

# show mpls oam echo statistics

To display statistics about Multiprotocol Label Switching (MPLS) Operation, Administration, and Maintenance (OAM) echo request packets, use the **show mpls oam echo statistics** command in privileged EXEC mode.

**show mpls oam echo statistics [summary]**

<b>Syntax Description</b>	<b>summary</b>	(Optional) Displays summary information about the echo request packets (that is, the type, length, values (TLVs) version and the return codes of echo packets are not displayed).
---------------------------	----------------	---

<b>Command Modes</b>	Privileged EXEC
----------------------	-----------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.4(6)T	This command was introduced.
	12.0(32)SY	This command was integrated into Cisco IOS Release 12.0(32)SY.
	12.4(11)T	This command was integrated into Cisco IOS Release 12.4(11)T.
	12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
	12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

<b>Usage Guidelines</b>	<p>You can use the <b>show mpls oam echo statistics</b> command to display the following:</p> <ul style="list-style-type: none"> <li>• Currently configured TLV version for MPLS OAM operations.</li> <li>• Return code distribution among the received MPLS echo reply packets.</li> <li>• Statistics of sent and received MPLS echo packets, and counts of incomplete packet dispatches and timed out MPLS echo requests.</li> </ul>
-------------------------	--

If you enter the **summary** keyword, the Echo Reply count shows all the echo reply packets, regardless of whether they are valid responses to a sent request packet. Therefore, the number of return codes will not match the number of echo reply packets received.

<b>Examples</b>	The following example displays sample detailed output when the <b>summary</b> keyword is not specified:
-----------------	---

```
Router# show mpls oam echo statistics

Cisco TLV version: RFC 4379 Compliant
Return code distribution:
!-Success (3) - 5
B-Unlabeled output interface (9) - 0
D-DS map mismatch (5) - 0
f-Forward Error Correction (FEC) mismatch (10) - 0
F-No FEC mapping (4) - 0
I-Unknown upstream interface index (6) - 0
L-Labeled output interface (8) - 0
m-Unsupported TLVs (2) - 0
```

```

M-Malformed echo request (1) - 0
N-No label entry (11) - 0
p-Premature termination of link-state packet (LSP) (13) - 0
P-No receive interface label protocol (12) - 0
U-Reserved (7) - 0
x-No return code (0) - 0
X-Undefined return code - 0
Echo Requests: sent (5)/received (0)/timedout (0)/unsent (0)
Echo Replies: sent (0)/received (5)/unsent (0)

```

The following example displays sample output when the **summary** keyword is specified:

```

Router# show mpls oam echo statistics summary
Cisco TLV version: RFC 4379 Compliant
Echo Requests: sent (5)/received (0)/timedout (0)/unsent (0)
Echo Replies: sent (0)/received (5)/unsent (0)

```

[Table 121](#) describes the significant fields shown in the displays.

**Table 121** *show mpls oam echo statistics Field Descriptions*

Field	Description
Return Code Distribution	In each line of the return code distribution, the following information is displayed: <ul style="list-style-type: none"> <li>• Single-character code corresponding to the return code in the received packet (for example ! or B).</li> <li>• Description of the return code (for example, Success).</li> <li>• Value of the return code (for example, (3)).</li> <li>• Number of packets received with the return code (for example, 5).</li> </ul>
sent	Number of MPLS echo request packets that the router sent.
timedout	Number of MPLS echo request packets that timed out.
received	Number of MPLS echo request packets that the router received from the network.
unsent	Number of MPLS echo requests that were not forwarded due to errors.

# show mpls platform

To display platform-specific information, use the **show mpls platform** command in EXEC mode.

```
show mpls platform {common | eompls | gbte-tunnels | reserved-vlans vlan vlan-id | statistics
[reset] | vpn-vlan-mapping}
```

## Syntax Description

<b>common</b>	Displays the counters for shared code between the LAN and WAN interfaces.
<b>eompls</b>	Displays information about the Ethernet over Multiprotocol Label Switching (EoMPLS)-enabled interface.
<b>gbte-tunnels</b>	Displays information about the Multicast Multilayer Switching (MMLS) Guaranteed Bandwidth Traffic Engineering (GBTE) tunnels.
<b>reserved-vlans vlan <i>vlan-id</i></b>	Displays Route Processor (RP)-reserved VLAN <b>show</b> commands; valid values are from 0 to 4095.
<b>statistics</b>	Displays information about the RP-control plane statistics.
<b>reset</b>	(Optional) Resets the statistics counters.
<b>vpn-vlan-mapping</b>	Displays information about the Virtual Private Network (VPN)-to-VLAN mapping table.

## Defaults

This command has no default settings.

## Command Modes

EXEC

## Command History

Release	Modification
12.2(17b)SXA	Support for this command was introduced on the Supervisor Engine 720.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

## Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 2.

## Examples

This example shows how to display the counters for shared code between the LAN and WAN interfaces:

```
Router# show mpls platform common

Common MPLS counters for LAN and WAN
-----

No. of MPLS configured LAN interfaces          = 12
No. of cross-connect configured VLAN interfaces = 0
Router#
```

This example shows how to display the EoMPLS-enabled interface information:

```
Router# show mpls platform eompls
```

```
Interface      VLAN
GigabitEthernet 101
FastEthernet6/1 2022
Router#
```

This example shows how to display the GBTE-tunnels information:

```
Router# show mpls platform gbte-tunnels
```

```
To           From           InLbl  I/I/F kbps    Kbits    H/W Info
Router#
```

This example shows how to display the RP-reserved VLAN **show** commands:

```
Router# show mpls platform reserved-vlans vlan 1005
```

#### Note

This example shows the output if there are no configured reserved VLANs.

This example shows how to display the information about the RP-control plane statistics:

```
Router# show mpls platform statistics
```

```
RP MPLS Control Plane Statistics:
=====
Reserved VLAN creates          0000000001

0      1025     Yes         No       No             No           No
1      0         No          No       Yes            Yes          No
Router#
```

# show mpls prefix-map

## Note

Effective with Cisco IOS Release 12.4(20)T, the **show mpls prefix-map** command is not available in Cisco IOS software.

To display the prefix map used to assign a quality of service (QoS) map to network prefixes that match a standard IP access list, use the **show mpls prefix-map** command in privileged EXEC mode.

```
show mpls prefix-map [prefix-map]
```

Syntax Description	<i>prefix-map</i>	(Optional) Number specifying the prefix map to be displayed.
--------------------	-------------------	--

Command Modes	Privileged EXEC (#)
---------------	---------------------

Command History	Release	Modification
	12.0(5)T	This command was introduced.
	12.0(10)ST	This command was modified to reflect Multiprotocol Label Switching (MPLS) Internet Engineering Task Force (IETF) syntax and terminology.
	12.2(2)T	This command was integrated into Cisco IOS Release 12.2(2)T.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	12.4(20)T	This command was removed.

Usage Guidelines	Not entering a specific <i>prefix-map</i> argument number causes all prefix maps to be displayed.
------------------	---

**Examples** The following is sample output from the **show mpls prefix-map** command:

```
Router# show mpls prefix-map 2
prefix-map 2 access-list 2 cos-map 2
```

[Table 122](#) describes the fields shown in the display.

**Table 122** *show mpls prefix-map Field Descriptions*

Field	Description
prefix-map	Unique number of a prefix map.
access-list	Unique number of an access list.
cos-map	Unique number of a QoS map.

---

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>mpls prefix-map</b>	Configures a router to use a specified QoS map when a label destination prefix matches the specified access-list.

# show mpls static binding

To display Multiprotocol Label Switching (MPLS) static label bindings, use the **show mpls static binding** command in privileged EXEC mode.

```
show mpls static binding [ipv4 [vrf vrf-name]] [prefix {mask-length | mask}] [local | remote]
[nexthop address]
```

Syntax Description		
<b>ipv4</b>	(Optional)	Displays IPv4 static label bindings.
<b>vrf</b> <i>vrf-name</i>	(Optional)	The static label bindings for a specified VPN routing and forwarding instance.
<i>prefix</i> { <i>mask-length</i>   <i>mask</i> }	(Optional)	Labels for a specific prefix.
<b>local</b>	(Optional)	Displays the incoming (local) static label bindings.
<b>remote</b>	(Optional)	Displays the outgoing (remote) static label bindings.
<b>nexthop</b> <i>address</i>	(Optional)	Displays the label bindings for prefixes with outgoing labels for which the specified next hop is to be displayed.

**Command Modes** Privileged EXEC (#)

Command History	Release	Modification
	12.0(23)S	This command was introduced.
	12.0(26)S	This command was modified. The <b>vrf</b> <i>vrf-name</i> keyword argument pair was added.
	12.3(14)T	This command was integrated into Cisco IOS Release 12.3(14)T.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.

**Usage Guidelines** If you do not specify any optional arguments, the **show mpls static binding** command displays information about all static label bindings. Or the information can be limited to any of the following:

- Bindings for a specific prefix or mask
- Local (incoming) labels
- Remote (outgoing) labels
- Outgoing labels for a specific next hop router

**Examples** In the following output, the **show mpls static binding ipv4** command with no optional arguments displays all static label bindings:

```
Router# show mpls static binding ipv4
```

```
10.0.0.0/8: Incoming label: none;
  Outgoing labels:
    10.13.0.8          explicit-null
10.0.0.0/8: Incoming label: 55 (in LIB)
  Outgoing labels:
    10.0.0.66         2607
10.66.0.0/16: Incoming label: 17 (in LIB)
  Outgoing labels:  None
```

In the following output, the **show mpls static binding ipv4** command displays remote (outgoing) statically assigned labels only:

```
Router# show mpls static binding ipv4 remote

10.0.0.0/8:
  Outgoing labels:
    10.13.0.8          explicit-null
10.0.0.0/8:
  Outgoing labels:
    10.0.0.66         2607
```

In the following output, the **show mpls static binding ipv4** command displays local (incoming) statically assigned labels only:

```
Router# show mpls static binding ipv4 local

10.0.0.0/8: Incoming label: 55 (in LIB)
10.66.0.0/16: Incoming label: 17 (in LIB)
```

In the following output, the **show mpls static binding ipv4** command displays statically assigned labels for prefix 10.0.0.0 / 8 only:

```
Router# show mpls static binding ipv4 10.0.0.0/8

10.0.0.0/8: Incoming label: 55 (in LIB)
  Outgoing labels:
    10.0.0.66         2607
```

In the following output, the **show mpls static binding ipv4** command displays prefixes with statically assigned outgoing labels for next hop 10.0.0.66:

```
Router# show mpls static binding ipv4 10.0.0.0 8 nexthop 10.0.0.66

10.0.0.0/8: Incoming label: 55 (in LIB)
  Outgoing labels:
    10.0.0.66         2607
```

The following output, the **show mpls static binding ipv4 vrf** command displays static label bindings for a VPN routing and forwarding instance vpn100:

```
Router# show mpls static binding ipv4 vrf vpn100

192.168.2.2/32: (vrf: vpn100) Incoming label: 100020
Outgoing labels: None
192.168.0.29/32: Incoming label: 100003 (in LIB)
Outgoing labels: None
```

**Related Commands**

Command	Description
<b>mpls static binding ipv4</b>	Binds an IPv4 prefix or mask to a local or remote label.

# show mpls static crossconnect

To display statically configured Label Forwarding Information Database (LFIB) entries, use the **show mpls static crossconnect** command in privileged EXEC mode.

```
show mpls static crossconnect [low label [high label]]
```

<b>Syntax Description</b>	<i>low label high label</i> (Optional) Displays the statically configured LFIB entries.
---------------------------	---

<b>Command Modes</b>	Privileged EXEC
----------------------	-----------------

Command History	Release	Modification
	12.0(23)S	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.

<b>Usage Guidelines</b>	If you do not specify any label parameters, then all the configured static crossconnects are displayed.
-------------------------	---

<b>Examples</b>	The following output of the <b>show mpls static crossconnect</b> command shows the local and remote labels:
-----------------	---

```
Router# show mpls static crossconnect

Local  Outgoing  Outgoing  Next Hop
label  label      interface
45     46         pos5/0    point2point
```

[Table 123](#) describes the significant fields shown in the display.

**Table 123** *show mpls static crossconnect Field Descriptions*

Field	Description
Local label	Label assigned by this router.
Outgoing label	Label assigned by the next hop.
Outgoing interface	Interface through which packets with this label are sent.
Next Hop	IP address of next hop router's interface that is connected to this router's outgoing interface.

Related Commands	Command	Description
	<b>mpls static crossconnect</b>	Configures an LFIB entry for the specified incoming label and outgoing interface.

# show mpls tp

To display information about Multiprotocol Label Switching (MPLS) transport profile (TP) tunnels, use the **show mpls tp** command in user EXEC or privileged EXEC mode.

**show mpls tp** [**link numbers**]

**show mpls tp** [**lsps** [*node-id* [*options*]]] [**detail**]

**show mpls tp** [**summary**]

**show mpls tp** [**tunnel-tp** [*tunnel-num* [*options*]]] [**detail**]

## Syntax Description

<b>detail</b>	(Optional) Displays detailed output.
<b>link-numbers</b>	(Optional) Displays information about the MPLS TP link number database.
<b>lsps</b> [ <i>node-id</i> [ <i>options</i> ]]	(Optional) Displays information about the MPLS TP label switched paths (LSPs), including those on midpoint and endpoint routers. <ul style="list-style-type: none"> <li>• <i>node-id</i>—Displays only the LSP information for that node ID.</li> <li>• <i>options</i>—You can use a combination of the following options: <ul style="list-style-type: none"> <li>– <b>endpoints</b>—Displays LSP information for the endpoint routers.</li> <li>– <b>global-id num</b>—Displays LSP information for matching the global ID.</li> <li>– <b>lsp</b> {<i>num</i>   <b>protect</b>   <b>working</b>}—Displays LSP information for a specific LSP.</li> <li>– <b>midpoints</b>—Displays information about LSP midpoints configured on a router.</li> <li>– <b>tunnel-name</b> <i>tunnel-tp-name</i>—Displays the information for a specific named tunnel.</li> <li>– <b>tunnel-tp num</b>—Displays LSP information for a specific tunnel.</li> </ul> </li> </ul>
<b>summary</b>	(Optional) Displays a summary of all link numbers.
<b>tunnel-tp</b> [ <i>options</i> ]	(Optional) Displays information for MPLS-TP tunnels. You can use a combination of any of the following options: <ul style="list-style-type: none"> <li>• <i>tunnel-tp-number</i>—Displays the information for a specific numbered tunnel.</li> <li>• <b>lsps</b>—Displays LSP information for MPLS-TP tunnels.</li> <li>• <i>tunnel-tp-name</i>—Displays the information for a specific named tunnel.</li> </ul>

## Command Modes

User EXEC (>)  
Privileged EXEC (#)

**Command History**

Release	Modification
15.1(1)SA	This command was introduced.
15.1(3)S	This command was integrated.

**Examples**

The following examples display MPLS TP link number information:

```
Router> show mpls tp link-numbers
```

```
MPLS-TP Link Numbers:
Link   Interface   Next Hop      RX Macs
1      Ethernet0/0  10.10.10.10
2      Ethernet0/1  0180.c200.0000  0180.c200.0000
```

```
Router> show mpls tp tunnel-tp
```

```
MPLS-TP Tunnels:
Tunnel Peer                               Active Local   Out   Out   Oper
Number global-id::node-id::tun           LSP Label   Label  Interface State
-----
1      1::104.10.1.1::1                       work 211    112   Et0/0   up
2      20::104.10.1.1::2                      work 221    122   Et0/0   up
3      1::104.10.1.1::3                       work 231    132   Et0/1   up
4      0::10.20.20.4::4                       work 241    142   Et0/1   up
5      1::104.01.1.1::5                       work 251    152   Et0/0   up
```

**Related Commands**

Command	Description
<code>debug mpls tp</code>	Displays MPLS TP debug messages.

# show mpls traffic tunnel backup

To display information about the backup tunnels that are currently configured, use the **show mpls traffic tunnel backup** command in user EXEC or privileged EXEC mode.

**show mpls traffic tunnel backup tunnel***tunnel-id*

<b>Syntax Description</b>	<b>tunnel</b> <i>tunnel-id</i>	Tunnel ID of the backup tunnel for which you want to display information.
---------------------------	--------------------------------	---

**Command Default** Information about currently configured backup tunnels is not displayed.

**Command Modes** User EXEC  
Privileged EXEC

Command History	Release	Modification
	12.0(22)S	This command was introduced.
	12.2(18)SXD1	This command was integrated into Cisco IOS Release 12.2(18)SXD1.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T

**Examples** The following is sample output from the **show mpls traffic tunnel backup tunnel** *tunnel-id* command:

```
Router# show mpls traffic tunnel backup tunnel1000

Tunnel1000          Dest: 10.0.0.9          State: Up
any-pool cfg 100 inuse 0 num_lsps 0
protects: ATM0.1
```

[Table 124](#) describes the significant fields shown in the display.

**Table 124 show mpls traffic tunnel backup Field Descriptions**

Field	Description
Tunnel	Tunnel ID of the backup tunnel for which this information is being displayed.
Dest	IP address of the destination of the backup tunnel.
State	State of the backup tunnel. Valid values are Up, Down, or Admin-down.
any-pool	Pool from which bandwidth is acquired. Valid values are any-pool, global-pool, and sub-pool.
cfg	Amount of bandwidth configured for that pool.
inuse	Amount of bandwidth currently being used.

**Table 124** *show mpls traffic tunnel backup Field Descriptions (continued)*

Field	Description
num_lsps	Number of label-switched paths (LSPs) being protected.
protects	The protected interfaces that are using this backup tunnel.

**Related Commands**

Command	Description
<b>tunnel mpls traffic-eng backup-bw</b>	Specifies what types of LSPs can use a backup tunnel, whether the backup tunnel should provide bandwidth protection, and if so, how much.

# show mpls traffic-eng autoroute

To display tunnels announced to the Interior Gateway Protocol (IGP), including interface, destination, and bandwidth, use the **show mpls traffic-eng autoroute** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng autoroute**

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values

**Command Modes** User EXEC  
Privileged EXEC

Command History	Release	Modification
	12.0(5)S	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

**Usage Guidelines** The enhanced shortest path first (SPF) calculation of the IGP has been modified so that it uses traffic engineering tunnels. This command shows which tunnels IGP is currently using in its enhanced SPF calculation (that is, which tunnels are up and have autoroute configured).

**Examples** The following is sample output from the **show mpls traffic-eng autoroute** command. Note that the tunnels are organized by destination. All tunnels to a destination carry a share of the traffic tunneled to that destination.

```
Router# show mpls traffic-eng autoroute

MPLS TE autorouting enabled
  destination 0002.0002.0002.00 has 2 tunnels
    Tunnel1021 (traffic share 10000, nexthop 10.2.2.2, absolute metric 11)
    Tunnel1022 (traffic share 3333, nexthop 10.2.2.2, relative metric -3)
  destination 0003.0003.0003.00 has 2 tunnels
    Tunnel1032 (traffic share 10000, nexthop 172.16.3.3)
    Tunnel1031 (traffic share 10000, nexthop 172.16.3.3, relative metric -1)
```

[Table 125](#) describes the significant fields shown in the display.

**Table 125** *show mpls traffic-eng autoroute Field Descriptions*

Field	Description
MPLS TE autorouting enabled	IGP automatically routes traffic into tunnels.
destination	MPLS traffic engineering tailend router system ID.
traffic share	A factor based on bandwidth, indicating how much traffic this tunnel should carry, relative to other tunnels, to the same destination. If two tunnels go to a single destination, one with a traffic share of 200 and the other with a traffic share of 100, the first tunnel carries two-thirds of the traffic.
nexthop	MPLS traffic engineering tailend IP address of the tunnel.
absolute metric	MPLS traffic engineering metric with mode absolute of the tunnel.
relative metric	MPLS traffic engineering metric with mode relative of the tunnel.

**Related Commands**

Command	Description
<b>show isis mpls traffic-eng tunnel</b>	Displays information about tunnels considered in the IS-IS next hop calculation.
<b>tunnel mpls traffic-eng autoroute announce</b>	Causes the IGP to use the tunnel (if it is up) in its enhanced SPF calculation.
<b>tunnel mpls traffic-eng autoroute metric</b>	Specifies the MPLS traffic engineering tunnel metric that the IGP enhanced SPF calculation will use.

# show mpls traffic-eng auto-tunnel backup

To display information about dynamically created Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels, use the **show mpls traffic-eng auto-tunnel backup** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng auto-tunnel backup**

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values

**Command Modes** User EXEC  
Privileged EXEC

Command History	Release	Modification
	15.1(1)S	This command was introduced.

**Examples** The following is sample output from the **show mpls traffic-eng auto-tunnel backup** command.

```
Router# show mpls traffic-eng auto-tunnel backup

State: Enabled
  Tunnel Count: 3 (up:2, down: 1)
  Tunnel ID Range: 65436-65535
  Create Nhop only: Yes
  SRLG: Not configured
  Delete unused tunnels after: 50 Seconds

Config:
  Unnumbered i/f: Looback0
  Affinity: 0x2/0xFFFF
```

[Table 125](#) describes the significant fields shown in the display.

**Table 126** *show mpls traffic-eng auto-tunnel backup Field Descriptions*

Field	Description
State	State of the dynamically created tunnel. Valid values are enabled or disabled.
Tunnel Count	Number of dynamically created backup tunnels created.
Tunnel ID Range	Tunnel ID range used when creating dynamically created backup tunnels.
Create Nhop only	Whether the feature was configured to enable the dynamic creation of NHOP backup tunnels (and not NNHOP). Valid values are yes or no.

**Table 126** *show mpls traffic-eng auto-tunnel backup Field Descriptions (continued)*

Field	Description
SRLG	Type of Shared Risk Link Group. Valid values are forced, preferred, or not configured.
Delete unused tunnels after	Number of seconds before an unused dynamically created tunnel is torn down.
Unnumbered i/f	The interface configured with the <b>mpls traffic-eng autotunnel backup config unnumbered-interface</b> command.
Affinity	The affinity and mask configured with the <b>mpls traffic-eng autotunnel backup config affinity</b> command.

**Related Commands**

Command	Description
<b>mpls traffic-eng auto-tunnel backup config affinity</b>	Enables you to specify link attributes on dynamically created MPLS TE backup tunnels.
<b>mpls traffic-eng auto-tunnel backup config unnumbered-interface</b>	Enables you to specify the interface to use as the unnumbered interface.
<b>mpls traffic-eng auto-tunnel backup nhop-only</b>	Specifies dynamically created NHOP backup tunnels only.
<b>mpls traffic-eng auto-tunnel backup srlg</b>	Specifies the use of Shared Risk Link Groups (SRLGs) as part of the dynamic backup tunnel calculation.
<b>mpls traffic-eng auto-tunnel backup timers</b>	Specifies the use of timers with dynamically created backup tunnels.
<b>mpls traffic-eng auto-tunnel backup tunnel-num</b>	Specifies tunnel interface numbers for dynamically created backup tunnels.

# show mpls traffic-eng auto-tunnel mesh

To display the cloned mesh tunnel interfaces of each autotemplate interface and the current range of mesh tunnel interface numbers, use the **show mpls traffic-eng auto-tunnel mesh** command in user EXEC mode or privileged EXEC mode.

**show mpls traffic-eng auto-tunnel mesh**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** User EXEC (>  
Privileged EXEC (#)

Command History	Release	Modification
	12.0(27)S	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

**Examples** The following is output from the **show mpls traffic-eng auto-tunnel mesh** command that shows the cloned mesh tunnel interfaces for autotemplate1 and shows the range of mesh tunnel interface numbers. Information for only one autotemplate is displayed because only one autotemplate was configured.

```
Router# show mpls traffic-eng auto-tunnel mesh

Auto-Template1:

Using access-list 1 to clone the following tunnel interfaces:

  Destination  Interface
  -----
  10.2.2.2     Tunnel64336
  10.3.3.3     Tunnel64337

Mesh tunnel interface numbers: min 64336 max 65337
```

[Table 127](#) describes the significant fields shown in the display.

**Table 127 show mpls traffic-eng auto-tunnel mesh Field Descriptions**

Field	Description
Auto-Template1	Name of the autotemplate.
Destination	Destination addresses for the mesh tunnel interface cloned from access list 1.

**Table 127** *show mpls traffic-eng auto-tunnel mesh Field Descriptions (continued)*

Field	Description
Interface	Mesh tunnel interfaces cloned from access list 1.
min 64336 max 65337	Range of mesh tunnel interface numbers for this Auto-Template1—minimum (64336) and maximum (65337).

**Related Commands**

Command	Description
<b>interface auto-template</b>	Creates the template interface.
<b>mpls traffic-eng auto-tunnel mesh tunnel-num</b>	Configures the range of mesh tunnel interface numbers.

# show mpls traffic-eng destination list

To display an Multiprotocol Label Switching (MPLS) traffic engineering (TE) point-to-multipoint (P2MP) destination list, use the **show mpls traffic-eng destination list** command in user EXEC or privileged EXEC configuration mode.

**show mpls traffic-eng destination list** [*name destination-list-name* | **identifier** *destination-list-identifier*]

<b>Syntax Description</b>	<b>name</b> <i>destination-list-name</i> (Optional) Specifies the name of a destination list.
	<b>identifier</b> <i>destination-list-identifier</i> (Optional) Specifies the number of a destination list.

**Command Modes**  
 User EXEC (>)  
 Privileged EXEC (#)

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.2(33)SRE	This command was introduced.

**Usage Guidelines**  
 This command displays the information about any destination lists configured for an MPLS TE P2MP configuration.

**Examples**  
 The following example displays information about a destination list:

```
Router# show mpls traffic-eng destination-list

Destination list: name p2mp-list1
                  ip 10.3.3.3 path-option 1 dynamic
                  ip 10.4.4.4 path-option 15 explicit identifier 4
                  ip 10.5.5.5 path-option 2 explicit name r1-r2-r4-r5
```

[Table 128](#) describes the significant fields shown in the display.

**Table 128 show mpls traffic-eng destination-list Field Descriptions**

Field	Description
Destination list	The name of the destination list.
ip	The IP address of the path's destination.
path-option	Information about the dynamic or explicit path.

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>mpls traffic-eng destination-list</b>	Creates a destination list for MPLS Point-to-Multipoint Traffic Engineering.

# show mpls traffic-eng fast-reroute database

To display the contents of the Multiprotocol Label Switching (MPLS) traffic engineering (TE) Fast Reroute (FRR) database, use the **show mpls traffic-eng fast-reroute database** command in user EXEC or privileged EXEC mode.

## Cisco IOS Release 15.0(1)M and Later

```
show mpls traffic-eng fast-reroute database [interface type number |
labels low-label [-high-label]] [backup-interface {tunnel tunnel-number | unresolved}] [role
{head | middle}] [state {active | ready | requested}] [detail] [vrf name]
```

## Cisco IOS Releases 12.0S and 12.2S

```
show mpls traffic-eng fast-reroute database [destination-prefix slot slot-number | interface type
number | labels low-label [-high-label]] [backup-interface {tunnel tunnel-number |
unresolved}] [role {head | middle}] [state {active | ready | requested}] [detail] [vrf name]
```

Syntax	Description
<i>destination-prefix</i>	(Optional) IP address of the destination.
<b>slot</b>	Specifies the MPLS Forwarding Infrastructure (MFI) slot.
<i>slot-number</i>	Slot number of the destination.
<b>labels</b>	(Optional) Shows only database entries that possess in-labels (local labels) assigned by this router. You specify either a starting value or a range of values.
<i>low-label</i>	(Optional) Starting label value or lowest value in the range.
<i>-high-label</i>	(Optional) Highest label value in the range.
<b>interface</b> <i>type number</i>	(Optional) Specifies the interface type and number to display the database entries related to the primary outgoing interface.
<b>backup-interface</b>	(Optional) Shows only database entries related to the backup outgoing interface.
<b>tunnel</b> <i>tunnel-number</i>	(Optional) Specifies the tunnel interface name and number.
<b>unresolved</b>	(Optional) Specifies the unresolved backup interface.
<b>role</b>	(Optional) Shows entries associated either with the tunnel head or tunnel midpoint.
<b>head</b>	Entry associated with tunnel head.
<b>middle</b>	Entry associated with tunnel midpoint.
<b>state</b>	(Optional) Displays entries that match one of four possible states: active, ready, partial, or complete.
<b>active</b>	Specifies the label switched paths (LSP) with an active FRR state.
<b>ready</b>	Specifies the LSPs with a ready FRR state.
<b>requested</b>	Specifies the LSPs with a requested FRR state.

<b>detail</b>	(Optional) Shows long-form information: Label Forwarding Information Base (LFIB)-FRR total number of clusters, groups, and items in addition to the short-form information of prefix, label and state.
<b>vrf name</b>	(Optional) Shows entries for a Virtual Private Network (VPN) routing/forwarding instance.

**Command Modes**

User EXEC (>)  
Privileged EXEC (#)

**Command History**

Release	Modification
12.0(10)ST	This command was introduced.
12.2(18)S	This command was integrated into Cisco IOS Release 12.2(18)S.
12.2(18)SXD	This command was modified. It was implemented on the Catalyst 6000 series with the SUP720 processor.
12.2(28)SB	This command was modified. It was implemented on the Cisco 10000(PRE-2) router.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SRE	This command was modified. The output was updated to display MPLS TE point-to-multipoint (P2MP) information.

**Examples**

**Sample Output for Cisco IOS Releases 12.0S and 12.2S**

The following is sample output from the **show mpls traffic-eng fast-reroute database** command at a tunnel head link:

```
Router# show mpls traffic-eng fast-reroute database 10.0.0.0

Tunnel head fast reroute information:

Prefix      Tunnel  In-label  Out intf/label  FRR intf/label  Status
10.0.0.0/16 Tu111    Tun hd    PO0/0:Untagged Tu4000:16        ready
10.0.0.0/16 Tu449    Tun hd    PO0/0:Untagged Tu4000:736       ready
10.0.0.0/16 Tu314    Tun hd    PO0/0:Untagged Tu4000:757       ready
10.0.0.0/16 Tu313    Tun hd    PO0/0:Untagged Tu4000:756       ready
```

Table 129 describes the fields shown in the display.

**Table 129 show mpls traffic-eng fast-reroute database Field Descriptions**

Field	Description
Prefix	Address to which packets with this label are going.
Tunnel	Tunnel’s identifying number.
In-label	Label advertised to other routers to signify a particular prefix. The value “Tun hd” occurs when no such label has been advertised.

