

ATM Mode for Two-Wire or Four-Wire SHDSL

This document describes the ATM Mode for Two-Wire or Four-Wire SHDSL feature on the Cisco 1700 series, Cisco 1800 series, Cisco 2600 series, Cisco 2800, Cisco 3631, Cisco 3700, and Cisco 3800 series routers.

The ATM Mode for Two-Wire or Four-Wire SHDSL feature adds four-wire support in fixed line-rate mode only on a WIC-1SHDSL-V2. Two-wire mode supports two-wire line-rate and auto line-rate. This feature builds on the existing features of the Multirate Symmetrical High-Speed Digital Subscriber Line (G.SHDSL) feature supported on the 1-port G.SHDSL WAN interface card (WIC-1SHDSL). The four-wire feature of G.991.2 doubles the bandwidth in ATM mode and increases usable distance over two pairs of wires.

The WIC-1SHDSL-V2 supports ATM on two-wire and four-wire line mode. Embedded Operation Channel (EOC) messages support for customer premise equipment (CPE) is provided for two-wire and four-wire modes.

Feature Specifications for the ATM Mode for SHDSL

Feature History

Release	Modification
12.3(4)XD	This feature (WIC-1SHDSL-V2) was introduced on the Cisco 2600 series and Cisco 3700 series routers to add four-wire support. Two-wire support was previously available in <i>1-Port G.SHDSL WAN Interface Card for Cisco 2600 Series and Cisco 3600 Series Routers</i> , Release 12.2(8)T.
12.3(4)XG	This feature (WIC-1SHDSL-V2) was integrated into Cisco IOS Release 12.3(4)XG on the Cisco 1700 series routers.
12.3(7)T	This feature (WIC-1SHDSL-V2) was integrated into the Cisco IOS Release 12.3(7)T on the Cisco 2600 series, Cisco 3631, and Cisco 3700 series routers. Cisco 1700 series routers do not support the WIC-1SHDSL-V2 in this release.
12.3(4)XG1	Support for the auto line-mode feature was added.
12.3(11)T	Support for the following was added: additional annex parameters for Cisco 1700, Cisco 2600, Cisco 2800, Cisco 3631, Cisco 3700, and Cisco 3800 series routers; the HDSL2-SHDSL-LINE-MIB (RFC3276); and support for the ATM Mode for SHDSL feature was added for Cisco 2800 series, and Cisco 3800 series routers.
12.3(14)T	Support was added for Cisco 1800 series routers and the Cisco 2801 Integrated Services router.

Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

Prerequisites for ATM Mode for Two-Wire or Four-Wire SHDSL

- A G.SHDSL WIC must be installed in the router to match the DSL service to be configured.
- Minimum memory recommendations are shown in [Table 1](#).

Table 1 Minimum Memory Recommendations for ATM Mode for Two-Wire or Four-Wire SHDSL

Platform Name	Image Name	Flash Memory Recommended	DRAM Memory Recommended
Cisco 1700 Series	IOS IP BASE	16 MB	64 MB
Cisco 1800 Series	IOS IP BASE	16 MB	64 MB
Cisco 2610XM, Cisco 2611XM, Cisco 2620XM, Cisco 2621XM, Cisco 2650XM, Cisco 2651XM	IOS IP BASE	16 MB	64 MB
Cisco 2691	IOS IP BASE	32 MB	128 MB
Cisco 2800 Series	IOS IP BASE	32 MB	128 MB
Cisco 3631	IOS IP BASE	32 MB	128 MB
Cisco 3725	IOS IP BASE	32 MB	128 MB
Cisco 3745	IOS IP BASE	32 MB	128 MB
Cisco 3800 Series	IOS IP BASE	32 MB	128 MB

