

Configuring wIPS and Profiles

This chapter describes how to configure wIPS profiles and those items that must be configured in conjunction to operate wIPS.

This chapter contains the following sections:

- Guidelines and Limitations, page 8-1
- Prerequisites, page 8-1
- Information About wIPS Configuration and Profile Management, page 8-2

Guidelines and Limitations

- The mobility services engine can only be configured from one NCS.
- If your wIPS deployment consists of a controller, access point, and MSE, you must set all the three entities to the UTC timezone.
- A controller is associated to a single configuration profile. All wIPS mode access points connected to that controller share the same wIPS configuration.

Prerequisites

Before you can configure wIPS profiles you must do the following:

1. Install a mobility services engine (if one is not already operating in the network). See the *Cisco 3350 Mobility Services Engine Getting Started Guide* or *Cisco 3310 Mobility Services Engine Getting Started Guide*:

http://www.cisco.com/en/US/products/ps9742/prod_installation_guides_list.html

- 2. Add the mobility services engine to the NCS (if not already added).
- **3.** Configure access points to operate in wIPS monitor mode. See the "Configuring Access Points for wIPS Monitor Mode" section on page 8-2.
- 4. Configure wIPS profiles. See the "Configuring wIPS Profiles" section on page 8-4.

Information About wIPS Configuration and Profile Management

Configuration of wIPS profiles follows a chained hierarchy starting with the NCS, which is used for profile viewing and modification. The actual profiles are stored within the wIPS service running on the MSE.

From the wIPS service on the mobility services engine, profiles are propagated to specific controllers, which in turn communicate this profile transparently to wIPS mode access points associated to that respective controller. (See Figure 8-1).

Figure 8-1 Configuration and Update of wIPS Profiles

When a configuration change to a wIPS profile is made at the NCS and applied to a set of mobility services engines and controllers, the following occurs:

- 1. The configuration profile is modified on the NCS and version information is updated.
- 2. An XML-based profile is pushed to the wIPS engine running on the mobility services engine. This update occurs over the SOAP/XML protocol.
- **3.** The wIPS engine on the mobility services engine updates each controller associated with that profile by pushing out the configuration profile over NMSP.
- **4.** The controller receives the updated wIPS profile, stores it into NVRAM (replacing any previous revision of the profile) and propagates the updated profile to its associated wIPS access points using CAPWAP control messages.
- **5.** A wIPS mode access point receives the updated profile from the controller and applies the modifications to its wIPS software engine.

This section contains the following topics:

- Guidelines and Limitations, page 8-2
- Configuring Access Points for wIPS Monitor Mode, page 8-2
- Configuring wIPS Profiles, page 8-4

Guidelines and Limitations

- Only Cisco Aironet 1130, 1140, 1240, 1250, 3502E and 3502I Series Access Points support wIPS monitor mode.
- The wIPS submode is supported only when the access point mode is Monitor, Local, or HREAP. But for 1130 and 1240 access points, wIPS is supported only in monitor mode.

Configuring Access Points for wIPS Monitor Mode

To configure an access point to operate in wIPS monitor mode, follow these steps:

Step 1 Choose Configure > Access Points.

Step 2 Click the 802.11a or 802.11b/g radio link (see Figure 8-2).

Figure 8-2	Configure > Access Points > Radio
------------	-----------------------------------

AP Name	Ethernet MAC	IP Address	<u>Radio</u>	Map Location	22
<u>1240-1</u>	00:1d:45:23:d5:a0	209.165.200.230	<u>802.11a</u>	Unassigned	273

Step 3 In the Access Point page, unselect the Admin Status check box to disable the radio.

Figure 8-3 Access Points > Radio

Α	<u>Access Point > 1240-1 > '802.11a'</u>			
G	eneral			
	AP Name	1240-1		
	AP Base Radio MAC	00:1d:46:7e:8a:60		
	Admin Status			
	Controller	209.165.200.231	8	
	Site Config ID	0	7315	
			∩	

Step 4 Click Save.

Note Repeat these steps for each radio on an access point that is to be configured for wIPS monitor mode.

- Step 5 Once the radios are disabled, choose Configure > Access Points and then click the name of the access point of the radio you just disabled.
- **Step 6** In the access point dialog box, choose **Monitor** from the AP Mode drop-down list (see Figure 8-4).

Figure 8-4 Configure > Access Points > Access Point Detail

General **		
AP Name	1240-1	
Ethernet MAC	00:1d:45:23:d5:a0	
Base Radio MAC	00:1d:46:7e:8a:60	
Country Code	US 👻	
IP Address	209.165.200.232	
Admin Status	Enabled	
AP Static IP	Enabled	
AP Mode	Monitor 👻	
Enhanced WIPS Engine	🗹 Enabled	
Monitor Mode Optimization	WIPS -	29
AP Failover Priority	Low 👻	2731

- **Step 7** Select the **Enabled** check box for the Enhanced WIPS Engine.
- Step 8 From the Monitor Mode Optimization drop-down list, choose WIPS.
- Step 9 Click Save.

- **Step 10** Click **OK** when prompted to reboot the access point.
- **Step 11** To reenable the access point radio, choose **Configure > Access Points**.
- **Step 12** Click the appropriate access point radio (see Figure 8-5).

