-pr	rimary Primary OSU encoding	method. Valid values are: oma-dm or soap-xml .
method-se	econdary (Optional) Secondary (OSU encoding method. Valid values are: oma-dm or soap-xml .
The OSU 1	method list is not configured.	
WLAN co	nfiguration	
Release	Modification	
Release 8.2	This command was introduced.	
	osu-index method-pu method-see The OSU n WLAN co Release Release	osu-index OSU index. Enter a val method-primary Primary OSU encoding method-secondary (Optional) Secondary C The OSU method list is not configured. WLAN configuration Release Modification Release This command was introduced.

This example shows how to configure an OSU method list:

Cisco Controller > config wlan hotspot hs2 osu sp method add 12 2 oma-dm oma-dm

config wlan hotspot hs2 osu sp method delete

To delete an Online Sign Up (OSU) method list, use the **config wlan hotspot hs2 osu sp method delete** command in WLAN configuration mode.

config wlan hotspot hs2 osu sp method delete wlan-id osu-index method

Syntax Description	wlan-id	WLAN identification number. Enter a value between 1 and 512.
	osu-index	OSU index. Enter a value between 1 and 16.
	method	The OSU encoding method. Valid values are oma-dm or soap-xml .
Command Default	The OSU n	nethod list is configured.
Command Modes	WLAN con	ifiguration
Command History	Release	Modification
	Release 8.2	This command was introduced.

This example shows how to delete an OSU method list:

Cisco Controller > config wlan hotspot hs2 osu sp method delete 12 2 oma-dm

config wlan hotspot hs2 osu sp nai add

To create an Online Sign Up (OSU) Network Access Identifier (NAI), use the **config wlan hotspot hs2 osu sp nai add** command in WLAN configuration mode.

config wlan hotspot hs2 osu sp nai add wlan-id osu-index nai	config wlan	hotspot h	s2 osu sp	o nai add	wlan-id	osu-index	nai
--	-------------	-----------	-----------	-----------	---------	-----------	-----

Syntax Description	wlan-id	WLAN identification number. Enter a value between 1 and 512.
	osu-index	OSU index. Enter a value between 1 and 16.
	nai	OSU Server NAI. Enter a name within a maximum limit of 255 characters
Command Default	The OSU N	VAI is not configured.
Command Modes	WLAN con	figuration
Command History	Release	Modification
	Release 8.2	This command was introduced.

This example shows how to configure an OSU NAI:

Cisco Controller > config wlan hotspot hs2 osu sp nai add 12 2 nai-1 $\,$

config wlan hotspot hs2 osu sp nai delete

To delete an Online Sign Up (OSU) Network Access Identifier (NAI), use the **config wlan hotspot hs2 osu sp nai delete** command in WLAN configuration mode.

config wlan	hotspot hs2	osu sp nai delete	wlan-id	osu-index
-------------	-------------	-------------------	---------	-----------

Syntax Description	wlan-id	WLAN identification number. I	Enter a value between 1 and 512.
	osu-index	OSU index. Enter a value betw	een 1 and 16.
Command Default	The OSU N	NAI is configured.	
Command Modes	WLAN cor	ofiguration	
Command History	Release	Modification	
	Release 8.2	This command was introduced.	
	-		

This example shows how to delete an OSU NAI:

Cisco Controller > config wlan hotspot hs2 osu sp nai delete 12 2

config wlan hotspot hs2 osu sp uri add

To create an Online Sign Up (OSU) URI, use the **config wlan hotspot hs2 osu sp uri add** command in WLAN configuration mode.

config wlan hotspot hs2 osu sp uri add wlan-id osu-index uri

Syntax Description	wlan-id	WLAN identification number. I	Enter a value between 1 and 512.
	osu-index	OSU index. Enter a value betwee	een 1 and 16.
	uri	OSU server name. Enter a Unifo	rm Resource Identifier (URI) with a maximum of 255 characters.
Command Default	The OSU U	JRI is not configured.	
Command Modes	WLAN cor	nfiguration	
Command History	Release	Modification	
	Release 8.2	This command was introduced.	

This example shows how to create an OSU URI:

Cisco Controller > config wlan hotspot hs2 osu sp uri add 12 2 server

config wlan hotspot hs2 osu sp uri delete

	To delete a	n Online Sign Up (OSU) URI, us	e the config wlan hotspot hs2 o	su sp uri delete command.
	config wla	n hotspot hs2 osu sp uri delete	wlan-idosu-index	
Syntax Description	wlan-id	WLAN identification number. I	Enter a value between 1 and 512.	-
	osu-index	OSU index. Enter a value betw	een 1 and 16.	-
Command Default	The OSU U	JRI is configured.		
Command Modes	WLAN con	nfiguration		
Command History	Release	Modification		
	Release 8.2	This command was introduced.		

This example shows how to delete an OSU URI:

Cisco Controller > config wlan hotspot hs2 osu sp uri delete 12 2

config wlan hotspot hs2 wan-metrics downlink

To configure the downlink WAN metrics, use the **config wlan hotspot hs2 wan-metrics downlink** command in WLAN configuration mode.

config wlan hotspot hs2 wan-metrics downlink wlan-id dlink-speed dlink-load

Syntax Description	wlan-id	WLAN identification number. Enter a value between 1 and 512.
	dlink-speed	WAN backhaul link speed, in Kbps. The range is from 0 to 4,294,967,295.
	dlink-load	WAN backhaul link load. The range is from 0 to 100.
Command Default	The downlin	k WAN metrics are not configured.
Command Modes	WLAN conf	iguration
Command History	Release	Modification
	Release 8.2	This command was introduced.

This example shows how to configure downlink WAN metrics:

Cisco Controller > config wlan hotspot hs2 wan-metrics downlink 12 2468 10

config wlan hotspot hs2 wan-metrics link-status

To configure the link status of WAN metrics, use the **config wlan hotspot hs2 wan-metrics link-status** command in WLAN configuration mode.

	config wlar	hotspot hs2 wan-metrics link-status wlan-id link-status
Syntax Description	wlan-id	WLAN identification number. Enter a value between 1 and 512
	link-status	Link status. Valid values are:
		• 0 —Unknown
		• 1 —Up
	• 2 —Down	
		• 3 —Test
Command Default	The link sta	tus is not configured.
Command Modes	WLAN con	figuration
Command History	Release	Modification
	Release	This command was introduced.

Cisco Controller > config wlan hotspot hs2 wan-metrics link-status 12 1

config wlan hotspot hs2 wan-metrics Imd

To configure the load measurement duration of WAN metrics, use the **config wlan hotspot hs2 wan-metrics Imd** command in WLAN configuration mode.

config wlan hotspot hs2 wan-metrics lmd wlan-id lmd-value

Syntax Description	wlan-id	WLAN identification number.	Enter a value between 1 and 512.
	lmd-value	Load measurement duration of	WAN. The range is from 0 to 65535.
Command Default	Load meas	urement duration of WAN is not c	configured.
Command Modes	WLAN cor	ofiguration	
Command History	Release	Modification	
	Release 8.2	This command was introduced.	

This example shows how to configure load measurement duration of WAN metrics:

Cisco Controller > config wlan hotspot hs2 wan-metrics lmd 1 2456

config wlan hotspot hs2 wan-metrics uplink

To configure the uplink WAN metrics, use the **config wlan hotspot hs2 wan-metrics uplink** command in WLAN configuration mode.

config wlan hotspot hs2 wan-metrics uplink wlan-id ulink-speed ulink-load

Syntax Description	wlan-id	WLAN identification number. Enter a value between 1 and 512.
	ulink-speed	WAN backhaul link speed, in Kbps. The range is from 0 to 4,294,967,295.
	ulink-load	WAN backhaul link load. The range is from 0 to 100.
Command Default	The uplink V	WAN metrics are not configured.
Command Modes	WLAN conf	figuration
Command History	Release	Modification
	Release	This command was introduced.

This example shows how to configure the uplink WAN metrics:

Cisco Controller > config wlan hotspot hs2 wan-metrics uplink 12 2468 10

config wlan hotspot msap

To configure the Mobility Service Advertisement Protocol (MSAP) parameters on a WLAN, use the **config** wlan hotspot msap command.

config wlan hotspot msap {enable | disable | server-id *server_id} wlan_id*

Syntax Description	enable	Enables MSAP on the WLAN.
	disable	Disables MSAP on the WLAN.
	server-id	Specifies the MSAP server id.
	server_id	MSAP server ID. The range is from 1 to 10.
	wlan id	Wireless LAN identifier from 1 to 512.

 Command History
 Release
 Modification

 7.6
 This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable MSAP on a WLAN:

(Cisco Controller) >config wlan hotspot msap enable 4

config wlan interface

To configure a wireless LAN interface or an interface group, use the config wlan interface command.

config wlan interface {*wlan_id* | **foreignAp**} {*interface-name* | *interface-group-name*}

Syntax Description	wlan_id	(Optional) Wireless LAN identifier (1 to 512).
	foreignAp	Specifies third-party access points.
	interface-name	Interface name.
	interface-group-name	P Interface group name.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config wlan interface 16 VLAN901

config wlan ipv6 acl

To configure IPv6 access control list (ACL) on a wireless LAN, use the config wlan ipv6 acl command.

config wlan ipv6 acl wlan_id acl_name

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	acl_name	IPv6 ACL name.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure an IPv6 ACL for local switching:

(Cisco Controller) >config wlan ipv6 acl 22 acl_sample

config wlan kts-cac

To configure the Key Telephone System-based CAC policy for a WLAN, use the **config wlan kts-cac** command.

config wlan kts-cac { **enable** | **disable** } *wlan_id*

Syntax Description	enable	Enables the KTS-based CAC policy.
	disable	Disables the KTS-based CAC policy.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	To enable the k	KTS-based CAC policy for a WLAN, ensure that you do the following:
-	Configure	the QoS profile for the WLAN to Platinum by entering the following command:
	config wla	an qos wlan-id platinum
	• Disable th	e WLAN by entering the following command:
	config wla	an disable wlan-id
	• Disable F	lexConnect local switching for the WLAN by entering the following command:
	config wla	an flexconnect local-switching wlan-id disable
	The following 4:	example shows how to enable the KTS-based CAC policy for a WLAN with the ID

(Cisco Controller) >config wlan kts-cac enable 4

config wlan layer2 acl

To configure a Layer 2 access control list (ACL) on a centrally switched WLAN, use the **config wlan acl layer2** command.

	<pre>config wlan layer2 acl wlan_id { acl_name none }</pre>			
Syntax Description	<i>wlan_id</i> Wireless LAN identifier. The range is from 1 to 512.			
	acl_name Layer2 ACL name. The name can be up to 32 alphanumeric characters.			
	none Clears any Layer2 ACL mapped to the WLAN.			
Command Default	None			
Command History	Release Modification			
	7.5 This command was introduced.			
Usage Guidelines	You can create a maximum of 16 rules for a Layer 2 ACL.			
	You can create a maximum of 64 Layer 2 ACLs on a controller.			
	A maximum of 16 Layer 2 ACLs are supported per access point because an access point supports a maximum of 16 WLANs.			
	S			
	Ensure that the Layer 2 ACL names do not conflict with the FlexConnect ACL names because an access point does not support the same Layer 2 and Layer 3 ACL names.			
	The following example shows how to apply a Layer 2 ACL on a WLAN:			
	(Cisco Controller) >config wlan layer2 acl 1 acl_12_1			

config wlan ldap

To add or delete a link to a configured Lightweight Directory Access Protocol (LDAP) server, use the **config** wlan ldap command.

config wlan ldap { **add** *wlan_id server_id* | **delete** *wlan_id* { **all** | *server_id* } }

Syntax Description	add	Adds a link to a configured LDAP server.
	wlan_id	Wireless LAN identifier between 1 and 512.
	server_id	LDAP server index.
	delete	Removes the link to a configured LDAP server.
	all	Specifies all LDAP servers.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	Use this comma	and to specify the LDAP server priority for the WLAN.
	To specify the I	DAP server priority, one of the following must be configured and enabled:
	• 802.1X au	thentication and Local EAP
	• Web authe	ntication and LDAP
	Note Local I	EAP was introduced in controller software release 4.1; LDAP support on athentication was introduced in controller software release 4.2.

The following example shows how to add a link to a configured LDAP server with the WLAN ID 100 and server ID 4:

(Cisco Controller) >config wlan ldap add 100 4

config wlan learn-ipaddr-cswlan

To configure client IP address learning on a centrally switched WLAN, use the **config wlan learn-ipaddr-cswlan** command.

	config wl	an learn-ipaddr-cswlan <i>wlan_id</i> {enable disable}		
Syntax Description	wlan_id	Wireless LAN identifier from 1 to 512.		
	enable	Enables client IPv4 address learning on the centrally switched WLAN		
	disable	Disables client IPv4 address learning on the centrally switched WLAN		
Command Default	None			
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
	8.0	This command supports only IPv4 address format.		
Usage Guidelines	If the client is configured with Layer 2 encryption, the controller cannot learn the client IP address and will periodically drop the client. Disable this option so that the controller maintains the client connection without waiting to learn the client IP address.			
	The follow WLAN:	wing example shows how to enable client IP address learning on a centrally switched		
	(Cisco C	ontroller) > config wlan learn-ipaddr-cswlan 2 enable		
Related Commands	show wla	show wlan		

config wlan load-balance

To override the global load balance configuration and enable or disable load balancing on a particular WLAN, use the **config wlan load-balance** command.

