Debugs ASA IKEv2 para el VPN de sitio a sitio con PSKs

Contenido

Introducción

Este documento proporciona la información para entender los debugs IKEv2 en el dispositivo de seguridad adaptante (ASA) cuando se utiliza la clave del preshared (PSKs).

prerrequisitos

Requisitos

No hay requisitos específicos para este documento.

Componentes Utilizados

Este documento no tiene restricciones específicas en cuanto a versiones de software y de hardware.

La información que contiene este documento se creó a partir de los dispositivos en un ambiente de laboratorio específico. Todos los dispositivos que se utilizan en este documento se pusieron en funcionamiento con una configuración verificada (predeterminada). Si la red está funcionando, asegúrese de haber comprendido el impacto que puede tener cualquier comando.

Convenciones

Consulte Convenciones de Consejos TécnicosCisco para obtener más información sobre las

convenciones del documento.

Cuestión central

El intercambio de paquetes en IKEv2 es radicalmente diferente de cuáles estaba en IKEv1. Considerando que en IKEv1 había un intercambio claramente demarcado phase1 que consistió en 6 paquetes seguidos por un intercambio de la fase 2 que consistido en 3 paquetes, el intercambio IKEv2 es variable. Para información más detallada sobre las diferencias y una explicación del intercambio de paquetes, refiera al intercambio de paquetes IKEv2 y al debugging del nivel del protocolo.

Debugs usados

```
debug crypto ikev2 protocol 127
debug crypto ikev2 platform 127
```