Figure 8-5 Configure > Access Points > Radio

AP Name	Ethernet MAC	IP Address	<u>Radio</u>	Map Location	
<u>1240-1</u>	00:1d:45:23:d5:a0	209.165.200.225	<u>802.11a</u>	Unassigned	
<u>1130-1</u>	00:14:6a:1b:3b:6a	209.165.200.226	802.11a	Unassigned	130
<u>1250-1</u>	00:1b:d5:13:15:e2	209.165.200.227	802.11b/q/n	Unassigned	273

- Step 13 In the Radio Detail page, select the Admin Status Enabled check box.
- Step 14 Click Save.

Repeat this procedure for each access point and each respective radio configured for wIPS monitor mode.

Configuring wIPS Profiles

By default, the mobility services engine and corresponding wIPS access points inherit the default wIPS profile from the NCS. This profile comes pre-tuned with a majority of attack alarms enabled by default and monitors attacks against access points within the same RFGroup as the wIPS access points. In this manner, the system comes pre-setup to monitor attacks against a deployment model that utilizes an integrated solution in which both the WLAN infrastructure and wIPS access points are intermixed on the same controller.

Some of the configuration steps that follow are marked as *Overlay-Only* and are only to be undertaken when deploying the Adaptive wIPS solution to monitor an existing WLAN Infrastructure such as an autonomous or completely separate controller-based WLAN.

To configure wIPS profiles, follow these steps:

Step 1 Choose Configure > wIPS Profiles.

The wIPS Profiles page appears (see Figure 8-6).

💧 Home Monitor 🔻 Co	nfigure 🔻 Services 🔻 Reports 👻 Administration 💌	Vitual Dollar R. ROOT DOFMIN	8 의
wIPS Profiles	WIPS Profiles Configure > wIPS Profiles		
SSID Group List			
	None detected		

Figure 8-6 wIPS Profiles > Profile List

Step 3 In the Profile Parameters dialog box, choose a profile template from the Copy From drop-down list.

You cannot edit the default profile	
You cannot edit the default profile.	

- Step 4 After selecting a profile and entering a profile name, click Save and Edit.
- **Step 5** (Optional) Configure SSIDs in the SSID Group List page.

By default, the system monitors attacks launched against the local Wireless LAN Infrastructure (as defined by APs which have the same RF Group name). If the system should also be required to monitor attacks against another network, such as when deployed in an overlay deployment model, the SSID groups feature must be utilized.

If this step is not required, simply click Next.

- a. Select the MyWLAN check box and choose Edit Group from the drop-down list, then click Go.
- **b.** Enter SSIDs to Monitor.
- c. Enter the SSID name (separate multiple entries by a single space), and click Save.

The SSID Groups page appears confirming that the SSIDs are added successfully.

d. Click Next.

The Select Policy and Policy Rules summary panes appear.

•	٩,
N	ote

In the Select Policy pane, you can enable or disable attacks to be detected and reported. You can also edit specific thresholds for alarms and turn on forensics.

Step 6 To enable or disable attacks to be detected and reported, select the check box next to the specific attack type in question in the Select Policy pane.

Step 7 To edit the profile, click the name of the attack type (such as DoS: Association flood).The configuration pane for that attack type appears in the right pane above the policy rule description.

- **Step 8** To modify a policy rule do the following:
 - a. In the Policy Rules pane, select the check box next to the policy rule, and click Edit. The Policy Rule Configuration dialog box appears (see Figure 8-7).

Figure 8-7 Policy Rule Configuration Dialog Box

Policy Rule Configuration	×
Severity	Critical 💌
Notification	Forensic
Number of active associations	100
Туре	C SSID © Device Group
Device Group	Internal 💌
Save Cancel	

- **b.** Choose the severity of the alarm.
- c. Select the Forensic check box if you want to capture packets for this alarm.
- **d.** Modify the number of active associations, if desired. (This value varies by alarm type).
- **e.** Select the type of WLAN infrastructure (SSID or Device Group) that the system monitors for attacks.
 - 1. If you select SSID, continue with Step 9.
 - 2. If you select Device Group, continue with Step 10.

Note Device Group (Type) and Internal are the defaults. *Internal* indicates all access points within the same RF Group. Selecting SSID as the type, allows you to monitor a separate network, which is typical of an overlay deployment.

- **Step 9** (Optional), For overlay deployments only, to add a policy rule for an SSID, do the following:
 - **a**. To add a policy rule, click **Add** (see Figure 8-8).

Select Policy	Policy Rules	
Security wIDS/wIPS	DoS: Association flood	<u>_</u>
OoS Attack Against AP OoS: Association flood	Add Edit Delete Move Up Move Down	3140
DoS: Association table overflow	Threshold ACL/SSID Group Notification Severity	27

In the Policy Rule Configuration dialog box, choose MyWLAN from the SSID Group list (see Figure 8-9).

Figure 8-9 Policy Rule Configuration Dialog Box for SSIDs

Policy Rule Configuration	
Severity	Critical 💌
Notification	Forensic
Number of active associations	100
Туре	⊙ SSID ○ Device Group
SSID Group	Guest Any MywLAN Neighbor Other
Save Cancel	

- c. Click Save after all changes are complete.
- **d.** Modify each policy rule. Continue with Step 10 when all modifications are complete. (See Figure 8-10).

When you configure a system to monitor another WLAN infrastructure by SSID, changes must be made for each and every policy rule to monitor. You must create a policy rule under each separate alarm which defines the system to monitor attacks against the SSID Group created earlier.
