# Using the Command-Line Interface in Cisco IOS Software

---

**Last Updated: October 14, 2009**

This document provides basic information about the command-line interface (CLI) in Cisco IOS software and how you can use some of the CLI features. This document contains the following sections:

- [Initially Configuring a Device, page i](#)
- [Using the CLI, page ii](#)
- [Saving Changes to a Configuration, page xi](#)
- [Additional Information, page xii](#)

For more information about using the CLI, see the “[Using the Cisco IOS Command-Line Interface](#)” section of the *Cisco IOS Configuration Fundamentals Configuration Guide*.

For information about the software documentation set, see the “[About Cisco IOS Software Documentation](#)” document.

## Initially Configuring a Device

Initially configuring a device varies by platform. For information about performing an initial configuration, see the hardware installation documentation that is provided with the original packaging of the product or go to the Product/Technologies Support area of Cisco.com at <http://www.cisco.com/go/techdocs>.

After you have performed the initial configuration and connected the device to your network, you can configure the device by using the console port or a remote access method, such as Telnet or Secure Shell (SSH), to access the CLI or by using the configuration method provided on the device, such as Security Device Manager.

### Changing the Default Settings for a Console or AUX Port

There are only two changes that you can make to a console port and an AUX port:

- Change the port speed with the **config-register 0x** command. Changing the port speed is not recommended. The well-known default speed is 9600.
- Change the behavior of the port; for example, by adding a password or changing the timeout value.

**Note**

The AUX port on the Route Processor (RP) installed in a Cisco ASR 1000 series router does not serve any useful customer purpose and should be accessed only under the advisement of a customer support representative.

## Using the CLI

This section describes the following topics:

- [Understanding Command Modes, page ii](#)
- [Using the Interactive Help Feature, page v](#)
- [Understanding Command Syntax, page vi](#)
- [Understanding Enable and Enable Secret Passwords, page vii](#)
- [Using the Command History Feature, page viii](#)
- [Abbreviating Commands, page ix](#)
- [Using Aliases for CLI Commands, page ix](#)
- [Using the no and default Forms of Commands, page x](#)
- [Using the debug Command, page x](#)
- [Filtering Output Using Output Modifiers, page x](#)
- [Understanding CLI Error Messages, page xi](#)

## Understanding Command Modes

The CLI command mode structure is hierarchical, and each mode supports a set of specific commands. This section describes the most common of the many modes that exist.

[Table 1](#) lists common command modes with associated CLI prompts, access and exit methods, and a brief description of how each mode is used.

**Table 1**     *CLI Command Modes*

Command Mode	Access Method	Prompt	Exit Method	Mode Usage
User EXEC	Log in.	Router>	Issue the <b>logout</b> or <b>exit</b> command.	<ul style="list-style-type: none"> <li>• Change terminal settings.</li> <li>• Perform basic tests.</li> <li>• Display device status.</li> </ul>
Privileged EXEC	From user EXEC mode, issue the <b>enable</b> command.	Router#	Issue the <b>disable</b> command or the <b>exit</b> command to return to user EXEC mode.	<ul style="list-style-type: none"> <li>• Issue <b>show</b> and <b>debug</b> commands.</li> <li>• Copy images to the device.</li> <li>• Reload the device.</li> <li>• Manage device configuration files.</li> <li>• Manage device file systems.</li> </ul>
Global configuration	From privileged EXEC mode, issue the <b>configure terminal</b> command.	Router(config)#	Issue the <b>exit</b> command or the <b>end</b> command to return to privileged EXEC mode.	Configure the device.
Interface configuration	From global configuration mode, issue the <b>interface</b> command.	Router(config-if)#	Issue the <b>exit</b> command to return to global configuration mode or the <b>end</b> command to return to privileged EXEC mode.	Configure individual interfaces.
Line configuration	From global configuration mode, issue the <b>line vty</b> or <b>line console</b> command.	Router(config-line)#	Issue the <b>exit</b> command to return to global configuration mode or the <b>end</b> command to return to privileged EXEC mode.	Configure individual terminal lines.

**Table 1** CLI Command Modes (continued)

Command Mode	Access Method	Prompt	Exit Method	Mode Usage
ROM monitor	From privileged EXEC mode, issue the <b>reload</b> command. Press the <b>Break</b> key during the first 60 seconds while the system is booting.	rommon # >  The # symbol represents the line number and increments at each prompt.	Issue the <b>continue</b> command.	<ul style="list-style-type: none"> <li>Run as the default operating mode when a valid image cannot be loaded.</li> <li>Access the fall-back procedure for loading an image when the device lacks a valid image and cannot be booted.</li> <li>Perform password recovery when a Ctrl-Break sequence is issued within 60 seconds of a power-on or reload event.</li> </ul>
Diagnostic (available only on Cisco ASR 1000 series routers)	<p>The router boots or enters diagnostic mode in the following scenarios. When a Cisco IOS process or processes fail, in most scenarios the router will reload.</p> <ul style="list-style-type: none"> <li>A user-configured access policy was configured using the <b>transport-map</b> command, which directed the user into diagnostic mode.</li> <li>The router was accessed using an RP auxiliary port.</li> <li>A break signal (<b>Ctrl-C</b>, <b>Ctrl-Shift-6</b>, or the <b>send break</b> command) was entered, and the router was configured to enter diagnostic mode when the break signal was received.</li> </ul>	Router(diag)#	<p>If a Cisco IOS process failure is the reason for entering diagnostic mode, the failure must be resolved and the router must be rebooted to exit diagnostic mode.</p> <p>If the router is in diagnostic mode because of a transport-map configuration, access the router through another port or use a method that is configured to connect to the Cisco IOS CLI.</p> <p>If the RP auxiliary port was used to access the router, use another port for access. Accessing the router through the auxiliary port is not useful for customer purposes.</p>	<ul style="list-style-type: none"> <li>Inspect various states on the router, including the Cisco IOS state.</li> <li>Replace or roll back the configuration.</li> <li>Provide methods of restarting the Cisco IOS software or other processes.</li> <li>Reboot hardware (such as the entire router, an RP, an ESP, a SIP, a SPA) or other hardware components.</li> <li>Transfer files into or off of the router using remote access methods such as FTP, TFTP, and SCP.</li> </ul>

EXEC commands are not saved when the software reboots. Commands that you issue in a configuration mode can be saved to the startup configuration. If you save the running configuration to the startup configuration, these commands will execute when the software is rebooted. Global configuration mode is the highest level of configuration mode. From global configuration mode, you can enter a variety of other configuration modes, including protocol-specific modes.

ROM monitor mode is a separate mode that is used when the software cannot load properly. If a valid software image is not found when the software boots or if the configuration file is corrupted at startup, the software might enter ROM monitor mode. Use the question symbol (?) to view the commands that you can use while the device is in ROM monitor mode.

```
rommon 1 > ?
alias                set and display aliases command
boot                 boot up an external process
confreg              configuration register utility
cont                 continue executing a downloaded image
context              display the context of a loaded image
cookie               display contents of cookie PROM in hex
.
.
.
rommon 2 >
```

The following example shows how the command prompt changes to indicate a different command mode:

```
Router> enable
Router# configure terminal
Router(config)# interface ethernet 1/1
Router(config-if)# ethernet
Router(config-line)# exit
Router(config)# end
Router#
```

**Note**

A keyboard alternative to the **end** command is Ctrl-Z.

## Using the Interactive Help Feature

The CLI includes an interactive Help feature. [Table 2](#) describes the purpose of the CLI interactive Help commands.

**Table 2** CLI Interactive Help Commands

Command	Purpose
<b>help</b>	Provides a brief description of the Help feature in any command mode.
<b>?</b>	Lists all commands available for a particular command mode.
<i>partial command?</i>	Provides a list of commands that begin with the character string (no space between the command and the question mark).
<i>partial command</i> <Tab>	Completes a partial command name (no space between the command and <Tab>).
<i>command ?</i>	Lists the keywords, arguments, or both associated with the command (space between the command and the question mark).
<i>command keyword ?</i>	Lists the arguments that are associated with the keyword (space between the keyword and the question mark).

The following examples show how to use the help commands:

### **help**

```
Router> help
```

Help may be requested at any point in a command by entering a question mark '?'. If nothing matches, the help list will be empty and you must backup until entering a '?' shows the available options.

Two styles of help are provided:

1. Full help is available when you are ready to enter a command argument (e.g. 'show ?') and describes each possible argument.
2. Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (e.g. 'show pr?'.)

### **?**

```
Router# ?
```

```
Exec commands:
```

access-enable	Create a temporary access-List entry
access-profile	Apply user-profile to interface
access-template	Create a temporary access-List entry
alps	ALPS exec commands
archive	manage archive files

```
<snip>
```

### **partial command?**

```
Router(config)# zo?
```

```
zone zone-pair
```

### **partial command<Tab>**

```
Router(config)# we<Tab> webvpn
```

### **command ?**

```
Router(config-if)# pppoe ?
```

enable	Enable pppoe
max-sessions	Maximum PPPOE sessions

### **command keyword ?**

```
Router(config-if)# pppoe enable ?
```

group	attach a BBA group
-------	--------------------

```
<cr>
```

## Understanding Command Syntax

Command syntax is the format in which a command should be entered in the CLI. Commands include the name of the command, keywords, and arguments. Keywords are alphanumeric strings that are used literally. Arguments are placeholders for values that a user must supply. Keywords and arguments may be required or optional.

Specific conventions convey information about syntax and command elements. [Table 3](#) describes these conventions.

**Table 3**     *CLI Syntax Conventions*

Symbol/Text	Function	Notes
< > (angle brackets)	Indicate that the option is an argument.	Sometimes arguments are displayed without angle brackets.
A.B.C.D.	Indicates that you must enter a dotted decimal IP address.	Angle brackets (< >) are not always used to indicate that an IP address is an argument.
WORD (all capital letters)	Indicates that you must enter one word.	Angle brackets (< >) are not always used to indicate that a WORD is an argument.
LINE (all capital letters)	Indicates that you must enter more than one word.	Angle brackets (< >) are not always used to indicate that a LINE is an argument.
<cr> (carriage return)	Indicates the end of the list of available keywords and arguments, and also indicates when keywords and arguments are optional. When <cr> is the only option, you have reached the end of the branch or the end of the command if the command has only one branch.	—

The following examples show syntax conventions:

```
Router(config)# ethernet cfm domain ?
WORD domain name
Router(config)# ethernet cfm domain dname ?
level
Router(config)# ethernet cfm domain dname level ?
<0-7> maintenance level number
Router(config)# ethernet cfm domain dname level 7 ?
<cr>

Router(config)# snmp-server file-transfer access-group 10 ?
protocol protocol options
<cr>

Router(config)# logging host ?
Hostname or A.B.C.D IP address of the syslog server
ipv6 Configure IPv6 syslog server
```

## Understanding Enable and Enable Secret Passwords

Some privileged EXEC commands are used for actions that impact the system, and it is recommended that you set a password for these commands to prevent unauthorized use. Two types of passwords, enable (not encrypted) and enable secret (encrypted), can be set. The following commands set these passwords and are issued in global configuration mode:

- **enable password**
- **enable secret password**

Using an enable secret password is recommended because it is encrypted and more secure than the enable password. When you use an enable secret password, text is encrypted (unreadable) before it is written to the config.text file. When you use an enable password, the text is written as entered (readable) to the config.text file.

Each type of password is case sensitive, can contain from 1 to 25 uppercase and lowercase alphanumeric characters, and can start with a numeral. Spaces are also valid password characters; for example, “two words” is a valid password. Leading spaces are ignored, but trailing spaces are recognized.

**Note**

Both password commands have numeric keywords that are single integer values. If you choose a numeral for the first character of your password followed by a space, the system will read the number as if it were the numeric keyword and not as part of your password.

When both passwords are set, the enable secret password takes precedence over the enable password.

To remove a password, use the **no** form of the commands: **no enable password** or **no enable secret password**.

For more information about password recovery procedures for Cisco products, see [http://www.cisco.com/en/US/products/sw/iosswrel/ps1831/products\\_tech\\_note09186a00801746e6.shtml](http://www.cisco.com/en/US/products/sw/iosswrel/ps1831/products_tech_note09186a00801746e6.shtml).

## Using the Command History Feature

The command history feature saves, in a command history buffer, the commands that you enter during a session. The default number of saved commands is 10, but the number is configurable within the range of 0 to 256. This command history feature is particularly useful for recalling long or complex commands.

To change the number of commands saved in the history buffer for a terminal session, issue the **terminal history size** command:

```
Router# terminal history size num
```

A command history buffer is also available in line configuration mode with the same default and configuration options. To set the command history buffer size for a terminal session in line configuration mode, issue the **history** command:

```
Router(config-line)# history [size num]
```

To recall commands from the history buffer, use the following methods:

- Press Ctrl-P or the Up Arrow key—Recalls commands beginning with the most recent command. Repeat the key sequence to recall successively older commands.
- Press Ctrl-N or the Down Arrow key—Recalls the most recent commands in the history buffer after they have been recalled using Ctrl-P or the Up Arrow key. Repeat the key sequence to recall successively more recent commands.

**Note**

The arrow keys function only on ANSI-compatible terminals such as the VT100.

- Issue the **show history** command in user EXEC or privileged EXEC mode—Lists the most recent commands that you entered. The number of commands that are displayed is determined by the setting of the **terminal history size** and **history** commands.

The command history feature is enabled by default. To disable this feature for a terminal session, issue the **terminal no history** command in user EXEC or privileged EXEC mode or the **no history** command in line configuration mode.

## Abbreviating Commands

Typing a complete command name is not always required for the command to execute. The CLI recognizes an abbreviated command when the abbreviation contains enough characters to uniquely identify the command. For example, the **show version** command can be abbreviated as **sh ver**. It cannot be abbreviated as **s ver** because **s** could mean **show**, **set**, or **systat**. The **sh v** abbreviation also is not valid because the **show** command has **vrp** as a keyword in addition to **version**. (Command and keyword examples are from Cisco IOS Release 12.4(13)T.)

## Using Aliases for CLI Commands

To save time and the repetition of entering the same command multiple times, you can use a command alias. An alias can be configured to do anything that can be done at the command line, but an alias cannot move between modes, type in passwords, or perform any interactive functions.

Table 4 shows the default command aliases.

**Table 4**     *Default Command Aliases*

Command Alias	Original Command
<b>h</b>	help
<b>lo</b>	logout
<b>p</b>	ping
<b>s</b>	show
<b>u</b> or <b>un</b>	undebug
<b>w</b>	where

To create a command alias, issue the **alias** command in global configuration mode. The syntax of the command is **alias mode command-alias original-command**. Following are some examples:

- Router(config)# **alias exec prt partition**—privileged EXEC mode
- Router(config)# **alias configure sb source-bridge**—global configuration mode
- Router(config)# **alias interface rl rate-limit**—interface configuration mode

To view both default and user-created aliases, issue the **show alias** command.

For more information about the **alias** command, see

[http://www.cisco.com/en/US/docs/ios/fundamentals/command/reference/cf\\_a1.html](http://www.cisco.com/en/US/docs/ios/fundamentals/command/reference/cf_a1.html).

## Using the no and default Forms of Commands

Most configuration commands have a **no** form that is used to reset a command to its default value or disable a feature or function. For example, the **ip routing** command is enabled by default. To disable this command, you would issue the **no ip routing** command. To re-enable IP routing, you would issue the **ip routing** command.

Configuration commands may also have a **default** form, which returns the command settings to their default values. For commands that are disabled by default, using the **default** form has the same effect as using the **no** form of the command. For commands that are enabled by default and have default settings, the **default** form enables the command and returns the settings to their default values.

The **no** form is documented in the command pages of command references. The **default** form is generally documented in the command pages only when the **default** form performs a different function than the plain and **no** forms of the command. To see what **default** commands are available on your system, enter **default ?** in the appropriate command mode.

## Using the debug Command

A **debug** command produces extensive output that helps you troubleshoot problems in your network. These commands are available for many features and functions within Cisco IOS software. Some **debug** commands are **debug all**, **debug aaa accounting**, and **debug mpls packets**. To use **debug** commands during a Telnet session with a device, you must first enter the **terminal monitor** command. To turn off debugging completely, you must enter the **undebg all** command.

For more information about **debug** commands, see the *Cisco IOS Debug Command Reference* at [http://www.cisco.com/en/US/docs/ios/debug/command/reference/db\\_book.html](http://www.cisco.com/en/US/docs/ios/debug/command/reference/db_book.html).

### Caution

Debugging is a high priority and high CPU utilization process that can render your device unusable. Use **debug** commands only to troubleshoot specific problems. The best times to run debugging are during periods of low network traffic and when few users are interacting with the network. Debugging during these periods decreases the likelihood that the **debug** command processing overhead will affect network performance or user access or response times.

## Filtering Output Using Output Modifiers

Many commands produce lengthy output that may use several screens to display. Using output modifiers, you can filter this output to show only the information that you want to see.

The following three output modifiers are available:

- **begin** *regular-expression*—Displays the first line in which a match of the regular expression is found and all lines that follow.
- **include** *regular-expression*—Displays all lines in which a match of the regular expression is found.
- **exclude** *regular-expression*—Displays all lines except those in which a match of the regular expression is found.

To use one of these output modifiers, type the command followed by the pipe symbol (**|**), the modifier, and the regular expression that you want to search for or filter. A regular expression is a case-sensitive alphanumeric pattern. It can be a single character or number, a phrase, or a more complex string.

The following example illustrates how to filter output of the **show interface** command to display only lines that include the expression “protocol.”

```
Router# show interface | include protocol

FastEthernet0/0 is up, line protocol is up
Serial4/0 is up, line protocol is up
Serial4/1 is up, line protocol is up
Serial4/2 is administratively down, line protocol is down
Serial4/3 is administratively down, line protocol is down
```

## Understanding CLI Error Messages

You may encounter some error messages while using the CLI. [Table 5](#) shows the common CLI error messages.

**Table 5** Common CLI Error Messages

Error Message	Meaning	How to Get Help
% Ambiguous command: “show con”	You did not enter enough characters for the command to be recognized.	Reenter the command followed by a space and a question mark (?). The keywords that you are allowed to enter for the command appear.
% Incomplete command.	You did not enter all the keywords or values required by the command.	Reenter the command followed by a space and a question mark (?). The keywords that you are allowed to enter for the command appear.
% Invalid input detected at “^” marker.	You entered the command incorrectly. The caret (^) marks the point of the error.	Enter a question mark (?) to display all the commands that are available in this command mode. The keywords that you are allowed to enter for the command appear.

For more system error messages, see the following document:

- [Cisco IOS Release 12.4T System Message Guide](#)

## Saving Changes to a Configuration

To save changes that you made to the configuration of a device, you must issue the **copy running-config startup-config** command or the **copy system:running-config nvram:startup-config** command. When you issue these commands, the configuration changes that you made are saved to the startup configuration and saved when the software reloads or power to the device is turned off or interrupted. The following example shows the syntax of the **copy running-config startup-config** command:

```
Router# copy running-config startup-config
Destination filename [startup-config]?
```

You press Enter to accept the startup-config filename (the default), or type a new filename and then press Enter to accept that name. The following output is displayed indicating that the configuration was saved.

```
Building configuration...
[OK]
Router#
```

On most platforms, the configuration is saved to NVRAM. On platforms with a Class A flash file system, the configuration is saved to the location specified by the CONFIG\_FILE environment variable. The CONFIG\_FILE variable defaults to NVRAM.

# About Cisco IOS Software Documentation

---

**Last Updated: November 20, 2009**

This document describes the objectives, audience, conventions, and organization used in Cisco IOS software documentation. Also included are resources for obtaining technical assistance, additional documentation, and other information from Cisco. This document is organized into the following sections:

- [Documentation Objectives, page i](#)
- [Audience, page i](#)
- [Documentation Conventions, page i](#)
- [Documentation Organization, page iii](#)
- [Additional Resources and Documentation Feedback, page xi](#)

## Documentation Objectives

Cisco IOS documentation describes the tasks and commands available to configure and maintain Cisco networking devices.

## Audience

The Cisco IOS documentation set is intended for users who configure and maintain Cisco networking devices (such as routers and switches) but who may not be familiar with the configuration and maintenance tasks, the relationship among tasks, or the Cisco IOS commands necessary to perform particular tasks. The Cisco IOS documentation set is also intended for those users experienced with Cisco IOS software who need to know about new features, new configuration options, and new software characteristics in the current Cisco IOS release.

## Documentation Conventions

In Cisco IOS documentation, the term *router* may be used to refer to various Cisco products; for example, routers, access servers, and switches. These and other networking devices that support Cisco IOS software are shown interchangeably in examples and are used only for illustrative purposes. An example that shows one product does not necessarily mean that other products are not supported.

This section contains the following topics:

- [Typographic Conventions, page ii](#)
- [Command Syntax Conventions, page ii](#)
- [Software Conventions, page iii](#)
- [Reader Alert Conventions, page iii](#)

## Typographic Conventions

Cisco IOS documentation uses the following typographic conventions:

Convention	Description
<b>^</b> or Ctrl	Both the ^ symbol and Ctrl represent the Control (Ctrl) key on a keyboard. For example, the key combination <b>^D</b> or <b>Ctrl-D</b> means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)
<i>string</i>	A string is a nonquoted set of characters shown in italics. For example, when setting a Simple Network Management Protocol (SNMP) community string to <i>public</i> , do not use quotation marks around the string; otherwise, the string will include the quotation marks.

## Command Syntax Conventions

Cisco IOS documentation uses the following command syntax conventions:

Convention	Description
<b>bold</b>	Bold text indicates commands and keywords that you enter as shown.
<i>italic</i>	Italic text indicates arguments for which you supply values.
[x]	Square brackets enclose an optional keyword or argument.
...	An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.
	A vertical line, called a pipe, that is enclosed within braces or square brackets indicates a choice within a set of keywords or arguments.
[x   y]	Square brackets enclosing keywords or arguments separated by a pipe indicate an optional choice.
{x   y}	Braces enclosing keywords or arguments separated by a pipe indicate a required choice.
[x {y   z}]	Braces and a pipe within square brackets indicate a required choice within an optional element.

## Software Conventions

Cisco IOS software uses the following program code conventions:

Convention	Description
Courier font	Courier font is used for information that is displayed on a PC or terminal screen.
<b>Bold Courier font</b>	Bold Courier font indicates text that the user must enter.
< >	Angle brackets enclose text that is not displayed, such as a password. Angle brackets also are used in contexts in which the italic font style is not supported; for example, ASCII text.
!	An exclamation point at the beginning of a line indicates that the text that follows is a comment, not a line of code. An exclamation point is also displayed by Cisco IOS software for certain processes.
[ ]	Square brackets enclose default responses to system prompts.

## Reader Alert Conventions

Cisco IOS documentation uses the following conventions for reader alerts:

### Caution

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

### Note

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

### Timesaver

Means *the described action saves time*. You can save time by performing the action described in the paragraph.

## Documentation Organization

This section describes the Cisco IOS documentation set, how it is organized, and how to access it on Cisco.com. It also lists the configuration guides, command references, and supplementary references and resources that comprise the documentation set. It contains the following topics:

- [Cisco IOS Documentation Set, page iv](#)
- [Cisco IOS Documentation on Cisco.com, page iv](#)
- [Configuration Guides, Command References, and Supplementary Resources, page v](#)

# Cisco IOS Documentation Set

The Cisco IOS documentation set consists of the following:

- Release notes and caveats provide information about platform, technology, and feature support for a release and describe severity 1 (catastrophic), severity 2 (severe), and select severity 3 (moderate) defects in released Cisco IOS software. Review release notes before other documents to learn whether updates have been made to a feature.
- Sets of configuration guides and command references organized by technology and published for each standard Cisco IOS release.
  - Configuration guides—Compilations of documents that provide conceptual and task-oriented descriptions of Cisco IOS features.
  - Command references—Compilations of command pages in alphabetical order that provide detailed information about the commands used in the Cisco IOS features and the processes that comprise the related configuration guides. For each technology, there is a single command reference that supports all Cisco IOS releases and that is updated at each standard release.
- Lists of all the commands in a specific release and all commands that are new, modified, removed, or replaced in the release.
- Command reference book for **debug** commands. Command pages are listed in alphabetical order.
- Reference book for system messages for all Cisco IOS releases.

## Cisco IOS Documentation on Cisco.com

The following sections describe the organization of the Cisco IOS documentation set and how to access various document types.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### New Features List

The New Features List for each release provides a list of all features in the release with hyperlinks to the feature guides in which they are documented.

### Feature Guides

Cisco IOS features are documented in feature guides. Feature guides describe one feature or a group of related features that are supported on many different software releases and platforms. Your Cisco IOS software release or platform may not support all the features documented in a feature guide. See the Feature Information table at the end of the feature guide for information about which features in that guide are supported in your software release.

### Configuration Guides

Configuration guides are provided by technology and release and comprise a set of individual feature guides relevant to the release and technology.

### Command References

Command reference books contain descriptions of Cisco IOS commands that are supported in many different software releases and on many different platforms. The books are organized by technology. For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

### Cisco IOS Supplementary Documents and Resources

Supplementary documents and resources are listed in [Table 2 on page xi](#).

## Configuration Guides, Command References, and Supplementary Resources

[Table 1](#) lists, in alphabetical order, Cisco IOS software configuration guides and command references, including brief descriptions of the contents of the documents. The Cisco IOS command references contain commands for Cisco IOS software for all releases. The configuration guides and command references support many different software releases and platforms. Your Cisco IOS software release or platform may not support all these technologies.

[Table 2](#) lists documents and resources that supplement the Cisco IOS software configuration guides and command references. These supplementary resources include release notes and caveats; master command lists; new, modified, removed, and replaced command lists; system messages; and the debug command reference.

For additional information about configuring and operating specific networking devices, and to access Cisco IOS documentation, go to the Product/Technologies Support area of Cisco.com at the following location:

<http://www.cisco.com/go/techdocs>

<ul style="list-style-type: none"> <li>• <i>Cisco IOS Wide-Area Networking Configuration Guide</i></li> <li>• <i>Cisco IOS Wide-Area Networking Command Reference</i></li> </ul>	Frame Relay; Layer 2 Tunnel Protocol Version 3 (L2TPv3); L2VPN Pseudowire Redundancy; L2VPN Interworking; Layer 2 Local Switching; Link Access Procedure, Balanced (LAPB); and X.25.
<ul style="list-style-type: none"> <li>• <i>Cisco IOS Wireless LAN Configuration Guide</i></li> <li>• <i>Cisco IOS Wireless LAN Command Reference</i></li> </ul>	Broadcast key rotation, IEEE 802.11x support, IEEE 802.1x authenticator, IEEE 802.1x local authentication service for Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling (EAP-FAST), Multiple Basic Service Set ID (BSSID), Wi-Fi Multimedia (WMM) required elements, and Wi-Fi Protected Access (WPA).

Table 2 lists documents and resources that supplement the Cisco IOS software configuration guides and command references.

**Table 2** Cisco IOS Supplementary Documents and Resources

Document Title or Resource	Description
<i>Cisco IOS Master Command List, All Releases</i>	Alphabetical list of all the commands documented in all Cisco IOS releases.
<i>Cisco IOS New, Modified, Removed, and Replaced Commands</i>	List of all the new, modified, removed, and replaced commands for a Cisco IOS release.
<i>Cisco IOS System Message Guide</i>	List of Cisco IOS system messages and descriptions. System messages may indicate problems with your system, may be informational only, or may help diagnose problems with communications lines, internal hardware, or system software.
<i>Cisco IOS Debug Command Reference</i>	Alphabetical list of <b>debug</b> commands including brief descriptions of use, command syntax, and usage guidelines.
Release Notes and Caveats	Information about new and changed features, system requirements, and other useful information about specific software releases; information about defects in specific Cisco IOS software releases.
MIBs	Files used for network monitoring. To locate and download MIBs for selected platforms, Cisco IOS releases, and feature sets, use <a href="#">Cisco MIB Locator</a> .
RFCs	Standards documents maintained by the Internet Engineering Task Force (IETF) that Cisco IOS documentation references where applicable. The full text of referenced RFCs may be obtained at the following URL:  <a href="http://www.rfc-editor.org/">http://www.rfc-editor.org/</a>

## Additional Resources and Documentation Feedback

*What's New in Cisco Product Documentation* is released monthly and describes all new and revised Cisco technical documentation. The *What's New in Cisco Product Documentation* publication also provides information about obtaining the following resources:

- Technical documentation
- Cisco product security overview
- Product alerts and field notices
- Technical assistance

Cisco IOS technical documentation includes embedded feedback forms where you can rate documents and provide suggestions for improvement. Your feedback helps us improve our documentation.

## **Basic MPLS**

# MPLS Static Labels

---

**First Published: October 2002**

**Last Updated: July 13, 2007**

This document describes the Cisco MPLS Static Labels feature. It identifies the supported platforms, provides configuration examples, and lists related Cisco IOS command-line interface (CLI) commands.

## **Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## **History for the MPLS Static Labels feature**

<b>Release</b>	<b>Modification</b>
12.0(23)S	This feature was introduced.
12.2(33)SRA	This feature was integrated into Cisco IOS Release 12.2(33)SRA.
12.2(33)SXH	This feature was integrated into Cisco IOS Release 12.2(33)SXH.

# Feature Overview

Generally, label switching routers (LSRs) dynamically learn the labels they should use to label-switch packets by means of label distribution protocols that include:

- Label Distribution Protocol (LDP), the Internet Engineering Task Force (IETF) standard, used to bind labels to network addresses
- Resource Reservation Protocol (RSVP) used to distribute labels for traffic engineering (TE)
- Border Gateway Protocol (BGP) used to distribute labels for Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs)

To use a learned label to label-switch packets, an LSR installs the label into its Label Forwarding Information Base (LFIB).

The MPLS Static Labels feature provides the means to configure statically:

- The binding between a label and an IPv4 prefix
- The contents of an LFIB crossconnect entry

## Benefits

### Static Bindings Between Labels and IPv4 Prefixes

Static bindings between labels and IPv4 prefixes can be configured to support MPLS hop-by-hop forwarding through neighbor routers that do not implement LDP label distribution.

### Static Crossconnects

Static crossconnects can be configured to support MPLS Label Switched Path (LSP) midpoints when neighbor routers do not implement either the LDP or RSVP label distribution, but do implement an MPLS forwarding path.

## Restrictions

- The trouble shooting process for MPLS static labels is complex.
- On a provider edge (PE) router for MPLS VPNs, there is no mechanism for statically binding a label to a customer network prefix (VPN IPv4 prefix).
- MPLS static crossconnect labels remain in the LFIB even if the router to which the entry points goes down.
- MPLS static crossconnect mappings remain in effect even with topology changes.
- MPLS static labels are not supported for label-controlled Asynchronous Transfer Mode (lc-atm).
- MPLS static bindings are not supported for local prefixes.

## Prerequisites

The network must support the following Cisco IOS features before you enable MPLS static labels:

- Multiprotocol Label Switching (MPLS)
- IP Cisco Express Forwarding

# Configuration Tasks

See the following sections for the configuration tasks for the this feature:

- [Configuring MPLS Static Prefix/Label Bindings, page 3](#) (required)
- [Verifying MPLS Static Prefix/Label Bindings, page 3](#) (optional)
- [Configuring MPLS Static Crossconnects, page 4](#) (required)
- [Verifying MPLS Static Crossconnect Configuration, page 4](#) (optional)

## Configuring MPLS Static Prefix/Label Bindings

To configure MPLS static prefix/label bindings, use the following commands beginning in global configuration mode:

	Command	Purpose
<b>Step 1</b>	Router# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	Router(config)# <b>mpls label range</b> <i>min-label max-label [static</i> <i>min-static-label max-static-label]</i>	Specifies a range of labels for use with MPLS Static Labels feature.  (Default is no labels reserved for static assignment.)
<b>Step 3</b>	Router(config)# <b>mpls static binding ipv4</b> <i>prefix mask [input   output nexthop]</i> <i>label</i>	Specifies static binding of labels to IPv4 prefixes.  Bindings specified are installed automatically in the MPLS forwarding table as routing demands.

## Verifying MPLS Static Prefix/Label Bindings

To verify the configuration for MPLS static prefix/label bindings, use this procedure:

- Step 1** Enter **show mpls label range** command. The output shows that the new label ranges do not take effect until a reload occurs:

```
Router# show mpls label range

Downstream label pool: Min/Max label: 16/100000
    [Configured range for next reload: Min/Max label: 200/100000]
Range for static labels: Min/Max/Number: 16/199
```

The following output from the **show mpls label range** command, executed after a reload, indicates that the new label ranges are in effect:

```
Router# show mpls label range

Downstream label pool: Min/Max label: 200/100000
Range for static labels: Min/Max/Number: 16/199
```

- Step 2** Enter the **show mpls static binding ipv4** command to show the configured static prefix/label bindings:

```
Router# show mpls static binding ipv4

10.17.17.17/32: Incoming label: 251 (in LIB)
```

```

    Outgoing labels:
      10.0.0.1          18
10.18.18.18/32: Incoming label: 201 (in LIB)
    Outgoing labels:
10.0.0.1implicit-null

```

- Step 3** Use the **show mpls forwarding-table** command to determine which static prefix/label bindings are currently in use for MPLS forwarding.

```
Router# show mpls forwarding-table
```

Local tag	Outgoing tag or VC	Prefix or Tunnel Id	Bytes tag switched	Outgoing interface	Next Hop
201	Pop tag	10.18.18.18/32	0	PO1/1/0	point2point
	2/35	10.18.18.18/32	0	AT4/1/0.1	point2point
251	18	10.17.17.17/32	0	PO1/1/0	point2point

## Configuring MPLS Static Crossconnects

To configure MPLS static crossconnects, use the following command beginning in global configuration mode:

	Command	Purpose
<b>Step 1</b>	Router# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	Router(config)# <b>mpls label range</b> <i>min-label max-label [static</i> <i>min-static-label max-static-label]</i>	Specifies a range of labels for use with MPLS Static Labels feature.  (Default is no labels reserved for static assignment.)
<b>Step 3</b>	Router(config)# <b>mpls static binding ipv4</b> <i>prefix mask [input   output nexthop]</i> <i>label</i>	Specifies static binding of labels to IPv4 prefixes.  Bindings specified are installed automatically in the MPLS forwarding table as routing demands.

## Verifying MPLS Static Crossconnect Configuration

To verify the configuration for MPLS static crossconnects, use this procedure:

- Step 1** Use the **show mpls static crossconnect** command to display information about crossconnects that have been configured:

```
Router# show mpls static crossconnect
```

Local label	Outgoing label	Outgoing interface	Next Hop
34	22	pos3/0	point2point (in LFIB)

## Monitoring and Maintaining MPLS Static Labels

Refer to the following Table to monitor and maintain MPLS Static Labels.

Command	Purpose
Router# <b>show mpls forwarding-table</b>	Displays the contents of the MPLS LFIB.
Router# <b>show mpls label range</b>	Displays information about the static label range.
Router# <b>show mpls static binding ipv4</b>	Displays information about the configured static prefix/label bindings.
Router# <b>show mpls static crossconnect</b>	Displays information about the configured crossconnects.

## Configuration Examples

This section provides the following configuration examples for the MPLS Static Labels feature:

- [Configuring MPLS Static Prefixes/Labels Example, page 5](#)
- [Configuring MPLS Static Crossconnects Example, page 6](#)

### Configuring MPLS Static Prefixes/Labels Example

In the following output, the **mpls label range** command reconfigures the range used for dynamically assigned labels from 16 to 100000 to 200 to 100000 and configures a static label range of 16 to 199.

```
Router# configure terminal
```

```
Enter configuration commands, one per line. End with CNTL/Z.
```

```
Router(config)# mpls label range 200 100000 static 16 199
```

```
% Label range changes take effect at the next reload.
```

```
Router(config)# end
```

In the following output, the **show mpls label range** command indicates that the new label ranges do not take effect until a reload occurs:

```
Router# show mpls label range
```

```
Downstream label pool: Min/Max label: 16/100000  
[Configured range for next reload: Min/Max label: 200/100000]  
Range for static labels: Min/Max/Number: 16/199
```

In the following output, the **show mpls label range** command, executed after a reload, indicates that the new label ranges are in effect:

```
Router# show mpls label range
```

```
Downstream label pool: Min/Max label: 200/100000  
Range for static labels: Min/Max/Number: 16/199
```

In the following output, the **mpls static binding ipv4** commands configure static prefix/label bindings. They also configure input (local) and output (remote) labels for various prefixes:

```
Router# configure terminal
```

```
Enter configuration commands, one per line. End with CNTL/Z.
```

```
Router(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 55
```

```

Router(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 output 10.0.0.66 2607

Router(config)# mpls static binding ipv4 10.6.0.0 255.255.0.0 input 17

Router(config)# mpls static binding ipv4 10.0.0.0 255.0.0.0 output 10.13.0.8 explicit-null

Router(config)# end

```

In the following output, the **show mpls static binding ipv4** command displays the configured static prefix/label bindings:

```

Router# show mpls static binding ipv4

10.0.0.0/8: Incoming label: none;
    Outgoing labels:
10.13.0.8          explicit-null
10.0.0.0/8: Incoming label: 55 (in LIB)
    Outgoing labels:
    10.0.0.66          2607
10.66.0.0/16: Incoming label: 17 (in LIB)
    Outgoing labels:  None

```

## Configuring MPLS Static Crossconnects Example

In the following output, the **mpls static crossconnect** command configures a crossconnect from incoming label 34 to outgoing label 22 out interface pos3/0:

```

Router# configure terminal

Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# mpls static crossconnect 34 pos3/0 22

Router(config)# end

```

In the following output, the **show mpls static crossconnect** command displays the configured crossconnect:

```

Router# show mpls static crossconnect

Local  Outgoing  Outgoing  Next Hop
label  label     interface
34     22        pos3/0    point2point (in LFIB)

```

# Glossary

**BGP**—Border Gateway Protocol. The predominant interdomain routing protocol used in IP networks.

**Border Gateway Protocol**—See BGP.

**FIB**—Forwarding Information Base. A table that contains a copy of the forwarding information in the IP routing table.

**Forwarding Information Base**—See FIB.

**label**—A short, fixed-length identifier that tells switching nodes how the data (packets or cells) should be forwarded.

**label binding**—An association between a label and a set of packets, which can be advertised to neighbors so that a label switched path can be established.

**Label Distribution Protocol**—See LDP.

**Label Forwarding Information Base**—See LFIB.

**label imposition**—The act of putting the first label on a packet.

**label switching router**—See LSR.

**LDP**—Label Distribution Protocol. The protocol that supports MPLS hop-by-hop forwarding by distributing bindings between labels and network prefixes.

**LFIB**—Label Forwarding Information Base. A data structure in which destinations and incoming labels are associated with outgoing interfaces and labels.

**LSR**—label switching router. A Layer 3 router that forwards a packet based on the value of an identifier encapsulated in the packet.

**MPLS**—Multiprotocol Label Switching. An industry standard on which label switching is based.

**MPLS hop-by-hop forwarding**—The forwarding of packets along normally routed paths using MPLS forwarding mechanisms.

**Multiprotocol Label Switching**—See MPLS.

**Resource Reservation Protocol**—See RSVP.

**RIB**—Routing Information Base. A common database containing all the routing protocols running on a router.

**Routing Information Base**—See RIB.

**RSVP**—Resource Reservation Protocol. A protocol for reserving network resources to provide quality of service guarantees to application flows.

**traffic engineering**—Techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods were used.

**Virtual Private Network**—See VPN.

**VPN**—Virtual Private Network. A network that enables IP traffic to use tunneling to travel securely over a public TCP/IP network.

# NetFlow MPLS Label Export

---

**First Published: February 23, 2006**

**Last Updated: February 15, 2008**

The NetFlow MPLS Label Export feature allows a label switch router (LSR) to collect and export Multiprotocol Label Switching (MPLS) labels allocated by the LSR when an adjacent router pushes that label on the top of the label stack of a transit packet. At the same time, the LSR collects the prefix associated with the MPLS label and the application that allocated the label. The router collects the information in a table called the MPLS Prefix/Application/Label (PAL) table and exports this data to a NetFlow collector as the label is allocated or, if so configured, periodically exports the full MPLS PAL table.

You can use this information to create a provider edge (PE)-to-PE matrix, which is useful for network traffic planning and billing. To realize this benefit, you must export the MPLS label information to a NetFlow collector for analysis. This feature also provides information that a NetFlow collector can use to create a Virtual Private Network (VPN) routing and forwarding instance (VRF)-to-PE and PE-to-VRF matrix.

## Finding Feature Information in This Module

*Your Cisco IOS software release may not support all of the features documented in this module.* To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for NetFlow MPLS Label Export”](#) section on page 16.

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [How to Configure NetFlow MPLS Label Export, page 7](#)
- [Configuration Examples for NetFlow MPLS Label Export, page 12](#)
- [Additional References, page 13](#)
- [Command Reference, page 15](#)
- [Feature Information for NetFlow MPLS Label Export, page 16](#)
- [Glossary, page 17](#)

## Prerequisites for NetFlow MPLS Label Export

The NetFlow MPLS Label Export feature requires the following:

- NetFlow configured on the LSR
- MPLS enabled on the LSR

If you are exporting data to a Cisco NetFlow collector, the following requirements apply:

- NetFlow Version 9 export format configured on the LSR
- NetFlow collector and analyzer that can use MPLS PAL records exported in NetFlow Version 9 format

## Restrictions for NetFlow MPLS Label Export

The following restrictions apply to the NetFlow MPLS Label Export feature for Cisco IOS 12.2S releases and Cisco IOS Release 12.5(1):

- The MPLS PAL table does not support the export of information for the following:
  - IP Version 6 (IPv6) labels
  - IP Multicast labels
  - Quality of service (QoS) labels
  - Traffic engineering (TE) tunnel headend labels
- The ability to create a VRF-to-VRF traffic matrix is not supported.
- If one application deallocates a label and a second application soon reallocates the same label, the NetFlow collector might not be able to determine how many packets flowed while the label was owned by each application.
- In MPLS PAL table records, for labels allocated by VPNs, Border Gateway Protocol (BGP) IPv4, or BGP VPN Version 4 (VPNv4), the stored prefix can be either 0.0.0.0 or a route distinguisher (RD)-specific address:
  - If you do not configure the **mpls export vpnv4 prefixes** command, VPN prefixes are not tracked in the MPLS PAL table. These prefixes are displayed by the **show mpls flow mappings** command as 0.0.0.0.
  - If you configure the **mpls export vpnv4 prefixes** command, VPN prefixes are tracked and RD-specific addresses are displayed by the **show mpls flow mappings** command.

# Information About NetFlow MPLS Label Export

The following sections contain useful information for understanding how to configure and use the NetFlow MPLS Label Export feature:

- [MPLS Label Information Gathering and Exporting, page 3](#)
- [Labels Allocated by VPNs, BGP IPv4, or BGP VPNv4 in the MPLS PAL Table, page 4](#)
- [MPLS PAL Table Record Export, page 4](#)
- [MPLS PAL and NetFlow Statistics Correlation on a NetFlow Collector, page 6](#)
- [MPLS Label Mapping on a Line Card, page 7](#)

## MPLS Label Information Gathering and Exporting

In a Cisco IOS 12.0S, 12.3T, or 12.4T release that supports the MPLS-Aware NetFlow feature, the mapping of the MPLS label to a prefix and an MPLS application is achieved through the use of the Label Forwarding Information Base (LFIB). You can display this information with the **show ip cache verbose flow** command. These releases do not support the NetFlow MPLS Label Export feature.

In a Cisco IOS 12.2(28)SB release or later release that supports the NetFlow MPLS Label Export feature, the mapping of the MPLS label to a destination prefix or Forwarding Equivalence Class (FEC) and to the MPLS application currently using the label is achieved through the use of an MPLS PAL table. Each supported MPLS application on the router where the NetFlow MPLS Label Export feature is configured registers its label values, prefixes, and owning applications as the labels are allocated. This label-tracking functionality operates on the Route Processor (RP) software.

The MPLS label information (label to prefix and application) mapping is exported to a NetFlow collector at the time when the label is allocated. You can configure periodic export of the full MPLS PAL table to a collector for further processing and analysis through the use of the **mpls export interval** command.

An *interval* argument to the **mpls export interval** command controls the time in minutes between full MPLS PAL table exports to the NetFlow collector. You can configure an interval in the range of 0 to 10080 (1 week) minutes:

- If you want to export MPLS PAL table information only when the label is allocated, then configure this command with a 0 time interval with the **mpls export interval 0** command.
- If you want to trigger an immediate export of the full MPLS PAL table, reconfigure the command with an *interval* argument that is different from the interval that is configured. For example, if you have configured the **mpls export interval 1440** command, reconfigure the command with any nonzero number except 1440.
- If you have a complex network that generates a large amount of traffic, configure a large interval between MPLS PAL table exports. You might want to configure an interval from 6 to 12 hours (360 and 720 minutes).