Restrictions for ATM Mode for Two-Wire or Four-Wire SHDSL

- The *auto* parameter of the **line-mode** command on the WIC-1SHDSL-V2 is supported only in Cisco IOS Release 12.3(4)XG1 and later releases.
- The WIC-1SHDSL-V2 ATM Mode for SHDSL does not support ATM adaption layer 1 (AAL1) and/or circuit emulation service.
- ATM adaption layer 2 (AAL2) is not supported on Cisco 1700 series, and Cisco 2801 routers.
- The ATM Mode for SHDSL does not interface with AIM-ATM.
- The ATM Mode for SHDSL does not support available bit rate (ABR) class of service (CoS).
- The ATM Mode for SHDSL does not support unspecified bit rate plus (UBR+).
- The ATM Mode for SHDSL only support 23 private virtual circuits (PVC) per WIC.
- The WIC-1SHDSL-V2 should be inserted only into onboard WIC slots or NM-2W, NM-1FE2W, NM-1FE1R2W, NM-2FE2W, NM-1FE2W-V2, or NM-2FE2W-V2 network modules. This WIC is not supported in NM-1E2W, NM-1E1R-2W, or NM-2E2W combination network modules.
- The WIC-1SHDSL-V2 does not support T1/E1 mode in four-wire mode.
- The WIC-1SHDSL does not support T1/E1 mode.

Information About ATM Mode for Two-Wire or Four-Wire SHDSL

This section provides information about the ATM Mode for SHDSL feature.

- [SHDSL Features, page 3](#)
- [ATM Features, page 4](#)
- [Interface and Controller Numbering on the Cisco 1721 Router, page 4](#)
- [Interface Numbering on Cisco 2800 and Cisco 3800 Series Routers, page 5](#)

SHDSL Features

Supported SHDSL features are listed as follows:

- ITU G.991.2 support (full support for Annex A & B)
 - Dying Gasp (ITU G.991.2) is supported.
 - Terminating wetting current is supported.
 - Two-wire mode supports speeds from 192 kbps to 2.304 Mbps in increments of 64 kbps in both fixed and auto line rate.
 - Four-wire mode supports speeds from 384 kbps to 4.608 Mbps in increments of 128 kbps in fixed line rate only and provides increased rate capability and greater reach.

ATM Features

The supported ATM features in this release:

- Provide ATM traffic management to enable service providers to manage their core ATM network infrastructures.
- Support ATM class of service features constant bit rate (CBR), variable bit rate-nonreal time (VBR-nrt), variable bit rate-real time (VBR-rt), and unspecified bit rate (UBR).
- Operate back-to-back or through a digital subscriber line access multiplexer (DSLAM).
- Provide toll-quality Voice over IP delivery over AAL5.
- Support VoATM over AAL2, but AAL2 is not supported on the Cisco 1700 series routers.
- Support VoATM over AAL5.

Interface and Controller Numbering on the Cisco 1721 Router

If a WIC-1SHDSL-V2 is installed in a Cisco 1721 router, the interfaces and controllers are assigned numbers based on a numbering scheme that is different from the slot numbering scheme on other Cisco routers. This is because the Cisco 1721 router assigns only a slot number without also assigning a port number. Other Cisco routers typically use a slot and port number combination.

If the WIC-1SHDSL-V2 (the DSL controller) is installed in slot 0, the T1/E1 controllers and the ATM interfaces (ADSL/SHDSL) will be numbered relative to the DSL controller in slot 0. See [Table 2](#) for examples of the slot numbering scheme on the Cisco 1721 router.

With an ATM or MFT T1/E1 card in slot 0, the WIC-1SHDSL-V2 in slot 1 will be numbered relative to the number of ports in slot 0.

If both slots are occupied by DSL controllers, the logical interfaces configured on each controller will have the same number as the slot occupied by the DSL controller. All logical interfaces on the WIC-1SHDSL-V2, such as serial interfaces created during the configuration of channel groups in T1/E1 mode, will have the same number as the DSL controller.

Table 2 *Examples of Slot Numbering on the Cisco 1721 Router*

Interface Cards and Controllers Installed	Slot Numbering Assignment
A WIC-1SHDSL-V2 is in slot 0, and an MFT-T1/E1 is installed in the other slot, which will be numbered as slot 1.	For WIC-1SHDSL-V2: <pre>controller ds1 0 interface atm0 (or controller t1 0)</pre> For MFT-T1: <pre>controller t1 1</pre>
A WIC-1SHDSL-V2 is in slot 0, and an ADSL/SHDSL WIC is in slot 1.	For WIC-1SHDSL-V2: <pre>controller ds1 0, interface atm0 (or controller t1 0)</pre> For ADSL/SHDSL WIC: <pre>interface atm 1</pre>

Table 2 Examples of Slot Numbering on the Cisco 1721 Router (continued)