**Table 129** show mpls traffic-eng fast-reroute database Field Descriptions (continued)

Field	Description
Out intf/label	<p>Out interface—short name of the physical interface through which traffic goes to the protected link.</p> <p>Out label:</p> <ul style="list-style-type: none"> <li>At a tunnel head, this is the label advertised by the tunnel destination device. The value “Untagged” occurs when no such label has been advertised.</li> <li>At tunnel midpoints, this is the label selected by the next hop device. The “Pop Tag” value occurs when the next hop is the tunnel’s final hop.</li> </ul>
FRR intf/label	<p>Fast Reroute interface—the backup tunnel interface.</p> <p>Fast Reroute label:</p> <ul style="list-style-type: none"> <li>At a tunnel head, this is the label selected by the tunnel tail to indicate the destination network. The value “Untagged” occurs when no such label has been advertised.</li> <li>At tunnel midpoints, this has the same value as the Out Label.</li> </ul>
Status	State of the rewrite: partial, ready, complete, or active. (These terms are defined above in the “Syntax Description” section).

The following is sample output from the **show mpls traffic-eng fast-reroute database** command with the **detail** keyword included at a tunnel head link:

```
Router# show mpls traffic-eng fast-reroute database 10.0.0.0. detail

LFIB FRR Database Summary:
  Total Clusters:      2
  Total Groups:        2
  Total Items:         789
Link 10:PO5/0 (Down, 1 group)
  Group 51:PO5/0->Tu4000 (Up, 779 members)
    Prefix 10.0.0.0/16, Tu313, active
      Input label Tun hd, Output label PO0/0:773, FRR label Tu4000:773
    Prefix 10.0.0.0/16, Tu392, active
      Input label Tun hd, Output label PO0/0:775, FRR label Tu4000:775
    Prefix 10.0.0.0/16, Tu111, active
      Input label Tun hd, Output label PO0/0:16, FRR label Tu4000:16
    Prefix 10.0.0.0/16, Tu394, active
      Input label Tun hd, Output label PO0/0:774, FRR label Tu4000:774
```

Table 130 describes the significant fields when the **detail** keyword is used.

**Table 130 show mpls traffic-eng fast-reroute database with detail Keyword Field Descriptions**

Field	Description
Total Clusters	A cluster is the physical interface upon which Fast Reroute link protection has been enabled.
Total Groups	A group is a database record that associates the link-protected physical interface with a backup tunnel. A cluster (physical interface) therefore can have one or more groups.  For example, the cluster Ethernet4/0/1 is protected by backup Tunnel1 and backup Tunnel2, and so has two groups.
Total Items	An item is a database record that associates a rewrite with a group. A group therefore can have one or more items.
Link 10:PO5/0 (Down, 1 group)	This field describes a cluster (physical interface): <ul style="list-style-type: none"> <li>• 10 is the interface’s unique IOS-assigned ID number.</li> <li>• The colon (:) is followed by the interface’s short name.</li> <li>• Parentheses contain the operating state of the interface (Up or Down) and the number of groups associated with it.</li> </ul>
Group 51:PO5/0->Tu4000 (Up, 779 members)	This field describes a group: <ul style="list-style-type: none"> <li>• 51 is the ID number of the backup interface.</li> <li>• The colon (:) is followed by the group’s physical interface short name.</li> <li>• The hyphen and angle bracket (-&gt;) is followed by the backup tunnel interface short name.</li> <li>• Parentheses contain the operating state of the tunnel interface (Up or Down) and the number of items—also called “members”— associated with it.</li> </ul>

The following is sample output from the **show mpls traffic-eng fast-reroute database** command with the **labels** keyword specified at a midpoint link:

```
Router# show mpls traffic-eng fast-reroute database labels 250-255

Tunnel head fast reroute information:
Prefix Tunnel In-label Outintf/label FRR intf/label Status

LSP midpoint frr information:

LSP identifier In-label Out intf/label FRR intf/label Status
10.110.0.10 229 [7334] 255 PO0/0:694 Tu4000:694 active
10.110.0.10 228 [7332] 254 PO0/0:693 Tu4000:693 active
10.110.0.10 227 [7331] 253 PO0/0:692 Tu4000:692 active
```

```

10.110.0.10 226 [7334] 252          PO0/0:691      Tu4000:691     active
10.110.0.10 225 [7333] 251          PO0/0:690      Tu4000:690     active
10.110.0.10 224 [7329] 250          PO0/0:689      Tu4000:689     active

```

### MPLS Traffic Engineering Point-to-Multipoint Fast Reroute Information

The following example shows MPLS TE P2MP information as part of the command output.

```
Router> show mpls traffic-eng fast-reroute database
```

P2P Headend FRR information:

```

Protected tunnel      In-label Out intf/label  FRR intf/label  Status
-----
Tunnell1             Tun hd   Et0/1:20        Tu777:20        ready

```

P2P LSP midpoint frr information:

```

LSP identifier      In-label Out intf/label  FRR intf/label  Status
-----

```

P2MP Sub-LSP FRR information:

```

Sub-LSP identifier
src_lspid[subid]->dst_tunid  In-label Out intf/label  FRR intf/label  Status
-----
10.1.1..201_1[1]->10.1.1..203_22  Tun hd   Et0/0:20        Tu666:20        ready
10.1.1..201_1[2]->10.1.1..206_22  Tun hd   Et0/0:20        Tu666:20        ready
10.1.1..201_1[3]->10.1.1..213_22  Tun hd   Et0/0:20        Tu666:20        ready

```

Table 131 describes the significant field shown in the display.

**Table 131** show mpls traffic-eng fast-reroute database Point-to-Multipoint Field Descriptions

Field	Description
Sub-LSP identifier src_lspid[subid]->dst_tunid	The source and destination address of the sub-LSP being protected. The P2MP ID is appended to the source address. The tunnel ID is appended to the destination address.

The **detail** keyword provides more information about the P2MP LSPs:

```
Router# show mpls traffic-eng fast-reroute database detail
```

FRR Database Summary:

```

Number of protected interfaces: 1
Number of protected tunnels: 2
Number of backup tunnels: 1
Number of active interfaces: 0

```

P2MP Sub-LSPs:

```

Tun ID: 1, LSP ID: 9, Source: 10.2.0.1
Destination: 10.2.5.3, Subgroup ID: 19
State      : Ready
InLabel    : Tunnel Head
OutLabel   : Se6/0:16
FRR OutLabel : Tu100:16

```

#### Related Commands

Command	Description
show mpls traffic-eng fast-reroute log reroutes	Displays contents of the Fast Reroute event log.

# show mpls traffic-eng fast-reroute log reroutes

To display the contents of the Fast Reroute event log, use the **show mpls traffic-eng fast-reroute log reroutes** command in user EXEC mode.

**show mpls traffic-eng fast-reroute log reroutes**

**Syntax Description** This command has no arguments or keywords.

**Defaults** No default behavior or values.

**Command Modes** user EXEC

Command History	Release	Modification
	12.0(10)ST	This command was introduced.
	12.2(18)S	This command was integrated into Cisco IOS Release 12.2(18)S.
	12.2(18)SXD	This command was implemented on the Catalyst 6000 series with the SUP720 processor.
	12.2(28)SB	This command was implemented on the Cisco 10000(PRE-2) router.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Examples** The following example shows output from the **show mpls traffic-eng fast-reroute log reroutes** command:

```
Router# show mpls traffic-eng fast-reroute log reroutes

When      Interface  Event   Rewrites  Duration  CPU msec  Suspends  Errors
00:27:39  PO0/0     Down    1079      30 msec   30        0         0
00:27:35  PO0/0     Up      1079      40 msec   40        0         0
```

[Table 132](#) describes significant fields shown in the display.

**Table 132** *show mpls traffic-eng fast-reroute log reroutes Field Descriptions*

Field	Description
When	Indicates how long ago the logged event occurred (before this line was displayed on your screen). Displayed as hours, minutes, seconds.
Interface	The physical or tunnel interface where the logged event occurred.
Event	The change to Up or Down by the affected interface.
Rewrites	Total number of reroutes accomplished because of this event.
Duration	Time elapsed during the rerouting process, in milliseconds.
CPU msec	CPU time spent processing those reroutes, in milliseconds. (This is less than or equal to the Duration value).

**Table 132** *show mpls traffic-eng fast-reroute log reroutes Field Descriptions (continued)*

<b>Field</b>	<b>Description</b>
Suspends	Number of times that reroute processing for this event was interrupted to let the CPU handle other tasks.
Errors	Number of unsuccessful reroute attempts.

# show mpls traffic-eng forwarding-adjacency

To display traffic engineering (TE) tunnels that are advertised as links in an Interior Gateway Protocol (IGP) network, use the **show mpls traffic-eng forwarding-adjacency** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng forwarding-adjacency** [*ip-address*]

<b>Syntax Description</b>	<i>ip-address</i>	(Optional) Destination address for forwarding adjacency tunnels.
---------------------------	-------------------	--

<b>Command Modes</b>	User EXEC Privileged EXEC
----------------------	------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(15)S	This command was introduced.
	12.0(16)ST	This command was integrated into Cisco IOS Release 12.0(16)ST.
	12.2(18)S	This command was integrated into Cisco IOS Release 2.2(18)S.
	12.2(18)SXD	This command was integrated into Cisco IOS Release 12.2(18)SXD.
	12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

**Usage Guidelines** Use the **show mpls traffic-eng forwarding-adjacency** command to display information about tunnels configured with the **tunnel mpls traffic-eng forwarding-adjacency** command.

**Examples** The following is sample output from the **show mpls traffic-eng forwarding-adjacency** command:

```
Router# show mpls traffic-eng forwarding-adjacency

destination 0168.0001.0007.00 has 1 tunnels
  Tunnel7      (traffic share 100000, nexthop 192.168.1.7)
               (flags:Announce Forward-Adjacency, holdtime 0)

Router# show mpls traffic-eng forwarding-adjacency 192.168.1.7

destination 0168.0001.0007.00 has 1 tunnels
  Tunnel7      (traffic share 100000, nexthop 192.168.1.7)
               (flags:Announce Forward-Adjacency, holdtime 0)
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>debug mpls traffic-eng forwarding-adjacency</b>	Displays debug messages for traffic engineering forwarding adjacency events.
<b>tunnel mpls traffic-eng forwarding-adjacency</b>	Advertises a TE tunnel as a link in an IGP network.

# show mpls traffic-eng forwarding path-set

To display the sublabel switched paths (sub-LSPs) that originate from the headend router, use the **show mpls traffic-eng forwarding path-set** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng forwarding path-set [brief | detail]**

Syntax Description	brief	(Optional) Displays information about the sub-LSPs in a table format.
	detail	(Optional) Displays detailed information about the sub-LSPs.

Command Modes	User EXEC (>) Privileged EXEC (#)
---------------	--------------------------------------

Command History	Release	Modification
	12.2(33)SRE	This command was introduced.

## Examples

The following example displays information about the sub-LSPs in a summary format, including the number of sub-LSPs and the number of paths from the headend router.

```
Router> show mpls traffic-eng forwarding path-set

ID          Input I/F  LSPID  InLabel  PathCnt  subLSPCnt
----          -
9F000001 Tu22      1      none     2        6
```

The following example shows six sub-LSPs originating at the headend router and going to different destinations. All the sub-LSPs belong to the same path set, which is a collection of paths. The path set is given a unique ID, which is shown in the PSID column of the example:

```
Router# show mpls traffic-eng forwarding path-set brief

Sub-LSP Identifier
src_lspid[subid]->dst_tunid          InLabel Next Hop      I/F    PSID
-----
10.1.1.201_1[1]->10.1.1.203_22      none    10.0.0.205    Et0/0  9F000001
10.1.1.201_1[2]->10.1.1.206_22      none    10.0.0.205    Et0/0  9F000001
10.1.1.201_1[3]->10.1.1.213_22      none    10.0.0.205    Et0/0  9F000001
10.1.1.201_1[4]->10.1.1.214_22      none    10.0.1.202    Et0/1  9F000001
10.1.1.201_1[5]->10.1.1.216_22      none    10.0.1.202    Et0/1  9F000001
10.1.1.201_1[6]->10.1.1.217_22      none    10.0.1.202    Et0/1  9F000001
```

The **show mpls traffic-eng forwarding path-set detail** command shows more information about the sub-LSPs that originate from the headend router. For example:

```
Router# show mpls traffic-eng forwarding path-set detail

LSP: Source: 10.1.0.1, TunID: 100, LSPID: 7
Destination: 10.2.0.1, P2MP Subgroup ID: 1
Path Set ID: 0x30000001
OutLabel : Serial2/0, 16
Next Hop : 10.1.3.2
```

```

FRR OutLabel : Tunnel666, 16

LSP: Source: 10.1.0.1, TunID: 100, LSPID: 7
Destination: 10.3.0.1, P2MP Subgroup ID: 2
  Path Set ID: 0x30000001
  OutLabel : Serial2/0, 16
  Next Hop : 10.1.3.2
  FRR OutLabel : Tunnel666, 16

```

Table 133 describes the significant fields shown in the display.

**Table 133** show mpls traffic-eng forwarding path-set Field Descriptions

Field	Description
ID	Path set ID.
Input I/F	The ID assigned to the tunnel that the sub-LSPs use.
LSPID	Sub-LSP ID.
InLabel	MPLS label in the input interface.
PathCnt	Number of paths from the headend router.
subLSPCnt	Number of sub-LSPs from the headend router.
Sub-LSP Identifier src_lspid[subid]->dst_tunid	The source and destination address of the sub-LSP being protected. The P2MP ID is appended to the source address. The tunnel ID is appended to the destination address.
Next Hop	Next-hop router.
I/F	The interface that the sub-LSPs use.
PSID	Path set ID.
Source	IP address of the headend router.
TunID	The ID assigned to the tunnel that the sub-LSPs use.
Destination	IP address of the destination router.
P2MP Subgroup ID	A consecutive number assigned to each sub-LSP.
Path Set ID	Path set ID.
OutLabel	The interface from which the label exits and the MPLS label that exits the interface.
FRR OutLabel	The tunnel from which the label exits and the MPLS label that exits the tunnel.

#### Related Commands

Command	Description
<b>ip path-option</b>	Specifies an explicit or dynamic path option for a particular destination address in a destination list

# show mpls traffic-eng forwarding statistics

To display information about Multiprotocol Label Switching (MPLS) traffic engineering (TE) point-to-pultipoint (P2MP) paths and sublabel switched paths (sub-LSPs), use the **show mpls traffic-eng forwarding statistics** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng forwarding statistics**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SRE	This command was introduced.

**Examples** The following example displays information about MPLS TE P2MP paths and sub-LSPs:

```
Router# show mpls traffic-eng forwarding statistics

TE P2MP:

Statistics:
  Path Set Creation:          2
  Path Set Deletion:         0
  Input Label Allocation for Path Sets:  2
  Input Label Free:          0
  Current Label Allocated:    2
  PSI Nodes Allocated:       2
  PSI Nodes Freed:           0
  Add sub-LSP to Path Set:    5
  Delete sub-LSP from Path Set 0 (prune: 0, flush: 0)
  Update Path for FRR:        4

Failures:
  None
```

Table 134 describes the significant fields shown in the display.

**Table 134** show mpls traffic-eng forwarding statistics Field Descriptions

Field	Description
Path Set Creation	Number of path sets created.
Path Set Deletion	Number of path sets deleted.
Input Label Allocation for Path Sets	Number of input labels allocated for the path sets.
Input Label Free	Number of free input labels.
Current Label Allocated	Number of labels allocated for forwarding.

**Table 134** *show mpls traffic-eng forwarding statistics Field Descriptions (continued)*

<b>Field</b>	<b>Description</b>
PSI Nodes Allocated	Number of path set nodes allocated.
PSI Nodes Freed	Number of path set nodes freed
Add sub-LSP to Path Set	Number of sub-LSPs in the path set.
Delete sub-LSP from Path Set	Number of sub-LSPs removed from the path set, either by pruning or flushing.
Update Path for FRR	Number of paths updated for fast reroute.
Failures	Number of path set failures

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show mpls traffic-eng forwarding path-set</b>	Display the sub-LSPs that originate from the headend router.

# show mpls traffic-eng link-management admission-control

To show which tunnels were admitted locally and their parameters (such as, priority, bandwidth, incoming and outgoing interface, and state), use the **show mpls traffic-eng link-management admission-control** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng link-management admission-control** [*interface-name*]

<b>Syntax Description</b>	<i>interface-name</i>	(Optional) Displays only tunnels that were admitted on the specified interface.
---------------------------	-----------------------	---

<b>Command Modes</b>	User EXEC Privileged EXEC
----------------------	------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(5)S	This command was introduced.
	12.1(3)T	The command output changed. The BW field now shows bandwidth in kbps, and it is followed by the status (reserved or held) of the bandwidth.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

**Examples** The following is sample output from the **show mpls traffic-eng link-management admission-control** command:

```
Router # show mpls traffic-eng link-management admission-control

System Information::
  Tunnels Count:      4
  Tunnels Selected:  4
TUNNEL ID            UP IF      DOWN IF    PRIORITY STATE          BW (kbps)
10.106.0.6 1000_1  AT1/0.2   -          0/0           Resv Admitted  0
10.106.0.6 2000_1  Et4/0/1   -          1/1           Resv Admitted  0
10.106.0.6 1_2     Et4/0/1   Et4/0/2   1/1           Resv Admitted  3000          R
10.106.0.6 2_2     AT1/0.2   AT0/0.2   1/1           Resv Admitted  3000          R
```

Table 135 describes the significant fields shown in the display.

**Table 135** show mpls traffic-eng link-management admission-control Field Descriptions

<b>Field</b>	<b>Description</b>
Tunnels Count	Total number of tunnels admitted.
Tunnels Selected	Number of tunnels to be displayed.
TUNNEL ID	Tunnel identification.

**Table 135** *show mpls traffic-eng link-management admission-control Field Descriptions*

Field	Description
UP IF	Upstream interface that the tunnel used.
DOWN IF	Downstream interface that the tunnel used.
PRIORITY	Setup priority of the tunnel followed by the hold priority.
STATE	Admission status of the tunnel.
BW (kbps)	Bandwidth of the tunnel (in kbps). If an “R” follows the bandwidth number, the bandwidth is reserved. If an “H” follows the bandwidth number, the bandwidth is temporarily being held for a path message.

**Related Commands**

Command	Description
<b>show mpls traffic-eng link-management advertisements</b>	Displays local link information that MPLS traffic engineering link management is currently flooding into the global traffic engineering topology.
<b>show mpls traffic-eng link-management bandwidth-allocation</b>	Displays current local link information.
<b>show mpls traffic-eng link-management igp-neighbors</b>	Displays IGP neighbors.
<b>show mpls traffic-eng link-management interfaces</b>	Displays per-interface resource and configuration information.
<b>show mpls traffic-eng link-management summary</b>	Displays a summary of link management information.

# show mpls traffic-eng link-management advertisements

To display local link information that Multiprotocol Label Switching (MPLS) traffic engineering link management is flooding into the global traffic engineering topology, use the **show mpls traffic-eng link-management advertisements** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng link-management advertisements**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

Command History	Release	Modification
	12.0(5)S	This command was introduced.
	12.1(3)T	The command output was modified.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	The output was enhanced to show Internet Gateway Protocol (IGP) recovery status provided by the Cisco IOS Software Modularity: MPLS Layer 3 VPNs feature.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

**Examples** The following is sample output from the **show mpls traffic-eng link-management advertisements** command:

```
Router# show mpls traffic-eng link-management advertisements

Flooding Status:      ready
Configured Areas:    1
IGP Area[1] ID:: isis level-1
  System Information::
    Flooding Protocol:  ISIS
  Header Information::
    IGP System ID:      0001.0000.0001.00
    MPLS TE Router ID:  10.106.0.6
    Flooded Links:      1
  Link ID:: 0
    Link IP Address:    10.1.0.6
    IGP Neighbor:       ID 0001.0000.0001.02
    Admin. Weight:      10
    Physical Bandwidth: 10000 kbits/sec
    Max Reservable BW:  5000 kbits/sec
  Downstream::
    Reservable Bandwidth[0]: 5000 kbits/sec
    Reservable Bandwidth[1]: 2000 kbits/sec
    Reservable Bandwidth[2]: 2000 kbits/sec
    Reservable Bandwidth[3]: 2000 kbits/sec
    Reservable Bandwidth[4]: 2000 kbits/sec
    Reservable Bandwidth[5]: 2000 kbits/sec
```

```

Reservable Bandwidth[6]:      2000 kbits/sec
Reservable Bandwidth[7]:      2000 kbits/sec
Attribute Flags:              0x00000000

```

Table 136 describes the significant fields shown in the display.

**Table 136** *show mpls traffic-eng link-management advertisements Field Descriptions*

Field	Description
Flooding Status	Status of the link management flooding system.
Configured Areas	Number of the Interior Gateway Protocol (IGP) areas configured.
IGP Area [1] ID	Name of the first IGP area.
Flooding Protocol	IGP that is flooding information for this area.
IGP System ID	Identification that IGP flooding uses in this area to identify this node.
MPLS TE Router ID	MPLS traffic engineering router ID.
Flooded Links	Number of links that are flooded in this area.
Link ID	Index of the link that is being described.
Link IP Address	Local IP address of this link.
IGP Neighbor	IGP neighbor on this link.
Admin. Weight	Administrative weight associated with this link.
Physical Bandwidth	Link bandwidth capacity (in kbps).
Max Reservable BW	Amount of reservable bandwidth (in kbps) on this link.
Reservable Bandwidth	Amount of bandwidth (in kbps) that is available for reservation.
Attribute Flags	Attribute flags of the link are being flooded.

The following is sample output from the **show mpls traffic-eng link-management advertisements** command with the enhanced output, which shows the “IGP recovering” status, from the Cisco IOS Software Modularity: MPLS Layer 3 VPNs feature:

```

Router# show mpls traffic-eng link-management advertisements

show mpls traffic-eng link-management advertisements
Flooding Status:      ready (IGP recovering)
Configured Areas:     1
IGP Area[1] ID::     ospf area nil
  System Information::
    Flooding Protocol:  OSPF
  Header Information::

```

Table 137 describes the significant fields shown in the display.

**Table 137** *show mpls traffic-eng link-management advertisements Field Descriptions*

Field	Description
Flooding Status	Status of the link management flooding system. The notation (IGP recovering) indicates that flooding cannot be determined because an IP routing process restart is in progress.
Configured Areas	Number of the IGP areas configured.

Related Commands	Command	Description
	show mpls traffic-eng link-management bandwidth-allocation	Displays current local link information.
	show mpls traffic-eng link-management igp-neighbors	Displays IGP neighbors.
	show mpls traffic-eng link-management interfaces	Displays per-interface resource and configuration information.
	show mpls traffic-eng link-management summary	Displays a summary of link management information.

# show mpls traffic-eng link-management bandwidth-allocation

To display current local link information, use the **show mpls traffic-eng link-management bandwidth-allocation** command in user EXEC or privileged EXEC mode.

```
show mpls traffic-eng link-management bandwidth-allocation [summary] [interface-type
interface-number]
```

Syntax Description		
	<b>summary</b>	(Optional) Displays summary of bandwidth allocation.
	<i>interface-type</i>	(Optional) The specified interface that admitted tunnels.
	<i>interface-number</i>	

Command Modes	
	User EXEC (>)
	Privileged EXEC (#)

Command History	Release	Modification
	12.0(5)S	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	12.2(33)SRC	This command was modified. The <b>summary</b> <i>interface-name</i> <i>interface-number</i> keyword-argument combination was added.
	Cisco IOS XE Release 2.6	This command was integrated into Cisco IOS XE Release 2.6.

Usage Guidelines	
	Advertised information might differ from the current information, depending on how flooding was configured.

## Examples

### Interface Example

The following is sample output from the **show mpls traffic-eng link-management bandwidth-allocation** command for a specified interface:

```
Router# show mpls traffic-eng link-management bandwidth-allocation gigabitEthernet 4/0/1

System Information::
  Links Count:          2
  Bandwidth Hold Time: max. 15 seconds
Link ID:: Ge4/0/1 (10.1.0.6)
Link Status:
  Physical Bandwidth:  10000 kbits/sec
  Max Reservable BW:  5000 kbits/sec (reserved:0% in, 60% out)
  BW Descriptors:     1
  MPLS TE Link State: MPLS TE on, RSVP on, admin-up, flooded
```

```

Inbound Admission:  reject-huge
Outbound Admission: allow-if-room
Admin. Weight:      10 (IGP)
IGP Neighbor Count: 1
Up Thresholds:      15 30 45 60 75 80 85 90 95 96 97 98 99 100 (default)
Down Thresholds:    100 99 98 97 96 95 90 85 80 75 60 45 30 15 (default)
Downstream Bandwidth Information (kbits/sec):
KEEP PRIORITY      BW HELD  BW TOTAL HELD  BW LOCKED  BW TOTAL LOCKED
0                   0         0              0          0
1                   0         0              3000       3000
2                   0         0              0          3000
3                   0         0              0          3000
4                   0         0              0          3000
5                   0         0              0          3000
6                   0         0              0          3000
7                   0         0              0          3000
    
```

Table 138 describes the significant fields shown in the display.

**Table 138** show mpls traffic-eng link-management bandwidth-allocation Field Descriptions

Field	Description
Links Count	Number of links configured for Multiprotocol Label Switching (MPLS) traffic engineering (TE).
Bandwidth Hold Time	Amount of time, in seconds, that bandwidth can be held.
Link ID	Interface name and IP address of the link being described.
Physical Bandwidth	Link bandwidth capacity (in kilobits per second).
Max Reservable BW	Amount of reservable bandwidth on this link.
BW Descriptors	Number of bandwidth allocations on this link.
MPLS TE Link State	Status of the link's MPLS traffic engineering-related functions.
Inbound Admission	Link admission policy for incoming tunnels.
Outbound Admission	Link admission policy for outgoing tunnels.
Admin. Weight	Link administrative weight.
IGP Neighbor Count	List of the Interior Gateway Protocol (IGP) neighbors directly reachable over this link.
Up Thresholds	Link's bandwidth thresholds for allocations.
Down Thresholds	Link's bandwidth thresholds for deallocations.
KEEP PRIORITY	Priority levels for the link's bandwidth allocations.
BW HELD	Amount of bandwidth (in kbps) temporarily held at this priority for path messages.
BW TOTAL HELD	Bandwidth held at this priority and those above it.
BW LOCKED	Amount of bandwidth reserved at this priority.
BW TOTAL LOCKED	Bandwidth locked at this priority and those above it.

**Summary Example for Regular TE (or Russian Dolls Model [RDM] DiffServ-Aware TE) with Multiple Interfaces**

The following is sample output from the **show mpls traffic-eng link-management bandwidth-allocation summary** command for all the configured interfaces:

```
Router# show mpls traffic-eng link-management bandwidth-allocation summary
```

```

interface      Intf Max      Intf Avail    Sub Max      Sub Avail
              kbps         kbps         kbps         kbps
Et0/0         47000        42500        42000        40500
Et1/0         7500         7500         0             0

```

Table 139 describes the significant fields shown in the display.

**Table 139** *show mpls traffic-eng link-management bandwidth-allocation summary Field Descriptions*

Field	Description
interface	Name of the interface.
Intf Max	Maximum amount of bandwidth, in kbps, available on the interface.
Intf Avail	Amount of bandwidth, in kbps, currently available on the interface.
Sub Max	Maximum amount of bandwidth, in kbps, available in the subpool.
Sub Avail	Amount of bandwidth, in kbps, currently available in the subpool.

#### Summary Example for Regular TE (or Russian Dolls Model [RDM] DiffServ-Aware (DS) TE) with a Single Interface

The following is sample output from the **show mpls traffic-eng link-management bandwidth-allocation summary** command for one configured interface:

```

Router# show mpls traffic-eng link-management bandwidth-allocation summary Ethernet 0/0

interface      Intf Max      Intf Avail    Sub Max      Sub Avail
              kbps         kbps         kbps         kbps
Et0/0         47000        42500        42000        40500

```

See Table 139 for an explanation of the fields.

#### Summary Example with a Specified Interface for Maximum Allocation Model (MAM) DS-TE

The following is sample output from the **show mpls traffic-eng link-management bandwidth-allocation summary** command for all the configured interfaces:

```

Router# show mpls traffic-eng link-management bandwidth-allocation summary

interface      Intf Max      BC0 Max      BC0 Avail    BC1 Max      BC1 Avail
              kbps         kbps         kbps         kbps         kbps
Et0/0         45000        40000        37000        30000        28500
Et1/0         0            0            0            0            0

```

Table 140 describes the significant fields shown in the display.

**Table 140** *show mpls traffic-eng link-management bandwidth-allocation summary Field Descriptions*

Field	Description
interface	Name of the interface.
Intf Max	Maximum amount of bandwidth, in kbps, available on the interface.
BC0 Max	Maximum amount of bandwidth, in kbps, available in the global pool.
BC0 Avail	Amount of bandwidth, in kbps, currently available in the global pool.

**Table 140** *show mpls traffic-eng link-management bandwidth-allocation summary Field Descriptions (continued)*

Field	Description
BC1 Max	Maximum amount of bandwidth, in kbps, available in the subpool.
BC1 Avail	Amount of bandwidth, in kbps, currently available in the subpool.

**Related Commands**

Command	Description
<b>show mpls traffic-eng link-management advertisements</b>	Displays local link information currently being flooded by MPLS traffic engineering link management into the global traffic engineering topology.
<b>show mpls traffic-eng link-management igp-neighbors</b>	Displays IGP neighbors.
<b>show mpls traffic-eng link-management interfaces</b>	Displays per-interface resource and configuration information.
<b>show mpls traffic-eng link-management summary</b>	Displays a summary of link management information.

# show mpls traffic-eng link-management igp-neighbors

To display Interior Gateway Protocol (IGP) neighbors, use the **show mpls traffic-eng link-management igp-neighbors** command in user EXEC or privileged EXEC mode.

