

advertise (virtual server submode)

To allow the CSM to advertise the IP address of the virtual server as the host route, use the **advertise** command in the SLB virtual server configuration mode. To stop advertising the host route for this virtual server, use the **no** form of this command.

advertise [active]

no advertise

Syntax Description	active	(Optional) Allows the CSM to advertise the IP address of the virtual server as host route.
---------------------------	---------------	--

Defaults The default for network mask is 255.255.255.255 if the network mask is not specified.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	1.1(1)	This command was introduced.

Usage Guidelines Without the active option, the CSM always advertises the virtual server IP address whether or not there is any active real server attached to this virtual server.

Examples This example shows how to restrict a client from using the virtual server:

```
Cat6k-2(config-slb-redirect-vs)# advertise 10.5.2.1 exclude
```

Related Commands [redirect-vserver](#)
[show module csm vserver redirect](#)

client (virtual server submode)

To restrict which clients are allowed to use the virtual server, use the **client** command in the SLB virtual server configuration mode. To remove the client definition from the configuration, use the **no** form of this command.

client *ip-address* [*network-mask*] [**exclude**]

no client *ip-address* [*network-mask*]

Syntax Description

<i>ip-address</i>	Client's IP address.
<i>network-mask</i>	(Optional) Client's IP mask.
exclude	(Optional) Specifies that the IP address is disallowed.

Defaults

The default for network mask is 255.255.255.255 if the network mask is not specified.

Command Modes

SLB virtual server configuration submode

Command History

Release	Modification
1.1(1)	This command was introduced.

Usage Guidelines

The network mask is applied to the source IP address of incoming connections and the result must match the IP address before the client is allowed to use the virtual server. If **exclude** is not specified, the IP address and network mask combination is allowed.

Examples

This example shows how to restrict a client from using the virtual server:

```
Cat6k-2(config-slb-vserver)# client 10.5.2.1 exclude
```

Related Commands

(virtual server submode)idle (virtual server submode)

To control the amount of time the CSM maintains connection information in the absence of packet activity, use the **idle** command in the SLB virtual server configuration submode. To change the idle timer to its default value, use the **no** form of this command.

idle *duration*

no idle

Syntax Description	<i>duration</i>	Idle connection timer duration in seconds; the range is from 4 to 65535.
---------------------------	-----------------	--

Defaults The default is 3600.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	1.1(1)	This command was introduced.

Usage Guidelines If you do not specify a duration value, the default value is applied.

Examples This example shows how to specify an idle timer duration of 4000:

```
Cat6k-2(config-slb-vserver)# idle 4000
```

Related Commands [show module csm vserver redirect vserver](#)

inservice (virtual server submode)

To enable the virtual server for load balancing, use the **inservice** command in the SLB virtual server configuration submode. To remove the virtual server from service, use the **no** form of this command.

inservice

no inservice

Syntax Description This command has no keywords or arguments.

Defaults The default is the virtual server is not in service.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	1.1(1)	This command was introduced.

Examples This example shows how to enable a virtual server for load balancing:

```
Cat6k-2(config-slb-vserver) # inservice
```

Related Commands [show module csm vserver redirect](#)
[vserver](#)

owner (virtual server submode)

To define an owner that may access the virtual server, use the **owner** command in the SLB virtual server submode. To remove the owner, use the **no** form of this command.

owner *owner-name* **maxconns** *number*

no owner maxconns

Syntax Description		
	<i>owner-name</i>	Name of the owner object.
	maxconns	Sets the maximum number of connections for this owner.
	<i>number</i>	Maximum number of connections.

Defaults This command has no default settings.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	3.1(1)	This command was introduced.

Examples This example shows how to specify an owner for virtual server access:

```
Cat6k-2(config-slb-vserver) # owner madrigal maxconns 1000
```

Related Commands [vserver](#)

parse-length (virtual server submode)

To set the maximum number of bytes to parse for URLs and cookies, use the **parse-length** command in the SLB virtual server configuration submode. To restore the default, use the **no** form of this command.

parse-length *bytes*

no parse-length

Syntax Description	<i>bytes</i>	Number of bytes; the range is from 1 to 4000.
--------------------	--------------	---

Defaults	The default is 600.
----------	---------------------

Command Modes	SLB virtual server configuration submode
---------------	--

Command History	Release	Modification
	1.1(1)	This command was introduced.