Interface Cards and Controllers Installed	Slot Numbering Assignment
An ATM or MFT T1/E1 card is in slot 0, and a WIC-1SHDSL-V2 is in slot 1. The WIC-1SHDSL-V2 will be numbered relative to the ports in slot 0.	For ADSL/SHDSL: interface atm 0 For WIC-1SHDSL-V2: controller dsl 1, interface atm 1 (or controller t1 1)
A 1MFT-T1/E1 is in slot 0, and a WIC-1SHDSL-V2 is in slot 1.	For 1MFT-T1/E1: controller t1 0 For WIC-1SHDSL-V2: controller dsl 1, interface atm 1 (or controller t1 1)
A 2MFT-T1/E1 is in slot 0, and a WIC-1SHDSL-V2 is in slot 1.	For 2MFT-T1/E1: controller t1 0 controller t1 1 For WIC-1SHDSL-V2: controller dsl 2, interface atm 2 (or controller t1 2)

Interface Numbering on Cisco 2800 and Cisco 3800 Series Routers

This section describes the interface numbering scheme for Cisco 2800 and Cisco 3800 series routers. If an interface card is installed in a Cisco 2800 series or Cisco 3800 series router, the interfaces must use a triple-number scheme to identify them. This triple-number assignment is different from the standard interface numbering scheme on other Cisco routers.

[Table 3](#) shows the interface numbering for the onboard Fast Ethernet ports and the interface slots on Cisco 2800 and Cisco 3800 series routers.

Table 3 Interface Numbering on Cisco 2800 Series and Cisco 3800 Series Router

Port/Slot	Interface Numbering	Example
Fast Ethernet ports (onboard)	0/0, 0/1	FE 0/0, 0/1
Slot 1	Slot 0/0/0	FE 0/0/0, 0/0/1, 0/0/2, 0/0/3
Slot 2	Slot 0/1/0	(Serial 2T) Serial 0/1/0, 0/1/1
Slot 3	Slot 0/2/0	FE 0/2/0
Slot 4	Slot 0/3/0	(G.SHDSL) ATM 0/3/0

How to Configure ATM Mode for Two-Wire or Four-Wire SHDSL

To configure the ATM Mode for Two-Wire or Four-Wire SHDSL feature, perform the following tasks:

- [Configuring G.SHDSL Service, page 6](#) (required)
- [Verifying the ATM Configuration, page 12](#) (optional)
- [Verifying DSL Configuration, page 16](#) (optional)
- [Troubleshooting Tasks, page 21](#) (optional)

Configuring G.SHDSL Service

This section details how to configure the ATM Mode for Two-Wire or Four-Wire SHDSL feature for G.SHDSL service.

To configure G.SHDSL service in ATM mode on a Cisco router containing a G.SHDSL WIC, complete the steps in the Summary Steps or the Detailed Steps, beginning in global configuration mode.

Prerequisites

The following list of prerequisites should be followed for this configuration:

- A G.SHDSL WIC must be installed in the router to match the DSL service to be configured.
- Routers may be set up for back-to-back operation as shown in [Figure 1](#) or they may be connected to a DSLAM.

Figure 1 Back-to-Back Setup

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **controller dsl slot/port**
4. **line-term {co | cpe}**
5. **dsl-mode shdsl symmetric annex mode**
6. **ignore-error-duration seconds**
7. **mode atm**
8. **line-mode [2-wire | 4-wire | auto]**
9. **line-rate [rate | auto]**
10. **exit**
11. **interface atm slot/port**

12. **ip address** *IP-address subnet-mask*
13. **atm ilmi-keepalive** [*seconds*]
14. **pvc** [*name*] *vpi/vci*
15. **protocol** *protocol [protocol-address]*
16. **vbr-rt** *peak-rate average-cell-rate burst*
17. **encapsulation** {*aal2 | aal5ciscoppp | aal5mux | aal5nlpid | aal5snap | aal5autoppp*}
18. **exit**
19. **exit**
20. **exit**
21. **show interface atm** *slot/port*
22. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none">Enter your password if prompted.
Step 2	configure terminal Example: Router# configure terminal	Enters the global configuration mode.
Step 3	controller dsl <i>slot/port</i> Example: Router(config)# controller dsl 0/1	Enters controller configuration mode. The keywords and arguments are as follows: <ul style="list-style-type: none">dsl—The type of controller.<i>slot/port</i>—The backplane slot number and port number for the interface being configured.
Step 4	line-term { <i>co cpe</i> } Example: Router(config-controller)# line-term cpe	Configures the DSL controller line termination as follows: <ul style="list-style-type: none">co—Central office.cpe—Customer premises equipment.