```
show mpls traffic-eng link-management igp-neighbors [interface-type number | igp-id {isis
isis-address | ospf ospf-id} | ip ip-address]
```

Syntax Description	
<i>interface-type number</i>	(Optional) Specifies the interface type and number for which the IGP neighbors are displayed.
<b>igp-id</b>	(Optional) Displays the IGP neighbors that are using a specified IGP identification.
<b>isis</b> <i>isis-address</i>	(Optional) Displays the specified IS-IS neighbor when you display neighbors by IGP ID.
<b>ospf</b> <i>ospf-id</i>	(Optional) Displays the specified OSPF neighbor when you display neighbors by IGP ID.
<b>ip</b> <i>ip-address</i>	(Optional) Displays the IGP neighbors that are using a specified IGP IP address.

Command Modes	
	User EXEC (>) Privileged EXEC (#)

Command History	Release	Modification
	12.0(5)S	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	12.4(24)T	This command was modified in a release earlier than Cisco IOS Release 12.4(24)T. The <i>interface-type</i> and <i>number</i> arguments were added.

**Examples** The following is sample output from the **show mpls traffic-eng link-management igp-neighbors** command:

```
Router# show mpls traffic-eng line-management igp-neighbors

Link ID:: Et0/2
  Neighbor ID: 0000.0024.0004.02 (area: isis level-1, IP: 10.0.0.0)
Link ID:: PO1/0/0
  Neighbor ID: 0000.0026.0001.00 (area: isis level-1, IP: 172.16.1.2)
```

[Table 141](#) describes the significant fields shown in the display.

**Table 141** *show mpls traffic-eng link-management igp-neighbors Field Descriptions*

Field	Description
Link ID	Link by which the neighbor is reached.
Neighbor ID	IGP identification information for the neighbor.

**Related Commands**

Command	Description
<b>show mpls traffic-eng link-management advertisements</b>	Displays local link information currently being flooded by MPLS traffic engineering link management into the global traffic engineering topology.
<b>show mpls traffic-eng link-management bandwidth-allocation</b>	Displays current local link information.
<b>show mpls traffic-eng link-management interfaces</b>	Displays per-interface resource and configuration information.
<b>show mpls traffic-eng link-management summary</b>	Displays a summary of link management information.

# show mpls traffic-eng link-management interfaces

To display interface resource and configuration information, use the **show mpls traffic-eng link-management interfaces** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng link-management interfaces** [*interface-name*]

<b>Syntax Description</b>	<i>interface-name</i>	(Optional) Displays information only for the specified interface.
<b>Command Modes</b>	User EXEC (>) Privileged EXEC (#)	
<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(5)S	This command was introduced.
	12.1(3)T	The command output was modified.
	12.2(28)SB	The command output was enhanced to display the Shared Risk Link Group (SRLG) membership of links.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

**Usage Guidelines** Use this command to display resource and configuration information for all configured interfaces.

**Examples** The following is sample output from the **show mpls traffic-eng link-management interfaces** command:

```
Router# show mpls traffic-eng link-management interfaces Et4/0/1

System Information::
  Links Count:          2
Link ID:: Et4/0/1 (10.1.0.6)
Link Status:
  Physical Bandwidth:  10000 kbits/sec
  Max Reservable BW:   5000 kbits/sec (reserved:0% in, 60% out)
  MPLS TE Link State:  MPLS TE on, RSVP on, admin-up, flooded
  Inbound Admission:   reject-huge
  Outbound Admission:  allow-if-room
  Admin. Weight:       10 (IGP)
  IGP Neighbor Count:  1
  IGP Neighbor:        ID 0001.0000.0001.02, IP 10.0.0.0 (Up)
  Flooding Status for each configured area [1]:
  IGP Area[1]: isis level-1: flooded
```

The following is sample output from the **show mpls traffic-eng link-management interfaces** command when SRLGs are configured:

```
Router# show mpls traffic-eng link-management interfaces pos3/1

System Information::
  Links Count:          11
Link ID:: PO3/1 (10.0.0.33)
  Link Status:
    SRLGs:              1 2
    Physical Bandwidth: 2488000 kbits/sec
    Max Res Global BW:  20000 kbits/sec (reserved:0% in, 0% out)
    Max Res Sub BW:     5000 kbits/sec (reserved:0% in, 0% out)
    MPLS TE Link State: MPLS TE on, RSVP on, admin-up, flooded
    Inbound Admission:  allow-all
    Outbound Admission: allow-if-room
    Admin. Weight:      10 (IGP)
    IGP Neighbor Count: 1
    IGP Neighbor:       ID 0000.0000.0004.00, IP 10.0.0.34 (Up)
    Flooding Status for each configured area [1]:
    IGP Area[1]: isis level-2: flooded
```

Table 142 describes the significant fields shown in the displays.

**Table 142** *show mpls traffic-eng link-management interfaces Field Descriptions*

Field	Description
Links Count	Number of links that were enabled for use with Multiprotocol Label Switching (MPLS) traffic engineering.
Link ID	Index of the link.
SRLGs	The SRLGs to which the link belongs.
Physical Bandwidth	Link's bandwidth capacity, in kbps.
Max Reservable BW	Amount of reservable bandwidth, in kb/s, on this link.
Max Res Global BW	Amount of reservable bandwidth, in kb/s, available for the global pool.
Max Res Sub BW	Amount of reservable bandwidth, in kb/s, available for the subpool.
MPLS TE Link State	The status of the MPLS link.
Inbound Admission	Link admission policy for inbound tunnels.
Outbound Admission	Link admission policy for outbound tunnels.
Admin. Weight	Administrative weight associated with this link.
IGP Neighbor Count	Number of Interior Gateway Protocol (IGP) neighbors directly reachable over this link.
IGP Neighbor	IGP neighbor on this link.
Flooding Status for each configured area	Flooding status for the specified configured area.

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show mpls traffic-eng link-management advertisements</b>	Displays local link information being flooded by MPLS traffic engineering link management into the global traffic engineering topology.
<b>show mpls traffic-eng link-management bandwidth-allocation</b>	Displays current local link information.
<b>show mpls traffic-eng link-management igp-neighbors</b>	Displays IGP neighbors.
<b>show mpls traffic-eng link-management summary</b>	Displays a summary of link management information.

# show mpls traffic-eng link-management summary

To display a summary of link management information, use the **show mpls traffic-eng link-management summary** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng link-management summary** [*interface-name*]

<b>Syntax Description</b>	<i>interface-name</i>	Specific interface for which information will be displayed.
---------------------------	-----------------------	---

<b>Command Modes</b>	User EXEC Privileged EXEC
----------------------	------------------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(5)S	This command was introduced.
	12.1(3)T	The command output was modified.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	The output was enhanced to display Internet Gateway Protocol (IGP) recovery status provided by the Cisco IOS Software Modularity: MPLS Layer 3 VPNs feature.

**Examples** The following is sample output from the **show mpls traffic-eng link-management summary** command:

```
Router# show mpls traffic-eng link-management summary

System Information::
  Links Count:          2
  Flooding System:     enabled
IGP Area ID:: isis level-1
  Flooding Protocol:   ISIS
  Flooding Status:     data flooded
  Periodic Flooding:   enabled (every 180 seconds)
  Flooded Links:       1
  IGP System ID:       0001.0000.0001.00
  MPLS TE Router ID:   10.106.0.6
  IGP Neighbors:       1
Link ID:: Et4/0/1 (10.1.0.6)
  Link Status:
    Physical Bandwidth: 10000 kbits/sec
    Max Reservable BW:  5000 kbits/sec (reserved:0% in, 60% out)
    MPLS TE Link State: MPLS TE on, RSVP on, admin-up, flooded
    Inbound Admission:  reject-huge
    Outbound Admission: allow-if-room
    Admin. Weight:      10 (IGP)
    IGP Neighbor Count: 1
Link ID:: AT0/0.2 (10.42.0.6)
  Link Status:
    Physical Bandwidth: 155520 kbits/sec
    Max Reservable BW:  5000 kbits/sec (reserved:0% in, 0% out)
    MPLS TE Link State: MPLS TE on, RSVP on
```

```

Inbound Admission:  allow-all
Outbound Admission: allow-if-room
Admin. Weight:      10 (IGP)
IGP Neighbor Count: 0

```

Table 143 describes the significant fields shown in the display.

**Table 143** *show mpls traffic-eng link-management summary Field Descriptions*

Field	Description
Links Count	Number of links configured for Multiprotocol Label Switching (MPLS) traffic engineering.
Flooding System	Enable status of the MPLS traffic engineering flooding system.
IGP Area ID	Name of the IGP area being described.
Flooding Protocol	IGP being used to flood information for this area.
Flooding Status	Status of flooding for this area.
Periodic Flooding	Status of periodic flooding for this area.
Flooded Links	Number of links that were flooded.
IGP System ID	IGP for this node associated with this area.
MPLS TE Router ID	MPLS traffic engineering router ID for this node.
IGP Neighbors	Number of reachable IGP neighbors associated with this area.
Link ID	Interface name and IP address of the link being described.
Physical Bandwidth	Link bandwidth capacity (in kbps).
Max Reservable BW	Amount of reservable bandwidth (in kbps) on this link.
MPLS TE Link State	Status of the link's MPLS traffic engineering-related functions.
Inbound Admission	Link admission policy for incoming tunnels.
Outbound Admission	Link admission policy for outgoing tunnels.
Admin. Weight	Link administrative weight.
IGP Neighbor Count	List of the IGP neighbors directly reachable over this link.

The following is sample output from the **show mpls traffic-eng link-management summary** command with the enhanced output, which shows the “IGP recovering” status, from the Cisco IOS Software Modularity: MPLS Layer 3 VPNs feature:

```

Router# show mpls traffic-eng link-management summary

System Information::
  Links Count:          3
  Flooding System:     enabled (IGP recovering)
IGP Area ID:: ospf area nil
  Flooding Protocol:   OSPF
  Flooding Status:     data flooded
  Periodic Flooding:   enabled (every 180 seconds)
  Flooded Links:       0

```

Table 144 describes the significant fields shown in the display.

**Table 144** show mpls traffic-eng link-management summary Field Descriptions

Field	Description
Links Count	Number of links configured for MPLS traffic engineering.
Flooding System	Status of the MPLS traffic engineering flooding system. The notation (IGP recovering) indicates that status cannot be determined because an IP routing process restart is in progress.
IGP Area ID	Name of the IGP area being described.
Flooding Protocol	IGP being used to flood information for this area.
Flooding Status	Status of flooding for this area.
Periodic Flooding	Status of periodic flooding for this area.
Flooded Links	Number of links that were flooded.

**Related Commands**

Command	Description
<b>show mpls traffic-eng link-management advertisements</b>	Displays local link information currently being flooded by MPLS traffic engineering link management into the global traffic engineering topology.
<b>show mpls traffic-eng link-management bandwidth-allocation</b>	Displays current local link information.
<b>show mpls traffic-eng link-management igp-neighbors</b>	Displays IGP neighbors.
<b>show mpls traffic-eng link-management interfaces</b>	Displays per-interface resource and configuration information.

# show mpls traffic-eng lsp attributes

To display global label switched path (LSP) attribute lists, use the **show mpls traffic-eng lsp attributes** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng lsp attributes** [*name string*] [*internal*]

Syntax Description	name	(Optional) Identifies a specific LSP attribute list.
	<i>string</i>	Describes the string argument.
	<b>internal</b>	(Optional) Displays LSP attribute list internal information.

**Command Default** If no keywords or arguments are specified, all LSP attribute lists are displayed.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

Command History	Release	Modification
	12.0(26)S	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
	Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.

**Usage Guidelines** Use this command to display information about all LSP attribute lists or a specific LSP attribute list.

**Examples** The following example shows output from the **show mpls traffic-eng lsp attributes** command:

```
Router# show mpls traffic-eng lsp attributes

LIST list1
  affinity 0xFF mask 0xFFFFFFFF
  auto-bw collect-bw
  bandwidth 12
  protection fast-reroute bw-protect
  lockdown
  priority 2 2
  record-route LIST 2
  bandwidth 5000
LIST hipriority
  priority 0 0
!
```

[Table 145](#) describes the significant fields shown in the display.

**Table 145** *show mpls traffic-eng lsp attributes Field Descriptions*

<b>Field</b>	<b>Description</b>
LIST	Identifies the LSP attribute list.
affinity	Indicates the LSP attribute that specifies attribute flags for LSP links. Values are 0 or 1.
mask	Indicates which attribute values should be checked.
auto-bw collect-bw	Indicates automatic bandwidth configuration.
protection fast re-route bw-protect	Indicates that the failure protection is enabled.
lockdown	Indicates that the reoptimization for the LSP is disabled.
priority	Indicates the LSP attribute that specifies LSP priority.
record-route	Indicates the record of the route used by the LSP.
bandwidth	Indicates the LSP attribute that specifies LSP bandwidth.

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>mpls traffic-eng lsp attributes</b>	Creates or modifies an LSP attribute list.

# show mpls traffic-eng process-restart iprouting

To display the status of IP routing and Multiprotocol Label Switching (MPLS) traffic engineering synchronization after an IP routing process restart, use the **show mpls traffic-eng process-restart iprouting** command in user EXEC or privileged EXEC mode.

**show mpls traffic-eng process-restart iprouting**

**Syntax Description** This command has no arguments or keywords.

**Command Modes** User EXEC  
Privileged EXEC

Command History	Release	Modification
	12.2(33)SXH	This command was introduced.

**Usage Guidelines** This command displays information about the synchronization between the IP routing process and MPLS TE that you can provide to your technical support representative when you are reporting a problem.

All counters are set to zero when the system process initializes and are not reset no matter how often the IP routing process restarts.

The following is sample output from the **show mpls traffic-eng process-restart iprouting** command when an IP routing process has restarted normally:

```
Router# show mpls traffic-eng process-restart iprouting
```

```
IP Routing Restart Statistics:
```

```
Current State: NORM
```

```
Flushing State: IDLE
```

State Entered	Count	Timestamp	Timestamp	Timestamp
INIT	1	05/10/06-13:07:01		
NORM	3	05/10/06-13:07:10	05/10/06-13:10:45	05/10/06-13:11:5
NORM-SPCT	0			
AWAIT-CFG	2	05/10/06-13:10:32	05/10/06-13:11:45	
CFG	2	05/10/06-13:10:32	05/10/06-13:11:45	
CMPL-FLSH	0			
NCMPL-FLSH	2	05/10/06-13:10:32	05/10/06-13:11:45	
NCMPL-FLSHD	2	05/10/06-13:10:32	05/10/06-13:11:45	

Stuck State	Count	Timestamp	Timestamp	Timestamp
No Stuck states encountered				

Counter	Count	Timestamp	Timestamp	Timestamp
Reg Succeed	40	05/10/06-13:11:51	05/10/06-13:11:45	05/10/06-13:11:45
Reg Fail	0			
Incarnation	5	05/10/06-13:11:45	05/10/06-13:11:45	05/10/06-13:10:37
Flushing	2	05/10/06-13:10:32	05/10/06-13:11:45	

Table 146 describes the normal output of the significant fields shown in the display. You should contact your technical support representative if your display has values other than those described in the table.

**Table 146** *show mpls traffic-eng process-restart iprouting Field Descriptions*

Field	Description
Current State	This indicates the restart status. NORM indicates that routing convergence has occurred and that TE and the Internet Gateway Protocols (IGPs) have synchronized.
Flushing State	This indicates the flushing state. It should indicate IDLE.
Stuck State	This indicates the stuck state. The Count column should indicate that no stuck state has been encountered.
Reg Fail	This indicates a registry failure. The Count column should indicate 0.

**Related Commands**

Command	Description
<b>debug mpls traffic-eng process-restart</b>	Displays information about process restarts for reporting to your technical support representative.

# show mpls traffic-eng topology

To display the Multiprotocol Label Switching (MPLS) traffic engineering global topology as currently known at the node, use the **show mpls traffic-eng topology** command in user EXEC or privileged EXEC mode.

```
show mpls traffic-eng topology [area area-id | level-1 | level-2] [ip-address [brief | internal] |
  igp-id {isis nsapaddr | ospf ip-address [network | router]} [brief] | srlg]
```

Syntax Description		
<b>area</b>	(Optional) Restricts output to an Open Shortest Path First (OSPF) area.	
<i>area-id</i>	The OSPF area ID. The range is from 0 to 4294967295.	
<b>level-1</b>	(Optional) Restricts output to a System-to-Intermediate System (IS-IS) level-1.	
<b>level-2</b>	(Optional) Restricts output to an IS-IS level-2.	
<i>ip-address</i>	(Optional) The node by the IP address (router identifier to interface address).	
<b>brief</b>	(Optional) Provides a less detailed version of the topology.	
<b>internal</b>	(Optional) Specifies to use the internal format.	
<b>igp-id</b>	(Optional) Specifies the node by Interior Gateway Protocol (IGP) router identifier.	
<b>isis nsapaddr</b>	Specifies the node by router identification if using Intermediate IS-IS.	
<b>ospf ip-address</b>	Specifies the node by router identifier if using OSPF.	
<b>network</b>	(Optional) Specifies the node type as network.	
<b>router</b>	(Optional) Specifies the node type as router.	
<b>srlg</b>	(Optional) Displays Shared Risk Link Groups (SRLG) membership for each link in a topology.	

Command Modes	
	User EXEC (>)
	Privileged EXEC (#)

Command History	Release	Modification
	12.0(5)S	This command was introduced.
	12.0(11)ST	This command was modified. The single “Reservable” column was replaced by two columns: one each for “global pool” and for “subpool.”
	12.2(8)T	This command was integrated into Cisco IOS Release 12.2(8)T.
	12.2(28)SB	This command was modified. The <b>area</b> , <b>level-1</b> , and <b>level-2</b> keywords were added.

Release	Modification
12.2(33)SRA	This command was modified and integrated into Cisco IOS Release 12.2(33)SRA. The <b>srlg</b> keyword was added.
12.2SX	This command was integrated into Cisco IOS Release 12.2SX. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

**Examples**

The following example shows output from the **show mpls traffic-eng topology** command:

```

```

Table 147 describes significant fields shown in the display.

**Table 147** *show mpls traffic-eng topology Field Descriptions*

Field	Description
My_System_id	Unique identifier of the IGP.
My_BC_Model_Type: MAM	Bandwidth constraints model of the local node: either Maximum Allocation Model (MAM) or Russian Dolls Model (RDM).
Signalling error holddown:	Link hold-down timer configured to handle path error events to exclude link from topology.
IGP Id	Identification of the advertising router.
MPLS TE Id	Unique MPLS traffic engineering node identifier.
Intf Id:	Interface identifier.
Router Node	Type of node.
Nbr IGP Id	Neighbor IGP router identifier.
Intf Address	The interface address of the link.
Nbr Intf Address:	IP address of the neighbor interface.
BC Model ID:	Bandwidth Constraints Model ID: RDM or MAM.
gen	Generation number of the link-state packet (LSP). This internal number is incremented when any new LSP is received.
Frag Id	IGP link-state advertisement (LSA) fragment identifier.
TE Metric	TE cost of the link.
IGP Metric	IGP cost of the link.
Attribute Flags	The requirements on the attributes of the links that the traffic crosses.
Physical BW	Physical line rate.
Max Reservable BW	Maximum amount of bandwidth, in kilobits per second (kb/s), that can be reserved on a link.
Total Allocated	Amount of bandwidth, in kb/s, allocated at that priority.
Reservable	Amount of available bandwidth, in kb/s, reservable for that TE-Class for two pools: BC0 (formerly called "global") and BC1 (formerly called "sub").

#### Related Commands

Command	Description
<b>show mpls traffic-eng tunnels</b>	Displays information about tunnels.

# show mpls traffic-eng topology path

To show the properties of the best available path to a specified destination that satisfies certain constraints, use the **show mpls traffic-eng topology path** command in user EXEC or privileged EXEC mode.

```
show mpls traffic-eng topology path {tunnel-interface [destination address]
| destination address} [bandwidth value] [priority value [value]]
[affinity value [mask mask]]
```

## Syntax Description

<i>tunnel-interface</i>	Name of an MPLS traffic engineering interface (for example, Tunnel1) from which default constraints should be copied.
<b>destination</b> <i>address</i>	(Optional) IP address specifying the path's destination.
<b>bandwidth</b> <i>value</i>	(Optional) Bandwidth constraint. The amount of available bandwidth that a suitable path requires. This overrides the bandwidth constraint obtained from the specified tunnel interface. You can specify any positive number.
<b>priority</b> <i>value</i> [ <i>value</i> ]	(Optional) Priority constraints. The setup and hold priorities used to acquire bandwidth along the path. If specified, this overrides the priority constraints obtained from the tunnel interface. Valid values are from 0 to 7.
<b>affinity</b> <i>value</i>	(Optional) Affinity constraints. The link attributes for which the path has an affinity. If specified, this overrides the affinity constraints obtained from the tunnel interface.
<b>mask</b> <i>mask</i>	(Optional) Affinity constraints. The mask associated with the affinity specification.

## Command Modes

User EXEC  
Privileged EXEC

## Command History

Release	Modification
12.1(3)T	This command was introduced.
12.0(10)ST	This command was integrated into Cisco IOS Release 12.0(10)ST.
12.0(22)S	This command was integrated into Cisco IOS Release 12.0(22)S.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

## Usage Guidelines

The specified constraints override any constraints obtained from a reference tunnel.

**Examples**

The following is sample output from the **show mpls traffic-eng topology path** command:

```
Router # show mpls traffic-eng topology path Tunnel1 bandwidth 1000

Query Parameters:
  Destination:10.112.0.12
  Bandwidth:1000
  Priorities:1 (setup), 1 (hold)
  Affinity:0x0 (value), 0xFFFF (mask)
Query Results:
  Min Bandwidth Along Path:2000 (kbps)
  Max Bandwidth Along Path:5000 (kbps)
  Hop  0:10.1.0.6      :affinity 00000000, bandwidth 2000 (kbps)
  Hop  1:10.1.0.10    :affinity 00000000, bandwidth 5000 (kbps)
  Hop  2:10.43.0.10   :affinity 00000000, bandwidth 2000 (kbps)
  Hop  3:10.112.0.12
```

[Table 148](#) describes the significant fields shown in the display.

**Table 148** *show mpls traffic-eng topology path Field Descriptions*

Field	Description
Destination	IP address of the path's destination.
Bandwidth	Amount of available bandwidth that a suitable path requires.
Priorities	Setup and hold priorities used to acquire bandwidth.
Affinity	Link attributes for which the path has an affinity.
Min Bandwidth Along Path	Minimum amount of bandwidth configured for a path.
Max Bandwidth Along Path	Maximum amount of bandwidth configured for a path.
Hop	Information about each link in the path.

# show mpls traffic-eng tunnels

To display information about traffic engineering (TE) tunnels, use the **show mpls traffic-eng tunnels** command in user EXEC or privileged EXEC mode.

```
show mpls traffic-eng tunnels [[attributes list-name] [destination address] [down] [interface
  type number] [name name] [name-regexp reg-exp] [property {auto-tunnel {backup | mesh |
  primary} | backup-tunnel | fast-reroute}] [role {all | head | middle | remote | tail}]
  [source-id {ipaddress [tunnel-id]}] [suboptimal constraints {current | max | none}]
  [statistics] [summary] [up]] [accounting | backup | brief | protection]
```

## Syntax Description

<b>attributes</b> <i>list-name</i>	(Optional) Restricts the display to tunnels that use a matching attributes list.
<b>destination</b> <i>address</i>	(Optional) Restricts the display to tunnels destined to a specified IP address.
<b>down</b>	(Optional) Displays tunnels that are not active.
<b>interface</b>	(Optional) Displays information for a specified interface.
<i>type</i>	Interface type. For more information, use the question mark (?) online help function.
<i>number</i>	Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function.
<b>name</b> <i>name</i>	(Optional) Displays the tunnel with the specified string. The tunnel string is derived from the interface description, if specified; otherwise, it is the interface name. The tunnel string is included in the signaling message so that it is available at all hops.
<b>name-regexp</b> <i>reg-exp</i>	(Optional) Displays tunnels whose descriptions match the specified regular expression.
<b>property</b>	(Optional) Displays tunnels with the specified property.
<b>auto-tunnel</b>	Displays information about autotunnels.
<b>backup</b>	Displays information about the Fast Reroute (FRR) protection provided by each tunnel selected by other options specified with this command. The information includes the physical interface protected by the tunnel, the number of TE label switched packets (LSPs) (that is, tunnels) protected, and the bandwidth protected.
<b>mesh</b>	Displays information about auto-tunnel mesh tunnel interfaces.
<b>primary</b>	Displays information about auto-tunnel primary tunnel interfaces.
<b>backup-tunnel</b>	Displays information about the FRR protection provided by each tunnel selected by other options specified with this command. The information includes the physical interface protected by the tunnel, the number of TE LSPs protected, and the bandwidth protected.
<b>fast-reroute</b>	Selects FRR-protected MPLS TE tunnels originating, transmitting, or terminating on this router.
<b>role</b>	Restricts the display to tunnels with the indicated role (all, head, middle, tail, or remote).
<b>all</b>	Displays all tunnels.
<b>head</b>	Displays tunnels with their head at this router.
<b>middle</b>	Displays tunnels with a midpoint at this router.

<b>remote</b>	Displays tunnels with their head at some other router; this is a combination of <b>middle</b> and <b>tail</b> keywords.
<b>tail</b>	Displays tunnels with a tail at this router.
<b>source-id</b>	(Optional) Restricts the display to tunnels with a matching source IP address or tunnel number.
<i>ipaddress</i>	Source IP address.
<i>tunnel-id</i>	Tunnel number. The range is from 0 to 65535.
<b>suboptimal</b>	(Optional) Displays information about tunnels using a suboptimal path.
<b>constraints</b>	Specifies constraints for finding the best comparison path.
<b>current</b>	Displays tunnels whose path metric is greater than the current shortest path, constrained by the tunnel's configured options. Selected tunnels would have a shorter path if they were reoptimized immediately.
<b>max</b>	Displays information for the specified tunneling interface.
<b>none</b>	Displays tunnels whose path metric is greater than the shortest unconstrained path. Selected tunnels have a longer path than the Interior Gateway Protocol's (IGP) shortest path.
<b>statistics</b>	(Optional) Displays event counters for one or more tunnels.
<b>summary</b>	(Optional) Displays event counters accumulated for all tunnels.
<b>up</b>	(Optional) Displays tunnels if the tunnel interface is up. Tunnel midpoints and tails are typically up or not present.
<b>accounting</b>	(Optional) Displays accounting information (the rate of the traffic flow) for tunnels.
<b>brief</b>	(Optional) Specifies a format with one line per tunnel.
<b>protection</b>	(Optional) Displays information about the protection provided by each tunnel selected by other options specified with this command. The information includes the protection (if any) provided to the tunnel by this router, the protection configured for the tunnel, and the bandwidth protected.

**Command Default**

General information about each MPLS TE tunnel known to the router is displayed.

**Command Modes**

User EXEC (>)  
Privileged EXEC (#)

**Command History**

Release	Modification
12.0(5)S	This command was introduced.
12.1(3)T	Input and output interface information was added to the new <b>brief</b> form of the output. The <b>suboptimal</b> and <b>interface</b> keywords were added to the nonbrief format. The nonbrief, nonsummary formats contain the history of the LSP selection.
12.0(10)ST	This command was integrated into Cisco IOS Release 12.0(10)ST.
12.0(22)S	The <b>property</b> and <b>protection</b> keywords were added. The command is supported on Cisco 10000 series routers.

Release	Modification
12.2(18)S	The following keywords were added: <b>accounting</b> , <b>attributes</b> , <b>name-regexp</b> , and <b>property auto-tunnel</b> . The <b>property backup</b> keyword was changed to <b>property backup-tunnel</b> .
12.2(18)SXD1	This command was integrated into Cisco IOS Release 12.2(18)SXD1.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
12.2(33)SRE	This command was modified. The <b>detail</b> and <b>dest-mode</b> keywords were added. The output was updated to display MPLS TE point-to-multipoint (P2MP) information.  The command output was enhanced to include the configuration and status when a path option list is configured for backup path options. The output also shows information about tunnels configured with autoroute announce.
15.0(1)S	This command was modified. The command output was enhanced to include information about P2MP LSPs and sub-LSPs.
12.2(50)SY	This command was integrated into Cisco IOS Release 12.2(50)SY.

## Usage Guidelines

To select the tunnels for which information is displayed, use the **auto-tunnel**, **backup-tunnel**, **attributes**, **destination**, **interface**, **name**, **name-regexp**, **property**, **role**, **source-id**, **suboptimal constraints**, **up**, and **down** keywords singly or combined.

To select the type of information displayed about the selected tunnels, use the **accounting**, **backup**, **protection**, **statistics**, and **summary** keywords.

The **auto-tunnel**, **backup-tunnel**, and **property** keywords display the same information, except that the **property** keyword restricts the display to autotunnels, backup tunnels, or tunnels that are FRR-protected.

The **name-regexp** keyword displays output for each tunnel whose name contains a specified string. For example, if there are tunnels named iou-100-t1, iou-100-t2, and iou-100-t100, the **show mpls traffic-eng tunnels name-regexp iou-100** command displays output for the three tunnels whose name contains the string iou-100.

If you specify the **name** keyword, the command output is displayed only if the command name is an exact match, for example, iou-100-t1.

The nonbrief and nonsummary formats of the output contain the history of the LSP selection.

### “Reroute Pending” State Changes in Cisco IOS Release 12.2(33)SRE

In releases earlier than Cisco IOS Release 12.2(33)SRE, MPLS TE P2P tunnels display “reroute pending” during reoptimization until the “delayed clean” status of the old path is complete. During the “delayed clean” process, the command output displays the following status:

```
Router# show mpls traffic-eng tunnels tunnel 534

Name: Router_t534                               (Tunnel534) Destination: 10.30.30.8
Status:
  Admin: up           Oper: up           Path: valid           Signalling: connected
  path option 10, type explicit PRIMARY_TO_8 (Basis for Setup, path weight 30)
  !!! path option 10 delayed clean in progress
  !!! Change in required resources detected: reroute pending
```

Currently Signalled Parameters:

Bandwidth: 300 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF  
Metric Type: TE (default)

In Cisco IOS Release 12.2(33)SRE and later releases, P2P and P2MP MPLS TE tunnels display “reroute pending” during reoptimization until the new path is used for forwarding. The “reroute pending” status is not displayed during the delayed clean operation. There is no change to data forwarding or tunnel creation. You might see the “reroute pending” status for a shorter time. In the following example, the “reroute pending” message appears, but the “delayed clean” message does not.

Router# **show mpls traffic-eng tunnels tunnel 534**

```
Name: Router_t534 (Tunnel534) Destination: 10.30.30.8
Status:
  Admin: up      Oper: up      Path: valid      Signalling: connected
  path option 10, type explicit PRIMARY_TO_8 (Basis for Setup, path weight 30)
  Change in required resources detected: reroute pending
  Currently Signalled Parameters:
  Bandwidth: 300 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
```

## Examples

The following is sample output from the **show mpls traffic-eng tunnels brief** command. It displays brief information about every MPLS TE tunnel known to the router.

Router# **show mpls traffic-eng tunnels brief**

```
Signalling Summary:
  LSP Tunnels Process:      running
  RSVP Process:            running
  Forwarding:              enabled
  Periodic reoptimization: every 3600 seconds, next in 1706 seconds
TUNNEL NAME                DESTINATION      UP IF    DOWN IF    STATE/PROT
Router_t1                  10.112.0.12     -        PO4/0/1    up/up
Router_t2                  10.112.0.12     -        unknown    up/down
Router_t3                  10.112.0.12     -        unknown    admin-down
Router_t1000               10.110.0.10     -        unknown    up/down
Router_t2000               10.110.0.10     -        PO4/0/1    up/up
Displayed 5 (of 5) heads, 0 (of 0) midpoints, 0 (of 0) tails
```

Table 149 describes the significant fields shown in the display.

**Table 149** *show mpls traffic-eng tunnels Field Descriptions*

Field	Description
LSP Tunnels Process	Status of the LSP tunnels process.
RSVP Process	Status of the Resource Reservation Protocol (RSVP) process.
Forwarding	Status of forwarding (enabled or disabled).
Periodic reoptimization	Schedule for periodic reoptimization (in seconds).
TUNNEL NAME	Name of the interface that is configured at the tunnel head.
DESTINATION	Identifier of the tailend router.
UP IF	Upstream interface that the tunnel used.
DOWN IF	Downstream interface that the tunnel used.
STATE/PROT	For tunnel heads, the value is admin-down, up, or down. For nonheads, the value is signaled.

The following is sample output from the **show mpls traffic-eng tunnels property fast-reroute brief** command. It displays brief information about all MPLS TE tunnels acting as FRR backup tunnels (**property backup-tunnel**) for interfaces on the router.

