

# Manually Configured IPv6 over IPv4 Tunnels

This feature provides support for manually configured IPv6 over IPv4 tunnels. A manually configured tunnel is equivalent to a permanent link between two IPv6 domains over an IPv4 backbone.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see [Bug Search Tool](#) and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

## Information About Manually Configured IPv6 over IPv4 Tunnels

### Overlay Tunnels for IPv6

Overlay tunneling encapsulates IPv6 packets in IPv4 packets for delivery across an IPv4 infrastructure (a core network or the figure below). By using overlay tunnels, you can communicate with isolated IPv6 networks without upgrading the IPv4 infrastructure between them. Overlay tunnels can be configured between border devices or between a border device and a host; however, both tunnel endpoints must support both the IPv4 and IPv6 protocol stacks. IPv6 supports the following types of overlay tunneling mechanisms:

- Manual
- Generic routing encapsulation (GRE)
- IPv4-compatible
- 6to4
- Intrasite Automatic Tunnel Addressing Protocol (ISATAP)

**Figure 1: Overlay Tunnels**

**Note**

Overlay tunnels reduce the maximum transmission unit (MTU) of an interface by 20 octets (assuming that the basic IPv4 packet header does not contain optional fields). A network that uses overlay tunnels is difficult to troubleshoot. Therefore, overlay tunnels that connect isolated IPv6 networks should not be considered a final IPv6 network architecture. The use of overlay tunnels should be considered as a transition technique toward a network that supports both the IPv4 and IPv6 protocol stacks or just the IPv6 protocol stack.

Use the table below to help you determine which type of tunnel that you want to configure to carry IPv6 packets over an IPv4 network.

**Table 1: Suggested Usage of Tunnel Types to Carry IPv6 Packets over an IPv4 Network**

Tunneling Type	Suggested Usage	Usage Notes
Manual	Simple point-to-point tunnels that can be used within a site or between sites.	Can carry IPv6 packets only.
GRE- and IPv4- compatible	Simple point-to-point tunnels that can be used within a site or between sites.	Can carry IPv6, Connectionless Network Service (CLNS), and many other types of packets.
IPv4- compatible	Point-to-multipoint tunnels.	Uses the <code>::/96</code> prefix. We do not recommend using this tunnel type.

Tunneling Type	Suggested Usage	Usage Notes
6to4	Point-to-multipoint tunnels that can be used to connect isolated IPv6 sites.	Sites use addresses from the 2002::/16 prefix.
6RD	IPv6 service is provided to customers over an IPv4 network by using encapsulation of IPv6 in IPv4.	Prefixes can be from the SP's own address block.
ISATAP	Point-to-multipoint tunnels that can be used to connect systems within a site.	Sites can use any IPv6 unicast addresses.

Individual tunnel types are discussed in detail in this document. We recommend that you review and understand the information about the specific tunnel type that you want to implement. When you are familiar with the type of tunnel you need, see the table below for a summary of the tunnel configuration parameters that you may find useful.

**Table 2: Tunnel Configuration Parameters by Tunneling Type**

Tunneling Type	Tunnel Configuration Parameter		
Tunnel Mode	Tunnel Source	Tunnel Destination	Interface Prefix or Address

Tunneling Type	Tunnel Configuration Parameter				
Manual	ipv6ip	An IPv4 address, or a reference to an interface on which IPv4 is configured.	An IPv4 address.	An IPv6 address.	
GRE/IPv4	gre ip		An IPv4 address.	An IPv6 address.	
IPv4- compatible	ipv6ip auto-tunnel		Not required. These are all point-to-multipoint tunneling types. The IPv4 destination address is calculated, on a per-packet basis, from the IPv6 destination.	Not required. The interface address is generated as <code>::<i>tunnel-source</i>/96</code> .	
6to4	ipv6ip 6to4			An IPv6 address. The prefix must embed the tunnel source IPv4 address.	
6RD	ipv6ip 6rd			An IPv6 address.	
ISATAP	ipv6ip isatap			An IPv6 prefix in modified eui-64 format. The IPv6 address is generated from the prefix and the tunnel source IPv4 address.	

## IPv6 Manually Configured Tunnels

A manually configured tunnel is equivalent to a permanent link between two IPv6 domains over an IPv4 backbone. The primary use is for stable connections that require regular secure communication between two edge devices or between an end system and an edge device, or for connection to remote IPv6 networks.