Syntax Description	enable	Enables band selection on a wireless LAN.
	disable	Disables band selection on a wireless LAN.
	wlan id	Wireless LAN identifier between 1 and 512.
Command Default	Load balancing	is enabled by default.
Command Default Command History	Load balancing	is enabled by default. Modification

(Cisco Controller) >config wlan load-balance allow enable 3

config wlan lobby-admin-access

To provide admin access to the lobby user on a particular WLAN, use the **config wlan lobby-admin-access** command.

Syntax Description	enable	Enables band selection on a wireless LAN.
	disable	Disables band selection on a wireless LAN.
	wlan_id	Wireless LAN identifier between 1 and 512.

Command Default Lobby admin user is disabled by default.

Command History	Release	Modification
	8.4	This command was introduced.

The following example shows how to enable lobby admin on a WLAN:

(Cisco Controller) >config wlan lobby-admin-access enable 2

config wlan mac-filtering

To change the state of MAC filtering on a wireless LAN, use the config wlan mac-filtering command.

config wlan mac-filtering {**enable** | **disable**} {*wlan_id* | **foreignAp**}

Syntax Description	enable	Enables MAC filtering on a wireless LAN.
	disable	Disables MAC filtering on a wireless LAN.
	wlan_id	Wireless LAN identifier from 1 to 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable the MAC filtering on WLAN ID 1:

(Cisco Controller) >config wlan mac-filtering enable 1

config wlan max-associated-clients

To configure the maximum number of client connections on a wireless LAN, guest LAN, or remote LAN, use the **config wlan max-associated-clients** command.

config wlan max-associated-clients max_clients wlan_id

Syntax Description	max_clients	Maximum number of client connections to be accepted.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to specify the maximum number of client connections on WLAN ID 2:

(Cisco Controller) >config wlan max-associated-clients 25 2

config wlan max-radio-clients

To configure the maximum number of WLAN client per access point, use the **config wlan max-radio-clients** command.

config wlan max-radio-clients max_radio_clients wlan_id

Syntax Description	max_radio_clients	Maximum number of client connections to be accepted per access point radio. The valid range is from 1 to 200.
	wlan_id	Wireless LAN identifier between 1 and 512.
	Name	
Command Default	None	
Command Default Command History	Release	Modification

The following example shows how to specify the maximum number of client connections per access point radio on WLAN ID 2:

(Cisco Controller) >config wlan max-radio-clients 25 2

I

config wlan mdns

To configure an multicast DNS (mDNS) profile for a WLAN, use the config wlan mdns command.

	config wlan mdns {enable disable profile {profile-name none} } {wlan_id all}				
Syntax Description	enable	Enables mDNS snooping on a WLAN.			
	disable	Disables mDNS snooping on a WLAN.			
	profile	Configures an mDNS profile for a WLAN.			
	profile-name	Name of the mDNS profile to be associated with a WLAN.			
	none	Removes all existing mDNS profiles from the WLAN. You cannot configure mDNS profiles on the WLAN.			
	wlan_id	Wireless LAN identifier from 1 to 512.			
	all	Configures the mDNS profile for all WLANs.			
Command Default	By default, mI	DNS snooping is enabled on WLANs.			
Command History	Release Modif	fication			
	7.4 This c introd	command was luced.			
Usage Guidelines	the services as interface group	ble the WLAN before you use this command. Clients receive service advertisements only for sociated with the profile. The controller gives the highest priority to the profiles associated to bs, followed by the interface profiles, and then the WLAN profiles. Each client is mapped to a on the order of priority.			
	The following	example shows how to configure an mDNS profile for a WLAN.			
	(Cisco Contr	oller) >config wlan mdns profile profile1 1			

config wlan media-stream

To configure multicast-direct for a wireless LAN media stream, use the config wlan media-stream command.

config wlan media-stream multicast-direct {*wlan_id* | **all**} {**enable** | **disable**}

Syntax Description	multicast-direct	Configures multicast-direct for a wireless LAN media stream.
	wlan_id	Wireless LAN identifier between 1 and 512.
	all	Configures the wireless LAN on all media streams.
	enable	Enables global multicast to unicast conversion.
	disable	Disables global multicast to unicast conversion.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines		ast-direct requires load based Call Admission Control (CAC) to run. WLAN quality of to be set to either gold or platinum.
	The following examp ID 2:	ble shows how to enable the global multicast-direct media stream with WLAN
	(Cisco Controller)	>config wlan media-stream multicast-direct 2 enable

config wlan mfp

To configure management frame protection (MFP) options for the wireless LAN, use the **config wlan mfp** command.

config wlan mfp { **client** [**enable** | **disable**] *wlan_id* | **infrastructure protection** [**enable** | **disable**] *wlan_id* }

Syntax Description	client enable disable wlan_id infrastructure protection		Configures client MFP for the wireless LAN.				
			 (Optional) Enables the feature. (Optional) Disables the feature. Wireless LAN identifier (1 to 512). (Optional) Configures the infrastructure MFP for the wireless LAN. 				
				Command Default	None		
				Command History	Release	Modification	1
					7.6	This comma	nd was introduced in a release earlier than Release 7.6.

The following example shows how to configure client management frame protection for WLAN ID 1:

(Cisco Controller) >config wlan mfp client enable 1

config wlan mobility anchor

To change the state of MAC filtering on a wireless LAN, use the config wlan mobility anchor command.

config wlan mobility anchor { **add** | **delete** } *wlan_id ip_addr* **priority** *priority-number*

Syntax Description	add	Enables MAC filtering on a wireless LAN.
	delete	Disables MAC filtering on a wireless LAN.
	wlan_id	Wireless LAN identifier between 1 and 512.
	ip_addr	Member switch IPv4 address for anchoring the wireless LAN.
	priority	Sets priority to the anchored wireless LAN IP address.
	priority-number	Range between 1 to 3.
Command Default	None	

-			
Րոՠՠ	hne	History	

ory	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	8.0	This command supports only IPv4 address format.	
	8.1	priority <i>number</i> parameter introduced.	

The following example shows how to configure and set priority to the mobility wireless LAN anchor list with WLAN ID 4 and IPv4 address 192.168.0.14

(Cisco Controller) >config wlan mobility anchor add 4 192.168.0.14 priority 1

Related Commands show wlan

config wlan mobility foreign-map

To configure interfaces or interface groups for foreign controllers, use the **config wlan mobility foreign-map** command.

config wlan mobility foreign-map { **add** | **delete** } *wlan_id foreign_mac_address* { *interface_name* | *interface_group_name* }

Syntax Description	add	Adds an interface or interface group to the map of foreign controllers.
	delete	Deletes an interface or interface group from the map of foreign controllers.
	wlan_id	Wireless LAN identifier from 1 to 512.
	foreign_mac_address	Foreign switch MAC address on a WLAN.
	interface_name	Interface name up to 32 alphanumeric characters.
	interface_group_name	Interface group name up to 32 alphanumeric characters.
ommand Default	None	
Command History	Release M	lodification
	7.6 TI	his command was introduced in a release earlier than Release 7.6.

The following example shows how to add an interface group for foreign controllers with WLAN ID 4 and a foreign switch MAC address on WLAN 00:21:1b:ea:36:60:

(Cisco Controller) >config wlan mobility foreign-map add 4 00:21:1b:ea:36:60 mygroup1

config wlan multicast buffer

To configure the radio multicast packet buffer size, use the config wlan multicast buffer command.

Syntax Description	enable	Enables the multicast interface feature for a wireless LAN.
	disable	Disables the multicast interface feature on a wireless LAN.
	buffer-size	Radio multicast packet buffer size. The range is from 30 to 60. Enter 0 to indicate APs will dynamically adjust the number of buffers allocated for multicast.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	The default buff	er size is 30
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure radio multicast buffer settings:

(Cisco Controller) >config wlan multicast buffer enable 45 222

config wlan multicast interface

To configure a multicast interface for a wireless LAN, use the config wlan multicast interface command.

config wlan multicast interface *wlan_id* {**enable** | **disable**} *interface_name*

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.		
	enable	Enables multicast interface feature for a wireless LAN.		
delete		Disables multicast interface feature on a wireless LAN.		
	interface_name	Interface name.		
		Note The interface name can only be specified in lower case characters.		
Command Default	Multicast is disable	ed.		
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		

The following example shows how to enable the multicast interface feature for a wireless LAN with WLAN ID 4 and interface name myinterface1:

(Cisco Controller) >config wlan multicast interface 4 enable myinterface1

config wlan mu-mimo

To enable Multi-User, Multiple-Input, Multiple-Output (MU-MIMO) on a WLAN, enter the **config wlan mu-mimo** command.

config wlan mu-mimo { enable disable } <i>wlan-id</i>			
Syntax Description	enable	e wlan-id	Enables MU-MIMO on the WLAN that is specified
	disabl	e wlan-id	Disables MU-MIMO on the WLAN that is specified
Command History	Release	e Modific	cation
	8.1	This cor	mmand was introduced.

config wlan nac

To enable or disable Network Admission Control (NAC) out-of-band support for a WLAN, use the **config** wlan nac command.

config wlan nac {**snmp** | **radius**} {**enable** | **disable**} *wlan_id* **Syntax Description** snmp Configures SNMP NAC support. radius Configures RADIUS NAC support. enable Enables NAC for the WLAN. disable Disables NAC for the WLAN. wlan_id WLAN identifier from 1 to 512. None **Command Default Command History** Release Modification 7.6 This command was introduced in a release earlier than Release 7.6. You should enable AAA override before you enable the RADIUS NAC state. You also should disable **Usage Guidelines** FlexConnect local switching before you enable the RADIUS NAC state. The following example shows how to configure SNMP NAC support for WLAN 13: (Cisco Controller) >config wlan nac snmp enable 13 The following example shows how to configure RADIUS NAC support for WLAN 34: (Cisco Controller) >config wlan nac radius enable 20

config wlan override-rate-limit

To override the bandwidth limits for upstream and downstream traffic per user and per service set identifier (SSID) defined in the QoS profile, use the **config wlan override-rate-limit** command.

config wlan override-rate-limit *wlan_id* { average-data-rate | average-realtime-rate | burst-data-rate | burst-realtime-rate } { per-ssid | per-client } { downstream | upstream } *rate*

Syntax Description	wlan_id		Wireless LAN identifier between 1 and 512.	
	average-data-rate average-realtime-rate burst-data-rate burst-realtime-rate per-ssid per-client downstream upstream rate		Specifies the average data rate for TCP traffic per user or per SSID. The range is from 0 to 51,2000 Kbps.	
			Specifies the average real-time data rate for UDP traffic per user or per SSID. The range is from 0 to 51,2000 Kbps.	
			Specifies the peak data rate for TCP traffic per user or per SSID. The range is from 0 to 51,2000 Kbps.	
			Specifies the peak real-time data rate for UDP traffic per user or per SSID. The range is from 0 to 51,2000 Kbps.	
			Configures the rate limit for an SSID per radio. The combined traffic of all clients will not exceed this limit.	
			Configures the rate limit for each client associated with the SSID.	
			Configures the rate limit for downstream traffic. Configures the rate limit for upstream traffic.	
				Data rate for TCP or UDP traffic per user or per SSID. The range is form 0 to 51,2000 Kbps. A value of 0 imposes no bandwidth restriction on the QoS profile.
			Command Default	None
Command History	Release	Modification		
	7.6	This command was int	roduced in a release earlier than Release 7.6.	
Usage Guidelines	The rate limits are enforced by the controller and the AP. For central switching, the controller handles the downstream enforcement of per-client rate limit and the AP handles the enforcement of the upstream traffic and per-SSID rate limit for downstream traffic. When the AP enters standalone mode it handles the downstream enforcement of per-client rate limits too.			
	AP for downst	ream and upstream traffic. How	ne modes, per-client and per-SSID rate limiting is done by the vever, in FlexConnect standalone mode, the configuration is not configuration is lost and rate limiting does not happen after	

For roaming clients, if the client roams between the APs on the same controller, same rate limit parameters are applied on the client. However, if the client roams from an anchor to a foreign controller, the per-client downstream rate limiting uses the parameters configured on the anchor controller while upstream rate limiting uses the parameters of the foreign controller.