```
Router# show mpls traffic-eng tunnels property fast-reroute brief

Signalling Summary:
  LSP Tunnels Process:      running
  RSVP Process:            running
  Forwarding:              enabled
  Periodic reoptimization: every 3600 seconds, next in 2231 seconds
  Periodic FRR Promotion:  every 300 seconds, next in 131 seconds
  Periodic auto-bw collection: disabled
TUNNEL NAME                DESTINATION      UP IF    DOWN IF    STATE/PROT
Router_t2000              10.110.0.10     -        PO4/0/1    up/up
Router_t2                  10.112.0.12     -        unknown    up/down
Router_t3                  10.112.0.12     -        unknown    admin-down
Displayed 3 (of 9) heads, 0 (of 1) midpoints, 0 (of 0) tails
```

The following is sample output from the **show mpls traffic-eng tunnels backup** command. This command selects every MPLS TE tunnel known to the router and displays information about the FRR protection that each selected tunnel provides for interfaces on this router; the command does not generate output for tunnels that do not provide FRR protection of interfaces on this router.

```
Router# show mpls traffic-eng tunnels backup

Router_t578
  LSP Head, Tunnel578, Admin: up, Oper: up
  Src 10.55.55.55, Dest 10.88.88.88, Instance 1

auto-tunnel auto-tunnel created tunnels
backup-tunnel Tunnels used as fast reroute
fast-reroute Tunnels protected by fast reroute

```

The following is sample output from the **show mpls traffic-eng tunnels accounting** command. This command displays the rate of the traffic flow for the tunnels.

```

Router# show mpls traffic-eng tunnels accounting

Tunnel1 (Destination 10.103.103.103; Name iou-100_t1)

```

```

5 minute output rate 0 kbits/sec, 0 packets/sec
Tunnel2 (Destination 10.103.103.103; Name iou-100_t2)
5 minute output rate 0 kbits/sec, 0 packets/sec Tunnel100 (Destination 10.101.101.101;
Name iou-100_t100)
5 minute output rate 0 kbits/sec, 0 packets/sec Totals for 3 Tunnels
5 minute output rate 0 kbits/sec, 0 packets/sec

```

When the MPLS TE P2MP feature is configured, the **show mpls traffic-eng tunnels** command categorizes the output as follows:

- P2P tunnels/LSPs
- P2MP tunnels
- P2MP sub-LSPs

The following sample output of the **show mpls traffic-eng tunnels brief** command displays information about the P2MP tunnel and the sub-LSP:

```
Router# show mpls traffic-eng tunnels brief
```

Signalling Summary:

```

LSP Tunnels Process:          running
Passive LSP Listener:        running
RSVP Process:                 running
Forwarding:                   enabled
Periodic reoptimization:     every 60 seconds, next in 5 seconds
Periodic FRR Promotion:      Not Running
Periodic auto-bw collection:  disabled

```

P2P TUNNELS/LSPs:

TUNNEL NAME	DESTINATION	UP IF	DOWN IF	STATE/PROT
p2p-LSP	10.2.0.1	-	Se2/0	up/up

Displayed 2 (of 2) heads, 0 (of 0) midpoints, 0 (of 0) tails

P2MP TUNNELS:

INTERFACE	STATE/PROT	DEST UP/CFG	CURRENT TUNID	LSPID
Tunnel2	up/up	3/10	2	1
Tunnel5	up/down	1/10	5	2

Displayed 2 (of 2) P2MP heads

P2MP SUB-LSPS:

The following sample output from the **show mpls traffic-eng tunnels** command for Cisco IOS Release 12.2(33)SRE shows autoroute destination information:

```

Router# show mpls traffic-eng tunnel tunnel 109

Name: PE-7_t109 (Tunnel109) Destination: 10.0.0.9
Status:
  Admin: up Oper: up Path: valid Signalling: connected
  path option 1, type explicit to_109 (Basis for Setup, path weight 64)
  path option 20, type explicit to_109_alt

Config Parameters:
  Bandwidth: 0 kbps (Global Priority: 7 7 Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
  Autoroute announce: enabled LockDown: disabled Loadshare: 0 bx-based
  auto-bw: disabled
  AutoRoute destination: enabled

```

Table 150 describes the significant fields shown in the display.

**Table 150** show mpls traffic-eng tunnels Field Descriptions

Field	Description
LSP Tunnels Process	Status of the LSP tunnels process.
RSVP Process	Status of the RSVP process.

**Table 150** *show mpls traffic-eng tunnels Field Descriptions (continued)*

Field	Description
Forwarding	Status of forwarding (enabled or disabled).
Periodic reoptimization	Schedule for periodic reoptimization (in seconds).
TUNNEL NAME	Name of the interface that is configured at the tunnel head.
DESTINATION	Identifier of the tailend router.
UP IF	Upstream interface that the tunnel used.
DOWN IF	Downstream interface that the tunnel used.
STATE/PROT	For tunnel heads, admin-down, up, or down. For nonheads, signaled.
Adjustment threshold	Configured threshold. This field is displayed only if a threshold is explicitly configured.
Overflow Limit Overflow Threshold	These fields are displayed only if an overflow limit was specified in the <b>tunnel mpls traffic-eng auto-bw</b> command. The tunnel resizes before the end of the sampling interval if the output rate exceeds the current bandwidth by the percentage specified in the overflow threshold, or if the output rate exceeds the number of times specified in the overflow limit.
Overflow Threshold Crossed	Number of times the output rate exceeded the overflow threshold in consecutive collection intervals. This value is reset at the beginning of the automatic bandwidth sampling interval.
Number of Auto-bw Adjustment resize requests	Number of times the tunnel was resized because an output rate exceeded the adjustment threshold. This field is displayed only if the number is greater than zero and if automatic bandwidth is enabled on the tunnel. This counter is reset each time automatic bandwidth is enabled on the tunnel. You can clear this counter at any time by entering the <b>clear mpls traffic-eng auto-bw timer</b> command.
Time since last Auto-bw Adjustment resize request	The amount of time (in minutes and seconds) since the last bandwidth adjustment.
Number of Auto-bw Overflow resize requests	The number of times (in seconds) the tunnel was resized because an overflow limit was exceeded. This field is displayed only if the number is greater than zero and if an overflow limit is enabled on the tunnel. This counter is reset each time automatic bandwidth is enabled on the tunnel. You can clear this counter at any time by entering the <b>clear mpls traffic-eng auto-bw timer</b> command.
Time since last Auto-bw Overflow resize request	The amount of time (in seconds) since the tunnel was resized because an overflow limit was exceeded.

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>mpls traffic-eng reoptimize timers frequency</b>	Controls the frequency with which tunnels with established LSPs are checked for better LSPs.
<b>mpls traffic-eng tunnels (configuration)</b>	Enables MPLS traffic engineering tunnel signaling on a device.
<b>mpls traffic-eng tunnels (interface)</b>	Enables MPLS traffic engineering tunnel signaling on an interface.

# show mpls traffic-eng tunnels statistics

To display event counters for one or more Multiprotocol Label Switching (MPLS) traffic engineering tunnels, use the **show mpls traffic-eng tunnels statistics** command in user EXEC and privileged EXEC mode.

**show mpls traffic-eng tunnels** [**tunnel** *tunnel-name*] **statistics** [**summary**]

Syntax Description	
<b>tunnel</b> <i>tunnel-name</i>	(Optional) Displays event counters accumulated for the specified tunnel.
<b>summary</b>	(Optional) Displays event counters accumulated for all tunnels.

**Defaults** If you enter the command without any keywords, the command displays the event counters for every MPLS traffic engineering tunnel interface configured on the router.

**Command Modes** User EXEC (>)  
Privileged EXEC mode (#)

Command History	Release	Modification
	12.0(14)ST	This command was introduced.
	12.2(11)S	This command was integrated into Cisco IOS Release 12.2(11)S.
	12.0(22)S	This command was integrated into Cisco IOS Release 12.0(22)S.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
	12.2(33)SRE	This command was modified. The output was updated to display MPLS TE point-to-multipoint (P2MP) information.

**Usage Guidelines** A label switching router (LSR) maintains counters for each MPLS traffic engineering tunnel headend that counts significant events for the tunnel, such as state transitions for the tunnel, changes to the tunnel path, and various signaling failures. You can use the **show mpls traffic-eng tunnels statistics** command to display these counters for a single tunnel, for every tunnel, or for all tunnels (accumulated values). Displaying the counters is often useful for troubleshooting tunnel problems.

**Examples** The following are examples of output from the **show mpls traffic-eng tunnels statistics** command:

```
Router# show mpls traffic-eng tunnels tunnel tunnel1001 statistics
```

```
Tunnel1001 (Destination 10.8.8.8; Name Router_t1001)
```

```
Management statistics:
```

```

    Path:25 no path, 1 path no longer valid, 0 missing ip exp path
    5 path changes
    State:3 transitions, 0 admin down, 1 oper down
  Signalling statistics:
    Opens:2 succeeded, 0 timed out, 0 bad path spec
    0 other aborts
    Errors:0 no b/w, 0 no route, 0 admin
    0 bad exp route, 0 rec route loop, 0 other

```

Router# **show mpls traffic-eng tunnels statistics**

```

Tunnel1001 (Destination 10.8.8.8; Name Router_t1001)
  Management statistics:
    Path:25 no path, 1 path no longer valid, 0 missing ip exp path
    5 path changes
    State:3 transitions, 0 admin down, 1 oper down
  Signalling statistics:
    Opens:2 succeeded, 0 timed out, 0 bad path spec
    0 other aborts
    Errors:0 no b/w, 0 no route, 0 admin
    0 bad exp route, 0 rec route loop, 0 other
.
.
.

```

```

Tunnel7050 (Destination 10.8.8.8; Name Router_t7050)
  Management statistics:
    Path: 19 no path, 1 path no longer valid, 0 missing ip exp path
    3 path changes
    State: 3 transitions, 0 admin down, 1 oper down
  Signalling statistics:
    Opens: 2 succeeded, 0 timed out, 0 bad path spec
    0 other aborts
    Errors:0 no b/w, 0 no route, 0 admin
    0 bad exp route, 0 rec route loop, 0 other

```

Router# **show mpls traffic-eng tunnels statistics summary**

```

  Management statistics:
    Path:2304 no path, 73 path no longer valid, 0 missing ip exp path
    432 path changes
    State:300 transitions, 0 admin down, 100 oper down
  Signalling statistics:
    Opens:200 succeeded, 0 timed out, 0 bad path spec
    0 other aborts
    Errors:0 no b/w, 18 no route, 0 admin
    0 bad exp route, 0 rec route loop, 0 other

```

The following **show mpls traffic-eng tunnels statistics** command displays status information about P2MP path and LSPs for Tunnel 100:

Router# **show mpls traffic-eng tunnels statistics**

```

Tunnel100 (Name p2mp-1_t100)
  Management statistics:
    Path:    0 no path, 0 path no longer valid, 0 missing ip exp path
            97 path changes, 306 path lookups
            0 protection pathoption_list errors
            0 invalid inuse popt in pathoption list
            0 loose path reoptimizations, triggered by PathErrors
    State:  1 transitions, 0 admin down, 0 oper down
  Signalling statistics:

```

```

Opens:  1 succeeded, 0 timed out, 0 bad path spec
        0 other aborts
LSP Activations: 97 succeeded
Last Failure: No path that satisfy tunnel constraints
Failures stats:
  5: No path that satisfy tunnel constraints
Errors: 0 no b/w, 288 no route, 0 admin, 0 remerge detected
        0 bad exp route, 0 rec route loop, 0 frr activated
        0 other

```

Table 151 describes the significant fields shown in the display.

**Table 151** *show mpls traffic-eng tunnels statistics Field Descriptions*

Field	Description
Tunnel 1001	Name of the tunnel interface.
Destination	IP address of the tunnel tailend.
Name	Internal name for the tunnel, composed of the router name and the tunnel interface number.
Path	Heading for counters for tunnel path events are as follows: <ul style="list-style-type: none"> <li>no path—Number of unsuccessful attempts to calculate a path for the tunnel.</li> <li>path no longer valid—Number of times a previously valid path for the tunnel became invalid.</li> <li>missing ip exp path—Number of times that attempts to use “obtain a path for the tunnel” failed because no path was configured (and there was no dynamic path option for the tunnel).</li> <li>path changes—Number of times the tunnel path changed.</li> </ul>
State	Heading for counters for tunnel state transitions.
Opens	Heading for counters for tunnel open attempt events.
Errors	Heading for various tunnel signaling errors, such as no bandwidth, no route, admin (preemption), a bad explicit route, and a loop in the explicit route.

#### Related Commands

Command	Description
<b>clear mpls traffic-eng tunnel counters</b>	Clears the counters for all MPLS traffic engineering tunnels.

# show mpls traffic-eng tunnels summary

To display summary information about tunnels, use the **show mpls traffic-eng tunnels summary** command in user EXEC or privileged EXEC mode.

## show mpls traffic-eng tunnels summary

**Syntax Description** This command has no arguments or keywords.

**Command Modes** User EXEC  
Privileged EXEC

Command History	Release	Modification
	12.0(5)S	This command was introduced.
	12.0(10)ST	This command was integrated into Cisco IOS Release 12.0(10)ST.
	12.0(22)S	This command output was updated to display periodic Fast Reroute information. The command is supported on the Cisco 10000 series ESRs.
	12.2(18)SXD1	This command was integrated into Cisco IOS Release 12.2(18)SXD1.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(33)SRA	The command output was modified to display the number of tunnels that were attempted and successful in being recovered following a failover.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
	12.2(33)SRE	This command was modified. The output was updated to display Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) point-to-multipoint (P2MP) information.
	15.0(1)S	This command was modified. The command output was updated to display stateful switchover (SSO) recovery information for MPLS TE P2MP tunnels.

**Usage Guidelines** Use the **show mpls traffic-eng tunnels summary** command to display the number of tunnel headends that were attempted and successful at being recovered following SSO.

**Examples** The following is sample output from the **show mpls traffic-eng tunnels summary** command:

```
Router# show mpls traffic-eng tunnels summary

Signalling Summary:
  LSP Tunnels Process:          running
  Passive LSP Listener:        running
  RSVP Process:                 running
  Forwarding:                   enabled
  Periodic reoptimization:      every 3600 seconds, next in 1420 seconds
  Periodic FRR Promotion:       Not Running
  Periodic auto-bw collection:  every 300 seconds, next in 234 seconds
  P2P:
```

```

Head: 1 interfaces, 1 active signalling attempts, 1 established
      1 activations, 0 deactivations
      1 SSO recovery attempts, 1 SSO recovered
Midpoints: 0, Tails: 0

P2MP:
Head: 1 interfaces, 2 active signalling attempts, 2 established
      2 sub-LSP activations, 0 sub-LSP deactivations
      1 LSP successful activations, 0 LSP deactivations
      1 SSO recovery attempts, LSP Recovered: 1 full, 0 partial, 0 fail
Midpoints: 0, Tails: 0

```

Table 152 describes the significant fields shown in the display.

**Table 152** *show mpls traffic-eng tunnels summary Field Descriptions*

Field	Description
LSP Tunnels Process	Multiprotocol Label Switching (MPLS) traffic engineering has or has not been enabled.
Passive LSP Listener	The device listens for LSPs and can terminate them, if desired.
RSVP Process	Resource Reservation Protocol (RSVP) has or has not been enabled. (This feature is enabled as a consequence of MPLS traffic engineering being enabled.)
Forwarding	Indicates whether appropriate forwarding is enabled. (Appropriate forwarding on a router is Cisco Express Forwarding switching.)
Head	Summary information about tunnel heads at this device. Information includes: <ul style="list-style-type: none"> <li>• interfaces—Number of MPLS traffic engineering tunnel interfaces.</li> <li>• active signalling attempts—Number of LSPs currently successfully signaled or being signaled.</li> <li>• established—Number of LSPs currently signaled.</li> <li>• activations—Number of signaling attempts initiated.</li> <li>• deactivations—Number of signaling attempts terminated.</li> <li>• SSO recovery attempts—Number of MPLS traffic engineering tunnel headend LSPs that were attempted to be recovered following an SSO event.</li> <li>• SSO recovered—Number of MPLS traffic engineering tunnel headend LSPs that were successfully recovered following an SSO event.</li> </ul>
Midpoints	Number of midpoints at this device.
Tails	Number of tails at this device.
Periodic reoptimization	Frequency of periodic reoptimization and time (in seconds) until the next periodic reoptimization.

**Table 152** *show mpls traffic-eng tunnels summary Field Descriptions (continued)*

<b>Field</b>	<b>Description</b>
Periodic FRR Promotion	Frequency that scanning occurs to determine if link-state packets (LSPs) should be promoted to better backup tunnels, and time (in seconds) until the next scanning.
Periodic auto-bw collection	Frequency of automatic bandwidth collection and time left (in seconds) until the next collection.

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>mpls traffic-eng reoptimize timers frequency</b>	Controls the frequency with which tunnels with established LSPs are checked for better LSPs.
<b>mpls traffic-eng tunnels (configuration)</b>	Enables MPLS traffic engineering tunnel signaling on a device.
<b>mpls traffic-eng tunnels (interface)</b>	Enables MPLS traffic engineering tunnel signaling on an interface.

# show mpls ttfib

To display information about the Multiprotocol Label Switching (MPLS) TTFIB table, use the **show mpls ttfib** command in EXEC mode.

```
show mpls ttfib [detail [hardware] | vrf instance [detail]]
```

Syntax Description	
detail	(Optional) Displays detailed information.
hardware	(Optional) Displays detailed hardware information.
vrf instance	(Optional) Displays entries for a specified Virtual Private Network (VPN) routing and forwarding instance (VRF).

**Defaults** This command has no default settings.

**Command Modes** EXEC

Command History	Release	Modification
	12.2(17b)SXA	Support for this command was introduced on the Supervisor Engine 720.
	12.2(17d)SXB	Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

**Note**

The **show mpls ttfib** command is not supported on Cisco 7600 Series Routers starting from Cisco IOS Release 12.2(33)SRB onwards.

**Examples** This example shows how to display information about the MPLS TTFIB table:

```
Router# show mpls ttfib
```

```

Local  Outgoing  Packets Tag          LTL  Dest.  Destination  Outgoing
Tag    Tag or VC  Switched  Index Vlanid  Mac Address  Interface

# show pw-udp vc

To display information about pseudowire User Datagram Protocol (UDP) virtual circuits (VCs), use the **show pw-udp vc** command in user EXEC or privileged EXEC mode.

**show pw-udp vc** [*vcid id* [*max-vc*]] [*destination address*] [*detail* | *ssm id*]

Syntax Description	vcid id	(Optional) Specifies the minimum VC ID. Valid values are from 1-4294967295.
	max-vc	(Optional) Maximum VC ID. Valid values are from 1-4294967295.
	destination address	(Optional) Specifies the destination hostname or IP address of the VC.
	detail	(Optional) Displays detailed information about the UDP VCs.
	ssm id	(Optional) Displays the Source Specific Multicast (SSM) information.

**Command Default** If no arguments or keywords are specified, information about all pseudowire UDP VCs is displayed.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

Command History	Release	Modification
	15.1(2)S	This command was introduced.

**Examples** The following is sample output for the **show pw-udp vc** command:

```
Router# show pw-udp vc 100 200 detail

Local intf      Local circuit          VC ID      Status
-----
CE4/2/0:0      CESoPSN Basic         100        established
  LAddr: 10.1.1.151    LPort: 50100
  RAddr: 10.1.1.153    RPort: 50100
  VC statistics:
    transit packet totals: receive 770614, send 770613
    transit byte totals:   receive 151040344, send 50089845
    transit packet drops:  receive 0, send 0, seq error 0
CE4/2/1:0      CESoPSN Basic         200        established
  LAddr: 10.1.1.151    LPort: 50200
  RAddr: 10.1.1.153    RPort: 50200
  VC statistics:
    transit packet totals: receive 770614, send 770613
    transit byte totals:   receive 151040344, send 50089845
    transit packet drops:  receive 0, send 0, seq error 0
```

Table 153 describes the significant fields shown in the display.

**Table 153** show pw-udp vc Field Descriptions

Field	Description
Local intf	Name of the access circuit (AC) interface.
Local circuit	Interface type. For example, CESoPSN Basic.
VC ID	Virtual circuit ID.
Status	State of the pseudowire VC with the following possible values: <ul style="list-style-type: none"> <li>• Provisioned—Pseudowire has been provisioned but the data plane is not up.</li> <li>• Checkpoint wait—Pseudowire has been provisioned but still waiting for the checkpoint information from the active RP (need this information to proceed to the activating state). This state is applicable only on the standby RP.</li> <li>• Activating—Data plane has been activated, but not yet turned active.</li> <li>• Established—Data plane has been established and ready to forward traffic.</li> </ul>

**Related Commands**

Command	Description
<b>encapsulation (pseudowire)</b>	Specifies an encapsulation type for tunneling Layer 2 traffic over a pseudowire.

# show running interface auto-template

To display configuration information for a tunnel's interface, use the **show running interface auto-template** command in privileged EXEC mode.

**show running interface auto-template** *num*

<b>Syntax Description</b>	<i>num</i>	Number of the tunnel interface for which you want to display information.
---------------------------	------------	---

<b>Command Modes</b>	Privileged EXEC (#)
----------------------	---------------------

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	12.0(27)S	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

<b>Usage Guidelines</b>	The space before the <i>num</i> argument is optional.
-------------------------	---

**Examples** The following is output from the **show running interface auto-template** command:

```
Router# show running interface auto-template 1

interface auto-templatel
 ip unnumbered Loopback0
 no ip directed-broadcast
 no keepalive
 tunnel destination access-list 1
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng path-option 1 dynamic
```

Table 154 describes the significant fields shown in the display.

**Table 154** *show running interface auto-template* Field Descriptions

<b>Field</b>	<b>Description</b>
ip unnumbered Loopback0	Indicates the type and number of another interface on which the router has an assigned IP address. It cannot be another unnumbered interface.
no ip directed-broadcast	Indicates that no IP broadcast addresses are used for the autotunnel interface.
no keepalive	Indicates that no keepalives are set for the autotunnel interface.

**Table 154** show running interface auto-template Field Descriptions (continued)

Field	Description
tunnel destination access-list 1	Indicates that access list 1 is the access list that the template interface will use for obtaining the autotunnel interface destination address.
tunnel mode mpls traffic-eng	Indicates that the mode of the autotunnel is set to Multiprotocol Label Switching (MPLS) for traffic engineering.
tunnel mpls traffic-eng autoroute announce	Indicates that the Interior Gateway Protocol (IGP) should use the tunnel (if the tunnel is up) in its enhanced shortest path first (SPF) calculation.
tunnel mpls traffic-eng path-option 1 dynamic	Indicates that a path option (path-option1) for the label switch router (LSR) for the MPLS traffic engineering (TE) mesh tunnel is configured dynamically.

**Related Commands**

Command	Description
<b>interface auto-template</b>	Creates the template interface.
<b>tunnel destination access-list</b>	Specifies the access list that the template interface will use for obtaining the mesh tunnel interface destination address.

# show running-config vrf

To display the subset of the running configuration of a router that is linked to a specific Virtual Private Network (VPN) routing and forwarding (VRF) instance or to all VRFs configured on the router, use the **show running-config vrf** command in user EXEC or privileged EXEC mode.

**show running-config vrf** [*vrf-name*]

<b>Syntax Description</b>	<i>vrf-name</i> (Optional) Name of the VRF configuration that you want to display.
---------------------------	--

**Command Default** If you do not specify a *vrf-name* argument, the running configurations of all VRFs on the router are displayed.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

Command History	Release	Modification
	12.2(28)SB	This command was introduced.
	12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.

**Usage Guidelines** Use the **show running-config vrf** command to display a specific VRF configuration or to display all VRF configurations on the router. To display the configuration of a specific VRF, enter the name of the VRF as an argument to the command.

This command displays the following elements of the VRF configuration:

- The VRF submode configuration
- The routing protocol and static routing configurations associated with the VRF
- The configuration of the interfaces in the VRF, which includes the configuration of any owning controller and physical interface for a subinterface

**Examples** The following is sample output from the **show running-config vrf** command. It includes a base VRF configuration for VRF vpn3 and Border Gateway Protocol (BGP) and Open Shortest Path First (OSPF) configurations associated with VRF vpn3.

```
Router# show running-config vrf vpn3

```

Table 155 describes the significant fields shown in the display.

**Table 155** show running-config vrf Field Descriptions

Field	Description
Current configuration: 604 bytes	Number of bytes (604) in the VRF vpn3 configuration.
ip vrf vpn3	Name of the VRF (vpn3) for which the configuration is displayed.
rd 100:3	Identifies the route distinguisher (100:3) for VRF vpn3.
route-target export 100:3 route-target import 100:3	Specifies the route-target extended community for VRF vpn3. <ul style="list-style-type: none"> <li>Routes tagged with route-target export 100:3 are exported from VRF vpn3.</li> <li>Routes tagged with the route-target import 100:3 are imported into VRF vpn3.</li> </ul>
interface Loopback1	Virtual interface associated with VRF vpn3.
ip vrf forwarding vpn3	Associates VRF vpn3 with the named interface.
ip address 10.43.43.43 255.255.255.255	IP address of the loopback interface.
interface Ethernet6/0	Interface associated with VRF vpn3.
ip address 172.17.0.1 255.0.0.0	IP address of the Ethernet interface.

**Table 155** show running-config vrf Field Descriptions (continued)

Field	Description
router bgp 100	Sets up a BGP routing process for the router with autonomous system number 100.
address-family ipv4 vrf vpn3	Sets up a routing session for VRF vpn3 using standard IP Version 4 address prefixes.
redistribute connected	Redistributes routes automatically established by IP on an interface into the BGP routing domain.
redistribute ospf 101 match external 1 external 2	Redistribute routes from the OSPF 101 routing domain into the BGP routing domain.
router ospf 101 vrf vpn3	Set up an OSPF routing process and associates VRF vpn3 with OSPF VRF processes.
area 1 sham-link 10.43.43.43 10.23.23.23 cost 10	Configure a sham-link interface on a provider edge (PE) router in a Multiprotocol Label Switching (MPLS) VPN backbone. <ul style="list-style-type: none"> <li>• 1 is the ID number of the OSPF area assigned to the sham-link.</li> <li>• 10.43.43.43 is the IP address of the source PE router.</li> <li>• 10.23.23.23 is the IP address of the destination PE router.</li> <li>• 10 is the OSPF cost to send IP packets over the sham-link interface.</li> </ul>
network 172.17.0.0 0.255.255.255 area 1	Defines the interfaces on which OSPF runs and defines the area ID for those interfaces.

**Related Commands**

Command	Description
<b>ip vrf</b>	Configures a VRF routing table.
<b>show ip interface</b>	Displays the usability status of interfaces configured for IP.
<b>show ip vrf</b>	Displays the set of defined VRFs and associated interfaces.
<b>show running-config interface</b>	Displays the configuration for a specific interface.