Command or Action	Purpose
<p>Step 5</p> <pre>dsl-mode shdsl symmetric annex mode</pre> <p>Example: Router(config-controller)# dsl-mode shdsl symmetric annex A</p>	<p>Sets the DSL operating mode parameters. The valid values are:</p> <ul style="list-style-type: none"> • A: Supports Annex A of G.991.2 standard for North America. This is the default. • B: Supports Annex B of G.991.2 standard for Europe. • A–B: Supports Annex A or B. For CPE mode only. CO mode is not supported. Selected when the line trains. • A–B–ANFP: Supports Annex A or B–ANFP. For CPE mode only. CO mode is not supported. Selected when the line trains. • B–ANFP: Supports Annex B–ANFP.
<p>Step 6</p> <pre>ignore-error-duration (seconds)</pre> <p>Example: Router(config-controller)# ignore-error-duration 15</p>	<p>(Optional) Permits the router to ignore errors for a given amount of time when training the line when connected to a controller with a different chipset type.</p> <ul style="list-style-type: none"> • <i>seconds</i>—Number of seconds for which errors are ignored. The range is 15 to 30 seconds. If this value is omitted, an error message appears.
<p>Step 7</p> <pre>mode atm</pre> <p>Example: Router(config-controller)# mode atm</p>	<p>Enables ATM encapsulation and creates a logical ATM interface slot/port.</p> <p>Note If the no mode atm command is used to leave ATM mode, the router must be rebooted to clear the mode.</p>
<p>Step 8</p> <p>For CPE:</p> <pre>line-mode [4-wire 2-wire line-number auto]</pre> <p>For CO:</p> <pre>line-mode {4-wire 2-wire line-number}</pre> <p>Example: Router(config-controller)# line-mode 4-wire</p>	<p>(Optional) Configures the controller to operate in two-wire or four-wire mode. The two-wire mode is the default if this step is not configured or if the mode is not specified.</p> <ul style="list-style-type: none"> • 2-wire—Configures the controller to operate in two-wire mode. This is the default if this step is omitted or if the mode is not specified. • 4-wire—Configures the controller to operate in four-wire mode. • <i>line-number</i>—For two-wire mode only, selects the pair of wires used. Valid values are line-zero (default) or line-one. Line-zero selects RJ-11 pin 1 and pin 2; line-one selects RJ-11 pin 3 and pin 4. • auto—Configures the line mode to be automatically detected for the CPE. This option is not available for configuring the CO.

	Command or Action	Purpose
<p>Step 9</p> <pre>line-rate {rate auto}</pre> <p>Example: Router(config-controller)# line-rate 1024</p>	<p>Specifies the DSL line rate for the SHDSL port. Only fix line-rate mode is supported in four-wire mode. The argument is as follows:</p> <ul style="list-style-type: none"> • auto—Allows the controller to select the rate. This option is available only in two-wire mode. • rate—Sets the DSL line rate. The supported line rates are as follows: <ul style="list-style-type: none"> – For two-wire mode—192, 256, 320, 384, 448, 512, 576, 640, 704, 768, 832, 896, 960, 1024, 1088, 1152, 1216, 1280, 1344, 1408, 1472, 1536, 1600, 1664, 1728, 1792, 1856, 1920, 1984, 2048, 2112, 2176, 2240, and 2304 – For four-wire mode—384, 512, 640, 768, 896, 1024, 1152, 1280, 1408, 1536, 1664, 1792, 1920, 2048, 2176, 2304, 2432, 2560, 2688, 2816, 2944, 3072, 3200, 3328, 3456, 3584, 3712, 3840, 3968, 4096, 4224, 4352, 4480, and 4608. <p>Note The configured line rate is the data rate available. Third-party equipment may use a line rate that includes an additional SHDSL overhead of 8 kbps for two-wire mode or 16 kbps for four-wire mode.</p>	
<p>Step 10</p> <pre>exit</pre> <p>Example: Router(config-controller)# exit</p>	<p>Exits controller configuration mode.</p>	
<p>Step 11</p> <pre>interface atm slot/port</pre> <p>Example: Router(config)# interface atm 1/0</p>	<p>Enters ATM configuration mode for interface ATM 0 in slot 1.</p> <p>The keywords and arguments are as follows:</p> <ul style="list-style-type: none"> • slot—The backplane slot number for the interface being configured. • port—The backplane port number for the interface being configured. <p>Note If a slot has two subslots for WIC modules and no ATM interface is present in subslot 0, the WIC will take ATM x/0 as its interface number even if placed in subslot 1 (ATMx/1).</p> <p>If a two-port WIC is present in subslot 0, the WIC will use ATM x/2 as its interface number. This subslot number is pertinent to all interface commands such as show interface atm and show dsl interface atm.</p>	