The following example shows how to configure the burst real-time actual rate 2000 Kbps for the upstream traffic per SSID:

(Cisco Controller) >config wlan override-rate-limit 2 burst-realtime-rate per-ssid upstream 2000

config wlan opendns-mode

To configure WLAN OpenDNS mode to force or copy or ignore the DNS to OpenDNS server access, use the **config wlan opendns-mode**command.

config wlan opendns-mode *wlan-id* { ignore | force | copy }

ignore force	Ignores the OpenDNS mode.	
force	Forces the OpenDNS mode.	
	-	
сору	Copies the OpenDNS mode.	
(Controll	(Controller Configuration) >	
Release	Modification	
8.4	This command was introduced.	
	(Controll Release	

Example

The following example shows how to configure per WLAN OpenDNS mode to copy DNS to OpenDNS server:

(Cisco Controller) > config wlan opendns-mode wlan1 copy

config wlan opendns-profile

To configure per WLAN OpenDNS profile to force or copy or ignore the Domain Name System (DNS) to OpenDNS server access, use the **config wlan opendns-profile** command.

	config wlan o	pendns profile <i>wlan-id profile-name</i> { enable disab
Syntax Description	wlan-id	Wireless LAN network.
	profile-name	OpenDNS profile name used for tracking this profile.
	enable	Maps OpenDNS identity.
	disable	Removes OpenDNS identity.
Command Modes	(Controller Co	onfiguration) >
Command History	Release Mod	ification
	8.4 This	command was introduced.
Usage Guidelines	None	

onfig wlan opendns profile *wlan-id profile-name* {enable | disable}

Example

The following example shows how to configure a WLAN on OpenDNS profile to force the DNS to OpenDNS server:

(Cisco Controller) > config wlan opendns-profile wlan1 user1 enable

I

config wlan passive-client

Syntax Description	enable	Enables the passive-client feature on a WLAN.
	disable	Disables the passive-client feature on a WLAN.
	wlan_id	WLAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
		able the global multicast mode and multicast-multicast mode by using the config network al and config network multicast mode commands before entering this command.

(Cisco Controller) >config wlan passive-client enable 2

config wlan peer-blocking

To configure peer-to-peer blocking on a WLAN, use the config wlan peer-blocking command.

config wlan peer-blocking {**disable** | **drop** | **forward-upstream**} *wlan_id* **Syntax Description** disable Disables peer-to-peer blocking and bridge traffic locally within the controller whenever possible. drop Causes the controller to discard the packets. forward-upstream Causes the packets to be forwarded on the upstream VLAN. The device above the controller decides what action to take regarding the packets. wlan_id WLAN identifier between 1 and 512. None **Command Default Command History** Modification Release 7.6 This command was introduced in a release earlier than Release 7.6.

The following example shows how to disable the peer-to-peer blocking for WLAN ID 1:

(Cisco Controller) >config wlan peer-blocking disable 1

config wlan pmipv6 default-realm

To configure a default realm for a PMIPv6 WLAN, use the config wlan pmipv6 default-realm command.

config wlan pmipv6 default-realm { default-realm-name | none } wlan_id

Syntax Description	default-realm-name Default realm name for the WLAN.			
	none	Clears the realm name for the WLAN.		
	wlan_id	Wireless LAN identifier between 1 and 512.		
Command Default	None.			

Command History

Release	Modification
7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure a default realm name on a PMIPv6 WLAN:

(Cisco Controller) >config wlan pmipv6 default-realm XYZ 6

I

config wlan pmipv6 mobility-type

To configure the mobility type on a WLAN, use the **config wlan pmipv6 mobility-type** command.

	config wla	n pmipv6 mobility-type {none pmipv6 } { w	$vlan_id \mid all \}$
Syntax Description	none	Configures a WLAN with Simple IP mobility.	
	pmipv6	Configures a WLAN with PMIPv6 mobility.	
	all	Enables the specified type of mobility for all WLANs.	
	wlan_id	WLAN identifier between 1 and 512.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release	earlier than Release 7.6.
Usage Guidelines	You must disable the WLAN when you configure the mobility type.		
	The following example shows how to configure the mobility type as PMIPv6 on a WLAN:		
	(Cisco Controller) >config wlan pmipv6 mobility-type pmipv6 16		

config wlan pmipv6 profile_name

To configure a profile name for the PMIPv6 WLAN, use the config wlan pmipv6 profile_name command.

config wlan pmipv6 profile_name profile_name wlan_id

Syntax Description	profile_nam	<i>e</i> Profile name for the PMIPv6 WLAN.
	wlan_id	Wireless LAN identifier from 1 to 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	with the cont	nd binds a profile name to the PMIPv6 WLAN or SSID. Each time that a mobile node associates roller, it uses the profile name and NAI in the trigger to the PMIPV6 module. The PMIPV6 cts all the profile specific parameters such as LMA IP, APN, and NAI and sends the PBU to the
	The followin	g example shows how to create a profile named ABC01 on a PMIPv6 WLAN:
	(Cisco Cont	roller) >config wlan pmipv6 profile_name ABC01 16

I

config wlan policy

To configure a policy on a WLAN, use the **config wlan policy** command.

config wlan policy { **add** | **delete** } *priority-index wlan-id*

Syntax Description	add	Adds a policy on a WLAN.		
	delete	Deletes an existing policy from a WLAN.		
	priority-index	Priority index of the policy to be configured on the WLAN. The policies are applied to the clients according to the priority index. The range is from 1 to 16. Name of the profiling policy. WLAN identifier from 1 to 512.		
	policy_name			
	wlan-id			
Command Default	There is no WLAN policy.			
Command History	Release Modification			
	7.5 This command was introduced.			
Usage Guidelines	You can apply up to 16 policies on a WLAN.			
	The following example shows how t	to configure a policy on a WLAN:		
	(Cisco Controller) > config wla	n policy add 1 teacher_policy 1		

config wlan profiling

To configure client profiling on a WLAN, use the config wlan profiling command.

Syntax Description	local	Configures client profiling in Local mode for a WLAN.
	radius	Configures client profiling in RADIUS mode on a WLAN.
	all	Configures DHCP and HTTP client profiling in a WLAN.
	dhcp	Configures DHCP client profiling alone in a WLAN.
	http	Configures HTTP client profiling in a WLAN.
	enable	Enables the specific type of client profiling in a WLAN.
		When you enable HTTP profiling, the controller collects th HTTP attributes of clients for profiling.
		When you enable DHCP profiling, the controller collects th DHCP attributes of clients for profiling.
	disable	Disables the specific type of client profiling in a WLAN.
	wlan_id	
-	Ensure that you	Wireless LAN identifier from 1 to 512.
Command Default	Ensure that you Client profiling	a have disabled the WLAN before configuring client profiling on the WLAN.
Command Default	Ensure that you	a have disabled the WLAN before configuring client profiling on the WLAN.
Command Default	Ensure that you Client profiling Release 7.6	a have disabled the WLAN before configuring client profiling on the WLAN. g is disabled. Modification This command was introduced in a release earlier than Release 7.6.

config wlan qos

To change the quality of service (QoS) for a wireless LAN, use the config wlan qos command.

config wlan qos wlan_id { bro	onze s	silver	gold	platinum }
config wlan qos foreignAp {	bronze	silver	gold	platinum }

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.				
	bronze	Specifies the bronze QoS policy.				
	silver	Specifies the silver QoS policy.				
	gold	Specifies the gold QoS policy.				
	platinum	Specifies the platinum QoS policy.				
	foreignAp	Specifies third-party access points.				
Command Default	The default QoS	policy is silver.				
Command History	Release	Modification				
	7.6	This command was introduced in a release earlier than Release 7.6.				

The following example shows how to set the highest level of service on wireless LAN 1:

(Cisco Controller) >config wlan qos 1 gold

config wlan radio

To set the Cisco radio policy on a wireless LAN, use the **config wlan radio** command.

 $config wlan \ radio \ wlan_id \ \{ all \ | \ 802.11a \ | \ 802.11bg \ | \ 802.11g \ | \ 802.11ag \}$

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	all	Configures the wireless LAN on all radio bands.
	802.11a	Configures the wireless LAN on only 802.11a.
	802.11b g	Configures the wireless LAN on only 802.11b/g (only 802.11b if 802.11g is disabled).
	802.11g	Configures the wireless LAN on 802.11g only.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the wireless LAN on all radio bands:

(Cisco Controller) >config wlan radio 1 all

config wlan radius_server acct

To configure RADIUS accounting servers of a WLAN, use the config wlan radius_server acct command.

config wlan radius_server acct {**enable** | **disable**} *wlan_id* | **add** *wlan_id server_id* | **delete** *wlan_id* {**all** | *server_id*} | **framed-ipv6** { **address** | **both** | **prefix** } *wlan_id*}

Syntax Description	enable	Enables RADIUS accounting for the WLAN.
	disable	Disables RADIUS accounting for the WLAN.
	wlan_id	Wireless LAN identifier from 1 to 512.
	add	Adds a link to a configured RADIUS accounting server.
	server_id	RADIUS server index.
	delete	Deletes a link to a configured RADIUS accounting server.
	address	Configures an accounting framed IPv6 attribute to an IPv6 address.
	both	Configures the accounting framed IPv6 attribute to an IPv6 address and prefix.
	prefix	Configures the accounting framed IPv6 attribute to an IPv6 prefix.

Command Default None

 Command History
 Release
 Modification

 7.6
 This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable RADIUS accounting for the WLAN 2:

(Cisco Controller) >config wlan radius_server acct enable 2

The following example shows how to add a link to a configured RADIUS accounting server:

(Cisco Controller) > config wlan radius_server acct add 2 5

7.6

config wlan radius_server acct interim-update

To configure the interim update of a RADIUS accounting server of a WLAN, use the **config wlan radius_server acct interim-update** command.

config wlan radius_server acct interim-update { **enable** | **disable** | *interval* } *wlan_id*

Suntax Description		
Syntax Description	interim-update	Configures the interim update of the RADIUS accounting server.
	enable	Enables interim update of the RADIUS accounting server for the WLAN.
	disable	Disables interim update of the RADIUS accounting server for the WLAN.
	interval	Interim update interval that you specify. The valid range is 180 seconds to 3600 seconds.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	Interim update of a	a RADIUS accounting sever is set at 600 seconds.
Command History	Release	Modification
	-	

The following example shows how to specify an interim update of 200 seconds to a RADIUS accounting server of WLAN 2:

This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config wlan radius_server acct interim-update 200 2

config wlan radius_server auth

To configure RADIUS authentication servers of a WLAN, use the config wlan radius_server auth command.

config wlan radius_server auth {**enable** *wlan_id* | **disable** *wlan_id*} {**add** *wlan_id server_id* | **delete** *wlan_id* {**all** | *server_id*} }

Syntax Description	auth	Configures a RADIUS authentication
	enable	Enables RADIUS authentication for this WLAN.
	wlan_id	Wireless LAN identifier from 1 to 512.
	disable	Disables RADIUS authentication for this WLAN.
	add	Adds a link to a configured RADIUS server.
	server_id	RADIUS server index.
	delete	Deletes a link to a configured RADIUS server.
	all	Deletes all links to configured RADIUS servers.
Command Default	None	
Command History	Release	Modification

The following example shows how to add a link to a configured RADIUS authentication server with WLAN ID 1 and Server ID 1:

This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config wlan radius_server auth add 1 1

7.6

config wlan radius_server overwrite-interface

To configure a wireless LAN's RADIUS dynamic interface, use the **config wlan radius_server overwrite-interface** command.

config wlan radius_server overwrite-interface { **enable** | **disable** } *wlan_id*

Syntax Description	enable	Enables RADIUS dynamic interface for this WLAN.
	disable	Disables RADIUS dynamic interface for this WLAN.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines		uses the management interface as identity. If the RADIUS server is on a directly connected ace, the traffic is sourced from the dynamic interface. Otherwise, the management IP address
		enabled, controller uses the interface specified on the WLAN configuration as identity and ADIUS related traffic on the WLAN.
	The following on 1:	example shows how to enable RADIUS dynamic interface for a WLAN with an ID
	(Cisco Contro	oller) >config wlan radius_server overwrite-interface enable 1

config wlan radius_server realm

To configure realm on a WLAN, use the config wlan radius_server realm command.

config wlan *radius_server***realm** { **enable** | **disable** } *wlan-id*

Syntax Description	radius_server	Radius server index. The range is from 1 to 17.	
	enable	Enable realm on a WLAN.	
	disable	Disable realm on a WLAN.	
	wlan-id	WLAN ID. The range is from 1 to 512.	
Command Default	None		
Command History	Release	Modification	
	8.0	This command was introduced.	