Examples	This example shows how to set the number of bytes to parse for URLs and cookies: Cat6k-2(config-slb-vserver)# parse-length 1000
----------	---

Related Commands	show module csm vserver redirect vserver
------------------	--

pending (virtual server submode)

To set the pending connection timeout, use the **pending** command in the SLB virtual server configuration submode. To restore the default, use the **no** form of this command.

pending *timeout*

no pending

Syntax Description	<i>timeout</i>	Seconds to wait before a connection is considered unreachable. Range is from 1 to 65535.
---------------------------	----------------	---

Defaults The default pending timeout is 30 seconds.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	2.2(1)	This command was introduced.

Usage Guidelines This command is used to prevent denial-of-service (DOS) attacks. The pending connection timeout sets the response time for terminating connections if a switch becomes flooded with traffic. The pending connections are configurable on a per-virtual-server basis.

Examples This example shows how to set the number to wait for a connection to be made to the server:

```
Cat6k-2(config-slb-vserver) # pending 300
```

Related Commands [show module csm vserver redirect vserver](#)

persistent rebalance (virtual server submode)

To enable or disable HTTP 1.1 persistence for connections in the virtual server, use the **persistent rebalance** command in the SLB virtual server configuration submode. To disable persistence, use the **no** form of this command.

persistent rebalance

no persistent rebalance

Syntax Description This command has no keywords or arguments.

Defaults Persistence is disabled.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	2.1(1)	This command was introduced.

Examples This example shows how to enable the HTTP 1.1 persistence:

```
Cat6k-2(config-slb-vserver) # persistent rebalance
```

Related Commands [show module csm vserver redirect vserver](#)

replicate csrp (virtual server submode)

To enable connection redundancy, use the **replicate csrp** command in the SLB virtual server configuration submode. To disable connection redundancy, use the **no** form of this command.

```
replicate csrp {sticky | connection}
```

```
no replicate csrp {sticky | connection}
```

Syntax Description		
	sticky	Replicates the sticky database to the backup CSM.
	connection	Replicates connections to the backup CSM.

Defaults Connection redundancy is disabled.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	2.1(1)	This command was introduced.

Usage Guidelines Sticky and connection replication can be enabled or disabled separately. For replication to occur, you must enable SLB fault tolerance with the **ft group** command.

Examples This example shows how to enable connection redundancy:
 Cat6k-2 (config-slb-vserver) # **replicate csrp connection**

Related Commands [ft group](#)
[show module csm vserver redirect](#)
[vserver](#)

reverse-sticky (virtual server submode)

To ensure that the CSM switches connections in the opposite direction back to the original source, use the **reverse-sticky** command in the virtual server submode. To remove the reverse-sticky option from the policy or the default policy of a virtual server, use the **no** form of this command.

```
reverse-sticky group-id
```

```
no reverse-sticky
```

Syntax Description

<i>group-id</i>	Number identifying the sticky group to which the virtual server belongs; the range is from 0 to 255.
-----------------	--

Defaults

Reverse sticky is not enabled.

Command Modes

SLB virtual server configuration submode

Command History

Release	Modification
1.1(1)	This command was introduced.
3.1(1)	The IP reverse-sticky command is introduced.

Usage Guidelines

Sticky connections are not tracked. The group ID default is 0. The sticky feature is not used for other virtual servers. The network default is 255.255.255.255.

Examples

This example shows how to set the IP reverse-sticky feature:

```
Cat6k-2(config-module-csm) # vserver PUBLIC_HTTP
Cat6k-2(config-slb-vserver) # reverse-sticky 60
```

Related Commands

[sticky](#)
[sticky-group \(policy submode\)](#)
[show module csm sticky](#)
[show module csm vserver redirect](#)

serverfarm (virtual server submode)

To associate a server farm with a virtual server, use the **serverfarm** command in SLB virtual server configuration submode. To remove a server farm association from the virtual server, use the **no** form of this command.

```
serverfarm primary-serverfarm [backup sorry-serverfarm [sticky]]
```

```
no serverfarm
```

Syntax Description		
	<i>primary-serverfarm</i>	Character string used to identify the server farm.
	backup	(Optional) Sets the name of a backup server farm.
	<i>sorry-serverfarm</i>	(Optional) Backup server farm name.
	sticky	(Optional) Associates the backup server farm with a virtual server.