Command or Action	Purpose
<p>Step 12 <code>ip address ip-address subnet-mask</code></p> <p>Example: Router(config-if)# <code>ip address 192.168.10.25 255.255.255.0</code></p>	<p>Assigns an IP address to the DSL ATM interface.</p>
<p>Step 13 <code>atm ilmi-keepalive [seconds]</code></p> <p>Example: Router(config-if)# <code>atm ilmi-keepalive 5</code></p>	<p>(Optional) Enables Integrated Local Management Interface (ILMI) keepalives.</p> <ul style="list-style-type: none"> <code>seconds</code>—The number of seconds between keepalives. If you enable ILMI keepalives without specifying the seconds, the default time interval is 3 seconds.
<p>Step 14 <code>pvc [name] vpi/vci</code></p> <p>Example: Router(config-if)# <code>pvc [name] vpi/vci</code></p>	<p>Enters atm-virtual-circuit (interface-atm-vc) configuration mode, and configures a new ATM permanent virtual circuit (PVC) by assigning a name (optional) and VPI/VCI numbers.</p> <p>The default traffic shaping is an unspecified bit rate (UBR); the default encapsulation is AAL5+LLC/SNAP.</p> <ul style="list-style-type: none"> <code>name</code>—(Optional) Name of the PVC or map. The name can be up to 15 characters long. <code>vpi</code>— ATM network virtual path identifier (VPI) for this PVC. The absence of the “/” and a VPI value causes the VPI value to default to 0. <p>Value Ranges:</p> <ul style="list-style-type: none"> Cisco 2600 and Cisco 3600 series routers using Inverse Multiplexing for ATM (IMA): 0 to 15, 64 to 79, 128 to 143, and 192 to 207 <p>The <code>vpi</code> and <code>vci</code> arguments cannot both be set to 0; if one is 0, the other cannot be 0.</p> <ul style="list-style-type: none"> <code>vci</code>—ATM network virtual channel identifier (VCI) for this PVC. This value ranges from 0 to 1 less than the maximum value set for this interface by the atm vc-per-vc command. Typically, lower values from 0 to 31 are reserved for specific traffic (for example, F4 OAM, SVC signaling, ILMI, and so on) and should not be used. <p>The VCI is a 16-bit field in the header of the ATM cell. The VCI value is unique only on a single link, not throughout the ATM network, because it has local significance only.</p> <p>The <code>vpi</code> and <code>vci</code> arguments cannot both be set to 0; if one is 0, the other cannot be 0.</p>

	Command or Action	Purpose
Step 15	<p><code>protocol protocol [protocol-address]</code></p> <p>Example: Router(config-if-vc)# <code>protocol ip 192.168.0.4</code></p>	<p>(Optional) Enables IP connectivity and creates a point-to-point IP address for the virtual circuit (VC).</p> <ul style="list-style-type: none"> • <i>protocol</i>—Choose the ip protocol for this configuration. • <i>protocol-address</i>—Destination address that is being mapped to a permanent virtual circuit (PVC).
Step 16	<p><code>vbr-rt peak-rate average-cell-rate burst</code></p> <p>Example: Router(config-if-vc)# <code>vbr-rt peak-rate average-cell-rate burst</code></p>	<p>(Optional) Configures the PVC for real-time variable bit rate (VBR) traffic shaping.</p> <ul style="list-style-type: none"> • <i>peak rate</i>—Peak cell rate (PCR). • <i>average-cell-rate</i>—Average cell rate (ACR). • <i>burst</i>—Burst size in cells.
Step 17	<p><code>encapsulation {aal2 aal5ciscoPPP aal5mux aal5nlpid aal5snap aal5autoppP}</code></p> <p>Example: Router(config-if-vc)# <code>encapsulation aal2</code></p>	<p>(Optional) Configures the ATM adaptation layer (AAL) and encapsulation type.</p> <ul style="list-style-type: none"> • aal2—AAL2. • aal5ciscoPPP—Cisco PPP over AAL5. • aal5mux—AAL5+MUX. • aal5nlpid—AAL5+NLPID. • aal5snap—AAL5+LLC/SNAP. • aal5autoppP—PPP Autosense over AAL5. <p>The default is aal5snap.</p>
Step 18	<p><code>exit</code></p> <p>Example: Router(config-if-vc)# <code>exit</code></p>	Exits interface-atm-vc configuration mode.
Step 19	<p><code>exit</code></p> <p>Example: Router(config-if)# <code>exit</code></p>	Exits ATM interface configuration mode.
Step 20	<p><code>exit</code></p> <p>Example: Router(config)# <code>exit</code></p>	Exits global configuration mode.