The following example shows how to enable realm on a WLAN:

(Cisco Controller) > config wlan 2 realm enable 50

config wlan roamed-voice-client re-anchor

To configure a roamed voice client's reanchor policy, use the **config wlan roamed-voice-client re-anchor** command.

config wlan roamed-voice-client re-anchor {**enable** | **disable**} *wlan_id*

enable	Enables the roamed client's reanchor policy.
disable	Disables the roamed client's reanchor policy.
wlan_id	Wireless LAN identifier between 1 and 512.
The roamed clie	ent reanchor policy is disabled.
Release	Modification
-	disable wlan_id The roamed clie

The following example shows how to enable a roamed voice client's reanchor policy where WLAN ID is 1:

(Cisco Controller) >config wlan roamed-voice-client re-anchor enable 1

config wlan security 802.1X

To change the state of 802.1X security on the wireless LAN Cisco radios, use the **config wlan security 802.1X** command.

Syntax Description	enable		Enables the 802.1X settings.			
	wlan_id foreignAp		Wireless LAN identifier between 1 and 512. Specifies third-party access points.			
	encryption 0 40 40 104 on-macfilter-failure enable		Specifie	s the static WEP keys and indexes.		
			Specifies a WEP key size of 0 (no encryption) bits. The default value is 104.			
			Note	All keys within a wireless LAN must be the same size.		
			Specifies a WEP key size of 40 bits. The default value is 104			
			Note	All keys within a wireless LAN must be the same size.		
			Specifies a WEP key size of 104 bits. The default value is 104.			
				Note	All keys within a wireless LAN must be the same size.	
			Configures 802.1X on MAC filter failure. Enables 802.1X authentication on MAC filter failure.			
	disable		Disables 802.1X authentication on MAC filter failure.			
Command Default	None					
Command History	Release	Modification				
	7.6This command was introduced in a release earlier than Release 7.6.					
Usage Guidelines	To change the encryption level of 802.1X security on the wireless LAN Cisco radios, use the following key sizes:					
	• 0—no 802.1X encryption.					
	• 40—40/64	-bit encryption.				

• 104—104/128-bit encryption. (This is the default encryption setting.)

The following example shows how to configure 802.1X security on WLAN ID 16.

(Cisco Controller) >config wlan security 802.1X enable 16

config wlan security ckip

To configure Cisco Key Integrity Protocol (CKIP) security options for the wireless LAN, use the **config wlan** security ckip command.

config wlan security ckip {enable | disable} wlan_id [akm psk set-key {hex | ascii} {40 | 104} key key_index wlan_id | mmh-mic {enable | disable} wlan_id | kp {enable | disable} wlan_id]

Syntax Description	enable	Enables CKIP security.					
	disable	Disables CKIP security.					
	wlan_id	Wireless LAN identifier from 1 to 512.					
	akm psk set-key	(Optional) Configures encryption key management for the CKIP wireless LAN.					
	hex	Specifies a hexadecimal encryption key.					
	ascii	Specifies an ASCII encryption key.					
	40	Sets the static encryption key length to 40 bits for the CKIP WLAN. 40-bit keys must contain 5 ASCII text characters or 10 hexadecimal characters.					
	104	Sets the static encryption key length to 104 bits for the CKIP WLAN. 104-bit keys must contain 13 ASCII text characters or 26 hexadecimal characters.					
	key	Specifies the CKIP WLAN key settings.					
	key_index	Configured PSK key index.					
	mmh-mic	(Optional) Configures multi-modular hash message integrity check (MMH MIC) validation for the CKIP wireless LAN.					
	kp	(Optional) Configures key-permutation for the CKIP wireless LAN.					
Command Default	None						
Command History	Release	Modification					
	7.6	This command was introduced in a release earlier than Release 7.6.					

The following example shows how to configure a CKIP WLAN encryption key of 104 bits (26 hexadecimal characters) for PSK key index 2 on WLAN 03:

(Cisco Controller) >config wlan security ckip akm psk set-key hex 104 key 2 03

config wlan security cond-web-redir

7.6

To enable or disable conditional web redirect, use the config wlan security cond-web-redir command.

config wlan security cond-web-redir {**enable** | **disable**} *wlan_id*

	wlan_id	Wireless LAN identifier between 1 and 512.	
Command Default	None Release	Modification	

This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable the conditional web direct on WLAN ID 2:

(Cisco Controller) >config wlan security cond-web-redir enable 2

config wlan security eap-params

To configure local EAP timers on a WLAN, use the config wlan security eap-params command.

config wlan security eap-params{ {**enable** | **disbale**} | **eapol-key-timeout***timeout* | **eap-key-retries** *retries* | **identity-request-timeout** | **identity-request-retries** | **request-timeout** *timeout* | **request-retries** *retries* } *wlan_id*

Syntax Description	{enable disable }	Specifies to enable or disable SSID specific EAP timeouts or retries. The default value is disabled.		
	eapol-key-timeout timeout	Specifies the amount of time (200 to 5000 milliseconds) that the controller attempts to send an EAP key over the WLAN to wireless clients using local EAP. The valid range is 200 to 5000 milliseconds.		
		The default value is 1000 milliseconds.		
	eapol-key-retries retries	Specifies the maximum number of times (0 to 4 retries) that the controller attempts to send an EAP key over the WLAN to wireless clients using local EAP.		
		The default value is 2.		
	identity-request- timeout timeout	Specifies the amount of time (1 to 120 seconds) that the controller attempts to send an EAP identity request to wireless clients within WLAN using local EAP.		
		The default value is 30 seconds.		
	identity-request-retries retries	Specifies the maximum number of times (0 to 4 retries) that the controller attempts to retransmit the EAP identity request to wireless clients within WLAN using local EAP.		
		The default value is 2.		
	request-timeout	Specifies the amount of time (1 to 120 seconds) in which the controller attempts to send an EAP parameter request to wireless clients within WLAN using local EAP.		
		The default value is 30 seconds.		
	request-retries	Specifies the maximum number of times (0 to 20 retries) that the controller attempts to retransmit the EAP parameter request to wireless clients within WLAN using local EAP.		
		The default value is 2.		
	wlan-id	WLAN identification number.		

Command Default	The default EAPOL key timeout is 1000 milliseconds.
	The default for EAPOL key retries is 2.
	The default identity request timeout is 30 seconds.
	The default identity request retries is 2.
	The default request timeout is 30 seconds.
	The default request retries is 2.

Command History	Release	Modification	
	7.6	This command was introduced.	

The following example shows how to enable SSID specific EAP parameters on a WLAN:

(Cisco Controller) > config wlan security eap-params enable 4 The following example shows how to set EAPOL key timeout parameter on a WLAN:

(Cisco Controller) > config wlan security eap-params eapol-key-retries 4 The following example shows how to set EAPOL key retries on a WLAN:

(Cisco Controller) > config wlan security eap-params eapol-key-retries 4

config wlan security eap-passthru

To configure the 802.1X frames pass through on to the external authenticator, use the **config wlan security eap-passthru** command.

config wlan security eap-passthru	{enable	disable }	wlan_id
-----------------------------------	---------	-----------	---------

Syntax Description	enable	Enables 802.1X frames pass through to external authenticator.
	disable	Disables 802.1X frames pass through to external authenticator.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command Default Command History	None Release	Modification

(Cisco Controller) >config wlan security eap-passthru enable 2

config wlan security ft

To configure 802.11r Fast Transition Roaming parameters, use the config wlan security ft command.

Syntax Description	adaptive enable disable		Configures 802.11r Fast Transition Roaming adaptive support. This is the default option.	
			Enables 802.11r Fast Transition Roaming support.	
			Disables 802.11r Fast Transition Roaming support.	
	reassociation-ti	meout	Configures reassociation deadline interval.	
	timeout-in-seconds		Reassociation timeout value, in seconds. The valid range is 1 to 100 seconds.	
	wlan_id		Wireless LAN identifier between 1 and 512.	
Command Default	None			
Command History	Release	Modification		
	7.6This command was introduced in a release earlier than Release 7.6.			
	8.3	This command was	modified. The adaptive keyword was added.	
Usage Guidelines	Ensure that you have disabled the WLAN before you proceed.			
	The following example shows how to enable 802.11r Fast Transition Roaming support on WLAN 2:			
	(Cisco Control)	ler) > config wlan sec u	urity ft enable 2	
	The following example shows how to set a reassociation timeout value of 20 seconds for 802.11r Fast Transition Roaming support on WLAN 2:			
	(Cisco Controller) >config wlan security ft reassociation-timeout 20 2			

config wlan security ft over-the-ds

To configure 802.11r fast transition parameters over a distributed system, use the **config wlan security ft over-the-ds** command.

config wlan security ft over-the-ds {**enable** | **disable**} *wlan_id*

Syntax Description	enable	Enables 802.11r fast transition roaming support over a distributed system.
	disable	Disables 802.11r fast transition roaming support over a distributed system.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	Enabled.	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	Ensure that you	a have disabled the WLAN before you proceed.
	Ensure that 802	2.11r fast transition is enabled on the WLAN.
	The following e system on WLA	example shows how to enable 802.11r fast transition roaming support over a distributed AN ID 2:
	(Cisco Contro	oller) >config wlan security ft over-the-ds enable 2

config wlan security IPsec disable

To disable IPsec security, use the config wlan security IPsec disable command.

	config wlan security IPsec disable { <i>wlan_id</i> foreignAp }		
Syntax Description	<i>wlan_id</i> Wireless LAN identifier between 1 and 512.		
	foreignAp	Specifies third-party access points.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	

The following example shows how to disable the IPsec for WLAN ID 16:

(Cisco Controller) >config wlan security IPsec disable 16

config wlan security IPsec enable

To enable IPsec security, use the config wlan security IPsec enable command.

	config wlan security IPsec enable { <i>wlan_id</i> foreignAp }		
Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.	
	foreignAp	Specifies third-party access points.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	

The following example shows how to enable the IPsec for WLAN ID 16:

(Cisco Controller) >config wlan security IPsec enable 16

config wlan security IPsec authentication

To modify the IPsec security authentication protocol used on the wireless LAN, use the **config wlan security IPsec authentication** command.

config wlan security IPsec authentication {**hmac-md5** | **hmac-sha-1**} {*wlan_id* | **foreignAp**}

Syntax Description	hmac-md5	Specifies the IPsec HMAC-MD5 authentication protocol.
	hmac-sha-1	Specifies the IPsec HMAC-SHA-1 authentication protocol.
	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the IPsec HMAC-SHA-1 security authentication parameter for WLAN ID 1:

(Cisco Controller) >config wlan security IPsec authentication hmac-sha-1 1

config wlan security IPsec encryption

To modify the IPsec security encryption protocol used on the wireless LAN, use the **config wlan security IPsec encryption** command.

config wlan security IPsec encryption {3des | aes | des} {*wlan_id* | foreignAp}

Syntax Description	3des	Enables IPsec 3DES encryption.
	aes	Enables IPsec AES 128-bit encryption.
	des	Enables IPsec DES encryption.
	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the IPsec AES encryption:

(Cisco Controller) >config wlan security IPsec encryption aes 1

config wlan security IPsec config

To configure the proprietary Internet Key Exchange (IKE) CFG-Mode parameters used on the wireless LAN, use the **config wlan security IPsec config** command.

config wlan security IPsec config qotd *ip_address* {*wlan_id* | **foreignAp**}

Syntax Description	qotd	Configures the quote-of-the day server IP for cfg-mode.
	ip_address	Quote-of-the-day server IP for cfg-mode.
	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	a way for the VI by assigning a b	method of distributing the session keys (encryption and authentication), as well as providing PN endpoints to agree on how the data should be protected. IKE keeps track of connections bundle of Security Associations (SAs), to each connection.
	cfg-mode for W	
	(Cisco Control	ller) >config wlan security IPsec config qotd 44.55.66.77 1

config wlan security IPsec ike authentication

To modify the IPsec Internet Key Exchange (IKE) authentication protocol used on the wireless LAN, use the **config wlan security IPsec ike authentication** command.

config wlan security IPsec ike authentication {**certificates** { $wlan_id \mid$ **foreignAp**} | **pre-share-key** { $wlan_id \mid$ **foreignAp**} $key \mid$ **xauth-psk** { $wlan_id \mid$ **foreignAp**} key}

Syntax Description	certificates	Enables the IKE certificate mode.
	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
	pre-share-key	Enables the IKE Xauth with preshared keys.
	xauth-psk	Enables the IKE preshared key.
	key	Key required for preshare and xauth-psk.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the IKE certification mode:

(Cisco Controller) >config wlan security IPsec ike authentication certificates 16

config wlan security IPsec ike dh-group

To modify the IPsec Internet Key Exchange (IKE) Diffie Hellman group used on the wireless LAN, use the **config wlan security IPsec ike dh-group** command.

config wlan security IPsec ike dh-group {*wlan_id* | foreignAp} {group-1 | group-2 | group-5}

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
	group-1	Specifies DH group 1 (768 bits).
	group-2	Specifies DH group 2 (1024 bits).
	group-5	Specifies DH group 5 (1536 bits).
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the Diffe Hellman group parameter for group-1:

(Cisco Controller) >config wlan security IPsec ike dh-group 1 group-1

config wlan security IPsec ike lifetime

To modify the IPsec Internet Key Exchange (IKE) lifetime used on the wireless LAN, use the **config wlan** security IPsec ike lifetime command.

config wlan security IPsec ike lifetime {*wlan_id* | **foreignAp**} *seconds*

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
	seconds	IKE lifetime in seconds, between 1800 and 345600.
Command Default	None	
Command Default Command History	None Release	Modification

The following example shows how to configure the IPsec IKE lifetime use on the wireless LAN:

(Cisco Controller) >config wlan security IPsec ike lifetime 1 1900

config wlan security IPsec ike phase1

To modify IPsec Internet Key Exchange (IKE) Phase 1 used on the wireless LAN, use the **config wlan security IPsec ike phase1** command.

config wlan security IPsec ike phase1 {**aggressive** | **main**} {*wlan_id* | **foreignAp**}

Syntax Description	aggressive	Enables the IKE aggressive mode.
	main	Enables the IKE main mode.
	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to modify IPsec IKE Phase 1:

(Cisco Controller) >config wlan security IPsec ike phase1 aggressive 16

config wlan security IPsec ike contivity

To modify Nortel's Contivity VPN client support on the wireless LAN, use the **config wlan security IPsec ike contivity** command.

config wlan security IPsec ike contivity {**enable** | **disable**} {*wlan_id* | **foreignAp**}

Syntax Description	enable	Enables contivity support for this WLAN.
	disable	Disables contivity support for this WLAN.
	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to modify Contivity VPN client support:

(Cisco Controller) >config wlan security IPsec ike contivity enable 14

config wlan security wpa akm ft

To configure authentication key-management using 802.11r fast transition 802.1X, use the **config wlan** security wpa akm ft command.

config wlan security wpa akm ft [**over-the-air** | **over-the-ds** | **psk** | [**reassociation-timeout** seconds]] { **enable** | **disable** } wlan_id

Syntax Description	over-the-air	(Optional) Configures 802.11r fast transition roaming over-the-air support.	
	over-the-ds	(Optional) Configures 802.11r fast transition roaming DS support.	
	psk	(Optional) Configures 802.11r fast transition PSK support.	
	reassociation-timeout	(Optional) Configures the reassociation deadline interval.	
		The valid range is between 1 to 100 seconds. The default value is 20 seconds.	
	seconds	Reassociation deadline interval in seconds.	
	enable	Enables 802.11r fast transition 802.1X support.	
	disable	Disables 802.11r fast transition 802.1X support.	
	wlan_id	Wireless LAN identifier between 1 and 512.	
Command Default	None		
Command History	Release N	N odification	
	7.6 T	This command was introduced in a release earlier than Release 7.6.	

The following example shows how to configure authentication key-management using 802.11r fast transition:

(Cisco Controller) >config wlan security wpa akm ft reassociation-timeout 25 1

config wlan security ft

To configure 802.11r Fast Transition Roaming parameters, use the config wlan security ft command.

	config wlan securit wlan_id	yft {adaptive enable	disable reassociation-timeout <i>timeout-in-seconds</i> }
Syntax Description	adaptive		Configures 802.11r Fast Transition Roaming adaptive support. This is the default option.
	enable		Enables 802.11r Fast Transition Roaming support.
	disable		Disables 802.11r Fast Transition Roaming support.
	reassociation-time	out	Configures reassociation deadline interval.
	timeout-in-seconds		Reassociation timeout value, in seconds. The valid range is 1 to 100 seconds.
	wlan_id		Wireless LAN identifier between 1 and 512.
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introdu	uced in a release earlier than Release 7.6.
	8.3	This command was modif	ed. The adaptive keyword was added.
Usage Guidelines	Ensure that you hav	e disabled the WLAN before	you proceed.
	The following exam 2:	ple shows how to enable 802	2.11r Fast Transition Roaming support on WLAN
	(Cisco Controller) >config wlan security	ft enable 2
		ple shows how to set a reass ming support on WLAN 2:	ociation timeout value of 20 seconds for 802.11r
	(Cisco Controller	x) >config wlan security	ft reassociation-timeout 20 2

config wlan security passthru

To modify the IPsec pass-through used on the wireless LAN, use the config wlan security passthru command.

	config wlan secu	urity passthru {enable disable} { <i>wlan_id</i> foreignAp} [<i>ip_address</i>]
Syntax Description	enable	Enables IPsec pass-through.
	disable	Disables IPsec pass-through.
	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
	ip_address	(Optional) IP address of the IPsec gateway (router) that is terminating the VPN tunnel.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to modify IPsec pass-through used on the wireless LAN:

(Cisco Controller) >config wlan security passthru enable 3 192.12.1.1

config wlan security pmf

To configure 802.11w Management Frame Protection (MFP) on a WLAN, use the **config wlan security pmf** command.

$config \ wlan \ security \ pmf \ \{ disable \ \mid \ optional \ \mid \ required \ \mid \ association-comeback$

association-comeback_timeout | saquery-retrytimeout saquery-retry_timeout } wlan_id

Syntax Description	disable	Disables 802.11w MFP protection on a WLAN.			
	optional	Enables 802.11w MFP protection on a WLAN.			
	required	Requires clients to negotiate 802.11w MFP protection on a WLAN.			
	association-comeba	ack Configures the 802.11w association comeback time.			
	association-comebac	<i>ck_timeout</i> Association comeback interval in seconds. Time interval that an associated client must wait before the association is tried again after it is denied with a status code 30. The status code 30 message is "Association request rejected temporarily; Try again later".			
		The range is from 1 to 20 seconds.			
	saquery-retrytime	Configures the 802.11w Security Association (SA) query retry timeout.			
	saquery-retry_timed	Time interval identified in the association response to an already associated client before the association can be tried again. This time interval checks if the client is a real client and not a rogue client during the association comeback time. If the client does not respond within this time, the client association is deleted from the controller. The range is from 100 to 500 ms.			
	wlan_id	Wireless LAN identifier from 1 to 512.			
Command Default	Default SA query retry timeout is 200 milliseconds.				
	Default association comeback timeout is 1 second.				
Command History	Release	Modification			
	7.6	This command was introduced in a release earlier than Release 7.6.			
Usage Guidelines	802.11w introduces an Integrity Group Temporal Key (IGTK) that is used to protect broadcast or multicast robust management frames. IGTK is a random value, assigned by the authenticator station (controller) used to protect MAC management protocol data units (MMPDUs) from the source STA. The 802.11w IGTK key is derived using the four way handshake and is used only on WLANs that are configured with WPA or WPA2 security at Layer 2.				
	The following examp	ple shows how to enable 802.11w MFP protection on a WLAN:			
	(Cisco Controller) > config wlan security pmf optional 1			

The following example shows how to configure the SA query retry timeout on a WLAN: (Cisco Controller) > config wlan security pmf saquery-retrytimeout 300 1

I

config wlan security sgt

To configures Secure Group Tag (SGT) for a WLAN, use the config wlan security sgt command.

config wlan security sgt {value | wlan-id} wlan_id

Syntax Description	value	SGT value
	wlan-id	WLAN ID
Command Default	None	
Command History	Release	Modification
	8.4	This command was introduced

7.6

config wlan security splash-page-web-redir

To enable or disable splash page web redirect, use the config wlan security splash-page-web-redir command.

This command was introduced in a release earlier than Release 7.6.

config wlan security splash-page-web-redir { enable | disable } wlan_id

Syntax Description	enable	Enables splash page web redirect.
	disable	Disables splash page web redirect.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	Splash page we	b redirect is disabled.
Command History	Release	Modification

The following example shows how to enable spash page web redirect:

(Cisco Controller) >config wlan security splash-page-web-redir enable 2

config wlan security static-wep-key authentication

To configure static Wired Equivalent Privacy (WEP) key 802.11 authentication on a wireless LAN, use the **config wlan security static-wep-key authentication** command.

config wlan security static-wep-key authentication {shared-key | open} wlan_id

Syntax Description	shared-key	Enables shared key authentication.
	open	Enables open system authentication.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command Default Command History	None Release	Modification

(Cisco Controller) >config wlan security static-wep-key authentication shared-key 1

config wlan security static-wep-key disable

To disable the use of static Wired Equivalent Privacy (WEP) keys, use the **config wlan security static-wep-key disable** command.

config wlan security static-wep-key disable wlan_id

Syntax Description	<i>wlan_id</i> Wireless LAN identifier between 1 and 512.		
Command Default	None		
Command History	Release	Modification	

The following example shows how to disable the static WEP keys for WLAN ID 1:

(Cisco Controller) >config wlan security static-wep-key disable 1

config wlan security static-wep-key enable

To enable the use of static Wired Equivalent Privacy (WEP) keys, use the **config wlan security static-wep-key** enable command.

config wlan security static-wep-key enable wlan_id

Syntax Description	<i>wlan_id</i> Wireless LAN identifier between 1 and 512.		
Command Default	None		
Command History	Release	Modification	

The following example shows how to enable the use of static WEK keys for WLAN ID 1:

(Cisco Controller) >config wlan security static-wep-key enable 1

config wlan security static-wep-key encryption

To configure the static Wired Equivalent Privacy (WEP) keys and indexes, use the **config wlan security static-wep-key encryption** command.

config wlan security static-wep-key encryption *wlan_id* {40 | 104} {hex | ascii} *key key-index*

Syntax Description	wlan_id	Wireless LAN identifier from 1 to 512.	
	40	Specifies the encryption level of 40.	
	104	Specifies the encryption level of 104.	
	hex	Specifies to use hexadecimal characters to enter key.	
	ascii	Specifies whether to use ASCII characters to enter key.	
	key	WEP key in ASCII.	
	key-index	Key index (1 to 4).	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	One unique WEP key index can be applied to each wireless LAN. Because there are only four WEP key indexes, only four wireless LANs can be configured for static WEP Layer 2 encryption.		
	Make sure to dis	able 802.1X before using this command.	
	-	cample shows how to configure the static WEP keys for WLAN ID 1 that uses aracter 0201702001 and key index 2:	
	(Cisco Control	ler) >config wlan security static-wep-key encryption 1 40 hex 0201702001 2	

config wlan security tkip

To configure the Temporal Key Integrity Protocol (TKIP) Message Integrity Check (MIC) countermeasure hold-down timer, use the **config wlan security tkip** command.

config wlan security tkip hold-down time wlan_id

Syntax Description	hold-down	Configures the TKIP MIC countermeasure hold-down timer.
	time	TKIP MIC countermeasure hold-down time in seconds. The range is from 0 to 60 seconds.
	wlan_id	Wireless LAN identifier from 1 to 512.
Command Default	The default T	KIP countermeasure is set to 60 seconds.
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	When this sit	rmeasure mode can occur if the access point receives 2 MIC errors within a 60 second period. uation occurs, the access point deauthenticates all TKIP clients that are associated to that 802.11 ds off any clients for the countermeasure holdoff time.
	The following	g example shows how to configure the TKIP MIC countermeasure hold-down timer:
	(Cisco Cont	roller) >config wlan security tkip

config wlan usertimeout

	To configure the timeout for idle client sessions for a WLAN, use the config wlan usertimeout command. config wlan usertimeout <i>timeout wlan_id</i>			
Syntax Description	timeout	Timeout for idle client sessions for a WLAN. If the client sends traffic less than the threshold, the client is removed on timeout. The range is from 15 to 100000 seconds.		
	wlan_id	Wireless LAN identifier between 1 and 512.		
Command Default	The defau	alt client session idle timeout is 300 seconds.		
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
Usage Guidelines		out value that you configure here overrides the global timeout that you define using the command twork usertimeout .		
	The follo	wing example shows how to configure the idle client sessions for a WLAN:		

(Cisco Controller) >config wlan usertimeout 100 1

config wlan security web-auth

To change the status of web authentication used on a wireless LAN, use the **config wlan security web-auth** command.

config wlan security web-auth {{acl | enable | disable} {wlan_id | foreignAp} [acl_name | none]} | {on-macfilter-failure wlan_id} | {server-precedence wlan_id | local | ldap | radius} | {flexacl wlan_id [ipv4_acl_name | none]} | {ipv6 acl wlan_id [ipv6_acl_name | none]} | {mac-auth-server {ip_address wlan_id}} | {timeout {value_in_seconds wlan_id}} | {web-portal-server {ip_address wlan_id}}

Syntax Description	acl	Configures the access control list.
	enable	Enables web authentication.
	disable	Disables web authentication.
	wlan_id	Wireless LAN identifier from 1 to 512.
	foreignAp	Specifies third-party access points.
	acl_name	(Optional) ACL name (up to 32 alphanumeric characters).
	none	(Optional) Specifies no ACL name.
	on-macfilter-failure	Enables web authentication on MAC filter failure.
	server-precendence	Configures the authentication server precedence order for Web-Auth users.
	local	Specifies the server type.
	ldap	Specifies the server type.
	radius	Specifies the server type.
	flexacl	Configures Flexconnect Access Control List.
	ipv4_acl_name	(Optional) IPv4 ACL name. You can enter up to 32 alphanumeric characters.
	ipv6_acl_name	(Optional) IPv6 ACL name. You can enter up to 32 alphanumeric characters.
	ipv6	Configures IPv6 related parameters.
	mac-auth-server	Configures MAC authentication server for the WLAN.
		WLAN.

	timeout	Configures Local Web aut	hentication Timeout.
		NoteThe CWA ses600 seconds.	sion timeout is fixed to
	value_in_seconds	Timeout value in seconds; 300 and 14400 seconds.	valid range is between
	web-portal-server	Configures CMCC web po	ortal server for the WLAN.
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Rel	ease 7.6.