The *interval* argument that you specify is the least amount of time that passes before another export of the MPLS PAL table occurs. The system could delay the MPLS PAL table export for 10 minutes if the PAL export queue already contains a large number of entries. This could happen if the export occurred at a time when thousands of routes just came up, or if NetFlow did not have the time to clear the export queue from either a previous export of the full table or a previous time when thousands of routes came up in a brief period of time.

After you have entered the **mpls export interval** command, you can use the **show mpls flow mappings** command to display MPLS PAL table entries. To display information about the number of MPLS PAL records exported to the collector, use the **show ip flow export verbose** command.

## Labels Allocated by VPNs, BGP IPv4, or BGP VPNv4 in the MPLS PAL Table

If you want to see VPN prefix information, that is, labels allocated by VPN, BGP IPv4, or BGP VPNv4, you need to configure the **mpls export vpnv4 prefixes** command. If you do not configure the **mpls export vpnv4 prefixes** command, MPLS PAL stores labels allocated by these application as prefix 0.0.0.0.

After you configure the **mpls export vpnv4 prefixes** command, the VPN prefix and the associated RD are stored in the MPLS PAL table. VPN addresses are made unique by adding an RD to the front of the address. The RD removes any ambiguity when the same VPN prefix is used for more than one VRF.

### Note

To export VPN prefixes and associated RDs from the MPLS PAL table, the first time you configure the **mpls export vpnv4 prefixes** command you need to save the configuration and reboot the router or clear all routes from the table.

To display the VPN prefix entries in the MPLS PAL table, use the **show mpls flow mappings** command.

With the **mpls export vpnv4 prefixes** command configured, a line of the output might look like this:

```
Router# show mpls flow mappings
```

Label	Owner	Route-Distinguisher	Prefix	Allocated
.				
.				
27	BGP	100:1	10.34.0.0	00:57:48

The format of the Route-Distinguisher field in the output depends on how the RD was configured. The RD can be configured in the as-number:network number (ASN:nn) format, as shown in the example, or it can be configured in the IP address:network number format (IP-address:nn).

If you did not configure the **mpls export vpnv4 prefixes** command, a line of the output looks like this:

```
Router# show mpls flow mappings
```

.				
.				
.				
Label	Owner	Route-Distinguisher	Prefix	Allocated
21	BGP		0.0.0.0	00:52:18

The Route-Distinguisher field is not populated and the Prefix is displayed as 0.0.0.0.

If the MPLS PAL table tracks a per-VRF aggregate label and you configured the **mpls export vpnv4 prefixes** command, the **show mpls flow mappings** command displays the RD associated with the per-VRF aggregate label, but the prefix for the per-VRF aggregate label is reported as 0.0.0.0. If the **mpls export vpnv4 prefixes** command is not configured, the per-VRF aggregate label is reported with no RD and prefix 0.0.0.0, and you cannot distinguish the per-VRF aggregate label from a normal BGP label.

## MPLS PAL Table Record Export

In Cisco IOS Release 12.0S and later releases, the export of MPLS-Aware NetFlow cache records makes use of the NetFlow Version 9 export format data and template. The export of MPLS PAL table entries also uses the NetFlow Version 9 export format. MPLS PAL packets are exported as NetFlow options packets rather than NetFlow data packets. NetFlow options packets are defined in *Cisco Systems NetFlow Services Export Version 9*, Request for Comments (RFC) 3954.

The RP on the PE router learns and queues the MPLS PAL table records for export. The RP can combine large numbers of PAL table entries in a single Version 9 record and send the record to the NetFlow collector. The information exported by the RP contains instances of the following for each tracked label:

Label, allocating-application (Owner), Route-Distinguisher, Prefix, time stamp (Allocated)

Because the mapping may change as labels expire and are reused, each PAL record contains a time stamp indicating the system uptime at which the label was allocated.

#### **NetFlow Export Template Format Used for MPLS PAL Entries**

This is the NetFlow Version 9 export template format used for MPLS PAL entries:

MPLS label: 3 bytes

MPLS label application type: 1 byte

MPLS label IP prefix: 4 bytes

MPLS VPN prefix RD: 8 bytes

MPLS label allocation time: 4 bytes

#### **MPLS Application Types Exported**

The following MPLS application types are exported in the MPLS label application type field:

TE = 1

ATOM = 2

VPN = 3

BGP = 4

LDP = 5

#### **Options Template and Options Data Record for MPLS PAL Record Export**

[Figure 1](#) shows an example of the options template and options data record for MPLS PAL record export. This example shows that MPLS label 44 was allocated by a VPN 0x03 at 08:50:20 and is associated with the IP address 10.20.0.20 and with RD 100:1.

**Figure 1**      **MPLS PAL Export Format Record**

## MPLS PAL and NetFlow Statistics Correlation on a NetFlow Collector

A NetFlow collector can gather the PAL NetFlow packets from a PE router and correlate the label mappings with the recent NetFlow records from adjacent provider core (P) routers.

For example, the MPLS PAL export packet contains MPLS label mappings over a period of time, as each label is allocated and reallocated on the PE router. The packet might contain the following information:

```
label 5, prefix 10.0.0.0, type LDP, 12:00:00
label 4, prefix 10.10.0.0, type LDP, 13:00:00
label 5, prefix 10.9.0.0, type VPN, 14:00:00
```

The NetFlow collector then receives a NetFlow packet from the adjacent P router indicating the following:

```
label 5, 123 packets, 9876 bytes, time 12:22:15.
```

The collector would match the time range known from the PAL packets with the line card (LC) packet time stamp. This would result in the correct mapping for label 5 at time 12:22:15, as follows:

```
label 5, application LDP, prefix 10.0.0.0.
```

The NetFlow collector needs to be able to handle relative differences in the time stamps caused by different reboot times of the P and PE routers.

To implement the offline label mapping checks in the NetFlow collector, the collector needs to maintain a history of label mappings obtained from the MPLS PAL NetFlow packets sent by the RP. If a label is deallocated and reallocated, the collector should track both the old and the new MPLS PAL information for the label.

**Note**

On a rare occasion, the collector might not be able to accurately track how many packets flowed for a label that has been deallocated by one application and soon reallocated by another application.

## MPLS Label Mapping on a Line Card

Label to prefix and application mapping is registered and exported from the router RP. This functionality does not occur on the line card. If you want to see the mapping for a particular label on a line card and the label of interest is tracked by the MPLS PAL table, then you can do the following:

- Enter the **show mpls forwarding** command on the line card.
- Enter the **show mpls flow mappings** on the RP.
- Compare the output of the two commands.

You might find the **| include** keyword to the commands useful in this case. For example, You could enter the **show mpls flow mappings | include 777** command to see the information for any label with substring 777.

## How to Configure NetFlow MPLS Label Export

Perform the following tasks to configure the NetFlow MPLS Label Export feature on an LSR. This feature provides the label, prefix, and application mapping through the MPLS PAL table that collects and exports the data to a NetFlow collector.

- [Configuring NetFlow MPLS Label Export and MPLS PAL Table Export, page 7](#) (required)
- [Displaying Information About the MPLS PAL Table, page 9](#) (optional)
- [Configuring the Export of MPLS VPN Version 4 Label Information from the MPLS PAL Table to a NetFlow Collector, page 10](#) (optional)

## Configuring NetFlow MPLS Label Export and MPLS PAL Table Export

Perform this task to configure the NetFlow MPLS Label Export feature and MPLS PAL table export to a NetFlow collector. You can use the information generated for network traffic planning and billing.

The following task must be completed before MPLS labels are allocated by the router for the MPLS PAL table to be exported to a NetFlow collector.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls export interval *interval***
4. **end**

5. `copy running-config startup-config`
6. `exit`
7. Reboot the router.

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>enable</code>  <b>Example:</b> <code>Router&gt; enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<code>configure terminal</code>  <b>Example:</b> <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	<code>mpls export interval interval</code>  <b>Example:</b> <code>Router(config)# mpls export interval 360</code>	Configures a periodic time interval for the export of the entire MPLS PAL table to a NetFlow collector. <ul style="list-style-type: none"> <li>The <i>interval</i> argument specifies the time in minutes between full PAL table exports. The range of valid time intervals is 0 to 10,080 minutes.</li> <li>We recommend that you select a time interval from 360 minutes (6 hours) to 1440 minutes (24 hours) depending on the size of your network and how often the NetFlow collector might be restarted.</li> <li>If you enter an interval of 0, full PAL table exports are disabled. PAL information is exported only as labels are allocated.</li> <li>If you need to restart your NetFlow collector and want to learn PAL information immediately, you can change the <i>interval</i> argument. When you change the time interval, the application exports the full PAL table.</li> </ul> <b>Note</b> Allocated labels are tracked only after you enter the <b>mpls export interval</b> command. Any labels allocated before you enter this command are not tracked.
Step 4	<code>end</code>  <b>Example:</b> <code>Router(config)# end</code>	Exits to privileged EXEC mode.
Step 5	<code>copy running-config startup-config</code>  <b>Example:</b> <code>Router# copy running-config startup-config</code>	Copies the modified configuration into router NVRAM, permanently saving the settings.  The next time the router is reloaded or rebooted the NetFlow MPLS Label Export feature is already part of the configuration.

	Command or Action	Purpose
Step 6	<code>exit</code>  <b>Example:</b> <code>Router# exit</code>	Exits to user EXEC mode.
Step 7	Reboot the router.	(Optional) Saves the configuration and reboots the router to ensure that the information collected by this feature is complete.

## Displaying Information About the MPLS PAL Table

Perform this task to display information about the MPLS PAL table. The information displayed includes the label, the application that allocated the label, an RD and destination prefix associated with the label, and the time the label was allocated by the application.

### SUMMARY STEPS

1. `enable`
2. `show mpls flow mappings`
3. `show ip flow export verbose | include PAL`
4. `exit`

### DETAILED STEPS

#### Step 1 `enable`

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```
Router> enable
Router#
```

#### Step 2 `show mpls flow mappings`

Use this command to display entries in the MPLS PAL table. For example:

```
Router# show mpls flow mappings
```

Label	Owner	Route-Distinguisher	Prefix	Allocated
18	LDP		10.0.0.5	00:52:10
21	BGP		0.0.0.0	00:52:18
22	BGP		0.0.0.0	00:52:18
25	BGP		0.0.0.0	00:51:44
26	LDP		10.32.0.0	00:52:10
27	TE-MIDPT		10.30.0.2	00:52:06
28	LDP		10.33.0.0	00:52:10
29	LDP		10.0.0.1	00:52:10
30	LDP		10.0.0.3	00:52:10

In this example, the `mpls export vpnv4 prefixes` command was not configured. Therefore, the MPLS PAL functionality did not export an RD for the BGP application, and the associated prefix is exported as 0.0.0.0.

The following shows sample output from the `show mpls flow mappings` command if you previously entered the `mpls export vpnv4 prefixes` command:

```
Router# show mpls flow mappings
```

Label	Owner	Route-Distinguisher	Prefix	Allocated
16	LDP		10.0.0.3	00:58:03
17	LDP		10.33.0.0	00:58:03
19	TE-MIDPT		10.30.0.2	00:58:06
20	LDP		10.0.0.5	00:58:03
23	LDP		10.0.0.1	00:58:03
24	LDP		10.32.0.0	00:58:03
27	BGP	100:1	10.34.0.0	00:57:48
31	BGP	100:1	10.0.0.9	00:58:21
32	BGP	100:1	10.3.3.0	00:58:21

### Step 3 show ip flow export verbose | include PAL

Use this command to display the number of MPLS PAL records that were exported to the NetFlow collector. For example:

```
Router# show ip flow verbose | include PAL
```

```
6 MPLS PAL records exported
```

When you specify the **verbose** keyword and MPLS PAL records have been exported using NetFlow Version 9 data format, the command output contains an additional line that precedes the “x records exported in y UDP datagrams” line.

### Step 4 exit

Use this command to exit to user EXEC mode. For example:

```
Router# exit
Router>
```

## Configuring the Export of MPLS VPN Version 4 Label Information from the MPLS PAL Table to a NetFlow Collector

Perform the following task to configure the export of VPNv4 label information from the MPLS PAL table to a NetFlow collector.

This allows you to track VPN prefix information for MPLS labels allocated by VPNs, BGP IPv4, and BGP VPNv4. You can use the data analyzed by the collector to assist in network traffic planning and billing.

### Prerequisites

A VRF must be configured on the router.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls export interval *interval***
4. **mpls export vpnv4 prefixes**

5. **end**
6. **copy running-config startup-config**
7. **exit**
8. Reboot the router.
9. **enable**
10. **show mpls flow mappings**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls export interval interval</b>  <b>Example:</b> Router(config)# mpls export interval 1440	Configures the collection and export of MPLS PAL information to a NetFlow collector. <ul style="list-style-type: none"> <li>The <i>interval</i> argument specifies the time in minutes between full PAL table exports. The range of valid time intervals is 0 to 10,080 minutes.</li> <li>We recommend that you select a time interval of 6 hours (360 minutes) to 24 hours (1440 minutes) depending on the size of your network.</li> <li>If you enter an interval of 0, full PAL table exports are disabled. PAL information is exported only as labels are allocated.</li> <li>If you need to restart your NetFlow collector and want to learn PAL information immediately, you can change the <i>interval</i> argument. When you change the time interval, the application exports the full PAL table.</li> </ul>
Step 4	<b>mpls export vpnv4 prefixes</b>  <b>Example:</b> Router(config)# mpls export vpnv4 prefixes	Configures the tracking and export of VPNv4 label information from the MPLS PAL table to a NetFlow collector.
Step 5	<b>end</b>  <b>Example:</b> Router(config)# end	Exits to privileged EXEC mode.

	Command or Action	Purpose
<b>Step 6</b>	<code>copy running-config startup-config</code>  <b>Example:</b> Router# <code>copy running-config startup-config</code>	Copies the modified configuration into router NVRAM, permanently saving the settings.  The next time the router is rebooted the tracking and export of VPNv4 label information from the MPLS PAL table to a NetFlow collector is already part of the configuration.
<b>Step 7</b>	<code>exit</code>  <b>Example:</b> Router# <code>exit</code>	Exits to user EXEC mode.
<b>Step 8</b>	Reboot the router.	(Optional) Saves the configuration and reboots the router to ensure that the information collected by this feature is complete.
<b>Step 9</b>	<code>enable</code>  <b>Example:</b> Router> <code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
<b>Step 10</b>	<code>show mpls flow mappings</code>  <b>Example:</b> Router# <code>show mpls flow mappings</code>	Displays MPLS PAL table entries that include VPNv4 prefixes and VPN RDs.

## Configuration Examples for NetFlow MPLS Label Export

This section contains the following configuration examples for the NetFlow MPLS Label Export feature:

- [Configuring NetFlow MPLS Prefix/Application/Label Table Export: Examples, page 12](#)
- [Configuring the Export of MPLS VPNv4 Label Information from the MPLS PAL Table: Example, page 13](#)

### Configuring NetFlow MPLS Prefix/Application/Label Table Export: Examples

The following examples show how to configure NetFlow MPLS PAL table export on a PE router.

This example shows how to configure the export of the full MPLS PAL table every 480 minutes (8 hours):

```
configure terminal
!
mpls export interval 480
end
copy running-config startup-config
exit
```

This example shows how to configure MPLS PAL information export only as the labels are allocated:

```
configure terminal
!
mpls export interval 0
end
```

```
copy running-config startup-config
exit
```

In this example, the full MPLS PAL table is not exported repeatedly.

## Configuring the Export of MPLS VPNv4 Label Information from the MPLS PAL Table: Example

The following example shows how to configure the export of MPLS VPNv4 label information from the MPLS PAL table:

```
configure terminal
!
mpls export interval 720
mpls export vpnv4 prefixes
end
copy running-config startup-config
exit
```

The full MPLS PAL table with MPLS VPNv4 label information is configured to export to the NetFlow collector every 720 minutes (12 hours).

# Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*.

- **mpls export interval**
- **mpls export vpnv4 prefixes**
- **show ip flow export**
- **show mpls flow mappings**

# Feature Information for NetFlow MPLS Label Export

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release. Unless noted otherwise, subsequent releases of that Cisco IOS software release also support that feature.

**Table 1** Feature Information for NetFlow MPLS Label Export

Feature Name	Releases	Feature Information
NetFlow MPLS Label Export	12.2(28)SB 12.2(33)SRA	<p>The NetFlow MPLS Label Export feature provides the label switch router (LSR) with the capability of collecting and exporting the top label in the MPLS label stack along with its prefix or Forwarding Equivalence Class (FEC) and the application allocating the label to a NetFlow collector for supported MPLS applications.</p> <p>In 12.2(28)SB, this feature was introduced.</p> <p>In 12.2(33)SRA, this feature was integrated into a 12.2SRA release.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">MPLS Label Information Gathering and Exporting, page 3</a></li> <li>• <a href="#">Labels Allocated by VPNs, BGP IPv4, or BGP VPNv4 in the MPLS PAL Table, page 4</a></li> <li>• <a href="#">MPLS PAL Table Record Export, page 4</a></li> <li>• <a href="#">MPLS PAL and NetFlow Statistics Correlation on a NetFlow Collector, page 6</a></li> <li>• <a href="#">MPLS Label Mapping on a Line Card, page 7</a></li> <li>• <a href="#">Configuring NetFlow MPLS Label Export and MPLS PAL Table Export, page 7</a></li> <li>• <a href="#">Displaying Information About the MPLS PAL Table, page 9</a></li> <li>• <a href="#">Configuring the Export of MPLS VPN Version 4 Label Information from the MPLS PAL Table to a NetFlow Collector, page 10</a></li> </ul>

# Glossary

**BGP**—Border Gateway Protocol. An interdomain routing protocol that replaces Exterior Gateway Protocol (EGP). A BGP system exchanges reachability information with other BGP systems. It is defined by RFC 1163.

**export packet**—A type of packet built by a device (for example, a router) with NetFlow services enabled. The packet is addressed to another device (for example, the NetFlow Collection Engine). The packet contains NetFlow statistics. The other device processes the packet (parses, aggregates, and stores information on IP flows).

**FEC**—Forward Equivalency Class. A set of packets that can be handled equivalently for the purpose of forwarding and thus is suitable for binding to a single label. The set of packets destined for an address prefix is one example of an FEC. A flow is another example.

**flow**—A unidirectional stream of packets between a given source and destination—each of which is defined by a network-layer IP address and transport-layer source and destination port numbers. A unique flow is defined as the combination of the following key fields: source IP address, destination IP address, source port number, destination port number, Layer 3 protocol type, type of service (ToS), and input logical interface.

**flowset**—A collection of flow records that follow the packet header in an export packet. A flowset contains information that must be parsed and interpreted by the NetFlow Collection Engine. There are two different types of flowsets: template flowsets and data flowsets. An export packet contains one or more flowsets, and both template and data flowsets can be mixed in the same export packet.

**IPv6**—IP Version 6. Replacement for IP Version 4 (IPv4). IPv6 includes support for flow ID in the packet header, which can be used to identify flows. Formerly called IPng (next generation).

**label**—A short, fixed-length identifier that tells switching nodes how the data (packets or cells) should be forwarded.

**LDP**—Label Distribution Protocol. A standard protocol that operates between Multiprotocol Label Switching (MPLS)-enabled routers to negotiate the labels (addresses) used to forward packets. The Cisco proprietary version of this protocol is the Tag Distribution Protocol (TDP).

**LFIB**—Label Forwarding Information Base. A data structure and way of managing forwarding in which destinations and incoming labels are associated with outgoing interfaces and labels.

**LSR**—label switch router. A router that forwards packets in a Multiprotocol Label Switching (MPLS) network by looking only at the fixed-length label.

**MPLS**—Multiprotocol Label Switching. A switching method in which IP traffic is forwarded through use of a label. This label instructs the routers and the switches in the network where to forward the packets. The forwarding of MPLS packets is based on preestablished IP routing information.

**NetFlow**—A Cisco IOS application that provides statistics on packets flowing through the router. It is emerging as a primary network accounting and security technology.

**NetFlow Collection Engine** (formerly NetFlow FlowCollector)—A Cisco application that is used with NetFlow on Cisco routers and Catalyst series switches. The NetFlow Collection Engine collects packets from the router that is running NetFlow and decodes, aggregates, and stores them. You can generate reports on various aggregations that can be set up on the NetFlow Collection Engine.

**NetFlow v9**—NetFlow export format Version 9. A flexible and extensible means of carrying NetFlow records from a network node to a collector. NetFlow Version 9 has definable record types and is self-describing for easier NetFlow Collection Engine configuration.

**network byte order**—Internet-standard ordering of the bytes corresponding to numeric values.

**options data record**—Special type of data record that is used in the NetFlow process. It is based on an options template and has a reserved template ID that provides information about the NetFlow process itself.

**options template**—A type of template record that the router uses to communicate the format of NetFlow-related data to the NetFlow collector.

**P router**—provider core or backbone router. A router that is part of a service provider's core or backbone network and is connected to the provider edge (PE) routers.

**packet header**—First part of an export packet. It provides basic information about the packet (such as the NetFlow version, number of records contained in the packet, and sequence numbering) so that lost packets can be detected.

**PAL table**—Prefix/Application/Label table. A data structure that collects and exports the prefix, application, and time stamp for a specific label.

**PE router**—provider edge router. A router that is part of a service provider's network connected to a customer edge (CE) router. All Virtual Private Network (VPN) processing occurs in the PE router.

**RD**—route distinguisher. An 8-byte value that is concatenated with an IPv4 prefix to create a unique VPN IPv4 prefix.

There are two formats for configuring the route distinguisher argument. It can be configured in the as-number:network number (ASN:nn) format or it can be configured in the IP address:network number format (IP-address:nn).

**RP**—Route Processor. A processor module in the Cisco 7000 series routers that contains the CPU, system software, and most of the memory components that are used in the router. Sometimes called a Supervisory Processor.

**TE**—traffic engineering. Techniques and processes that cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods were used.

**TE tunnel**—traffic engineering tunnel. A label-switched tunnel that is used for traffic engineering. Such a tunnel is set up through means other than normal Layer 3 routing; it is used to direct traffic over a path.

**template flowset**—A collection of template records that are grouped in an export packet.

**template ID**—A unique number that distinguishes a template record produced by an export device from other template records produced by the same export device. A NetFlow Collection Engine application can receive export packets from several devices. You should be aware that uniqueness is not guaranteed across export devices. Thus, you should configure the NetFlow Collection Engine to cache the address of the export device that produced the template ID in order to enforce uniqueness.

**VPN**—Virtual Private Network. A secure IP-based network that shares resources on one or more physical networks. A VPN contains geographically dispersed sites that can communicate securely over a shared backbone.

**VPNv4 prefix**—IPv4 prefix preceded by an 8-byte route distinguisher. The VPN addresses are made unique by adding a route distinguisher to the front of the address.

# ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection

---

**First Published:** January 01, 2006  
**Last Updated:** October 02, 2009

This feature allows you to configure multiple VCs that have different quality of service (QoS) characteristics between any pair of ATM-connected routers that support this feature. VC bundle management allows multiple VCs with various QoS settings to be directed to the same destination and to map traffic to the VCs based on protocol criteria associated with the traffic. Three experimental (EXP) bits in the Multiprotocol Label Switching (MPLS) packets determine which VC in the bundle to use to forward the packets.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection”](#) section on page 27.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Americas Headquarters:**  
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

- [Configuration Examples for ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection, page 22](#)
- [Additional References, page 25](#)
- [Feature Information for ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection, page 27](#)

## Prerequisites for ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection

This feature requires ATM VC management, Cisco Express Forwarding, and Forwarding Information Base (FIB) and Label Forwarding Information Base (LFIB) switching functionality.

## Restrictions for ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection

- The router at the remote end must be running a version of Cisco IOS software that supports MPLS and ATM VC management.
- This feature is not supported on either the ATM interface processor (AIP) or the ATM Lite port adapter (PA-A1).

## Information About ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection

You need to understand the concepts in the following sections to configure the MPLS EXP Bits Based ATM PVC Bundles VC Selection feature:

- [ATM VC Bundle Management, page 2](#)
- [ATM VC Bundle Configuration, page 3](#)
- [Benefits of ATM VC Bundle Management, page 4](#)
- [VC Bundle Management Supported Features, page 5](#)

## ATM VC Bundle Management

The MPLS EXP Bits Based ATM PVC Bundles VC Selection feature is an extension to the IP to ATM Class of Service feature suite. The IP to ATM Class of Service feature suite, using VC support and bundle management, maps QoS characteristics between IP and ATM. It provides customers that have multiple VCs (with varying qualities of service to the same destination) the ability to build a QoS differentiated network.

The IP to ATM Class of Service feature suite allows customers to use IP precedence level as the selection criterion for packet forwarding. This feature provides customers with the option of using the MPLS experimental level as an additional selection criterion for packet forwarding.

**Note**

If a selection criterion for packet forwarding is not selected (that is, if the packet is unlabeled), this feature uses the IP precedence level as the default selection criterion.

For more information about the IP to ATM Class of Service feature suite, see the [“Related Documents” section on page 25](#).

## ATM VC Bundle Configuration

ATM VC bundle management allows you to configure multiple VCs that have different QoS characteristics between any pair of ATM-connected routers. As shown in [Figure 1](#), these VCs are grouped in a bundle and are referred to as bundle members.

**Figure 1**      **ATM VC Bundle**

ATM VC bundle management allows you to define an ATM VC bundle and add VCs to it. Each VC of a bundle has its own ATM traffic class and ATM traffic parameters. You can apply attributes and characteristics to discrete VC bundle members, or you can apply them collectively at the bundle level.

Using VC bundles, you can create differentiated service by flexibly distributing MPLS EXP levels over the different VC bundle members. You can map a single MPLS EXP level, or a range of these levels, to each discrete VC in the bundle, thereby enabling individual VCs in the bundle to carry packets marked with different MPLS EXP levels. You can use Weighted Random Early Detection (WRED) or distributed WRED (dWRED) to further differentiate service across traffic that has different MPLS EXP levels.

To determine which VC in the bundle to use to forward a packet to its destination, the ATM VC bundle management software matches MPLS EXP levels between packets and VCs (see [Figure 2](#)). IP traffic is sent to the next hop address for the bundle because all VCs in a bundle share the same destination, but the VC used to carry a packet depends on the value set for that packet in the MPLS EXP level of the type of service (ToS) byte of its header. The ATM VC bundle management software matches the MPLS EXP level of the packet to the MPLS EXP levels assigned to a VC, sending the packet out on the appropriate VC.

Moreover, the ATM VC bundle management software allows you to configure how traffic will be redirected when the VC to which the packet was initially directed goes down. [Figure 2](#) illustrates how the ATM VC bundle management software determines which permanent virtual circuit (PVC) bundle member to use to carry a packet and how WRED (or dWRED) is used to differentiate traffic on the same VC.

**Figure 2** *ATM VC Bundle PVC Selection for Packet Transfer*

The support of multiple parallel ATM VCs allows you to create stronger service differentiation at the IP layer. For example, you might want to configure the network to provide IP traffic belonging to real-time class of service (CoS) such as Voice over IP traffic on an ATM VC with strict constraints on constant bit rate (CBR) or variable bit rate real-time (VBR-rt), while also allowing the network to transport nonreal-time traffic over a more elastic ATM unspecified bit rate (UBR) PVC. UBR is effectively the ATM version of best-effort service. Using a multiple parallel ATM VC configuration allows you to make full use of your network capacity.

## Benefits of ATM VC Bundle Management

ATM VC bundle management was designed to provide a true working solution to class-based services, without the investment of new ATM network infrastructures. It allows networks to offer different service classes (sometimes termed differential service classes) across the entire WAN, not just the routed portion. Mission-critical applications can be given exceptional service during periods of high network usage and congestion. In addition, noncritical traffic can be restricted in its network usage, ensuring greater QoS for more important traffic and user types.

ATM VC bundle management gives customers the option of using the MPLS EXP level, in addition to IP precedence, as a selection criterion for packet forwarding.

## VC Bundle Management Supported Features

The following features are supported on an MPLS over VC bundle:

- PVC support only (no switched virtual circuits or SVCs):
  - Support for multipoint and point-to-point subinterfaces.
  - Support for AAL5SNAP (RFC1483 bridging) and multiplex (MUX) type VCs encapsulation.
  - Use of static mapping and Inverse Address Resolution Protocol (Inverse ARP) for the next hop protocol address (supported on multipoint subinterfaces only).
  - PVCs associated with VC bundles through explicit configuration.
  - Use of Interim Local Management Interface (ILMI) and Operation, Administration, and Maintenance (OAM) functionality in the PVC management feature for PVC failure detection.
- VC selection within the bundle:
  - Uses three EXP bits in the MPLS header to define the precedence levels, with level 7 being the highest for MPLS traffic.
  - No automapping of VCs to precedence levels can be done. The user must use the **mpls experimental** command under each member VC to explicitly specify the mapping.
  - Multiple precedence levels can be mapped to one VC.
  - Packets with the PAK\_PRIORITY\_CRUCIAL flag set go on a high precedence (level 6) VC. These packets include IP routing packets such as Intermediate System-Intermediate System (IS-IS) packets for integrated IP routing. Label Distribution Protocol (LDP) and Tag Distribution Protocol (TDP) messages, and Inverse ARP packets also use a precedence level 6 VC. However, OAM cells still flow in the individual VC to detect PVC failures, although the PAK\_PRIORITY\_CRUCIAL flag is set for them.
  - Regular **ping** commands use the lowest precedence (level 0) VC. If other protocols such as Internetwork Packet Exchange (IPX) are configured in the bundle, they will also use the lowest precedence level VC for their traffic.
- ATM Inverse ARP:
  - Inverse ARP is viewed as a parameter at the bundle level and can be enabled or disabled only for the bundle, not for individual VCs in the bundle.
  - The PAK\_PRIORITY\_CRUCIAL flag is set in each ATM Inverse ARP packet and the packets use the precedence level 6 VC.
  - Inverse ARP for other protocols such as IPX is off by default unless it is configured in the bundle.
- Broadcast and multicast:
  - Broadcasting can be turned on or off at the bundle level, not at the individual VC level in the bundle.
  - Pseudobroadcasting is used for forwarding the broadcast traffic.
  - VC selection for the broadcast traffic is based on the precedence levels of the broadcast packets.
- Bundle management:
  - According to the protected group rule, when all members in the protected group fail, the bundle is declared down.
  - According to the protected VC rule, when a protected VC goes down, the bundle goes down.
  - A VC can be a standalone VC or belong to only one bundle.

- When a bundle goes down, no traffic should be forwarded out the bundle, even if some of the VCs in the bundle are still up.
- In VC bumping, each bundle member can specify if bumping is allowed. If bumping is allowed, the next lower precedence level VC is selected when a VC goes down. This is the implicit bumping rule. Traffic is restored to the original VC when it comes back.
- In explicit VC bumping, a VC can specify to which precedence level it wants to bump its traffic when it goes down. Only one precedence level can be specified for bumping. If the VC that carries the bumped traffic also fails, the traffic will follow the bumping rules specified for that VC.
- In reject bumping, a VC may also be configured not to accept the bumped traffic.
- When no alternate VC can be found for some bumped traffic, the bundle has to be declared down.
- To avoid bringing down a bundle because of a failure of the lowest precedence VC, configure explicit bumping on the lowest precedence VC.
- Bundle status attributes and their current status for each VC in the bundle can be displayed in a tabular form using EXEC commands.
- Bundle statistics are the same statistics provided for VC that have been aggregated for a VC bundle.
- Bundle debugging commands, when enabled, print bundle events and bundle errors.
- Packet forwarding:
  - There are four possible paths for MPLS packet forwarding over the VC bundle: IP to MPLS, MPLS to MPLS, MPLS to IP, and locally generated packets.
  - Process switching is used for locally generated packets.
  - Cisco Express Forwarding FIB switching is used for the IP to MPLS path.
  - Cisco Express Forwarding LFIB switching is used for the MPLS to MPLS and MPLS to IP paths.
  - No fast switching is supported for transit IP packets. The fast switching path does not classify IP packets based on their precedence levels.
  - VC bundle configuration is already added to handle the IP VC bundle feature and may be used without any modification.

## How to Configure ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection

This section contains the following procedures:

- [Configuring MPLS and Creating a VC Bundle, page 7](#) (required)
- [Configuring the Bundle-Level Protocol, page 9](#) (required)
- [Configuring Parameters on a VC Bundle Member Directly, page 9](#) (optional)
- [Configuring a VC Class and Applying Parameters to a Bundle, page 11](#) (optional)
- [Attaching a Class to a Bundle, page 14](#) (optional)
- [Configuring a VC Bundle at the Subinterface Level, page 15](#) (optional)

- [Assigning VC and Bundle Attributes, page 18](#) (optional)
- [Verifying ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection Configuration, page 21](#) (optional)

## Configuring MPLS and Creating a VC Bundle

Perform this task to enable MPLS and create a VC bundle. When you create a VC bundle, you enter bundle configuration mode, in which you can assign attributes and parameters to the bundle and to all of its member VCs.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip cef [distributed]**
4. **mpls ldp advertise-labels**
5. **interface atm** *interface-number* [*subinterface-number* {**mpls** | **multipoint** | **point-to-point**}]
6. **ip address** *ip-address mask*
7. **mpls ip**
8. **bundle** *bundle-name*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>ip cef [distributed]</b>  <b>Example:</b> Router(config)# ip cef	Enables Cisco Express Forwarding, which is needed for MPLS.  <b>Note</b> This command without the optional keyword enables Cisco Express Forwarding on the Route Processor (RP) card. The optional <b>distributed</b> keyword is used to enable distributed Cisco Express Forwarding for the Versatile Interface Processor (VIP)-based platforms.
Step 4	<b>mpls ldp advertise-labels</b>  <b>Example:</b> Router(config)# mpls ldp advertise-labels	Controls the distribution of locally assigned, incoming labels by means of the LDP, and allows TDP neighbors to exchange messages between them.

	Command or Action	Purpose
<b>Step 5</b>	<pre>interface atm interface-number[.subinterface-number {mpls   multipoint   point-to-point}]</pre> <p><b>Example:</b> Router(config)# interface atm 0/0/3</p>	Configures an ATM interface and enters interface configuration mode.
<b>Step 6</b>	<pre>ip address ip-address mask</pre> <p><b>Example:</b> Router(config-if)# ip address 10.13.11.3 255.255.0.0</p>	Sets the IP address for an interface.
<b>Step 7</b>	<pre>mpls ip</pre> <p><b>Example:</b> Router(config-if)# mpls ip</p>	Enables MPLS forwarding of IP packets along normally routed paths for the platform.
<b>Step 8</b>	<pre>bundle bundle-name</pre> <p><b>Example:</b> Router(config-if)# bundle new-york</p>	Creates or modifies a bundle and enters bundle configuration mode. The prompt changes to the following:  Router(config-if-atm-bundle)#

## What to Do Next

Decide whether you want to configure the VC bundle member directly or use a VC class attached to a bundle.

You can apply parameters (or attributes) to bundles either by applying the parameters directly to the bundle or by applying the parameters to a VC class assigned to the bundle.

Applying parameters by using VC classes assigned to the bundle allows you to apply multiple parameters at once because you apply the VC class to the bundle and to all of its VC members. This method allows you to apply a parameter across all VCs for the bundle, after which (for some parameters) you can later modify that parameter for individual VCs. After configuring the parameters for the VC class, you need to attach the VC class to the bundle.

To configure the VC bundle member directly, complete the procedure in the [“Configuring Parameters on a VC Bundle Member Directly”](#) section on page 9. To use a VC class attached to a bundle, instead complete the procedures in both the [“Configuring a VC Class and Applying Parameters to a Bundle”](#) section and the [“Attaching a Class to a Bundle”](#) section on page 14.

Parameters applied directly to a bundle take priority over those applied to VC classes assigned to the bundle, and the steps for this task are in the [“Configuring the Bundle-Level Protocol”](#) section on page 9. Parameters applied to VC classes assigned to the bundle take priority over those applied to individual VCs.

### Note

Some parameters applied through a VC class or directly to the bundle can be superseded by commands that you apply directly to individual VCs in bundle-VC configuration mode.

## Configuring the Bundle-Level Protocol

Perform this task to configure a protocol that applies to the bundle and to all of its members. The commands in these steps are entered in bundle configuration mode.

### SUMMARY STEPS

1. **protocol** *protocol* [*protocol-address* | **inarp**] [[**no**] **broadcast**]
2. **encapsulation** [**aal5mux** | **aal5snap**]

### DETAILED STEPS

Command or Action	Purpose
<b>Step 1</b> <b>protocol</b> <i>protocol</i> [ <i>protocol-address</i>   <b>inarp</b> ] [[ <b>no</b> ] <b>broadcast</b> ]  <b>Example:</b> Router(config-if-atm-bundle)# <b>protocol</b> <i>clns</i> 10.0000.0000.0000.3333.00 <b>broadcast</b>	Configures a static map (the map statement for the bundle) for an ATM PVC, SVC, or VC class. <ul style="list-style-type: none"> <li>• <i>protocol</i>—Networking protocol.</li> <li>• <i>protocol-address</i>—Destination address that is being mapped to a PVC.</li> <li>• <b>inarp</b>—(Valid only for IP and IPX protocols on PVCs) Enables Inverse ARP on an ATM PVC. If you specify a protocol address instead of the <b>inarp</b> keyword, Inverse ARP is automatically disabled for that protocol.</li> <li>• [[<b>no</b>] <b>broadcast</b>—Indicates that this map entry is used when the corresponding protocol sends broadcast packets to the interface.</li> </ul> <b>Note</b> Pseudobroadcasting is supported. The <b>broadcast</b> keyword of the <b>protocol</b> command takes precedence if you previously configured the <b>broadcast</b> command on the ATM PVC or SVC.
<b>Step 2</b> <b>encapsulation</b> [ <b>aal5mux</b>   <b>aal5snap</b> ]  <b>Example:</b> Router(config-if-atm-bundle)# <b>encapsulation</b> <b>aal5snap</b>	Configures the ATM adaptation layer (AAL) and encapsulation type for every VC in the bundle. <ul style="list-style-type: none"> <li>• <b>aal5mux</b>—AAL and encapsulation type for multiplex (MUX) type VCs. A protocol must be specified when using this encapsulation type.</li> <li>• <b>aal5snap</b>—AAL and encapsulation type that supports Inverse ARP.</li> </ul>

## Configuring Parameters on a VC Bundle Member Directly

Perform this task to configure parameters on an individual VC bundle member directly. The commands in these steps are entered in bundle-VC configuration mode.

### SUMMARY STEPS

1. **pvc-bundle** *pvc-name* [**vpi**]/[**vci**]
2. **ubr** *pcr*

3. **vbr-nrt** *pcr scr [mbs]*
4. **mpls experimental** [*other* | *range*]
5. **bump** {*implicit* | *explicit precedence-level* | **traffic**}
6. **protect** {*group* | **vc**}
7. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>pvc-bundle</b> <i>pvc-name</i> [<i>vpi</i>/][<i>vci</i>]</p> <p><b>Example:</b>  Router(config-if-atm-bundle)# pvc-bundle  ny-control 207</p>	<p>Adds a VC to a bundle as a member and enters bundle-VC configuration mode to configure VC specific parameters.</p> <ul style="list-style-type: none"> <li>The VC is created upon exiting the mode.</li> <li><b>vpi</b>—ATM network virtual path identifier (VPI) for this PVC. The absence of the slash mark (/) and a VPI value defaults the value to 0. The <b>vpi</b> and <b>vci</b> keywords cannot both be set to 0.</li> <li><b>vci</b>—ATM network virtual channel identifier (VCI) for this PVC. The value range is from 0 to 1 less than the maximum value set for this interface by the <b>atm vc-per-vp</b> command.</li> </ul> <p><b>Note</b> The <b>pvc-bundle</b> command is used instead of the <b>pvc</b> command to avoid the ambiguity between this command and the interface <b>pvc</b> command.</p>
Step 2	<p><b>ubr</b> <i>pcr</i></p> <p><b>Example:</b>  Router(config-if-atm-member)# ubr 10000</p>	<p>Configures UBR QoS and specifies the output peak cell rate (PCR) for the VC bundle member.</p>
Step 3	<p><b>vbr-nrt</b> <i>pcr scr [mbs]</i></p> <p><b>Example:</b>  Router(config-if-atm-member)# vbr-nrt 20000  10000 32</p>	<p>Configures variable bit rate non-real-time (VBR-nrt) QoS with a PCR, a sustaining cell rate (SCR), and maximum burst size (MBS).</p>
Step 4	<p><b>mpls experimental</b> [<i>other</i>   <i>range</i>]</p> <p><b>Example:</b>  Router(config-if-atm-member)# mpls  experimental 7</p>	<p>Configures MPLS EXP levels for a VC class that can be assigned to a VC bundle and thus applied to all VC members of that bundle.</p> <ul style="list-style-type: none"> <li>This command is ignored if the class that contains it is not attached to a bundle member.</li> <li><b>other</b>—Any precedence level from 0 to 7 not explicitly configured.</li> <li><b>range</b>—An MPLS EXP level specified as a number or a range of numbers. Ranges can be expressed with a hyphen (2-5, for example), and numbers and ranges can be expressed in groups separated by commas; 1, 3, 5-7, for example.</li> </ul>

	Command or Action	Purpose
Step 5	<b>bump</b> { <b>implicit</b>   <b>explicit</b> <i>precedence-level</i>   <b>traffic</b> }  <b>Example:</b> Router(config-if-atm-member)# bump explicit 7	Configures the bumping rules and applies only to bundle members. <ul style="list-style-type: none"> <li>• <b>implicit</b>—Applies the implicit bumping rule, which is the default, to a single VC or PVC bundle member or to all VCs in the bundle (VC-class mode). The implicit bumping rule stipulates that bumped traffic is to be carried by a VC or PVC with a lower precedence level.</li> <li>• <b>explicit</b> <i>precedence-level</i>—Specifies a precedence level from 0 to 7 for the traffic to be bumped to.</li> <li>• <b>traffic</b>—Specifies that the VC or PVC accepts bumped traffic (the default condition). The <b>no</b> form of this command stipulates that the VC or PVC does not accept any bumped traffic.</li> </ul>
Step 6	<b>protect</b> { <b>group</b>   <b>vc</b> }  <b>Example:</b> Router(config-if-atm-member)# protect vc	Configures a VC class with protected group or protected VC status for application to a VC bundle member. <ul style="list-style-type: none"> <li>• This command makes a bundle member part of the protected group of a bundle or a protected VC in a bundle.</li> <li>• <b>group</b>—Configures the VC or PVC bundle member as part of the protected group of the bundle.</li> <li>• <b>vc</b>—Configures the VC or PVC member as individually protected.</li> </ul>
Step 7	<b>exit</b>  <b>Example:</b> Router(config-if-atm-member)# exit	Exits the current configuration mode. <ul style="list-style-type: none"> <li>• Continue entering <b>exit</b> at the prompt to exit each configuration mode.</li> </ul>

## Configuring a VC Class and Applying Parameters to a Bundle

Perform this task to configure a VC class to contain commands that configure all VC members of a bundle when the class is applied to that bundle. The parameters are applied in VC-class configuration mode. Use the **vc-class atm** command in global configuration mode to enter the VC-class configuration mode.

### Commands Ignored in a VC Class Bundle

When a VC is part of a bundle, some of the VC configuration in the VC class will no longer be applicable to the VC and will be ignored. The inheritance rule for VCs in VC bundles follows this order: VC configuration, bundle configuration, subinterface configuration. In VC mode and bundle mode, the configuration with the individual command takes precedence over the configuration with the **class** command.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vc-class atm** *name*
4. **oam-bundle** [**manage**] [*frequency*]
5. **mpls experimental** [**other** | *range*]
6. **bump** {**implicit** | **explicit** *precedence-level* | **traffic**}
7. **protect** {**group** | **vc**}
8. **exit**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>vc-class atm</b> <i>name</i>  <b>Example:</b> Router(config)# vc-class atm bundle-class	Creates a VC class for an ATM interface and enters VC-class configuration mode.
Step 4	<b>oam-bundle</b> [ <b>manage</b> ] [ <i>frequency</i> ]  <b>Example:</b> Router(config-vc-class)# oam-bundle manage 3	Enables end-to-end F5 OAM loopback cell generation and determines whether the bundle is OAM managed, that is, whether every VC in the bundle is OAM managed. There is no effect if the VC class that contains this command is not attached to a bundle. <ul style="list-style-type: none"> <li><b>manage</b>—Enables OAM management. If this keyword is omitted, loopback cells are sent, but the bundle is not managed.</li> <li><i>frequency</i>—Seconds between transmitted OAM loopback cells. Default is 10 seconds.</li> </ul>

Command or Action	Purpose
<p><b>Step 5</b></p> <pre>mpls experimental [<i>other</i>   <i>range</i>]</pre> <p><b>Example:</b> Router(config-vc-class)# mpls experimental 7</p>	<p>Configures MPLS EXP levels for a VC class that can be assigned to a VC bundle and thus applied to all VC members of that bundle.</p> <ul style="list-style-type: none"> <li>This command is ignored if the class that contains it is not attached to a bundle member.</li> <li><b>other</b>—Any precedence level from 0 to 7 not explicitly configured.</li> <li><b>range</b>—An MPLS EXP level specified as a number or a range of numbers. Ranges can be expressed with a hyphen (2-5, for example), and numbers and ranges can be expressed in groups separated by commas; 1, 3, 5-7, for example.</li> </ul>
<p><b>Step 6</b></p> <pre>bump {implicit   explicit <i>precedence-level</i>   traffic}</pre> <p><b>Example:</b> Router(config-vc-class)# no bump traffic</p>	<p>Configures the bumping rules and applies only to bundle members.</p> <ul style="list-style-type: none"> <li><b>implicit</b>—Applies the implicit bumping rule, which is the default, to a single VC or PVC bundle member or to all VCs in the bundle (VC-class mode). The implicit bumping rule stipulates that bumped traffic is to be carried by a VC or PVC with a lower precedence level.</li> <li><b>explicit <i>precedence-level</i></b>—Specifies a precedence level from 0 to 7 for the traffic to be bumped to.</li> <li><b>traffic</b>—Specifies that the VC or PVC accepts bumped traffic (the default condition). The <b>no</b> form of this command stipulates that the VC or PVC does not accept any bumped traffic.</li> </ul>
<p><b>Step 7</b></p> <pre>protect {group   vc}</pre> <p><b>Example:</b> Router(config-vc-class)# protect vc</p>	<p>Configures a VC class with protected group or protected VC status for application to a VC bundle member.</p> <ul style="list-style-type: none"> <li>This command makes a bundle member part of the protected group of a bundle or a protected VC in a bundle.</li> <li><b>group</b>—Configures the VC or PVC bundle member as part of the protected group of the bundle.</li> <li><b>vc</b>—Configures the VC or PVC member as individually protected.</li> </ul>
<p><b>Step 8</b></p> <pre>exit</pre> <p><b>Example:</b> Router(config-vc-class)# exit</p>	<p>Exits the current configuration mode.</p> <ul style="list-style-type: none"> <li>Continue entering <b>exit</b> at the prompt to exit each configuration mode.</li> </ul>

## Attaching a Class to a Bundle

Perform this task to attach a VC class containing bundle-level configuration commands to a bundle. Enter the **bundle** command in global configuration mode to enter bundle configuration mode.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm** *interface-number* [*.subinterface-number* {**mpls** | **multipoint** | **point-to-point**}]
4. **bundle** *bundle-name*
5. **class-bundle** *vc-class-name*
6. **exit**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface atm</b> <i>interface-number</i> [ <i>.subinterface-number</i> { <b>mpls</b>   <b>multipoint</b>   <b>point-to-point</b> }]  <b>Example:</b> Router(config)# interface atm 0/0/3	Configures an ATM interface and enters interface configuration mode.
Step 4	<b>bundle</b> <i>bundle-name</i>  <b>Example:</b> Router(config-if)# bundle new-york	Creates or modifies a bundle and enters bundle configuration mode. <ul style="list-style-type: none"><li>• <i>bundle-name</i>—Specifies the name of the bundle to be created. Name is limited to 16 characters.</li></ul>
Step 5	<b>class-bundle</b> <i>vc-class-name</i>  <b>Example:</b> Router(config-if-atm-bundle)# class-bundle class1	Configures a bundle with the bundle-level commands contained in the specified VC class.
Step 6	<b>exit</b>  <b>Example:</b> Router(config-if-atm-bundle)# exit	Exits the current configuration mode. <ul style="list-style-type: none"><li>• Continue entering <b>exit</b> at the prompt to exit each configuration mode.</li></ul>

## Configuring a VC Bundle at the Subinterface Level

Perform this task to configure a bundle at the subinterface configuration level. The bundle submode is activated by entering the **bundle** command. This mode is similar to the VC mode.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm** *interface-number* [*.subinterface-number* {**mpls** | **multipoint** | **point-to-point**}]
4. **bundle** *bundle-name*
5. **encapsulation** [**aal5mux** | **aal5snap**]
6. **protocol** *protocol* {*protocol-address* | **inarp**} [[**no**] **broadcast**]
7. **class** *class-name*
8. **pvc-bundle** *pvc-name* [**vpi**]/[**vci**]
9. **ubr** *pcr*
10. **vbr-nrt** *pcr scr* [*mbs*]
11. **exit**
12. **oam-bundle** [**manage**] [*frequency*]
13. **oam retry** [*up-count*] [*down-count*] [*retry-frequency*]
14. **inarp** [*minutes*]
15. **broadcast**
16. **exit**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface atm</b> <i>interface-number</i> [ <i>.subinterface-number</i> { <b>mpls</b>   <b>multipoint</b>   <b>point-to-point</b> }]  <b>Example:</b> Router(config)# interface atm 0/0/3	Configures an ATM interface and enters interface configuration mode.

	Command or Action	Purpose
Step 4	<b>bundle</b> <i>bundle-name</i>  <b>Example:</b> Router(config-if)# bundle new-york	Creates or modifies a bundle and enters bundle configuration mode. <ul style="list-style-type: none"> <li><i>bundle-name</i>—Specifies the name of the bundle to be created. Name is limited to 16 characters.</li> </ul>
Step 5	<b>encapsulation</b> [ <b>aal5mux</b>   <b>aal5snap</b> ]  <b>Example:</b> Router(config-atm-bundle)# encapsulation aal5snap	Configures the AAL and encapsulation type for every VC in the bundle. <ul style="list-style-type: none"> <li><b>aal5mux</b>—AAL and encapsulation type for multiplex (MUX) type VCs. A protocol must be specified when using this encapsulation type.</li> <li><b>aal5snap</b>—AAL and encapsulation type that supports Inverse ARP.</li> </ul>
Step 6	<b>protocol</b> <i>protocol</i> [ <i>protocol-address</i>   <b>inarp</b> ] [[ <b>no</b> ] <b>broadcast</b> ]  <b>Example:</b> Router(config-atm-bundle)# protocol clns 10.0000.0000.0000.3333.00 broadcast	Configures a static map (the map statement for the bundle) for an ATM PVC, SVC, or VC class. <ul style="list-style-type: none"> <li><i>protocol</i>—Networking protocol.</li> <li><i>protocol-address</i>—Destination address that is being mapped to a PVC.</li> <li><b>inarp</b>—(Valid only for IP and IPX protocols on PVCs) Enables Inverse ARP on an ATM PVC. If you specify a protocol address instead of the <b>inarp</b> keyword, Inverse ARP is automatically disabled for that protocol.</li> <li><b>[no] broadcast</b>—Indicates that this map entry is used when the corresponding protocol sends broadcast packets to the interface.</li> </ul> <p><b>Note</b> Pseudobroadcasting is supported. The <b>broadcast</b> keyword of the <b>protocol</b> command takes precedence if you previously configured the <b>broadcast</b> command on the ATM PVC or SVC.</p>
Step 7	<b>class</b> <i>class-name</i>  <b>Example:</b> Router(config-atm-bundle)# class control-class	Attaches a named VC class to this bundle.

	Command or Action	Purpose
Step 8	<p><b>pvc-bundle</b> <i>pvc-name</i> [<b>vpi</b>/][<b>vci</b>]</p> <p><b>Example:</b> Router(config-if-atm-bundle)# pvc-bundle ny-control 207</p>	<p>Adds a VC to a bundle as a member and enters bundle-VC configuration mode to configure VC specific parameters.</p> <ul style="list-style-type: none"> <li>The VC is created upon exiting the mode.</li> <li><b>vpi</b>—ATM network virtual path identifier (VPI) for this PVC. The absence of the slash mark (/) and a VPI value defaults the value to 0. The <b>vpi</b> and <b>vci</b> keywords cannot both be set to 0.</li> <li><b>vci</b>—ATM network virtual channel identifier (VCI) for this PVC. The value range is from 0 to 1 less than the maximum value set for this interface by the <b>atm vc-per-vp</b> command.</li> </ul> <p><b>Note</b> The <b>pvc-bundle</b> command is used instead of the <b>pvc</b> command to avoid the ambiguity between this command and the interface <b>pvc</b> command.</p>
Step 9	<p><b>ubr</b> <i>pcr</i></p> <p><b>Example:</b> Router(config-if-atm-member)# ubr 10000</p>	<p>Configures UBR QoS and specifies the output PCR for the VC bundle member.</p>
Step 10	<p><b>vbr-nrt</b> <i>pcr scr [mbs]</i></p> <p><b>Example:</b> Router(config-if-atm-member)# vbr-nrt 20000 10000 32</p>	<p>Configures VBR-nrt QoS with a PCR, an SCR, and MBS.</p>
Step 11	<p><b>exit</b></p> <p><b>Example:</b> Router(config-if-atm-member)# exit</p>	<p>Exits bundle-VC configuration mode and returns to bundle configuration mode.</p>
Step 12	<p><b>oam-bundle</b> [<b>manage</b>] [<i>frequency</i>]</p> <p><b>Example:</b> Router(config-if-atm-member)# oam-bundle manage 6</p>	<p>Enables OAM for every VC in the bundle.</p> <ul style="list-style-type: none"> <li><b>manage</b>—Enables OAM management. If this keyword is omitted, loopback cells are sent, but the bundle is not managed.</li> <li><i>frequency</i>—Seconds between transmitted OAM loopback cells. Default is 10 seconds.</li> </ul>
Step 13	<p><b>oam retry</b> [<i>up-count</i>] [<i>down-count</i>] [<i>retry-frequency</i>]</p> <p><b>Example:</b> Router(config-if-atm-member)# oam retry 5 3 10</p>	<p>Configures OAM parameters for every VC in the bundle.</p> <ul style="list-style-type: none"> <li><i>up-count</i>—Consecutive end-to-end F5 OAM loopback cell responses that must be received to change a connection state to up. Default is 3.</li> <li><i>down-count</i>—Consecutive end-to-end F5 OAM loopback cell responses that are not received to change a PVC state to down. Default is 5.</li> <li><i>retry-frequency</i>—Frequency (in seconds) that end-to-end F5 OAM loopback cells are transmitted when a change in the up/down state is being verified. Default is 1 second.</li> </ul>

	Command or Action	Purpose
Step 14	<b>inarp</b> <i>[minutes]</i>  <b>Example:</b> Router(config-if-atm-member)# inarp 1	Configures the Inverse ARP time period. <ul style="list-style-type: none"><li>• Default is 15 minutes.</li></ul>
Step 15	<b>broadcast</b>  <b>Example:</b> Router(config-if-atm-member)# broadcast	Enables broadcast forwarding on this bundle.
Step 16	<b>exit</b>  <b>Example:</b> Router(config-if-atm-member)# exit	Exits the current configuration mode. <ul style="list-style-type: none"><li>• Continue entering <b>exit</b> at the prompt to exit each configuration mode.</li></ul>

## Assigning VC and Bundle Attributes

The **pvc-bundle** command activates the bundle-VC configuration mode, in which specific VC and bundle member attributes can be assigned.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm** *interface-number* [*.subinterface-number* {**mpls** | **multipoint** | **point-to-point**}]
4. **bundle** *bundle-name*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>enable</b></p> <p><b>Example:</b> Router&gt; enable</p>	<p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<p><b>configure terminal</b></p> <p><b>Example:</b> Router# configure terminal</p>	<p>Enters global configuration mode.</p>
Step 3	<p><b>interface atm</b> <i>interface-number</i> [.subinterface-number {<b>mpls</b>   <b>multipoint</b>   <b>point-to-point</b>}]</p> <p><b>Example:</b> Router(config)# interface atm 0/0/3</p>	<p>Configures an ATM interface and enters interface configuration mode.</p>
Step 4	<p><b>bundle</b> <i>bundle-name</i></p> <p><b>Example:</b> Router(config-if)# bundle new-york</p>	<p>Creates or modifies a bundle and enters bundle configuration mode.</p>
Step 5	<p><b>pvc-bundle</b> <i>pvc-name</i> [<b>vpi</b>/][<b>vci</b>]</p> <p><b>Example:</b> Router(config-if-atm-bundle)# pvc-bundle ny-control 207</p>	<p>Adds a VC to a bundle as a member and enters bundle-VC configuration mode to configure VC specific parameters.</p> <ul style="list-style-type: none"> <li>The VC is created upon exiting the mode.</li> <li><b>vpi</b>—ATM network virtual path identifier (VPI) for this PVC. The absence of the slash mark (/) and a VPI value defaults the value to 0. The <b>vpi</b> and <b>vci</b> keywords cannot both be set to 0.</li> <li><b>vci</b>—ATM network virtual channel identifier (VCI) for this PVC. The value range is from 0 to 1 less than the maximum value set for this interface by the <b>atm vc-per-vp</b> command.</li> </ul> <p><b>Note</b> The <b>pvc-bundle</b> command is used instead of the <b>pvc</b> command to avoid the ambiguity between this command and the interface <b>pvc</b> command.</p>
Step 6	<p><b>class</b> <i>class-name</i></p> <p><b>Example:</b> Router(config-if-atm-member)# class control-class</p>	<p>Attaches a VC class to this VC.</p>
Step 7	<p><b>ubr</b> <i>pcr</i></p> <p><b>Example:</b> Router(config-if-atm-member)# ubr 10000</p>	<p>Configures UBR QoS and specifies the output PCR for the VC bundle member.</p>

	Command or Action	Purpose
Step 8	<b>vbr-nrt</b> <i>pcr scr [mbs]</i>  <b>Example:</b> Router(config-if-atm-member)# vbr-nrt 20000 10000 32	Configures VBR-nrt QoS with a PCR, an SCR, and MBS.
Step 9	<b>mpls experimental</b> [ <i>other</i>   <i>range</i> ]  <b>Example:</b> Router(config-if-atm-member)# mpls experimental 7	Defines the experimental levels for packets to be forwarded on this PVC. <ul style="list-style-type: none"> <li>• <b>other</b>—Any precedence level from 0 to 7 not explicitly configured.</li> <li>• <b>range</b>—An MPLS EXP level specified as a number or a range of numbers. Ranges can be expressed with a hyphen (2-5, for example), and numbers and ranges can be expressed in groups separated by commas; 1, 3, 5-7, for example.</li> </ul>
Step 10	<b>bump</b> { <i>implicit</i>   <i>explicit precedence-level</i>   <i>traffic</i> }  <b>Example:</b> Router(config-if-atm-member)# bump explicit 7	Specifies the bumping rule for the VC. <ul style="list-style-type: none"> <li>• <b>implicit</b>—Applies the implicit bumping rule, which is the default, to a single VC or PVC bundle member or to all VCs in the bundle (VC class mode). The implicit bumping rule stipulates that bumped traffic is to be carried by a VC or PVC with a lower precedence level.</li> <li>• <b>explicit precedence-level</b>—Specifies a precedence level from 0 to 7 for the traffic to be bumped to.</li> <li>• <b>traffic</b>—Specifies that the VC or PVC accepts bumped traffic (the default condition). The <b>no</b> form of this command stipulates that the VC or PVC does not accept any bumped traffic.</li> </ul>
Step 11	<b>protect</b> { <i>group</i>   <i>vc</i> }  <b>Example:</b> Router(config-if-atm-member)# protect vc	Configures a VC class with protected group or protected VC status for application to a VC bundle member. <ul style="list-style-type: none"> <li>• This command makes a bundle member part of the protected group of a bundle or a protected VC in a bundle.</li> <li>• <b>group</b>—Configures the VC or PVC bundle member as part of the protected group of the bundle.</li> <li>• <b>vc</b>—Configures the VC or PVC member as individually protected.</li> </ul>
Step 12	<b>exit</b>  <b>Example:</b> Router(config-if-atm-member)# exit	Exits the current configuration mode. <ul style="list-style-type: none"> <li>• Continue entering <b>exit</b> at the prompt to exit each configuration mode.</li> </ul>

# Verifying ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection Configuration

Use the commands in the following steps as needed, to verify configurations for the ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection feature.

## SUMMARY STEPS

1. **enable**
2. **debug atm bundle adjacency events**
3. **debug atm bundle error**
4. **debug atm bundle events**
5. **debug atm bundle inarp**
6. **show atm bundle** *[bundle-name]*
7. **show mpls forwarding-table** [{*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>debug atm bundle adjacency events</b>  <b>Example:</b> Router# debug atm bundle adjacency	Displays information about adjacency events such as addition, removal, and update of adjacencies for the bundle.
Step 3	<b>debug atm bundle error</b>  <b>Example:</b> Router# debug atm bundle error	Displays debug messages for PVC bundle errors.
Step 4	<b>debug atm bundle events</b>  <b>Example:</b> Router# debug atm bundle event	Displays bundle events such as when VC bumping occurs, when the bundle goes up or down, and so on.
Step 5	<b>debug atm bundle inarp</b>  <b>Example:</b> Router# debug atm bundle inarp	Displays information about Inverse ARP events and errors on the bundle.

	Command or Action	Purpose
Step 6	<b>show atm bundle</b> [ <i>bundle-name</i> ]  <b>Example:</b> Router# show atm bundle new-york	Displays the bundle attributes assigned to each VC member and the current working status of the VC members.
Step 7	<b>show mpls forwarding-table</b> [{ <i>network</i> { <i>mask</i>   <i>length</i> }   <i>labels</i> <i>label</i> [- <i>label</i> ]   <b>interface</b> <i>interface</i>   <i>next-hop</i> <i>address</i>   <b>lsp-tunnel</b> [ <i>tunnel-id</i> ]}] [ <i>detail</i> ]  <b>Example:</b> Router# show mpls forwarding-table detail	Displays the contents of the MPLS FIB.

## Configuration Examples for ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection

This section provides the following configuration examples:

- [Configuring MPLS: Example, page 22](#)
- [Defining ATM VC Classes and Parameters: Example, page 22](#)
- [Associating an ATM VC Bundle with the Interface: Example, page 23](#)
- [Creating a VC Class: Example, page 24](#)

### Configuring MPLS: Example

The following example shows how to configure MPLS:

```
ip cef
mpls ldp advertise-labels
!
interface atm 0/0/3
 ip address 10.13.11.3 255.255.0.0
 mpls ip
 bundle bundle1
```

### Defining ATM VC Classes and Parameters: Example

In the following example, VC classes are defined with parameters applicable to individual VCs in the bundle. Each VC class is preceded by a description of how it will be used.

```
! The following commands define the bundle class. Any bundle that uses this class will
! have AAL5snap encapsulation, broadcast on, use of Inverse ARP to resolve IP addresses,
! and OAM enabled at the bundle class level in the inheritance chain.
! This router uses IS-IS as an IP routing protocol.
!
router isis
 net 10.0000.0000.0000.1111.00
!
vc-class atm bundle-class
 encapsulation aal5snap
```

```

broadcast
protocol ip inarp
oam-bundle manage 3
oam 4 3 10
!
! The following VC class defines the parameters applicable to an individual VC
! in a bundle. The control-class carries precedence 7 traffic and it takes the
! bundle down when it is down. It uses the implicit bumping rule.
! The QoS is set to VBR-nrt.
!
vc-class atm control-class
mpls experimental 7
protect vc
vbr-nrt 10000 5000 32
!
! The following VC class defines a premium class that carries precedence level 6 and 5
! traffic. It does not allow other traffic to be bumped onto it. The VC will choose
! precedence 7 VC as the alternate VC for its traffic when it goes down, and it belongs
! to the protected group of the bundle. The QoS type is VBR-nrt.
!
vc-class atm premium-class
mpls experimental 6-5
no bump traffic
protect group
bump explicit 7
vbr-nrt 20000 10000 32
!
! The following VC class defines a priority class that carries precedence levels
! 4 through 2 traffic, uses the implicit bumping rule, allows bumped traffic,
! and belongs to the protected group of the bundle. The QoS type is UBR+.
!
vc-class atm priority-class
mpls experimental 4-2
protect group
ubr+ 10000 3000
!
! The following VC class defines a basic-class that carries the traffic of the precedence
! levels not specified in the profile; it is part of a protected group.
! The QoS type is UBR.
!
vc-class atm basic-class
mpls experimental other
protect group
ubr 10000

```

## Associating an ATM VC Bundle with the Interface: Example

The following interface has one bundle, new-york, for connecting to three neighbors: new-york, san-francisco, and los-angeles. The new-york and san-francisco bundles have four members and los-angeles has three members.

```

interface atm 1/0.1 multipoint
ip address 10.0.0.1 255.255.255.0
ip router isis
bundle new-york
!
! The following commands enable IP and OSI traffic flows in the bundle. The protocol ip
! command takes precedence over the protocol ip inarp command in the bundle class,
! according to the inheritance rule. The protocol clns command is configured so IP routing
! can be integrated. The OSI routing packets will go on the highest precedence VC in the
! bundle, while the OSI data packets, if any, will use the lowest precedence VC in the

```

```

! bundle. Other protocols such as IPX or AppleTalk, if configured, would always use the
! lowest precedence VC in the bundle.
  protocol ip 10.10.1.2 broadcast
  protocol clns 49.0000.0000.0000.2222.00 broadcast
  class bundle-class
!
! The following commands show how to configure the PVC bundles, including adding a VC
! to a bundle as a member.
  pvc-bundle ny-control 207
    class control-class
  pvc-bundle ny-premium 206
    class premium-class
  pvc-bundle ny-priority 204
    class priority-class
  pvc-bundle ny-basic 201
    class basic-class
bundle san-francisco
  protocol clns 49.0000.0000.0000.3333.00 broadcast
  inarp 1
  class bundle-class
  pvc-bundle sf-control 307
    class control-class
  pvc-bundle sf-premium 306
    class premium-class
  pvc-bundle sf-priority 304
    class priority-class
  pvc-bundle sf-basic 301
    class basic-class
bundle los-angeles
  protocol ip 1.1.1.4 broadcast
  protocol clns 49.0000.0000.0000.4444.00 broadcast
  inarp 1
  class bundle-class
  pvc-bundle la-high 407
    precedence 7-5
    protect vc
    class premium-class
  pvc-bundle la-mid 404
    precedence 4-2
    protect group
    class priority-class
  pvc-bundle la-low 401
    precedence other
    protect group
    class basic-class
!
The following commands configure PVC la-other as a standalone VC that does not belong to
any of the bundles.
!
  pvc la-other 400
    no protocol ip inarp
    broadcast

```

## Creating a VC Class: Example

In the following example, a class called class1 is created and then applied to the bundle called bundle1:

```

! The following commands create the class class1:
vc-class atm class1
  encapsulation aal5snap
  broadcast
  protocol ip inarp

```

```
oam-bundle manage 3
oam 4 3 10
!
! The following commands apply class1 to the bundle called bundle1:
bundle bundle1
class-bundle class1
```

With hierarchy precedence rules taken into account, VCs belonging to the bundle named bundle1 will be characterized by these parameters: AAL5SNAP (RFC1483 bridging) encapsulation, broadcast on, use of Inverse ARP to resolve IP addresses, and OAM enabled.

## **MPLS Label Distribution Protocol**

# MPLS Label Distribution Protocol (LDP)

---

**First Published: January 1, 1999**

**Last Updated: May 1, 2008**

Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) enables peer label switch routers (LSRs) in an MPLS network to exchange label binding information for supporting hop-by-hop forwarding in an MPLS network. This module explains the concepts related to MPLS LDP and describes how to configure MPLS LDP in a network.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for MPLS Label Distribution Protocol](#)” section on [page 27](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Prerequisites for MPLS LDP

Label switching on a router requires that Cisco Express Forwarding (CEF) be enabled on that router.

## Information About MPLS LDP

To configure MPLS LDP, you should understand the following concepts:

- [Introduction to MPLS LDP, page 2](#)
- [MPLS LDP Functional Overview, page 2](#)
- [LDP and TDP Support, page 2](#)
- [Introduction to LDP Sessions, page 3](#)
- [Introduction to LDP Label Bindings, Label Spaces, and LDP Identifiers, page 4](#)

## Introduction to MPLS LDP

MPLS LDP provides the means for LSRs to request, distribute, and release label prefix binding information to peer routers in a network. LDP enables LSRs to discover potential peers and to establish LDP sessions with those peers for the purpose of exchanging label binding information.

MPLS LDP enables one LSR to inform another LSR of the label bindings it has made. Once a pair of routers communicate the LDP parameters, they establish a label-switched path (LSP). MPLS LDP enables LSRs to distribute labels along normally routed paths to support MPLS forwarding. This method of label distribution is also called hop-by-hop forwarding. With IP forwarding, when a packet arrives at a router the router looks at the destination address in the IP header, performs a route lookup, and forwards the packet to the next hop. With MPLS forwarding, when a packet arrives at a router the router looks at the incoming label, looks up the label in a table, and then forwards the packet to the next hop. MPLS LDP is useful for applications that require hop-by-hop forwarding, such as MPLS VPNs.

## MPLS LDP Functional Overview

Cisco MPLS LDP provides the building blocks for MPLS-enabled applications, such as MPS Virtual Private Networks (VPNs).

LDP provides a standard methodology for hop-by-hop, or dynamic label, distribution in an MPLS network by assigning labels to routes that have been chosen by the underlying Interior Gateway Protocol (IGP) routing protocols. The resulting labeled paths, called label switch paths (LSPs), forward label traffic across an MPLS backbone to particular destinations. These capabilities enable service providers to implement MPLS-based IP VPNs and IP+ATM services across multivendor MPLS networks.

## LDP and TDP Support

LDP supersedes Tag Distribution Protocol (TDP). See [Table 1](#) for information about LDP and TDP support in Cisco IOS releases.

Use caution when upgrading the image on a router that uses TDP. Ensure that the TDP sessions are established when the new image is loaded. You can accomplish this by issuing the global configuration command **mpls label protocol tdp**. Issue this command and save it to the startup configuration before loading the new image. Alternatively, you can enter the command and save the running configuration immediately after loading the new image.

**Table 1** *LDP and TDP Support*

## Introduction to LDP Sessions

When you enable MPLS LDP, the LSRs send out messages to try to find other LSRs with which they can create LDP sessions. The following sections explain the differences between directly connected LDP sessions and nondirectly connected LDP sessions.

### Directly Connected MPLS LDP Sessions

If an LSR is one hop from its neighbor, it is directly connected to its neighbor. The LSR sends out LDP link Hello messages as User Datagram Protocol (UDP) packets to all the routers on the subnet (multicast). A neighboring LSR may respond to the link Hello message, allowing the two routers to establish an LDP session. This is called basic discovery.

To initiate an LDP session between routers, the routers determine which router will take the active role and which router will take the passive role. The router that takes the active role establishes the LDP TCP connection session and initiates the negotiation of the LDP session parameters. To determine the roles, the two routers compare their transport addresses. The router with the higher IP address takes the active role and establishes the session.

After the LDP TCP connection session is established, the LSRs negotiate the session parameters, including the method of label distribution to be used. Two methods are available:

- Downstream Unsolicited: An LSR advertises label mappings to peers without being asked to.
- Downstream on Demand: An LSR advertises label mappings to a peer only when the peer asks for them.

For information about creating LDP sessions, see the [“Enabling Directly Connected LDP Sessions” section on page 6](#).

## Nondirectly Connected MPLS LDP Sessions

If the LSR is more than one hop from its neighbor, it is nondirectly connected to its neighbor. For these nondirectly connected neighbors, the LSR sends out a targeted Hello message as a UDP packet, but as a unicast message specifically addressed to that LSR. The nondirectly connected LSR responds to the Hello message and the two routers begin to establish an LDP session. This is called extended discovery.

An MPLS LDP targeted session is a label distribution session between routers that are not directly connected. When you create an MPLS traffic engineering tunnel interface, you need to establish a label distribution session between the tunnel headend and the tailend routers. You establish nondirectly connected MPLS LDP sessions by enabling the transmission of targeted Hello messages.

You can use the **mpls ldp neighbor targeted** command to set up a targeted session when other means of establishing targeted sessions do not apply, such as configuring **mpls ip** on a traffic engineering (TE) tunnel or configuring Any Transport over MPLS (AToM) virtual circuits (VCs). For example, you can use this command to create a targeted session between directly connected MPLS label switch routers (LSRs) when MPLS label forwarding convergence time is an issue.

The **mpls ldp neighbor targeted** command can improve label convergence time for directly connected neighbor LSRs when the link(s) directly connecting them are down. When the links between the neighbor LSRs are up, both the link and targeted Hellos maintain the LDP session. If the links between the neighbor LSRs go down, the targeted Hellos maintain the session, allowing the LSRs to retain labels learned from each other. When a link directly connecting the LSRs comes back up, the LSRs can immediately reinstall labels for forwarding use without having to reestablish their LDP session and exchange labels.

The exchange of targeted Hello messages between two nondirectly connected neighbors can occur in several ways, including the following:

- Router 1 sends targeted Hello messages carrying a response request to Router 2. Router 2 sends targeted Hello messages in response if its configuration permits. In this situation, Router 1 is considered to be *active* and Router 2 is considered to be *passive*.
- Router 1 and Router 2 both send targeted Hello messages to each other. Both routers are considered to be *active*. Both, one, or neither router can also be *passive*, if they have been configured to respond to requests for targeted Hello messages from each other.

The default behavior of an LSR is to ignore requests from other LSRs that send targeted Hello messages. You can configure an LSR to respond to requests for targeted Hello messages by issuing the **mpls ldp discovery targeted-hello accept** command.

The active LSR mandates the protocol that is used for a targeted session. The passive LSR uses the protocol of the received targeted Hello messages.

For information about creating MPLS LDP targeted sessions, see the [“Establishing Nondirectly Connected MPLS LDP Sessions”](#) section on page 8.

## Introduction to LDP Label Bindings, Label Spaces, and LDP Identifiers

An LDP label binding is an association between a destination prefix and a label. The label used in a label binding is allocated from a set of possible labels called a label space.

LDP supports two types of label spaces:

- Interface-specific—An interface-specific label space uses interface resources for labels. For example, label-controlled ATM (LC-ATM) interfaces use virtual path identifiers/virtual circuit identifiers (VPIs/VCI) for labels. Depending on its configuration, an LDP platform may support zero, one, or more interface-specific label spaces.

- Platform-wide—An LDP platform supports a single platform-wide label space for use by interfaces that can share the same labels. For Cisco platforms, all interface types, except LC-ATM, use the platform-wide label space.

LDP uses a 6-byte quantity called an LDP Identifier (or LDP ID) to name label spaces. The LDP ID is made up of the following components:

- The first four bytes, called the LDP router ID, identify the LSR that owns the label space.
- The last two bytes, called the local label space ID, identify the label space within the LSR. For the platform-wide label space, the last two bytes of the LDP ID are always both 0.

The LDP ID takes the following form:

<LDP router ID> : <local label space ID>

The following are examples of LDP IDs:

- 172.16.0.0:0
- 192.168.0.0:3

The router determines the LDP router ID as follows, if the **mpls ldp router-id** command is not executed,

1. The router examines the IP addresses of all operational interfaces.
2. If these IP addresses include loopback interface addresses, the router selects the largest loopback address as the LDP router ID.
3. Otherwise, the router selects the largest IP address pertaining to an operational interface as the LDP router ID.

The normal (default) method for determining the LDP router ID may result in a router ID that is not usable in certain situations. For example, the router might select an IP address as the LDP router ID that the routing protocol cannot advertise to a neighboring router. The **mpls ldp router-id** command allows you to specify the IP address of an interface as the LDP router ID. Make sure the specified interface is operational so that its IP address can be used as the LDP router ID.

When you issue the **mpls ldp router-id** command without the **force** keyword, the router selects the IP address of the specified interface (provided that the interface is operational) the next time it is necessary to select an LDP router ID, which is typically the next time the interface is shut down or the address is configured.

When you issue the **mpls ldp router-id** command with the **force** keyword, the effect of the **mpls ldp router-id** command depends on the current state of the specified interface:

- If the interface is up (operational) and if its IP address is not currently the LDP router ID, the LDP router ID changes to the IP address of the interface. This forced change in the LDP router ID tears down any existing LDP sessions, releases label bindings learned via the LDP sessions, and interrupts MPLS forwarding activity associated with the bindings.
- If the interface is down (not operational) when the **mpls ldp router-id interface force** command is issued, when the interface transitions to up, the LDP router ID changes to the IP address of the interface. This forced change in the LDP router ID tears down any existing LDP sessions, releases label bindings learned via the LDP sessions, and interrupts MPLS forwarding activity associated with the bindings.

## How to Configure MPLS LDP

This section contains the following procedures:

- [Enabling Directly Connected LDP Sessions, page 6](#) (required)

- [Establishing Nondirectly Connected MPLS LDP Sessions, page 8](#) (optional)
- [Saving Configurations: MPLS/Tag Switching Commands, page 11](#) (optional)
- [Specifying the LDP Router ID, page 11](#) (optional)
- [Preserving QoS Settings with MPLS LDP Explicit Null, page 13](#) (optional)
- [Protecting Data Between LDP Peers with MD5 Authentication, page 17](#) (optional)

## Enabling Directly Connected LDP Sessions

This procedure explains how to configure MPLS LDP sessions between two directly connected routers.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `mpls ip`
4. `mpls label protocol {ldp | tdp | both}`
5. `interface type number`
6. `mpls ip`
7. `exit`
8. `exit`
9. `show mpls interfaces [interface] [detail]`
10. `show mpls ldp discovery [all | vrf vpn-name] [detail]`
11. `show mpls ldp neighbor [[vrf vpn-name] [address | interface] [detail] | [all]]`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
	<b>Example:</b> <code>Router&gt; enable</code>	
Step 2	<code>configure terminal</code>	Enters global configuration mode.
	<b>Example:</b> <code>Router# configure terminal</code>	
Step 3	<code>mpls ip</code>	Configures MPLS hop-by-hop forwarding globally. <ul style="list-style-type: none"><li>• The <b>mpls ip</b> command is enabled by default; you do not have to specify this command.</li><li>• Globally enabling MPLS forwarding does not enable it on the router interfaces. You must enable MPLS forwarding on the interfaces as well as for the router.</li></ul>
	<b>Example:</b> <code>Router(config)# mpls ip</code>	

	Command or Action	Purpose
<b>Step 4</b>	<pre>mpls label protocol {ldp   tdp   both}</pre> <p><b>Example:</b> Router(config)# mpls label protocol ldp</p>	<p>Configures the use of LDP on all interfaces. LDP is the default.</p> <ul style="list-style-type: none"> <li>If you set all interfaces globally to LDP, you can override specific interfaces with either the <b>tdp</b> or <b>both</b> keyword by specifying the command in interface configuration mode.</li> </ul>
<b>Step 5</b>	<pre>Router(config)# interface type number</pre> <p><b>Example:</b> Router(config)# interface ethernet3/0</p>	Specifies the interface to be configured and enters interface configuration mode.
<b>Step 6</b>	<pre>mpls ip</pre> <p><b>Example:</b> Router(config-if)# mpls ip</p>	<p>Configures MPLS hop-by-hop forwarding on the interface.</p> <ul style="list-style-type: none"> <li>You must enable MPLS forwarding on the interfaces as well as for the router.</li> </ul>
<b>Step 7</b>	<pre>exit</pre> <p><b>Example:</b> Router(config-if)# exit</p>	Exits interface configuration mode and enters global configuration mode.
<b>Step 8</b>	<pre>exit</pre> <p><b>Example:</b> Router(config)# exit</p>	Exits global configuration mode and enters privileged EXEC mode.
<b>Step 9</b>	<pre>show mpls interfaces [interface] [detail]</pre> <p><b>Example:</b> Router# show mpls interfaces</p>	Verifies that the interfaces have been configured to use LDP, TDP, or both.
<b>Step 10</b>	<pre>show mpls ldp discovery [all   vrf vpn-name] [detail]</pre> <p><b>Example:</b> Router# show mpls ldp discovery</p>	Verifies that the interface is up and is sending Discovery Hello messages.
<b>Step 11</b>	<pre>show mpls ldp neighbor [[vrf vpn-name] [address   interface] [detail]   [all]]</pre> <p><b>Example:</b> Router# show mpls ldp neighbor</p>	Displays the status of LDP sessions.

## Examples

The following **show mpls interfaces** command verifies that interfaces Ethernet 1/0 and 1/1 have been configured to use LDP:

```
Router# show mpls interfaces
```

Interface	IP	Tunnel	BGP	Static	Operational
Ethernet3/0	Yes (ldp)	No	No	No	Yes
Ethernet3/1	Yes	No	No	No	Yes

The following **show mpls ldp discovery** command verifies that the interface is up and is sending LDP Discovery Hello messages (as opposed to TDP Hello messages):

```
Router# show mpls ldp discovery
```

```
Local LDP Identifier:
 172.16.12.1:0
Discovery Sources:
Interfaces:
  Ethernet3/0 (ldp): xmit
```

The following example shows that the LDP session between routers was successfully established:

```
Router# show mpls ldp neighbor
```

```
Peer LDP Ident: 10.1.1.2:0; Local LDP Ident 10.1.1.1:0
TCP connection: 10.1.1.2.18 - 10.1.1.1.66
State: Oper; Msgs sent/rcvd: 12/11; Downstream
Up time: 00:00:10
LDP discovery sources:
FastEthernet1/0, Src IP addr: 10.20.10.2
Addresses bound to peer LDP Ident:
10.1.1.2    10.20.20.1    10.20.10.2
```

For examples on configuring directly connected LDP sessions, see the [“Configuring Directly Connected MPLS LDP Sessions: Example”](#) section on page 20.

## Establishing Nondirectly Connected MPLS LDP Sessions

This section explains how to configure nondirectly connected MPLS LDP sessions, which enable you to establish an LDP session between routers that are not directly connected.

### Prerequisites

- MPLS requires CEF.
- You must configure the routers at both ends of the tunnel to be active or enable one router to be passive with the **mpls ldp discovery targeted-hello accept** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ip**
4. **mpls label protocol {ldp | tdp | both}**

5. **interface** *tunnelnumber*
6. **tunnel destination** *ip-address*
7. **mpls ip**
8. **exit**
9. **exit**
10. **show mpls ldp discovery** [**all** | **vrf** *vpn-name*] [**detail**]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls ip</b>  <b>Example:</b> Router(config)# mpls ip	Configures MPLS hop-by-hop forwarding globally. <ul style="list-style-type: none"> <li>The <b>mpls ip</b> command is enabled by default; you do not have to specify this command.</li> <li>Globally enabling MPLS forwarding does not enable it on the router interfaces. You must enable MPLS forwarding on the interfaces as well as for the router.</li> </ul>
Step 4	<b>mpls label protocol</b> { <b>ldp</b>   <b>tdp</b>   <b>both</b> }  <b>Example:</b> Router(config)# mpls label protocol ldp	Configures the use of LDP on all interfaces. LDP is the default. <ul style="list-style-type: none"> <li>If you set all interfaces globally to LDP, you can override specific interfaces with either the <b>tdp</b> or <b>both</b> keyword by specifying the command in interface configuration mode.</li> </ul>
Step 5	<b>interface</b> <i>tunnelnumber</i>  <b>Example:</b> Router(config)# interface tunnell	Configures a tunnel interface and enters interface configuration mode.
Step 6	<b>tunnel destination</b> <i>ip-address</i>  <b>Example:</b> Router(config-if)# tunnel destination 172.16.1.1	Assigns an IP address to the tunnel interface.
Step 7	<b>mpls ip</b>  <b>Example:</b> Router(config-if)# mpls ip	Configures MPLS hop-by-hop forwarding on the interface. <ul style="list-style-type: none"> <li>You must enable MPLS forwarding on the interfaces as well as for the router.</li> </ul>

	Command or Action	Purpose
Step 8	<b>exit</b>  <b>Example:</b> Router(config-if)# exit	Exits interface configuration mode and enters global configuration mode.
Step 9	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode and enters privileged EXEC mode.
Step 10	<b>show mpls ldp discovery</b> [all   vrf vpn-name] [detail]  <b>Example:</b> Router# show mpls ldp discovery	Verifies that the interface is up and is sending Discovery Hello messages.

## Example

The following example shows the output of the **show mpls ldp discovery** command for a nondirectly connected LDP session.