Defaults This command has no default settings.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	1.1(1)	This command was introduced.
	3.1(1)	The sorry server (backup server) option was added to this command.

Usage Guidelines The server farm name must match the server farm name specified in a previous module CSM submode **serverfarm** command.

The backup server farm can be associated with a policy. A primary server farm must be associated with that policy to allow the backup server farm to function properly. The backup server farm can have a different predictor option than the primary server. When the sticky option is used for a policy, then stickiness can apply to real servers in the backup server farm. Once a connection has been balanced to a server in the backup server farm, subsequent connections from the same client can be stuck to the same server even when the real servers in the primary server farm come back to the operational state. You may allow the sticky attribute when applying the backup server farm to a policy.

By default, the sticky option does not apply to the backup server farm. To remove the backup server farm, you can either use the **serverfarm** command without the backup option or use the **no serverfarm** command.

Examples This example shows how to associate a server farm with a virtual server named PUBLIC_HTTP:

```
Cat6k-2(config-slb-vserver) # serverfarm PUBLIC_HTTP back-up seveneleven sticky
```

■ `serverfarm (virtual server submode)`

Related Commands

slb-policy (virtual server submode)

To associate a load-balancing policy with a virtual server, use the **slb-policy** command in the SLB virtual server configuration submode. To remove a policy from a virtual server, use the **no** form of this command.

slb-policy *policy-name*

no slb-policy *policy-name*

Syntax Description

<i>policy-name</i>	Policy associated with a virtual server.
--------------------	--

Defaults

This command has no default settings.

Command Modes

SLB virtual server configuration submode

Command History

Release	Modification
1.1(1)	This command was introduced.

Usage Guidelines

Multiple load-balancing policies can be associated with a virtual server. URLs in incoming requests are parsed and matched against policies defined in the same order in which they are defined with this command. The policy name must match the name specified in a previous **policy** command.

Note

The order of the policy association is important; you should enter the highest priority policy first.

Examples

This example shows how to associate a policy with a virtual server.:

```
Cat6k-2 (config-slbf-vserver) # slb-policy COOKIE-POLICY1
```

Related Commands

[policy](#)
[show module csm owner](#)
[show module csm vserver redirect](#)

ssl-sticky (virtual server submode)

To allow SSL sticky operation, use the **ssl-sticky** command in the SLB virtual server configuration submode. To remove the SSL sticky feature, use the **no** form of this command.

ssl-sticky offset X length Y

no ssl-sticky

Syntax Description

offset	Specifies the SSL ID offset.
<i>X</i>	Sets the offset value.
length	Specifies the SSL ID length.
<i>Y</i>	Sets the length.

Defaults

Offset is 0 and length is 32.

Command Modes

SLB virtual server configuration submode

Command History

Release	Modification
3.1(1)	This command was introduced.

Usage Guidelines

This feature allows you to stick an incoming SSL connection based only on this special section of the SSL ID specified by the offset and length values. The **ssl-sticky** command was added to ensure that the CSM always load balances an incoming SSL connection to the SSL termination engine that generated that SSL ID.

Examples

This example shows how to associate a policy with a virtual server:

```
Cat6k-2(config-slb-vserver)# ssl-sticky offset 0 length 32
```

Related Commands

[policy](#)
[show module csm owner](#)
[show module csm vserver redirect](#)

sticky (virtual server submode)

To ensure that connections from the client use the same real server, use the **sticky** command in the virtual server submode. To change the sticky timer to its default value and remove the sticky option from the virtual server, use the **no** form of this command.

```
sticky duration [group group-id] [netmask ip-netmask] [source | destination | both]
```

```
no sticky
```

Syntax Description

<i>duration</i>	Sticky timer duration in minutes; the range is from 1 to 65535.
group	(Optional) Places the virtual server in a sticky group for connection coupling.
<i>group-id</i>	(Optional) Number identifying the sticky group to which the virtual server belongs; the range is from 0 to 255.
netmask	(Optional) Specifies which part of the address should be used for stickiness.
<i>ip-netmask</i>	(Optional) Network that allows clients to be stuck to the same server.
source	(Optional) Specifies the source portion of the IP address.
destination	(Optional) Destination portion of the IP address.
both	(Optional) Specifies that both the source and destination portions of the IP address are used.