# show tech-support mpls

To generate a report of all Multiprotocol Label Switching (MPLS)-related information, use the **show tech-support mpls** command in privileged EXEC mode.

```
show tech-support mpls [vrf vrf-name]
```

## Syntax Description

<b>vrf vrf-name</b>	(Optional) Displays MPLS information about the specified VPN routing and forwarding (VRF) instance.
---------------------	---

## Command Modes

Privileged EXEC

## Command History

Release	Modification
12.2(25)S	This command was introduced.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB and implemented on the Cisco 10000 series routers.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

## Usage Guidelines

This command is useful when you contact technical support personnel with questions regarding MPLS. The **show tech-support mpls** command generates a series of reports. The **show tech-support mpls** command is equivalent to issuing the following commands:

### MPLS Forwarding Information Commands

```
show adjacency detail
show cef drop show cef events
show cef not-cef-switched
show cef state
show interface accounting | exclude sab
show interfaces statistic | exclude sabl
show ip cef adjacency discard
show ip cef adjacency drop
show ip cef adjacency glean
show ip cef adjacency null
show ip cef adjacency punt
show ip cef detail internal
show ip cef inconsistency
show ip cef summary
show ip cef unresolved internal
show ip interfaces
show ip route
show ip traffic
show mpls forwarding-table detail
show mpls interfaces all
```

show mpls interfaces all internal  
 show mpls label range  
 show mpls static binding

**MPLS Forwarding: Cell Mode (LC-ATM) Commands**

---

**Note** These commands are not supported on Cisco 10000 series routers.

---

show atm vc  
 show controller vsi descriptor  
 show controller vsi session  
 show controller vsi status  
 show XTagATM cross-connect  
 show XTagATM cross-connect traffic  
 show XTagATM vc

**MPLS Forwarding: Quality of Service (QoS) Commands**

---

**Note** These commands are not supported on Cisco 10000 series routers.

---

show interfaces fair-queue  
 show interfaces mpls-exp  
 show interfaces precedence

**MPLS Label Distribution Protocol (LDP) Commands**

show mpls atm-ldp bindings  
 show mpls atm-ldp bindwait  
 show mpls atm-ldp capability  
 show mpls atm-ldp summary <===== Not supported on Cisco 10000 series routers  
 show mpls ip binding detail  
 show mpls ldp backoff  
 show mpls ldp discovery all detail  
 show mpls ldp neighbor all  
 show mpls ldp neighbor detail  
 show mpls ldp parameters

**MPLS LDP: Stateful Switchover/Nonstop Forwarding (SSO/NSF) Support and Graceful Restart Commands**

show mpls checkpoint label-binding  
 show mpls ldp checkpoint  
 show mpls ldp graceful-restart  
 show mpls ldp neighbor graceful-restart

**MPLS Traffic Engineering Commands**

show ip ospf database opaque-area  
 show ip ospf database opaque-link  
 show ip ospf mpls traffic-eng fragment  
 show ip ospf mpls traffic-eng link  
 show ip rsvp fast-reroute detail  
 show ip rsvp installed  
 show ip rsvp interface

**show ip rsvp neighbor**  
**show ip rsvp reservation**  
**show ip rsvp sender**  
**show isis mpls traffic-eng adjacency-log**  
**show isis mpls traffic-eng advertisements**  
**show isis mpls traffic-eng tunnel**  
**show mpls traffic-eng link-management interfaces**  
**show mpls traffic-eng autoroute**  
**show mpls traffic-eng fast-reroute database detail**  
**show mpls traffic-eng fast-reroute log reroutes**  
**show mpls traffic-eng forwarding adjacency**  
**show mpls traffic-eng link-management admission-control**  
**show mpls traffic-eng link-management advertisements**  
**show mpls traffic-eng link-management bandwidth-allocation**  
**show mpls traffic-eng link-management summary**  
**show mpls traffic-eng topology**  
**show mpls traffic-eng tunnels**  
**show mpls traffic-eng tunnels brief**  
**show mpls traffic-eng tunnels statics summary**

#### **MPLS VPN Commands**

**show ip bgp labels**  
**show ip bgp neighbors**  
**show ip bgp vpnv4 all**  
**show ip bgp vpnv4 all labels**  
**show ip bgp vpnv4 all summary**  
**show ip vrf detail**  
**show ip vrf interfaces**  
**show ip vrf select**

#### **Any Transport over MPLS (AToM) Commands**

**show mpls l2transport binding**  
**show mpls l2transport hw-capability**  
**show mpls l2transport summary**  
**show mpls l2transport vc detail**

#### **MPLS VPN VRF-Specific Commands**

**show ip bgp vpnv4 *vpn-name* dampening flap-statistics**  
**show ip bgp vpnv4 *vpn-name* labels**  
**show ip bgp vpnv4 *vpn-name* peer-group**  
**show ip bgp vpnv4 *vpn-name* summary**  
**show ip bgp vpnv4 vrf *vpn-name* neighbors**  
**show ip vrf detail *vpn-name***  
**show ip vrf interfaces *vpn-name***  
**show ip vrf select *vpn-name***

#### **MPLS VPN VRF-Specific Forwarding Commands**

**show ip cef vrf *vpn-name* adjacency discard**  
**show ip cef vrf *vpn-name* adjacency drop**  
**show ip cef vrf *vpn-name* adjacency glean**  
**show ip cef vrf *vpn-name* adjacency null**  
**show ip cef vrf *vpn-name* adjacency punt**

```

show ip cef vrf vpn-name inconsistency
show ip cef vrf vpn-name internal
show ip cef vrf vpn-name summary
show ip route vrf vpn-name
show ip vrf interfaces vpn-name
show mpls forwarding-table vrf vpn-name
show mpls interface vrfvpn-name detail

```

#### MPLS LDP VRF-Specific Commands

```

show mpls ip binding vrf vpn-name atm detail
show mpls ip binding vrf vpn-name detail
show mpls ip binding vrf vpn-name local
show mpls ip binding vrf vpn-name summary
show mpls ldp discovery vrf vpn-name detail
show mpls ldp neighbor vrf vpn-name detail

```

#### MPLS LDP VRF Graceful Restart-Specific Commands

```

show mpls ldp neighbor vrf vpn-name graceful-restart

```

These commands are documented in individual feature modules or Cisco IOS Release 12.2 command references. Refer to the individual commands for information about the output these commands generate.

### Examples

The following example displays an abbreviated version of the **show tech-support mpls** command output:

```

Router# show tech-support mpls

----- show version -----

Cisco IOS Software, 7300 Software (C7300-P-M), Version 12.2(27)SBC, RELEASE SOF)
Technical Support: http://www.cisco.com/techsupport
Copyright (c) 1986-2005 by Cisco Systems, Inc.
Compiled Sat 10-Sep-05 17:44 by ssearch
.
.
.
----- show running-config -----

Building configuration...

```

Current configuration : 1827 bytes

.  
.  
.

----- show mpls ldp graceful-restart -----

LDP Graceful Restart is disabled  
 Neighbor Liveness Timer: 120 seconds  
 Max Recovery Time: 120 seconds  
 Forwarding State Holding Time: 600 seconds

#### Related Commands

Command	Description
<b>show tech-support</b>	Displays the equivalent of the <b>show buffers</b> , <b>show controllers</b> , <b>show interfaces</b> , <b>show process</b> , <b>show process memory</b> , <b>show running-config</b> , <b>show stacks</b> , and <b>show version</b> commands.

# show vfi

To display information related to a virtual forwarding instance (VFI), use the **show vfi** command in privileged EXEC mode.

```
show vfi [checkpoint [summary] | mac static address | memory [detail] | name vfi-name
         [checkpoint | mac static address] | neighbor ip-addr vcid vcid mac static address]
```

## Syntax Description

<b>checkpoint</b>	(Optional) Displays VFI checkpoint information.
<b>summary</b>	(Optional) Displays a summary of VFI checkpoint information.
<b>mac static address</b>	(Optional) Displays static MAC addresses in a bridge domain.
<b>memory</b>	(Optional) Displays VFI memory usage.
<b>detail</b>	(Optional) Displays details of VFI memory usage.
<b>name</b>	(Optional) Displays information for the specified VFI.
<i>vfi-name</i>	(Optional) Name of a specific VFI.
<b>neighbor</b>	(Optional) Displays VFI neighbor information.
<i>ip-addr</i>	(Optional) IP address of the neighbor (remote peer).
<b>vcid</b>	(Optional) Displays the virtual circuit (VC) ID for a peer.
<i>vcid</i>	(Optional) Integer from 1 to 4294967295 that identifies the VC.

## Command Modes

Privileged EXEC (#)

## Command History

Release	Modification
12.2(33)SRA	This command was introduced.
12.2(33)SRC	This command was modified. The <b>name</b> keyword was added.
12.2(33)SRE	This command was modified. The following keywords and arguments were added: <b>address</b> , <b>checkpoint</b> , <b>detail</b> , <b>mac</b> , <b>memory</b> , <b>neighbor ip-addr</b> , <b>static</b> , <b>summary</b> , and <b>vcid vcid</b> .
12.2(50)SY	This command was integrated into Cisco IOS Release 12.2(50)SY.

## Usage Guidelines

Use this command to verify VFI configurations and for troubleshooting.

## Examples

The following example shows status for a VFI named VPLS-2. The VC ID in the output represents the VPN ID; the VC is identified by the combination of the destination address and the VC ID.

```
Router# show vfi name VPLS-2

VFI name: VPLS-2, state: up
VPN ID: 100
Local attachment circuits:
  Vlan2
Neighbors connected via pseudowires:
Peer Address      VC ID      Split-horizon
```

10.1.1.1	2	Y
10.1.1.2	2	Y
10.2.2.3	2	N

Table 156 describes the significant fields shown in the display.

**Table 156** *show vfi name Field Descriptions*

Field	Description
VFI name	The name assigned to the VFI.
state	Status of the VFI (up or down).
Local attachment circuits	Interface or VLAN assigned to the VFI.
Peer Address	The IP address of the peer router.
VC ID	The VC ID assigned to the pseudowire.
Split-horizon	Indicates whether split horizon is enabled (Y) or disabled (N).

The following is sample output from the **show vfi** command. For the Virtual Private LAN Service (VPLS) autodiscovery feature, the command output includes autodiscovery information, as shown in the following example.

**Note**

VPLS autodiscovery is not supported in Cisco IOS Release 12.2(50)SY.

```
Router# show vfi
```

```
Legend: RT= Route-target, S=Split-horizon, Y=Yes, N=No
```

```
VFI name: VPLS1, state: up, type: multipoint
```

```
VPN ID: 10, VPLS-ID: 9:10
```

```
RD: 9:10, RT: 10.10.10.10:150
```

```
Local attachment circuits:
```

```
 Ethernet0/0.2
```

```
Neighbors connected via pseudowires:
```

Peer Address	VC ID	Discovered Router ID	S
10.7.7.1	10	10.7.7.1	Y
10.7.7.2	10	10.1.1.2	Y
10.7.7.3	10	10.1.1.3	Y
10.7.7.4	10	10.1.1.4	Y
10.7.7.5	10	-	Y

```
VFI name: VPLS2 state: up, type: multipoint
```

```
VPN ID: 11, VPLS-ID: 10.9.9.9:2345
```

```
RD: 10:11, RT: 10.4.4.4:151
```

```
Local attachment circuits:
```

```
 Ethernet0/0.3
```

```
Neighbors connected via pseudowires:
```

Peer Address	VC ID	Discovered Router ID	S
10.7.7.1	11	10.7.7.1	Y
10.7.7.2	11	10.1.1.5	Y

Table 157 describes the significant fields in the output related to VPLS autodiscovery.

**Table 157** *show vfi Field Descriptions for VPLS Autodiscovery*

Field	Description
VPLS-ID	The identifier of the VPLS domain. VPLS autodiscovery automatically generates a VPLS ID using the Border Gateway Protocol (BGP) autonomous system number and the configured VFI VPN ID.
RD	The route distinguisher (RD) to distribute endpoint information. VPLS autodiscovery automatically generates an RD using the BGP autonomous system number and the configured VFI VPN ID.
RT	The route target (RT). VPLS autodiscovery automatically generates a route target using the lower 6 bytes of the RD and VPLS ID.
Discovered Router ID	A unique identifier assigned to the PE router. VPLS autodiscovery automatically generates the router ID using the Multiprotocol Label Switching (MPLS) global router ID.

The following is sample output from the **show vfi** command for a specified VFI named H-VPLS-A-VFI. Because the optional **name** keyword is entered, the checkpoint information for the specific VFI is displayed.

```
Router# show vfi name H-VPLS-A-VFI checkpoint

VFI Active RP
Checkpointing: Allowed
ISSU Client id: 2092, Session id: 65543, Compatible with peer

                VFI      VFI AC      VFI PW
Bulk-sync          1          1          3
Checkpoint failures: 0          3          21
Recovered at switchover: 0          0          0
Recovery failures:  0          0          0

Legend: C=Checkpointed

VFI name: H-VPLS-A-VFI, state: up, type: multipoint
VPN ID: 12, Internal ID 1 C
Local attachment circuits:
  Vlan200 16387 / 8195 C
Neighbors connected via pseudowires:
Peer ID      VC ID      SSM IDs
10.0.0.12   12         4096 / 12292   C
10.0.0.15   12         8193 / 16389   C
10.0.0.14   12         12290 / 20486  C
```

Table 158 describes the significant fields shown in the display.

**Table 158** *show vfi name checkpoint Field Descriptions*

Field	Description
Checkpointing	Specifies whether checkpointing is allowed on this VFI.
ISSU Client id	The ID number assigned to the In-service Software Upgrade (ISSU) client.
Session id	The current VFI session ID number.

**Table 158** *show vfi name checkpoint Field Descriptions*

Field	Description
VFI	Status of the VFI.
VFI AC	Status of the Attachment Circuit (AC).
VFI PW	Status of the pseudowire for this VFI.
Checkpoint failures	The number of checkpoint failures on this interface.
Recovered at switchover	The number of checkpoint failures recovered on this interface at switchover.
Recovery failures	The number of checkpoint failures recovered on this interface.
VFI name	The name assigned to the VFI.
state	Status of the VFI (up or down).
type	VFI type.
VPN ID	The ID number of the VPN.
Local attachment circuits	The interface or VLAN assigned to the VFI.
Peer ID	The IP address of the peer router.
VC ID	The VC ID assigned to the pseudowire.

The following is sample output from the **show vfi** command using the **memory** and **detail** keywords.

```
Router# show vfi memory detail
```

```

VFI memory                In-use Asked-For/Allocated Count  Size  Cfg/Max
-----
VFI structs                In-use Asked-For/Allocated Count  Size  Cfg/Max
-----
vfi_context_t              :      --      --/--          --   52   --/--
vfi_circuit_retry          :      --      --/--          --   24   --/--

Total allocated: 0.000 Mb, 0 Kb, 0 bytes

```

Table 159 describes the significant fields shown in the display.

**Table 159** *show vfi memory detail Field Descriptions*

<b>Field</b>	<b>Description</b>
VFI memory	The amount of memory available for use.
In-use	The amount of memory actively used.
Asked-For/Allocated	The amount of memory originally requested/amount of memory allocated.
Count	The number of pieces of this named memory that exist.
Size	The memory size allocated by the system for this chunk.
Config/Max	The number of chunklets per chunk.
VFI structs	The data structures being used.
Total allocated	Total allocated memory.

#### **Related Commands**

<b>Command</b>	<b>Description</b>
<b>show checkpoint</b>	Displays information about the Checkpoint Facility (CF) subsystem on a Cisco CMTS.
<b>show xconnect</b>	Displays information about xconnect attachment circuits and pseudowires.

# show vrf

To display the defined Virtual Private Network (VPN) routing and forwarding (VRF) instances, use the **show vrf** command in user EXEC or privileged EXEC mode.

```
show vrf [ipv4 | ipv6] [interface | brief | detail | id | select | lock] [vrf-name]
```

Syntax Description	
<b>ipv4</b>	(Optional) Displays IPv4 address-family type VRF instances.
<b>ipv6</b>	(Optional) Displays IPv6 address-family type VRF instances.
<b>interface</b>	(Optional) Displays the interface associated with the specified VRF instances.
<b>brief</b>	(Optional) Displays brief information about the specified VRF instances.
<b>detail</b>	(Optional) Displays detailed information about the specified VRF instances.
<b>id</b>	(Optional) Displays VPN-ID information for the specified VRF instances.
<b>select</b>	(Optional) Displays selection information for the specified VRF instances.
<b>lock</b>	(Optional) Displays VPN lock information for the specified VRF instances.
<i>vrf-name</i>	(Optional) Name assigned to a VRF.

**Command Default** If you do not specify any arguments or keywords, the command displays concise information about all configured VRFs.

**Command Modes** User EXEC (>)  
Privileged EXEC (#)

Command History	Release	Modification
	12.2(33)SRB	This command was introduced.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
	12.4(20)T	This command was integrated into Cisco IOS Release 12.4(20)T.
	Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.
	12.2(33)SRE	This command was modified. When backup paths have been created either through the Prefix Independent Convergence or Best External feature, the output of the <b>show vrf detail</b> command displays the following line:  <b>Prefix protection with additional path enabled</b>

**Usage Guidelines** Use the **show vrf** command to display information about specified VRF instances or all VRF instances. Specify no arguments or keywords to display information on all VRF instances.

**Examples**

The following is the sample output from the **show vrf** command that displays brief information about all configured VRF instances:

```
Router# show vrf

Name                Default RD          Protocols           Interfaces
-----
N1                  100:0              ipv4, ipv6          Lo1
V1                  1:1                ipv4                Et0/1.1
V2                  2:2                ipv4, ipv6          Et0/1.2
                   Et0/1.3
V3                  3:3                ipv4                Lo3
                   Et0/1.4
```

[Table 160](#) describes the significant fields shown in the display.

**Table 160** show vrf Field Descriptions

Field	Description
Name	Name of the VRF instance.
Default RD	The default route distinguisher (RD) for the specified VRF instances.
Protocols	The address-family protocol type for the specified VRF instance.
Interfaces	The network interface associated with the VRF instance.

The following example displays output from the **show vrf** command with the **detail** keyword. The information shown is for a VRF named cisco1.

```
Router# show vrf detail

VRF cisco1; default RD 100:1; default VPNID <not set>
  Interfaces:
    Ethernet0/0          Loopback10
  Address family ipv4 (Table ID = 0x1):
    Connected addresses are not in global routing table
    Export VPN route-target communities
      RT:100:1
    Import VPN route-target communities
      RT:100:1
    No import route-map
    No export route-map
    VRF label distribution protocol: not configured
  Address family ipv6 (Table ID = 0xE000001):
    Connected addresses are not in global routing table
    Export VPN route-target communities
      RT:100:1
    Import VPN route-target communities
      RT:100:1
    No import route-map
    No export route-map
    VRF label distribution protocol: not configured
```

[Table 161](#) describes the significant fields shown in the display.

**Table 161** *show vrf detail Field Descriptions*

Field	Description
default RD 100:1	The RD given to this VRF.
Interfaces:	Interfaces to which the VRF is attached.
Export VPN route-target communities RT:100:1	Route-target VPN extended communities to be exported.
Import VPN route-target communities RT:100:1	Route-target VPN extended communities to be imported.

The following example displays output from the **show vrf detail** command when backup paths have been created either through the Prefix Independent Convergence or Best External feature. The output of the **show vrf detail** command displays the following line:

```

Prefix protection with additional path enabled
Router# show vrf detail

VRF vpn1 (VRF Id = 1); default RD 1:1; default VPNID <not set>
  Interfaces:
    Et1/1
Address family ipv4 (Table ID = 1 (0x1)):
  Export VPN route-target communities
    RT:1:1
  Import VPN route-target communities
    RT:1:1
  No import route-map
  No export route-map
  VRF label distribution protocol: not configured
  VRF label allocation mode: per-prefix
Prefix protection with additional path enabled
Address family ipv6 not active.

```

The following is the sample output from the **show vrf lock** command that displays VPN lock information:

```

Router# show vrf lock

VRF Name: Mgmt-intf; VRF id = 4085 (0xFF5)
VRF lock count: 3
  Lock user: RTMGR, lock user ID: 2, lock count per user: 1

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>vrf definition</b>	Configures a VRF routing table instance and enters VRF configuration mode.
<b>vrf forwarding</b>	Associates a VRF instance with an interface or subinterface.

# show xconnect

To display information about xconnect attachment circuits and pseudowires, use the **show xconnect** command in user EXEC or privileged EXEC mode.

```
show xconnect {{all | interface type number} [detail] | peer ip-address {all | vcid vcid-value}
[detail] | pwmib [peer ip-address vcid-value]}
```

## Cisco IOS SR and S Trains

```
show xconnect {{all | interface type number | memory | rib} [detail] [checkpoint] | peer
ip-address {all | vcid vcid-value} [detail] | pwmib [peer ip-address vcid-value]}
```

## Cisco uBR10012 Router and Cisco uBR7200 Series Universal Broadband Routers

```
show xconnect {all | peer ip-address {all | vcid vcid-value} | pwmib [peer ip-address vcid-value]}
[detail]
```

Syntax	Description
<b>all</b>	Displays information about all xconnect attachment circuits and pseudowires.
<b>interface</b>	Displays information about xconnect attachment circuits and pseudowires on the specified interface.
<i>type</i>	Interface type. For more information, use the question mark (?) online help function. Valid values for the <i>type</i> argument are as follows: <ul style="list-style-type: none"> <li>• <b>atm number</b>—Displays xconnect information for a specific ATM interface or subinterface.</li> <li>• <b>atm number vp vpi-value</b>—Displays virtual path (VP) xconnect information for a specific ATM virtual path identifier (VPI). This command will not display information about virtual circuit (VC) xconnects using the specified VPI.</li> <li>• <b>atm number vc vpi-value/vci-value</b>—Displays VC xconnect information for a specific ATM VPI and virtual circuit identifier (VCI) combination.</li> <li>• <b>ethernet number</b>—Displays port-mode xconnect information for a specific Ethernet interface or subinterface.</li> <li>• <b>fastethernet number</b>—Displays port-mode xconnect information for a specific Fast Ethernet interface or subinterface.</li> <li>• <b>serial number</b>—Displays xconnect information for a specific serial interface.</li> <li>• <b>serial number dlci-number</b>—Displays xconnect information for a specific Frame Relay data-link connection identifier (DLCI).</li> </ul>
<i>number</i>	Interface or subinterface number. For more information about the numbering syntax for your networking device, use the question mark (?) online help function.
<b>detail</b>	(Optional) Displays detailed information about the specified xconnect attachment circuits and pseudowires.

<b>checkpoint</b>	(Optional) Displays the autodiscovered pseudowire information that is checkpointed to the standby route processor (RP).
<b>peer</b>	Displays information about xconnect attachment circuits and pseudowires associated with the specified peer.
<i>ip-address</i>	IP address of the peer.
<b>all</b>	Displays all xconnect information associated with the specified peer IP address.
<b>vcid</b>	Displays xconnect information associated with the specified peer IP address and the specified VC ID.
<i>vcid-value</i>	VC ID value.
<b>pwmib</b>	Displays information about the pseudowire Management Information Base (MIB).
<b>memory</b>	Displays information about the xconnect memory usage.
<b>rib</b>	Displays information about the pseudowire routing information base (RIB).

**Command Modes**

User EXEC (>)  
Privileged EXEC (#)

**Command History**

<b>Release</b>	<b>Modification</b>
12.0(31)S	This command was introduced.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.4(11)T	This command was integrated into Cisco IOS Release 12.4(11)T.
12.2(33)SRB	This command was modified. The <b>rib</b> keyword was added.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.
Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.
12.4(24)T	This command was modified in a release earlier than Cisco IOS Release 12.4(24)T. The <b>pwmib</b> keyword was added.
12.2(33)SRC	This command was modified in a release earlier than Cisco IOS Release 12.2(33)SRC. The <b>memory</b> keyword was added.
12.2(33)SCC	This command was integrated into Cisco IOS Release 12.2(33)SCC.
15.1(1)S	This command was integrated into Cisco IOS Release 15.1(1)S. The output of the <b>show xconnect rib</b> command and the <b>show xconnect rib detail</b> command was modified to support dynamic pseudowire switching on Autonomous System Boundary Routers (ASRBs). The <b>checkpoint</b> keyword was added.
12.2(33)SCF	This command was modified. The output was changed to capture the backup pseudowire information.

**Usage Guidelines**

The **show xconnect** command can be used to display, sort, and filter basic information about all xconnect attachment circuits and pseudowires.

You can use the **show xconnect** command output to help determine the appropriate steps required to troubleshoot an xconnect configuration problem. More specific information about a particular type of xconnect can be displayed using the commands listed in the “Related Commands” table.

## Examples

The following example shows the **show xconnect all** command output in the brief (default) display format:

Table 162 describes the significant fields shown in the display.

**Table 162 show xconnect all Field Descriptions**

Field	Description
XC ST	<p>State of the xconnect attachment circuit or pseudowire. Valid states are:</p> <ul style="list-style-type: none"> <li>• DN—The xconnect attachment circuit or pseudowire is down. Either segment 1, segment 2, or both segments are down.</li> <li>• IA—The xconnect attachment circuit or pseudowire is inactive. This state is valid only when pseudowire redundancy is configured.</li> <li>• NH—One or both segments of this xconnect no longer have the required hardware resources available to the system.</li> <li>• UP—The xconnect attachment circuit or pseudowire is up. Both segment 1 and segment 2 must be up for the xconnect to be up.</li> </ul>
Segment1 or Segment2	<p>Information about the type of xconnect, the interface type, and the IP address the segment is using. Types of xconnects are as follows:</p> <ul style="list-style-type: none"> <li>• ac—Attachment circuit</li> <li>• l2tp—Layer 2 Tunnel Protocol</li> <li>• mpls—Multiprotocol Label Switching</li> <li>• pri ac—Primary attachment circuit</li> <li>• sec ac—Secondary attachment circuit</li> </ul>
S1 or S2	<p>State of the segment. Valid states are:</p> <ul style="list-style-type: none"> <li>• AD—The segment is administratively down.</li> <li>• DN—The segment is down.</li> <li>• HS—The segment is in hot standby mode.</li> <li>• RV—The segment is recovering from a graceful restart.</li> <li>• SB—The segment is in a standby state.</li> <li>• UP—The segment is up.</li> </ul>

The additional fields displayed in the detailed output are self-explanatory.

**VPLS Autodiscovery Feature Example**

For the VPLS Autodiscovery feature, issuing the **show xconnect** command with the **rib** keyword provides RIB details, as shown in the following example:

```

Router# show xconnect rib

Local Router ID: 10.9.9.9

Legend: O=Origin, P=Provisioned, TID=Target ID, B=BGP, Y=Yes, N=No
O P VPLS/VPWS-ID TID Next-Hop Route-Target

```

```

-----+-----+-----+-----
B Y 10:123          192.0.2.0  192.0.2.5  10:123
B N 10:123          192.0.2.1  192.0.2.6  10:123
B Y 10.100.100.100:1234  192.0.2.3  192.0.2.7  10.111.111.111:12345
                                     192.0.2.8  10.8.8.8:345
                                     192.0.2.9
B Y 192.0.3.1:1234  192.0.2.4  10.1.1.1   10.111.111.111:12345

```

Table 163 describes the significant fields shown in the display.

**Table 163** *show xconnect rib Field Descriptions*

Field	Description
Local Router ID	A unique router identifier. VPLS Autodiscovery automatically generates a router ID using the MPLS global router ID.
O	The origin of the route.
P	Whether the pseudowire has been provisioned using a learned route.
VPLS/WPWS-ID	The Virtual Private LAN Service (VPLS) domain. VPLS Autodiscovery automatically generates a VPLS ID using the Border Gateway Protocol (BGP) autonomous system number and the configured VFI VPN ID.
TID	The target ID. The IP address of the destination router.
Next-Hop	The IP address of the next hop router.
Route-Target	The route target (RT). VPLS Autodiscovery automatically generates a route target using the lower 6 bytes of the route distinguisher (RD) and VPN ID.

For VPLS Autodiscovery, issuing the **show xconnect** command with the **rib** and **detail** keywords provides more information about the routing information base, as shown in the following example:

```

Router# show xconnect rib detail

Local Router ID: 10.9.9.9

VPLS-ID 10:123, TID 10.7.7.7
  Next-Hop: 10.7.7.7
  Hello-Source: 10.9.9.9
  Route-Target: 10:123
  Incoming RD: 10:10
  Forwarder: vfi VPLS1
  Origin: BGP
  Provisioned: Yes
VPLS-ID 10:123, TID 10.7.7.8
  Next-Hop: 10.7.7.8
  Hello-Source: 10.9.9.9
  Route-Target: 10:123
  Incoming RD: 10:11
  Forwarder: vfi VPLS1
  Origin: BGP
  Provisioned: No
VPLS-ID 10.100.100.100:1234, TID 0.0.0.2
  Next-Hop: 10.2.2.2, 10.3.3.3, 10.4.4.4
  Hello-Source: 10.9.9.9
  Route-Target: 10.111.111.111:12345, 10.8.8.8:345

```

```

Incoming RD: 10:12
Forwarder: vfi VPLS2
Origin: BGP
Provisioned: Yes
VPLS-ID 10.100.100.100:1234, TID 10.13.1.1
Next-Hop: 10.1.1.1
Hello-Source: 10.9.9.9
Route-Target: 10.111.111.111:12345
Incoming RD: 10:13
Forwarder: vfi VPLS2
Origin: BGP
Provisioned: Yes
    
```

Table 164 describes the significant fields shown in the display.

**Table 164** show xconnect rib detail Field Descriptions

Field	Description
Hello-Source	The source IP address used when Label Distribution Protocol (LDP) hello messages are sent to the LDP peer for the autodiscovered pseudowire.
Incoming RD	The route distinguisher for the autodiscovered pseudowire.
Forwarder	The VFI to which the autodiscovered pseudowire is attached.

**L2VPN VPLS Inter-AS Option B Examples**

The following is sample output from the **show xconnect rib** command when used in an L2VPN VPLS Inter-AS Option B configuration:

```

Router# show xconnect rib

Local Router ID: 10.9.9.9

+- Origin of entry (i=iBGP/e=eBGP)
| +- Provisioned (Yes/No)?
| | +- Stale entry (Yes/No)?
| | |
v v v
O P S      VPLS-ID      Target ID      Next-Hop      Route-Target
-+-+-----+-----+-----+-----+-----+
i Y N      1:1          10.11.11.11   10.11.11.11   1:1
i Y N      1:1          10.12.12.12   10.12.12.12   1:1
    
```

Table 165 describes the significant fields shown in the display.

**Table 165** show xconnect rib Field Descriptions

Field	Description
Local Router ID	A unique router identifier. VPLS Autodiscovery automatically generates a router ID using the MPLS global router ID.
Origin of entry	The origin of the entry. The origin can be “i” for internal BGP or “e” for external BGP.
Provisioned	Whether the pseudowire has been provisioned using a learned route; Yes or No.
Stale entry	Stale entry; Yes or No.

**Table 165** *show xconnect rib Field Descriptions (continued)*

Field	Description
VPLS-ID	The Virtual Private LAN Service (VPLS) domain. VPLS Autodiscovery automatically generates a VPLS ID using the Border Gateway Protocol (BGP) autonomous system number and the configured VFI VPN ID.
Target ID	The target ID. The IP address of the destination router.
Next-Hop	The IP address of the next hop router.
Route-Target	The route target (RT). VPLS Autodiscovery automatically generates a route target using the lower 6 bytes of the route distinguisher (RD) and VPN ID.

The following is sample output from the **show xconnect rib detail** command when used in an ASBR configuration. On an ASBR, the **show xconnect rib detail** command displays the Layer 2 VPN BGP network layer reachability information (NLRI) received from the BGP peers. The display also shows the signaling messages received from the targeted Label Distribution Protocol (LDP) sessions for a given target attachment individual identifier (TAII).

```
Router# show xconnect rib detail

Local Router ID: 10.1.1.3

VPLS-ID: 1:1, Target ID: 10.1.1.1
  Next-Hop: 10.1.1.1
  Hello-Source: 10.1.1.3
  Route-Target: 2:2
  Incoming RD: 10.0.0.0:1
  Forwarder:
  Origin: BGP
  Provisioned: Yes
  SAI1: 10.0.0.1, LDP Peer Id: 10.255.255.255, VC Id: 1001 ***
  SAI2: 10.1.0.1, LDP Peer Id: 10.255.255.255, VC Id: 1002 ***
```

After the passive TPE router receives the BGP information (and before the passive TPE router receives the LDP label), the peer information will be displayed in the output of the **show xconnect rib** command. The peer information will not be displayed in the **show mpls l2transport vc** command because the VFI ATOM xconnect has not yet been provisioned.

Therefore, for passive TPEs, the entry “Passive : Yes” is added to the output from the **show xconnect rib detail** command. In addition, the entry “Provisioned: Yes” is displayed after the neighbor xconnect is successfully created (without any retry attempts).

In the sample output, the two lines beginning with “SAI” show that this ASBR is stitching two provider PE routers (10.0.0.1 and 10.1.0.1) to the TAIL 10.1.1.1.

[Table 166](#) describes the significant fields shown in the display.

**Table 166** *show xconnect rib detail (for the ASBR) Field Descriptions*

Field	Description
VPLS-ID	The VPLS identifier.
Target ID	The target ID. The IP address of the destination router.
Next-Hop	The IP address of the next hop router.

**Table 166** *show xconnect rib detail (for the ASBR) Field Descriptions (continued)*

Field	Description
Hello-Source	The source IP address used when LDP hello messages are sent to the LDP peer for the autodiscovered pseudowire.
Route-Target	The route target (RT). VPLS Autodiscovery automatically generates a route target using the lower 6 bytes of the route distinguisher (RD) and VPN ID.
Incoming RD	The route distinguisher for the autodiscovered pseudowire.
Forwarder	The VFI to which the autodiscovered pseudowire is attached.
Origin	The origin of the entry.
Provisioned	Indicates whether the neighbor xconnect was successfully created (without any retry attempts).
SAII	Source attachment individual identifier.

The following is sample output from the **show xconnect rib checkpoint** command. Autodiscovered pseudowire information is checkpointed to the standby Route Processor (RP). The **show xconnect rib checkpoint** command displays that pseudowire information.