```
Router# show mpls ldp discovery

Local LDP Identifier:
    172.16.0.0:0
Discovery Sources:
Interfaces:
    POS2/0 (ldp): xmit/recv
        LDP Id: 172.31.255.255:0
    Tunnell (ldp): Targeted -> 192.168.255.255
Targeted Hellos:
    172.16.0.0 -> 192.168.255.255 (ldp): active, xmit/recv
        LDP Id: 192.168.255.255:0
    172.16.0.0 -> 192.168.0.0 (tdp): passive, xmit/recv
        TDP Id: 192.168.0.0:0
```

This command output indicates that:

- The local LSR (172.16.0.0) sent LDP link Hello messages on interface POS2/0 and discovered neighbor 172.31.255.255.
- The local LSR sent LDP targeted Hello messages associated with interface Tunnell1 to target 192.168.255.255. The LSR was configured to use LDP.
- The local LSR is active for targeted discovery activity with 192.168.255.255; this means that the targeted Hello messages it sends to 192.168.255.255 carry a response request. The local LSR was configured to have an LDP session with the nondirectly connected LSR 192.168.255.255.
- The local LSR is not passive from the discovery activity with 192.168.255.255 for one of the following reasons:
  - The targeted Hello messages it receives from 192.168.255.255 do not carry a response request.
  - The local LSR has not been configured to respond to such requests.
- The local LSR sent TDP directed Hello messages to the target LSR 192.168.0.0. This LSR uses TDP because the Hello messages received from the target LSR 192.168.0.0 were TDP directed Hello messages.

- The local LSR is passive in discovery activity with LSR 192.168.0.0. This means that the directed Hello messages it receives from LSR 192.168.0.0 carry a response request and that the local LSR has been configured with the **mpls ldp discovery targeted-hello accept** command to respond to such requests from LSR 192.168.0.0.
- The local LSR is not active in discovery activity with LSR 192.168.0.0, because no application that requires an LDP session with LSR 192.168.0.0 has been configured on the local LSR.

For examples of configuring LDP targeted sessions, see the [“Establishing Nondirectly Connected MPLS LDP Sessions: Example”](#) section on page 22.

## Saving Configurations: MPLS/Tag Switching Commands

In releases of Cisco IOS software prior to 12.4(2)T, some MPLS commands had both a tag-switching version and an MPLS version. For example, the two commands **tag-switching ip** and **mpls ip** were the same. To support backward compatibility, the tag-switching form of the command was written to the saved configuration.

Starting in Cisco IOS Release 12.4(2)T, the MPLS form of the command is written to the saved configuration.

For example, if an ATM interface is configured using the following commands, which have both a tag-switching form and an MPLS form:

```
Router(config)# interface ATM3/0
Router(config-if)# ip unnumbered Loopback0
router(config-if)# tag-switching ip
Router(config-if)# mpls label protocol ldp
```

After you enter these commands and save this configuration or display the running configuration with the **show running** command, the commands saved or displayed appear as follows:

```
interface ATM3/0
ip unnumbered Loopback0
mpls ip
mpls label protocol ldp
```

## Specifying the LDP Router ID

The **mpls ldp router-id** command allows you to establish the IP address of an interface as the LDP router ID.

The following steps describe the normal process for determining the LDP router ID:

1. The router considers all the IP addresses of all operational interfaces.
2. If these addresses include loopback interface addresses, the router selects the largest loopback address. Configuring a loopback address helps ensure a stable LDP ID for the router, because the state of loopback addresses does not change. However, configuring a loopback interface and IP address on each router is not required.

The loopback IP address does not become the router ID of the local LDP ID under the following circumstances:

- If the loopback interface has been explicitly shut down.
- If the **mpls ldp router-id** command specifies that a different interface should be used as the LDP router ID.

If you use a loopback interface, make sure that the IP address for the loopback interface is configured with a /32 network mask. In addition, make sure that the routing protocol in use is configured to advertise the corresponding /32 network.

3. Otherwise, the router selects the largest interface address.

The router might select a router ID that is not usable in certain situations. For example, the router might select an IP address that the routing protocol cannot advertise to a neighboring router.

The router implements the router ID the next time it is necessary to select an LDP router ID. The effect of the command is delayed until the next time it is necessary to select an LDP router ID, which is typically the next time the interface is shut down or the address is deconfigured.

If you use the **force** keyword with the **mpls ldp router-id** command, the router ID takes effect more quickly. However, implementing the router ID depends on the current state of the specified interface:

- If the interface is up (operational) and its IP address is not currently the LDP router ID, the LDP router ID is forcibly changed to the IP address of the interface. This forced change in the LDP router ID tears down any existing LDP sessions, releases label bindings learned via the LDP sessions, and interrupts MPLS forwarding activity associated with the bindings.
- If the interface is down, the LDP router ID is forcibly changed to the IP address of the interface when the interface transitions to up. This forced change in the LDP router ID tears down any existing LDP sessions, releases label bindings learned via the LDP sessions, and interrupts MPLS forwarding activity associated with the bindings.

Prerequisites

Make sure the specified interface is operational before assigning it as the LDP router ID.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ip**
4. **mpls label protocol {ldp | tdp | both}**
5. **mpls ldp router-id interface [force]**
6. **exit**
7. **show mpls ldp discovery [all | detail |vrf vpn-name]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
	<b>Example:</b> Router> enable	
Step 2	<b>configure terminal</b>	Enters global configuration mode.
	<b>Example:</b> Router# configure terminal	

	Command or Action	Purpose
Step 3	<b>mpls ip</b>  <b>Example:</b> Router(config)# mpls ip	Configures MPLS hop-by-hop forwarding globally. <ul style="list-style-type: none"> <li>The <b>mpls ip</b> command is enabled by default; you do not have to specify this command.</li> <li>Globally enabling MPLS forwarding does not enable it on the router interfaces. You must enable MPLS forwarding on the interfaces as well as for the router.</li> </ul>
Step 4	<b>mpls label protocol {ldp   tdp   both}</b>  <b>Example:</b> Router(config)# mpls label protocol ldp	Configures the use of LDP on all interfaces. LDP is the default. <ul style="list-style-type: none"> <li>If you set all interfaces globally to LDP, you can override specific interfaces with either the <b>tdp</b> or <b>both</b> keyword by specifying the command in interface configuration mode.</li> </ul>
Step 5	<b>mpls ldp router-id interface [force]</b>  <b>Example:</b> Router(config)# mpls ldp router-id pos2/0/0	Specifies the preferred interface for determining the LDP router ID.
Step 6	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode and enters privileged EXEC mode.
Step 7	<b>show mpls ldp discovery [all   detail   vrf vpn-name]</b>  <b>Example:</b> Router# show mpls ldp discovery	Displays the LDP identifier for the local router.

## Example

The following example assigns interface pos2/0/0 as the LDP router ID:

```
Router> enable
Router# configure terminal
Router(config)# mpls ip
Router(config)# mpls label protocol ldp
Router(config)# mpls ldp router-id pos2/0/0 force
```

The following example displays the LDP router ID (10.15.15.15):

```
Router# show mpls ldp discovery

Local LDP Identifier:
 10.15.15.15:0
Discovery Sources:
 Interfaces:
   Ethernet4 (ldp): xmit/recv
     LDP Id: 10.14.14.14:0
```

## Preserving QoS Settings with MPLS LDP Explicit Null

Normally, LDP advertises an Implicit Null label for directly connected routes. The Implicit Null label causes the second last (penultimate) label switched router (LSR) to remove the MPLS header from the packet. In this case, the penultimate LSR and the last LSR do not have access to the quality of service (QoS) values that the packet carried before the MPLS header was removed. To preserve the QoS values, you can configure the LSR to advertise an explicit NULL label (a label value of zero). The LSR at the penultimate hop forwards MPLS packets with a NULL label instead of forwarding IP packets.

Note

An explicit NULL label is not needed when the penultimate hop receives MPLS packets with a label stack that contains at least two labels and penultimate hop popping is performed. In that case, the inner label can still carry the QoS value needed by the penultimate and edge LSR to implement their QoS policy.

When you issue the **mpls ldp explicit-null** command, Explicit Null is advertised in place of Implicit Null for directly connected prefixes.

SUMMARY STEPS

- 1. **enable**
- 2. **configure terminal**
- 3. **mpls ip**
- 4. **mpls label protocol {ldp | tdp | both}**
- 5. **interface** *type number*
- 6. **mpls ip**
- 7. **exit**
- 8. **mpls ldp explicit-null** [**for** *prefix-acl* | **to** *peer-acl* | **for** *prefix-acl to peer-acl*]
- 9. **exit**
- 10. **show mpls forwarding-table** [*network {mask | length}* | **labels** *label* [- *label*] | **interface** *interface* | *next-hop address* | **lsp-tunnel** [*tunnel-id*]] [**vrf** *vpn-name*] [**detail**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
	<b>Example:</b> Router> enable	
Step 2	<b>configure terminal</b>	Enters global configuration mode.
	<b>Example:</b> Router# configure terminal	

	Command or Action	Purpose
Step 3	<b>mpls ip</b>  <b>Example:</b> Router(config)# mpls ip	Configures MPLS hop-by-hop forwarding globally. <ul style="list-style-type: none"> <li>The <b>mpls ip</b> command is enabled by default; you do not have to specify this command.</li> <li>Globally enabling MPLS forwarding does not enable it on the router interfaces. You must enable MPLS forwarding on the interfaces as well as for the router.</li> </ul>
Step 4	<b>mpls label protocol {ldp   tdp   both}</b>  <b>Example:</b> Router(config)# mpls label protocol ldp	Configures the use of LDP on all interfaces. LDP is the default. <ul style="list-style-type: none"> <li>If you set all interfaces globally to LDP, you can override specific interfaces with either the <b>tdp</b> or <b>both</b> keyword by specifying the command in interface configuration mode.</li> </ul>
Step 5	<b>interface type number</b>  <b>Example:</b> Router(config)# interface atm2/0	Specifies the interface to be configured and enters interface configuration mode.
Step 6	<b>mpls ip</b>  <b>Example:</b> Router(config-if)# mpls ip	Configures MPLS hop-by-hop forwarding on the interface. <ul style="list-style-type: none"> <li>You must enable MPLS forwarding on the interfaces as well as for the router.</li> </ul>
Step 7	<b>exit</b>  <b>Example:</b> Router(config-if)# exit	Exits interface configuration mode and enters global configuration mode.
Step 8	<b>mpls ldp explicit-null [for prefix-acl   to peer-acl   for prefix-acl to peer-acl]</b>  <b>Example:</b> Router(config)# mpls ldp explicit-null	Advertises an Explicit Null label in situations where it would normally advertise an Implicit Null label.
Step 9	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode and enter privileged EXEC mode.
Step 10	<b>show mpls forwarding-table [network {mask   length}   labels label [- label]   interface interface   next-hop address   lsp-tunnel [tunnel-id]] [vrf vpn-name] [detail]</b>  <b>Example:</b> Router# show mpls forwarding-table	Verifies that MPLS packets are forwarded with an explicit-null label (value of 0).

## Examples

Enabling explicit-null on an egress LSR causes that LSR to advertise the explicit-null label to all adjacent MPLS routers.

```
Router# configure terminal
```

```
Router(config)# mpls ldp explicit-null
```

If you issue the **show mpls forwarding-table** command on an adjacent router, the output shows that MPLS packets are forwarded with an explicit-null label (value of 0). In the following example, the second column shows that entries have outgoing labels of 0, where once they were marked “Pop label”.

```
Router# show mpls forwarding-table
```

Local label	Outgoing label or VC	Prefix or Tunnel Id	Bytes label switched	Outgoing interface	Next Hop
19	Pop tag	10.12.12.12/32	0	Fa2/1/0	172.16.0.1
22	0	10.14.14.14/32	0	Fa2/0/0	192.168.0.2
23	0	172.24.24.24/32	0	Fa2/0/0	192.168.0.2
24	0	192.168.0.0/8	0	Fa2/0/0	192.168.0.2
25	0	10.15.15.15/32	0	Fa2/0/0	192.168.0.2
26	0	172.16.0.0/8	0	Fa2/0/0	192.168.0.2
27	25	10.16.16.16/32	0	Fa2/0/0	192.168.0.22
28	0	10.34.34.34/32	0	Fa2/0/0	192.168.0.2

Enabling explicit-null and specifying the **for** keyword with a standard access control list (ACL) changes all adjacent MPLS routers' tables to swap an explicit-null label for only those entries specified in the access-list. In the following example, an access-list is created that contains the 10.24.24.24 entry. Explicit null is configured and the access list is specified.

```
Router# configure terminal
Router(config)# mpls label protocol ldp
Router(config)# access-list 24 permit host 10.24.24.24
Router(config)# mpls ldp explicit-null for 24
```

If you issue the **show mpls forwarding-table** command on an adjacent router, the output shows that the only the outgoing labels for the addresses specified (172.24.24.24/32) change from Pop label to 0. All other Pop label outgoing labels remain the same.

```
Router# show mpls forwarding-table
```

Local label	Outgoing label or VC	Prefix or Tunnel Id	Bytes label switched	Outgoing interface	Next Hop
19	Pop tag	10.12.12.12/32	0	Fa2/1/0	172.16.0.1
22	0	10.14.14.14/32	0	Fa2/0/0	192.168.0.2
23	0	172.24.24.24/32	0	Fa2/0/0	192.168.0.2
24	0	192.168.0.0/8	0	Fa2/0/0	192.168.0.2
25	0	10.15.15.15/32	0	Fa2/0/0	192.168.0.2
26	0	172.16.0.0/8	0	Fa2/0/0	192.168.0.2
27	25	10.16.16.16/32	0	Fa2/0/0	192.168.0.22
28	0	10.34.34.34/32	0	Fa2/0/0	192.168.0.2

Enabling explicit null and adding the **to** keyword and an access list enables you to advertise explicit-null labels to only those adjacent routers specified in the access-list. To advertise explicit-null to a particular router, you must specify the router's LDP ID in the access-list.

In the following example, an access-list contains the 10.15.15.15/32 entry, which is the LDP ID of an adjacent MPLS router. The router that is configured with explicit null advertises explicit-null labels only to that adjacent router.

```
Router# show mpls ldp discovery
```

```
Local LDP Identifier:
 10.15.15.15:0
Discovery Sources:
  Interfaces:
    Ethernet4 (ldp): xmit/recv
      TDP Id: 10.14.14.14:0
```

```

Router# configure terminal
Router(config)# mpls label protocol ldp
Router(config)# access-list 15 permit host 10.15.15.15
Router(config)# mpls ldp explicit-null to 15

```

If you issue the **show mpls forwarding-table** command, the output shows that explicit null labels are going only to the router specified in the access list.

```
Router# show mpls forwarding-table
```

Local label	Outgoing label or VC Pop tag	Prefix or Tunnel Id	Bytes label switched	Outgoing interface	Next Hop
19		10.12.12.12/32	0	Fa2/1/0	172.16.0.1
22	0	10.14.14.14/32	0	Fa2/0/0	192.168.0.2
23	0	172.24.24.24/32	0	Fa2/0/0	192.168.0.2
24	0	192.168.0.0/8	0	Fa2/0/0	192.168.0.2
25	0	10.15.15.15/32	0	Fa2/0/0	192.168.0.2
26	0	172.16.0.0/8	0	Fa2/0/0	192.168.0.2
27	25	10.16.16.16/32	0	Fa2/0/0	192.168.0.22
28	0	10.34.34.34/32	0	Fa2/0/0	192.168.0.2

Enabling explicit-null with both the **for** and **to** keywords enables you to specify which routes to advertise with explicit-null labels and to which adjacent routers to advertise these explicit-null labels.

```
Router# show access 15
```

```

Standard IP access list 15
  permit 10.15.15.15 (7 matches)

```

```
Router# show access 24
```

```

Standard IP access list 24
  permit 10.24.24.24 (11 matches)

```

```

Router# configure terminal
Router(config)# mpls label protocol ldp
Router(config)# mpls ldp explicit-null for 24 to 15

```

If you issue the **show mpls forwarding-table** command on the router called 47K-60-4, the output shows that it receives explicit null labels for 10.24.24.24/32.

```
Router# show mpls forwarding-table
```

Local label	Outgoing label or VC	Prefix or Tunnel Id	Bytes label switched	Outgoing interface	Next Hop
17	0 <---	10.24.24.24/32	0	Et4	172.16.0.1
20	Pop tag	172.16.0.0/8	0	Et4	172.16.0.1
21	20	10.12.12.12/32	0	Et4	172.16.0.1
22	16	10.0.0.0/8	0	Et4	172.16.0.1
23	21	10.13.13.13/32	0	Et4	172.16.0.1
25	Pop tag	10.14.14.14/32	0	Et4	172.16.0.1
27	Pop tag	192.168.0.0/8	0	Et4	172.16.0.1
28	25	10.16.16.16/32	0	Et4	172.16.0.1
29	Pop tag	192.168.34.34/32	0	Et4	172.16.0.1

## Protecting Data Between LDP Peers with MD5 Authentication

You can enable authentication between two LDP peers, which verifies each segment sent on the TCP connection between the peers. You must configure authentication on both LDP peers using the same password; otherwise, the peer session is not established.

Authentication uses the Message Digest 5 (MD5) algorithm to verify the integrity of the communication and authenticate the origin of the message.

To enable authentication, issue the **mpls ldp neighbor** command with the **password** keyword. This causes the router to generate an MD5 digest for every segment sent on the TCP connection and check the MD5 digest for every segment received from the TCP connection.

When you configure a password for an LDP neighbor, the router tears down existing LDP sessions and establishes new sessions with the neighbor.

If a router has a password configured for a neighbor, but the neighboring router does not have a password configured, a message such as the following appears on the console who has a password configured while the two routers attempt to establish an LDP session. The LDP session is not established.

```
%TCP-6-BADAUTH: No MD5 digest from [peer's IP address](11003) to [local router's IP address](646)
```

Similarly, if the two routers have different passwords configured, a message such as the following appears on the console. The LDP session is not established.

```
%TCP-6-BADAUTH: Invalid MD5 digest from [peer's IP address](11004) to [local router's IP address](646)
```

SUMMARY STEPS

- 1. **enable**
- 2. **configure terminal**
- 3. **mpls ip**
- 4. **mpls label protocol {ldp | tdp | both}**
- 5. **mpls ldp neighbor [vrf vpn-name] ip-address [password [0-7] password-string]**
- 6. **show mpls ldp neighbor [[vrf vpn-name] [address | interface] [detail] | [all]]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
	<b>Example:</b> Router> enable	
Step 2	<b>configure terminal</b>	Enters global configuration mode.
	<b>Example:</b> Router# configure terminal	

	Command or Action	Purpose
Step 3	<b>mpls ip</b>  <b>Example:</b> Router(config)# mpls ip	Configures MPLS hop-by-hop forwarding globally. <ul style="list-style-type: none"> <li>The <b>mpls ip</b> command is enabled by default; you do not have to specify this command.</li> <li>Globally enabling MPLS forwarding does not enable it on the router interfaces. You must enable MPLS forwarding on the interfaces as well as for the router.</li> </ul>
Step 4	<b>mpls label protocol {ldp   tdp   both}</b>  <b>Example:</b> Router(config)# mpls label protocol ldp	Configures the use of LDP on all interfaces. LDP is the default. <ul style="list-style-type: none"> <li>If you set all interfaces globally to LDP, you can override specific interfaces with either the <b>tdp</b> or <b>both</b> keyword by specifying the command in interface configuration mode.</li> </ul>
Step 5	<b>mpls ldp neighbor [vrf vpn-name] ip-address [password [0-7] password-string]</b>  <b>Example:</b> Router(config)# mpls ldp neighbor 172.27.0.15 password onethirty9	Specifies authentication between two LDP peers.
Step 6	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits global configuration mode and enters privileged EXEC mode.
Step 7	<b>show mpls ldp neighbor [[vrf vpn-name] [address   interface] [detail]   [all]]</b>  <b>Example:</b> Router# show mpls ldp neighbor detail	Displays the status of LDP sessions.  If the passwords have been set on both LDP peers and the passwords match, the <b>show mpls ldp neighbor</b> command displays that the LDP session was successfully established.

## Examples

The following example configures a router with the password cisco:

```
Router> enable
Router# configure terminal
Router(config)# mpls ip
Router(config)# mpls label protocol ldp
Router(config)# mpls ldp neighbor 10.1.1.1 password cisco
Router(config)# exit
```

The following example shows that the LDP session between routers was successfully established:

```
Router# show mpls ldp neighbor

Peer LDP Ident: 10.1.1.2:0; Local LDP Ident 10.1.1.1:0
TCP connection: 10.1.1.2.11118 - 10.1.1.1.646
State: Oper; Msgs sent/rcvd: 12/11; Downstream
Up time: 00:00:10
LDP discovery sources:
FastEthernet1/0, Src IP addr: 10.20.10.2
Addresses bound to peer LDP Ident:
10.1.1.2    10.20.20.1    10.20.10.2
```

The following **show mpls ldp neighbor detail** command shows that MD5 (shown in bold) is used for the LDP session.

```
Router# show mpls ldp neighbor 10.0.0.21 detail

Peer LDP Ident: 10.0.0.21:0; Local LDP Ident 10.0.0.22:0
TCP connection: 10.0.0.21.646 - 10.0.0.22.14709; MD5 on
State: Oper; Msgs sent/rcvd: 1020/1019; Downstream; Last TIB rev sent 2034
Up time: 00:00:39; UID: 3; Peer Id 1;
LDP discovery sources:
  FastEthernet1/1; Src IP addr: 172.16.1.1
    holdtime: 15000 ms, hello interval: 5000 ms
Addresses bound to peer LDP Ident:
  10.0.0.21      10.0.38.28      10.88.88.2      172.16.0.1
  172.16.1.1
Peer holdtime: 180000 ms; KA interval: 60000 ms; Peer state: estab
```

## MPLS LDP Configuration Examples

This section includes the following configuration examples:

- [Configuring Directly Connected MPLS LDP Sessions: Example, page 20](#)
- [Establishing Nondirectly Connected MPLS LDP Sessions: Example, page 22](#)

### Configuring Directly Connected MPLS LDP Sessions: Example

[Figure 1](#) shows a sample network for configuring directly connected LDP sessions.

This example configures the following:

- MPLS hop-by-hop forwarding for the POS links between Router 1 and Router 2 and between Router 1 and Router 3.
- LDP for label distribution between Router 1 and Router 2.
- TDP for label distribution between Router 1 and Router 3.
- A loopback interface and IP address for each LSR that can be used as the LDP router ID.

**Figure 1 Configuration of MPLS LDP****Note**

The configuration examples below show only the commands related to configuring LDP for Router 1, Router 2, and Router 3 in the sample network shown in [Figure 1](#).

**Router 1 Configuration**

```

ip cef distributed
interface Loopback0
ip address 172.16.0.11 255.255.255.255
!
interface POS3/0/0
ip address 10.0.0.44 255.0.0.0
mpls ip
mpls label protocol ldp
!
interface POS3/0/1
ip address 192.168.0.44 255.0.0.0
mpls ip
mpls label protocol tdp

```

```

!Assumes R1 supports distributed CEF
!Loopback interface for LDP ID.

```

```

!Enable hop-by-hop MPLS forwarding
!Use LDP for this interface

```

```

!Enable hop-by-hop MPLS forwarding
!Use TDP for this interface

```

**Router 2 Configuration**

```

ip cef distributed
!
interface Loopback0
ip address 172.16.0.22 255.255.255.255
!
interface POS2/0/0
ip address 10.0.0.33 255.0.0.0
mpls ip
mpls label protocol ldp

```

```

!Assumes R2 supports distributed CEF
!Loopback interface for LDP ID.

```

```

!Enable hop-by-hop MPLS forwarding
!Use LDP for this interface

```

**Router 3 Configuration**

```

ip cef
!
interface Loopback0
ip address 172.16.0.33 255.255.255.255
!

```

```

!Assumes R3 does not support dCEF
!Loopback interface for LDP ID.

```

```

interface POS1/0
ip address 192.168.0.55 255.0.0.0
mpls ip                                !Enable hop-by-hop MPLS forwarding
mpls label protocol tdp                !Use TDP for this interface

```

The LDP configuration for Router 1 uses the **mpls label protocol ldp** command in interface configuration mode, because some of its interfaces use LDP and some use TDP. Another way to configure Router 1 is to use the **mpls label protocol ldp** command in global configuration mode to configure LDP as the default protocol for interfaces and use the **mpls label protocol tdp** command in interface configuration mode to configure TDP for the POS3/0/1 link to Router 3. This alternative way to configure Router 1 is shown below:

#### Router 1 Configuration

```

ip cef distributed                      !Assumes R1 supports dCEF
mpls label protocol ldp                !Use LDP for the default protocol
!
interface Loopback0                    !Loopback interface for LDP ID.
ip address 172.16.0.11 255.255.255.255
interface POS3/0/0
ip address 10.0.0.44 255.0.0.0
mpls ip                                !Enable hop-by-hop MPLS forwarding
                                         !Use LDP (configured i/f default)

interface POS3/0/1
ip address 192.168.0.44 255.0.0.0
mpls ip                                !Enable hop-by-hop MPLS forwarding
mpls label protocol tdp                !Use TDP for this interface

```

The configuration of Router 2 also uses the **mpls label protocol ldp** command in interface configuration mode. To specify LDP for all interfaces, use the **mpls label protocol ldp** command in global configuration mode without any interface **mpls label protocol** commands.

Configuring the **mpls ip** command on an interface triggers the transmission of discovery Hello messages for the interface.

## Establishing Nondirectly Connected MPLS LDP Sessions: Example

The following examples illustrate the configuration of platforms for MPLS LDP nondirectly connected sessions using the sample network shown in [Figure 2](#). Note that Routers 1, 4, 5, and 6 in this sample network are not directly connected to each other.

**Figure 2**      **Sample Network for Configuring LDP for Targeted Sessions**

The configuration example shows the following:

- Targeted sessions between Routers 1 and 4 use LDP. Routers 1 and 4 are both active.
- Targeted sessions between Routers 1 and 6 use LDP. Router 1 is active and Router 6 is passive.
- Targeted sessions between Routers 1 and 5 use TDP. Router 5 is active.

These examples assume that the active ends of the nondirectly connected sessions are associated with tunnel interfaces, such as MPLS traffic engineering tunnels. They show only the commands related to configuring LDP targeted sessions. The examples do not show configuration of the applications that initiate the targeted sessions.

### Router 1 Configuration

Tunnel interfaces Tunnel14 and Tunnel16 specify LDP for targeted sessions associated with these interfaces. The targeted session for Router 5 requires TDP. The **mpls label protocol ldp** command in global configuration mode makes it unnecessary to explicitly specify LDP as part of the configuration from the Tunnel14 and Tunnel16.

```
ip cef distributed                !Router1 supports distributed CEF

mpls label protocol ldp          !Use LDP as default for all interfaces

interface Loopback0              !Loopback interface for LDP ID.
ip address 10.25.0.11 255.255.255.255

interface Tunnel14               !Tunnel to Router 4 requiring label distribution
tunnel destination 10.11.0.4    !Tunnel endpoint is Router 4
mpls ip                         !Enable hop-by-hop forwarding on the interface

interface Tunnel15               !Tunnel to Router 5 requiring label distribution
tunnel destination 10.11.0.5    !Tunnel endpoint is Router 5
mpls label protocol tdp         !Use TDP for session with Router 5
mpls ip                         !Enable hop-by-hop forwarding on the interface

interface Tunnel16               !Tunnel to Router 6 requiring label distribution
tunnel destination 10.11.0.6    !Tunnel endpoint is Router 6
```

```
mpls ip                                !Enable hop-by-hop forwarding on the interface
```

#### Router 4 Configuration

The **mpls label protocol ldp** command in global configuration mode makes it unnecessary to explicitly specify LDP as part of the configuration for the Tunnel41 targeted session with Router 1.

```
ip cef distributed                      !Router 4 supports distributed CEF

mpls label protocol ldp                !Use LDP as default for all interfaces

interface Loopback0                    !Loopback interface for LDP ID.
ip address 10.25.0.44 255.255.255.255

interface Tunnel41                      !Tunnel to Router 1 requiring label distribution
tunnel destination 10.11.0.1           !Tunnel endpoint is Router 1
mpls ip                                !Enable hop-by-hop forwarding on the interface
```

#### Router 5 Configuration

Router 5 must use TDP for all targeted sessions. Therefore, its configuration includes the **mpls label protocol tdp** command.

```
ip cef                                !Router 5 supports CEF

mpls label protocol tdp                !Use TDP as default for all interfaces

interface Loopback0                    !Loopback interface for LDP ID.
ip address 10.25.0.55 255.255.255.255

interface Tunnel51                      !Tunnel to Router 1 requiring label distribution
tunnel destination 10.11.0.1           !Tunnel endpoint is Router 1
mpls ip                                !Enable hop-by-hop forwarding on the interface
```

#### Router 6 Configuration

By default, a router cannot be a passive neighbor in targeted sessions. Therefore, Router 1, Router 4, and Router 5 are active neighbors in any targeted sessions. The **mpls ldp discovery targeted-hello accept** command permits Router 6 to be a passive target in targeted sessions with Router 1. Router 6 can also be an active neighbor in targeted sessions, although the example does not include such a configuration.

```
ip cef distributed                      !Router 6 supports distributed CEF

interface Loopback0                    !Loopback interface for LDP ID.
ip address 10.25.0.66 255.255.255.255

mpls ldp discovery targeted-hellos accept from LDP_SOURCES
                                         !Respond to requests for targeted hellos
                                         !from sources permitted by acl LDP_SOURCES

ip access-list standard LDP_SOURCES      !Define acl for targeted hello sources.
permit 10.11.0.1                          !Accept targeted hello request from Router 1.
deny any                                  !Deny requests from other sources.
```

# Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mo/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mo/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or a Cisco IOS master commands list.:

- **mpls label protocol** (global configuration)
- **mpls ldp router-id**

# Feature Information for MPLS Label Distribution Protocol

Table 2 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2** Feature Information for MPLS Label Distribution Protocol Overview

Feature Name	Releases	Feature Information
MPLS Label Distribution Protocol	12.0(10)ST	This feature was introduced in Cisco IOS Release 12.0(10)ST, incorporating a new set of Multiprotocol Label Switching (MPLS) CLI commands implemented for use with Cisco routers and switches. The CLI commands in this release reflected MPLS command syntax and terminology, thus facilitating the orderly transition from a network using the Tag Distribution Protocol (TDP) to one using the Label Distribution Protocol (LDP).
	12.0(14)ST	
	12.1(2)T	
	12.1(8a)E	
	12.2(2)T	
	12.2(4)T	In Cisco IOS Release 12.0(14)ST, several new MPLS CLI commands were introduced, support for MPLS VPNs was added by means of a new <i>vrf vpn-name</i> parameter in certain existing commands, and other commands were modified to ensure consistent interpretation of associated <i>prefix-access-list</i> arguments by Cisco IOS software.
	12.2(8)T	
	12.0(21)ST	
	12.0(22)S	
	12.0(23)S	
	12.2(13)T	In Cisco IOS 12.1(2)T, this feature was integrated into this release. Also, the <b>debug mpls atm-ldp api</b> , <b>debug mpls atm-ldp routes</b> , and <b>debug mpls atm-ldp states</b> commands were modified.
	12.4(3)	
	12.4(5)	
		This feature was integrated into Cisco IOS Release 12.1(8a)E.
		This feature was integrated into Cisco IOS Release 12.2(2)T.

Table 2 Feature Information for MPLS Label Distribution Protocol Overview (continued)

Feature Name	Releases	Feature Information
		<p>In Cisco IOS Release 12.2(4)T, support was added for Cisco MGX 8850 and MGX 8950 switches equipped with a Cisco MGX RPM-PR card, and the VPI range in the <b>show mpls atm-ldp bindings</b> and <b>show mpls ip binding</b> commands was changed to 4095.</p> <p>In Cisco IOS Release 12.2(8)T, the <b>debug mpls atm-ldp failure</b> command was introduced.</p> <p>In Cisco IOS Release 12.0(21)ST, the <b>mpls ldp neighbor implicit-withdraw</b> command was introduced.</p> <p>This feature was integrated into Cisco IOS Release 12.0(22)S. The <b>mpls ldp neighbor targeted-session</b> command and the <b>interface</b> keyword for the <b>mpls ldp advertise-labels</b> command were added.</p> <p>This feature was integrated into Cisco IOS Release 12.0(23)S. Default values for the <b>mpls ldp discovery</b> command <b>holdtime</b> and <b>interval</b> keywords were changed.</p> <p>This feature was integrated into Cisco IOS Release 12.2(13)T.</p> <p>In Cisco IOS Release 12.4(3), the default MPLS label distribution protocol changed from TDP to LDP. See <a href="#">“LDP and TDP Support” section on page 2</a> for more information. If no protocol is explicitly configured by the <b>mpls label protocol</b> command, LDP is the default label distribution protocol. See the <b>mpls label protocol</b> (global configuration) command for more information.</p> <p>Also in Cisco IOS Release 12.4(3), LDP configuration commands are saved by using the MPLS form of the command rather than the tag-switching form. Previously, commands were saved by using the tag-switching form of the command, for backward compatibility. See the <a href="#">“Saving Configurations: MPLS/Tag Switching Commands” section on page 11</a> for more information.</p> <p>In Cisco IOS Release 12.4(5), the <b>vrf vrf-name</b> keyword/argument pair was added for the <b>mpls ldp router-id</b> command to allow you to associate the LDP router ID with a nondefault VRF.</p>

# MPLS LDP Session Protection

---

**First Published: November 8, 2004**

**Last Updated: May 31, 2007**

The MPLS LDP Session Protection feature provides faster label distribution protocol convergence when a link recovers following an outage. MPLS LDP Session Protection protects a label distribution protocol (LDP) session between directly connected neighbors or an LDP session established for a traffic engineering (TE) tunnel.

## **Finding Feature Information in This Module**

*Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for MPLS LDP Session Protection](#)” section on page 23.*

## **Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About MPLS LDP Session Protection

MPLS LDP Session Protection maintains LDP bindings when a link fails. MPLS LDP sessions are protected through the use of LDP Hello messages. When you enable MPLS LDP, the label switched routers (LSRs) send messages to find other LSRs with which they can create LDP sessions.

- If the LSR is one hop from its neighbor, it is directly connected to its neighbor. The LSR sends out LDP Hello messages as User Datagram Protocol (UDP) packets to all the routers on the subnet. The hello message is called an LDP Link Hello. A neighboring LSR responds to the hello message and the two routers begin to establish an LDP session.
- If the LSR is more than one hop from its neighbor, it is not directly connected to its neighbor. The LSR sends out a directed hello message as a UDP packet, but as a unicast message specifically addressed to that LSR. The hello message is called an LDP Targeted Hello. The nondirectly connected LSR responds to the Hello message and the two routers establish an LDP session. (If the path between two LSRs has been traffic engineered and has LDP enabled, the LDP session between them is called a targeted session.)

MPLS LDP Session Protection uses LDP Targeted Hellos to protect LDP sessions. Take, for example, two directly connected routers that have LDP enabled and can reach each other through alternate IP routes in the network. An LDP session that exists between two routers is called an LDP Link Hello Adjacency. When MPLS LDP Session Protection is enabled, an LDP Targeted Hello Adjacency is also established for the LDP session. If the link between the two routers fails, the LDP Link Adjacency also fails. However, if the LDP peer is still reachable through IP, the LDP session stays up, because the LDP Targeted Hello Adjacency still exists between the routers. When the directly connected link recovers, the session does not need to be reestablished, and LDP bindings for prefixes do not need to be releared.

## How to Configure MPLS LDP Session Protection

This section explains how to configure and verify MPLS LDP Session Protection:

- [Enabling MPLS LDP Session Protection, page 2](#) (required)
- [Customizing MPLS LDP Session Protection, page 5](#) (optional)
- [Verifying MPLS LDP Session Protection, page 6](#) (optional)

### Enabling MPLS LDP Session Protection

You use the **mpls ldp session protection** command to enable MPLS LDP Session Protection. This command enables LDP sessions to be protected during a link failure. By default, the command protects all LDP sessions. The command has several options that enable you to specify which LDP sessions to protect. The **vrf** keyword lets you protect LDP sessions for a specified VRF. The **for** keyword lets you specify a standard IP access control list (ACL) of prefixes that should be protected. The **duration** keyword enables you to specify how long the router should retain the LDP Targeted Hello Adjacency following the loss of the LDP Link Hello Adjacency.

## Prerequisites

LSRs must be able to respond to LDP targeted hellos. Otherwise, the LSRs cannot establish a targeted adjacency. All routers that participate in MPLS LDP Session Protection must be enabled to respond to targeted hellos. Both neighbor routers must be configured for session protection or one router must be configured for session protection and the other router must be configured to respond to targeted hellos.

## Restrictions

This feature is not supported under the following circumstances:

- With TDP sessions
- With extended access lists
- With LC-ATM routers

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip cef** [distributed]
4. **interface loopback***number*
5. **ip address** {*prefix mask*}
6. **interface** *interface*
7. **mpls ip**
8. **mpls label protocol** {**ldp** | **tdp** | **both**}
9. **exit**
10. **mpls ldp session protection** [**vrf** *vpn-name*] [**for** *acl*] [**duration** *seconds*]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>ip cef [distributed]</b>  <b>Example:</b> Router(config)# ip cef	Configures Cisco Express Forwarding.
Step 4	<b>interface loopbacknumber</b>  <b>Example:</b> Router(config)# interface Loopback0	Configures a loopback interface and enters interface configuration mode.
Step 5	<b>ip address {prefix mask}</b>  <b>Example:</b> Router(config-if)# ip address 10.25.0.11 255.255.255.255	Assigns an IP address to the loopback interface.
Step 6	<b>interface interface</b>  <b>Example:</b> Router(config-if)# interface POS3/0	Specifies the interface to configure.
Step 7	<b>mpls ip</b>  <b>Example:</b> Router(config-if)# mpls ip	Configures MPLS hop-by-hop forwarding for a specified interface.
Step 8	<b>mpls label protocol {ldp   tdp   both}</b>  <b>Example:</b> Router(config-if)# mpls label protocol ldp	Configures the use of LDP on a specific interface or on all interfaces.  In interface configuration mode, the command sets the default label distribution protocol for the interface to be LDP, overriding any default set by the global <b>mpls label protocol</b> command.  In global configuration mode, the command sets all the interfaces to LDP.

	Command or Action	Purpose
Step 9	<b>exit</b>  <b>Example:</b> Router(config-if)# exit	Exits from interface configuration mode.
Step 10	<b>mpls ldp session protection</b> [ <b>vrf</b> <i>vpn-name</i> ] [ <b>for</b> <i>acl</i> ] [ <b>duration</b> <i>seconds</i> ]  <b>Example:</b> Router(config)# mpls ldp session protection	Enables MPLS LDP Session Protection.

## Customizing MPLS LDP Session Protection

You can modify MPLS LDP Session Protection by using the keywords in the **mpls ldp session protection** command. The following sections explain how to customize the feature.

### Specifying How Long an LDP Targeted Hello Adjacency Should Be Retained

The default behavior of the **mpls ldp session protection** command allows an LDP Targeted Hello Adjacency to exist indefinitely following the loss of an LDP Link Hello Adjacency. You can issue the **duration** keyword to specify the number of seconds (from 30 to 2,147,483) that the LDP Targeted Hello Adjacency is retained after the loss of the LDP Link Hello Adjacency. When the link is lost, a timer starts. If the timer expires, the LDP Targeted Hello Adjacency is removed.

### Specifying Which Routers Should Have MPLS LDP Session Protection

The default behavior of the **mpls ldp session protection** command allows MPLS LDP Session Protection for all neighbor sessions. You can issue either the **vrf** or **for** keyword to limit the number of neighbor sessions that are protected.

### Enabling MPLS LDP Session Protection on Specified VPN Routing and Forwarding Instances

If the router is configured with at least one VPN routing and forwarding (VRF) instance, you can use the **vrf** keyword to select which VRF is to be protected. You cannot specify more than one VRF with the **mpls ldp session protection** command. To specify multiple VRFs, issue the command multiple times.

### Enabling MPLS LDP Session Protection on Specified Peer Routers

You can create an access list that includes several peer routers. You can specify that access list with the **for** keyword to enable LDP Session Protection for the peer routers in the access control list.

## Verifying MPLS LDP Session Protection

To verify that LDP Session Protection has been correctly configured, perform the following steps.

### SUMMARY STEPS

1. show mpls ldp discovery
2. show mpls ldp neighbor
3. show mpls ldp neighbor detail

### DETAILED STEPS

#### Step 1 show mpls ldp discovery

Issue this command and check that the output contains xmit/recv to the peer router.

```
Router# show mpls ldp discovery
```

```
Local LDP Identifier:
 10.0.0.5:0
Discovery Sources:
Interfaces:
  ATM5/1/0.5 (ldp): xmit/recv
    LDP Id: 10.0.0.1:0
Targeted Hellos:
 10.0.0.5 -> 10.0.0.3 (ldp): active, xmit/recv
    LDP Id: 10.0.0.3:0
```

#### Step 2 show mpls ldp neighbor

Issue this command to check that the targeted hellos are active.

```
Router# show mpls ldp neighbor
```

```
Peer LDP Ident: 10.0.0.3:0; Local LDP Ident 10.0.0.5:0
TCP connection: 10.0.0.3.646 - 10.0.0.5.11005
State: Oper; Msgs sent/rcvd: 1453/1464; Downstream
Up time: 21:09:56
LDP discovery sources:
  Targeted Hello 10.0.0.5 -> 10.0.0.3, active
Addresses bound to peer LDP Ident:
 10.3.104.3      10.0.0.2      10.0.0.3
```

#### Step 3 show mpls ldp neighbor detail

Issue this command to check that the MPLS LDP Session Protection state is Ready or Protecting. If the second last line of the output shows Incomplete, the Targeted Hello Adjacency is not up yet.

```
Router# show mpls ldp neighbor detail
```

```
Peer LDP Ident: 10.16.16.16:0; Local LDP Ident 10.15.15.15:0
TCP connection: 10.16.16.16.11013 - 10.15.15.15.646
State: Oper; Msgs sent/rcvd: 53/51; Downstream; Last TIB rev sent 74
Up time: 00:11:32; UID: 1; Peer Id 0;
LDP discovery sources:
  Targeted Hello 10.15.15.15 -> 10.16.16.16, active, passive;
    holdtime: infinite, hello interval: 10000 ms
Addresses bound to peer LDP Ident:
 10.0.0.2      10.16.16.16      10.101.101.101 11.0.0.1
Peer holdtime: 180000 ms; KA interval: 60000 ms; Peer state: estab
Clients: Dir Adj Client
```

```
LDP Session Protection enabled, state: Protecting
duration: infinite
```

## Troubleshooting Tips

Use the **clear mpls ldp neighbor** command if you need to terminate an LDP session after a link goes down. This is useful for situations where the link needs to be taken out of service or needs to be connected to a different neighbor.

To enable the display of events related to MPLS LDP Session Protection, use the **debug mpls ldp session protection** command.

## Configuration Examples for MPLS LDP Session Protection

Figure 1 shows a sample configuration for MPLS LDP Session Protection.

**Figure 1** *MPLS LDP Session Protection Example*

### R1

# MPLS LDP-IGP Synchronization

---

**First Published: November 20, 2004**

**Last Updated: September 2, 2009**

The MPLS LDP-IGP Synchronization feature ensures that the Label Distribution Protocol (LDP) is fully established before the Interior Gateway Protocol (IGP) path is used for switching.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature History for MPLS LDP-IGP Synchronization](#)” section on page 17.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Configuration Examples for MPLS LDP-IGP Synchronization, page 14](#)
- [Additional References, page 15](#)
- [Feature History for MPLS LDP-IGP Synchronization, page 17](#)

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Prerequisites for MPLS LDP-IGP Synchronization

- This feature is supported only on interfaces that are running Open Shortest Path First (OSPF) or Intermediate System-to-System (IS-IS) processes.
- This feature works when LDP is enabled on interfaces with either the **mpls ip** command or the **mpls ldp autoconfig** command.

## Restrictions for MPLS LDP-IGP Synchronization

- In Cisco IOS Release 12.2(33)SB, and Cisco IOS Release 12.2(33)SRB, the MPLS LDP-IGP Synchronization feature is not supported with IS-IS. Only OSPF is supported.
- The Tag Distribution Protocol (TDP) is not supported. You must specify that the default label distribution protocol is LDP for a router or for an interface.
- This feature is not supported on tunnel interfaces or LC-ATM interfaces.
- This feature is not supported with interface-local label space or downstream-on-demand (DoD) requests.
- This feature does not support targeted LDP sessions. Therefore, Any Transport over MPLS (AToM) sessions are not supported.

## Information About MPLS LDP-IGP Synchronization

To configure the MPLS LDP-IGP Synchronization feature, you should understand the following concepts:

- [How MPLS LDP-IGP Synchronization Works, page 2](#)
- [MPLS LDP-IGP Synchronization with Peers, page 3](#)
- [MPLS LDP-IGP Synchronization Delay Timer, page 3](#)
- [MPLS LDP-IGP Synchronization Incompatibility with IGP Nonstop Forwarding, page 4](#)
- [MPLS LDP-IGP Synchronization Compatibility with LDP Graceful Restart, page 4](#)

## How MPLS LDP-IGP Synchronization Works

Packet loss can occur because the actions of the IGP and LDP are not synchronized. Packet loss can occur in the following situations:

- When an IGP adjacency is established, the router begins forwarding packets using the new adjacency before the LDP label exchange completes between the peers on that link.
- If an LDP session closes, the router continues to forward traffic using the link that is associated with the LDP peer rather than an alternate pathway with a fully synchronized LDP session.

The MPLS LDP-IGP Synchronization feature does the following:

- Provides a means to synchronize LDP and IGPs to minimize Multiprotocol Label Switching (MPLS) packet loss.
- Enables you to globally enable LDP-IGP synchronization on each interface that is associated with an IGP OSPF or IS-IS process.

- Provides a means to disable LDP-IGP synchronization on interfaces that you do not want enabled.
- Prevents MPLS packet loss due to synchronization conflicts.
- Works when LDP is enabled on interfaces using either the **mpls ip** or **mpls ldp autoconfig** command.

To enable LDP-IGP synchronization on each interface that belongs to an OSPF or IS-IS process, enter the **mpls ldp sync** command. If you do not want some of the interfaces to have LDP-IGP synchronization enabled, issue the **no mpls ldp igp sync** command on those interfaces.

If the LDP peer is reachable, the IGP waits indefinitely (by default) for synchronization to be achieved. To limit the length of time the IGP session must wait, enter the **mpls ldp igp sync holddown** command. If the LDP peer is not reachable, the IGP establishes the adjacency to enable the LDP session to be established.

When an IGP adjacency is established on a link but LDP-IGP synchronization is not yet achieved or is lost, the IGP advertises the max-metric on that link.

## MPLS LDP-IGP Synchronization with Peers

When the MPLS LDP-IGP Synchronization feature is enabled on an interface, LDP determines if any peer connected by the interface is reachable by looking up the peer's transport address in the routing table. If a routing entry (including longest match or default routing entry) for the peer exists, LDP assumes that LDP-IGP synchronization is required for the interface and notifies the IGP to wait for LDP convergence.

LDP-IGP synchronization with peers requires that the routing table be accurate for the peer's transport address. If the routing table shows there is a route for the peer's transport address, that route must be able to reach the peer's transport address. However, if the route is a summary route, a default route, or a statically configured route, it may not be the correct route for the peer. You must verify that the route in the routing table can reach the peer's transport address.

When the routing table has an inaccurate route for the peer's transport address, LDP cannot set up a session with the peer, which causes the IGP to wait for LDP convergence unnecessarily for the sync hold-down time.

## MPLS LDP-IGP Synchronization Delay Timer

Cisco IOS Release 12.0(32)SY and later releases of the MPLS LDP-IGP Synchronization feature provide the option to configure a delay time for MPLS LDP and IGP synchronization on an interface-by-interface basis. Normally, when LDP-IGP synchronization is configured, LDP notifies IGP as soon as LDP is converged. When the delay timer is configured, this notification is delayed. If you want to configure a delay time on an interface, use the **mpls ldp igp sync delay delay-time** command in interface configuration mode. To remove the delay timer from a specified interface, enter the **no mpls ldp igp sync delay** command. This command sets the delay time to 0 seconds, but leaves MPLS LDP-IGP synchronization enabled.

When LDP is fully established and synchronized, LDP checks the delay timer:

- If you configured a delay time, LDP starts the timer. When the timer expires, LDP checks that synchronization is still valid and notifies the OSPF process.
- If you did not configure a delay time, if synchronization is disabled or down, or if an interface was removed from an IGP process, LDP stops the timer and immediately notifies the OSPF process.

If you configure a new delay time while a timer is running, LDP saves the new delay time but does not reconfigure the running timer.

## MPLS LDP-IGP Synchronization Incompatibility with IGP Nonstop Forwarding

The MPLS LDP-IGP Synchronization feature is not supported during the startup period if IGP nonstop forwarding (NSF) is configured. The MPLS LDP-IGP Synchronization feature conflicts with IGP NSF when the IGP is performing NSF during startup. After the NSF startup is complete, the MPLS LDP-IGP Synchronization feature is supported.

## MPLS LDP-IGP Synchronization Compatibility with LDP Graceful Restart

LDP graceful restart protects traffic when an LDP session is lost. If an interface that supports a graceful-restart-enabled LDP session fails, MPLS LDP-IGP synchronization is still achieved on the interface while it is protected by Graceful Restart. MPLS LDP-IGP synchronization is eventually lost under the following circumstances

- If LDP fails to restart before the LDP Graceful Restart reconnect timer expires.
- If an LDP session restarts through other interfaces, but the LDP session on the protected interface fails to recover when the LDP Graceful Restart recovery timer expires.

## How to Configure MPLS LDP-IGP Synchronization

This section contains the following procedures:

- [Configuring MPLS LDP-IGP Synchronization with OSPF Interfaces, page 4](#) (required)
- [Disabling MPLS LDP-IGP Synchronization on Some OSPF Interfaces, page 6](#) (optional)
- [Verifying MPLS LDP-IGP Synchronization with OSPF, page 7](#) (optional)
- [Configuring MPLS LDP-IGP Synchronization with IS-IS Interfaces, page 8](#) (required)
- [Disabling MPLS LDP-IGP Synchronization on Some IS-IS Interfaces, page 12](#) (optional)
- [Verifying MPLS LDP-IGP Synchronization with IS-IS, page 12](#) (optional)

## Configuring MPLS LDP-IGP Synchronization with OSPF Interfaces

To configure MPLS LDP-IGP synchronization with OSPF interfaces, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ip**
4. **mpls label protocol ldp**
5. **interface** *type number*
6. **ip address** *prefix mask*

7. **mpls ip**
8. **exit**
9. **router ospf process-id**
10. **network ip-address wildcard-mask area area-id**
11. **mpls ldp sync**
12. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls ip</b>  <b>Example:</b> Router(config)# mpls ip	Globally enables hop-by-hop forwarding.
Step 4	<b>mpls label protocol ldp</b>  <b>Example:</b> Router(config)# mpls label protocol ldp	Specifies LDP as the default label distribution protocol.
Step 5	<b>interface type number</b>  <b>Example:</b> Router(config)# interface POS3/0	Specifies the interface to configure and enters interface configuration mode.
Step 6	<b>ip address prefix mask</b>  <b>Example:</b> Router(config-if)# ip address 10.25.0.11 255.255.255.255	Assigns an IP address to the interface.
Step 7	<b>mpls ip</b>  <b>Example:</b> Router(config-if)# mpls ip	Enables hop-by-hop forwarding on the interface.
Step 8	<b>exit</b>  <b>Example:</b> Router(config-if)# exit	Exits interface configuration mode.

	Command or Action	Purpose
Step 9	<b>router</b> <i>ospf process-id</i>  <b>Example:</b> Router(config)# router ospf 1	Enables OSPF routing and enters router configuration mode.
Step 10	<b>network</b> <i>ip-address wildcard-mask area area-id</i>  <b>Example:</b> Router(config-router)# network 10.0.0.0 0.255.255.255 area 3	Defines an interface on which OSPF runs and defines the area ID for that interface.
Step 11	<b>mpls ldp sync</b>  <b>Example:</b> Router(config-router)# mpls ldp sync	Enables MPLS LDP-IGP synchronization for interfaces for an OSPF or an IS-IS process.
Step 12	<b>end</b>  <b>Example:</b> Router(config-router)# end	Exits router configuration mode and returns to privileged EXEC mode.

## Disabling MPLS LDP-IGP Synchronization on Some OSPF Interfaces

When you issue the **mpls ldp sync** command, all of the interfaces that belong to an OSPF process are enabled for LDP-IGP synchronization. To remove LDP-IGP synchronization from some interfaces, use the **no** form of the **mpls ldp igp sync** command on those interfaces. The following configuration steps show how to disable LDP-IGP synchronization from some OSPF interfaces after they have been configured with LDP-IGP synchronization through the **mpls ldp sync** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **no mpls ldp igp sync**
5. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface type number</b>  <b>Example:</b> Router(config)# interface POS3/0	Specifies the interface to configure and enters interface configuration mode.
Step 4	<b>no mpls ldp igp sync</b>  <b>Example:</b> Router(config-if)# no mpls ldp igp sync	Disables MPLS LDP-IGP synchronization for that interface.
Step 5	<b>end</b>  <b>Example:</b> Router(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

## Verifying MPLS LDP-IGP Synchronization with OSPF

After you configure the interfaces for LDP, OSPF, and LDP-IGP synchronization, verify that the configuration is working correctly using the **show mpls ldp igp sync** and **show ip ospf mpls ldp interface** commands.

## SUMMARY STEPS

1. **enable**
2. **show mpls ldp igp sync**
3. **show ip ospf mpls ldp interface**

## DETAILED STEPS

Step 1	<b>enable</b>  Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>show mpls ldp igp sync</b>  The output of this command (as shown in the following example) shows that MPLS LDP-IGP synchronization is configured correctly, because LDP is configured and the SYNC status shows that synchronization is enabled.  Router# <b>show mpls ldp igp sync</b>