Defaults

The sticky option is not in the server.

Command Modes

SLB virtual server configuration submode

Command History

Release	Modification
1.1(1)	This command was introduced.
3.1(1)	The IP reverse-sticky optional parameters are introduced.

Usage Guidelines

Sticky connections are not tracked. The group ID default is 0. The sticky feature is not used for other virtual servers. The network default is 255.255.255.255.

The last real server that was used for a connection from a client is stored for the *duration* value after the end of the client's latest connection. If a new connection from the client to the virtual server is initiated during that time, the same real server that was used for the previous connection is chosen for the new connection.

A nonzero sticky group ID must correspond to a sticky group previously created using the **sticky** command. Virtual servers in the same sticky group share sticky state information.

Examples

This example shows how to set the sticky timer duration and places the virtual server in a sticky group for connection coupling:

```
Cat6k-2(config-module-csm)# vserver PUBLIC_HTTP
Cat6k-2(config-slb-vserver)# sticky 60 group 3
```

Related Commands

url-hash (virtual server submode)

To set the beginning and ending pattern of a URL to parse URLs for the URL hash load-balancing algorithm, use the **url-hash** command in the SLB virtual server configuration submode. To remove the hashing from service, use the **no** form of this command.

```
url-hash { begin-pattern | end-pattern } pattern
```

```
no url-hash
```

Syntax Description	begin-pattern	Specifies the beginning of the URL to parse.
	end-pattern	Specifies the ending of the URL to parse.
	<i>pattern</i>	Pattern string to parse.

Defaults URL hasing is off.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	2.1(1)	This command was introduced.

Usage Guidelines The beginning and ending patterns apply to the URL hashing algorithm that is set using the **predictor** command in the SLB server farm submode.

Examples This example shows how to specify a URL pattern to parse:

```
Cat6k-2(config-slb-vserver)# url hash begin pattern lslkjfsj
```

Related Commands [predictor \(serverfarm submode\)](#)
[show module csm vserver redirect](#)

virtual (virtual server submode)

To configure virtual server attributes, use the **virtual** command in the SLB virtual server configuration submode. To set the virtual server's IP address to 0.0.0.0 and its port number to zero, use the **no** form of this command.

virtual *ip-address* [*ip-mask*] **tcp** *port* [**service** {**ftp** | **rtsp** | **termination**}]

virtual *ip-address* [*ip-mask*] **udp** *port* [**service** {**rtsp** | **per packet**}]

virtual *ip-address* [*ip-mask*] {**any** | *protocol-number*} [**service per-packet**]

no virtual *ip-address*

Syntax Description

<i>ip-address</i>	IP address for the virtual server.
<i>ip-mask</i>	(Optional) Mask for the IP address to allow connections to an entire network.
tcp <i>port</i>	Specifies the TCP port.
service ftp	(Optional) Combines connections associated with the same service so that all related connections from the same client use the same real server. FTP data connections are combined with the control session that created them. If you want to configure FTP services, these keywords are required.
service rtsp	(Optional) Combines connections to the Real Time Streaming Protocol (RTSP) TCP port 554.
service termination	(Optional) Enables TCP termination for DoS attack protection.
udp <i>port</i>	Specifies the UDP port.
any <i>protocol-number</i>	Load-balancing protocol, either TCP, UDP, any, or a number from 0 to 255.
service per-packet	(Optional) Enables load balancing for each packet independently. This option is for non-TCP only.

Defaults

The default IP mask is 255.255.255.255.

Command Modes

SLB virtual server configuration submode

Command History

Release	Modification
1.1(1)	This command was introduced.
2.1(1)	<i>ip-netmask</i> , UDP/arbitrary protocol introduced.
2.2.1	RTSP support introduced.
3.2(1)	Added TCP termination for DoS attack prevention and per packet load balancing.

Usage Guidelines

Clients connecting to the virtual server use this address to access the server farm. A port of 0 (or **any**) means that this virtual server handles all ports not specified for handling by another virtual server with the same IP address. The port is used only for TCP or UDP load balancing. No virtual servers can be configured with the same virtual settings and VLAN.