```
Router# show xconnect rib checkpoint

Xconnect RIB Active RP:
  Checkpointing      : Allowed
  Checkpointing epoch: 1
  ISSU Client id: 2102, Session id: 82, Compatible with peer

Add entries send ok      :      0
Add entries send fail    :      0
Delete entries send ok   :      0
Delete entries send fail:      0

+- Checkpointed to standby (Y/N)?
| +- Origin of entry (i=iBGP/e=eBGP)
| |
| v v
C O      VPLS-ID      Target ID      Next-Hop      Route-Target
-+-+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
N e 1:1      10.1.1.2      10.1.1.2      2:2
N e 1:1      10.1.1.1      10.1.1.3      2:2
```

Table 167 describes the significant fields shown in the display.

**Table 167** *show xconnect rib checkpoint Field Descriptions*

Field	Description
Checkpointing	Indicates whether checkpointing is allowed.
Checkpointing epoch	Checkpointing epoch number.
Checkpointed to standby	Indicates whether the autodiscovered pseudowire information is checkpointed to standby RP.
Origin of entry	The origin of the entry; “i” for internal BGP or “e” for external BGP.

**Table 167** *show xconnect rib checkpoint Field Descriptions (continued)*

Field	Description
VPLS-ID	The VPLS identifier.
Target ID	The target ID. The IP address of the destination router
Next-Hop	The IP address of the next hop router.
Route-Target	The route target (RT). VPLS Autodiscovery automatically generates a route target using the lower 6 bytes of the RD and VPN ID.

**Related Commands**

Command	Description
<b>show atm pvc</b>	Displays all ATM PVCs and traffic information.
<b>show atm vc</b>	Displays all ATM PVCs and SVCs and traffic information.
<b>show atm vp</b>	Displays the statistics for all VPs on an interface or for a specific VP.
<b>show connect</b>	Displays configuration information about drop-and-insert connections that have been configured on a router.
<b>show frame-relay pvc</b>	Displays statistics about PVCs for Frame Relay interfaces.
<b>show interfaces</b>	Displays statistics for all interfaces configured on the router or access server.
<b>show l2tun session</b>	Displays the current state of Layer 2 sessions and protocol information about L2TP control channels.
<b>show mpls l2transport binding</b>	Displays VC label binding information.
<b>show mpls l2transport vc</b>	Displays information about AToM VCs that have been enabled to route Layer 2 packets on a router.

# show xtagatm cos-bandwidth-allocation

## Note

Effective with Cisco IOS Release 12.4(20)T, the **show xtagatm cos-bandwidth-allocation** command is not available in Cisco IOS software.

To display information about quality of service (QoS) bandwidth allocation on extended Multiprotocol Label Switching (MPLS) ATM (XTagATM) interfaces, use the **show xtagatm cos-bandwidth-allocation** command in user EXEC or privileged EXEC mode.

```
show xtagatm cos-bandwidth-allocation [xtagatm interface-number]
```

## Syntax Description

<b>xtagatm</b>	(Optional) Specifies the XTagATM interface number.
<i>interface-number</i>	Number of the XTagATM interface. Range: 0 to 2147483647.

## Defaults

Available 50 percent, control 50 percent.

## Command Modes

User EXEC (>)  
Privileged EXEC (#)

## Command History

Release	Modification
12.0(5)T	This command was introduced.
12.4(20)T	This command was removed.

## Usage Guidelines

Use this command to display QoS bandwidth allocation information for the following QoS traffic categories:

- Available
- Standard
- Premium
- Control

## Examples

The following example shows output from this command:

```
Router# show xtagatm cos-bandwidth-allocation xtagatm 123
```

```
CoS           Bandwidth allocation
available     25%
standard     25%
premium      25%
control      25%
```

[Table 168](#) describes the significant fields shown in the display.

**Table 168** *show xtagatm cos-bandwidth-allocation Field Descriptions*

<b>Field</b>	<b>Description</b>
CoS	Class of service for transmitted packets.
Bandwidth Allocation	Percentage bandwidth allocated to each QoS traffic category.

# show xtagatm cross-connect

## Note

Effective with Cisco IOS Release 12.4(20)T, the **show xtagatm cross-connect** command is not available in Cisco IOS software.

To display information about the Label Switch Controller (LSC) view of the cross-connect table on the remotely controlled ATM switch, use the **show xtagatm cross-connect** command in user EXEC or privileged EXEC mode.

```
show xtagatm cross-connect [traffic] [interface interface [vpi vci] | descriptor descriptor
  [vpi vci]]
```

## Syntax Description

<i>traffic</i>	(Optional) Displays receive and transmit cell counts for each connection.
<b>interface</b> <i>interface</i>	(Optional) Displays only connections with an endpoint of the specified interface.
<i>vpi vci</i>	(Optional) Displays only detailed information on the endpoint with the specified virtual path identifier (VPI)/virtual channel identifier (VCI) on the specified interface.
<b>descriptor</b> <i>descriptor</i>	(Optional) Displays only connections with an endpoint on the interface with the specified physical descriptor.

## Command Modes

User EXEC (>)  
Privileged EXEC (#)

## Command History

Release	Modification
12.0(5)T	This command was introduced.
12.4(20)T	This command was removed.

## Examples

Each connection is listed twice in the output from the **show xtagatm cross-connect** command, because it shows each interface that is linked by the connection.

The following is sample output from the **show xtagatm cross-connect** command:

```
Router# show xtagatm cross-connect
```

Phys Desc	VPI/VCI	Type	X-Phys Desc	X-VPI/VCI	State
10.1.0	1/37	->	10.3.0	1/35	UP
10.1.0	1/34	->	10.3.0	1/33	UP
10.1.0	1/33	<->	10.2.0	0/32	UP
10.1.0	1/32	<->	10.3.0	0/32	UP
10.1.0	1/35	<-	10.3.0	1/34	UP
10.2.0	1/57	->	10.3.0	1/49	UP
10.2.0	1/53	->	10.3.0	1/47	UP
10.2.0	1/48	<-	10.1.0	1/50	UP
10.2.0	0/32	<->	10.1.0	1/33	UP
10.3.0	1/34	->	10.1.0	1/35	UP

10.3.0	1/49	<-	10.2.0	1/57	UP
10.3.0	1/47	<-	10.2.0	1/53	UP
10.3.0	1/37	<-	10.1.0	1/38	UP
10.3.0	1/35	<-	10.1.0	1/37	UP
10.3.0	1/33	<-	10.1.0	1/34	UP
10.3.0	0/32	<->	10.1.0	1/32	UP

Table 169 describes the significant fields shown in the display.

**Table 169** *show xtagatm cross-connect Field Descriptions*

Field	Description
Phys desc	Physical descriptor. A switch-supplied string identifying the interface on which the endpoint exists.
VPI/VCI	Virtual path identifier and virtual channel identifier for this endpoint.
Type	The type can be one of the following: A right arrow (->) indicates an ingress endpoint, where traffic is received into the switch. A left arrow (<-) indicates an egress endpoint, where traffic is transmitted from the interface. A bidirectional arrow (<->) indicates that traffic is both transmitted and received at this endpoint.
X-Phys Desc	Physical descriptor for the interface of the other endpoint belonging to the cross-connect.
X-VPI/VCI	Virtual path identifier and virtual channel identifier of the other endpoint belonging to the cross-connect.
State	Indicates the status of the cross-connect to which this endpoint belongs. The state is typically UP; other values, all of which are transient, include the following: <ul style="list-style-type: none"> <li>• DOWN</li> <li>• ABOUT_TO_DOWN</li> <li>• ABOUT_TO_CONNECT</li> <li>• CONNECTING</li> <li>• ABOUT_TO_RECONNECT</li> <li>• RECONNECTING</li> <li>• ABOUT_TO_RESYNC</li> <li>• RESYNCING</li> <li>• NEED_RESYNC_RETRY</li> <li>• ABOUT_TO_RESYNC_RETRY RETRYING_RESYNC</li> <li>• ABOUT_TO_DISCONNECT</li> <li>• DISCONNECTING</li> </ul>

The following is sample output from the **show xtagatm cross-connect** command for a single endpoint:

```
Router# show xtagatm cross-connect descriptor 10.1.0 1 42
```

```

Phys desc: 10.1.0
Interface: n/a
Intf type: switch control port
VPI/VCI: 1/42
X-Phys desc: 10.2.0
X-Interface: XTagATM0
X-Intf type: extended tag ATM
X-VPI/VCI: 2/38
Conn-state: UP
Conn-type: input/output
Cast-type: point-to-point
Rx service type: Tag COS 0
Rx cell rate: n/a
Rx peak cell rate: 10000
Tx service type: Tag COS 0
Tx cell rate: n/a
Tx peak cell rate: 10000
    
```

Table 170 describes the significant fields shown in the display.

**Table 170** *show xtagatm cross-connect descriptor Field Descriptions*

Field	Description
Phys desc	Physical descriptor. A switch-supplied string identifying the interface on which the endpoint exists.
Interface	The (Cisco IOS) interface name.
Intf type	Interface type. Can be either extended Multiprotocol Label Switched (MPLS) ATM (XTagATM) or a switch control port.
VPI/VCI	Virtual path identifier and virtual channel identifier for this endpoint.
X-Phys desc	Physical descriptor for the interface of the other endpoint belonging to the cross-connect.
X-Interface	The (Cisco IOS) name for the interface of the other endpoint belonging to the cross-connect.
X-Intf type	Interface type for the interface of the other endpoint belonging to the cross-connect.
X-VPI/VCI	Virtual path identifier and virtual channel identifier of the other endpoint belonging to the cross-connect.

**Table 170** *show xtagatm cross-connect descriptor Field Descriptions (continued)*

Field	Description
Conn-state	<p>Indicates the status of the cross-connect to which this endpoint belongs. The cross-connect state is typically UP; other values, all of which are transient, include the following:</p> <ul style="list-style-type: none"> <li>• DOWN ABOUT_TO_DOWN ABOUT_TO_CONNECT</li> <li>• CONNECTING</li> <li>• ABOUT_TO_RECONNECT</li> <li>• RECONNECTING</li> <li>• ABOUT_TO_RESYNC</li> <li>• RESYNCING</li> <li>• NEED_RESYNC_RETRY</li> <li>• ABOUT_TO_RESYNC_RETRY</li> <li>• RETRYING_RESYNC</li> <li>• ABOUT_TO_DISCONNECT</li> <li>• DISCONNECTING</li> </ul>
Conn-type	<p>Input—Indicates an ingress endpoint where traffic is only expected to be received into the switch.</p> <p>Output—Indicates an egress endpoint, where traffic is only expected to be sent from the interface.</p> <p>Input/output—Indicates that traffic is expected to be both send and received at this endpoint.</p>
Cast-type	Indicates whether the cross-connect is multicast.
Rx service type	Quality of service type for the receive, or ingress, direction. This is MPLS QoS <n>, (MPLS Quality of Service <n>), where n is in the range from 0 to 7 for input and input/output endpoints; this will be N/A for output endpoints. (In the first release, this is either 0 or 7.)
Rx cell rate	(Guaranteed) cell rate in the receive, or ingress, direction.
Rx peak cell rate	Peak cell rate in the receive, or ingress, direction, in cells per second. This is n/a for an output endpoint.
Tx service type	Quality of service type for the transmit, or egress, direction. This is MPLS QoS <n>, (MPLS Class of Service <n>), where n is in the range from 0 to 7 for output and input/output endpoints; this will be N/A for input endpoints.
Tx cell rate	(Guaranteed) cell rate in the transmit, or egress, direction.
Tx peak cell rate	Peak cell rate in the transmit, or egress, direction, in cells per second. This is N/A for an input endpoint.

# show xtagatm vc

## Note

Effective with Cisco IOS Release 12.4(20)T, the **show xtagatm vc** command is not available in Cisco IOS software.

To display information about terminating virtual circuits (VCs) on extended Multiprotocol Label Switching (MPLS) ATM (XTagATM) interfaces, use the **show xtagatm vc** command in user EXEC or privileged EXEC mode.

```
show xtagatm vc [vcd [interface]]
```

## Syntax Description

<i>vcd</i>	(Optional) Virtual circuit descriptor (virtual circuit number). If you specify the <i>vcd</i> argument, information displays about all VCs with that virtual circuit descriptor (VCD). If you do not specify the <i>vcd</i> argument, a summary description of all VCs on all XTagATM interfaces displays.
<i>interface</i>	(Optional) Interface number. If you specify the <i>interface</i> and the <i>vcd</i> arguments, information displays about the specified VC on the specified interface.

## Command Modes

User EXEC (>)  
Privileged EXEC (#)

## Command History

Release	Modifications
12.0(5)T	This command was introduced.
12.4(20)T	This command was removed.

## Usage Guidelines

The columns marked VCD, VPI, and VCI display information for the corresponding private VC on the control interface. The private VC connects the XTagATM VC to the external switch. It is termed private because its VPI and VCI are only used for communication between the MPLS LSC and the switch, and it is different from the VPI and VCI seen on the XTagATM interface and the corresponding switch port.

## Examples

Each connection is listed twice in the sample output from the **show xtagatm vc** command under each interface that is linked by the connection. Connections are marked as input (unidirectional traffic flow, into the interface), output (unidirectional traffic flow, away from the interface), or in/out (bidirectional).

The following is sample output from the **show xtagatm vc** command:

```
Router# show xtagatm vc
```

```
AAL / Control Interface
Interface      VCD   VPI   VCI  Type  Encapsulation  VCD   VPI   VCI  Status
XTagATM0      1     0     32   PVC   AAL5-SNAP      2     0     33  ACTIVE
XTagATM0      2     1     33   TVC   AAL5-MUX       4     0     37  ACTIVE
XTagATM0      3     1     34   TVC   AAL5-MUX       6     0     39  ACTIVE
```

Table 171 describes the significant fields shown in the display.

**Table 171** *show xtagatm vc Field Descriptions*

Field	Description
VCD	Virtual circuit descriptor (virtual circuit number).
VPI	Virtual path identifier.
VCI	Virtual circuit identifier.
Control Interf. VCD	VCD for the corresponding private VC on the control interface.
Control Interf. VPI	VPI for the corresponding private VC on the control interface.
Control Interf. VCI	VCI for the corresponding private VC on the control interface.
Encapsulation	Displays the type of connection on the interface.
Status	Displays the current state of the specified ATM interface.

#### Related Commands

Command	Description
<b>show atm vc</b>	Displays information about private ATM VCs.
<b>show xtagatm cross-connect</b>	Displays information about remotely connected ATM switches.

## snmp mib mpls vpn

To configure Simple Network Management Protocol (SNMP) controls for Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) notification thresholds, use the **snmp mib mpls vpn** command in global configuration mode. To disable SNMP controls for MPLS VPN thresholds, use the **no** form of this command.

```
snmp mib mpls vpn {illegal-label number | max-threshold seconds}
```

```
no snmp mib mpls vpn {illegal-label | max-threshold}
```

Syntax Description	illegal-label	Controls MPLS VPN illegal label threshold exceeded notifications.
	<i>number</i>	Number of illegal labels allowed before SNMP sends an illegal label threshold notification. The valid range is from 1 to 4,294,967,295. The default is 0.
	max-threshold	Controls MPLS VPN maximum threshold exceeded notifications.
	<i>seconds</i>	Time in seconds before SNMP resends maximum threshold notifications. The valid range is from 0 to 4,294,967,295. The default is 0.

**Command Default** SNMP controls are not configured for MPLS VPN routing and forwarding (VRF) tables.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SRC	This command was introduced.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.

**Usage Guidelines** Use this command to configure the number of illegal labels allowed for routes in the MPLS VRF before SNMP sends an illegal label threshold notification, or to configure the time elapsed before SNMP resends a maximum threshold notification.

Use the **snmp mib mpls vpn illegal-label** command to indicate how many illegal MPLS VPN labels you want to allow before you receive a notification. Once this number is exceeded, SNMP sends an illegal-label notification to a network management system (NMS), if you have one configured; otherwise, the router issues a syslog error message. If you do not configure this command, SNMP sends an illegal label notification on the first occurrence of an illegal label.

Use the **snmp mib mpls vpn max-threshold** command if you want to receive maximum threshold notifications periodically when attempts are made to add routes to the VRF after the maximum threshold is exceeded. If you do not configure this command, SNMP sends a single maximum threshold notification at the time that the maximum threshold is exceeded. Notifications are sent to an NMS if you configured one; otherwise, the router issues a syslog error message. Another notification is not sent until the number of routes goes below the maximum threshold and then exceeds the threshold again.

**Examples**

The following example shows how to configure an illegal label threshold of 50 labels:

```
configure terminal
!
snmp mib mpls vpn illegal-label 50
```

The following example shows how to configure the time interval of 600 seconds for resending maximum threshold notifications:

```
configure terminal
!
snmp mib mpls vpn max-threshold 600
```

**Related Commands**

Command	Description
<b>ip vrf</b>	Specifies a name for a VRF routing table and enters VRF configuration mode (for IPv4 VRF only).
<b>maximum routes</b>	Limits the maximum number of routes in a VRF to prevent a PE router from importing too many routes.
<b>vrf definition</b>	Configures a VRF routing table instance and enters VRF configuration mode.

## snmp-server community

To set up the community access string to permit access to the Simple Network Management Protocol (SNMP), use the **snmp-server community** command in global configuration mode. To remove the specified community string, use the **no** form of this command.

```
snmp-server community string [view view-name] [ro | rw] [ipv6 nacl] [access-list-number | extended-access-list-number | access-list-name]
```

```
no snmp-server community string
```

### Syntax Description

<i>string</i>	Community string that consists of 1 to 32 alphanumeric characters and functions much like a password, permitting access to SNMP. Blank spaces are not permitted in the community string.  <b>Note</b> The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.
<b>view</b>	(Optional) Specifies a previously defined view. The view defines the objects available to the SNMP community.
<i>view-name</i>	(Optional) Name of a previously defined view.
<b>ro</b>	(Optional) Specifies read-only access. Authorized management stations can retrieve only MIB objects.
<b>rw</b>	(Optional) Specifies read-write access. Authorized management stations can both retrieve and modify MIB objects.
<b>ipv6</b>	(Optional) Specifies an IPv6 named access list.
<i>nacl</i>	(Optional) IPv6 named access list.
<i>access-list-number</i>	(Optional) Integer from 1 to 99 that specifies a standard access list of IP addresses or a string (not to exceed 64 characters) that is the name of a standard access list of IP addresses allowed access to the SNMP agent.  Alternatively, an integer from 1300 to 1999 that specifies a list of IP addresses in the expanded range of standard access list numbers that are allowed to use the community string to gain access to the SNMP agent.

### Command Default

An SNMP community string permits read-only access to all objects.

### Command Modes

Global configuration (config)

### Command History

Release	Modification
10.0	This command was introduced.
12.0(14)ST	This command was integrated into Cisco IOS Release 12.0(14)ST.
12.0(17)S	This command was integrated into Cisco IOS Release 12.0(17)S.
12.2(14)S	This command was integrated into Cisco IOS Release 12.2(14)S.

Release	Modification
12.3(2)T	The access list values were enhanced to support the expanded range of standard access list values and to support named standard access lists.
12.0(27)S	The <b>ipv6 nacl</b> keyword and argument pair was added to support assignment of IPv6 named access lists. This keyword and argument pair is not supported in Cisco IOS 12.2S releases.
12.3(14)T	The <b>ipv6 nacl</b> keyword and argument pair was integrated into Cisco IOS Release 12.3(14)T to support assignment of IPv6 named access lists. This keyword and argument pair is not supported in Cisco IOS 12.2S releases.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.4(11)T	This command was integrated into Cisco IOS Release 12.4(11)T.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
Cisco IOS XE Release 2.1	This command was introduced on Cisco ASR 1000 Aggregation Series Routers.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.2(33)SRE	This command was modified. The automatic insertion of the <b>snmp-server community</b> command into the configuration, along with the community string specified in the <b>snmp-server host</b> command, is changed. The <b>snmp-server community</b> command has to be manually configured.
15.1(0)M	This command was modified. The automatic insertion of the <b>snmp-server community</b> command into the configuration, along with the community string specified in the <b>snmp-server host</b> command, is changed. The <b>snmp-server community</b> command has to be manually configured.

### Usage Guidelines

The **no snmp-server** command disables all versions of SNMP (SNMPv1, SNMPv2C, SNMPv3).

The first **snmp-server** command that you enter enables all versions of SNMP.

To configure SNMP community strings for the MPLS LDP MIB, use the **snmp-server community** command on the host network management station (NMS).

### Note

In Cisco IOS Release 12.0(3) to 12.2(33)SRD, if a community string was not defined using the **snmp-server community** command prior to using the **snmp-server host** command, the default form of the **snmp-server community** command was automatically inserted into the configuration. The password (community string) used for this automatic configuration of the **snmp-server community** was same as specified in the **snmp-server host** command. However, in Cisco IOS Release 12.2(33)SRE and later releases, you have to manually configure the **snmp-server community** command.

The **snmp-server community** command can be used to specify only an IPv6 named access list, only an IPv4 access list, or both. For you to configure both IPv4 and IPv6 access lists, the IPv6 access list must appear first in the command statement.

**Note**

The @ symbol is used as a delimiter between the community string and the context in which it is used. For example, specific VLAN information in BRIDGE-MIB may be polled using community@VLAN\_ID (for example, public@100) where 100 is the VLAN number. Avoid using the @ symbol as part of the SNMP community string when configuring this command.

**Examples**

The following example shows how to set the read/write community string to newstring:

```
Router(config)# snmp-server community newstring rw
```

The following example shows how to allow read-only access for all objects to members of the standard named access list lmnop that specify the comaccess community string. No other SNMP managers have access to any objects.

```
Router(config)# snmp-server community comaccess ro lmnop
```

The following example shows how to assign the string comaccess to SNMP, allow read-only access, and specify that IP access list 4 can use the community string:

```
Router(config)# snmp-server community comaccess ro 4
```

The following example shows how to assign the string manager to SNMP and allow read-write access to the objects in the restricted view:

```
Router(config)# snmp-server community manager view restricted rw
```

The following example shows how to remove the community comaccess:

```
Router(config)# no snmp-server community comaccess
```

The following example shows how to disable all versions of SNMP:

```
Router(config)# no snmp-server
```

The following example shows how to configure an IPv6 access list named list1 and links an SNMP community string with this access list:

```
Router(config)# ipv6 access-list list1
Router(config-ipv6-acl)# permit ipv6 any any
Router(config-ipv6-acl)# exit
Router(config)# snmp-server community comaccess rw ipv6 list1
```

**Related Commands**

Command	Description
<b>access-list</b>	Configures the access list mechanism for filtering frames by protocol type or vendor code.
<b>show snmp community</b>	Displays SNMP community access strings.
<b>snmp-server enable traps</b>	Enables the router to send SNMP notification messages to a designated network management workstation.
<b>snmp-server host</b>	Specifies the targeted recipient of an SNMP notification operation.
<b>snmp-server view</b>	Creates or updates a view entry.

## snmp-server enable traps (MPLS)

To enable a label switch router (LSR) to send Simple Network Management Protocol (SNMP) notifications or informs to an SNMP host, use the **snmp-server enable traps** command in global configuration mode. To disable notifications or informs, use the **no** form of this command.

**snmp-server enable traps** [*notification-type*] [*notification-option*]

**no snmp-server enable traps** [*notification-type*] [*notification-option*]

### Syntax Description

<i>notification-type</i>	<p>(Optional) Specifies the particular type of SNMP notification(s) to be enabled on the LSR. If a notification type is not specified, all SNMP notifications applicable to the LSR are enabled and sent to the SNMP host. Any one or all of the following keywords can be specified in any combination as the <i>notification-type</i> (family name) in the <b>snmp-server enable traps</b> command:</p> <ul style="list-style-type: none"> <li>• <b>bgp</b>—Sends Border Gateway Protocol (BGP) state change notifications.</li> <li>• <b>config</b>—Sends configuration notifications.</li> <li>• <b>entity</b>—Sends entity MIB modification notifications.</li> <li>• <b>envmon</b>—Sends Cisco enterprise-specific environmental monitor notifications whenever certain environmental thresholds are exceeded. <i>Notification-option</i> arguments (below) can be specified in combination with this keyword.</li> <li>• <b>frame-relay</b>—Sends Frame Relay notifications.</li> <li>• <b>hsrp</b>—Sends Hot Standby Routing Protocol (HSRP) notifications.</li> <li>• <b>isdn</b>—Sends ISDN notifications. <i>Notification-option</i> arguments (see examples below) can be specified in combination with this keyword.</li> <li>• <b>repeater</b>—Sends Ethernet repeater (hub) notifications. <i>Notification-option</i> arguments (see examples below) can be specified in combination with this keyword.</li> <li>• <b>rsvp</b>—Sends Resource Reservation Protocol (RSVP) notifications.</li> <li>• <b>rtr</b>—Sends Service Assurance Agent/Response Time Reporter (RTR) notifications.</li> <li>• <b>snmp [authentication]</b>—Sends RFC 1157 SNMP notifications. Using the <b>authentication</b> keyword produces the same effect as not using it. Both the <b>snmp-server enable traps snmp</b> and the <b>snmp-server enable traps snmp authentication</b> forms of this command globally enable the following SNMP notifications (or, if you are using the <b>no</b> form of the command, disables such notifications): <b>authenticationFailure</b>, <b>linkUp</b>, <b>linkDown</b>, and <b>warmstart</b>.</li> <li>• <b>syslog</b>—Sends system error message (syslog) notifications. You can specify the level of messages to be sent using the <b>logging history level</b> command.</li> </ul>
--------------------------	--

*notification-type*  
(continued)

- **mpls ldp**—Sends notifications about status changes in LDP sessions. Note that this keyword is specified as *mpls ldp*. This syntax, which the CLI interprets as a two-word construct, has been implemented in this manner to maintain consistency with other MPLS commands. *Notification-option* arguments (below) can be specified in combination with this keyword.
- **mpls traffic-eng**—Sends notifications about status changes in MPLS label distribution tunnels. This keyword is specified as *mpls traffic-eng*. This syntax, which the CLI interprets as a two-word construct, has been implemented in this manner to maintain consistency with other MPLS commands. *Notification-option* arguments (below) can be specified in combination with this keyword.

*notification-option*

(Optional) Defines the particular options associated with the specified *notification-type* that are to be enabled on the LSR.

- **envmon [voltage | shutdown | supply | fan | temperature]**

When you specify the **envmon** keyword, you can enable any one or all of the following environmental notifications in any combination: **voltage**, **shutdown**, **supply**, **fan**, or **temperature**. If you do not specify an argument with the **envmon** keyword, all types of system environmental notifications are enabled on the LSR.

- **isdn [call-information | isdn u-interface]**

When you specify the **isdn** keyword, you can use either the **call-information** argument (to enable an SNMP ISDN call information option for the ISDN MIB subsystem) or the **isdn u-interface** argument (to enable an SNMP ISDN U interface option for the ISDN U Interfaces MIB subsystem), or both. If you do not specify an argument with the **isdn** keyword, both types of isdn notifications are enabled on the LSR.

- **repeater [health | reset]**

When you specify the **repeater** keyword, you can use either the **health** argument or the **reset** argument, or both (to enable the IETF Repeater Hub MIB [RFC 1516] notification). If you do not specify an argument with the **repeater** keyword, both types of notifications are enabled on the LSR.

- **mpls ldp [session-up | session-down | pv-limit | threshold]**

When you specify the **mpls ldp** keyword, you can use any one or all of the following arguments in any combination to indicate status changes in LDP sessions: **session-up**, **session-down**, **pv-limit**, or **threshold**. If you do not specify an argument with the **mpls ldp** keyword, all four types of LDP session notifications are enabled on the LSR.

- **mpls traffic-eng [up | down | reroute]**

When you specify the **mpls traffic-eng** keyword, you can use any one or all of the following arguments in any combination to enable the sending of notifications regarding status changes in MPLS label distribution tunnels: **up**, **down**, or **reroute**. If you do not specify an argument with the **mpls traffic-eng** keyword, all three types of tunnel notifications are enabled on the LSR.

**Defaults**

If you issue this command on an LSR without specifying any *notification-type* keywords, the default behavior of the LSR is to enable all notification types controlled by the command (some notification types cannot be controlled by means of this command).

**Command Modes**

Global configuration

**Command History**

Release	Modification
11.1	This command was introduced.
11.3	The <b>snmp-server enable traps snmp authentication</b> form of this command was introduced to replace the <b>snmp-server trap-authentication</b> command.
12.0(17)ST	The <b>mpls traffic-eng</b> keyword was added to define a class or family of specific SNMP notifications for use with the <i>notification-type</i> and <i>notification-option</i> parameters of the <b>snmp-server enable traps</b> command.
12.0(21)ST	The <b>mpls ldp</b> keyword was added to define a class or family of specific SNMP notifications for use with the <i>notification-type</i> and <i>notification-option</i> parameters of the <b>snmp-server enable traps</b> command.
12.0(22)S	This command was integrated into Cisco IOS Release 12.0(22)S.
12.2(18)S	This command was integrated into Cisco IOS Release 12.2(18)S.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.4(11)T	This command was integrated into Cisco IOS Release 12.4(11)T.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

**Usage Guidelines**

To configure an LSR to send SNMP LDP notifications, you must issue at least one **snmp-server enable traps** command on the router.

To configure an LSR to send either notifications (traps) or informs to a designated network management station (NMS), you must issue the **snmp-server host** command on that device, using the keyword (**traps** or **informs**) that suits your purposes.

If you issue the **snmp-server enable traps** command without keywords, all SNMP notification types are enabled on the LSR. If you issue this command with specific keywords, only the notification types associated with those particular keywords are enabled on the LSR.

The **snmp-server enable traps** command is used in conjunction with the **snmp-server host** command. You use the latter command to specify the NMS host (or hosts) targeted as the recipient(s) of the SNMP notifications generated by SNMP-enabled LSRs in the network. To enable an LSR to send such notifications, you must issue at least one **snmp-server host** command on the LSR.

**Examples**

In the following example, the router is enabled to send all notifications to the host specified as myhost.cisco.com. The community string is defined as public.