The following example shows how to configure the security policy for WLAN ID 1 and an ACL named ACL03:

(Cisco Controller) >config wlan security web-auth acl 1 ACL03

config wlan security web-auth captive-bypass

To configure captive-bypass on a wireless LAN, use the **config wlan security web-auth captive-bypass** command.

config wlan security web-auth captive-bypass {enable | disable | none }

enable		Enable the captive-bypass for WLAN.	
disable		Disable the captive-bypass for WLAN.	
none		Clear the captive-bypass configuration for WLAN. And global captive network assistant bypass setting will get applied	
wlan-id		Enter WLAN identifier between 1 and 16.	
Release	Modification		
8.4	This command is introduced.		
	disable none wlan-id Release	disable none wlan-id Release Modification	

The following example shows how to enable Captive Network Bypass:

(Cisco Controller) >config wlan security web-auth captive-bypass enable 1

config wlan security web-auth qrscan-des-key

To configure the QR-scan DES key in a WLAN, use the **config wlan security web-auth qrscan-des-key** command.

config wlan security web-auth qrscan-des-key {*DES key stringwlan_id* }

Syntax Description	DES key string	Enter	the DES key of 8 characters.
	wlan-id	Enter	WLAN Identifier between 1 and 16.
Command History	Release	Modification	
	8.4	This command was introduced.	

The following example shows how to configure the QR-scan DES key:

(Cisco Controller) >config wlan security web-auth qrscan-des-key 1

config wlan security web-passthrough acl

To add an access control list (ACL) to the wireless LAN definition, use the **config wlan security web-passthrough acl** command.

config wlan security web-passthrough acl {*wlan_id* | **foreignAp**} {*acl_name* | **none**}

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
	acl_name	ACL name (up to 32 alphanumeric characters).
	none	Specifies that there is no ACL.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to add an ACL to the wireless LAN definition:

(Cisco Controller) >config wlan security web-passthrough acl 1 ACL03

config wlan security web-passthrough disable

To disable a web captive portal with no authentication required on a wireless LAN, use the **config wlan** security web-passthrough disable command.

config wlan security web-passthrough disable {*wlan_id* | **foreignAp**}

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to disable a web captive portal with no authentication required on wireless LAN ID 1:

(Cisco Controller) >config wlan security web-passthrough disable 1

config wlan security web-passthrough email-input

To configure a web captive portal using an e-mail address, use the **config wlan security web-passthrough** email-input command.

config wlan security web-passthrough email-input {**enable** | **disable**} {*wlan_id* | **foreignAp**}

Syntax Description	email-input	Configures a web captive portal using an e-mail address.
	enable	Enables a web captive portal using an e-mail address.
	disable	Disables a web captive portal using an e-mail address.
	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure a web captive portal using an e-mail address:

(Cisco Controller) >config wlan security web-passthrough email-input enable 1

config wlan security web-passthrough enable

To enable a web captive portal with no authentication required on the wireless LAN, use the **config wlan** security web-passthrough enable command.

config wlan security web-passthrough enable {*wlan_id* | **foreignAp**}

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
	foreignAp	Specifies third-party access points.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable a web captive portal with no authentication required on wireless LAN ID 1:

(Cisco Controller) >config wlan security web-passthrough enable 1

config wlan security web-passthrough qr-scan

To enable or disable qr-scan on the WLAN, use the config wlan security web-passthrough qr-scan command.

	config wlan see	curity web-passthrough qr-scan { { localenable disable } enable disable }
Syntax Description	local	Configures QR code scanning support locally on AP for clients.
		• enable–enables QR code scanning support for clients.
		• disable-disables QR code scanning support for clients.
	enable	Enables QR code scanning support for clients.
	disable	Disables QR code scanning support for clients.
	wlan-id	Enter WLAN Identifier between 1 and 16.
Command Default	None	
Command History	Release	Modification
	8.4	This command was introduced.

The following example shows how to enable qr-scan on WLAN ID 1:

(Cisco Controller) >config wlan security web-passthrough qr-scan enable 1

config wlan security wpa akm 802.1x

To configure authentication key-management (AKM) using 802.1X, use the **config wlan security wpa akm** 802.1x command.

config wlan security wpa akm 802.1x {**enable** | **disable**} *wlan_id*

Syntax Description	enable	Enables the 802.1X support.
	disable	Disables the 802.1X support.
	wlan_id	Wireless LAN identifier from 1 to 512.
	None	
command Default	None	
Command Default	Release	Modification

(Cisco Controller) >config wlan security wpa akm 802.1x enable 1

config wlan security wpa akm cckm

To configure authentication key-management using Cisco Centralized Key Management (CCKM), use the **config wlan security wpa akm cckm** command.

config wlan security wpa akm cckm { **enable** *wlan_id* | **disable** *wlan_id* | *timestamp-tolerance* }

Syntax Description	enable	Enables CCKM support.
	disable	Disables CCKM support.
	wlan_id	Wireless LAN identifier between 1 and 512.
	timestamp-tolerance	CCKM IE time-stamp tolerance. The range is between 1000 to 5000 milliseconds; the default is 1000 milliseconds.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure authentication key-management using CCKM.

(Cisco Controller) >config wlan security wpa akm cckm 1500

config wlan security wpa akm ft

To configure authentication key-management using 802.11r fast transition 802.1X, use the **config wlan** security wpa akm ft command.

config wlan security wpa akm ft [**over-the-air** | **over-the-ds** | **psk** | [**reassociation-timeout** seconds]] {**enable** | **disable**} wlan_id

Syntax Description	over-the-air	(Optional) Configures 802.11r fast transition roaming over-the-air support.
	over-the-ds	(Optional) Configures 802.11r fast transition roaming DS support.
	psk	(Optional) Configures 802.11r fast transition PSK support.
	reassociation-timeout	(Optional) Configures the reassociation deadline interval.
		The valid range is between 1 to 100 seconds. The default value is 20 seconds.
	seconds	Reassociation deadline interval in seconds.
	enable	Enables 802.11r fast transition 802.1X support.
	disable	Disables 802.11r fast transition 802.1X support.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release N	lodification
	7.6 T	This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure authentication key-management using 802.11r fast transition:

(Cisco Controller) >config wlan security wpa akm ft reassociation-timeout 25 1

config wlan security wpa akm pmf

To configure Authenticated Key Management (AKM) of management frames, use the **config wlan security wpa akm pmf** command.

config wlan security wpa akm pmf {**802.1x** | **psk**} {**enable** | **disable**}*wlan_id*

Syntax Description	802.1x	Configures 802.1X authentication for protection of management frames (PMF).	
	psk	Configures preshared keys (PSK) for PMF.	
	enable	Enables 802.1X authentication or PSK for PMF.	
	disable	Disables 802.1X authentication or PSK for PMF.	
	wlan_id	Wireless LAN identifier from 1 to 512.	
Command Default	Disabled.		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	_
Usage Guidelines		has two new AKM suites: 00-0F-AC:5 or 00-0F-AC:6. You must enable WPA and then disable to configure PMF on the WLAN.	he

The following example shows how to enable 802.1X authentication for PMF in a WLAN:

(Cisco Controller) >config wlan security wpa akm pmf 802.1x enable 1

config wlan security wpa akm psk

To configure the Wi-Fi protected access (WPA) preshared key mode, use the **config wlan security wpa akm psk** command.

config wlan security wpa akm psk { { enable | disable } | { set-key key-format key } | { auto-key
{ enable | disable } } | { pmkid { enable | disable } } wlan_id }

Syntax Description	enable	Enables WPA-PSK.
	disable	Disables WPA-PSK.
	set-key	Configures a preshared key.
	key-format	Specifies key format. Either ASCII or hexadecimal.
	key	WPA preshared key.
	auto-key {enable disable}	Configures auto PSK on the WLAN.
	pmkid {enable disable}	Configures PMK ID inclusion in M1 of 4-way handshake messages.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release Moo	lification
	7.6 This	s command was introduced in a release earlier than Release 7.6.
	8.10 The	pmkid {enable disable} was introduced.
Examples	The following example sh	ows how to configure the WPA preshared key mode:
	(Cisco Controller) > co	nfig wlan security wpa akm psk disable 1

config wlan security wpa disable

To disable WPA1, use the config wlan security wpa disable command.

config wlan security wpa disable wlan_id

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification

The following example shows how to disable WPA:

(Cisco Controller) >config wlan security wpa disable 1

config wlan security wpa enable

To enable WPA1, use the config wlan security wpa enable command.

config wlan security wpa enable wlan_id

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config wlan security wpa enable 1

config wlan security wpa ciphers

To configure the Wi-Fi protected authentication (WPA1) or Wi-Fi protected authentication (WPA2), use the **config wlan security wpa ciphers** command.

config wlan security wpa { wpa1 | wpa2 } ciphers { aes | tkip } { enable | disable } wlan_id

Syntax Description	wpa1	Configures WPA1 support.	
	wpa2	Configures WPA2 support.	
	ciphers	Configures WPA ciphers.	
	aes	Configures AES encryption support.	
	tkip	Configures TKIP encryption support.	
	enable	Enables WPA AES/TKIP mode.	
	disable	Disables WPA AES/TKIP mode.	
	wlan_id	Wireless LAN identifier between 1 and 512.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	If you are not specifying the WPA versions, it implies the following:		
	• If the cipher enabled is AES, you are configuring WPA2/AES.		
	• If the ciphe	ers enabled is AES+TKIP, you are configuring WPA/TKIP, WPA2/AES, or WPA/TKIP.	
	• If the ciphe	er enabled is TKIP, you are configuring WPA/TKIP or WPA2/TKIP.	
	The following e	example shows how to encrypt the WPA:	
	(Cisco Contro	ller) >config wlan security wpa wpal ciphers aes enable 1	

config wlan security wpa gtk-random

To enable the randomization of group temporal keys (GTK) between access points and clients on a WLAN, use the **config wlan security wpa gtk-random** command.

config wlan security wpa gtk-random { **enable** | **disable** } *wlan_id*

Syntax Description	enable	Enables the randomization of GTK keys between the access point and clients.	
	disable	Disables the randomization of GTK keys between the access point and clients.	
	wlan_id	WLAN identifier between 1 and 512.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	-	a enable this command, the clients in the Basic Service Set (BSS) get a unique GTK key. The c serve multicast or broadcast traffic.	lients
	The follow a WLAN:	wing example shows how to enable the GTK randomization for each client associated on	
	(Cisco C	ontroller) >config wlan security wpa gtk-random enable 3	

config wlan security wpa osen disable

To disable OSU Server-Only Authenticated L2 Encryption Network (OSEN) on a WLAN, use the **config** wlan security wpa osen enable command in WLAN configuration mode.

config wlan security wpa osen disable wlan-id

Syntax Description	<i>wlan-id</i> WLAN identification number. Enter a value between 1 and 512.			
Command Default	OSEN is enabled.			
Command Modes	WLAN configuration			
Command History	Release	Modification	-	
	Release 8.2	This command was introduced.	-	
			-	

This example shows how to disable OSEN on a WLAN:

Cisco Controller > config wlan security wpa osen disable 12

config wlan security wpa osen enable

To enable OSU Server-Only Authenticated L2 Encryption Network (OSEN) on a WLAN, use the **config** wlan security wpa osen enable command in WLAN configuration mode.

config wlan security wpa osen enable wlan-id

Syntax Description	<i>wlan-id</i> WLAN identification number. Enter a value between 1 and 512.			
Command Default	OSEN is not enabled.			
Command Modes	WLAN configuration			
Command History	Release	Modification		
	Release 8.2	This command was introduced.		