The following TCP port names can be used in place of a number:

XOT—X25 over TCP (1998)

dns—Domain Name Service (53)

ftp—File Transfer Protocol (21)

https—HTTP over Secure Sockets Layer (443)

matip-a—Mapping of Airline Traffic over IP, Type A (350)

nntp—Network News Transport Protocol (119)

pop2—Post Office Protocol v2 (109)

pop3—Post Office Protocol v3 (110)

smtp—Simple Mail Transport Protocol (25)

telnet—Telnet (23)

www—World Wide Web—Hypertext Transfer Protocol (80)

any—Traffic for any port (the same as specifying a 0).

Examples

This example shows how to create a virtual server and assign it an IP address, protocol, and port:

```
Cat6k-2(config-slb-vserver) # virtual 102.35.44.79 tcp 1
```

Related Commands

unidirectional (virtual server submode)

To select the traffic type and appropriate timeout value, use the **unidirectional** command in the SLB virtual server submode. **[no | default] unidirectional**

Syntax Description	no	(Optional) Removes the traffic type and timeout values. from the configuration.
	default	(Optional) Specifies that the CSM selects the appropriate behavior (unidirectional or bidirectional) based on the protocol.

Defaults The default is **default**.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	2.1(1)	This command was introduced.
	3.1(1)	This command was introduced.

Usage Guidelines The CSM selects the traffic type and the correct timeout behavior for that traffic. The current timeout value can be displayed using the **show module csm** or **vserver detail** commands.

Examples This example shows how to select the traffic type and the timeout behavior:

```
Cat6k-2(config-slb-vserver)# default unidirectional
```

Related Commands [show module csm](#)

vlan (virtual server submode)

To define which source VLANs may access the virtual server, use the **vlan** command in the SLB virtual server submode. To remove the VLAN, use the **no** form of this command.

vlan *vlan-number*

no vlan

Syntax Description	
<i>vlan-number</i>	VLAN that the virtual server may access.

Defaults The default is all VLANs.

Command Modes SLB virtual server configuration submode

Command History	Release	Modification
	2.1(1)	This command was introduced.

Usage Guidelines The VLAN must correspond to an SLB VLAN previously created with the **vlan** command.

Examples This example shows how to specify a VLAN for virtual server access:

```
Cat6k-2 (config-slb-vserver) # vlan 5
```

Related Commands

- [show module csm vserver redirect](#)

- [vlan \(virtual server submode\)](#)

vlan

To define which source VLANs may access the virtual server, and then enter the VLAN submode, use the **vlan** command in the CSM submode. To remove the VLAN, use the **no** form of this command.

vlan *vlan-number* [**client** | **server**]

no vlan

Syntax Description	<i>vlan-number</i>	VLAN that the virtual server may access.
	client server	Specifies the client-side or server-side VLAN.

Defaults The default is all VLANs.

Command Modes SLB configuration submode

Command History	Release	Modification
		2.1(1)

Usage Guidelines The VLAN must correspond to an SLB VLAN previously created with the **vlan** command.

Examples This example shows how to specify a VLAN for virtual server access:

```
Cat6k-2(config-slb-csm)# vlan 5
```

Related Commands

alias (VLAN submode)

To assign multiple IP addresses to the CSM, use the **alias** command in the SLB VLAN configuration submode. To remove an alias IP addresses from the configuration, use the **no** form of this command.

alias *ip-address netmask*

no alias *ip-address netmask*

Syntax Description

<i>ip-address</i>	Alias IP address; a maximum of 255 addresses are allowed per VLAN.
<i>netmask</i>	Network mask.

Defaults

This command has no default settings.

Command Modes

SLB VLAN configuration submode

Command History

Release	Modification
1.1(1)	This command was introduced for server VLANs.
2.1(1)	This command is now available for both client and server VLANs.

Usage Guidelines

This command allows you to place the CSM on a different IP network than real servers without using a router.