```
Ethernet0/0:
LDP configured; SYNC enabled.
SYNC status: sync achieved; peer reachable.
IGP holddown time: infinite.
Peer LDP Ident: 10.0.0.1:0
IGP enabled: OSPF 1
```

If MPLS LDP-IGP synchronization is not enabled on an interface, the output appears as follows:

```
Ethernet5/1:
LDP configured; LDP-IGP Synchronization not enabled.
```

### Step 3 **show ip ospf mpls ldp interface**

The output of the **show ip ospf mpls ldp interface** command in the following example shows that the interfaces are properly configured:

```
Router# show ip ospf mpls ldp interface

Ethernet3/0/0
  Process ID 1, Area 0
  LDP is configured through LDP autoconfig
  LDP-IGP Synchronization: Yes
  Holddown timer is not configured
  Timer is not running
Ethernet3/0/2
  Process ID 1, Area 0
  LDP is configured through LDP autoconfig
  LDP-IGP Synchronization: Yes
  Holddown timer is not configured
  Timer is not running
```

## Configuring MPLS LDP-IGP Synchronization with IS-IS Interfaces

### Note

In Cisco IOS Releases 12.2(33)SRB and 12.2(33)SB, the MPLS LDP-IGP Synchronization feature is not supported with IS-IS. Only OSPF is supported.

The following sections contain the steps and examples for configuring MPLS LDP-IGP synchronization for interfaces that are running IS-IS processes:

- [Configuring MPLS LDP-IGP Synchronization on All IS-IS Interfaces, page 8](#)
- [Configuring MPLS LDP-IGP Synchronization on an IS-IS Interface, page 10](#)

## Configuring MPLS LDP-IGP Synchronization on All IS-IS Interfaces

This section contains the steps for configuring the MPLS LDP-IGP Synchronization feature on all interfaces that are running IS-IS processes.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ip**

4. **mpls label protocol ldp**
5. **router isis** *process-name*
6. **mpls ldp sync**
7. **mpls ldp autoconfig**
8. **exit**
9. **interface** *type number*
10. **ip address** *prefix mask*
11. **ip router isis** *process-name*
12. **mpls ip**
13. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls ip</b>  <b>Example:</b> Router(config)# mpls ip	Globally enables hop-by-hop forwarding.
Step 4	<b>mpls label protocol ldp</b>  <b>Example:</b> Router(config)# mpls label protocol ldp	Specifies LDP as the default label distribution protocol.
Step 5	<b>router isis</b> <i>process-name</i>  <b>Example:</b> Router(config)# router isis ISIS	Enables the IS-IS protocol on the router, specifies an IS-IS process, and enters router configuration mode.
Step 6	<b>mpls ldp sync</b>  <b>Example:</b> Router(config-router)# mpls ldp sync	Enables MPLS LDP-IGP synchronization on interfaces belonging to an IS-IS process.
Step 7	<b>mpls ldp autoconfig</b>  <b>Example:</b> Router(config-router)# mpls ldp autoconfig	Configures auto-configuration to quickly configure the auto synchronization. When auto-configure is configured, auto-sync configuration is not required on any interfaces with MPLS enabled.

	Command or Action	Purpose
Step 8	<b>exit</b>  <b>Example:</b> Router(config-router)# exit	Exits router configuration mode and returns to global configuration mode.
Step 9	<b>interface</b> <i>type number</i>  <b>Example:</b> Router(config)# interface POS0/3	Specifies the interface to configure and enters interface configuration mode.
Step 10	<b>ip address</b> <i>prefix mask</i>  <b>Example:</b> Router(config-if)# ip address 10.25.25.11 255.255.255.0	Assigns an IP address to the interface.
Step 11	<b>ip router isis</b> <i>process-name</i>  <b>Example:</b> Router(config-if)# ip router isis ISIS	Enables IS-IS.
Step 12	<b>mpls ip</b>  <b>Example:</b> Router(config-if)# mpls ip	Enables MPLS IP.
Step 13	<b>end</b>  <b>Example:</b> Router(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

## Configuring MPLS LDP-IGP Synchronization on an IS-IS Interface

This section contains the steps for configuring the MPLS LDP-IGP Synchronization feature on an interface that is running an IS-IS process.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip address** *prefix mask*
5. **mpls ldp igp sync**
6. **ip router isis**
7. **exit**
8. **router isis**
9. **mpls ldp sync**
10. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface type number</b>  <b>Example:</b> Router(config)# interface POS0/2	Specifies the interface to configure and enters interface configuration mode.
Step 4	<b>ip address prefix mask</b>  <b>Example:</b> Router(config-if)# ip address 10.50.72.4 255.0.0.0	Assigns an IP address to the interface.
Step 5	<b>mpls ldp igp sync</b>  <b>Example:</b> Router(config-if)# mpls ldp igp sync	Enables MPLS LDP-IGP synchronization.
Step 6	<b>ip router isis</b>  <b>Example:</b> Router(config-if)# ip router isis	Enables the IS-IS protocol for IP on the interface.
Step 7	<b>exit</b>  <b>Example:</b> Router(config-if)# exit	Exits interface configuration mode and returns to global configuration mode.
Step 8	<b>router isis</b>  <b>Example:</b> Router(config)# router isis	Enables IS-IS process on the router.
Step 9	<b>mpls ldp sync</b>  <b>Example:</b> Router(config-router)# mpls ldp sync	Enables LDP-IGP synchronization for interfaces that belongs to an IS-IS process.
Step 10	<b>end</b>  <b>Example:</b> Router(config-router)# end	Exits router configuration mode and returns to privileged EXEC mode.

## Disabling MPLS LDP-IGP Synchronization on Some IS-IS Interfaces

When you issue the **mpls ldp sync** command, all of the interfaces that belong to an IS-IS process are enabled for LDP-IGP synchronization. To remove LDP-IGP synchronization from some interfaces, use the **no** form of the **mpls ldp igp sync** command on those interfaces. The following configuration steps show how to disable LDP-IGP synchronization from some IS-IS interfaces after they have been configured with LDP-IGP synchronization through the **mpls ldp sync** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **no mpls ldp igp sync**
5. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface</b> <i>type number</i>  <b>Example:</b> Router(config)# interface POS3/0	Specifies the interface to configure and enters interface configuration mode.
Step 4	<b>no mpls ldp igp sync</b>  <b>Example:</b> Router(config-if)# no mpls ldp igp sync	Disables MPLS LDP-IGP synchronization for that interface.
Step 5	<b>end</b>  <b>Example:</b> Router(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

## Verifying MPLS LDP-IGP Synchronization with IS-IS

After you configure the interfaces for LDP-IGP synchronization with IS-IS, you can verify that the configuration is working correctly with the **show isis mpls ldp** command.

## SUMMARY STEPS

1. **enable**
2. **show isis mpls ldp**

## DETAILED STEPS

---

**Step 1 enable**

Enables privileged EXEC mode. Enter your password if prompted.

**Step 2 show isis mpls ldp**

The output of the following command shows that IS-IS is configured on the interface (ISIS is UP) and that MPLS LDP-IGP synchronization with IS-IS is configured properly (SYNC achieved).

```
Router# show isis mpls ldp
```

```
Interface: POS0/2; ISIS tag null enabled
ISIS is UP on interface
AUTOCONFIG Information :
  LDP enabled: NO
SYNC Information :
  Required: YES
  Achieved: YES
  IGP Delay: NO
  Holddown time: Infinite
  State: SYNC achieved
```

If MPLS LDP-IGP synchronization with IS-IS is not enabled on an interface, the output looks like the following:

```
Interface: Ethernet0; ISIS tag null enabled
ISIS is UP on interface
AUTOCONFIG Information :
  LDP enabled: NO
SYNC Information :
  Required: NO
```

If MPLS LDP-IGP synchronization with IS-IS is configured but is not enabled, the output looks like the following:

```
Interface: Ethernet0/0; ISIS tag ISIS-1 enabled
ISIS is UP on interface
AUTOCONFIG Information :
  LDP enabled: YES
SYNC Information :
  Required: YES
  Achieved: NO
  IGP Delay: YES
  Holddown time: Infinite
  State: Holding down until SYNC
```

The IS-IS process holds down the adjacency of the interface until synchronization is enabled.

---

## Troubleshooting Tips

Use the **debug mpls ldp igp sync** command to display events related to MPLS LDP-IGP synchronization.

## Configuration Examples for MPLS LDP-IGP Synchronization

The following sections show examples for the MPLS LDP-IGP Synchronization feature with OSPF and IS-IS processes:

- [MPLS LDP-IGP Synchronization with OSPF: Example, page 14](#)
- [MPLS LDP-IGP Synchronization with IS-IS: Example, page 14](#)

### MPLS LDP-IGP Synchronization with OSPF: Example

The following configuration commands enable LDP for OSPF process 1. The **mpls ldp sync** command and the OSPF **network** commands enable LDP on interfaces POS0/0, POS0/1, and POS1/1, respectively. The **no mpls ldp igp sync** command on interface POS1/0 prevents LDP from being enabled on interface POS1/0, even though OSPF is enabled for that interface.

```
Router# configure terminal
Router(config)# interface POS0/0
Router(config-if)# ip address 10.0.0.1
Router(config-if)# mpls ip
!
Router(config)# interface POS0/1
Router(config-if)# ip address 10.0.1.1
Router(config-if)# mpls ip
!
Router(config)# interface POS1/1
Router(config-if)# ip address 10.1.1.1
Router(config-if)# mpls ip
!
Router(config)# interface POS1/0
Router(config-if)# ip address 10.1.0.1
Router(config-if)# mpls ip
!
Router(config)# router ospf 1
Router(config-router)# network 10.0.0.0 0.0.255.255 area 3
Router(config-router)# network 10.1.0.0 0.0.255.255 area 3
Router(config-router)# mpls ldp sync
Router(config-router)# exit
Router(config)# interface POS1/0
Router(config-if)# no mpls ldp igp sync
```

### MPLS LDP-IGP Synchronization with IS-IS: Example

#### Note

In Cisco IOS Release 12.2(33)SRB and 12.2(33)SB, the MPLS LDP-IGP Synchronization feature is not supported with IS-IS. Only OSPF is supported.

The following commands configure MPLS LDP-IGP synchronization on interfaces POS0/2 and POS0/3, which are running IS-IS processes:

```

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# interface POS0/2
Router(config-if)# ip router isis
Router(config-if)# exit
Router(config)# router isis
Router(config-router)# mpls ldp sync
!
!
Router(config)# interface POS0/3
Router(config-if)# ip router isis
Router(config-if)# exit
Router(config)# router isis
Router(config-router)# mpls ldp sync

```

# Feature History for MPLS LDP-IGP Synchronization

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS LDP-IGP Synchronization

Feature Name	Releases	Feature Information
MPLS LDP-IGP Synchronization	12.0(30)S 12.0(32)SY 12.2(33)SB 12.2(33)SRB 15.0(1)M 12.3(14)T Cisco IOS XE Release 2.1	<p>The MPLS LDP-IGP Synchronization feature ensures that LDP is fully established before the IGP path is used for switching.</p> <p>In 12.0(30)S, this feature was introduced.</p> <p>In 12.0(32)SY, support for enabling synchronization on interfaces running Intermediate System-to-System (IS-IS) processes was added.</p> <p>In 12.2(33)SB, the feature was integrated. MPLS LDP-IGP synchronization for IS-IS is not supported in this release.</p> <p>In 12.2(33)SRB, the feature was integrated. MPLS LDP-IGP synchronization for IS-IS is not supported in this release.</p> <p>In 12.3(14)T, this feature was integrated. MPLS LDP-IGP synchronization for IS-IS is not supported in this release.</p> <p>In 15.0(1)M, support for enabling synchronization on interfaces running IS-IS processes was added.</p> <p>In XE 2.1, this feature was implemented on Cisco ASR 1000 Series Routers.</p> <p>The following commands were modified: <b>debug mpls ldp igp sync</b>, <b>mpls ldp igp sync</b>, <b>mpls ldp igp sync holddown</b>, <b>mpls ldp sync</b>, <b>show ip ospf mpls ldp interface</b>, <b>show isis mpls ldp</b>, and <b>show mpls ldp igp sync</b>.</p>

# MPLS LDP Autoconfiguration

---

**First Published: November 8, 2004**

**Last Updated: November 25, 2009**

The MPLS LDP Autoconfiguration feature enables you to globally configure Label Distribution Protocol (LDP) on every interface associated with a specified Interior Gateway Protocol (IGP) instance.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for MPLS LDP Autoconfiguration](#)” section on page 13.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Restrictions for MPLS LDP Autoconfiguration

The MPLS LDP Autoconfiguration feature has the following restrictions:

- In Cisco IOS Release 12.0(32)SY, the **mpls ldp autoconfig** command is supported only with the IS-IS interface. Other IGPs are not supported.
- If LDP is disabled globally, the **mpls ldp autoconfig** command fails and generates a console message explaining that LDP must first be enabled globally by means of the global **mpls ip** command.
- If the **mpls ldp autoconfig** command is configured for an IGP instance, you cannot issue the global **no mpls ip** command. To disable LDP, you must first issue the **no mpls ldp autoconfig** command.
- For interfaces running IS-IS processes, you can enable Multiprotocol Label Switching (MPLS) for each interface, using the router mode command **mpls ldp autoconfig** or **mpls ldp igp autoconfig** at the interface level.
- You specify that the default label distribution protocol is LDP for a router or for an interface. Tag Distribution Protocol (TDP) is not supported.
- The MPLS LDP Autoconfiguration feature is not supported on traffic engineering tunnel interfaces.

## Information About MPLS LDP Autoconfiguration

To enable LDP, you should configure it globally and on each interface where it is needed. Configuring LDP on many interfaces can be time-consuming. The following section provides information about autoconfiguration feature on OSPF and IS-IS interfaces:

- [MPLS LDP Autoconfiguration on OSPF and IS-IS Interfaces](#)

## MPLS LDP Autoconfiguration on OSPF and IS-IS Interfaces

The MPLS LDP Autoconfiguration feature enables you to globally enable LDP on every interface associated with an IGP instance. This feature is supported on OSPF and IS-IS IGPs. It provides a means to block LDP from being enabled on interfaces that you do not want enabled. The goal of the MPLS LDP Autoconfiguration feature is to make configuration easier, faster, and error free.

You issue the **mpls ldp autoconfig** command to enable LDP on each interface that is running an OSPF or IS-IS process. If you do not want some of the interfaces to have LDP enabled, you can issue the **no** form of the **mpls ldp igp autoconfig** command on those interfaces.

## How to Configure MPLS LDP Autoconfiguration

This section contains the following procedures:

- [Configuring MPLS LDP Autoconfiguration with OSPF Interfaces, page 3](#) (required)
- [Disabling MPLS LDP Autoconfiguration from Selected OSPF Interfaces, page 4](#) (optional)
- [Verifying MPLS LDP Autoconfiguration with OSPF, page 5](#) (optional)
- [Configuring MPLS LDP Autoconfiguration with IS-IS Interfaces, page 6](#) (required)
- [Disabling MPLS LDP Autoconfiguration from Selected IS-IS Interfaces, page 8](#) (optional)

- [Verifying MPLS LDP Autoconfiguration with IS-IS, page 9](#) (optional)

## Configuring MPLS LDP Autoconfiguration with OSPF Interfaces

The following steps explain how to configure LDP for interfaces running OSPF processes.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ip**
4. **mpls label protocol ldp**
5. **interface** *type number*
6. **ip address** *prefix mask*
7. **exit**
8. **router ospf** *process-id*
9. **network** *ip-address wildcard-mask area area-id*
10. **mpls ldp autoconfig** [**area** *area-id*]
11. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls ip</b>  <b>Example:</b> Router(config)# mpls ip	Globally enables hop-by-hop forwarding.
Step 4	<b>mpls label protocol ldp</b>  <b>Example:</b> Router(config)# mpls label protocol ldp	Specifies LDP as the default label distribution protocol.
Step 5	<b>interface</b> <i>type number</i>  <b>Example:</b> Router(config)# interface POS 3/0	Specifies the interface to configure and enters interface configuration mode.

	Command or Action	Purpose
Step 6	<b>ip address</b> <i>prefix mask</i>  <b>Example:</b> Router(config-if)# ip address 10.0.0.11 255.255.255.255	Assigns an IP address to the interface.
Step 7	<b>exit</b>  <b>Example:</b> Router(config-if)# exit	Exits interface configuration mode.
Step 8	<b>router ospf</b> <i>process-id</i>  <b>Example:</b> Router(config)# router ospf 1	Enables OSPF routing and enters router configuration mode.
Step 9	<b>network</b> <i>ip-address wildcard-mask area area-id</i>  <b>Example:</b> Router(config-router)# network 10.0.0.0 0.0.255.255 area 3	Specifies the interface on which OSPF runs and defines the area ID for that interface.
Step 10	<b>mpls ldp autoconfig</b> [ <i>area area-id</i> ]  <b>Example:</b> Router(config-router)# mpls ldp autoconfig area 3	Enables the MPLS LDP Autoconfiguration feature to enable LDP on interfaces belonging to an OSPF process. <ul style="list-style-type: none"> <li>If no area is specified, the command applies to all interfaces associated with the OSPF process. If an area ID is specified, then only interfaces associated with that OSPF area are enabled with LDP.</li> </ul>
Step 11	<b>end</b>  <b>Example:</b> Router(config-router)# end	Exits router configuration mode and returns to privileged EXEC mode.

## Disabling MPLS LDP Autoconfiguration from Selected OSPF Interfaces

When you issue the **mpls ldp autoconfig** command, all the interfaces that belong to an OSPF area are enabled for LDP. To remove LDP from some interfaces, use the **no mpls ldp igp autoconfig** command on those interfaces. The following configuration steps show how to disable LDP from some of the interfaces after they were configured with the MPLS LDP Autoconfiguration feature with the **mpls ldp autoconfig** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **no mpls ldp igp autoconfig**
5. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface</b> <i>type number</i>  <b>Example:</b> Router(config)# interface POS 3/0	Specifies the interface to configure and enters interface configuration mode.
Step 4	<b>no mpls ldp igp autoconfig</b>  <b>Example:</b> Router(config-if)# no mpls ldp igp autoconfig	Disables LDP for that interface.
Step 5	<b>end</b>  <b>Example:</b> Router(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

## Verifying MPLS LDP Autoconfiguration with OSPF

The following steps explain how to verify the MPLS LDP Autoconfiguration feature.

## SUMMARY STEPS

1. **enable**
2. **show mpls interfaces** [*type number* / **vrf** *vpn-name*] [**all**] [**detail**] [**internal**]
3. **show mpls ldp discovery** [**vrf** *vpn-name* / **all**] [**detail**]

## DETAILED STEPS

- |               |   |
|---------------|---|
| <b>Step 1</b> | <b>enable</b><br><br>Enables privileged EXEC mode. Enter your password if prompted.   |
| <b>Step 2</b> | <b>show mpls interfaces</b> [ <i>type number</i> / <b>vrf</b> <i>vpn-name</i> ] [ <b>all</b> ] [ <b>detail</b> ] [ <b>internal</b> ]<br><br>The <b>show mpls interfaces</b> command displays the method used to enable LDP on an interface: <ul style="list-style-type: none"> <li>• If LDP is enabled by the <b>mpls ldp autoconfig</b> command, the output displays:               <pre>IP labeling enabled (ldp):   IGP config</pre> </li> </ul> |

- If LDP is enabled by the **mpls ip** command, the output displays:

```
IP labeling enabled (ldp):
  Interface config
```

- If LDP is enabled by the **mpls ip** command and the **mpls ldp autoconfig** command, the output displays:

```
IP labeling enabled (ldp):
  Interface config
  IGP config
```

The following example shows that LDP was enabled on the interface by both the **mpls ip** and **mpls ldp autoconfig** commands:

```
Router# show mpls interfaces Serial 2/0 detail
```

```
Interface Serial2/0:
  IP labeling enabled (ldp):
    Interface config
    IGP config
  LSP Tunnel labeling enabled
  BGP labeling not enabled
  MPLS operational
  Fast Switching Vectors:
    IP to MPLS Fast Switching Vector
    MPLS Turbo Vector
    MTU = 1500
```

### Step 3 **show mpls ldp discovery [vrf vpn-name / all] [detail]**

The **show mpls ldp discovery detail** command also shows how LDP was enabled on the interface. In the following example, LDP was enabled by both the **mpls ip** and **mpls ldp autoconfig** commands:

```
Router# show mpls ldp discovery detail
```

```
Local LDP Identifier:
  10.11.11.11:0
Discovery Sources:
Interfaces:
  Serial2/0 (ldp): xmit/rcv
    Enabled: Interface config, IGP config;
    Hello interval: 5000 ms; Transport IP addr: 10.11.11.11
    LDP Id: 10.10.10.10:0
    Src IP addr: 10.0.0.1; Transport IP addr: 10.10.10.10
    Hold time: 15 sec; Proposed local/peer: 15/15 sec
```

## Configuring MPLS LDP Autoconfiguration with IS-IS Interfaces

The following steps explain how to configure the MPLS LDP Autoconfiguration feature for interfaces that are running IS-IS processes.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **ip address prefix mask**

5. **ip router isis**
6. **exit**
7. **mpls ip**
8. **mpls label protocol ldp**
9. **router isis**
10. **mpls ldp autoconfig** [*level-1* / *level-2*]
11. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>interface</b> <i>type number</i>  <b>Example:</b> Router(config)# interface POS 0/2	Specifies the interface to configure and enters interface configuration mode.
Step 4	<b>ip address</b> <i>prefix mask</i>  <b>Example:</b> Router(config-if)# ip address 10.50.72.4 255.0.0.0	Assigns an IP address to the interface.
Step 5	<b>ip router isis</b>  <b>Example:</b> Router(config-if)# ip router isis	Enables IS-IS for IP on the interface.
Step 6	<b>exit</b>  <b>Example:</b> Router(config-if)# exit	Exits interface configuration mode.
Step 7	<b>mpls ip</b>  <b>Example:</b> Router(config)# mpls ip	Globally enables hop-by-hop forwarding.
Step 8	<b>mpls label protocol ldp</b>  <b>Example:</b> Router(config)# mpls label protocol ldp	Specifies LDP as the default label distribution protocol.

	Command or Action	Purpose
Step 9	<code>router isis</code>  <b>Example:</b> <code>Router(config)# router isis</code>	Enables an IS-IS process on the router and enters router configuration mode.
Step 10	<code>mpls ldp autoconfig [level-1   level-2]</code>  <b>Example:</b> <code>Router(config-router)# mpls ldp autoconfig</code>	Enables the LDP for interfaces that belong to an IS-IS process.
Step 11	<code>end</code>  <b>Example:</b> <code>Router(config-router)# end</code>	Exits router configuration mode and returns to privileged EXEC mode.

## Disabling MPLS LDP Autoconfiguration from Selected IS-IS Interfaces

When you issue the **mpls ldp autoconfig** command, all the interfaces that belong to an IS-IS process are enabled for LDP. To remove LDP from some interfaces, use the **no mpls ldp igp autoconfig** command on those interfaces. The following configuration steps show how to disable LDP from some of the interfaces after they were configured with the MPLS LDP Autoconfiguration feature with the **mpls ldp autoconfig** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **no mpls ldp igp autoconfig**
5. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>enable</code>  <b>Example:</b> <code>Router&gt; enable</code>	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<code>configure terminal</code>  <b>Example:</b> <code>Router# configure terminal</code>	Enters global configuration mode.
Step 3	<code>interface type number</code>  <b>Example:</b> <code>Router(config)# interface POS 3/0</code>	Specifies the interface to configure and enters interface configuration mode.

	Command or Action	Purpose
Step 4	<code>no mpls ldp igp autoconfig</code>  <b>Example:</b> Router(config-if)# no mpls ldp igp autoconfig	Disables LDP for that interface.
Step 5	<code>end</code>  <b>Example:</b> Router(config-if)# end	Exits interface configuration mode and returns to privileged EXEC mode.

## Verifying MPLS LDP Autoconfiguration with IS-IS

You can verify that the MPLS LDP Autoconfiguration feature is working correctly with the **show isis mpls ldp** command.

### SUMMARY STEPS

1. **enable**
2. **show isis mpls ldp**

### DETAILED STEPS

#### Step 1 **enable**

Enables privileged EXEC mode.

#### Step 2 **show isis mpls ldp**

The output of the following **show isis mpls ldp** command shows that IS-IS is configured on the interface and that LDP is enabled:

```
Router# show isis mpls ldp
```

```
Interface: POS0/2; ISIS tag null enabled
ISIS is UP on interface
AUTOCONFIG Information :
  LDP enabled: YES
  SYNC Information :
    Required: NO
```

The output shows :

- IS-IS is up.
- LDP is enabled.

If the MPLS LDP Autoconfiguration feature is not enabled on an interface, the output looks like the following:

```
Interface: Ethernet0; ISIS tag null enabled
ISIS is UP on interface
AUTOCONFIG Information :
  LDP enabled: NO
  SYNC Information :
    Required: NO
```

## Troubleshooting Tips

You can use the **debug mpls ldp autoconfig** command to display events that are related to the MPLS LDP Autoconfiguration feature.

## Configuration Examples for MPLS LDP Autoconfiguration

The following sections show examples for the MPLS LDP Autoconfiguration feature with OSPF and IS-IS processes.

- [MPLS LDP Autoconfiguration with OSPF: Example, page 10](#)
- [MPLS LDP Autoconfiguration with IS-IS: Examples, page 10](#)

### MPLS LDP Autoconfiguration with OSPF: Example

The following configuration commands enable LDP for OSPF process 1 area 3. The **mpls ldp autoconfig area 3** command and the OSPF **network** commands enable LDP on POS interfaces 0/0, 0/1, and 1/1. The **no mpls ldp igp autoconfig** command on POS interface 1/0 prevents LDP from being enabled on POS interface 1/0, even though OSPF is enabled for that interface.

```
configure terminal
interface POS 0/0
 ip address 10.0.0.1 255.0.0.0
!
interface POS 0/1
 ip address 10.0.1.1 255.0.0.1
!
interface POS 1/1
 ip address 10.1.1.1 255.255.0.0
!
interface POS 1/0
 ip address 10.1.0.1 0.1.0.255
 exit
!
router ospf 1
 network 10.0.0.0 0.0.255.255 area 3
 network 10.1.0.0 0.0.255.255 area 3
 mpls ldp autoconfig area 3
 end
interface POS 1/0
 no mpls ldp igp autoconfig
```

### MPLS LDP Autoconfiguration with IS-IS: Examples

The following example shows the configuration of the MPLS LDP Autoconfiguration feature on POS0/2 and 0/3 interfaces, which are running IS-IS processes:

```
configure terminal
interface POS 0/2
 ip address 10.0.0.1 255.0.0.1
 ip router isis
!
interface POS 0/3
 ip address 10.1.1.1 255.0.1.0
 ip router isis
```

```

exit

mpls ip
mpls label protocol ldp
router isis
mpls ldp autoconfig

```

# Feature Information for MPLS LDP Autoconfiguration

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://tools.cisco.com/ITDIT/CFN/jsp/index.jsp>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS LDP Autoconfiguration

Feature Name	Releases	Feature Information
MPLS LDP Autoconfiguration	12.0(30)S 12.0(32)SY 12.2(28)SB 12.2(33)SRB 12.3(14)T 15.0(1)M 12.2(33)XNE	<p>This feature enables you to globally configure LDP on every interface associated with a specified Interior Gateway Protocol (IGP) instance.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Information About MPLS LDP Autoconfiguration, page 2</a></li> <li>• <a href="#">How to Configure MPLS LDP Autoconfiguration, page 2</a></li> </ul> <p>In Cisco IOS Release 12.0(30)S, this feature was introduced with support for OSPF.</p> <p>In Cisco IOS Release 12.0(32)SY, support for IS-IS was added.</p> <p>This feature was integrated into Cisco IOS Release 12.2(28)SB with support for OSPF.</p> <p>This feature was integrated into Cisco IOS Release 12.2(33)SRB.</p> <p>This feature was integrated into Cisco IOS Release 12.3(14)T with support for OSPF.</p> <p>In Release 15.0(1)M, support for IS-IS was added.</p> <p>This feature was integrated into Cisco IOS Release 12.2(33)XNE with support for IS-IS on the Cisco 10000 series router.</p> <p>The following commands were modified: <b>mpls ldp autoconfig</b>, <b>mpls ldp igp autoconfig</b>, <b>show isis mpls ldp</b>, and <b>show mpls ldp discovery</b>.</p>

# MPLS—LDP MD5 Global Configuration

---

**First Published: February 28, 2006**

**Last Updated: July 11, 2008**

The MPLS—LDP MD5 Global Configuration feature provides enhancements to the Label Distribution Protocol (LDP) implementation of the Message Digest 5 (MD5) password. This feature allows you to enable LDP MD5 globally instead of on a per-peer basis. Using this feature you can set up password requirements for a set of LDP neighbors to help prevent unauthorized peers from establishing LDP sessions and to block spoofed TCP messages.

This document provides information about and configuration information for the global configuration of LDP MD5 protection.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for MPLS—LDP MD5 Global Configuration”](#) section on [page 20](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Additional References, page 18](#)
- [Command Reference, page 19](#)
- [Glossary, page 22](#)
- [Feature Information for MPLS—LDP MD5 Global Configuration, page 20](#)

## Prerequisites for MPLS—LDP MD5 Global Configuration

- Cisco Express Forwarding or distributed Cisco Express Forwarding must be enabled on the label switch router (LSR).
- Routing (static or dynamic) must be configured for the LSR.
- Multiprotocol Label Switching (MPLS) LDP must be configured on the LSR. However, you can configure LDP MD5 protection before you configure MPLS LDP. You can then use LDP MD5 protection after you configure MPLS LDP.
- A Virtual Private Network (VPN) routing and forwarding instance (VRF) must be configured if you want to configure MPLS LDP MD5 global configuration for a VRF. If you delete a VRF, the LDP MD5 global configuration for that VRF is automatically removed.

## Restrictions for MPLS—LDP MD5 Global Configuration

MD5 protection described in this document applies only to the LDP sessions. All enhancements described in this document do not affect Tag Distribution Protocol (TDP) sessions.

## Information About MPLS—LDP MD5 Global Configuration

Before you configure the MPLS—LDP MD5 Global Configuration feature, you must understand the following:

- [Enhancements to LDP MD5 Protection for LDP Messages Between Peers, page 2](#)
- [LDP MD5 Password Configuration Information, page 3](#)
- [LDP MD5 Password Configuration for Routing Tables, page 4](#)

## Enhancements to LDP MD5 Protection for LDP Messages Between Peers

The MPLS—LDP MD5 Global Configuration feature provides the following enhancements to the LDP support of MD5 passwords:

- You can specify peers for which MD5 protection is required. This can prevent the establishment of LDP sessions with unexpected peers.
- You can configure passwords for groups of peers. This increases the scalability of LDP password configuration management.
- The established LDP session with a peer is not automatically torn down when the password for that peer is changed. The new password is used the next time an LDP session is established with the peer.

- You can control when the new password is used. You can configure the new password on the peer before forcing the use of the new password.
- If the neighboring nodes support graceful restart, then LDP sessions are gracefully restarted. The LDP MD5 password configuration is checkpointed to the standby Route Processors (RPs). The LDP MD5 password is used by the router when the new active RP attempts to establish LDP sessions with neighbors after the switchover.

LDP session, advertisement, and notification messages are exchanged between two LDP peers over a TCP connection. You can configure the TCP MD5 option to protect LDP messages that are exchanged over a TCP connection. You can configure this protection for each potential LDP peer. As a result, an LDP ignores any LDP hello messages sent from an LSR for which you have not configured a password. (LDP tries to establish an LDP session with each neighbor from which a hello message is received.)

Before the introduction of the MPLS—LDP MD5 Global Configuration feature, you needed to configure a separate password for each LDP peer for which you wanted MD5 protection. This was the case even when the same password was used for multiple LDP peers. Before this feature, LDP would tear down LDP sessions with a peer immediately if a password for that peer had changed.

## LDP MD5 Password Configuration Information

Before the introduction of the MPLS—LDP MD5 Global Configuration feature, the command used for configuring a password for an LDP neighbor was **mpls ldp neighbor [vrf vrf-name] ip-address password [0 | 7] password**. This command configures a password for one neighbor whose router ID is the IP address in the specified VRF. An LSR can have zero or one such configuration for each LDP neighbor.

You can use the commands provided by the MPLS—LDP MD5 Global Configuration feature to configure passwords for LDP neighbors.

You must understand how LDP determines the password for an LDP session between peers before you configure MD5 password protection for your network. LDP determines the passwords for its sessions based on the commands that you enter.

You can enter an **mpls ldp password vrf vrf-name required [for acl]** command, either with an optional *acl* argument that permits the LDP router ID of the neighbor or without an *acl* argument. Make sure that you enter a command that configures a password. Otherwise, LDP might not establish a session with the neighbor in question.

For the commands in the following password-determining process, *A.B.C.D:N* represents the LDP neighbor in VRF *vpn1* and the neighbor LDP ID:

- *A.B.C.D* is the neighbor router ID.
- *N* is the neighbor label space ID.

To determine the password for an LDP session for the neighbor label space *A.B.C.D:N*, LDP looks at the password commands in the order indicated by the following statements:

- If you configured this command:

**mpls ldp neighbor vrf vpn1 A.B.C.D password pwd-nbr**

The LDP session password is *pwd-nbr*. LDP looks no further and uses the password you specify.

- Otherwise, LDP looks to see if you configured one or more **mpls ldp vrf vpn1 password option** commands. LDP considers the commands in order of the ascending *number* arguments (*number-1st* to *number-n*). For example:

**mpls ldp vrf vpn1 password option number-1st for acl-1st pwd-1st**

LDP compares the peer router ID of the neighbor (*A.B.C.D*) with this command. If *A.B.C.D* is permitted by the command access list *acl-1st*, the session password is the command password, that is, *pwd-1st*.

If *A.B.C.D* is not permitted by *acl-1st*, LDP looks at the command with the next ascending *number* argument (*number-2nd*):

**mpls ldp vrf vpn1 password option *number-2nd* for *acl-2nd* *pwd-2nd***

If *A.B.C.D* is permitted by the command access list *acl-2nd*, the session password is *pwd-2nd*.

If *A.B.C.D* is not permitted by the access list *acl-2nd*, LDP continues checking *A.B.C.D* against access lists until LDP:

- Finds *A.B.C.D* permitted by an access list. Then the command password is the session password.
- Has processed the *number-nth* argument of this command (*n* being the highest *number* argument you configured for this command).
- If the **mpls ldp vrf vpn1 password option *number-nth* for *acl-nth* *pwd-nth*** command produces no match and, therefore no password, LDP looks to see if you configured the following command:

**mpls ldp password vrf vpn1 fallback *pwd-fback***

If you configured this command, the session password is *pwd-fback*.

- Otherwise, if LDP has not found a password, you did not configure a password for the session. LDP does not use MD5 protection for the session TCP connection.

## LDP MD5 Password Configuration for Routing Tables

The MPLS—LDP MD5 Global Configuration feature introduces commands that can establish password protection for LDP sessions between LDP neighbors or peers. These commands can apply to routes in the global routing table or in a VRF.

By default, if the **vrf** keyword is not specified in the command, the command applies to the global routing table. The following sample commands would apply to routes in the global routing table:

```
Router# mpls ldp password required
Router# mpls ldp password option 15 for 99 pwd-acl
Router# mpls ldp password fallback pwd-fbck
```

You can configure LDP MD5 password protection for routes in a VRF only when the VRF is configured on the LSR. If you specify a VRF name and a VRF with that name is not configured on the LSR, LDP prints out a warning and discards the command. If you remove a VRF, LDP deletes the password configuration for that VRF. The following sample commands would apply to routes in a VRF, for example, VRF vpn1:

```
Router# mpls ldp vrf vpn1 password required
Router# mpls ldp vrf vpn1 password option 15 for 99 pwd-acl
Router# mpls ldp vrf vpn1 password fallback pwd-flbk
```

# How to Configure the MPLS—LDP MD5 Global Configuration Feature

Perform the following tasks to configure the MPLS—LDP MD5 Global Configuration feature:

- [Identifying LDP Neighbors for LDP MD5 Password Protection, page 5](#) (required)
- [Configuring an LDP MD5 Password for LDP Sessions, page 7](#) (required)
- [Verifying the LDP MD5 Configuration, page 14](#) (optional)

## Password Requirements for LDP Sessions

You might require password protection for a certain set of neighbors for security reasons (for example, to prevent LDP sessions being established with unauthorized peers, or to block spoofed TCP messages). To enforce this security, you can configure a password requirement for LDP sessions with those neighbors that must have MD5 protection (TCP session uses a password).

If you configure a password requirement for a neighbor and you did not configure a password for the neighbor, LDP tears down the LDP sessions with the neighbor. LDP also tears down the LDP sessions with the neighbor if you configured a password requirement and a password and the password is not used in the LDP sessions.

If a password is required for a neighbor and the LDP sessions with the neighbor are established to use a password, any configuration that removes the password for the neighbor causes the LDP sessions to be torn down.

To avoid unnecessary LDP session flapping, you should perform the task as described in this section and use caution when you change LDP passwords.

## Identifying LDP Neighbors for LDP MD5 Password Protection

Perform the following task to identify LDP neighbors for LDP MD5 password protection.

### Prerequisites

Before you start to configure passwords for LDP sessions, you must identify neighbors or groups of peers for which you want to provide MD5 protection. For example:

- You might have several customers that all use the same core routers. To ensure security you might want to provide each customer with a different password.
- You could have defined several departmental VRFs in your network. You could provide password protection for each VRF.
- Certain groups of peers might require password protection for security reasons. Password protection prevents unwanted LDP sessions.

Before you start to configure passwords for LDP sessions, you must identify neighbors or groups of peers for which you want to provide LDP MD5 password protection. This task uses the network in [Figure 1](#) to show how you might identify LDP neighbors for LDP MD5 protection.

After you identify LDP neighbors or a group of peers for LDP MD5 protection, you must decide if password protection is mandatory and what password commands to use for each peer.

## SUMMARY STEPS

1. Identify LDP neighbors or groups of peers for LDP MD5 password protection.
2. Decide what LDP MD5 protection is required for each neighbor or group of peers.

## DETAILED STEPS

**Step 1** Identify LDP neighbors or groups of peers for LDP MD5 password protection.

This task uses the network in [Figure 1](#) to show how you might identify LDP neighbors for LDP MD5 protection.

[Figure 1](#) shows a sample network that has the following topology:

- Carrier Supporting Carrier (CSC) is configured between provider edge (PE) router PE1 and customer edge (CE) router CE1 and between PE1 and CE2.
- Internal Border Gateway Protocol (IBGP) Virtual Private Network (VPN) IPv4 (VPNv4) to support Layer 3 VPNs is configured between PE1 and PE2.
- CE1 and CE3 are in VRF VPN1. CE2 and CE4 are in a different VRF, VPN2.

**Figure 1** Sample Network: Identifying LDP Neighbors for LDP MD5 Protection

For the sample network in [Figure 1](#), you could configure separate passwords on PE1 for the following:

- VRF VPN1
- VRF VPN2

You could also configure a password requirement on PE1 for P1, P2, CE1 and CE2.

**Step 2** Decide what LDP MD5 protection is required for each neighbor or group of peers.

- If you need to set up a password for an LDP session with one peer or neighbor, for example, from PE1 to CE1, you could use the `mpls ldp neighbor [vrf vrf-name] ip-address password [0 | 7] password-string` command, where `ip-address` is the router ID of the neighbor. See the [“Configuring an LDP MD5 Password for LDP Sessions”](#) section on page 7 for instructions.
- If you need to set up an LDP session password for a set of peers, for example for P1 and P2, you could set up an access list that permits access to these routers and denies access to all others. See the [“Configuring an LDP MD5 Password for LDP Sessions with a Selected Group of Peers”](#) section on page 12 for instructions.

- If you want to require a password for communication among VRF vpn1 members, you can configure a password requirement and password for VRF vpn1. If your network contains several VRFs, you can configure a password for each VRF. See the [“Configuring an LDP MD5 Password for LDP Sessions with Peers from a Specified VRF”](#) section on page 10 for instructions.

## Configuring an LDP MD5 Password for LDP Sessions

This section contains information about and instructions for configuring an LDP MD5 password for LDP sessions. You configure an LDP MD5 password to protect your routers from unwanted LDP sessions and provide LDP session security. You can provide LDP session security for a specific neighbor, or for LDP peers from a specific VRF or from the global routing table, or for a specific set of LDP neighbors.

After you have identified the LDP neighbor, LDP neighbors, or LDP peers in your network for which you want LDP MD5 password protection, perform the following procedures, as you require, to configure an LDP MD5 password for LDP sessions:

- [Configuring an LDP MD5 Password for a Specified Neighbor, page 7](#)
- [Configuring an LDP MD5 Password for LDP Sessions with Peers from a Specified VRF, page 10](#)
- [Configuring an LDP MD5 Password for LDP Sessions with a Selected Group of Peers, page 12](#)

## Configuring an LDP MD5 Password for a Specified Neighbor

Perform the following task to configure an LDP MD5 password for a specified neighbor.

LDP looks first for a password between the router and neighbor that is configured with the **mpls ldp neighbor [vrf vrf-name] ip-address password pwd-string** command. If a password is configured with this command, LDP uses that password before checking passwords configured by other commands.

You must add a configuration command for each neighbor or peer for which you want password protection.

### Prerequisites

Identify the LDP neighbor or peer for which you want MD5 password protection.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ldp neighbor [vrf vrf-name] ip-address password [0 | 7] password-string**
4. **end**
5. **show mpls ldp neighbor [vrf vrf-name | all] [ip-address | interface] [detail] [graceful-restart]**
6. **show mpls ldp neighbor [vrf vrf-name] [ip-address | interface] password [pending | current]**
7. **show mpls ldp discovery [vrf vrf-name | all] [detail]**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls ldp neighbor</b> [ <i>vrf vrf-name</i> ] <i>ip-address</i> <b>password</b> [ <i>0</i>   <i>7</i> ] <i>password-string</i>  <b>Example:</b> Router(config)# mpls ldp neighbor vrf vpn1 10.1.1.1 password nbrcelpwd	Configures a password key for computing MD5 checksums for the session TCP connection with the specified neighbor. <ul style="list-style-type: none"> <li>The <b>vrf</b> <i>vrf-name</i> keyword-argument pair specifies the VPN routing and forwarding instance for the specified neighbor.</li> <li>The <i>ip-address</i> argument specifies the router ID (IP address) that identifies a neighbor.</li> <li>The [<b>0</b>   <b>7</b>] keywords specify whether the password that follows is encrypted: <ul style="list-style-type: none"> <li><b>0</b> specifies a clear-text (nonencrypted) password.</li> <li><b>7</b> specifies a Cisco proprietary encrypted password.</li> </ul> </li> <li>The <i>password-string</i> argument defines the password key to be used for computing MD5 checksums for the session TCP connection with the specified neighbor.</li> </ul>
Step 4	<b>end</b>  <b>Example:</b> Router(config)# end	Exits to privileged EXEC mode.

	Command or Action	Purpose
Step 5	<p><code>show mpls ldp neighbor [vrf vrf-name   all]</code>  <code>[ip-address   interface] [detail]</code>  <code>[graceful-restart]</code></p> <p><b>Example:</b>  Router# show mpls ldp neighbor vrf vpn1 detail</p>	<p>Displays the status of LDP sessions.</p> <ul style="list-style-type: none"> <li>• The <b>vrf vrf-name</b> keyword-argument pair displays the LDP neighbors for the specified VRF instance (<i>vrf-name</i>).</li> <li>• The <b>all</b> keyword displays LDP neighbor information for all VPNs, including those in the default routing domain.</li> <li>• The <i>ip-address</i> argument identifies the neighbor with the IP address for which you configured password protection.</li> <li>• The <i>interface</i> argument defines the LDP neighbors accessible over this interface.</li> <li>• The <b>detail</b> keyword displays information in long form, including password information for this neighbor. Here are the items displayed: <ul style="list-style-type: none"> <li>– An indication as to whether a password is mandatory for this neighbor (required or not required)</li> <li>– The password source (neighbor, fallback or number [option number])</li> <li>– An indication as to whether the latest configured password for this neighbor is used by the TCP session (in use) or the TCP session uses an old password (stale)</li> </ul> </li> <li>• The <b>graceful-restart</b> keyword displays per-neighbor graceful restart information.</li> </ul>

	Command or Action	Purpose
Step 6	<p><code>show mpls ldp neighbor [vrf vrf-name] [ip-address   interface] password [pending   current]</code></p> <p><b>Example:</b> Router# show mpls ldp neighbor vrf vpn1 password</p>	<p>Displays password information used in established LDP sessions.</p> <ul style="list-style-type: none"> <li>The <b>vrf vrf-name</b> keyword-argument pair displays the LDP neighbors for the specified VRF instance (<i>vrf-name</i>).</li> <li>The <b>ip-address</b> argument identifies the neighbor with the IP address for which you configured password protection.</li> <li>The <b>interface</b> argument defines the LDP neighbors accessible over this interface.</li> <li>The <b>pending</b> keyword displays LDP sessions whose passwords are different from that in the current configuration.</li> <li>The <b>current</b> keyword displays LDP sessions whose password is the same as that in current configuration.</li> </ul> <p>If you do not specify an optional keyword for this command, password information for all established LDP sessions is displayed.</p>
Step 7	<p><code>show mpls ldp discovery [vrf vrf-name   all] [detail]</code></p> <p><b>Example:</b> Router# show mpls ldp discovery vrf vpn1 detail</p>	<p>Displays the status of the LDP discovery process.</p> <ul style="list-style-type: none"> <li>The <b>vrf vrf-name</b> keyword-argument pair displays the neighbor discovery information for the specified VRF instance (<i>vrf-name</i>).</li> <li>The <b>all</b> keyword displays LDP discovery information for all VPNs, including those in the default routing domain.</li> <li>The <b>detail</b> keyword displays detailed information about all LDP discovery sources on an LSR.</li> </ul>

## Configuring an LDP MD5 Password for LDP Sessions with Peers from a Specified VRF

Perform the following task to configure an LDP MD5 password for LDP sessions with peers from a specified VRF. You can also use this task to configure an LDP MD5 password for LDP sessions with peers from the global routing table.

This task provides you with LDP session protection with peers from a particular VRF or the global routing table. If you want a password requirement, you can use the **mpls ldp password required** command.

If only LDP sessions with a set of LDP neighbors need MD5 protection, configure a standard IP access list that10 permits the desired set of LDP neighbors and denies the rest. See the [“Configuring an LDP MD5 Password for LDP Sessions with a Selected Group of Peers”](#) section on page 12.

### Prerequisites

Identify LDP peers for which you want MD5 password protection.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ldp [vrf vrf-name] password fallback [0 | 7] password**
4. **mpls ldp [vrf vrf-name] password required [for acl]**
5. **end**
6. **show mpls ldp discovery [vrf vrf-name | all] [detail]**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls ldp [vrf vrf-name] password fallback [0   7] password</b>  <b>Example:</b> Router(config)# mpls ldp vrf vpn1 password fallback 0 vrfpwdvppn1	Configures an MD5 password for LDP sessions with peers. <ul style="list-style-type: none"> <li>• The <b>vrf vrf-name</b> keyword-argument pair specifies a VRF configured on the LSR.</li> <li>• The <b>[0   7]</b> keywords specify whether the password that follows is encrypted: <ul style="list-style-type: none"> <li>– <b>0</b> specifies a clear-text (nonencrypted) password.</li> <li>– <b>7</b> specifies a Cisco proprietary encrypted password.</li> </ul> </li> <li>• The <i>password</i> argument specifies the MD5 password to be used for the LDP sessions with peers whose connections are established through a named VRF or the global routing table.</li> </ul> <p>The example sets up an MD5 password for a VRF.</p>
Step 4	<b>mpls ldp [vrf vrf-name] password required [for acl]</b>  <b>Example:</b> Router(config)# mpls ldp vrf vpn1 password required	Specifies that LDP must use a password when establishing a session between LDP peers. <ul style="list-style-type: none"> <li>• The <b>vrf vrf-name</b> keyword-argument pair specifies a VRF configured on the LSR.</li> <li>• The <b>for acl</b> keyword-argument pair names an access list that specifies that a password is mandatory only for LDP sessions with neighbors whose LDP router IDs are permitted by the list. Only standard IP access lists can be used for the <i>acl</i> argument.</li> </ul>

	Command or Action	Purpose
Step 5	<b>end</b>  <b>Example:</b> Router(config)# end	Exits to privileged EXEC mode.
Step 6	<b>show mpls ldp discovery</b> [ <b>vrf</b> <i>vrf-name</i>   <b>all</b> ] [ <b>detail</b> ]  <b>Example:</b> Router# show mpls ldp discovery detail	Displays the status of the LDP discovery process. <ul style="list-style-type: none"> <li>The <b>vrf</b> <i>vrf-name</i> keyword-argument pair displays the neighbor discovery information for the specified VPN routing and forwarding instance (<i>vrf-name</i>).</li> <li>The <b>all</b> keyword displays LDP discovery information for all VPNs, including those in the default routing domain.</li> <li>The <b>detail</b> keyword displays detailed information about all LDP discovery sources on an LSR.</li> </ul> Use this command to verify that password configuration is correct for all LDP neighbors.

## Configuring an LDP MD5 Password for LDP Sessions with a Selected Group of Peers

Perform the following task to configure an LDP MD5 password for LDP sessions with a selected group of peers.

If only LDP sessions with a selected group of peers need MD5 protection, configure a standard IP access list that permits sessions with the desired group of peers (identified by LDP router IDs) and denies session with the rest. Configuring a password and password requirement for these neighbors or peers provides security by preventing LDP sessions from being established with unauthorized peers.

### Prerequisites

Identify the groups of peers for which you want MD5 password protection and define an access list that permits LDP sessions with the group of peers you require.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ldp** [**vrf** *vrf-name*] **password option** *number* **for** *acl* [**0** | **7**] *password*
4. **mpls ldp** [**vrf** *vrf-name*] **password required** [**for** *acl*]
5. **end**
6. **show mpls ldp discovery** [**vrf** *vrf-name* | **all**] [**detail**]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>mpls ldp [vrf vrf-name] password option number for acl [0   7] password</b>  <b>Example:</b> Router(config)# mpls ldp password option 25 for 10 aclpwdfor10	Configures an MD5 password for LDP sessions with neighbors whose LDP router IDs are permitted by a specified access list. <ul style="list-style-type: none"> <li>The <b>vrf vrf-name</b> keyword-argument pair specifies a VRF configured on the LSR.</li> <li>The <i>number</i> argument defines the order in which the access lists are evaluated in the determination of a neighbor password. The valid range is 1–32767.</li> <li>The <b>for acl</b> keyword-argument pair specifies the name of the access list that includes the LDP router IDs of those neighbors for which the password applies. Only standard IP access list values (1–99) can be used for the <i>acl</i> argument.</li> <li>The <b>[0   7]</b> keywords specifies whether the password that follows is encrypted: <ul style="list-style-type: none"> <li><b>0</b> specifies a clear-text (nonencrypted) password.</li> <li><b>7</b> specifies a Cisco proprietary encrypted password.</li> </ul> </li> <li>The <i>password</i> argument specifies the MD5 password to be used for the specified LDP sessions.</li> </ul>
Step 4	<b>mpls ldp [vrf vrf-name] password required [for acl]</b>  <b>Example:</b> Router(config)# mpls ldp password required for 10	Specifies that LDP must use a password when establishing a session between LDP peers. <ul style="list-style-type: none"> <li>The <b>vrf vrf-name</b> keyword-argument pair specifies a VRF configured on the LSR.</li> <li>The <b>for acl</b> keyword-argument pair names an access list. The access list specifies a password is mandatory only for LDP sessions with neighbors whose LDP router IDs are permitted by the list. Only standard IP access lists can be used for the <i>acl</i> argument.</li> </ul>

	Command or Action	Purpose
Step 5	<b>end</b>  <b>Example:</b> Router(config)# end	Exits to privileged EXEC mode.
Step 6	<b>show mpls ldp discovery [vrf vrf-name   all] [detail]</b>  <b>Example:</b> Router# show mpls ldp discovery detail	<p>Displays the status of the LDP discovery process.</p> <ul style="list-style-type: none"> <li>The <b>vrf vrf-name</b> keyword-argument pair displays the neighbor discovery information for the specified VPN routing and forwarding instance (<i>vrf-name</i>).</li> <li>The <b>all</b> keyword displays LDP discovery information for all VPNs, including those in the default routing domain.</li> <li>The <b>detail</b> keyword displays detailed information about all LDP discovery sources on an LSR.</li> </ul> <p>Use this command to verify password configuration is correct for all LDP neighbors.</p>

## Verifying the LDP MD5 Configuration

Perform the following task to verify that the LDP MD5 secure sessions are as you configured for all LDP neighbors.

### SUMMARY STEPS

1. **enable**
2. **show mpls ldp discovery detail**
3. **show mpls ldp neighbor detail**
4. **show mpls ldp neighbor password [pending | current]**
5. **exit**

### DETAILED STEPS

#### Step 1 **enable**

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```
Router> enable
Router#
```

#### Step 2 **show mpls ldp discovery detail**

Use this command to verify that the LDP MD5 password information is as you configured for each neighbor. For example:

```
Router# show mpls ldp discovery detail

Local LDP Identifier:
 10.1.1.1:0
Discovery Sources:
Interfaces:
```

```

Ethernet1/0 (ldp): xmit/recv
  Hello interval: 5000 ms; Transport IP addr: 10.1.1.1
  LDP Id: 10.4.4.4:0
  Src IP addr: 10.0.20.4; Transport IP addr: 10.4.4.4
  Hold time: 15 sec; Proposed local/peer: 15/15 sec
  Password: not required, none, stale
Targeted Hellos:
  10.1.1.1 -> 10.3.3.3 (ldp): passive, xmit/recv
    Hello interval: 10000 ms; Transport IP addr: 10.1.1.1
    LDP Id: 10.3.3.3:0
    Src IP addr: 10.3.3.3; Transport IP addr: 10.3.3.3
    Hold time: 90 sec; Proposed local/peer: 90/90 sec
    Password: required, neighbor, in use

```

The Password field might display any of the following for the status of the password:

- Required or not required—Indicates whether password configuration is required.
- Neighbor, none, option #, or fallback—Indicates the password source when the password was configured.
- In use (current) or stale (previous)—Indicates the current LDP session password usage status.

Look at the output of the command to verify your configuration.

### Step 3 show mpls ldp neighbor detail

Use this command to verify that the password information for a neighbor is as you configured. For example:

Router# **show mpls ldp neighbor detail**

```

Peer LDP Ident: 10.3.3.3:0; Local LDP Ident 10.1.1.1:0
  TCP connection: 10.3.3.3.11018 - 10.1.1.1.646
  Password: required, neighbor, in use
  State: Oper; Msgs sent/rcvd: 167/167; Downstream; Last TIB rev sent 9
  Up time: 02:24:02; UID: 5; Peer Id 3;
  LDP discovery sources:
    Targeted Hello 10.1.1.1 -> 10.3.3.3, passive;
      holdtime: 90000 ms, hello interval: 10000 ms
  Addresses bound to peer LDP Ident:
    10.3.3.3      10.0.30.3
  Peer holdtime: 180000 ms; KA interval: 60000 ms; Peer state: estab
Peer LDP Ident: 10.4.4.4:0; Local LDP Ident 10.1.1.1:0
  TCP connection: 10.4.4.4.11017 - 10.1.1.1.646
  Password: not required, none, stale
  State: Oper; Msgs sent/rcvd: 9/9; Downstream; Last TIB rev sent 9
  Up time: 00:05:35; UID: 6; Peer Id 1;
  LDP discovery sources:
    Ethernet1/0; Src IP addr: 10.0.20.4
      holdtime: 15000 ms, hello interval: 5000 ms
  Addresses bound to peer LDP Ident:
    10.0.40.4      10.4.4.4      10.0.20.4
  Peer holdtime: 180000 ms; KA interval: 60000 ms; Peer state: estab

```

### Step 4 show mpls ldp neighbor password [pending | current]

Use this command to verify that LDP sessions are using the password configuration that you expect, either the same as or different from that in the current configuration. The **pending** keyword displays information for LDP sessions whose password is different from that in the current configuration. The **current** keyword displays information for LDP sessions whose password is the same as that in the current configuration.

For example:

```
Router# show mpls ldp neighbor password
```

```
Peer LDP Ident: 10.4.4.4:0; Local LDP Ident 10.1.1.1:0
TCP connection: 10.4.4.4.11017 - 10.1.1.1.646
Password: not required, none, stale
State: Oper; Msgs sent/rcvd: 57/57
Peer LDP Ident: 10.3.3.3:0; Local LDP Ident 10.1.1.1:0
TCP connection: 10.3.3.3.11018 - 10.1.1.1.646
Password: required, neighbor, in use
State: Oper; Msgs sent/rcvd: 216/215
```

```
Router# show mpls ldp neighbor password pending
```

```
Peer LDP Ident: 10.4.4.4:0; Local LDP Ident 10.1.1.1:0
TCP connection: 10.4.4.4.11017 - 10.1.1.1.646
Password: not required, none, stale
State: Oper; Msgs sent/rcvd: 57/57
```

```
Router# show mpls ldp neighbor password current
```

```
Peer LDP Ident: 10.3.3.3:0; Local LDP Ident 10.1.1.1:0
TCP connection: 10.3.3.3.11018 - 10.1.1.1.646
Password: required, neighbor, in use
State: Oper; Msgs sent/rcvd: 216/215
```

This command displays password information used in established LDP sessions. If you do not enter an optional **pending** or **current** keyword for the command, password information for all established LDP sessions is displayed.

#### Step 5 **exit**

Use this command to exit to user EXEC mode. For example:

```
Router# exit
Router>
```

## Configuration Examples for Configuring the MPLS—LDP MD5 Global Configuration Feature

This section contains the following example for configuring the MPLS—LDP MD5 Global Configuration feature:

- [Configuring an LDP MD5 Password for LDP Sessions: Examples, page 16](#)

## Configuring an LDP MD5 Password for LDP Sessions: Examples

The section contains the following examples for configuring an LDP MD5 password for LDP sessions:

- [Configuring an LDP MD5 Password for LDP Sessions for a Specified Neighbor: Example, page 17](#)
- [Configuring an LDP MD5 Password for LDP Sessions with Peers from a Specified VRF: Example, page 17](#)

- [Configuring an LDP MD5 Password for LDP Sessions with a Selected Group of Peers: Example, page 17](#)

## Configuring an LDP MD5 Password for LDP Sessions for a Specified Neighbor: Example

The following example shows how to configure an LDP MD5 password for LDP sessions for a specified neighbor:

```
enable
configure terminal
mpls ldp vrf vpn1 10.1.1.1 password nbrscrtpwd
end
```

This sets up nbrscrtpwd as the password to use for LDP sessions for the neighbor whose LDP router ID is 10.1.1.1. Communication with this neighbor is through VRF vpn1.

## Configuring an LDP MD5 Password for LDP Sessions with Peers from a Specified VRF: Example

The following example shows how to configure an LDP MD5 password for LDP sessions with peers from a specified VRF. The password vrfpwdvpn1 is configured for use with LDP peers that communicate using VRF vpn1. A password is required; otherwise, LDP tears down the session.

```
enable
configure terminal
mpls ldp vrf vpn1 password fallback vrfpwdvpn1
mpls ldp vrf vpn1 password required
end
```

The following example shows how to configure a password that is used for sessions for peers that communicate using the global routing table:

```
enable
configure terminal
mpls ldp password fallback vrfpwdvppn1
end
```

## Configuring an LDP MD5 Password for LDP Sessions with a Selected Group of Peers: Example

The following example shows how to configure an LDP MD5 password for LDP sessions with a selected group of peers. The required password aclpwdfor10 is configured for access list 10. Only those LDP router IDs permitted in access list 10 are required to use the password.

```
enable
configure terminal
mpls ldp password option 25 for 10 aclpwdfor10
mpls ldp password required for 10
end
```

Access list 10 might look something like this:

```
enable
configure terminal
access-list 10 permit 10.1.1.1
access-list 10 permit 10.3.3.3
access-list 10 permit 10.4.4.4
access-list 10 permit 10.1.1.1
access-list 10 permit 10.2.2.2
end
```

Feature Name	Releases	Feature Information
MPLS—LDP MD5 Global Configuration	12.2(28)SB 12.0(32)SY 12.2(33)SRB 12.4(20)T	<p>The MPLS—LDP MD5 Global Configuration feature provides enhancements to the Label Distribution Protocol (LDP) implementation of the Message Digest 5 (MD5) password. This feature allows you to enable LDP MD5 globally instead of on a per-peer basis. Using this feature you can set up password requirements for a set of LDP neighbors to help prevent unauthorized peers from establishing LDP sessions and to block spoofed TCP messages.</p> <p>In 12.2(28)SB, this feature was introduced.</p> <p>In 12.0(32)SY, this feature was integrated into Cisco IOS Release 12.0(32)SY.</p> <p>This feature was integrated into Cisco IOS Release 12.2(33)SRB.</p> <p>This feature was integrated into Cisco IOS Release 12.4(20)T.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Enhancements to LDP MD5 Protection for LDP Messages Between Peers, page 2</a></li> <li>• <a href="#">LDP MD5 Password Configuration Information, page 3</a></li> <li>• <a href="#">LDP MD5 Password Configuration for Routing Tables, page 4</a></li> <li>• <a href="#">Password Requirements for LDP Sessions, page 5</a></li> <li>• <a href="#">Identifying LDP Neighbors for LDP MD5 Password Protection, page 5</a></li> <li>• <a href="#">Identifying LDP Neighbors for LDP MD5 Password Protection, page 5</a></li> <li>• <a href="#">Configuring an LDP MD5 Password for LDP Sessions, page 7</a></li> <li>• <a href="#">Verifying the LDP MD5 Configuration, page 14</a></li> </ul> <p>The following commands were modified by this feature:  <b>mpls ldp password fallback, mpls ldp password option, mpls ldp password required, show mpls ldp discovery, show mpls ldp neighbor, show mpls ldp neighbor password.</b></p>

# Glossary

**BGP**—Border Gateway Protocol. An interdomain routing protocol that replaces External Gateway Protocol (EGP). BGP systems exchange reachability information with other BGP systems. BGP is defined by RFC 1163.

**EGP**—Exterior Gateway Protocol. An internet protocol for exchanging routing information between autonomous systems. EGP is documented in RFC 904. EGP is not to be confused with the general term exterior gateway protocol. EGP is an obsolete protocol that was replaced by Border Gateway Protocol (BGP).

**CE router**—customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router.

**CSC**—Carrier Supporting Carrier. A situation where one service provider allows another service provider to use a segment of its backbone network. The service provider that provides the segment of the backbone network to the other provider is called the backbone carrier. The service provider that uses the segment of the backbone network is called the customer carrier.

**LDP**—Label Distribution Protocol. A standard protocol between Multiprotocol Label Switching (MPLS)-enabled routers that is used in the negotiation of the labels used to forward packets. The Cisco proprietary version of this protocol is the Tag Distribution Protocol (TDP).

**LDP peer**—A label switch router (LSR) that is the receiver of label space information from another LSR. If an LSR has a label space to advertise to another LSR, or to multiple LSRs, one Label Distribution Protocol (LDP) session exists for each LSR (LDP peer) receiving the label space information.

**MD5**—Message Digest 5. A one-way hashing algorithm that produces a 128-bit hash. Both MD5 and Secure Hash Algorithm (SHA) are variations on MD4 and are designed to strengthen the security of the MD4 hashing algorithm. Cisco uses hashes for authentication within the IPSec framework. SNMP v.2 uses MD5 for message authentication, to verify the integrity of the communication, to authenticate the message origin, and to check its timeliness.

**MPLS**—Multiprotocol Label Switching. A switching method that forwards IP traffic through use of labels. Each label instructs the routers and the switches in the network where to forward a packet based on preestablished IP routing information.

**PE router**—provider edge router. A router that is part of a service provider's network connected to a customer edge (CE) router. All Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) processing occurs in the PE router.

**VPN**—Virtual Private Network. Enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic forwarded from one network to another. A VPN uses tunneling to encrypt all information at the IP level.

**VRF**—A VPN routing and forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a PE router.

# MPLS LDP—Lossless MD5 Session Authentication

---

**First Published: November 30, 2007**

**Last Updated: July 11, 2008**

The MPLS LDP—Lossless MD5 Session Authentication feature enables a Label Distribution Protocol (LDP) session to be password-protected without tearing down and reestablishing the LDP session.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for MPLS LDP—Lossless MD5 Session Authentication” section on page 31](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Prerequisites for MPLS LDP—Lossless MD5 Session Authentication

The MPLS LDP—Lossless MD5 Session Authentication feature is an enhancement to the MPLS LDP MD5 Global Configuration feature. Before configuring the MPLS LDP—Lossless MD5 Session Authentication feature, refer to the [MPLS—LDP MD5 Global Configuration](#) feature module for more information on how the message digest algorithm 5 (MD5) works with MPLS LDP to ensure that LDP segments remain properly protected.

**Note**

The MPLS LDP—Lossless MD5 Session Authentication feature must be configured before MPLS LDP is configured.

Configure the following features on the label switch router (LSR) before configuring the MPLS LDP—Lossless MD5 Session Authentication feature:

- Cisco Express Forwarding or distributed Cisco Express Forwarding
- Static or dynamic routing
- MPLS Virtual Private Network (VPN) routing and forwarding (VRFs) instances for MPLS VPNs
- MPLS LDP—Lossless MD5 Session Authentication for the MPLS VPN VRFs

**Note**

If a VRF is deleted, then the lossless MD5 session authentication for that VRF is automatically removed.

## Restrictions for MPLS LDP—Lossless MD5 Session Authentication

MD5 protection applies to LDP sessions between peers. Tag Distribution Protocol (TDP) sessions between peers are not protected.

## Information About MPLS LDP—Lossless MD5 Session Authentication

You should understand the following concepts before configuring the MPLS LDP—Lossless MD5 Session Authentication feature:

- [How MPLS LDP Messages in MPLS LDP—Lossless MD5 Session Authentication are Exchanged, page 3](#)
- [The Evolution of MPLS LDP MD5 Password Features, page 3](#)
- [Keychains Use with MPLS LDP—Lossless MD5 Session Authentication, page 4](#)
- [Application of Rules to Overlapping Passwords, page 4](#)
- [Password Rollover Period Guidelines, page 5](#)
- [Resolving LDP Password Problems, page 5](#)

## How MPLS LDP Messages in MPLS LDP—Lossless MD5 Session Authentication are Exchanged

MPLS LDP messages (discovery, session, advertisement, and notification messages) are exchanged between LDP peers through two channels:

- LDP discovery messages are transmitted as User Datagram Protocol (UDP) packets to the well-known LDP port.
- Session, advertisement, and notification messages are exchanged through a TCP connection established between two LDP peers.

The MPLS LDP—Lossless MD5 Session Authentication feature allows an LDP session to be password-protected without tearing down and reestablishing the LDP session. The MD5 password can be implemented and changed without interrupting the LDP session.

## The Evolution of MPLS LDP MD5 Password Features

The initial version of LDP MD5 protection allowed authentication to be enabled between two LDP peers and each segment sent on the TCP connection was verified between the peers. Authentication was configured on both LDP peers using the same password; otherwise, the peer session was not established. The **mpls ldp neighbor** command was issued with the **password** keyword. When MD5 protection was enabled, the router tore down the existing LDP sessions and established new sessions with the neighbor router.

An improved MD5 protection feature, called MPLS—LDP MD5 Global Configuration, was later introduced that allowed LDP MD5 to be enabled globally instead of on a per-peer basis. Using this feature, password requirements for a set of LDP neighbors could be configured. The MPLS LDP MD5 Global Configuration feature also improved the ability to maintain the LDP session. The LDP session with a peer was not automatically torn down when the password for that peer was changed. The new password was implemented the next time an LDP session was established with the peer.

The MPLS LDP—Lossless MD5 Session Authentication feature is based on the MPLS LDP MD5 Global Configuration feature. However, the MPLS LDP—Lossless MD5 Session Authentication feature provides the following enhancements:

- Activate or change LDP MD5 session authentication without interrupting the LDP session.
- Configure multiple passwords, so one password can be used now and other passwords later.
- Configure asymmetric passwords, which allows one password to be used for incoming TCP segments and a different password to be used for outgoing TCP segments.
- Configure passwords so that they overlap for a period of time. This functionality is beneficial when the clocks on two LSRs are not synchronized.

These enhancements are available by using the **key-chain** command, which allows different key strings to be used at different times according to the keychain configuration.

## Keychains Use with MPLS LDP—Lossless MD5 Session Authentication

The MPLS LDP—Lossless MD5 Session Authentication feature allows keychains to be used to specify different MD5 keys to authenticate LDP traffic exchanged in each direction.

In the following example, three passwords are configured:

- Key 1 specifies the lab password. The **send-lifetime** command enables the lab password to authenticate the outgoing TCP segments from November 2, 2007, at 10:00:00 a.m. until December 2, 2007, at 10:00:00 a.m. The **accept-lifetime** command is configured so that the lab password is never used to authenticate incoming TCP segments. The **accept-lifetime** command enables the lab password for 1 second on January 1, 1970. By setting the date to the past and by enabling a duration of 1 second, the password for incoming TCP segments immediately expires. If the **accept-lifetime** command is omitted from the keychain configuration, then the password is always valid for incoming TCP segments.
- Key 2 and key 3 specify the lab2 and lab3 passwords, respectively. The **send-lifetime** commands enable the passwords for 1 second on January 1, 1970. By setting the date to the past and by enabling a duration of 1 second, the passwords for outgoing TCP segments immediately expire. If the **send-lifetime** commands are omitted from the keychain configuration, the passwords are always valid for outgoing TCP segments. The **accept-lifetime** commands for key 2 and key 3 enable the passwords to authenticate the incoming TCP segments from November 2, 2007, at 10:00:00 a.m. until November 17, 2007, at 10:00:00 a.m. and from November 17, 2007, at 10:00:00 a.m. until December 2, 2007, at 10:00:00 a.m., respectively.

```
key chain ldp-pwd
key 1
  key-string lab
  send-lifetime 10:00:00 Nov 2 2007 10:00:00 Dec 2 2007
  accept-lifetime 00:00:00 Jan 1 1970 duration 1
key 2
  key-string lab2
  send-lifetime 00:00:00 Jan 1 1970 duration 1
  accept-lifetime 10:00:00 Nov 2 2007 10:00:00 Nov 17 2007
key 3
  key-string lab3
  send-lifetime 00:00:00 Jan 1 1970 duration 1
  accept-lifetime 10:00:00 Nov 17 2007 10:00:00 Dec 2 2007
!
mpls ldp password option 1 for nbr-acl key-chain ldp-pwd
```

## Application of Rules to Overlapping Passwords

Overlapping passwords can be useful when two LSRs have clocks that are not synchronized. The overlapping passwords provide a window to ensure that TCP packets are not dropped. The following rules apply to overlapping passwords:

- If the send-lifetime value for the next password begins before the send-lifetime value of the current password expires, the password with the shorter key ID is used during the overlap period. The send-lifetime value of the current password can be shortened by configuring a shorter send-lifetime value. Similarly, the send-lifetime value of the current password can be lengthened by configuring a longer send-lifetime value.

- If the accept-lifetime value for the next password begins before the accept-lifetime value of the current password expires, both the next password and the current password are used concurrently. The next password information is passed to TCP. If TCP fails to authenticate the incoming segments with the current password, it tries authenticating with the next password. If TCP authenticates a segment using the new password, it discards the current password and uses the new password from that point on.
- If a password for incoming or outgoing segments expires and no additional valid password is configured, one of the following actions take place:
  - If a password is required for the neighbor, LDP drops the existing session.
  - If a password is not required for the neighbor, LDP attempts to roll over to a session that does not require authentication. This attempt also fails unless the password expires on both LSRs at the same time.

## Password Rollover Period Guidelines

Both old and new passwords are valid during a rollover period. This ensures a smooth rollover when clocks are not synchronized between two LDP neighbors. When passwords are configured using a keychain, the rollover period is equal to the accept-lifetime overlap between two successive receive passwords.

The minimum rollover period (the duration between two consecutive MD5 key updates) must be longer than the value of the LDP keepalive interval time to ensure an update of new MD5 authentication keys. If LDP session hold time is configured to its default value of 3 minutes, the LDP keepalive interval is 1 minute. The minimum rollover period should be 5 minutes. However, we recommend that the minimum rollover period is set to between 15 and 30 minutes.

To ensure a seamless rollover, follow these guidelines:

- Ensure that the local time on the peer LSRs is the same before configuring the keychain.
- Check for error messages (TCP-6-BADAUTH) that indicate keychain misconfiguration.
- Validate the correct keychain configuration by checking for the following password messages:

```
%LDP-5-PWDCFG: Password configuration changed for 10.1.1.1:0
%LDP-5-PWDRO: Password rolled over for 10.1.1.1:0
```

## Resolving LDP Password Problems

LDP displays error messages when an unexpected neighbor attempts to open an LDP session, or the LDP password configuration is invalid. Some existing LDP debugs also display password information.

When a password is required for a potential LDP neighbor, but no password is configured for it, the LSR ignores LDP hello messages from that neighbor. When the LSR processes the hello message and tries to establish a TCP connection with the neighbor, it displays the error message and stops establishing the LDP session with the neighbor. The error is rate-limited and has the following format:

```
00:00:57: %LDP-5-PWD: MD5 protection is required for peer 10.2.2.2(11051), no password configured
```

When passwords do not match between LDP peers, TCP displays the following error message on the LSR that has the lower router ID; that is, the router that has the passive role in establishing TCP connections:

```
00:01:07: %TCP-6-BADAUTH: Invalid MD5 digest from 10.2.2.2(11051) to 10.1.1.1(646)
```

If one peer has a password configured and the other one does not, TCP displays the following error messages on the LSR that has a password configured:

```
00:02:07: %TCP-6-BADAUTH: No MD5 digest from 10.1.1.1(646) to 10.2.2.2(11099)
```

## How to Configure MPLS LDP—Lossless MD5 Session Authentication

This section contains the following procedures:

- [Configuring MPLS LDP—Lossless MD5 Session Authentication Using a Keychain, page 7](#) (Optional)
- [Enabling the Display of MPLS LDP Password Rollover Changes and Events, page 12](#) (Optional)
- [Changing MPLS LDP—Lossless MD5 Session Authentication Passwords, page 13](#) (Optional)

## Configuring MPLS LDP—Lossless MD5 Session Authentication Using a Keychain

Perform this task to configure the MPLS LDP—Lossless MD5 Session Authentication feature using a keychain. Keychains allow a different key string to be used at different times according to the keychain configuration. MPLS LDP queries the appropriate keychain to obtain the current live key and key ID for the specified keychain.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **access-list** *access-list-number* {**permit** | **deny**} {*type-code wildcard-mask* | *ip-address mask*}
4. **key chain** *name-of-chain*
5. **key** *key-id*
6. **key-string** *string*
7. **accept-lifetime** {*start-time* | **local start-time**} {**duration seconds** | *end-time* | **infinite**}
8. **send-lifetime** {*start-time* | **local start-time**} {**duration seconds** | *end-time* | **infinite**}
9. **exit**
10. **exit**
11. **mpls ldp** [**vrf** *vrf-name*] **password option number for acl** {**key-chain** *keychain-name* | [**0** | **7**] *password*}
12. **exit**
13. **show mpls ldp neighbor** [**vrf** *vrf-name* | **all**] [*ip-address* | *interface*] [**detail**] [**graceful-restart**]

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b>  <b>Example:</b> Router> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter the password if prompted.</li> </ul>
Step 2	<b>configure terminal</b>  <b>Example:</b> Router# configure terminal	Enters global configuration mode.
Step 3	<b>access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> } { <i>type-code wildcard-mask</i>   <i>ip-address mask</i> }  <b>Example:</b> Router(config)# access-list 10 permit 10.2.2.2	Creates an access list.
Step 4	<b>key chain</b> <i>name-of-chain</i>  <b>Example:</b> Router(config)# key chain ldp-pwd	Enables authentication for routing protocols and identifies a group of authentication keys. <ul style="list-style-type: none"> <li>Enters keychain configuration mode.</li> </ul>
Step 5	<b>key</b> <i>key-id</i>  <b>Example:</b> Router(config-keychain)# key 1	Identifies an authentication key on a keychain. <ul style="list-style-type: none"> <li>The <i>key-id</i> value must be a numeral.</li> <li>Enters keychain key configuration mode.</li> </ul>
Step 6	<b>key-string</b> <i>string</i>  <b>Example:</b> Router(config-keychain-key)# key-string pwd1	Specifies the authentication string for a key. <ul style="list-style-type: none"> <li>The <i>string</i> value can be 1 to 80 uppercase or lowercase alphanumeric characters; the first character cannot be a numeral.</li> </ul>

	Command or Action	Purpose
Step 7	<p><b>accept-lifetime</b> {<i>start-time</i>   <b>local</b> <i>start-time</i>}  {<b>duration</b> <i>seconds</i>   <i>end-time</i>   <b>infinite</b>}</p> <p><b>Example:</b>  Router(config-keychain-key)# accept-lifetime 10:00:00  Jan 13 2007 10:00:00 Jan 13 2009</p>	<p>Specifies the time period during which the authentication key on a keychain can be used for verifying incoming TCP segments.</p> <p>The <i>start-time</i> argument identifies the time to start and the local <i>start-time</i> argument identifies the time to start in the local time zone. Both arguments have the same parameters:</p> <p><b>Note</b> The time reference depends on the clock time zone configuration on the router. If no time zone configured, then the default time zone uses the Coordinated Universal Time (UTC) time. If it is configured, either the Eastern Standard Time (EST) or Pacific Standard Time (PST) time zone is used.</p> <ul style="list-style-type: none"> <li>• <i>hh:mm:ss</i> is the time format.</li> <li>• Enter the number of days from 1 to 31.</li> <li>• Enter the name of the month.</li> <li>• Enter the year from the present to 2035.</li> </ul> <p>Once the start time is entered, select from the following:</p> <ul style="list-style-type: none"> <li>• The <b>duration</b> keyword sets the key lifetime duration in seconds.</li> <li>• The <i>end-time</i> argument sets the time to stop. These parameters are the same as those used for the <i>start-time</i> argument.</li> <li>• The <b>infinite</b> keyword allows the accept-lifetime period to never expire.</li> </ul> <p>If the <b>no accept-lifetime</b> value is defined, the associated receive password is valid for authenticating incoming TCP segments.</p>

Command or Action	Purpose
<p><b>Step 8</b></p> <pre>send-lifetime {start-time   local start-time} {duration seconds   end-time   infinite}</pre> <p><b>Example:</b>  Router(config-keychain-key)# send-lifetime 10:00:00  Jan 13 2007 10:00:00 Jan 13 2009</p>	<p>Specifies the time period during which the authentication key on a keychain can be used for verifying outgoing TCP segments. The <i>start-time</i> argument identifies the time to start and the local <i>start-time</i> argument identifies the time to start in the local time zone. Both arguments have the same parameters:</p> <p><b>Note</b> The time reference depends on the clock time zone configuration on the router. If no time zone configured, then the default time zone uses the UTC time. If it is configured, either the EST or PST time zone is used.</p> <ul style="list-style-type: none"> <li>• <i>hh:mm:ss</i> is the time format.</li> <li>• Enter the number of days from 1 to 31.</li> <li>• Enter the name of the month.</li> <li>• Enter the year from 1993 to 2035.</li> </ul> <p>Once the start time is entered, select from the following:</p> <ul style="list-style-type: none"> <li>• The <b>duration</b> keyword sets the send lifetime duration in seconds.</li> <li>• The <i>end-time</i> argument sets the time to stop. These parameters are the same as those used for the <i>start-time</i> argument.</li> <li>• The <b>infinite</b> keyword allows the send lifetime period to never expire.</li> </ul> <p>If the <b>no send-lifetime</b> value is defined, the associated send password is valid for authenticating outgoing TCP segments.</p>
<p><b>Step 9</b></p> <pre>exit</pre> <p><b>Example:</b>  Router(config-keychain-key)# exit</p>	<p>Exits from keychain key configuration mode.</p>
<p><b>Step 10</b></p> <pre>exit</pre> <p><b>Example:</b>  Router(config-keychain)# exit</p>	<p>Exits from keychain configuration mode.</p>

	Command or Action	Purpose
<b>Step 11</b>	<p><b>mpls ldp</b> [<b>vrf</b> <i>vrf-name</i>] <b>password</b> <b>option</b> <i>number</i> <b>for</b> <i>acl</i> {<b>key-chain</b> <i>keychain-name</i>   [<b>0</b>   <b>7</b>] <i>password</i>}</p> <p><b>Example:</b></p> <pre>Router(config)# mpls ldp password option 1 for 10 keychain ldp-pwd</pre>	<p>Configures an MD5 password for LDP sessions with neighbors whose LDP router IDs are permitted by a specified access list.</p> <ul style="list-style-type: none"> <li>• The <b>vrf</b> <i>vrf-name</i> keyword-argument pair specifies a VRF configured on the LSR.</li> <li>• The <i>number</i> argument defines the order in which the access lists are evaluated in the determination of a neighbor password. The valid range is 1 to 32767.</li> <li>• The <b>for</b> <i>acl</i> keyword-argument pair specifies the name of the access list that includes the LDP router IDs of those neighbors for which the password applies. Only standard IP access list values (1 to 99) can be used for the <i>acl</i> argument.</li> <li>• The <b>key-chain</b> <i>keychain-name</i> keyword-argument pair specifies the name of the keychain to use.</li> <li>• The <b>0</b> and <b>7</b> keywords specify whether the password that follows is hidden (encrypted); <ul style="list-style-type: none"> <li>– <b>0</b> specifies an unencrypted password.</li> <li>– <b>7</b> specifies an encrypted password.</li> </ul> </li> <li>• The <i>password</i> argument specifies the MD5 password to be used for the specified LDP sessions.</li> </ul>

	Command or Action	Purpose
Step 12	<b>exit</b>  <b>Example:</b> Router(config)# exit	Exits from global configuration mode.
Step 13	<b>show mpls ldp neighbor</b> [ <b>vrf</b> <i>vrf-name</i>   <b>all</b> ] [ <i>ip-address</i>   <i>interface</i> ] [ <b>detail</b> ] [ <b>graceful-restart</b> ]  <b>Example:</b> Router# show mpls ldp neighbor detail	Displays the status of LDP sessions. <ul style="list-style-type: none"> <li>• The <b>vrf</b> <i>vrf-name</i> keyword-argument pair displays the LDP neighbors for the specified VRF instance.</li> <li>• The <i>ip-address</i> argument identifies the neighbor with the IP address for which password protection is configured.</li> <li>• The <i>interface</i> argument identifies the LDP neighbors accessible over this interface.</li> <li>• The <b>detail</b> keyword displays information in long form, including password information for this neighbor. Here are the items displayed: <ul style="list-style-type: none"> <li>– An indication as to whether a password is mandatory for this neighbor (required/not required)</li> <li>– The password source (neighbor/fallback/number [option number])</li> <li>– An indication as to whether the latest configured password for this neighbor is used by the TCP session (in use) or the TCP session uses an old password (stale)</li> </ul> </li> <li>• The <b>graceful-restart</b> keyword displays per-neighbor graceful restart information.</li> </ul>

## Enabling the Display of MPLS LDP Password Rollover Changes and Events

When a password is required for a neighbor, but no password is configured for the neighbor, the following debug message is displayed:

```
00:05:04: MDSym5 protection is required for peer 10.2.2.2:0(glbl), but no password configured.
```

To enable the display of events related to configuration changes and password rollover events, perform this task.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ldp logging password configuration** [**rate-limit** *number*]
4. **mpls ldp logging password rollover** [**rate-limit** *number*]