```
Router(config)# snmp-server enable traps
Router(config)# snmp-server host myhost.cisco.com public
```

In the following example, the router is enabled to send Frame Relay and environmental monitor notifications to the host specified as myhost.cisco.com. The community string is defined as public:

```
Router(config)# snmp-server enable traps frame-relay
Router(config)# snmp-server enable traps envmon temperature
Router(config)# snmp-server host myhost.cisco.com public
```

In the following example, notifications are not sent to any host. BGP notifications are enabled for all hosts, but the only notifications enabled to be sent to a host are ISDN notifications (which are not enabled in this example).

```
Router(config)# snmp-server enable traps bgp
Router(config)# snmp-server host host1 public isdn
```

In the following example, the router is enabled to send all inform requests to the host specified as myhost.cisco.com. The community string is defined as public.

```
Router(config)# snmp-server enable traps
Router(config)# snmp-server host myhost.cisco.com informs version 2c public
```

In the following example, HSRP MIB notifications are sent to the host specified as myhost.cisco.com. The community string is defined as public.

```
Router(config)# snmp-server enable hsrp
Router(config)# snmp-server host myhost.cisco.com traps version 2c public hsrp
```

#### Related Commands

Command	Description
<b>snmp-server host</b>	Specifies the intended recipient of an SNMP notification (that is, the designated NMS workstation in the network).

## snmp-server enable traps mpls ldp

To enable the sending of Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) Simple Network Management Protocol (SNMP) notifications, use the **snmp-server enable traps mpls ldp** command in global configuration mode. To disable the sending of MPLS LDP notifications, use the **no** form of this command.

```
snmp-server enable traps mpls ldp [pv-limit] [session-down] [session-up] [threshold]
```

```
no snmp-server enable traps mpls ldp [pv-limit] [session-down] [session-up] [threshold]
```

### Syntax Description

<b>pv-limit</b>	(Optional) Enables or disables path-vector (PV) limit notifications (mplsLdpPathVectorLimitMismatch).
<b>session-down</b>	(Optional) Enables or disables LDP session down notifications (mplsLdpSessionDown).
<b>session-up</b>	(Optional) Enables or disables LDP session up notifications (mplsLdpSessionUp).
<b>threshold</b>	(Optional) Enables or disables PV Limit notifications (mplsLdpFailedInitSessionThresholdExceeded).

### Command Default

The sending of SNMP notifications is disabled. If you do not specify an optional keyword, all four types of LDP notifications are enabled on the label switching router (LSR).

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.0(21)ST	This command was introduced.
12.2(13)T	This command was integrated into Cisco IOS Release 12.2(13)T.
12.0(30)S	This command was integrated into Cisco IOS Release 12.0(30)S.
12.2(27)SBC	This command was integrated into Cisco IOS Release 12.2(27)SBC.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

### Usage Guidelines

The MPLS LDP **pv-limit** (mplsLdpPathVectorLimitMismatch) notification provides a warning message that can be sent to the network management station (NMS) when two routers engaged in LDP operations have a dissimilar path-vector limits.

The value of the path-vector limit can range from 0 to 255; a value of 0 indicates that loop detection is off. Any value other than 0 up to 255 indicates that loop detection is on and specifies the maximum number of hops through which an LDP message can pass before a loop condition in the network is sensed.

The MPLS LDP threshold (mplsLdpFailedInitSessionThresholdExceeded) notification object provides a warning message that can be sent to an NMS when a local LSR and an adjacent LDP peer attempt to set up an LDP session between them, but fail to do so after a specified number of attempts. The default number of attempts is 8. This default value is implemented in Cisco IOS software and cannot be changed using either the command line interface (CLI) or an SNMP agent.

In general, Cisco routers support the same features across multiple platforms. Therefore, the most likely incompatibility to occur between Cisco LSRs is a mismatch of their respective ATM VPI/VCI label ranges. For example, if you specify a range of valid labels for an LSR that does not overlap the range of its adjacent LDP peer, the routers will try eight times to create an LDP session between themselves before the mplsLdpFailedInitSessionThresholdExceeded notification is generated.

The LSRs whose label ranges do not overlap continue their attempt to create an LDP session between themselves after the eight retry threshold is exceeded. In such cases, the LDP threshold exceeded notification alerts the network administrator to the existence of a condition in the network that may warrant attention.

RFC 3036, *LDP Specification*, details the incompatibilities that can exist between Cisco routers or other vendor LSRs in an MPLS network. Among these incompatibilities, for example, are the following:

- Nonoverlapping ATM VPI/VCI ranges (as noted) or nonoverlapping Frame Relay data-link connection identifier (DLCI) ranges between LSRs attempting to set up an LDP session
- Unsupported label distribution method
- Dissimilar protocol data unit (PDU) sizes
- Dissimilar LDP feature support

The **snmp-server enable traps mpls ldp** command is used with the **snmp-server host** command. Use the **snmp-server host** command to specify which host or hosts receive SNMP notifications. To send SNMP notifications, you must configure at least one **snmp-server host** command.

If the **pv-limit** keyword is used, a message is generated when the router establishes an LDP session with its adjacent peer LSR, but the two LSRs have dissimilar path-vector limits.

If the **session-down** keyword is used, a session-down message is generated when an LDP session between the router and its adjacent LDP peer is terminated.

If the **session-up** keyword is used, a message is generated when the router establishes an LDP session with another LDP entity (an adjacent LDP peer in the network).

If the **threshold** keyword is used, a message is generated after eight failed attempts to establish an LDP session between the router and an LDP peer. The failures can be caused by any type of incompatibility between the devices.

All four keywords can be used in the same command in any combination.

**Note**

---

An mplsLdpEntityFailedInitSessionThreshold trap is supported only on an LC-ATM.

---

**Examples**

In the following example, LDP-specific informs are enabled and will be sent to the host myhost.cisco.com through use of community string defined as public:

```
Router(config)# snmp-server enable traps mpls ldp
Router(config)# snmp-server host myhost.cisco.com informs version 2c public mpls-ldp
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>snmp-server host</b>	Specifies whether you want the SNMP notifications sent as traps or informs, the version of SNMP to use, the security level of the notifications (for SNMPv3), and the recipient (host) of the notifications.

## snmp-server enable traps mpls rfc ldp

To enable the sending of Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) Simple Network Management Protocol (SNMP) notifications defined in RFC 3815, use the **snmp-server enable traps mpls rfc ldp** command in global configuration mode. To disable the sending of MPLS LDP notifications, use the **no** form of this command.

**snmp-server enable traps mpls rfc ldp** [**pv-limit** | **session-down** | **session-up** | **threshold**]

**no snmp-server enable traps mpls rfc ldp** [**pv-limit** | **session-down** | **session-up** | **threshold**]

### Syntax Description

<b>pv-limit</b>	(Optional) Enables or disables MPLS RFC LDP path-vector (PV) limit mismatch notifications (mplsLdpPathVectorLimitMismatch).
<b>session-down</b>	(Optional) Enables or disables MPLS RFC LDP session down notifications (mplsLdpSessionDown).
<b>session-up</b>	(Optional) Enables or disables MPLS RFC LDP session up notifications (mplsLdpSessionUp).
<b>threshold</b>	(Optional) Enables or disables MPLS RFC LDP threshold exceeded notifications (mplsLdpInitSessionThresholdExceeded).

### Command Default

The sending of SNMP notifications is disabled by default. If you do not specify an optional keyword, all four types of MPLS RFC LDP notifications are enabled on the label switch router (LSR).

### Command Modes

Global configuration (config)

### Command History

Release	Modification
12.2(33)SRB	This command was introduced.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.

### Usage Guidelines

Use this command to enable the LDP notifications supported in *Definitions of Managed Objects for the Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP)*, RFC 3815.

The MPLS LDP **pv-limit** (mplsLdpPathVectorLimitMismatch) notification provides a warning message that can be sent to the network management station (NMS) when two routers engaged in LDP operations have a dissimilar path vector limits. We recommend that all LDP-enabled routers in the network be configured with the same path vector limits.

The value of the path vector limit can range from 0 to 255; a value of 0 indicates that loop detection is off; any value other than 0 up to 255 indicates that loop detection is on and, in addition, specifies the maximum number of hops through which an LDP message can pass before a loop condition in the network is sensed.

The MPLS LDP **threshold** (mplsLdpFailedInitSessionThresholdExceeded) notification object provides a warning message that can be sent to an NMS when a local LSR and an adjacent LDP peer attempt to set up an LDP session between them, but fail to do so after a specified number of attempts. The default number of attempts is eight. This default value is implemented in Cisco IOS software and cannot be changed using either the command-line interface (CLI) or an SNMP agent.

In general, Cisco routers support the same features across multiple platforms. Therefore, the most likely incompatibility to occur between Cisco LSRs is a mismatch of their respective ATM Virtual Path Identifier (VPI) and Virtual Channel Identifier (VCI) label ranges.

For example, if you specify a range of valid labels for an LSR that does not overlap the range of its adjacent LDP peer, the routers will try eight times to create an LDP session between themselves before the mplsLdpFailedInitSessionThresholdExceeded notification is generated.

The LSRs whose label ranges do not overlap continue their attempt to create an LDP session between themselves after the eight retry threshold is exceeded. In such cases, the LDP threshold exceeded notification alerts the network administrator to the existence of a condition in the network that may warrant attention.

RFC 3036, *LDP Specification*, details the incompatibilities that can exist between Cisco routers or between Cisco routers and other vendor LSRs in an MPLS network. Among these incompatibilities, for example, are the following:

- Nonoverlapping ATM VPI and VCI ranges (as noted) or nonoverlapping Frame Relay Data Link Connection Identifier (DLCI) ranges between LSRs attempting to configure an LDP session
- Unsupported label distribution method
- Dissimilar protocol data unit (PDU) sizes
- Dissimilar LDP feature support

The **snmp-server enable traps mpls rfc ldp** command is used with the **snmp-server host** command. Use the **snmp-server host** command to specify which host or hosts receive SNMP notifications. To send SNMP notifications, you must configure at least one **snmp-server host** command.

If the **pv-limit** keyword is used, a message is generated when the router establishes an LDP session with its adjacent peer LSR, but the two LSRs have dissimilar path vector limits.

If the **session-down** keyword is used, a session-down message is generated when an LDP session between the router and its adjacent LDP peer is terminated.

If the **session-up** keyword is used, a message is generated when the router establishes an LDP session with another LDP entity (an adjacent LDP peer in the network).

If the **threshold** keyword is used, a message is generated after eight failed attempts to establish an LDP session between the router and an LDP peer. The failures can be caused by any type of incompatibility between the devices.

## Examples

In the following example, LDP-specific informs are enabled and will be sent to the host myhost.cisco.com through use of community string defined as public:

```
Router(config)# snmp-server enable traps mpls rfc ldp
Router(config)# snmp-server host myhost.cisco.com informs version 2c public mpls-ldp
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>snmp-server host</b>	Specifies whether you want the SNMP notifications sent as traps or informs, the version of SNMP to use, the security level of the notifications (for SNMPv3), and the recipient (host) of the notifications.

# snmp-server enable traps mpls rfc vpn

To enable the sending of Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Simple Network Management Protocol (SNMP) notifications defined in RFC 4382, use the **snmp-server enable traps mpls rfc vpn** command in global configuration mode. To disable the sending of MPLS VPN notifications, use the **no** form of this command

```
snmp-server enable traps mpls rfc vpn [illegal-label] [max-thresh-cleared] [max-threshold]
[mid threshold] [vrf-down] [vrf-up]
```

```
no snmp-server enable traps mpls rfc vpn [illegal-label] [max-thresh-cleared] [max-threshold]
[mid threshold] [vrf-down] [vrf-up]
```

Syntax Description		
<b>illegal-label</b>	(Optional) Enables or disables an MPLS RFC VPN notification for any illegal labels received on a VPN routing and forwarding (VRF) instance interface.	
<b>max-thresh-cleared</b>	(Optional) Enables or disables an MPLS RFC VPN notification when the number of routes attempts to exceed the maximum limit and then drops below the maximum number of routes.	
<b>max-threshold</b>	(Optional) Enables or disables an MPLS RFC VPN notification when a route creation attempt was unsuccessful because the maximum route limit was reached.	
<b>mid-threshold</b>	(Optional) Enables or disables an MPLS RFC VPN warning when the number of routes created has exceeded the warning threshold.	
<b>vrf-down</b>	(Optional) Enables or disables an MPLS RFC VPN notification when the last interface associated with a VRF transitions to the down state.	
<b>vrf-up</b>	(Optional) Enables or disables an MPLS RFC VPN notification when the first interface associated with a VRF transitions to the up state when previously all interfaces were in the down state.	

**Command Default** The sending of SNMP notifications is disabled by default.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	12.2(33)SRC	This command was introduced.
	12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.

**Usage Guidelines** If this command is used without any of the optional keywords, all MPLS RFC VPN notification types are enabled.

The **illegal-label** keyword enables a notification for illegal labels received on a VRF interface. Labels are illegal if they are outside the legal range, do not have a Label Forwarding Information Base (LFIB) entry, or do not match table IDs for the label.

When the **max-thresh-cleared** keyword is used and you attempt to create a route on a VRF that already contains the maximum number of routes, the `mplsL3VpnVrfNumVrfRouteMaxThreshExceeded` notification is sent (if enabled). When you remove routes from the VRF so that the number of routes falls below the set limit, the `mplsL3VpnNumVrfRouteMaxThreshCleared` notification is sent. You can clear all routes from the VRF by using the **clear ip route vrf** command.

The **max-threshold** keyword enables a notification that a route creation attempt was unsuccessful because the maximum route limit was reached. Another notification is not sent until the number of routes falls below the maximum threshold and reaches the maximum threshold again. The `max-threshold` value is determined by the **maximum routes** command in VRF configuration mode. If both IPv4 and IPv6 address-family configurations are present in the VRF, the threshold is an aggregate of the maximum threshold values. An `mplsL3VpnVrfNumVrfRouteMaxThreshExceeded` notification is not sent until the second address family reaches its maximum route threshold. Routes are not added to the address family that has already reached its maximum route threshold.

**Note**

If you configure a single address-family VRF with a maximum and middle threshold, and later add the other address-family configuration to your VRF without configuring a maximum threshold, you no longer receive a maximum threshold notification for the original address family when the threshold is reached, but routes would no longer be added to the routing table for this address family.

The warning that the **mid-threshold** keyword enables is sent only at the time the warning threshold is exceeded. If both IPv4 and IPv6 address-family configurations are present in the VRF, the threshold is an aggregate of the middle or warning threshold values. An `mplsL3VpnVrfRouteMidThreshExceeded` notification is not sent until the second address family reaches its warning threshold.

The values for the **mid-threshold** and **max-threshold** keywords are set using the **maximum routes limit** `{warn-threshold | warning-only}` VRF command in configuration mode.

The **maximum routes** command gives you two options in the VRF address family configuration mode:

- **maximum routes limit warning-only**—generates a warning message when you attempt to exceed the limit. The specified limit is not enforced.

If you use the **maximum routes limit warning-only** command with the **snmp-server enable traps mpls rfc vpn** command, a mid-threshold SNMP notification is generated when the `limit` value is reached or exceeded. No max-threshold SNMP notification is generated.

- **maximum routes limit warn-threshold**—generates a warning message when the `warn-threshold` is reached. The specified limit is enforced.

If you use the **maximum routes limit warn-threshold** command with the **snmp-server enable traps mpls rfc vpn** command, a mid-threshold SNMP notification is generated when the `warn-threshold` value is reached. A max-threshold notification is generated when the `limit` value is reached.

**Note**

When both IPv4 and IPv6 address-family configurations exist, the `MPLS-L3-VPN-STD-MIB` displays the aggregate value of the maximum route settings (not to exceed the max int32 value). If the maximum route limit is configured for one address family and not for the other address family, the aggregate value is max int32 (4,294,967,295).

The notification types described are defined in the following MIB objects of the `MPLS-L3-VPN-STD-MIB`:

- mplsL3VpnVrfUp
- mplsL3VpnVrfDown
- mplsL3VpnVrfRouteMidThreshExceeded
- mplsL3VpnVrfNumVrfRouteMaxThreshExceeded
- mplsL3VpnNumVrfSecIllglLblThrshExcd
- mplsL3VpnNumVrfRouteMaxThreshCleared

### Examples

In the following example, MPLS RFC VPN trap notifications are sent to the host specified as 172.31.156.34 using the community string named public if a VRF transitions from an up or down state:

```
Router(config)# snmp-server host 172.31.156.34 traps public mpls-vpn
Router(config)# snmp-server enable traps mpls rfc vpn vrf-down vrf-up
```

### Related Commands

Command	Description
<b>clear ip route vrf</b>	Removes routes from the VRF routing table.
<b>maximum routes</b>	Limits the maximum number of routes in a VRF to prevent a PE router from importing too many routes.
<b>snmp-server host</b>	Specifies the recipient of SNMP notifications.

## snmp-server enable traps mpls traffic-eng

To enable Multiprotocol Label Switching (MPLS) traffic engineering tunnel state-change Simple Network Management Protocol (SNMP) notifications, use the **snmp-server enable traps mpls traffic-eng** command in global configuration mode. To disable MPLS traffic engineering tunnel state-change SNMP notifications, use the **no** form of this command.

**snmp-server enable traps mpls traffic-eng [up | down | reroute]**

**no snmp-server enable traps mpls traffic-eng [up | down | reroute]**

### Syntax Description

<b>up</b>	(Optional) Enables only mplsTunnelUp notifications { mplsTeNotifyPrefix 1 }.
<b>down</b>	(Optional) Enables only mplsTunnelDown notifications { mplsTeNotifyPrefix 2 }.
<b>reroute</b>	(Optional) Enables or disables only mplsTunnelRerouted notifications {mplsTeNotifyPrefix 3}.

### Command Default

SNMP notifications are disabled.

When this command is used without keywords, all available trap types (up, down, reroute) are enabled.

### Command Modes

Global configuration

### Command History

Release	Modification
12.0(17)S	This command was introduced.
12.0(17)ST	This command was integrated into Cisco IOS Release 12.0(17)ST.
12.2(8)T	This command was integrated into Cisco IOS Release 12.2(8)T.

### Usage Guidelines

SNMP notifications can be sent as traps or inform requests. This command enables both traps and inform requests.

This command enables or disables MPLS traffic engineering tunnel notifications. MPLS tunnel state-change notifications, when enabled, will be sent when the connection moves from an “up” to “down” state, when a connection moves from a “down” to “up” state, or when a connection is rerouted. If you do not specify a keyword in conjunction with this command, all three types of MPLS traffic engineering tunnel notifications are sent.

When the **up** keyword is used, mplsTunnelUp notifications are sent to a network management system (NMS) when an MPLS traffic engineering tunnel is configured and the tunnel transitions from an operationally “down” state to an “up” state.

When the **down** keyword is used, mplsTunnelDown notifications are generated and sent to the NMS when an MPLS traffic engineering tunnel transitions from an operationally “up” state to a “down” state.

When the **reroute** keyword is used, mplsTunnelRerouted notifications are sent to the NMS under the following conditions:

- The signaling path of an existing MPLS traffic engineering tunnel fails and a new path option is signaled and placed into effect (that is, the tunnel is rerouted).
- The signaling path of an existing MPLS traffic engineering tunnel is fully operational, but a better path option can be signaled and placed into effect (that is, the tunnel can be reoptimized). This reoptimization can be triggered by:
  - A timer
  - The issuance of an **mpls traffic-eng reoptimize** command
  - A configuration change that requires the resignaling of a tunnel

The mplsTunnelReoptimized notification is not generated when an MPLS traffic engineering tunnel is reoptimized. However, an mplsTunnelReroute notification is generated. Thus, at the NMS, you cannot distinguish between a tunnel reoptimization and a tunnel reroute event.

The **snmp-server enable traps mpls traffic-eng** command is used with the **snmp-server host** command. Use the **snmp-server host** command to specify which hosts receive SNMP notifications. To send SNMP notifications, you must configure at least one **snmp-server host** command.

### Examples

The following example shows how to enable the router to send MPLS notifications to the host at the address myhost.cisco.com using the community string defined as public:

```
Router(config)# snmp-server enable traps mpls traffic-eng
Router(config)# snmp-server host myhost.cisco.com informs version 2c public
```

### Related Commands

Command	Description
<b>snmp-server host</b>	Specifies the recipient of an SNMP notification operation.
<b>snmp-server trap-source</b>	Specifies the interface that an SNMP trap should originate from.

## snmp-server enable traps mpls vpn

To enable the router to send Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN)-specific Simple Network Management Protocol (SNMP) notifications (traps and informs), use the **snmp-server enable traps mpls vpn** command in global configuration mode. To disable MPLS VPN specific SNMP notifications, use the **no** form of this command.

```
snmp-server enable traps mpls vpn [illegal-label] [max-thresh-cleared] [max-threshold]
[mid-threshold] [vrf-down] [vrf-up]
```

```
no snmp-server enable traps mpls vpn [illegal-label] [max-thresh-cleared] [max-threshold]
[mid-threshold] [vrf-down] [vrf-up]
```

### Syntax Description

<b>illegal-label</b>	(Optional) Enables a notification for any illegal labels received on a VPN routing/forwarding instance (VRF) interface.
<b>max-thresh-cleared</b>	(Optional) Enables a notification when the number of routes attempts to exceed the maximum limit and then drops below the maximum number of routes.
<b>max-threshold</b>	(Optional) Enables a notification that a route creation attempt was unsuccessful because the maximum route limit was reached.
<b>mid-threshold</b>	(Optional) Enables a warning that the number of routes created has exceeded the warning threshold.
<b>vrf-down</b>	(Optional) Enables a notification for the removal of a VRF from an interface or the transition of an interface to the down state.
<b>vrf-up</b>	(Optional) Enables a notification for the assignment of a VRF to an interface that is operational or for the transition of a VRF interface to the operationally up state.

### Command Default

This command is disabled.

### Command Modes

Global configuration

### Command History

Release	Modification
12.0(21)ST	This command was introduced.
12.0(22)S	This command was integrated into Cisco IOS Release 12.0(22)S.
12.2(13)T	This command was integrated into Cisco IOS Release 12.2(13)T.
12.0(30)S	This command was updated with the <b>max-thresh-cleared</b> keyword.
12.2(28)SB2	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.

Release	Modification
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

### Usage Guidelines

If this command is used without any of the optional keywords, all MPLS VPN notification types are enabled.

The **illegal-label** keyword enables a notification for illegal labels received on a VRF interface. Labels are illegal if they are outside the legal range, do not have a Label Forwarding Information Base (LFIB) entry, or do not match table IDs for the label.

When the **max-thresh-cleared** keyword is used and you attempt to create a route on a VRF that already contains the maximum number of routes, the `mplsNumVrfRouteMaxThreshExceeded` notification is sent (if enabled). When you remove routes from the VRF so that the number of routes falls below the set limit, the `mplsNumVrfRouteMaxThreshCleared` notification is sent. You can clear all routes from the VRF by using the **clear ip route vrf** command.

The **max-threshold** keyword enables a notification that a route creation attempt was unsuccessful because the maximum route limit was reached. Another notification is not sent until the number of routes falls below the maximum threshold and reaches the maximum threshold again. The max-threshold value is determined by the **maximum routes** command in VRF configuration mode.

The warning that the **mid-threshold** keyword enables is sent only at the time the warning threshold is exceeded.

For the **vrf-up** (`mplsVrfIfUp`) or **vrf-down** (`mplsVrfIfDown`) notifications to be issued from an ATM or Frame Relay subinterface, you must first configure the **snmp-server traps atm subif** command or the **snmp-server traps frame-relay subif** command on the subinterfaces, respectively.

The values for the **mid-threshold** and **max-threshold** keywords are set using the **maximum routes limit** `{warn-threshold | warning-only}` VRF command in configuration mode.

The **maximum routes** command gives you two options:

- **maximum routes limit warning-only**—generates a warning message when you attempt to exceed the limit. The specified limit is not enforced.

If you use the **maximum routes limit warning-only** command with the **snmp-server enable traps mpls vpn** command, a mid-threshold SNMP notification is generated when the *limit* value is reached or exceeded. No max-threshold SNMP notification is generated.

- **maximum routes limit warn-threshold**—generates a warning message when the *warn-threshold* is reached. The specified limit is enforced.

If you use the **maximum routes limit warn-threshold** command with the **snmp-server enable traps mpls vpn** command, a mid-threshold SNMP notification is generated when the *warn-threshold* value is reached. A max-threshold notification is generated when the *limit* value is reached.

The notification types described are defined in the following MIB objects of the PPVPN-MPLS-VPN-MIB:

- `mplsVrfIfUp`
- `mplsVrfIfDown`
- `mplsNumVrfRouteMidThreshExceeded`
- `mplsNumVrfRouteMaxThreshExceeded`

- mplsNumVrfSecIllegalLabelThreshExceeded

The cMplsNumVrfRouteMaxThreshCleared notification type is defined in the CISCO-IETF-PPVPN-MPLS-VPN-MIB.

### Examples

In the following example, MPLS VPN trap notifications are sent to the host specified as 172.31.156.34 using the community string named public if a VRF transitions from an up or down state:

```
Router(config)# snmp-server host 172.31.156.34 traps public mpls-vpn
Router(config)# snmp-server enable traps mpls vpn vrf-down vrf-up
```

### Related Commands

Command	Description
<b>maximum routes</b>	Sets the warning threshold and route maximum for VRFs.
<b>snmp-server enable traps atm subif</b>	Enables ATM subinterface SNMP notifications.
<b>snmp-server enable traps frame-relay subif</b>	Enables Frame Relay subinterface SNMP notifications.
<b>snmp-server host</b>	Specifies the recipient of SNMP notifications.

## snmp-server group

To configure a new Simple Network Management Protocol (SNMP) group, use the **snmp-server group** command in global configuration mode. To remove a specified SNMP group, use the **no** form of this command.

```
snmp-server group group-name {v1 | v2c | v3 {auth | noauth | priv}} [context context-name]
[read read-view] [write write-view] [notify notify-view] [access [ipv6 named-access-list]
[acl-number | acl-name]]
```

```
no snmp-server group group-name {v1 | v2c | v3 {auth | noauth | priv}} [context context-name]
```

Syntax	Description
<i>group-name</i>	Name of the group.
<b>v1</b>	Specifies that the group is using the SNMPv1 security model. SNMPv1 is the least secure of the possible SNMP security models.
<b>v2c</b>	Specifies that the group is using the SNMPv2c security model. The SNMPv2c security model allows informs to be transmitted and supports 64-character strings.
<b>v3</b>	Specifies that the group is using the SNMPv3 security model. SNMPv3 is the most secure of the supported security models. It allows you to explicitly configure authentication characteristics.
<b>auth</b>	Specifies authentication of a packet without encrypting it.
<b>noauth</b>	Specifies no authentication of a packet.
<b>priv</b>	Specifies authentication of a packet with encryption.
<b>context</b>	(Optional) Specifies the SNMP context to associate with this SNMP group and its views.
<i>context-name</i>	(Optional) Context name.
<b>read</b>	(Optional) Specifies a read view for the SNMP group. This view enables you to view only the contents of the agent.
<i>read-view</i>	(Optional) String of a maximum of 64 characters that is the name of the view. The default is that the read-view is assumed to be every object belonging to the Internet object identifier (OID) space (1.3.6.1), unless the <b>read</b> option is used to override this state.
<b>write</b>	(Optional) Specifies a write view for the SNMP group. This view enables you to enter data and configure the contents of the agent.
<i>write-view</i>	(Optional) String of a maximum of 64 characters that is the name of the view. The default is that nothing is defined for the write view (that is, the null OID). You must configure write access.
<b>notify</b>	(Optional) Specifies a notify view for the SNMP group. This view enables you to specify a notify, inform, or trap.

<i>notify-view</i>	<p>(Optional) String of a maximum of 64 characters that is the name of the view.</p> <p>By default, nothing is defined for the notify view (that is, the null OID) until the <b>snmp-server host</b> command is configured. If a view is specified in the <b>snmp-server group</b> command, any notifications in that view that are generated will be sent to all users associated with the group (provided a SNMP server host configuration exists for the user).</p> <p>Cisco recommends that you let the software autogenerate the notify view. See the “Configuring Notify Views” section in this document.</p>
<b>access</b>	(Optional) Specifies a standard access control list (ACL) to associate with the group.
<b>ipv6</b>	(Optional) Specifies an IPv6 named access list. If both IPv6 and IPv4 access lists are indicated, the IPv6 named access list must appear first in the list.
<i>named-access-list</i>	(Optional) Name of the IPv6 access list.
[ <i>acl-number</i>   <i>acl-name</i> ]	<p>(Optional) The <i>acl-number</i> argument is an integer from 1 to 99 that identifies a previously configured standard access list.</p> <p>The <i>acl-name</i> argument is a string of a maximum of 64 characters that is the name of a previously configured standard access list.</p>

**Command Default**

No SNMP server groups are configured.

**Command Modes**

Global configuration

**Command History**

Release	Modification
11.(3)T	This command was introduced.
12.0(23)S	The <b>context</b> <i>context-name</i> keyword and argument pair was added.
12.3(2)T	The <b>context</b> <i>context-name</i> keyword and argument pair was integrated into Cisco IOS Release 12.3(2)T, and support for standard named access lists ( <i>acl-name</i> ) was added.
12.0(27)S	The <b>ipv6</b> <i>named-access-list</i> keyword and argument pair was added.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.
12.3(14)T	The <b>ipv6</b> <i>named-access-list</i> keyword and argument pair was integrated into Cisco IOS Release 12.3(14)T.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was integrated into Cisco IOS Release 12.2(31)SB2.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.

**Usage Guidelines**

When a community string is configured internally, two groups with the name public are autogenerated, one for the v1 security model and the other for the v2c security model. Similarly, deleting a community string will delete a v1 group with the name public and a v2c group with the name public.

No default values exist for authentication or privacy algorithms when you configure the **snmp-server group** command. Also, no default passwords exist. For information about specifying a Message Digest 5 (MD5) password, see the documentation of the **snmp-server user** command.

### Configuring Notify Views

The *notify-view* option is available for two reasons:

- If a group has a notify view that is set using SNMP, you may need to change the notify view.
- The **snmp-server host** command may have been configured before the **snmp-server group** command. In this case, you must either reconfigure the **snmp-server host** command, or specify the appropriate notify view.

Specifying a notify view when configuring an SNMP group is not recommended, for the following reasons:

- The **snmp-server host** command autogenerates a notify view for the user, and then adds it to the group associated with that user.
- Modifying the group's notify view will affect all users associated with that group.

Instead of specifying the notify view for a group as part of the **snmp-server group** command, use the following commands in the order specified:

1. **snmp-server user**—Configures an SNMP user.
2. **snmp-server group**—Configures an SNMP group, without adding a notify view.
3. **snmp-server host**—Autogenerates the notify view by specifying the recipient of a trap operation.

### SNMP Contexts

SNMP contexts provide VPN users with a secure way of accessing MIB data. When a VPN is associated with a context, that VPN's specific MIB data exists in that context. Associating a VPN with a context enables service providers to manage networks with multiple VPNs. Creating and associating a context with a VPN enables a provider to prevent the users of one VPN from accessing information about users of other VPNs on the same networking device.

Use this command with the **context** *context-name* keyword and argument to associate a read, write, or notify SNMP view with an SNMP context.

## Examples

### Create an SNMP Group

The following example shows how to create the SNMP server group “public,” allowing read-only access for all objects to members of the standard named access list “ltnop”:

```
Router(config)# snmp-server group public v2c access ltnop
```

### Remove an SNMP Server Group

The following example shows how to remove the SNMP server group “public” from the configuration:

```
Router(config)# no snmp-server group public v2c
```

### Associate an SNMP Server Group with Specified Views

The following example shows SNMP context “A” associated with the views in SNMPv2c group “GROUP1”:

```
Router(config)# snmp-server context A
Router(config)# snmp mib community commA
Router(config)# snmp mib community-map commA context A target-list commAVpn
Router(config)# snmp-server group GROUP1 v2c context A read viewA write viewA notify viewB
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>show snmp group</b>	Displays the names of groups on the router and the security model, the status of the different views, and the storage type of each group.
<b>snmp mib community-map</b>	Associates a SNMP community with an SNMP context, engine ID, security name, or VPN target list.
<b>snmp-server host</b>	Specifies the recipient of a SNMP notification operation.
<b>snmp-server user</b>	Configures a new user to a SNMP group.