If the ICMP protocol does not terminate, you may need to set the idle timeout of these connections. The alias IP address in the CSM serves three purposes:

- It is a shared next hop (gateway) for two CSMs in the redundant configuration. The servers should point to the alias as the default gateway. The Route Health Injection (RHI) service would be using the alias IP address as the next hop when inserting a route.
- If ping is destined to the alias IP address, the CSM sends the reply back to the source MAC. This reply is useful when performing an ICMP probe from one CSM, across a firewall farm, to the other CSM alias address.
- In the Global Server Load Balancing (GSLB) configuration, the alias IP address is the destination VIP for the DNS request.

Examples

This example shows how to assign multiple IP addresses to the CSM:

```
Cat6k-2 (config-slb-vlan-server) # alias 130.21.34.56 255.255.255.0
Cat6k-2 (config-slb-vlan-server) # alias 130.22.35.57 255.255.255.0
Cat6k-2 (config-slb-vlan-server) # alias 130.23.36.58 255.255.255.0
Cat6k-2 (config-slb-vlan-server) # alias 130.24.37.59 255.255.255.0
Cat6k-2 (config-slb-vlan-server) # alias 130.25.38.60 255.255.255.0
```

■ alias (VLAN submode)

gateway (VLAN submode)

To configure a gateway IP address, use the **gateway** command in the SLB VLAN configuration submode. To remove the gateway from the configuration, use the **no** form of this command.

gateway *ip-address*

no gateway *ip-address*

Syntax Description	<i>ip-address</i>	IP address of the client-side gateway.
--------------------	-------------------	--

Defaults This command has no default settings.

Command Modes SLB VLAN configuration submode

Command History	Release	Modification
	1.1(1)	This command was introduced for client VLANs.
2.1(1)	This command is now available for both client and server VLANs.	

Usage Guidelines You can configure up to 7 gateways per VLAN with a total of up to 255 gateways for the entire system. A gateway must be in the same network as specified in the **ip address** SLB VLAN command.

Examples This example shows how to configure a client-side gateway IP address:

```
Cat6k-2(config-slb-vlan-client)# gateway 130.21.34.56
```

Related Commands [ip address \(VLAN submode\)](#) (SLB VLAN configuration submode)

ip address (VLAN submode)

To assign an IP address to the CSM that is used for probes and ARP requests on a VLAN, use the **ip address** command in the SLB VLAN configuration submode. To remove the CSM IP address and disable probes and ARP requests from the configuration, use the **no** form of this command.

ip address *ip-address netmask*

no ip address

Syntax Description

<i>ip-address</i>	IP address for the CSM; only one management IP address is allowed per VLAN.
<i>netmask</i>	Network mask.

Defaults

This command has no default settings.

Command Modes

SLB VLAN configuration submode

Command History

Release	Modification
1.1(1)	This command was introduced.
2.2.1	Increases maximum number of unique VLAN IP addresses per system form 32 to 255.

Usage Guidelines

This command is applicable for both server and client VLANs. Up to 255 unique VLAN IP addresses are allowed per module.

Examples

This example shows how to assign an IP address to the CSM:

```
Cat6k-2(config-slb-vlan-client)# ip address 130.21.34.56 255.255.255.0
```

Related Commands

[show module csm vlan](#)

route (VLAN submode)

To configure networks that are one Layer 3 hop away from the CSM, use the **route** command in the SLB VLAN configuration submode. To remove the subnet or gateway IP address from the configuration, use the **no** form of this command.

```
route ip-address netmask gateway gw-ip-address
```

```
no route ip-address netmask gateway gw-ip-address
```

Syntax Description

<i>ip-address</i>	Subnet IP address.
<i>netmask</i>	Network mask.
gateway	Specifies that the gateway is configured.
<i>gw-ip-address</i>	Gateway IP address.

Defaults

This command has no default settings.

Command Modes

SLB VLAN configuration submode

Command History

Release	Modification
1.1(1)	This command was introduced for server VLANs.
2.1(1)	This command is now available for both client and server VLANs.

Usage Guidelines

You specify the Layer 3 networks subnet address and the gateway IP address to reach the next-hop router. The gateway address must be in the same network as specified in the **ip address** SLB VLAN command.