5. **exit**
6. **debug mpls ldp transport events**  
or  
**debug mpls ldp transport connections**

## DETAILED STEPS

- 
- Step 1 enable**  
This command enables privileged EXEC mode. Enter the password if prompted.
- Step 2 configure terminal**  
This command enables global configuration mode.
- Step 3 mpls ldp logging password configuration [rate-limit *number*]**  
This command is used to enable the display of events related to configuration changes. The output displays events when a new password is configured or an existing password has been changed or deleted. A rate limit of 1 to 60 messages a minute can be specified.
- Step 4 mpls ldp logging password rollover [rate-limit *number*]**  
This command is used to enable the display of events related to password rollover events. Events are displayed when a new password is used for authentication or when authentication is disabled. A rate limit of 1 to 60 messages a minute can be specified.
- Step 5 exit**  
This command exits global configuration mode.
- Step 6 debug mpls ldp transport events**  
or  
**debug mpls ldp transport connections**  
Either command displays notifications when a session TCP MD5 option is changed.  
For example:
- ```
00:03:44: ldp: MD5 setup for peer 10.2.2.2:0(global); password changed to adfas
00:05:04: ldp: MD5 setup for peer 10.52.52.2:0(vpn1(1)); password changed to [nil]
```
- 

## Changing MPLS LDP—Lossless MD5 Session Authentication Passwords

The MPLS LDP—Lossless MD5 Session Authentication feature allows MD5 passwords to be changed for LDP session authentication without having to close and reestablish an existing LDP session.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ldp [vrf *vrf-name*] password rollover duration *minutes***
4. **mpls ldp [vrf *vrf-name*] password fallback {key-chain *keychain-name* | [0 | 7] *password*}**
5. **no mpls ldp neighbor [vrf *vpn-name*] ip-address *password password***

6. **exit**

7. **show mpls ldp neighbor** [**vrf** *vrf-name*] [*ip-address* | *interface*] [**detail**] [**graceful-restart**]

|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>no mpls ldp neighbor</b> [<b>vrf</b> <i>vpn-name</i>] <i>ip-address</i><br/> <b>password</b> <i>password</i></p> <p><b>Example:</b><br/> Router(config)# no mpls ldp neighbor 10.11.11.11<br/> password lab1</p> | <p>Disables the configuration of a password for computing MD5 checksums for the session TCP connection with the specified neighbor.</p> <ul style="list-style-type: none"> <li>• The <b>vrf</b> <i>vpn-name</i> argument optionally specifies the VRF instance for the specified neighbor.</li> <li>• The <i>ip-address</i> argument identifies the neighbor router ID.</li> <li>• The <b>password</b> <i>password</i> keyword-argument pair is necessary so that the router computes MD5 checksums for the session TCP connection with the specified neighbor.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 6 | <p><b>exit</b></p> <p><b>Example:</b><br/> Router(config)# exit</p>                                                                                                                                                    | <p>Exits from global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 7 | <p><b>show mpls ldp neighbor</b> [<b>vrf</b> <i>vrf-name</i>] [<i>ip-address</i>   <i>interface</i>] [<b>detail</b>] [<b>graceful-restart</b>]</p> <p><b>Example:</b><br/> Router# show mpls ldp neighbor detail</p>   | <p>Displays the status of LDP sessions.</p> <ul style="list-style-type: none"> <li>• The <b>vrf</b> <i>vrf-name</i> keyword-argument pair displays the LDP neighbors for the specified VRF instance.</li> <li>• The <i>ip-address</i> argument identifies the neighbor with the IP address for which password protection is configured.</li> <li>• The <i>interface</i> argument lists the LDP neighbors accessible over this interface.</li> <li>• The <b>detail</b> keyword displays information in long form, including password information for this neighbor. Here are the items displayed: <ul style="list-style-type: none"> <li>– An indication as to whether a password is mandatory for this neighbor (required/not required)</li> <li>– The password source (neighbor/fallback/number [option number])</li> <li>– An indication as to whether the latest configured password for this neighbor is used by the TCP session (in use) or the TCP session uses an old password (stale)</li> </ul> </li> <li>• The <b>graceful-restart</b> keyword displays per-neighbor graceful restart information.</li> </ul> |

# Configuration Examples for MPLS LDP—Lossless MD5 Session Authentication

This section provides the following configuration examples:

- [Configuring MPLS LDP—Lossless MD5 Session Authentication Using a Keychain \(Symmetrical\): Example, page 16](#)
- [Configuring MPLS LDP—Lossless MD5 Session Authentication Using a Keychain \(Asymmetrical\): Example, page 17](#)
- [Changing MPLS LDP—Lossless MD5 Session Authentication Password: Example, page 18](#)
- [Changing MPLS LDP—Lossless MD5 Session Authentication Password Using a Rollover Without Keychain: Example, page 19](#)
- [Changing MPLS LDP—Lossless MD5 Session Authentication Password Using a Rollover with a Keychain: Example, page 20](#)
- [Changing MPLS LDP—Lossless MD5 Session Authentication Password Using a Fallback Password With a Keychain: Example, page 22](#)
- [Changing MPLS LDP—Lossless MD5 Session Authentication: Common Misconfiguration Examples, page 24](#)
- [Changing MPLS LDP—Lossless MD5 Session Authentication Using a Second Key to Avoid LDP Session Failure: Examples, page 26](#)

## Configuring MPLS LDP—Lossless MD5 Session Authentication Using a Keychain (Symmetrical): Example

The following example shows a configuration of two peer LSRs that use symmetrical MD5 keys:

### LSR1

```
access-list 10 permit 10.2.2.2
mpls ldp password required for 10
mpls ldp password option 1 for 10 ldp-pwd
!
key chain ldp-pwd
key 1
  key-string pwd1
  send-lifetime 10:00:00 Jan 1 2007 10:00:00 Feb 1 2007
  accept-lifetime 09:00:00 Jan 1 2007 11:00:00 Feb 1 2007
!
interface loopback0
  ip address 10.1.1.1 255.255.255.255
!
interface Ethernet0/0
  ip address 10.0.1.1 255.255.255.254
  mpls label protocol ldp
  tag-switching ip
```

### LSR2

```
access-list 10 permit 10.1.1.1
mpls ldp password required for 10
mpls ldp password option 1 for 10 ldp-pwd
!
```

```

key chain ldp-pwd
  key 1
    key-string pwd1
    send-lifetime 10:00:00 Jan 1 2007 10:00:00 Feb 1 2007
    accept-lifetime 09:00:00 Jan 1 2007 11:00:00 Feb 1 2007
  !
interface loopback0
  ip address 10.2.2.2 255.255.255.255
  !
interface Ethernet0/0
  ip address 10.0.1.2 255.255.255.254
  mpls label protocol ldp
  tag-switching ip

```

## Configuring MPLS LDP—Lossless MD5 Session Authentication Using a Keychain (Asymmetrical): Example

The following example shows a configuration of two peer LSRs that use asymmetrical MD5 keys:

### LSR1

```

access-list 10 permit 10.2.2.2
mpls ldp password required for 10
mpls ldp password option 1 for 10 ldp-pwd
!
key chain ldp-pwd
  key 1
    key-string pwd1
    accept-lifetime 00:00:00 Jan 1 2005 duration 1
    send-lifetime 10:00:00 Jan 1 2007 10:00:00 Feb 1 2007
  key 2
    key-string pwd2
    accept-lifetime 09:00:00 Jan 1 2007 11:00:00 Feb 1 2007
    send-lifetime 00:00:00 Jan 1 2005 duration 1
  !
interface loopback0
  ip address 10.1.1.1 255.255.255.255
  !
interface Ethernet0/0
  ip address 10.0.1.1 255.255.255.254
  mpls label protocol ldp
  tag-switching ip

```

### LSR2

```

access-list 10 permit 10.1.1.1
mpls ldp password required for 10
mpls ldp password option 1 for 10 ldp-pwd
!
key chain ldp-pwd
  key 1
    key-string pwd2
    accept-lifetime 00:00:00 Jan 1 2005 duration 1
    send-lifetime 10:00:00 Jan 1 2007 10:00:00 Feb 1 2007
  key 2
    key-string pwd1
    accept-lifetime 09:00:00 Jan 1 2007 11:00:00 Feb 1 2007
    send-lifetime 00:00:00 Jan 1 2005 duration 1
  !
interface loopback0
  ip address 10.2.2.2 255.255.255.255

```

```

!
interface Ethernet0/0
 ip address 10.0.1.2 255.255.255.254
 mpls label protocol ldp
 tag-switching ip

```

## Changing MPLS LDP—Lossless MD5 Session Authentication Password: Example

The following example shows the existing password configuration for LSR A, LSR B, and LSR C:

### LSR A Existing Configuration

```

mpls ldp router-id loopback0 force
mpls ldp neighbor 10.11.11.11 password lab1
mpls ldp neighbor 10.12.12.12 password lab1
mpls label protocol ldp
!
interface loopback0
 ip address 10.10.10.10 255.255.255.255
!
interface Ethernet1/0
 ip address 10.2.0.1 255.255.0.0
 mpls ip
!
interface Ethernet2/0
 ip address 10.0.0.1 255.255.0.0
 mpls ip

```

### LSR B Existing Configuration

```

mpls ldp router-id loopback0 force
mpls ldp neighbor 10.10.10.10 password lab1
mpls label protocol ldp
!
interface loopback0
 ip address 10.11.11.11 255.255.255.255
!
interface Ethernet1/0
 ip address 10.2.0.2 255.255.0.0
 mpls ip

```

### LSR C Existing Configuration

```

mpls ldp router-id loopback0 force
mpls ldp neighbor 10.10.10.10 password lab1
mpls label protocol ldp
!
interface loopback0
 ip address 10.12.12.12 255.255.255.255
!
interface Ethernet2/0
 ip address 10.0.0.2 255.255.0.0
 mpls ip
!

```

The following example shows how the lossless password change is configured using the **mpls ldp password rollover duration** command for LSR A, LSR B, and LSR C so there is enough time to change all the passwords on all of the routers:

#### LSR A New Configuration

```
mpls ldp password rollover duration 10
mpls ldp password fallback lab2
no mpls ldp neighbor 10.11.11.11 password lab1
no mpls ldp neighbor 10.12.12.12 password lab1
```

#### LSR B New Configuration

```
mpls ldp password rollover duration 10
mpls ldp password fallback lab2
no mpls ldp neighbor 10.10.10.10 password lab1
```

#### LSR C New Configuration

```
mpls ldp password rollover duration 10
mpls ldp password fallback lab2
no mpls ldp neighbor 10.10.10.10 password lab1
```

After 10 minutes has elapsed, the password changes. The following system logging message for LSR A confirms that the password rollover was successful:

```
%LDP-5-PWDRO: Password rolled over for 10.11.11.11:0
%LDP-5-PWDRO: Password rolled over for 10.12.12.12:0
```

## Changing MPLS LDP—Lossless MD5 Session Authentication Password Using a Rollover Without Keychain: Example

The MPLS LDP—Lossless MD5 Session Authentication password can be changed in a lossless way (without tearing down an existing LDP session) by using a password rollover without a keychain.

The following example shows the existing password configuration for LSR A and LSR B:

#### LSR A Existing Configuration

```
mpls ldp router-id loopback0 force
mpls ldp neighbor 10.11.11.11 password lab1
mpls label protocol ldp
!
interface loopback0
ip address 10.10.10.10 255.255.255.255
!
interface Ethernet1/0
ip address 10.2.0.1 255.255.0.0
mpls ip
```

**LSR B Existing Configuration**

```

mpls ldp router-id loopback0 force
mpls ldp neighbor 10.10.10.10 password lab1
mpls label protocol ldp
!
interface loopback0
ip address 10.11.11.11 255.255.255.255
!
interface Ethernet1/0
ip address 10.2.0.2 255.255.0.0
mpls ip

```

The following example shows the new password configuration for LSR A and LSR B:

**Note**

The rollover duration should be large enough so that the passwords can be changed on all impacted routers.

**LSR A New Configuration**

```

mpls ldp password rollover duration 10
mpls ldp neighbor 10.11.11.11 password lab2

```

**LSR B New Configuration**

```

mpls ldp password rollover duration 10
mpls ldp neighbor 10.10.10.10 password lab2

```

After 10 minutes (rollover duration), the password changes and the following system logging message confirms the password rollover at LSR A:

```
%LDP-5-PWDR0: Password rolled over for 10.11.11.11:0
```

## Changing MPLS LDP—Lossless MD5 Session Authentication Password Using a Rollover with a Keychain: Example

The MPLS LDP—Lossless MD5 Session Authentication password can be changed in a lossless way by using a password rollover with a keychain. The following configuration example shows the new password keychain configuration for LSR A, LSR B, and LSR C, in which the new password is ldp-pwd.

In the example, the desired keychain is configured first. The first pair of keys authenticate incoming TCP segments (recv key) and compute MD5 digests for outgoing TCP segments (xmit key). These keys should be the same keys as those currently in use; that is, in lab 1. The second recv key in the keychain should be valid after a few minutes. The second xmit key becomes valid at a future time.

**Note**

The rollover duration should be large enough so that the passwords can be changed on all impacted routers.

**LSR A New Configuration**

```

mpls ldp password rollover duration 10
access-list 10 permit 10.11.11.11
access-list 10 permit 10.12.12.12
!
key chain ldp-pwd
key 10
key-string lab1

```

```

send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
accept-lifetime 10:00:00 Jan 1 2007 10:45:00 Jan 1 2007
    key 11
    key-string lab2
send-lifetime 10:30:00 Jan 1 2007 10:30:00 Feb 1 2007
accept-lifetime 10:15:00 Jan 1 2007 10:45:00 Feb 1 2007
    key 12
    key-string lab3
send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007
accept-lifetime 10:15:00 Feb 1 2007 10:45:00 Mar 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd
no mpls ldp neighbor 10.11.11.11 password lab1
no mpls ldp neighbor 10.12.12.12 password lab1

```

### LSR B New Configuration

```

mpls ldp password rollover duration 10
access-list 10 permit 10.10.10.10
    key chain ldp-pwd
    key 10
    key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
accept-lifetime 10:00:00 Jan 1 2007 10:45:00 Jan 1 2007
    key 11
    key-string lab2
send-lifetime 10:30:00 Jan 1 2007 10:30:00 Feb 1 2007
accept-lifetime 10:15:00 Jan 1 2007 10:45:00 Feb 1 2007
    key 12
    key-string lab3
send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007
accept-lifetime 10:15:00 Feb 1 2007 10:45:00 Mar 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd
no mpls ldp neighbor 10.10.10.10 password lab1

```

### LSR C New Configuration

```

mpls ldp password rollover duration 10
access-list 10 permit 10.10.10.10
    key chain ldp-pwd
    key 10
    key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
accept-lifetime 10:00:00 Jan 1 2007 10:45:00 Jan 1 2007
    key 11
    key-string lab2
send-lifetime 10:30:00 Jan 1 2007 10:30:00 Feb 1 2007
accept-lifetime 10:15:00 Jan 1 2007 10:45:00 Feb 1 2007
    key 12
    key-string lab3
send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007
accept-lifetime 10:15:00 Feb 1 2007 10:45:00 Mar 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd
no mpls ldp neighbor 10.10.10.10 password lab1

```

After 10 minutes, the password changes and the following system logging message confirms the password rollover at LSR A.

```

%LDP-5-PWDRO: Password rolled over for 10.11.11.11:0
%LDP-5-PWDRO: Password rolled over for 10.12.12.12:0

```

## Changing MPLS LDP—Lossless MD5 Session Authentication Password Using a Fallback Password With a Keychain: Example

The MPLS LDP—Lossless MD5 Session Authentication password can be changed in a lossless way by using a fallback password when doing a rollover with a keychain.

### Note

The fallback password is used only when there is no other keychain configured. If there is a keychain configured, then the fallback password is not used.

The following example shows the existing password configuration for LSR A, LSR B, and LSR C:

### LSR A Existing Configuration

```
mpls ldp router-id loopback0 force
mpls label protocol ldp
!
interface loopback0
ip address 10.10.10.10 255.255.255.255
!
interface Ethernet1/0
ip address 10.2.0.1 255.255.0.0
mpls ip
!
interface Ethernet2/0
ip address 10.0.0.1 255.255.0.0
mpls ip
!
access-list 10 permit 10.11.11.11
access-list 10 permit 10.12.12.12
!
key chain ldp-pwd
key 10
key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
accept-lifetime 10:00:00 Jan 1 2007 10:45:00 Jan 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd
```

### LSR B Existing Configuration

```
mpls ldp router-id loopback0 force
mpls label protocol ldp
!
interface loopback0
ip address 10.11.11.11 255.255.255.255
!
interface Ethernet1/0
ip address 10.2.0.2 255.255.0.0
mpls ip
!
access-list 10 permit 10.10.10.10
key chain ldp-pwd
key 10
key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
accept-lifetime 10:00:00 Jan 1 2007 10:45:00 Jan 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd
```

**LSR C Existing Configuration**

```

mpls ldp router-id loopback0 force
mpls label protocol ldp
!
interface loopback0
ip address 10.12.12.12 255.255.255.255
!
interface Ethernet2/0
ip address 10.0.0.2 255.255.0.0
mpls ip
!
access-list 10 permit 10.10.10.10
key chain ldp-pwd
key 10
key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
accept-lifetime 10:00:00 Jan 1 2007 10:45:00 Jan 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd

```

**Note**

The fallback keychain is not used unless the keychain **ldp-pwd** is removed using the **no mpls ldp password option 5 for 10 key-chain ldp-pwd** command.

The following example shows the new configuration for LSR A, LSR B, and LSR C, where one keychain is configured with the name **ldp-pwd** and another keychain is configured with the name **fallback** for the fallback password.

**Note**

The rollover duration should be large enough so that the passwords can be changed on all impacted routers.

**LSR A New Configuration**

```

mpls ldp password rollover duration 10
!
key chain fallback
key 10
key-string fbk1
!
mpls ldp password fallback key-chain fallback
!
no mpls ldp password option 5 for 10 key-chain ldp-pwd

```

**LSR B New Configuration**

```

mpls ldp password rollover duration 10
!
key chain fallback
key 10
key-string fbk1
!
mpls ldp password fallback key-chain fallback
!
no mpls ldp password option 5 for 10 key-chain ldp-pwd

```

**LSR C New Configuration**

```

mpls ldp password rollover duration 10
key chain fallback
key 10
key-string fbk1
!
mpls ldp password fallback key-chain fallback
!
no mpls ldp password option 5 for 10 key-chain ldp-pwd

```

After 10 minutes, the password changes and the following system logging message confirms the password rollover at LSR A:

```

%LDP-5-PWDRO: Password rolled over for 10.11.11.11:0
%LDP-5-PWDRO: Password rolled over for 10.12.12.12:0

```

## Changing MPLS LDP—Lossless MD5 Session Authentication: Common Misconfiguration Examples

The following sections describe common misconfiguration examples that can occur when the MPLS LDP—Lossless MD5 Session Authentication password is migrated in a lossless way. Misconfigurations can lead to undesired behavior in an LDP session.

- [Incorrect Keychain LDP Password Configuration: Example, page 24](#)
- [Avoiding Access List Configuration Problems, page 26](#)

### Incorrect Keychain LDP Password Configuration: Example

Possible misconfigurations can occur when keychain-based commands are used with the **mpls ldp password option for key-chain** command. If the **accept-lifetime** or **send-lifetime** command is not specified in this configuration, then a misconfiguration can occur when more than two keys are in a keychain.

The following example shows an incorrect keychain configuration with three passwords for LSR A and LSR B in the keychain:

**LSR A Incorrect Keychain LDP Password Configuration**

```

access-list 10 permit 10.11.11.11
!
key chain ldp-pwd
key 10
key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
key 11
key-string lab2
send-lifetime 10:30:00 Jan 1 2007 10:30:00 Feb 1 2007
key 12
key-string lab3
send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd

```

**LSR B Incorrect Keychain LDP Password Configuration**

```

access-list 10 permit 10.10.10.10
key chain ldp-pwd
key 10
key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
key 11
key-string lab2
send-lifetime 10:30:00 Jan 1 2007 10:30:00 Feb 1 2007
key 12
key-string lab3
send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd

```

In the example, for both LSR A and LSR B, during the period of the third **send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007** command, all three configured keys are valid as receive keys, and only the last configured key is valid as a transmit key. The keychain resolution rules dictate that keys 10 and 11 are used as receive keys, and only the last key 12 can be used as the transmit key. Because the transmit and receive keys are mismatched, the LDP session will not stay active.

**Note**

When more than two passwords are configured in a keychain, the configuration needs to have both **accept-lifetime** and **send-lifetime** commands configured correctly for effective rollovers.

The following example shows the correct keychain configuration with multiple passwords in the keychain:

**LSR A Correct Keychain LDP Password Configuration**

```

access-list 10 permit 10.11.11.11
!
key chain ldp-pwd
key 10
key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
accept-lifetime 10:00:00 Jan 1 2007 10:45:00 Jan 1 2007
key 11
key-string lab2
send-lifetime 10:30:00 Jan 1 2007 10:30:00 Feb 1 2007
accept-lifetime 10:15:00 Jan 1 2007 10:45:00 Feb 1 2007
key 12
key-string lab3
send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007
accept-lifetime 10:15:00 Feb 1 2007 10:45:00 Mar 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd

```

**LSR B Correct Keychain LDP Password Configuration**

```

access-list 10 permit 10.10.10.10
key chain ldp-pwd
key 10
key-string lab1
send-lifetime 10:00:00 Jan 1 2007 10:30:00 Jan 1 2007
accept-lifetime 10:00:00 Jan 1 2007 10:45:00 Jan 1 2007
key 11
key-string lab2
send-lifetime 10:30:00 Jan 1 2007 10:30:00 Feb 1 2007
accept-lifetime 10:15:00 Jan 1 2007 10:45:00 Feb 1 2007
key 12

```

```
key-string lab3
send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007
accept-lifetime 10:15:00 Feb 1 2007 10:45:00 Mar 1 2007
!
mpls ldp password option 5 for 10 key-chain ldp-pwd
```

In the example above, for both LSR A and LSR B, during the period of the third **send-lifetime 10:30:00 Feb 1 2007 10:30:00 Mar 1 2007** command, only the last key 12 is valid as transmit and receive keys. Therefore, the LDP session remains active.

## Avoiding Access List Configuration Problems

Use caution when modifying or deleting an access list. Any empty access list implies "permit any" by default. So when either the **mpls ldp password option for key-chain** command or the **mpls ldp password option for** command is used for MPLS LDP MD5 session authentication, if the access list specified in the command becomes empty as a result of a modification or deletion, then all LDP sessions on the router expect a password. This configuration may cause undesired behavior in LDP sessions. To avoid this scenario, ensure that the proper access list is specified for each LSR.

## Changing MPLS LDP—Lossless MD5 Session Authentication Using a Second Key to Avoid LDP Session Failure: Examples

The MPLS LDP—Lossless MD5 Session Authentication feature works when a specified rollover period is configured. Typically, one rollover period overlaps the two accept lifetime values that are configured for two consecutive receive keys. The LDP process requests an update from the keychain manager for the latest valid transmit and receive keys once every minute. LDP compares the latest key set with the keys from the previous update in its database to determine if a key was removed, changed, or rolled over. When the rollover occurs, the LDP process detects the rollover and programs TCP with the next receive key.

The LDP session can fail if LDP is configured to use two keys for the MPLS LDP—Lossless MD5 Session Authentication feature where the first key uses a send and accept lifetime value and the second key is not configured. The configuration creates a special case where there are two rollovers but there is only one rollover period.

The following sections provide an example of this problem and a solution:

- [TCP Authentication and LDP Sessions Can Fail When a Second Rollover Period Is Missing: Example, page 27](#)
- [Reconfigure a Keychain to Prevent TCP Authentication and LDP Session Failures: Example, page 27](#)

## TCP Authentication and LDP Sessions Can Fail When a Second Rollover Period Is Missing: Example

In the following configuration, the first rollover is from “secondpass” to “firstpass.” The second rollover is from “firstpass” back to “secondpass.” The only rollover period in this configuration is the overlapping between the “firstpass” and “secondpass.” Because one rollover period is missing, LDP performs only the first rollover and not the second rollover, causing TCP authentication to fail and the LDP session to fail.

```
key chain ldp-pwd
key 1
  key-string firstpass
  accept-lifetime 01:03:00 Sep 10 2007 01:10:00 Sep 10 2007
  send-lifetime 01:05:00 Sep 10 2007 01:08:00 Sep 10 2007
key 2
  key-string secondpass
```

TCP authentication and LDP sessions can also fail if the second key has send and accept lifetime configured. In this case the accept lifetime of the first key is a subset of the accept lifetime of the second key. For example:

```
key chain ldp-pwd
key 1
  key-string firstpass
  accept-lifetime 01:03:00 Sep 10 2007 01:10:00 Sep 10 2007
  send-lifetime 01:05:00 Sep 10 2007 01:08:00 Sep 10 2007
key 2
  key-string secondpass
  accept-lifetime 01:03:00 Sep 9 2007 01:10:00 Sep 11 2007
  send-lifetime 01:05:00 Sep 9 2007 01:08:00 Sep 11 2007
```

## Reconfigure a Keychain to Prevent TCP Authentication and LDP Session Failures: Example

If the configuration needs to specify the last key in the keychain to always be valid, then configure the keychain to have at least two keys. Each key must be configured with both the send and accept lifetime period. For example:

```
key chain ldp-pwd
key 1
  key-string firstpass
  accept-lifetime 01:03:00 Sep 10 2007 01:10:00 Sep 10 2007
  send-lifetime 01:05:00 Sep 10 2007 01:08:00 Sep 10 2007
key 2
  key-string secondpass
  accept-lifetime 01:06:00 Sep 10 2007 01:17:00 Sep 10 2007
  send-lifetime 01:08:00 Sep 10 2007 01:15:00 Sep 10 2007
key 3
  key-string thirdpass
```

If the configuration needs to specify the first keychain for the time interval, then switch to use the second key forever after that interval. This is done by configuring the start time for the second key to begin shortly before the end time of the first key, and by configuring the second key to be valid forever after that interval. For example:

```
key chain ldp-pwd
key 1
  key-string firstpass
  accept-lifetime 00:03:00 Sep 10 2007 01:10:00 Sep 10 2007
  send-lifetime 00:05:00 Sep 10 2007 01:08:00 Sep 10 2007
key 2
  key-string secondpass
  accept-lifetime 01:06:00 Sep 10 2007 infinite
  send-lifetime 01:08:00 Sep 10 2007 infinite
```

If the configuration needs to specify the two keys in the order of the second key, first key, and second key again, then specify three keys in that order with the proper rollover period. For example:

```
key chain ldp-pwd
key 1
  key-string firstpass
  accept-lifetime 00:03:00 Sep 10 2007 01:10:00 Sep 10 2007
  send-lifetime 00:05:00 Sep 10 2007 01:08:00 Sep 10 2007
key 2
  key-string secondpass
  accept-lifetime 01:06:00 Sep 10 2007 01:17:00 Sep 10 2007
  send-lifetime 01:08:00 Sep 10 2007 01:15:00 Sep 10 2007
key 3
  key-string firstpass
  accept-lifetime 01:13:00 Sep 10 2007 infinite
  send-lifetime 01:15:00 Sep 10 2007 infinite
```

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup>.

- **mpls ldp logging password configuration**
- **mpls ldp logging password rollover**
- **mpls ldp neighbor password**
- **mpls ldp password fallback**
- **mpls ldp password option**
- **mpls ldp password required**
- **mpls ldp password rollover duration**
- **show mpls ldp discovery**
- **show mpls ldp neighbor**
- **show mpls ldp neighbor password**

# Feature Information for MPLS LDP—Lossless MD5 Session Authentication

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS LDP—Lossless MD5 Session Authentication

| Feature Name                                 | Releases                                            | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

# MPLS LDP Inbound Label Binding Filtering

Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) supports inbound label binding filtering. You can use the MPLS LDP feature to configure access control lists (ACLs) for controlling the label bindings a label switch router (LSR) accepts from its peer LSRs.

## History for the MPLS LDP Inbound Label Binding Filtering Feature

| Release     | Modification                                                                                     |
|-------------|--------------------------------------------------------------------------------------------------|
| 12.0(26)S   | This feature was introduced.                                                                     |
| 12.2(25)S   | This feature was integrated into Cisco IOS Release 12.2(25)S for the Cisco 7500 series router.   |
| 12.3(14)T   | This feature was integrated into Cisco IOS Release 12.3(14)T.                                    |

# Information about MPLS LDP Inbound Label Binding Filtering

The MPLS LDP Inbound Label Binding Filtering feature may be used to control the amount of memory used to store LDP label bindings advertised by other routers. For example, in a simple MPLS Virtual Private Network (VPN) environment, the VPN provider edge (PE) routers may require LSPs only to their peer PE routers (that is, they do not need LSPs to core routers). Inbound label binding filtering enables a PE router to accept labels only from other PE routers.

## How to Configure MPLS LDP Inbound Label Binding Filtering

This section includes the following tasks:

- [Configuring MPLS LDP Inbound Label Binding Filtering, page 2](#) (Required)
- [Verifying that MPLS LDP Inbound Label Bindings are Filtered, page 4](#) (Optional)

## Configuring MPLS LDP Inbound Label Binding Filtering

Perform this task to configure a router for inbound label filtering. The following configuration allows the router to accept only the label for prefix 25.0.0.2 from LDP neighbor router 10.12.12.12.

### Restrictions

Inbound label binding filtering does not support extended ACLs; it only supports standard ACLs.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list standard** *access-list-number*
4. **permit** {*source* [*source-wildcard*] | **any**} [**log**]
5. **exit**
6. **mpls ldp neighbor** [*vrf vpn-name*] *nbr-address* **labels accept** *acl*
7. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                             | Purpose                                                                                                          |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                | Enters global configuration mode.                                                                                |
| Step 3 | <b>ip access-list standard access-list-number</b><br><br><b>Example:</b><br>Router(config)# ip access-list standard 1                                         | Defines a standard IP access list with a number.                                                                 |
| Step 4 | <b>permit {source [source-wildcard]   any} [log]</b><br><br><b>Example:</b><br>Router(config-std-nacl)# permit 10.0.0.0                                       | Specifies one or more prefixes permitted by the access list.                                                     |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-std-nacl)# exit                                                                                           | Exits the current mode and goes to the next higher level.                                                        |
| Step 6 | <b>mpls ldp neighbor [vrf vpn-name] nbr-address labels accept acl</b><br><br><b>Example:</b><br>Router(config)# mpls ldp neighbor 10.12.12.12 labels accept 1 | Specifies the ACL to be used to filter label bindings for the specified LDP neighbor.                            |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                      | Exits the current mode and enters privileged Exec mode.                                                          |

## Verifying that MPLS LDP Inbound Label Bindings are Filtered

If inbound filtering is enabled, perform the following steps to verify that inbound label bindings are filtered:

- Step 1** Enter the **show mpls ldp neighbor** command to show the status of the LDP session, including the name or number of the ACL configured for inbound filtering.

```
show mpls ldp neighbor [vrf vpn-name][address | interface] [detail]
```

**Note** To display information about inbound label binding filtering, you must enter the **detail** keyword.

Following is sample output from the **show mpls ldp neighbor** command.

```
Router# show mpls ldp neighbor 10.12.12.12 detail

Peer LDP Ident: 10.12.12.12:0; Local LDP Ident 10.13.13.13:0
TCP connection: 10.12.12.12.646 - 10.13.13.13.12592
State: Oper; Msgs sent/rcvd: 49/45; Downstream; Last TIB rev sent 1257
Up time: 00:32:41; UID: 1015; Peer Id 0;
LDP discovery sources:
  Serial1/0; Src IP addr: 25.0.0.2
    holdtime: 15000 ms, hello interval: 5000 ms
Addresses bound to peer LDP Ident:
  10.0.0.129      10.12.12.12      10.0.0.2
Peer holdtime: 180000 ms; KA interval: 60000 ms; Peer state: estab
LDP inbound filtering accept acl: 1
```

- Step 2** Enter the **show ip access-list** command to display the contents of all current IP access lists or of a specified access list.

```
show ip access-list [access-list-number | access-list-name]
```

**Note** It is important that you enter this command to see how the access list is defined; otherwise, you cannot verify inbound label binding filtering.

*The following command output shows the contents of IP access list 1:*

```
Router# show ip access 1

Standard IP access list 1
  permit 10.0.0.0, wildcard bits 0.0.0.255 (1 match)
```

- Step 3** Enter the **show mpls ldp bindings** command to verify that the LSR has remote bindings only from a specified peer for prefixes permitted by the access list.

```
Router# show mpls ldp bindings

---

## Configuration Examples for MPLS LDP Inbound Label Binding Filtering

In the following example, the **mpls ldp neighbor labels accept** command is configured with an access control list to filter label bindings received on sessions with the neighbor 10.110.0.10.

Label bindings for prefixes that match 10.b.c.d are accepted, where b is less than or equal to 63, and c and d can be any integer between 0 and 128. Other label bindings received from 10.110.0.10 are rejected.

```
Router# configure terminal
Router(config)# access-list 1 permit 10.63.0.0 0.63.255.255
Router(config)# mpls ldp neighbor 10.110.0.10 labels accept 1
Router(config)# end
```

In the following example, the **show mpls ldp bindings neighbor** command displays label bindings that were learned from 10.110.0.10. This example verifies that the LIB does not contain label bindings for prefixes that have been excluded.

```
Router# show mpls ldp bindings neighbor 10.110.0.10

tib entry: 10.2.0.0/16, rev 4
    remote binding: tsr: 10.110.0.10:0, tag: imp-null
tib entry: 10.43.0.0/16, rev 6
    remote binding: tsr: 10.110.0.10:0, tag: 16
tib entry: 10.52.0.0/16, rev 8
    remote binding: tsr: 10.110.0.10:0, tag: imp-null
```

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*.

- `clear mpls ldp neighbor`

- **mpls ldp neighbor labels accept**
- **show mpls ldp neighbor**

# Glossary

**carrier supporting carrier**—A situation where one service provider allows another service provider to use a segment of its backbone network. The service provider that provides the segment of the backbone network to the other provider is called the backbone carrier. The service provider that uses the segment of the backbone network is called the customer carrier.

**CE router**—customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router.

**inbound label binding filtering**—Allows LSRs to control which label bindings it will accept from its neighboring LSRs. Consequently, an LSR does not accept or store some label bindings that its neighbors advertise.

**label**—A short fixed-length identifier that tells switching nodes how to forward data (packets or cells).

**label binding**—An association between a destination prefix and a label.

# MPLS LDP—Local Label Allocation Filtering

---

**First Published: January 7, 2008**

**Last Updated: April 11, 2008**

This feature introduces command-line interface (CLI) commands to modify the way in which Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) handles local label allocation. This MPLS LDP feature enhancement enables the configuration of filtering policies for selective local label binding assignments by LDP to improve LDP scalability and convergence.

This document contains information about and instructions on how to configure the MPLS LDP—Local Label Allocation Filtering feature.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for MPLS LDP—Local Label Allocation Filtering](#)” section on page 19.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Glossary, page 21](#)

## Prerequisites for MPLS LDP—Local Label Allocation Filtering

The MPLS LDP—Local Label Allocation Filtering feature requires the MPLS Forwarding Infrastructure (MFI).

## Restrictions for MPLS LDP—Local Label Allocation Filtering

The MPLS LDP—Local Label Allocation Filtering feature does not support access lists. This feature supports prefix lists.

Restrictions for the MPLS LDP—Local Label Allocation Filtering feature in Cisco IOS Releases 12.2(33)SRC and 12.2(33)SB:

- LDP local label allocation configuration for prefix list or host routes is supported only in the global routing table.
- LDP and RIB restart handling supported in Cisco IOX software does not apply.
- Wildcard Forwarding Equivalence Class (FEC) requests are not supported.
- Remote bindings are retained for LDP table entries that are filtered.

## Information About MPLS LDP—Local Label Allocation Filtering

Before you configure the MPLS LDP—Local Label Allocation Filtering feature, you should understand the following concepts:

- [MPLS LDP Local Label Allocation Filtering Overview, page 2](#)
- [Prefix Lists for MPLS LDP Local Label Allocation Filtering: Benefits and Description, page 4](#)
- [Local Label Allocation Changes Introduced in Cisco IOS Release 12.2\(33\)SRC and LDP Actions, page 4](#)
- [LDP Local Label Filtering and BGP Routes, page 5](#)

## MPLS LDP Local Label Allocation Filtering Overview

LDP allocates a local label for every route learned from the Interior Gateway Protocol (IGP). In the absence of inbound and outbound label filtering, these local labels are advertised to and learned by all peers.

In most Layer 3 Virtual Private Network (VPN) configurations only the label switched paths (LSPs) created to reach the /32 host routes or Border Gateway Protocol (BGP) next hops between the provider edge (PE) routers carry traffic and are relevant to the Layer 3 VPNs. LSPs between the PE routers that are not members of a VPN use more memory and create additional processing in LDP across the core.

With the load increases in the service provider domain in the last decade (1997–2007), scalability has become more important in the service provider networks. Controlling the local label allocation could off-load LDP processing of non-VPN LSPs in the service provider network core devices.

The MPLS LDP—Local Label Allocation Filtering feature introduces the **mpls ldp label** and **allocate** commands that allow you to configure LDP to selectively allocate local labels for a subset of the prefixes learned from the IGP. You can select that LDP allocate local labels for prefixes configured in a prefix list in the global table or for host routes in the global table.

Local label allocation filtering reduces the number of local labels allocated and therefore the number of messages exchanged with peers. This improves LDP scalability and convergence. [Figure 1](#) and [Figure 2](#) show how controlling local label allocation can reduce local label space size and greatly reduce the number of advertisements to peers. [Figure 1](#) shows default LDP label allocation behavior. LDP allocates a local label for every route and advertises a label binding for every route learned from the IGP.

**Figure 1** Default LDP Local Label Allocation Behavior

[Figure 2](#) shows LDP behavior with local label allocation control configured. The size of the local label space and the number of label binding advertisements are reduced with local label allocation filtering through the use of a prefix list. The decrease in the number of local labels and label binding advertisement messages reduces the amount of memory use and improves convergence time for LDP. The MPLS LDP—Local Label Allocation Filtering feature also allows for more efficient use of the label space.

**Figure 2** LDP Behavior with Local Label Allocation Controls

[Figure 2](#) shows that router R1 learns a number of routes from its IGP neighbors on routers R2, R3, and R4. A prefix list defined on router R1 specifies the prefixes for which LDP allocates a local label.

**Note**

In general, the number of Label Information Base (LIB) entries remains the same regardless of the kind of label filtering. This is because the remote label bindings for the prefixes that are filtered are kept in the LIB. Memory use is reduced because local label filtering decreases the number of local labels allocated and the number of label bindings advertised to and stored by the peers of an LSR.

## Prefix Lists for MPLS LDP Local Label Allocation Filtering: Benefits and Description

The MPLS LDP—Local Label Allocation Filtering feature allows you to configure LDP to allocate local labels for a subset of the learned prefixes. LDP accepts the prefix and allocates a local label if the prefix is permitted by a prefix list. If the prefix list is not defined, LDP accepts all prefixes and allocates local labels based on its default mode of operation.

The benefits of using prefix lists for LDP local label allocation filtering are as follows:

- Prefix lists provide more flexibility for specifying a subset of prefixes and masks.
- Prefix lists use a tree-based matching technique. This technique is more efficient than evaluating prefixes or host routes sequentially.
- Prefix lists are easy to modify.

You configure a prefix list for the MPLS LDP—Local Label Allocation Filtering feature with the **ip prefix-list** command. The format of the command is as follows: **ip prefix-list** {*list-name* / *list-number*} [**seq** *number*] {**deny** *network/length* | **permit** *network/length*} [**ge** *ge-length*] [**le** *le-length*]

## Local Label Allocation Changes Introduced in Cisco IOS Release 12.2(33)SRC and LDP Actions

The MPLS LDP—Local Label Allocation Filtering enhancement modifies the LDP's local label allocation handling. The feature supports local label allocation filtering through the specification of a prefix list or host routes.

With the introduction of this feature, LDP needs to determine whether a prefix filter is already configured to control the local label allocation on the local node. If a prefix list exists, the local label allocation is confined to the list of prefixes permitted by the configured prefix list.

LDP also needs to respond to local label allocation configuration changes and to configuration changes that affect the prefix list that LDP is using. Any of the following configuration changes can trigger LDP actions:

- Creating a local label allocation configuration
- Deleting or changing a local label allocation configuration
- Creating a new prefix list for a local label allocation configuration
- Deleting or changing a prefix list for a local label allocation configuration

LDP responds to local label allocation configuration changes by updating the LIB and the forwarding table in the global routing table. To update the LIB after a local label filter configuration change without a session reset, LDP keeps all remote bindings.

If you create a local label allocation configuration without defining a prefix list, no LDP action is required. The local label allocation configuration has no effect because the prefix list is created and permits all prefixes.

If you create or change a prefix list and prefixes that were previously allowed are rejected, LDP goes through a label withdraw and release procedure before the local labels for these prefixes are deallocated.

If you delete a prefix, LDP goes through the label withdraw and release procedure for the LIB local label. If the associated prefix is one for which no LIB entry should be allocated, LDP bypasses this procedure.

The LDP default behavior is to allocate local labels for all non-BGP prefixes. This default behavior does not change with the introduction of this feature and the **mpls ldp label** and **allocate** commands.

**Note**

The local label allocation filtering has no impact on inbound label filtering because both provide LDP filtering independently. The LDP Inbound Label Binding Filtering feature controls label bindings that a label switch router (LSR) accepts from its peer LSRs through the use of access control lists (ACLs). The MPLS LDP—Local Label Allocation Filtering feature controls the allocation of local labels through the use of prefix lists or host routes.

## LDP Local Label Filtering and BGP Routes

The LDP default behavior is to allocate local labels for all non-BGP prefixes.

LDP does not apply the configured local label filter to redistributed BGP routes in the global table for which BGP allocates local label, but LDP does the advertisements (Inter-AS Option C). LDP neither forwards these entries nor releases the local labels allocated by BGP.

## How to Configure MPLS LDP—Local Label Allocation Filtering

Perform the following tasks to configure the MPLS LDP—Local Label Allocation Filtering feature:

- [Creating a Prefix List for MPLS LDP Local Label Allocation Filtering, page 5](#) (optional)
- [Configuring MPLS LDP Local Label Allocation Filtering, page 7](#) (required)
- [Verifying MPLS LDP—Local Label Allocation Filtering Configuration, page 9](#) (optional)

## Creating a Prefix List for MPLS LDP Local Label Allocation Filtering

Perform the following task to create a prefix list for LDP local label allocation filtering. A prefix list allows LDP to selectively allocate local labels for a subset of the routes learned from the IGP. The decrease in the number of local labels in the LDP LIB and the number of label mapping advertisements reduces the amount of memory use and improves convergence time for LDP.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip prefix-list** {list-name | list-number} [seq number] {deny network/length | permit network/length} [ge ge-length] [le le-length]

## 4. end

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>ip prefix-list</b> { <i>list-name</i>   <i>list-number</i> } [ <i>seq number</i> ] { <b>deny</b> <i>network/length</i>   <b>permit</b> <i>network/length</i> } [ <b>ge</b> <i>ge-length</i> ] [ <b>le</b> <i>le-length</i> ]<br><br><b>Example:</b><br>Router(config)# ip prefix-list list1 permit 192.168.0.0/16 le 20 | Creates a prefix list or adds a prefix-list entry. <ul style="list-style-type: none"> <li>The <i>list-name</i> argument configures a name to identify the prefix list.</li> <li>The <i>list-number</i> argument configures a number to identify the prefix list.</li> <li>The <b>seq number</b> keyword and argument apply a sequence number to a prefix-list entry. The range of sequence numbers that can be entered is from 1 to 4294967294. If a sequence number is not entered when this command is configured, a default sequence numbering is applied to the prefix list. The number 5 is applied to the first prefix entry, and subsequent unnumbered entries are incremented by 5.</li> <li>The <b>deny</b> keyword denies access for a matching condition.</li> <li>The <b>permit</b> keyword permits access for a matching condition.</li> <li>The <i>network/length</i> arguments and keyword configure the network address, and the length of the network mask in bits. The network number can be any valid IP address or prefix. The bit mask can be a number from 0 to 32.</li> <li>The <b>ge ge-length</b> keyword and argument specify the lesser value of a range (the “from” portion of the range description) by applying the <i>ge-length</i> argument to the range specified. The <i>ge-length</i> argument represents the minimum prefix length to be matched. The <b>ge</b> keyword represents the greater than or equal to operator.</li> <li>The <b>le le-length</b> keyword and argument specify the greater value of a range (the “to” portion of the range description) by applying the <i>le-length</i> argument to the range specified. The <i>le-length</i> argument represents the maximum prefix length to be matched. The <b>le</b> keyword represents the less than or equal to operator.</li> </ul> |

|        | Command or Action                                   | Purpose                        |
|--------|-----------------------------------------------------|--------------------------------|
| Step 4 | <code>end</code>                                    | Exits to privileged EXEC mode. |
|        | <b>Example:</b><br><code>Router(config)# end</code> |                                |

## Configuring MPLS LDP Local Label Allocation Filtering

Perform the following task to configure LDP local allocation filtering. Configuring filtering policies for selective local label binding assignments by LDP improves LDP scalability and convergence. You can configure either a prefix list or host routes as a filter for local label allocation.

### Note

The **host-routes** keyword for the **allocate** command makes it convenient for you to specify a commonly used set of prefixes.

## Restrictions

A maximum of one local label allocation filter is supported for the global table.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ldp label**
4. **allocate global prefix-list** {*list-name* | *list-number*}
5. **allocate global host-routes**
6. **no allocate global** {**prefix-list** {*list-name* | *list-number*} | **host -routes**}
7. **no mpls ldp label**
8. **exit**
9. **exit**

## DETAILED STEPS

|        | Command or Action                                          | Purpose                                                                              |
|--------|------------------------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code>                                        | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br><code>Router&gt; enable</code>          | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <code>configure terminal</code>                            | Enters global configuration mode.                                                    |
|        | <b>Example:</b><br><code>Router# configure terminal</code> |                                                                                      |

|               | Command or Action                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <pre>mpls ldp label</pre> <p><b>Example:</b><br/>Router(config)# mpls ldp label</p>                                                                                   | Enters MPLS LDP label configuration mode to specify how MPLS LDP handles local label allocation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <pre>allocate global prefix-list {list-name   list-number}</pre> <p><b>Example:</b><br/>Router(config-ldp-lbl)# allocate global prefix-list list1</p>                 | <p>Configures local label allocation filters for learned routes for MPLS LDP.</p> <ul style="list-style-type: none"> <li>The <b>global</b> keyword specifies the global routing.</li> <li>The <b>prefix-list</b> keyword specifies a prefix list to be used as a filter for MPLS LDP local label allocation.</li> <li>The <i>list-name</i> argument indicates a name that identifies the prefix list.</li> <li>The <i>list-number</i> argument indicates a number that identifies the prefix list.</li> </ul>                                                                                                                                                 |
| <b>Step 5</b> | <pre>allocate global host-routes</pre> <p><b>Example:</b><br/>Router(config-ldp-lbl)# allocate global host-routes</p>                                                 | <p>Configures local label allocation filters for learned routes for MPLS LDP.</p> <ul style="list-style-type: none"> <li>The <b>global</b> keyword specifies the global routing.</li> <li>The <b>host-routes</b> keyword specifies that local label allocation be done for host routes only.</li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 6</b> | <pre>no allocate global {prefix-list {list-name   list-number}   host-routes}</pre> <p><b>Example:</b><br/>Router(config-ldp-lbl)# no allocate global host-routes</p> | <p>Removes the specific MPLS LDP local label allocation filter without resetting the LDP session.</p> <ul style="list-style-type: none"> <li>The <b>global</b> keyword specifies the global routing.</li> <li>The <b>prefix-list</b> keyword specifies a prefix list to be used as a filter for MPLS LDP local label allocation.</li> <li>The <i>list-name</i> argument indicates a name that identifies the prefix list.</li> <li>The <i>list-number</i> argument indicates a number that identifies the prefix list.</li> <li>The <b>host-routes</b> keyword specifies that host routes be used as a filter for MPLS LDP local label allocation.</li> </ul> |
| <b>Step 7</b> | <pre>no mpls ldp label</pre> <p><b>Example:</b><br/>Router(config-ldp-lbl)# no mpls ldp label</p>                                                                     | Removes all local label allocation filters configured under the MPLS LDP label configuration mode and restores LDP default behavior for local label allocation without a session reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 8</b> | <pre>exit</pre> <p><b>Example:</b><br/>Router(config-ldp-lbl)# exit</p>                                                                                               | Exits from MPLS LDP label configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 9</b> | <pre>exit</pre> <p><b>Example:</b><br/>Router(config)# exit</p>                                                                                                       | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Verifying MPLS LDP—Local Label Allocation Filtering Configuration

Perform the following task to verify the MPLS LDP—Local Label Allocation Filtering configuration.

### SUMMARY STEPS

1. **enable**
2. **show mpls ldp bindings detail**
3. **debug mpls ldp bindings filter**
4. **exit**

### DETAILED STEPS

---

**Step 1 enable**

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```
Router> enable
Router#
```

**Step 2 show mpls ldp bindings detail**

Use this command to verify that local label allocation filtering is configured as you expect. For example:

```
Router# show mpls ldp bindings detail

Advertisement spec:
  Prefix acl = bar
Local label filtering spec: host routes.

lib entry: 10.1.1.1/32, rev 9
lib entry: 10.10.7.0/24, rev 10
lib entry: 10.10.8.0/24, rev 11
lib entry: 10.10.9.0/24, rev 12
lib entry: 10.41.41.41/32, rev 17
lib entry: 10.50.50.50/32, rev 15
lib entry: 10.60.60.60/32, rev 18
lib entry: 10.70.70.70/32, rev 16
lib entry: 10.80.80.80/32, rev 14
```

The output of this command verifies that host routes are configured as the local label allocation filter for the router.