This example shows how to enable an OSEN on a WLAN:

Cisco Controller > config wlan security wpa osen enable 12

config wlan security wpa wpa1 disable

To disable WPA1, use the config wlan security wpa wpa1 disable command.

config wlan security wpa wpa1 disable wlan_id

Syntax Description	<i>wlan_id</i> Wireless LAN identifier between 1 and 512.	
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to disable WPA1:

(Cisco Controller) >config wlan security wpa wpa1 disable 1

config wlan security wpa wpa1 enable

To enable WPA1, use the **config wlan security wpa wpa1 enable** command.

config wlan security wpa wpa1 enable wlan_id

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config wlan security wpa wpal enable 1

config wlan security wpa wpa2 disable

To disable WPA2, use the config wlan security wpa wpa2 disable command.

config wlan security wpa wpa2 disable wlan_id

Syntax Description	<i>wlan_id</i> Wireless LAN identifier between 1 and 512.		
Command Default	None		
Command History	Release	Modification	

The following example shows how to disable WPA2:

(Cisco Controller) >config wlan security wpa wpa2 disable 1

config wlan security wpa wpa2 enable

To enable WPA2, use the config wlan security wpa wpa2 enable command.

config wlan security wpa wpa2 enable wlan_id

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default	None	
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

(Cisco Controller) >config wlan security wpa wpa2 enable 1

config wlan security wpa wpa2 cache

To configure caching methods on a WLAN, use the config wlan security wpa wpa2 cache command.

	config wl	an security wpa wpa2 cache sticky {enable disable} wlan_id
Syntax Description	sticky	Configures Sticky Key Caching (SKC) roaming support on the WLAN.
	enable	Enables SKC roaming support on the WLAN.
	disable	Disables SKC roaming support on the WLAN.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default Command History	None Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
Usage Guidelines	Master Ke client find PMKSA i	Sticky Key caching) also known as PKC (Pro Active Key caching), the client stores each Pairwise ey (PMK) ID (PMKID) against a Pairwise Master Key Security Association (PMKSA). When a ls an AP for which it has a PMKSA, it sends the PMKID in the association request to the AP. If the s alive in the AP, the AP provides support for fast roaming. In SKC, full authentication is done on AP to which the client associates and the client must keep the PMKSA associated with all APs.

The following example shows how to enable SKC roaming support on a WLAN:

(Cisco Controller) >config wlan security wpa wpa2 cache sticky enable 1

config wlan security wpa wpa2 cache sticky

To configure Sticky PMKID Caching (SKC) on a WLAN, use the **config wlan security wpa wpa2 cache sticky** command.

config wlan security wpa wpa2 cache sticky { enable | disable } wlan_id

Syntax Description	enable	Enables SKC on a WLAN.	
	disable	Disables SKC on a WLAN.	
	wlan_id	Wireless LAN identifier between 1 and 512 (inclusive).	
Command Default	Stkcky PN	MKID Caching is disabled.	
Command History	Release	Modification	
	7.6	This command was introduced in a release e	arlier than Release 7.6.
Usage Guidelines	sticky PM APs also r caching), Security A in the asso In SKC, ff the PMKS is precalcu • You • SKC • SKC	g in Release 7.2 and later releases, the controller supports IKID caching, the client receives and stores a different PM maintain a database of the PMKID issued to the client. In the the client stores each Pairwise Master Key (PMK) ID (PI Association (PMKSA). When a client finds an AP for which ociation request to the AP. If the PMKSA is alive in the AP, full authentication is done on each new AP to which the client SA associated with all APs. For SKC, PMKSA is a per AB ulated based on the BSSID of the new AP. cannot use SKC for large scale deployments as the control does not work across controllers in a mobility group. works only on WPA2-enabled WLANs.	IKID for every AP it associates with. The SKC also known as PKC (Pro Active Key MKID) against a Pairwise Master Key ch it has the PMKSA, it sends the PMKID the AP provides support for fast roaming. lient associates and the client must keep P cache that the client stores and PMKSA

The following example shows how to enable Sticky PMKID Caching on WLAN 5:

(Cisco Controller) >config wlan security wpa wpa2 cache sticky enable 5

config wlan security wpa wpa2 ciphers

To configure WPA2 ciphers and enable or disable Advanced Encryption Standard (AES) or Temporal Key Integrity Protocol (TKIP) data encryption for WPA2, use the **config wlan security wpa wpa2 ciphers** command

config wlan security wpa wpa2 ciphers {aes | tkip} {enable | disable} wlan_id

Syntax Description	(Cisco Controller) > aes	Configures AES data encryption for WPA2.
	tkip	Configures TKIP data encryption for WPA2.
	enable	Enables AES or TKIP data encryption for WPA2.
	disable	Disables AES or TKIP data encryption for WPA2.
	wlan_id	Wireless LAN identifier between 1 and 512.

Command Default AES is enabled by default.

Command History Release Modification		Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable AES data encryption for WPA2:

(Cisco Controller) >config wlan security wpa wpa2 ciphers aes enable 1

config wlan session-timeout

To change the timeout of wireless LAN clients, use the config wlan session-timeout command.

config wlan session-timeout {*wlan_id* | **foreignAp**} *seconds*

Syntax Description	wlan_id	Wireless LAN identifier between 1 and 512.			
	foreignAp	Specifies third-party access points.			
	seconds	Timeout or session duration in seconds. A value of zero is equivalent to no timeout.			
		Note The range of session timeout depends on the security type:			
		• Open system: 0-65535 (sec)			
		• 802.1x: 300-86400 (sec)			
		• static wep: 0-65535 (sec)			
		• cranite: 0-65535 (sec)			
		• fortress: 0-65535 (sec)			
		• CKIP: 0-65535 (sec)			
		• open+web auth: 0-65535 (sec)			
	• web pass-thru: 0-65535 (sec)				
	• wpa-psk: 0-65535 (sec)				
	• disable: To disable reauth/session-timeout timers.				
Command Default	None				
Usage Guidelines	is 86400 second	nt security type, which creates the PMK cache, the maximum session timeout that can be set s when the session timeout is disabled. For other client security such as open, WebAuth, and the PMK cache is not created, the session timeout value is shown as infinite when session led.			
Command History	Release	Modification			
	7.6	This command was introduced in a release earlier than Release 7.6.			
	The following en	xample shows how to configure the client timeout to 6000 seconds for WLAN ID			
	(Cisco Contro)	ller) > config wlan session-timeout 1 6000			

config wlan sip-cac disassoc-client

To enable client disassociation in case of session initiation protocol (SIP) call admission control (CAC) failure, use the **config wlan sip-cac disassoc-client** command.

config wlan sip-cac disassoc-client { enable		disable }	wlan_id
--	--	-----------	---------

Syntax Description	enable	Enables a client disassociation on a SIP CAC failure.
	disable	Disables a client disassociation on a SIP CAC failure.
	lan id	Wireless LAN identifier between 1 and 512.
	wlan_id	
Command Default Command History		ation for SIP CAC is disabled. Modification

The following example shows how to enable a client disassociation on a SIP CAC failure where the WLAN ID is 1:

(Cisco Controller) >config wlan sip-cac disassoc-client enable 1

config wlan sip-cac send-486busy

To configure sending session initiation protocol (SIP) 486 busy message if a SIP call admission control (CAC) failure occurs, use the **config wlan sip-cac send-486busy** command:

config wlan sip-cac send-486busy { **enable** | **disable** } *wlan_id*

Syntax Description	enable	Enables sending a SIP 486 busy message upon a SIP CAC failure.
	disable	Disables sending a SIP 486 busy message upon a SIP CAC failure.
	wlan_id	Wireless LAN identifier between 1 and 512.
Command Default		on protocol is enabled by default. Modification

The following example shows how to enable sending a SIP 486 busy message upon a SIP CAC failure where the WLAN ID is 1:

(Cisco Controller) >config wlan sip-cac send-busy486 enable 1

config wlan static-ip tunneling

To configure static IP client tunneling support on a WLAN, use the config wlan static-ip tunneling command.

config wlan static-ip tunneling	{enable	disable }	wlan_id
---------------------------------	---------	-----------	---------

Syntax Description	tunneling	Configures static IP client tunneling support on a WLAN.	
	enable	Enables static IP client tunneling support on a WLAN.	
	disable	Disables static IP client tunneling support on a WLAN.	
	wlan_id	Wireless LAN identifier from 1 to 512.	

Command Default None

Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable static IP client tunneling support for WLAN ID 3:

(Cisco Controller) >config wlan static-ip tunneling enable 34

L

config wlan uapsd compliant client enable

To enable WPA1, use the config wlan uapsd compliant-client enable command.

Note This was introduced for Ascom non-wmm capable phones and is not applicable for Cisco 792x/9971 IP phones. config wlan uapsd compliant-client enablewlan-id **Syntax Description** Wireless LAN identifier between 1 and 512. wlan_id None **Command Default** Release **Modification** 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to enable WPA1: (Cisco Controller) >config wlan uapsd compliant-client enable 1 **Property Description Property Type Property Value**

config wlan uapsd compliant-client disable

To disable WPA1, use the config wlan uapsd compliant-client disable command.

None

Note This was introduced for Ascom non-wmm capable phones and is not applicable for Cisco 792x/9971 IP phones.

config wlan uapsd compliant-client disablewlan-id

Syntax Descriptionwlan_idWireless LAN identifier between 1 and 512.	
---	--

Command Default

Release	Modification
7.6	This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable WPA1:

(Cisco Controller) >config wlan uapsd compliant-client disable 1

config wlan url-acl

To configure the WLAN's URL ACL, use the **config wlan url-acl** command.

config wlan url-aclWLAN-id acl-name

Syntax Description	WLAN-id	WLAN Identifier. The range is between 1 and 512
	acl-name	Name of the ACL.
Command Default	None	
Command History	Release	Modification
	8.3	This command was introduced.

This example shows how to cofigure a WLAN URL ACL:

(Cisco Controller) >config wlan url-acl 3 testacl

config wlan user-idle-threshold

To configure the threshold data sent by the client during the idle timeout for client sessions for a WLAN, use the **config wlan user-idle-threshold** command.

config wlan user-idle-threshold bytes wlan_id

Syntax Description	bytes	Threshold data sent by the client during the idle timeout for the client session for a WLAN. If the client send traffic less than the defined threshold, the client is removed on timeout. The range is from 0 to 10000000 bytes.
	wlan_id	Wireless LAN identifier between 1 and 512.
	-	
Command Default	The defau	It timeout for threshold data sent by client during the idle timeout is 0 bytes.
Command Default Command History	The defau	It timeout for threshold data sent by client during the idle timeout is 0 bytes. Modification

The following example shows how to configure the threshold data sent by the client during the idle timeout for client sessions for a WLAN:

(Cisco Controller) >config wlan user-idle-threshold 100 1

config wlan usertimeout

	To config	ure the timeout for idle client sessions for a WLAN, use the config wlan usertimeout command.		
	config wlan usertimeout timeout wlan_id			
Syntax Description	timeout	Timeout for idle client sessions for a WLAN. If the client sends traffic less than the threshold, the client is removed on timeout. The range is from 15 to 100000 seconds.		
	wlan_id	Wireless LAN identifier between 1 and 512.		
Command Default	The defau	alt client session idle timeout is 300 seconds.		
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
Usage Guidelines		out value that you configure here overrides the global timeout that you define using the command twork usertimeout .		
	The follo	wing example shows how to configure the idle client sessions for a WLAN:		

(Cisco Controller) >config wlan usertimeout 100 1

config wlan webauth-exclude

To release the guest user IP address when the web authentication policy time expires and exclude the guest user from acquiring an IP address for three minutes, use the **config wlan webauth-exclude** command.

	coming with webauth-exclude with in {enable disable}		
Syntax Description	wlan_id	Wireless LAN identifier (1 to 512).	
	enable	Enables web authentication exclusion.	
	disable	Disables web authentication exclusion.	
Command Default	Disabled.		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	You can use thi	is command for guest WLANs that are configured with web authentication.	
	This command	is applicable when you configure the internal DHCP scope on the controller.	
	reassociate with	en the web authentication timer expires for a guest user, the guest user can immediately h the same IP address before another guest user can acquire the IP address. If there are many imited IP address in the DHCP pool, some guest users might not be able to acquire an IP	
	authentication p The IP address	ble this feature on the guest WLAN, the guest user's IP address is released when the web bolicy time expires and the guest user is excluded from acquiring an IP address for three minutes. is available for another guest user to use. After three minutes, the excluded guest user can acquire an IP address, if available.	
	The following e	example shows how to enable the web authentication exclusion for WLAN ID 5:	

config wlan webauth-exclude *wlan_id* {**enable** | **disable**}

(Cisco Controller) >config wlan webauth-exclude 5 enable

config wlan wgb broadcast-tagging

To configure WGB broadcast tagging on a WLAN, use the config wlan wgb broadcast-tagging command.

config wlan wgb broadcast-tagging {enable | disable} wlan-id

Syntax Description	enable	Enables downlink broadcast pac WLAN.	ket VLAN tagging on a	
	disable	Disables downlink broadcast pa WLAN.	Disables downlink broadcast packet VLAN tagging on a WLAN.	
	wlan-id	WLAN ID on which the config	uration is to be applied.	
Command Default	WGB broadcast tagging is disabled by default.			
Command History	Release	Modification		
	8.3 This command was introduced.			