Examples

This example shows how to configure a network to the CSM:

```
Cat6k-2(config-slb-vlan-server)# route 130.21.34.56 255.255.255.0 gateway 120.22.36.40
```

Related Commands

[ip address \(VLAN submode\)](#)
[show module csm vlan](#)
[vlan \(virtual server submode\)](#)

xml-config

To enable XML for a CSM module, and then enter the XML configuration submode, use the **xml-config** command. To remove the XML configuration, use the **no** form of this command.

xml-config

no xml-config

Defaults

This command has no default settings.

Command Modes

Module CSM configuration submode

Command History

Release	Modification
3.1(1)	This command was introduced.

Examples

This example shows how to display the XML configuration:

```
Cat6k-2(config-module-csm) # xml-config
Cat6k-2(config-slb-xml) #
```

Related Commands

[client-group \(XML submode\)](#)
[credentials \(XML submode\)](#)
[vlan \(XML submode\)](#)

client-group (XML submode)

To allow only connections sourced from an IP address matching the client group, use the **client-group** command in the SLB XML configuration submode. To remove the client group connections, use the **no** form of this command.

```
client-group [1-99 | name]
```

```
no client-group
```

Syntax Description	1-99	(Optional) Client group number.
	<i>name</i>	(Optional) Name of the client group.

Defaults Client group connections are removed.

Command Modes SLB XML configuration submode

Command History	Release	Modification
	3.1(1)	This command was introduced.

Usage Guidelines When a client group is specified, only connections sourced from an IP address matching that client group are accepted by the CSM XML configuration interface. If no client group is specified, then no source IP address check is performed. Only one client group may be specified.

Examples This example shows how to specify a client group:

```
Cat6k-2 (config-slb-xml) # client-group domino
```

Related Commands [xml-config](#)

credentials (XML submode)

To define one or more username and password combinations, use the **credentials** command in the SLB XML configuration submode. To remove the credentials, use the **no** form of this command.

credentials *user-name password*

no credentials *user-name*

Syntax Description

<i>user-name</i>	Name of the credentials user.
<i>password</i>	Password for the credentials user.

Defaults

This command has no default settings.

Command Modes

SLB XML configuration submode

Command History

Release	Modification
3.1(1)	This command was introduced.

Usage Guidelines

When one or more credentials commands are specified, the CSM HTTP server authenticates user access.

Examples

This example shows how to specify the user and password credentials for access:

```
Cat6k-2(config-slb-xml)# credentials savis xxxxx
```

Related Commands

[client-group \(XML submode\)](#)
[xml-config](#)

inservice (XML submode)

To enable XML for use by the CSM, use the **inservice** command in the SLB XML configuration submode. If this command is not specified, XML is not used. To disable XML, use the **no** form of this command.

inservice

no inservice

Defaults

This command has no default settings.

Command Modes

SLB XML configuration submode

Command History

Release	Modification
3.1(1)	This command was introduced.

Examples

This example shows how to enable XML:

```
Cat6k-2(config-slb-xml)# inservice
```

Related Commands

[xml-config](#)

port (XML submode)

To specify the TCP port on which the CSM HTTP server listens, use the **port** command in the SLB XML configuration submode. To remove the port, use the **no** form of this command.

port *port-number*

no port

Syntax Description	<i>port-number</i>	Sets the CSM port.
---------------------------	--------------------	--------------------

Defaults	The default is port 80.
-----------------	-------------------------

Command Modes	SLB XML configuration submode
----------------------	-------------------------------

Command History	Release	Modification
	3.1(1)	This command was introduced.

Examples	This example shows how to specify the TCP port for the server:
-----------------	--

```
Cat6k-2(config-slb-xml)# port 80
```

Related Commands	client-group (XML submode)
-------------------------	--

vlan (XML submode)

To restrict the CSM HTTP server to accept connections only from the specified VLAN, use the **vlan** command in the SLB XML configuration submode. To specify that all VLANs are accepted, use the **no** form of this command.

vlan *id*

no vlan

Syntax Description	<i>id</i>	VLAN name.
--------------------	-----------	------------

Defaults	All VLANs are accepted.
----------	-------------------------

Command Modes	SLB XML configuration submode
---------------	-------------------------------

Command History	Release	Modification
	3.1(1)	This command was introduced.

Examples	This example shows how to specify an owner for virtual server access:
----------	---

```
Cat6k-2(config-slb-xml)# vlan 9
```

Related Commands	client-group (XML submode)
------------------	--