	Command or Action	Purpose
Step 21	<pre>show interface atm slot/port</pre> <p>Example: Router# <code>show interface atm 1/0</code></p>	<p>Displays the ATM interface configuration.</p> <p>The keywords and arguments are as follows:</p> <ul style="list-style-type: none"> <code>slot</code>—The backplane slot number for the interface being configured. <code>port</code>—The backplane port number for the interface being configured.
Step 22	<pre>exit</pre> <p>Example: Router# <code>exit</code></p>	<p>Exits privileged EXEC mode.</p>

Examples

Example of the Configuration Before Configuring ATM Mode:

```
controller DSL 0/0
 line-term cpe
```

Example for 4-wire ATM, Annex B, and Line Rate 3200

```
controller DSL 0/1
 mode atm
 line-term cpe
 line-mode 4-wire
 dsl-mode shdsl symmetric annex B
 line-rate 3200
```

What to Do Next

The next task is to verify the ATM mode or DSL mode for the router.

Verifying the ATM Configuration

Perform the steps in this section to verify the ATM Configuration.

SUMMARY STEPS

1. `enable`
2. `show running-config`
3. `show controllers atm slot/port`
4. `show atm vc`
5. `debug atm events`
6. `debug atm errors`
7. `show interface atm slot/port`
8. `exit`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>enable</code> Example: Router> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	<code>show running-config</code> Example: Router# <code>show running-config</code>	Displays current running configuration and the status for all controllers.
Step 3	<code>show controllers atm slot/port</code> Example: Router# <code>show controllers atm 0/1</code>	Displays ATM controller statistics. The keywords and arguments are as follows: <ul style="list-style-type: none"> <code>slot</code>—The backplane slot number for the interface being configured. <code>port</code>—The backplane port number for the interface being configured.
Step 4	<code>show atm vc</code> Example: Router# <code>show atm vc</code>	Displays PVC status.
Step 5	<code>debug atm events</code> Example: Router# <code>debug atm events</code>	Identifies ATM-related events as they are generated.
Step 6	<code>debug atm errors</code> Example: Router# <code>debug atm errors</code>	Identifies interfaces with ATM errors.
Step 7	<code>show interface atm slot/port</code> Example: Router# <code>show interface atm 0/1</code>	Displays the status of the ATM interface. Ensure that the ATM slot/port and the line protocol are up. The keywords and arguments are as follows: <ul style="list-style-type: none"> <code>slot</code>—The backplane slot number for the interface being configured. <code>port</code>—The backplane port number for the interface being configured.
Step 8	<code>exit</code> Router# <code>exit</code>	Exits privileged EXEC mode.