The following example shows how to enable WGB broadcast tagging on WLAN ID 1:

(Cisco Controller) >config wlan wgb broadcast-tagging wlan 1

config wlan wifidirect

To configure Wi-Fi Direct Client Policy on a WLAN, use the config wlan wifidirect command.

	config wlan wifidi	ct {allow disable not-allow xconnect-not-allow} wlan_id
Syntax Description	allow	Allows Wi-Fi Direct clients to associate with the WLAN
	disable	Ignores the Wi-Fi Direct status of clients thereby allowing Wi-Fi Direct clients to associate
	not-allow	
	xconnect-not-allo	Disallows the Wi-Fi Direct clients from associating with the WLAN
	wlan_id	Wireless LAN identifier (1 to 16).
Command Default	None	
Command History	Release	Modification
	7.6This command was introduced in a release earlier than Release 7.6.	

(Cisco Controller) >config wlan wifidirect allow 1

config wlan wmm

	To configure Wi-Fi Multimedia (WMM) mode on a wireless LAN, use the config wlan wmm con fig wlan wmm { allow disable require } <i>wlan_id</i>		
Syntax Description	allow	Allows WMM on the wireless LAN.	
	disable	Disables WMM on the wireless LAN.	
	require	Specifies that clients use WMM on the specified wireless LAN.	
	wlan_id	Wireless LAN identifier (1 to 512).	
Command Default	None		
Command History	ry Release Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	When the controller is in Layer 2 mode and WMM is enabled, you must put the access points on a trunk por in order to allow them to join the controller.		
	The following example shows how to configure wireless LAN ID 1 to allow WMM: (Cisco Controller) >config wlan wmm allow 1		
	The following e	example shows how to configure wireless LAN ID 1 to specify that clients use WMM:	
	(Cisco Contro	oller) > config wlan wmm require 1	

config wps ap-authentication

To configure access point neighbor authentication, use the config wps ap-authentication command.

	config wps ap-authentication [enable	disable threshold threshold_value]	
Syntax Description	enable	(Optional) Enables WMM on the wireless LAN.	
	disable	(Optional) Disables WMM on the wireless LAN.	
	threshold	(Optional) Specifies that WMM-enabled clients are on the wireless LAN.	
	threshold_value	Threshold value (1 to 255).	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure the access point neighbor authentication:		
	(Cisco Controller) > config wps ap-authentication threshold 25		

Related Commands show wps ap-authentication summary

config wps auto-immune

To enable or disable protection from Denial of Service (DoS) attacks, use the **config wps auto-immune** command.

config wps auto-immune {enable | disable | stop}

Syntax Description	enable	Enables the auto-immune feature.			
Syntax Description		Enables the auto-inimule reature.			
	disable	Disables the auto-immune feature.			
	stop	Stops dynamic auto-immune feature.			
Command Default	Disabled				
Command History	Release	Modification			
	7.6	This command was introduced in a release earlier than Release 7.6.			
Usage Guidelines	A potential attacker can use specially crafted packets to mislead the Intrusion Detection System (IDS) into treating a legitimate client as an attacker. It causes the controller to disconnect this legitimate client and launch a DoS attack. The auto-immune feature, when enabled, is designed to protect against such attacks. However, conversations using Cisco 792x phones might be interrupted intermittently when the auto-immune feature is enabled. If you experience frequent disruptions when using 792x phones, you might want to disable this feature.				
	The following example shows how to configure the auto-immune mode:				
	(Cisco Controller) > config wps auto-immune enable				
	The following example shows how to stop the auto-immune mode:				
	(Cisco Controller) > config wps auto-immune stop Dynamic Auto Immune by WIPS is stopped

config wps cids-sensor

To configure Intrusion Detection System (IDS) sensors for the Wireless Protection System (WPS), use the **config wps cids-sensor** command.

config wps cids-sensor { [**add** *index ip_address username password*] | [**delete** *index*] | [**enable** *index*] | [**fingerprint** *index*] | [**fingerprint** *index*] | [**fingerprint**] }

Syntax Description	add	(Ontional) Configuras a new IDS songer
Gyntux Deseription	auu	(Optional) Configures a new IDS sensor.
	index	IDS sensor internal index.
	ip_address	IDS sensor IP address.
	username	IDS sensor username.
	password	IDS sensor password.
	delete	(Optional) Deletes an IDS sensor.
	enable	(Optional) Enables an IDS sensor.
	disable	(Optional) Disables an IDS sensor.
	port	(Optional) Configures the IDS sensor's port number.
	port	Port number.
	interval	(Optional) Specifies the IDS sensor's query interval.
	query_interval	Query interval setting.
	fingerprint	(Optional) Specifies the IDS sensor's TLS fingerprint.
	sha1	(Optional) Specifies the TLS fingerprint.
	fingerprint	TLS fingerprint.

Command Default

t Command defaults are listed below as follows:

Port	443
Query interval	60
Certification fingerprint	00:00:00:00:00:00:00:00:00:00:00:00:00:
Query state	Disabled

Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to configure the intrusion detection system with the IDS index 1, IDS sensor IP address 10.0.0.51, IDS username Sensor_user0doc1, and IDS password passowrd01:		
	(Cisco Controller) > config w	ps cids-sensor add 1 10.0.0.51 Sensor_user0doc1 password01	
Related Commands	show wps cids-sensor detail		

I

config wps client-exclusion

To configure client exclusion policies, use the config wps client-exclusion command.

config wps client-exclusion {802.11-assoc | 802.11-auth | 802.11x-auth | ip-theft | web-auth | all} {enable | disable}

Syntax Description	802.11-assoc	Specifies that the controller excludes clients on the sixth 802.11 association attempt, after five consecutive failures.	
	802.11-auth	Specifies that the controller excludes clients on the sixth 802.11 authentication attempt, after five consecutive failures.	
	802.1x-auth	Specifies that the controller excludes clients on the sixth 802.11X authentication attempt, after five consecutive failures.	
	ip-theft	Specifies that the control excludes clients if the IP address is already assigned to another device.	
	web-auth	Specifies that the controller excludes clients on the fourth web authentication attempt, after three consecutive failures.	
	all enable	Specifies that the controller excludes clients for all of the above reasons. Enables client exclusion policies.	
Command Default	All policies are enabled.		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
	The following example shows how to disable clients on the 802.11 association attempt after five consecutive failures:		
	(Cisco Controller) > config wps client-exclusion 802.11-assoc disable		
Related Commands	show wps summary		

config wps mfp

To configure Management Frame Protection (MFP), use the config wps mfp command.

config wps mfp {infrastructure | ap-impersonation } {enable | disable} **Syntax Description** infrastructure Configures the MFP infrastructure. ap-impersonation Configures ap impersonation detection by MFP. Enables the MFP feature. enable disable Disables the MFP feature. None **Command Default Command History** Release Modification 7.6 This command was introduced in a release earlier than Release 7.6. The following example shows how to enable the infrastructure MFP:

(Cisco Controller) > config wps mfp infrastructure enable

Related Commands show wps mfp

config wps shun-list re-sync

To force the controller to synchronization with other controllers in the mobility group for the shun list, use the **config wps shun-list re-sync** command.

config wps shun-list re-sync

Syntax Description		
Command Default		
Command History	Release	Modification
	7.6	This command was introduced in a release earlier than Release 7.6.
	The following example shows how to configure the controller to synchronize with other controllers for the shun list:	

(Cisco Controller) > config wps shun-list re-sync

Related Commands show wps shun-list

config wps signature

To enable or disable Intrusion Detection System (IDS) signature processing, or to enable or disable a specific IDS signature, use the **config wps signature** command.

config wps signature {**standard** | **custom**} **state** *signature_id* {**enable** | **disable**}

Syntax Description	standard	Configures a standard IDS signature.	
	custom	Configures a standard IDS signature.	
	state	Specifies the state of the IDS signature.	
	signature_id	Identifier for the signature to be enabled or disabled.	
	enable	Enables the IDS signature processing or a specific IDS signature.	
	disable	Disables IDS signature processing or a specific IDS signature.	
Command Default	IDS signature processing is enable	d by default.	
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.		
	The following example shows how to enable IDS signature processing, which enables the processing of all IDS signatures:		
	(Cisco Controller) >config wps signature enable		
	The following example shows how to disable a standard individual IDS signature:		
	(Cisco Controller) > config wps signature standard state 15 disable		
Related Commands	config wps signature frequency		
	config wps signature interval		
	config wps signature mac-freque	ncy	
	config wps signature quiet-time config wps signature reset show wps signature events

show wps signature summary show wps summary

config wps signature frequency

To specify the number of matching packets per interval that must be identified at the individual access point level before an attack is detected, use the **config wps signature frequency** command.

config wps signature frequency signature_id frequency

Syntax Description	signature_id	Identifier for the signature to be configured.	
	frequency	Number of matching packets per interval that must be at the individual access point level before an attack is detected. The range is 1 to 32,000 packets per interval.	
Command Default	The <i>frequency</i> default value varies	s per signature.	
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.		
	The following example shows how to set the number of matching packets per interval per access point before an attack is detected to 1800 for signature ID 4:		
	(Cisco Controller) > config (wps signature frequency 4 1800	
Related Commands	config wps signature frequency		
	config wps signature interval		
	config wps signature quiet-time		
	config wps signature reset		
	show wps signature events		
	show wps signature summary		
	show wps summary		

config wps signature interval

To specify the number of seconds that must elapse before the signature frequency threshold is reached within the configured interval, use the **config wps signature interval** command.

config wps signature interval signature_id interval

signature_id	Identifier for the signature to be configured.	
interval	Number of seconds that must elapse before the signature frequency threshold is reached. The range is 1 to 3,600 seconds.	
The default value of <i>interval</i> varies per signature.		
Release	Modification	
7.6	This command was introduced in a release earlier than Release 7.6.	
 If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures. The following example shows how to set the number of seconds to elapse before reaching the signature frequency threshold to 200 for signature ID 1: (Cisco Controller) > config wps signature interval 1 200 		
 config wps signature frequency config wps signature config wps signature mac-frequency config wps signature quiet-time config wps signature reset show wps signature events show wps signature summary show wps summary 		
	<pre>interval interval The default value of interval varie Release 7.6 If IDS signature processing is disa individual signatures. The following example shows how frequency threshold to 200 for sig (Cisco Controller) > config variable config wps signature frequency config wps signature mac-frequency</pre>	

config wps signature mac-frequency

To specify the number of matching packets per interval that must be identified per client per access point before an attack is detected, use the **config wps signature mac-frequency** command.

config wps signature mac-frequency signature_id mac_frequency

Syntax Description	signature_id	Identifier for the signature to be configured.		
	mac_frequency	Number of matching packets per interval that must be identified per client per access point before an attack is detected. The range is 1 to 32,000 packets per interval.		
Command Default	The <i>mac_frequency</i> default value varies per signature.			
Command History	Release	Modification		
	7.6	This command was introduced in a release earlier than Release 7.6.		
Usage Guidelines	If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.			
	The following example shows how to set the number of matching packets per interval per client before an attack is detected to 50 for signature ID 3:			
	(Cisco Controller) > config wps signature mac-frequency 3 50			
Related Commands	config wps signature frequency			
	config wps signature interval			
	config wps signature interval			
	config wps signature interval config wps signature			
	config wps signature			
	config wps signature config wps signature quiet-time			
	config wps signature config wps signature quiet-time config wps signature reset			

config wps signature quiet-time

To specify the length of time after which no attacks have been detected at the individual access point level and the alarm can stop, use the **config wps signature quiet-time** command.

config wps signature quiet-time signature_id quiet_time

Syntax Description	signature_id	Identifier for the signature to be configured.	
	quiet_time	Length of time after which no attacks have been detected at the individual access point level and the alarm can stop. The range is 60 to 32,000 seconds.	
Command Default	The default value of <i>quiet_time</i> varies per signature.		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.		
	The following example shows how to set the number of seconds after which no attacks have been detected per access point to 60 for signature ID 1:		
	(Cisco Controller) > config	wps signature quiet-time 1 60	
Related Commands	config wps signature		
	config wps signature frequency		
	config wps signature interval		
	config wps signature mac-frequency		
	config wps signature reset		
	show wps signature events		
	show wps signature summary		
	show wps summary		

config wps signature reset

To reset a specific Intrusion Detection System (IDS) signature or all IDS signatures to default values, use the **config wps signature reset** command.

config wps signature reset {*signature_id* | **all**}

Syntax Description	signature_id	Identifier for the specific IDS signature to be reset.	
	all	Resets all IDS signatures.	
Command Default	None		
Command History	Release	Modification	
	7.6	This command was introduced in a release earlier than Release 7.6.	
Usage Guidelines	If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.		
	The following example shows how to reset the IDS signature 1 to default values:		
	(Cisco Controller) > config wps signature reset 1		
Related Commands	config wps signature		
	config wps signature frequency		
	config wps signature interval		
	config wps signature mac-frequency