# snmp-server host

To specify the recipient of a Simple Network Management Protocol (SNMP) notification operation, use the **snmp-server host** command in global configuration mode. To remove the specified host from the configuration, use the **no** form of this command.

```
snmp-server host {hostname | ip-address} [vrf vrf-name] [traps | informs] [version {1 | 2c | 3
[auth | noauth | priv]}] community-string [udp-port port] [notification-type]
```

```
no snmp-server host {hostname | ip-address} [vrf vrf-name] [traps | informs] [version {1 | 2c | 3
[auth | noauth | priv]}] community-string [udp-port port] [notification-type]
```

## Syntax Description

<i>hostname</i>	Name of the host. The SNMP notification host is typically a network management station (NMS) or SNMP manager. This host is the recipient of the SNMP traps or informs.
<i>ip-address</i>	IP address or IPv6 address of the SNMP notification host.
<b>vrf</b>	(Optional) Specifies that a Virtual Private Network (VPN) routing and forwarding (VRF) instance should be used to send SNMP notifications.
<i>vrf-name</i>	(Optional) VPN VRF instance used to send SNMP notifications.
<b>traps</b>	(Optional) Specifies that notifications should be sent as traps. This is the default.
<b>informs</b>	(Optional) Specifies that notifications should be sent as informs.
<b>version</b>	(Optional) Specifies the version of the SNMP that is used to send the traps or informs. The default is 1.  If you use the <b>version</b> keyword, one of the following keywords must be specified: <ul style="list-style-type: none"> <li>• <b>1</b>—SNMPv1.</li> <li>• <b>2c</b>—SNMPv2C.</li> <li>• <b>3</b>—SNMPv3. The most secure model because it allows packet encryption with the <b>priv</b> keyword. The default is <b>noauth</b>.</li> </ul> One of the following three optional security level keywords can follow the <b>3</b> keyword: <ul style="list-style-type: none"> <li>– <b>auth</b>—Enables message digest algorithm 5 (MD5) and Secure Hash Algorithm (SHA) packet authentication.</li> <li>– <b>noauth</b>—Specifies that the noAuthNoPriv security level applies to this host. This is the default security level for SNMPv3.</li> <li>– <b>priv</b>—Enables Data Encryption Standard (DES) packet encryption (also called “privacy”).</li> </ul>
<i>community-string</i>	Password-like community string sent with the notification operation.  <b>Note</b> You can set this string using the <b>snmp-server host</b> command by itself, but Cisco recommends that you define the string using the <b>snmp-server community</b> command prior to using the <b>snmp-server host</b> command.  <b>Note</b> The “at” sign (@) is used for delimiting the context information.

<b>udp-port</b>	(Optional) Specifies that SNMP traps or informs are to be sent to an NMS host.
<i>port</i>	(Optional) User Datagram Protocol (UDP) port number of the NMS host. The default is 162.
<i>notification-type</i>	<p>(Optional) Type of notification to be sent to the host. If no type is specified, all available notifications are sent. The notification type can be one or more of the following keywords:</p> <ul style="list-style-type: none"> <li>• <b>atm</b>—Sends ATM notifications.</li> <li>• <b>auth-framework</b>—Sends SNMP CISCO-AUTH-FRAMEWORK-MIB notifications.</li> <li>• <b>bgp</b>—Sends Border Gateway Protocol (BGP) state change notifications.</li> <li>• <b>bridge</b>—Sends SNMP STP Bridge MIB notifications.</li> <li>• <b>bstun</b>—Sends Block Serial Tunneling (BSTUN) event notifications.</li> <li>• <b>bulkstat</b>—Sends Data-Collection-MIB notifications.</li> <li>• <b>c6kxbar</b>—Sends SNMP crossbar notifications.</li> <li>• <b>callhome</b>—Sends Call Home MIB notifications.</li> <li>• <b>calltracker</b>—Sends Call Tracker call-start/call-end notifications.</li> <li>• <b>casa</b>—Sends CASA event notifications.</li> <li>• <b>cef</b>—Sends notifications related to Cisco Express Forwarding.</li> <li>• <b>chassis</b>—Sends SNMP chassis notifications.</li> <li>• <b>config</b>—Sends configuration change notifications.</li> <li>• <b>config-copy</b>—Sends SNMP config-copy notifications.</li> <li>• <b>config-ctid</b>—Sends SNMP config-ctid notifications.</li> <li>• <b>cpu</b>—Sends CPU-related notifications.</li> <li>• <b>csg</b>—Sends SNMP CSG notifications.</li> <li>• <b>dhcp-snooping</b>—Sends DHCP snooping MIB notifications.</li> <li>• <b>director</b>—Sends notifications related to DistributedDirector.</li> <li>• <b>dls</b>—Sends DLSW notifications.</li> <li>• <b>dot1x</b>—Sends 802.1X notifications.</li> <li>• <b>ds1</b>—Sends SNMP DS1 notifications.</li> <li>• <b>dspu</b>—Sends downstream physical unit (DSPU) notifications.</li> <li>• <b>eigrp</b>—Sends Enhanced Interior Gateway Routing Protocol (EIGRP) stuck-in-active (SIA) and neighbor authentication failure notifications.</li> <li>• <b>energywise</b>—Sends SNMP energywise notifications.</li> <li>• <b>entity</b>—Sends Entity MIB modification notifications.</li> <li>• <b>entity-diag</b>—Sends SNMP entity diagnostic MIB notifications.</li> <li>• <b>envmon</b>—Sends Cisco enterprise-specific environmental monitor notifications when an environmental threshold is exceeded.</li> </ul>

- 
- **errdisable**—Sends error disable notifications.
  - **ethernet-cfm**—Sends SNMP Ethernet CFM notifications.
  - **event-manager**—Sends SNMP Embedded Event Manager notifications.
  - **flash**—Sends flash media insertion and removal notifications.
  - **flexlinks**—Sends FLEX links notifications.
  - **frame-relay**—Sends Frame Relay notifications.
  - **fru-ctrl**—Sends entity FRU control notifications.
  - **hsrp**—Sends Hot Standby Routing Protocol (HSRP) notifications.
  - **ipmulticast**—Sends IP multicast notifications.
  - **iplocalpool**—Sends IP local pool notifications.
  - **ipmobile**—Sends Mobile IP notifications.
  - **ipsec**—Sends IP Security (IPsec) notifications.
  - **isakmp**—Sends SNMP ISAKMP notifications.
  - **isdn**—Sends ISDN notifications.
  - **l2tc**—Sends SNMP L2 tunnel configuration notifications.
  - **l2tun-pseudowire-status**—Sends pseudowire state change notifications.
  - **l2tun-session**—Sends Layer 2 tunneling session notifications.
  - **license**—Sends licensing notifications as traps or informs.
  - **llc2**—Sends Logical Link Control, type 2 (LLC2) notifications.
  - **mac-notification**—Sends SNMP MAC notifications.
  - **memory**—Sends memory pool and memory buffer pool notifications.
  - **module**—Sends SNMP module notifications.
  - **module-auto-shutdown**—Sends SNMP module auto shutdown MIB notifications.
  - **mpls-fast-reroute**—Sends SNMP MPLS traffic engineering fast reroute notifications.
  - **mpls-ldp**—Sends Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) notifications indicating status changes in LDP sessions.
  - **mpls-traffic-eng**—Sends MPLS traffic engineering notifications indicating changes in the status of MPLS traffic engineering tunnels.
  - **mpls-vpn**—Sends MPLS VPN notifications.
  - **msdp**—Sends SNMP MSDP notifications.
  - **mvpn**—Sends multicast virtual private network notifications.
  - **nhrp**—Sends Next Hop Resolution Protocol (NHRP) notifications.
  - **ospf**—Sends Open Shortest Path First (OSPF) sham-link notifications.
-

- 
- **pim**—Sends Protocol Independent Multicast (PIM) notifications.
  - **port-security**—Sends SNMP port-security notifications.
  - **power-ethernet**—Sends SNMP power ethernet notifications.
  - **pw-vc**—Sends SNMP pseudowire VC notifications.
  - **repeater**—Sends standard repeater (hub) notifications.
  - **rf**—Sends SNMP RF MIB notifications.
  - **rsrb**—Sends remote source-route bridging (RSRB) notifications.
  - **rsvp**—Sends Resource Reservation Protocol (RSVP) notifications.
  - **rtr**—Sends Response Time Reporter (RTR) notifications.
  - **sdlc**—Sends Synchronous Data Link Control (SDLC) notifications.
  - **sdllc**—Sends SDLC Logical Link Control (SDLLC) notifications.
  - **slb**—Sends SNMP SLB notifications.
  - **snmp**—Sends any enabled RFC 1157 SNMP linkUp, linkDown, authenticationFailure, warmStart, and coldStart notifications.

**Note** To enable RFC 2233 compliant link up/down notifications, you should use the **snmp server link trap** command.

- **sonet**—Sends SNMP SONET notifications.
  - **srp**—Sends Spatial Reuse Protocol (SRP) notifications.
  - **stp**—Sends SNMP STP MIB notifications.
  - **stun**—Sends serial tunnel (STUN) notifications.
  - **syslog**—Sends error message notifications (Cisco Syslog MIB). Use the **logging history level** command to specify the level of messages to be sent.
  - **tty**—Sends Cisco enterprise-specific notifications when a TCP connection closes.
  - **udp-port**—Sends notification host's UDP port number.
  - **vlan-mac-limit**—Sends SNMP L2 control VLAN MAC limit notifications.
  - **vlancreate**—Sends SNMP VLAN created notifications.
  - **vlandelete**—Sends SNMP VLAN deleted notifications.
  - **voice**—Sends SNMP voice traps.
  - **vrrp**—Sends Virtual Router Redundancy Protocol (VRRP) notifications.
  - **vswitch**—Sends SNMP virtual switch notifications.
  - **vsimaster**—Sends Virtual Switch Interface (VSI) Master notifications.
  - **vtp**—Sends SNMP VTP notifications.
  - **x25**—Sends X.25 event notifications.
-

**Command Default** This command is disabled by default. A recipient is not specified to receive notifications.

**Command Modes** Global configuration (config)

Command History	Release	Modification
	10.0	This command was introduced.
	<b>Cisco IOS Release 12 Mainline/T Train</b>	
	12.0(3)T	This command was modified. The <b>3</b> , <b>auth</b> , <b>noauth</b> , and <b>priv</b> keywords were added as part of the SNMPv3 Support feature. The <b>hsrp</b> and <b>voice</b> notification-type keywords were added.
	12.1(3)T	This command was modified. The <b>calltracker</b> notification-type keyword was added for the Cisco AS5300 and AS5800 platforms.
	12.2(2)T	This command was modified. The <b>vrf vrf-name</b> keyword and argument combination was added. The <b>ipmobile</b> notification-type keyword was added. Support for the <b>vsimaster</b> notification-type keyword was added for the Cisco 7200 and Cisco 7500 series.
	12.2(4)T	This command was modified. The <b>pim</b> and <b>ipsec</b> notification-type keywords were added.
	12.2(8)T	This command was modified. The <b>mpls-traffic-eng</b> and <b>director</b> notification-type keywords were added.
	12.2(13)T	This command was modified. The <b>srp</b> and <b>mpls-ldp</b> notification-type keywords were added.
	12.3(2)T	This command was modified. The <b>flash</b> and <b>l2tun-session</b> notification-type keywords were added.
	12.3(4)T	This command was modified. The <b>cpu</b> , <b>memory</b> , and <b>ospf</b> notification-type keywords were added.
	12.3(8)T	This command was modified. The <b>iplocalpool</b> notification-type keyword was added for the Cisco 7200 and 7301 series routers.
	12.3(11)T	This command was modified. The <b>vrrp</b> keyword was added.
	12.3(14)T	This command was modified. Support for SNMP over IPv6 transport was integrated into Cisco IOS Release 12.3(14)T. Either an IP or IPv6 Internet address can be specified as the <i>hostname</i> argument. The <b>eigrp</b> notification-type keyword was added.
	12.4(20)T	This command was modified. The <b>license</b> notification-type keyword was added.
	15.0(1)M	This command was modified. The <b>nhrp</b> notification-type keyword was added. The automatic insertion of the <b>snmp-server community</b> command into the configuration, along with the community string specified in the <b>snmp-server host</b> command, is changed. The <b>snmp-server community</b> command has to be manually configured.
	<b>Cisco IOS Release 12.0S</b>	
	12.0(17)ST	This command was modified. The <b>mpls-traffic-eng</b> notification-type keyword was added.
	12.0(21)ST	This command was modified. The <b>mpls-ldp</b> notification-type keyword was added.

Release	Modification
12.0(22)S	This command was modified. All features in the Cisco IOS Release 12.0ST train were integrated into Cisco IOS Release 12.0(22)S. The <b>mpls-vpn</b> notification-type keyword was added.
12.0(23)S	This command was modified. The <b>l2tun-session</b> notification-type keyword was added.
12.0(26)S	This command was modified. The <b>memory</b> notification-type keyword was added.
12.0(27)S	This command was modified. Support for SNMP over IPv6 transport was added. Either an IP or IPv6 Internet address can be specified as the <i>hostname</i> argument. The <b>vrf vrf-name</b> keyword and argument combination was added to support multiple Lightweight Directory Protocol (LDP) contexts for VPNs.
12.0(31)S	This command was modified. The <b>l2tun-pseudowire-status</b> notification-type keyword was added.
<b>Release 12.2S</b>	
12.2(18)S	This command was integrated into Cisco IOS Release 12.2(18)S.
12.2(25)S	This command was modified. The <b>cpu</b> and <b>memory</b> notification-type keywords were added.
12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(31)SB2	This command was modified. The <b>cef</b> notification-type keyword was added.
12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
12.2(33)SB	This command was integrated into Cisco IOS Release 12.2(33)SB.
12.2(33)SX15	This command was modified. The <b>dhcp-snooping</b> and <b>errdisable</b> notification-type keywords were added.
12.2(33)SRE	This command was modified. The automatic insertion of the <b>snmp-server community</b> command into the configuration, along with the community string specified in the <b>snmp-server host</b> command, is changed. The <b>snmp-server community</b> command has to be manually configured.
<b>Cisco IOS XE</b>	
Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.

### Usage Guidelines

If you enter this command with no optional keywords, the default is to send all notification-type traps to the host. No informs will be sent to the host.

The **no snmp-server host** command with no keywords disables traps, but not informs, to the host. To disable informs, use the **no snmp-server host informs** command.

**Note**

In Cisco IOS Release 12.0(3) to 12.2(33)SRD, if a community string was not defined using the **snmp-server community** command prior to using the **snmp-server host** command, the default form of the **snmp-server community** command was automatically inserted into the configuration. The password (community string) used for this automatic configuration of the **snmp-server community** was same as specified in the **snmp-server host** command. However, in Cisco IOS Release 12.2(33)SRE and later releases, you have to manually configure the **snmp-server community** command.

SNMP notifications can be sent as traps or inform requests. Traps are unreliable because the receiver does not send acknowledgments when it receives traps. The sender cannot determine if the traps were received. However, an SNMP entity that receives an inform request acknowledges the message with an SNMP response protocol data unit (PDU). If the sender never receives the response, the inform request can be sent again. Thus, informs are more likely than traps to reach their intended destination.

Compared to traps, informs consume more resources in the agent and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Also, traps are sent only once; an inform may be tried several times. The retries increase traffic and contribute to a higher overhead on the network.

If you do not enter an **snmp-server host** command, no notifications are sent. To configure the router to send SNMP notifications, you must enter at least one **snmp-server host** command. If you enter the command with no optional keywords, all trap types are enabled for the host.

To enable multiple hosts, you must issue a separate **snmp-server host** command for each host. You can specify multiple notification types in the command for each host.

When multiple **snmp-server host** commands are given for the same host and kind of notification (trap or inform), each succeeding command overwrites the previous command. Only the last **snmp-server host** command will be in effect. For example, if you enter an **snmp-server host inform** command for a host and then enter another **snmp-server host inform** command for the same host, the second command will replace the first.

The **snmp-server host** command is used in conjunction with the **snmp-server enable** command. Use the **snmp-server enable** command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one **snmp-server enable** command and the **snmp-server host** command for that host must be enabled.

Some notification types cannot be controlled with the **snmp-server enable** command. Some notification types are always enabled, and others are enabled by a different command. For example, the **linkUpDown** notifications are controlled by the **snmp trap link-status** command. These notification types do not require an **snmp-server enable** command.

The availability of a notification-type options depends on the router type and the Cisco IOS software features supported on the router. For example, the **envmon** notification type is available only if the environmental monitor is part of the system. To see what notification types are available on your system, use the command **help ?** at the end of the **snmp-server host** command.

The **vrf** keyword allows you to specify the notifications being sent to a specified IP address over a specific VRF. The VRF defines a VPN membership of a user so data is stored using the VPN.

In the case of the NMS sending the query having a correct SNMP community but that does not have a read or a write view, the SNMP agent returns the following error values:

- For a get or a getnext query, returns **GEN\_ERROR** for SNMPv1 and **AUTHORIZATION\_ERROR** for SNMPv2C.
- For a set query, returns **NO\_ACCESS\_ERROR**.

### Notification-Type Keywords

The *notification-type* keywords used in the **snmp-server host** command do not always match the keywords used in the corresponding **snmp-server enable traps** command. For example, the notification keyword applicable to Multiprotocol Label Switching Protocol (MPLS) traffic engineering tunnels is specified as **mpls-traffic-eng** (containing two hyphens and no embedded spaces). The corresponding parameter in the **snmp-server enable traps** command is specified as **mpls traffic-eng** (containing an embedded space and a hyphen).

This syntax difference is necessary to ensure that the command-line interface (CLI) interprets the *notification-type* keyword of the **snmp-server host** command as a unified, single-word construct, which preserves the capability of the **snmp-server host** command to accept multiple *notification-type* keywords in the command line. The **snmp-server enable traps** commands, however, often use two-word constructs to provide hierarchical configuration options and to maintain consistency with the command syntax of related commands. Table 172 maps some examples of **snmp-server enable traps** commands to the keywords used in the **snmp-server host** command.

**Table 172** SNMP-server enable traps Commands and Corresponding Notification Keywords

snmp-server enable traps Command	snmp-server host Command Keyword
snmp-server enable traps l2tun session	l2tun-session
snmp-server enable traps mpls ldp	mpls-ldp
snmp-server enable traps mpls traffic-eng <sup>1</sup>	mpls-traffic-eng
snmp-server enable traps mpls vpn	mpls-vpn

1. See the *Cisco IOS Multiprotocol Label Switching Command Reference* for documentation of this command.

### Examples

If you want to configure a unique SNMP community string for traps but prevent SNMP polling access with this string, the configuration should include an access list. The following example shows how to name a community string comaccess and number an access list 10:

```
Router(config)# snmp-server community comaccess ro 10
Router(config)# snmp-server host 192.20.2.160 comaccess
Router(config)# access-list 10 deny any
```

#### Note

The “at” sign (@) is used as a delimiter between the community string and the context in which it is used. For example, specific VLAN information in BRIDGE-MIB may be polled using *community@VLAN-ID* (for example, public@100), where 100 is the VLAN number.

The following example shows how to send RFC 1157 SNMP traps to a specified host named myhost.cisco.com. Other traps are enabled, but only SNMP traps are sent because only **snmp** is specified in the **snmp-server host** command. The community string is defined as comaccess.

```
Router(config)# snmp-server enable traps
Router(config)# snmp-server host myhost.cisco.com comaccess snmp
```

The following example shows how to send the SNMP and Cisco environmental monitor enterprise-specific traps to address 192.30.2.160 using the community string public:

```
Router(config)# snmp-server enable traps snmp
Router(config)# snmp-server enable traps envmon
Router(config)# snmp-server host 192.30.2.160 public snmp envmon
```

The following example shows how to enable the router to send all traps to the host myhost.cisco.com using the community string public:

```
Router(config)# snmp-server enable traps
Router(config)# snmp-server host myhost.cisco.com public
```

The following example will not send traps to any host. The BGP traps are enabled for all hosts, but only the ISDN traps are enabled to be sent to a host. The community string is defined as public.

```
Router(config)# snmp-server enable traps bgp
Router(config)# snmp-server host myhost.cisco.com public isdn
```

The following example shows how to enable the router to send all inform requests to the host myhost.cisco.com using the community string public:

```
Router(config)# snmp-server enable traps
Router(config)# snmp-server host myhost.cisco.com informs version 2c public
```

The following example shows how to send HSRP MIB informs to the host specified by the name myhost.cisco.com. The community string is defined as public.

```
Router(config)# snmp-server enable traps hsrp
Router(config)# snmp-server host myhost.cisco.com informs version 2c public hsrp
```

The following example shows how to send all SNMP notifications to example.com over the VRF named trap-vrf using the community string public:

```
Router(config)# snmp-server host example.com vrf trap-vrf public
```

The following example shows how to configure an IPv6 SNMP notification server with the IPv6 address 2001:0DB8:0000:ABCD:1 using the community string public:

```
Router(config)# snmp-server host 2001:0DB8:0000:ABCD:1 version 2c public udp-port 2012
```

The following example shows how to specify VRRP as the protocol using the community string public:

```
Router(config)# snmp-server enable traps vrrp
Router(config)# snmp-server host myhost.cisco.com traps version 2c public vrrp
```

The following example shows how to send all Cisco Express Forwarding informs to the notification receiver with the IP address 192.40.3.130 using the community string public:

```
Router(config)# snmp-server enable traps cef
Router(config)# snmp-server host 192.40.3.130 informs version 2c public cef
```

The following example shows how to enable all NHRP traps, and how to send all NHRP traps to the notification receiver with the IP address 192.40.3.130 using the community string public:

```
Router(config)# snmp-server enable traps nhrp
Router(config)# snmp-server host 192.40.3.130 traps version 2c public nhrp
```

## Related Commands

Command	Description
<b>show snmp host</b>	Displays recipient details configured for SNMP notifications.
<b>snmp-server enable peer-trap poor qov</b>	Enables poor quality of voice notifications for applicable calls associated with a specific voice dial peer.
<b>snmp-server enable traps</b>	Enables SNMP notifications (traps and informs).
<b>snmp-server enable traps nhrp</b>	Enables SNMP notifications (traps) for NHRP.
<b>snmp-server informs</b>	Specifies inform request options.

Command	Description
<b>snmp-server link trap</b>	Enables linkUp/linkDown SNMP trap that are compliant with RFC 2233.
<b>snmp-server trap-source</b>	Specifies the interface from which an SNMP trap should originate.
<b>snmp-server trap-timeout</b>	Defines how often to try resending trap messages on the retransmission queue.

# status protocol notification static

To enable the timers set in the specified class name, use the **status protocol notification static** command in pseudowire-class configuration mode. To disable the use of the specified class, use the **no** form of this command.

**status protocol notification static** *class-name*

**no status protocol notification static** *class-name*

<b>Syntax Description</b>	<i>class-name</i>	Name of an Operations, Administration, and Maintenance (OAM) class that was created with the <b>pseudowire-static-oam-class</b> command.
---------------------------	-------------------	--

<b>Command Default</b>	OAM classes are not specified.
------------------------	--------------------------------

<b>Command Modes</b>	Pseudowire-class configuration (config-pw-class)
----------------------	--

<b>Command History</b>	<b>Release</b>	<b>Modification</b>
	15.1(1)SA	This command was introduced.
	15.1(3)S	This command was integrated.

<b>Examples</b>	The following example enables the timers set in the class oam-class3: <pre>Router(config-pw-class)# <b>status protocol notification static oam-class3</b></pre>
-----------------	--

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>pseudowire-static-oam class</b>	Creates a class that defines the OAM parameters for the pseudowire.

# status (pseudowire class)

To enable the router to send pseudowire status messages to a peer router, even when the attachment circuit is down, use the **status** command in pseudowire class configuration mode. To disable the pseudowire status messages, use the **no** form of this command.

**status**

**no status**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Pseudowire status messages are sent and received if both routers support the messages.

**Command Modes** Pseudowire class configuration

Command History	Release	Modification
	12.2(33)SRC	This command was introduced.
	12.2(50)SY	This command was integrated into Cisco IOS Release 12.2(50)SY.

**Usage Guidelines** Both peer routers must support the ability to send and receive pseudowire status messages in label advertisement and label notification messages. If both peer routers do not support pseudowire status messages, Cisco recommends that you disable the messages with the **no status** command.

**Examples** The following example shows how to enable the router to send pseudowire status messages to a peer router:

```
enable
configure terminal
pseudowire-class test1
status
encapsulation mpls
```

Related Commands	Command	Description
	<b>debug mpls l2transport vc</b>	Displays debug messages about the pseudowire status.
	<b>show mpls l2transport vc detail</b>	Displays pseudowire status messages.

# status redundancy

To designate one pseudowire as the master or slave to display status information for both active and backup pseudowires, use the **status redundancy** command in pseudowire class configuration mode. To disable the pseudowire as the master or slave, use the **no** form of this command.

```
status redundancy {master | slave}
```

```
no status redundancy {master | slave}
```

## Syntax Description

<b>master</b>	Designates one pseudowire to work as the master.
<b>slave</b>	Designates one pseudowire to work as the slave.

## Command Default

The pseudowire is in slave mode.

## Command Modes

Pseudowire-class configuration mode (config-pw)

## Command History

Release	Modification
Cisco IOS XE Release 2.3	This command was introduced.

## Usage Guidelines

One pseudowire must be the master and the other must be assigned the slave. You cannot configure both pseudowires as master or slave.

## Examples

The following example designates the pseudowire as the master:

```
Router(config-pw)# status redundancy master
```

## Related Commands

Command	Description
<b>show xconnect</b>	Displays information about xconnect attachment circuits and pseudowires

# switching-point

To configure a switching point and specify a virtual circuit (VC) ID range, use the **switching-point** command in Layer 2 pseudowire routing configuration mode. To remove the switching point configuration, use the **no** form of this command.

**switching-point vcid** *minimum-vcid-value maximum-vcid-value*

**switching-point vcid**

## Syntax Description

<b>vcid</b>	Configures a VC ID range for the switching point.
<i>minimum-vcid-value</i>	Minimum value or starting point for the VC ID range. Valid entries are 1 to 2147483647.
<i>maximum-vcid-value</i>	Maximum value or ending point for the VC ID range. Valid entries are 1 to 2147483647.

## Command Default

If an Autonomous System Boundary Router (ASBR) has been configured as a switching point (accomplished by using the **no bgp default route-target filter** command), the default VC ID range is 1001 to 2147483647.

## Command Modes

Layer 2 pseudowire routing (config-l2\_pw\_rtg)

## Command History

Release	Modification
15.1(1)S	This command was introduced.

## Usage Guidelines

The **switching-point** command is used in Layer 2 pseudowire routing configuration mode. To enter Layer 2 pseudowire routing configuration mode, use the **l2 pseudowire routing** command.

### Changing the VC ID Range on an ASBR

The **switching-point** command was introduced in the L2VPN VPLS Inter-AS Option B feature and is intended for use on an Autonomous System Boundary Router (ASBR). With the L2VPN VPLS Inter-AS Option B feature, VC IDs in the VC ID range of 1001 to 2147483647 are reserved for switching pseudowires. This command allows you to change this range if, for example, an existing xconnect VC is using one of the reserved VC IDs.

## Examples

In the following example, the **switching-point** command has been used to specify a VCID range of 200 to 3500:

```
Router>
Router# enable
Router(config)# configure terminal
Router(config)# l2 pseudowire routing
Router(config-l2_pw_rtg)# switching-point vcid 200 3500
Router(config-l2_pw_rtg)# end
```

**Related Commands**

<b>Command</b>	<b>Description</b>
<b>l2 pseudowire routing</b>	Enables Layer 2 pseudowire routing and enters Layer 2 pseudowire routing configuration mode.
<b>no bgp default route-target filter</b>	Disables automatic BGP route-target community filtering or enables pseudowire switching in address family configuration mode.
<b>show xconnect</b>	Displays information about xconnect attachment circuits and pseudowires

# switching tlv

To advertise the switching point type-length variable (TLV) in the label binding, use the **switching tlv** command in pseudowire class configuration mode. To disable the display of the TLV, use the **no** form of this command.

**switching tlv**

**no switching tlv**

**Syntax Description** This command has no arguments or keywords.

**Command Default** Switching point TLV data is advertised to peers.

**Command Modes** Pseudowire class configuration (config-pw-class)

## Command History

Release	Modification
Cisco IOS XE Release 2.3	This command was introduced.

## Usage Guidelines

The pseudowire switching point TLV information includes the following information:

- Pseudowire ID of the last pseudowire segment traversed
- Pseudowire switching point description
- Local IP address of the pseudowire switching point
- Remote IP address of the last pseudowire switching point that was crossed or the T-PE router

By default, switching point TLV data is advertised to peers.

## Examples

The following example enables the display of the pseudowire switching TLV:

```
Router(config)# pseudowire-class atom
Router(config-pw-class)# switching tlv
```

## Related Commands

Command	Description
<b>show mpls l2transport binding</b>	Displays switching point TLV information.
<b>show mpls l2transport vc detail</b>	Displays switching point TLV information.