Examples

The following example shows how the `show interface atm` command is used and that the ATM slot/port and line protocol are up:

```
Router#show interfaces atm 0/0
```

```
ATM0/0 is up, line protocol is up
  Hardware is DSL/SAR
  MTU 4470 bytes, sub MTU 4470, BW 4608 Kbit, DLY 110 usec,
    reliability 0/255, txload 1/255, rxload 1/255
  Encapsulation ATM, loopback not set
  Encapsulation(s): AAL5 , PVC mode
  23 maximum active VCs, 256 VCs per VP, 1 current VCCs
  VC Auto Creation Disabled.
  VC idle disconnect time: 300 seconds
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: Per VC Queueing
  30 second input rate 0 bits/sec, 0 packets/sec
  30 second output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer

What to Do Next

Verify the configuration using the detailed steps in the [“Verifying DSL Configuration”](#) section on page 16.

Verifying DSL Configuration

Perform the steps in this section to verify the DSL Configuration.

SUMMARY STEPS

1. **enable**
2. **show running-config**
3. **show controller dsl slot/port**
4. **debug xdsl application**
5. **debug xdsl eoc**
6. **debug xdsl error**
7. **exit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>enable</code> Example: Router> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	<code>show running-config</code> Example: Router# <code>show running-config</code>	Displays the current running configuration and the status for all controllers.
Step 3	<code>show controller dsl slot/port</code> Example: Router# <code>show controller dsl 0/2</code>	Displays the DSL controller status. The keywords and arguments are as follows: <ul style="list-style-type: none"> <code>slot</code>—The backplane slot number for the interface being configured. <code>port</code>—The backplane port number for the interface being configured.
Step 4	<code>debug xdsl application</code> Example: Router# <code>debug dsl application</code>	Displays output of the DSL if the DSL does not come up.
Step 5	<code>debug xdsl eoc</code> Example: Router# <code>debug xdsl eoc</code>	Displays what is in the Embedded Operation Channel (EOC) messages.
Step 6	<code>debug xdsl error</code> Example: Router# <code>debug xdsl error</code>	Displays error messages.
Step 7	<code>exit</code> Router# <code>exit</code>	Exits privileged EXEC mode.

Examples

The following example shows how to verify four-wire ATM mode in line zero (CPE):

```
Router#show controller dsl 0/0

Troubleshooting Tasks

The following commands verify hardware on the router:

- **show version**—Lists the modules installed in the router. If DSL controllers are installed, the output

displays the following line:

- 1 DSL controller—Indicates one DSL controller is installed in the router

and one of the following lines:

- 1 ATM network interface(s)—If the DSL controller is configured for mode ATM
- 1 Channelized T1/PRI port(s)—If the DSL controller is configured for mode T1

- **show controllers atm**—Displays the ATM controller status and statistics. The sample below shows the output in ATM mode. Actual output may vary depending on the router and the configuration.

```

- **debug xdsl driver**
- **debug xdsl eoc**
- **debug xdsl error**

Glossary

ABR—available bit rate. An ATM service type in which the ATM network makes a “best effort” to meet the transmitter’s bandwidth requirements. ABR uses a congestion feedback mechanism that allows the ATM network to notify the transmitters that they should reduce their rate of data transmission until the congestion decreases. Thus, ABR offers a qualitative guarantee that the transmitter’s data can get to the intended receivers without unwanted cell loss.

ATM—Asynchronous Transfer Mode. A form of digitized data transmission based on fixed-length cells that can carry data, voice, and video at high speeds.

CBR—constant bit rate. A data transmission that can be represented by a nonvarying, or continuous, stream of bits or cell payloads. Applications such as voice circuits generate CBR traffic patterns. CBR is an ATM service type in which the ATM network guarantees to meet the transmitter’s bandwidth and quality-of-service (QoS) requirements.

CO—central office. Local telephone company office to which all local loops in a given area connect and in which circuit switching of subscriber lines occur.

CPE—customer premises equipment. CPE includes devices, such as CSU/DSUs, modems, and ISDN terminal adapters, required to provide an electromagnetic termination for wide-area network circuits before connecting to the router or access server. This equipment was historically provided by the telephone company, but is now typically provided by the customer in North American markets.

Downstream—Refers to the transmission of data from the central office (CO or COE) to the customer premises equipment (CPE).

G.SHDSL—Multirate Symmetrical High-Speed Digital Subscriber Line.

UBR—unspecified bit rate. QoS class defined by the ATM Forum for ATM networks. UBR allows any amount of data up to a specified maximum to be sent across the network, but there are no guarantees in terms of cell loss rate and delay. Compare with ABR (available bit rate), CBR, and VBR.

Upstream—Refers to the transmission of data from the customer premises equipment (CPE) to the central office equipment (CO or COE).

VBR—variable bit rate. QoS class defined by the ATM Forum for ATM networks. VBR is subdivided into a real time (rt) class and non-real time (nrt) class.

VBR-rt—VBR-real-time is used for connections in which there is a fixed timing relationship between samples.

VBR-nrt—VBR-non-real-time is used for connections in which there is no fixed timing relationship between samples, but that still need a guaranteed QoS. Compare with ABR, CBR, and UBR.