An IPv6 address is manually configured on a tunnel interface, and manually configured IPv4 addresses are assigned to the tunnel source and the tunnel destination. The host or device at each end of a configured tunnel must support both the IPv4 and IPv6 protocol stacks. Manually configured tunnels can be configured between border devices or between a border device and a host. Cisco Express Forwarding switching can be used for IPv6 manually configured tunnels, or Cisco Express Forwarding switching can be disabled if process switching is needed.

## How to Enable Manually Configured IPv6 over IPv4 Tunnels

### Configuring Manual IPv6 Tunnels

Perform this task to configure manual IPv6 tunnels.

## Before You Begin

With manually configured IPv6 tunnels, an IPv6 address is configured on a tunnel interface, and manually configured IPv4 addresses are assigned to the tunnel source and the tunnel destination. The host or router at each end of a configured tunnel must support both the IPv4 and IPv6 protocol stacks.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *tunnel-number*
4. **ipv6 address** *ipv6-prefix / prefix-length [eui-64]*
5. **tunnel source** *{ip-address| interface-type interface-number}*
6. **tunnel destination** *ip-address*
7. **tunnel mode ipv6ip**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode.  • Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
<b>Step 3</b>	<b>interface tunnel</b> <i>tunnel-number</i>  <b>Example:</b> Router(config)# interface tunnel 0	Specifies a tunnel interface and number, and enters interface configuration mode.
<b>Step 4</b>	<b>ipv6 address</b> <i>ipv6-prefix / prefix-length [eui-64]</i>  <b>Example:</b> Router(config-if)# ipv6 address 3ffe:b00:c18:1::3/127	Specifies the IPv6 network assigned to the interface and enables IPv6 processing on the interface.
<b>Step 5</b>	<b>tunnel source</b> <i>{ip-address  interface-type interface-number}</i>  <b>Example:</b> Router(config-if)# tunnel source ethernet 0	Specifies the source IPv4 address or the source interface type and number for the tunnel interface.  • If an interface is specified, the interface must be configured with an IPv4 address.

	Command or Action	Purpose
<b>Step 6</b>	<b>tunnel destination</b> <i>ip-address</i>  <b>Example:</b>  <pre>Router(config-if)# tunnel destination 192.168.30.1</pre>	Specifies the destination IPv4 address or hostname for the tunnel interface.
<b>Step 7</b>	<b>tunnel mode ipv6ip</b>  <b>Example:</b>  <pre>Router(config-if)# tunnel mode ipv6ip</pre>	Specifies a manual IPv6 tunnel.  <b>Note</b> The <b>tunnel mode ipv6ip</b> command specifies IPv6 as the passenger protocol and IPv4 as both the encapsulation and transport protocol for the manual IPv6 tunnel.

## Configuration Examples for Manually Configured IPv6 over IPv4 Tunnels

### Example: Configuring Manual IPv6 Tunnels

The following example configures a manual IPv6 tunnel between Router A and Router B. In the example, tunnel interface 0 for both Router A and Router B is manually configured with a global IPv6 address. The tunnel source and destination addresses are also manually configured.

#### Router A Configuration

```
interface ethernet 0
 ip address 192.168.99.1 255.255.255.0
interface tunnel 0
 ipv6 address 3ffe:b00:c18:1::3/127
 tunnel source ethernet 0
 tunnel destination 192.168.30.1
 tunnel mode ipv6ip
```

#### Router B Configuration

```
interface ethernet 0
 ip address 192.168.30.1 255.255.255.0
interface tunnel 0
 ipv6 address 3ffe:b00:c18:1::2/127
 tunnel source ethernet 0
 tunnel destination 192.168.99.1
 tunnel mode ipv6ip
```

# Feature Information for Manually Configured IPv6 over IPv4 Tunnels

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/featurenavigator](#). An account on Cisco.com is not required.

**Table 3: Feature Information for Manually Configured IPv6 over IPv4 Tunnels**

Feature Name	Releases	Feature Information
IPv6 Tunneling: Manually Configured IPv6 over IPv4 Tunnels	12.0(23)S 12.2(14)S 12.2(28)SB 12.2(33)SRA 12.2(2)T 15.0(1)S	A manually configured tunnel is equivalent to a permanent link between two IPv6 domains over an IPv4 backbone.  The following commands were introduced or modified: <b>tunnel destination</b> , <b>tunnel ipv6ip</b> , <b>tunnel source</b> .