**Step 3 debug mpls ldp binding filter**

Use this command to verify that local label allocation filtering was configured properly and to display how LDP accepts or withdraw labels. For example:

```
Router# debug mpls ldp binding filter

LDP Local Label Allocation Filtering changes debugging is on
.
.
.
```

**Step 4    exit**

Use this command to exit to user EXEC mode. For example:

```
Router# exit
Router>
```

---

## Configuration Examples for MPLS LDP—Local Label Allocation Filtering

This section contains the following configuration examples for the MPLS LDP—Local Label Allocation Filtering feature:

- [Creating a Prefix List for MPLS LDP Local Label Allocation Filtering: Examples, page 10](#)
- [Configuring MPLS LDP Local Label Allocation Filtering: Examples, page 11](#)
- [Sample MPLS LDP Local Label Allocation Filtering Configuration: Example, page 11](#)

### Creating a Prefix List for MPLS LDP Local Label Allocation Filtering: Examples

The following examples show how to configure a prefix list for MPLS LDP local label allocation filtering.

In this example, prefix list List1 permits only 192.168.0.0/16 prefixes. LDP accepts 192.168.0.0/16 prefixes, but would not assign a local label for the following prefixes: 192.168.0.0/24 and 192.168.2.0/24. For example:

```
configure terminal
!
ip prefix-list List1 permit 192.168.0.0/16
end
```

In the following example, prefix list List2 permits a range of prefixes from 192.168.0.0/16 to /20 prefixes. LDP would accept 192.168.0.0/16 prefixes, but would not assign local labels for the following prefixes: 192.168.0.0/24 and 192.168.2.0/24.

```
configure terminal
!
ip prefix-list List2 permit 192.168.0.0/16 le 20
end
```

In the following example, prefix list List3 permits a range of prefixes greater than /18. LDP would accept 192.168.17.0/20 and 192.168.2.0/24 prefixes, but would not assign a local label for 192.168.0.0/16.

```
configure terminal
!
ip prefix-list List3 permit 192.168.0.0/16 ge 18
end
```

## Configuring MPLS LDP Local Label Allocation Filtering: Examples

The following examples show how to configure MPLS LDP local label allocation filtering.

This examples shows how to allocate a prefix list to be used as a local label allocation filter:

```
configure terminal
!
ip prefix-list List3 permit 192.168.0.0/16 ge 18
!
mpls ldp label
  allocate global prefix-list List3
  exit
exit
```

Prefix list List3, which permits a range of prefixes greater than /18, is configured as the local label allocation filter for the router. LDP would allow 192.168.17.0/20 and 192.168.2.0/24 prefixes, but would withdraw labels for prefixes not in the allowed range.

In the following example, host routes are configured as the local label allocation filter:

```
configure terminal
!
mpls ldp label
  allocate global host-routes
  exit
exit
```

LDP allocates local labels for host routes that are in the global routing table.

In the following example, a specific local label allocation filter is removed:

```
configure terminal
!
mpls ldp label
  no allocate global host-routes
  exit
exit
```

In the following example, all local label allocation filters configured in MPLS LDP label configuration mode are removed and the default LDP local label allocation is restored without a session reset:

```
configure terminal
!
no mpls ldp label
  exit
exit
```

## Sample MPLS LDP Local Label Allocation Filtering Configuration: Example

Figure 3 is a sample configuration that is used in this section to show how MPLS LDP local label allocation filtering works:

- Routers R1, R2, and R3 have loopback addresses 10.1.1.1, 10.2.2.2, and 10.3.3.3 defined and advertised by the IGP, respectively.
- 10.1.1.1 is the router ID of Router R1, 10.2.2.2 is the router ID of Router R2, and 10.3.3.3 is the router ID of Router R3.
- A prefix list is defined on Router R1 to specify the local labels for which LDP allocates a local label.

Router R1 learns a number of routes from its IGP neighbors on Routers R2 and R3.

**Figure 3 LDP Local Label Allocation Filtering Example**

You can use LDP CLI commands to verify the following:

- Router R1 has allocated a local label for the correct subset of the prefixes.
- Routers R2 and R3 did not receive any remote bindings for the prefixes for which Router R1 did not assign a local label.

## Routing Table on Router R1

You can enter the **show ip route** command to display the current state of the routing table. The following example shows the routing table on Router R1 based on Figure 3:

```
R1# show ip route
```

```
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route
```

```
Gateway of last resort is not set
```

```
10.0.0.0/32 is subnetted, 1 subnets
C    10.1.1.1 is directly connected, Loopback0
10.2.0.0/32 is subnetted, 1 subnets
O    10.2.2.2 [110/11] via 10.10.7.1, 00:00:36, Ethernet1/0
10.3.0.0/32 is subnetted, 1 subnets
O    10.3.3.3 [110/11] via 10.10.9.1, 00:00:36, Ethernet3/0
10.0.0.0/24 is subnetted, 3 subnets
C    10.10.7.0 is directly connected, Ethernet1/0
O    10.10.8.0 [110/20] via 10.10.9.1, 00:00:36, Ethernet3/0
     [110/20] via 10.10.7.1, 00:00:36, Ethernet1/0
C    10.10.9.0 is directly connected, Ethernet3/0
```

## Local Label Bindings on Router R1, Router R2, and Router R3

You can enter the **show mpls ldp bindings** command on Routers R1, R2, and R3 to display the contents of the LIB on each router. In the following examples, the default LDP allocation behavior is in operation; that is, LDP allocates a local label for every route and advertises a label binding for every route learned from the IGP.

### LIB on Router R

This example shows the contents of the LIB on Router R1 based on the configuration in [Figure 3](#):

```
R1# show mpls ldp bindings

lib entry: 10.1.1.1/32, rev 7
    local binding:  label: imp-null
    remote binding: lsr: 10.3.3.3:0, label: 16
    remote binding: lsr: 10.2.2.2:0, label: 17
lib entry: 10.2.2.2/32, rev 13
    local binding:  label: 1000
    remote binding: lsr: 10.3.3.3:0, label: 18
    remote binding: lsr: 10.2.2.2:0, label: imp-null
lib entry: 10.3.3.3/32, rev 15
    local binding:  label: 1002
    remote binding: lsr: 10.3.3.3:0, label: imp-null
    remote binding: lsr: 10.2.2.2:0, label: 18
lib entry: 10.10.7.0/24, rev 8
    local binding:  label: imp-null
    remote binding: lsr: 10.3.3.3:0, label: 17
    remote binding: lsr: 10.2.2.2:0, label: imp-null
lib entry: 10.10.8.0/24, rev 11
    local binding:  label: 1001
    remote binding: lsr: 10.3.3.3:0, label: imp-null
    remote binding: lsr: 10.2.2.2:0, label: imp-null
lib entry: 10.10.9.0/24, rev 9
    local binding:  label: imp-null
    remote binding: lsr: 10.3.3.3:0, label: imp-null
    remote binding: lsr: 10.2.2.2:0, label: 16
```

The local labels assigned to 10.2.2.2 and 10.3.3.3 on Router R1 are advertised to Routers R2 and R3.

### LIB on Router R2

This example shows the contents of the LIB on Router R2 based on the configuration in [Figure 3](#):

```
R2# show mpls ldp bindings

lib entry: 10.1.1.1/32, rev 11
    local binding:  label: 17
    remote binding: lsr: 10.3.3.3:0, label: 16
    remote binding: lsr: 10.1.1.1:0, label: imp-null
lib entry: 10.2.2.2/32, rev 7
    local binding:  label: imp-null
    remote binding: lsr: 10.3.3.3:0, label: 18
    remote binding: lsr: 10.1.1.1:0, label: 1000
lib entry: 10.3.3.3/32, rev 15
    local binding:  label: 18
    remote binding: lsr: 10.3.3.3:0, label: imp-null
    remote binding: lsr: 10.1.1.1:0, label: 1002
lib entry: 10.10.7.0/24, rev 8
    local binding:  label: imp-null
    remote binding: lsr: 10.3.3.3:0, label: 17
    remote binding: lsr: 10.1.1.1:0, label: imp-null
lib entry: 10.10.8.0/24, rev 9
    local binding:  label: imp-null
    remote binding: lsr: 10.3.3.3:0, label: imp-null
    remote binding: lsr: 10.1.1.1:0, label: 1001
lib entry: 10.10.9.0/24, rev 13
    local binding:  label: 16
    remote binding: lsr: 10.3.3.3:0, label: imp-null
    remote binding: lsr: 10.1.1.1:0, label: imp-null
```

**LIB on Router R3**

This example shows the contents of the LIB on Router R3 based on the configuration in [Figure 3](#):

R3# **show mpls ldp bindings**

```
lib entry: 10.1.1.1/32, rev 13
  local binding: label: 16
  remote binding: lsr: 10.2.2.2:0, label: 17
  remote binding: lsr: 10.1.1.1:0, label: imp-null
lib entry: 10.2.2.2/32, rev 15
  local binding: label: 18
  remote binding: lsr: 10.2.2.2:0, label: imp-null
  remote binding: lsr: 10.1.1.1:0, label: 1000
lib entry: 10.3.3.3/32, rev 7
  local binding: label: imp-null
  remote binding: lsr: 10.2.2.2:0, label: 18
  remote binding: lsr: 10.1.1.1:0, label: 1002
lib entry: 10.10.7.0/24, rev 11
  local binding: label: 17
  remote binding: lsr: 10.2.2.2:0, label: imp-null
  remote binding: lsr: 10.1.1.1:0, label: imp-null
lib entry: 10.10.8.0/24, rev 8
  local binding: label: imp-null
  remote binding: lsr: 10.2.2.2:0, label: imp-null
  remote binding: lsr: 10.1.1.1:0, label: 1001
lib entry: 10.10.9.0/24, rev 9
  local binding: label: imp-null
  remote binding: lsr: 10.2.2.2:0, label: 16
  remote binding: lsr: 10.1.1.1:0, label: imp-null
```

**Local Label Allocation Filtering Configuration on Router R1**

You enter the **mpls ldp label** command to configure a local label allocation filter. The following examples show how to configure a local label allocation filter by host routes only and by a prefix list.

**Local Label Allocation Filter—Host Routes Only Configuration**

This example shows the selection of host routes as the only filter.

The following local label allocation filtering is defined on Router R1 under MPLS LDP label configuration mode:

```
configure terminal
!
mpls ldp label
  allocate global host-routes
exit
exit
```

**Local Label Allocation Filter—Prefix List Configuration**

The following example shows how to configure a local label allocation filter that allows or denies prefixes based on a prefix list:

```
configure terminal
!
mpls ldp label
  allocate global prefix-list ListA
exit
end
```

ListA is a prefix list defined as:

```
configure terminal
!
ip prefix-list ListA permit 0.0.0.0/32 ge 32
```

## Local Label Allocation Filtering Changes Label Bindings on Router R1, Router R2, and Router R3

After configuring a local label allocation filter on Router R1, you can enter the **show mpls ldp bindings** command again to see the changes in the local label bindings in the LIB on each router. Changes to the output in the LIB entries are highlighted in bold text.

This sample prefix list is used for the examples in this section:

```
ip prefix-list ListA permit 0.0.0.0/32 ge 32
```

### LIB on Router R1 After Local Label Allocation Filtering

This example shows how the configuration of a local label allocation prefix-list filter changes the contents of the LIB on Router R1:

R1# **show mpls ldp bindings**

```
lib entry: 10.1.1.1/32, rev 7
  local binding: label: imp-null
  remote binding: lsr: 10.3.3.3:0, label: 16
  remote binding: lsr: 10.2.2.2:0, label: 17
lib entry: 10.2.2.2/32, rev 13
  local binding: label: 1000
  remote binding: lsr: 10.3.3.3:0, label: 18
  remote binding: lsr: 10.2.2.2:0, label: imp-null
lib entry: 10.3.3.3/32, rev 15
  local binding: label: 1002
  remote binding: lsr: 10.3.3.3:0, label: imp-null
  remote binding: lsr: 10.2.2.2:0, label: 18
lib entry: 10.10.7.0/24, rev 8
  no local binding
  remote binding: lsr: 10.3.3.3:0, label: 17
  remote binding: lsr: 10.2.2.2:0, label: imp-null
lib entry: 10.10.8.0/24, rev 11
  no local binding
  remote binding: lsr: 10.3.3.3:0, label: imp-null
  remote binding: lsr: 10.2.2.2:0, label: imp-null
lib entry: 10.10.9.0/24, rev 9
  no local binding
  remote binding: lsr: 10.3.3.3:0, label: imp-null
  remote binding: lsr: 10.2.2.2:0, label: 16
```

Local label bindings for all but 10.2.2.2 and 10.3.3.3 on Router R1 are advertised as withdrawn.

### LIB on Router R2 After Local Label Allocation Filtering

This example shows how the configuration of a local label allocation prefix-list filter on Router R1 changes the contents of the LIB on Router R2:

R2# **show mpls ldp bindings**

```
lib entry: 10.1.1.1/32, rev 11
  local binding: label: 17
  remote binding: lsr: 10.3.3.3:0, label: 16
lib entry: 10.2.2.2/32, rev 7
```

```

        local binding:  label: imp-null
        remote binding: lsr: 10.3.3.3:0, label: 18
        remote binding: lsr: 10.1.1.1:0, label: 1000
lib entry: 10.3.3.3/32, rev 15
        local binding:  label: 18
        remote binding: lsr: 10.3.3.3:0, label: imp-null
        remote binding: lsr: 10.1.1.1:0, label: 1002
lib entry: 10.10.7.0/24, rev 8
        local binding:  label: imp-null
        remote binding: lsr: 10.3.3.3:0, label: 17
lib entry: 10.10.8.0/24, rev 9
        local binding:  label: imp-null
        remote binding: lsr: 10.3.3.3:0, label: imp-null
lib entry: 10.10.9.0/24, rev 13
        local binding:  label: 16
        remote binding: lsr: 10.3.3.3:0, label: imp-null

```

The 10.10.7.0/24, 10.10.8.0/24, and 10.10.9.0/24 prefixes are no longer assigned local labels. Therefore, Router R1 sends no label advertisement for these prefixes.

### LIB on Router R3 After Local Label Allocation Filtering

This example shows how the configuration of a local label allocation prefix-list filter on Router R1 changes the contents of the LIB on Router R3:

R3# **show mpls ldp bindings**

```

lib entry: 10.1.1.1/32, rev 13
        local binding:  label: 16
        remote binding: lsr: 10.2.2.2:0, label: 17
        remote binding: lsr: 10.1.1.1:0, label: imp-null
lib entry: 10.2.2.2/32, rev 15
        local binding:  label: 18
        remote binding: lsr: 10.2.2.2:0, label: imp-null
        remote binding: lsr: 10.1.1.1:0, label: 1000
lib entry: 10.3.3.3/32, rev 7
        local binding:  label: imp-null
        remote binding: lsr: 10.2.2.2:0, label: 18
        remote binding: lsr: 10.1.1.1:0, label: 1002
lib entry: 10.10.7.0/24, rev 11
        local binding:  label: 17
        remote binding: lsr: 10.2.2.2:0, label: imp-null
lib entry: 10.10.8.0/24, rev 8
        local binding:  label: imp-null
        remote binding: lsr: 10.2.2.2:0, label: imp-null
lib entry: 10.10.9.0/24, rev 9
        local binding:  label: imp-null
        remote binding: lsr: 10.2.2.2:0, label: 16

```

The 10.10.7.0/24, 10.10.8.0/24, and 10.10.9.0/24 prefixes are no longer assigned local labels. Again, Router R1 sends no label advertisement for these prefixes.

## Command to Display the Local Label Allocation Filter

You can enter the **show mpls ldp detail** command to display the filter used for local label allocation. For example:

Router# **show mpls ldp bindings detail**

```

Advertisement spec:
  Prefix acl = List1
Local label filtering spec: host routes. ! <--- Local local label filtering spec

```

```
lib entry: 10.1.1.1/32, rev 9
lib entry: 10.10.7.0/24, rev 10
lib entry: 10.10.8.0/24, rev 11
lib entry: 10.10.9.0/24, rev 12
lib entry: 10.41.41.41/32, rev 17
lib entry: 10.50.50.50/32, rev 15
lib entry: 10.60.60.60/32, rev 18
lib entry: 10.70.70.70/32, rev 16
lib entry: 10.80.80.80/32, rev 14
```

## Additional References

The following sections provide references related to the MPLS LDP—Local Label Allocation Filtering feature.

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*.

- **allocate**
- **debug mpls ldp bindings**
- **mpls ldp label**
- **show mpls ldp bindings**

# Feature Information for MPLS LDP—Local Label Allocation Filtering

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS LDP—Local Label Allocation Filtering

| Feature Name                              | Releases                  | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MPLS LDP—Local Label Allocation Filtering | 12.2(33)SRC<br>12.2(33)SB | <p>This feature introduces command-line interface (CLI) commands to modify the way in which Multiprotocol Label Switching (MPLS) Label Distribution Protocol (LDP) handles local label allocation. This MPLS LDP feature enhancement enables the configuration of filtering policies for selective local label binding assignments by LDP to improve LDP scalability and convergence. This document contains information about and instructions on how to configure the MPLS LDP—Local Label Allocation Filtering feature.</p> <p>In 12.2(33)SRC, the feature was introduced on a Cisco IOS 12.2SR release.</p> <p>In 12.2(33)SB, the feature was integrated into a Cisco IOS 12.2SB release.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">MPLS LDP Local Label Allocation Filtering Overview, page 2</a></li> <li>• <a href="#">Prefix Lists for MPLS LDP Local Label Allocation Filtering: Benefits and Description, page 4</a></li> <li>• <a href="#">Local Label Allocation Changes Introduced in Cisco IOS Release 12.2(33)SRC and LDP Actions, page 4</a></li> <li>• <a href="#">LDP Local Label Filtering and BGP Routes, page 5</a></li> <li>• <a href="#">Creating a Prefix List for MPLS LDP Local Label Allocation Filtering, page 5</a></li> </ul> |

# Glossary

**BGP**—Border Gateway Protocol. An interdomain routing protocol that replaces Exterior Gateway Protocol (EGP). A BGP system exchanges reachability information with other BGP systems. It is defined by RFC 1163.

**CE router**—customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router. CE routers do not have routes to associated Virtual Private Networks (VPNs) in their routing tables.

**FEC**—Forwarding Equivalency Class. A set of packets that can be handled equivalently for the purpose of forwarding and thus is suitable for binding to a single label. The set of packets destined for an address prefix is one example of an FEC.

**IGP**—Interior Gateway Protocol. Internet protocol used to exchange routing information within a single autonomous system. Examples of common Internet IGP protocols include Interior Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), Intermediate System-to-Intermediate System (IS-IS), and Routing Information protocol (RIP).

**label**—A short fixed-length label that tells switching nodes how to forward data (packets or cells).

**LDP**—Label Distribution Protocol. A standard protocol between Multiprotocol Label Switching (MPLS)-enabled routers that is used for the negotiation of the labels (addresses) used to forward packets.

**LIB**—Label Information Base. A database used by a label switch router (LSR) to store labels learned from other LSRs, and labels assigned by the local LSR.

**LSP**—label switched path. A sequence of hops in which a packet travels from one router to another router by means of label switching mechanisms. A label switched path can be established dynamically, based on normal routing mechanisms, or through configuration.

**LSR**—label switch router. A device that forwards Multiprotocol Label Switching (MPLS) packets based on the value of a fixed-length label encapsulated in each packet.

**MPLS**—Multiprotocol Label Switching. A switching method that forwards IP traffic using a label. This label instructs the routers and the switches in the network where to forward the packets. The forwarding of MPLS packets is based on preestablished IP routing information.

**PE router**—provider edge router. A router that is part of a service provider's network connected to a customer edge (CE) router. All Virtual Private Network (VPN) processing occurs in the PE router.

**VPN**—Virtual Private Network. A secure IP-based network that shares resources on one or more physical networks. A VPN contains geographically dispersed sites that can communicate securely over a shared backbone.

## **MPLS Traffic Engineering: Path Calculation and Setup**

# MPLS Traffic Engineering—LSP Attributes

---

**First Published: August 26, 2003**

**Last Updated: February 18, 2009**

This document describes how to configure label switched path (LSP) attributes for path options associated with Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels.

The MPLS Traffic Engineering—LSP Attributes feature is an extension to MPLS TE that provides an LSP Attribute List feature and a Path Option for Bandwidth Override feature. These features provide flexibility in the configuration of LSP attributes for MPLS TE tunnel path options. Several LSP attributes can be applied to path options for TE tunnels using an LSP attribute list. If bandwidth is the only LSP attribute you require, then you can configure a path option for bandwidth override.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for MPLS Traffic Engineering—LSP Attributes](#)” section on page 42.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for MPLS Traffic Engineering—LSP Attributes

The MPLS Traffic Engineering—LSP Attributes feature requires that you configure an MPLS TE tunnel before you configure either an LSP Attribute List or a Path Option for Bandwidth Override feature.

## Restrictions for MPLS Traffic Engineering—LSP Attributes

Reoptimization between path options with different bandwidth pool types (subpool versus global pool) and different priorities is not supported. Specifically,

- With the Path Option for Bandwidth Override feature, you need to configure bandwidth for path options with the same bandwidth pool as configured for the tunnel.
- With the LSP Attribute List feature, you need to configure both a bandwidth pool and priority for path options that are consistent with the bandwidth pool and priority configured on the tunnel or in other path options used by the tunnel.

## Information About MPLS Traffic Engineering—LSP Attributes

To configure the MPLS Traffic Engineering—LSP Attributes feature, you need the following information:

- [MPLS Traffic Engineering—LSP Attributes Benefits, page 2](#)
- [Traffic Engineering Bandwidth and Bandwidth Pools, page 3](#)
- [LSP Attribute Lists Usage and Management, page 3](#)
- [Autobandwidth and Path Option for Bandwidth Override, page 4](#)
- [Path Option Selection for MPLS TE Tunnel LSPs, page 5](#)

## MPLS Traffic Engineering—LSP Attributes Benefits

The MPLS Traffic Engineering—LSP Attributes provides an LSP Attribute List feature and a Path Option for Bandwidth Override feature. These features have the following benefits:

- The LSP Attributes List feature provides the ability to configure values for several LSP-specific path options for TE tunnels.
- One or more TE tunnels can specify specific path options by referencing an LSP attribute list.

- LSP attribute lists make the MPLS TE user interface more flexible, easier to use, and easier to extend and maintain.
- The Path Option for Bandwidth Override feature provides a single command that allows a TE tunnel to fall back temporarily to path options that can reduce bandwidth constraints.

## Traffic Engineering Bandwidth and Bandwidth Pools

MPLS traffic engineering allows constraint-based routing (CBR) of IP traffic. One of the constraints satisfied by CBR is the availability of required bandwidth over a selected path. Regular TE tunnel bandwidth is called the global pool. Subpool bandwidth is a portion of the global pool. Subpool bandwidth is not reserved from the global pool if it is not in use. Therefore, subpool tunnels require a higher priority than nonsubpool tunnels.

You can configure the LSP Attributes bandwidth path option to use either global pool (default) or subpool bandwidth. The bandwidth value for the path option may be any valid value and the pool does not have to be the same as that configured on the tunnel.

### Note

When you configure bandwidth for path options with the **bandwidth [sub-pool | global] kbps** command, use either all subpool bandwidths or all global-pool bandwidths.

You can configure bandwidth on both dynamic and explicit path options using either the LSP Attribute List feature or the Path Option for Bandwidth Override feature. The commands that enable these features are exclusive of each other. If bandwidth is the only LSP attribute that you need to set on the path option, then use the command to enable the Path Option for Bandwidth Override feature. This is the simplest way to configure multiple path options with decreasing bandwidth constraints. Once the **bandwidth** keyword is entered on the **tunnel mpls traffic-eng path-option** command in interface configuration mode, you cannot configure an LSP attribute list for that path option.

## LSP Attribute Lists Usage and Management

This section contains the following topics about LSP attribute lists usage and management:

- [Tunnel Attributes and LSP Attributes, page 3](#)
- [LSP Attributes and the LSP Attribute List, page 4](#)
- [LSP Attribute Lists Management, page 4](#)

## Tunnel Attributes and LSP Attributes

Cisco IOS tunneling interfaces have many parameters associated with MPLS TE. Typically, you configure these parameters with **tunnel mpls traffic-eng** commands in interface configuration mode. Many of these commands determine tunnel-specific properties, such as the load-sharing factor for the tunnel. These commands configure parameters that are unrelated to the particular LSP in use by the tunnel. However, some of the tunneling parameters apply to the LSP that the tunnel uses. You can configure the LSP-specific properties using an LSP attribute list.

## LSP Attributes and the LSP Attribute List

An LSP attribute list can contain values for each LSP-specific parameter that is configurable for a TE tunnel. You configure an LSP attribute list with the **mpls traffic-eng lsp attributes** *string* command, where *string* identifies the attribute list. The LSP attributes that you can specify include the following:

- Attribute flags for links that make up the LSP (**affinity** command)
- Automatic bandwidth configuration (**auto-bw** command)
- LSP bandwidth—global pool or subpool (**bandwidth** command)
- Disable reoptimization of the LSP (**lockdown** command)
- LSP priority (**priority** command)
- Protection failure (**protection** command)
- Record the route used by the LSP (**record-route** command)

## LSP Attribute Lists Management

The MPLS Traffic Engineering—LSP Attributes feature also provides commands that help you manage LSP attribute lists. You can do the following:

- Relist all attribute list entries (**list** command)
- Remove a specific attribute from the list (**no attribute** command)

The **exit** command exits from the LSP attributes configuration submode and returns you to global configuration mode.

Based on your requirements, you can configure LSP attributes lists with different sets of attributes for different path options. LSP attribute lists also provide an easy way to configure multiple TE tunnels to use the same LSP attributes. That is, you can reference the same LSP attribute list to configure LSP-specific parameters for one or more TE tunnels.

## Autobandwidth and Path Option for Bandwidth Override

If Traffic Engineering automatic bandwidth (autobandwidth) adjustment is configured for a tunnel, traffic engineering automatically adjusts the bandwidth allocation for the traffic engineering tunnel based on its measured usage of the bandwidth of the tunnel.

Traffic engineering autobandwidth samples the average output rate for each tunnel marked for automatic bandwidth adjustment. For each marked tunnel, it periodically adjusts the allocated bandwidth for the tunnel to be the largest sample for the tunnel since the last adjustment. The default reoptimization setting in the MPLS AutoBandwidth feature is every 24 hours

The frequency with which tunnel bandwidth is adjusted and the allowable range of adjustments is configurable on a per-tunnel basis. In addition, the sampling interval and the interval over which to average tunnel traffic to obtain the average output rate is user-configurable on a per-tunnel basis.

For more information on automatic bandwidth adjustment for TE tunnels, see the *MPLS Traffic Engineering (TE)—Automatic Bandwidth Adjustment for TE Tunnels* feature documentation.

The Path Option for Bandwidth Override feature allows you to override the bandwidth configured on a TE tunnel. This feature also overrides bandwidth configured or recalculated by automatic bandwidth adjustment if the path option in effect has bandwidth override enabled.

## Path Option Selection for MPLS TE Tunnel LSPs

This section contains the following topics about path option selection for MPLS TE Tunnel LSPs:

- [Constraint-Based Routing and Path Option Selection, page 5](#)
- [Tunnel Reoptimization and Path Option Selection, page 5](#)
- [Path Option Selection with Bandwidth Override, page 6](#)

### Constraint-Based Routing and Path Option Selection

MPLS traffic engineering automatically establishes and maintains LSPs across the backbone by using the Resource Reservation Protocol (RSVP). The path that an LSP uses is determined by the LSP resource requirements and network resources, such as bandwidth. Traffic engineering tunnels are calculated at the LSP head based on a fit between required and available resources (constraint-based routing).

Without the Path Option for Bandwidth Override feature, a TE tunnel establishes an LSP based on dynamic or explicit path options in order of preference. However, the bandwidth and other attributes configured on the TE tunnel allow the setup of an LSP only if LSP path options satisfy the constraints. If a path cannot be found that satisfies the configured path options, then the tunnel is not set up.

The Path Option for Bandwidth Override feature provides a fallback path option that allows overriding the bandwidth configured on the TE tunnel interface. For example, you can configure a path option that sets the bandwidth to zero (0) effectively removing the bandwidth constraint imposed by the constraint-based routing calculation.

### Tunnel Reoptimization and Path Option Selection

Reoptimization occurs when a device with traffic engineering tunnels periodically examines tunnels with established LSPs to learn if better LSPs are available. If a better LSP seems to be available, the device attempts to signal the better LSP. If the signaling is successful, the device replaces the older LSP with the new, better LSP.

Reoptimization can be triggered by a timer, the issuance of an **mpls traffic-eng reoptimize** command, or a configuration change that requires the resignalling of a tunnel. The MPLS AutoBandwidth feature, for example, uses a timer to set the frequency of reoptimization based on the bandwidth path option attribute. The Path Option for Bandwidth Override feature allows for the switching between bandwidth configured on the TE tunnel interface and bandwidth configured on a specific path option. This increases the success of signaling an LSP for the TE tunnel.

With bandwidth override configured on a path option, the traffic engineering software attempts to reoptimize the bandwidth every 30 seconds to reestablish the bandwidth configured on the tunnel (see the [“Configuring a Path Option for Bandwidth Override” section on page 26](#)).

You can disable reoptimization of an LSP with the **lockdown** command in an LSP attribute list. You can apply the LSP attribute list containing the **lockdown** command to a path option with the **tunnel mpls traffic-eng path-option** command.

#### Note

When you configure bandwidth for path options with the **bandwidth [sub-pool | global] kpbs** command, use either all subpool bandwidths or all global-pool bandwidths. Do not mix subpool and nonsubpool bandwidths, otherwise the path option does not reoptimize later.

## Path Option Selection with Bandwidth Override

The Path Option for Bandwidth Override feature allows you to configure bandwidth parameters on a specific path option with the **bandwidth** keyword on the **tunnel mpls traffic-eng path-option** command. When an LSP is signaled using a path option with a configured bandwidth, the bandwidth associated with the path option is signaled instead of the bandwidth configured directly on the tunnel.

This feature provides you with the ability to configure multiple path options that reduce the bandwidth constraint each time the headend of a tunnel fails to establish an LSP.

The following configuration shows three **tunnel mpls traffic-eng path-option** commands:

```
tunnel mpls traffic-eng bandwidth 1000
tunnel mpls traffic-eng path-option 1 explicit name path1
tunnel mpls traffic-eng path-option 2 explicit name path2 bandwidth 500
tunnel mpls traffic-eng path-option 3 dynamic bandwidth 0
```

The device selects a path option for an LSP in order of preference, as follows:

- The device attempts to signal an LSP using path options starting with path option 1.  
The device attempts to signal an LSP with the 1000 kbps bandwidth configured on the tunnel interface because path-option 1 has no bandwidth configured.
- If 1000 kbps bandwidth is not available over the network, the device attempts to establish an LSP using path-option 2.  
Path option 2 has a bandwidth of 500 kbps configured. This reduces the bandwidth constraint from the original 1000 kbps configured on the tunnel interface.
- If 500 kbps is not available, the device attempts to establish an LSP using path-option 3.  
Path-option 3 is configured as dynamic and has bandwidth 0. The device establishes the LSP if an IP path exists to the destination and all other tunnel constraints are met.

## How to Configure MPLS Traffic Engineering—LSP Attributes

This section contains the following processes for configuring the MPLS Traffic Engineering—LSP Attributes feature:

- [Configuring MPLS Traffic Engineering LSP Attribute Lists, page 6](#)
- [Configuring a Path Option for Bandwidth Override, page 26](#)

## Configuring MPLS Traffic Engineering LSP Attribute Lists

Perform the following tasks to configure and verify MPLS traffic engineering LSP attributes lists:

- [Configuring an LSP Attribute List, page 7](#) (required)
- [Adding Attributes to an LSP Attribute List, page 9](#) (optional)
- [Removing an Attribute from an LSP Attribute List, page 11](#) (optional)
- [Modifying an Attribute in an LSP Attribute List, page 12](#) (optional)
- [Deleting an LSP Attribute List, page 14](#) (optional)
- [Verifying Attributes Within an LSP Attribute List, page 15](#) (optional)
- [Verifying All LSP Attribute Lists, page 16](#) (optional)

- [Associating an LSP Attribute List with a Path Option for an MPLS TE Tunnel, page 17](#) (required)
- [Modifying a Path Option to Use a Different LSP Attribute List, page 21](#) (optional)
- [Removing a Path Option for an LSP for an MPLS TE Tunnel, page 23](#) (optional)
- [Verifying that LSP Is Signaled Using the Correct Attributes, page 25](#) (optional)

## Configuring an LSP Attribute List

Perform this task to configure a label switched path (LSP) attribute list with the desired attributes to be applied on a path option. Based on your requirements, you can configure LSP attributes lists with different sets of attributes for different path options. The LSP attribute list provides a user interface that is flexible, easy to use, and easy to extend and maintain for the configuration of MPLS TE tunnel path options.

LSP attribute lists also provide an easy way to configure multiple TE tunnels to use the same LSP attributes. That is, you can reference the same LSP attribute list to configure LSP-specific parameters for one or more TE tunnels.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng lsp attributes** *string*
4. **affinity** *value* [**mask** *value*]
5. **auto-bw** [**frequency** *secs*] [**max-bw** *kbps*] [**min-bw** *kbps*] [**collect-bw**]
6. **bandwidth** [**sub-pool** | **global**] *kbps*
7. **list**
8. **lockdown**
9. **priority** *setup-priority* [*hold-priority*]
10. **protection fast-reroute**
11. **record-route**
12. **no** *sub-command*
13. **exit**
14. **end**

### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                              |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br>Router> enable             | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                    |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                      |

|        | Command or Action                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>mpls traffic-eng lsp attributes</b> <i>string</i><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng lsp attributes 1                                                             | Configures an LSP attribute list and enters LSP Attributes configuration mode. <ul style="list-style-type: none"> <li>The <i>string</i> argument identifies a specific LSP attribute list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 4 | <b>affinity</b> <i>value</i> [ <b>mask</b> <i>value</i> ]<br><br><b>Example:</b><br>Router(config-lsp-attr)# affinity 0 mask 0                                                               | (Optional) Specifies attribute flags for links comprising an LSP. <ul style="list-style-type: none"> <li>The <i>value</i> argument is a value required for links that make up an LSP. Values of the bits are either 0 or 1.</li> <li>The <b>mask</b> <i>value</i> keyword argument combination indicates which attribute values should be checked. <ul style="list-style-type: none"> <li>If a bit in the mask is 0, an attribute value of the link or that bit is irrelevant.</li> <li>If a bit in the mask is 1, the attribute value of that link and the required affinity of the LSP for that bit must match.</li> </ul> </li> </ul>                                                                                                                                                                             |
| Step 5 | <b>auto-bw</b> [ <b>frequency</b> <i>secs</i> ] [ <b>max-bw</b> <i>kbps</i> ] [ <b>min-bw</b> <i>kbps</i> ] [ <b>collect-bw</b> ]<br><br><b>Example:</b><br>Router(config-lsp-attr)# auto-bw | (Optional) Specifies automatic bandwidth configuration. <ul style="list-style-type: none"> <li>The <b>frequency</b> <i>secs</i> keyword argument combination specifies the interval between bandwidth adjustments. The specified interval can be from 300 to 604800 seconds.</li> <li>The <b>max-bw</b> <i>kbps</i> keyword argument combination specifies the maximum automatic bandwidth, in kbps, for this path option. The value can be from 0 to 4294967295.</li> <li>The <b>min-bw</b> <i>kbps</i> keyword argument combination specifies the minimum automatic bandwidth, in kbps, for this path option. The value can be from 0 to 4294967295.</li> <li>The <b>collect-bw</b> keyword collects output rate information for the path option, but does not adjust the bandwidth of the path option.</li> </ul> |
| Step 6 | <b>bandwidth</b> [ <b>sub-pool</b>   <b>global</b> ] <i>kbps</i><br><br><b>Example:</b><br>Router(config-lsp-attr)# bandwidth 5000                                                           | (Optional) Specifies LSP bandwidth. <ul style="list-style-type: none"> <li>The <b>sub-pool</b> keyword indicates a subpool path option.</li> <li>The <b>global</b> keyword indicates a global pool path option. Entering this keyword is not necessary, for all path options are from the global pool in the absence of the <b>sub-pool</b> keyword.</li> <li>The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.</li> </ul>                                                                                                                                                                                                                                                                                                             |
| Step 7 | <b>list</b><br><br><b>Example:</b><br>Router(config-lsp-attr)# list                                                                                                                          | (Optional) Displays the contents of the LSP attribute list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|         | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 8  | <code>lockdown</code><br><br><b>Example:</b><br>Router(config-lsp-attr)# lockdown                                    | (Optional) Disables reoptimization of the LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 9  | <code>priority setup-priority [hold-priority]</code><br><br><b>Example:</b><br>Router(config-lsp-attr)# priority 1 1 | (Optional) Specifies the LSP priority. <ul style="list-style-type: none"> <li>The <i>setup-priority</i> argument is used when signaling an LSP to determine which existing LSPs can be preempted. Valid values are from 0 to 7, where a lower number indicates a higher priority. Therefore, an LSP with a setup priority of 0 can preempt any LSP with a non-0 priority.</li> <li>The <i>hold-priority</i> argument is associated with an LSP to determine if it should be preempted by other LSPs that are being signaled. Valid values are from 0 to 7, where a lower number indicates a higher priority.</li> </ul> |
| Step 10 | <code>protection fast-reroute</code><br><br><b>Example:</b><br>Router(config-lsp-attr)# protection fast-reroute      | (Optional) Enables failure protection on the LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 11 | <code>record-route</code><br><br><b>Example:</b><br>Router(config-lsp-attr)# record-route                            | (Optional) Records the route used by the LSP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 12 | <code>no sub-command</code><br><br><b>Example:</b><br>Router(config-lsp-attr)# no record-route                       | (Optional) Removes a specific attribute from the LSP attributes list. <ul style="list-style-type: none"> <li>The <i>sub-command</i> argument names the LSP attribute to remove from the attributes list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 13 | <code>exit</code><br><br><b>Example:</b><br>Router(config-lsp-attr)# exit                                            | (Optional) Exits from LSP Attributes configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 14 | <code>end</code><br><br><b>Example:</b><br>Router(config)# end                                                       | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Adding Attributes to an LSP Attribute List

Perform this task to add attributes to an LSP attribute list. The LSP attribute list provides a user interface that is flexible, easy to use, and that can be extended or changed at any time to meet the requirements of your MPLS TE tunnel traffic. LSP Attributes configuration mode is used to display the specific LSP attributes list and to add or change the required path option attribute.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng lsp attributes** *string*
4. **affinity** *value* [**mask** *value*]
5. **bandwidth** [**sub-pool** | **global**] *kbps*
6. **priority** *setup-priority* [*hold-priority*]
7. **list**
8. **exit**
9. **end**

## DETAILED STEPS

|--------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                           | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 3 | <b>mpls traffic-eng lsp attributes</b> <i>string</i><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng lsp attributes 1 | Configures an LSP attribute list and enters LSP Attributes configuration mode.<br><ul style="list-style-type: none"><li>The <i>string</i> argument identifies a specific LSP attribute list.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 4 | <b>affinity</b> <i>value</i> [ <b>mask</b> <i>value</i> ]<br><br><b>Example:</b><br>Router(config-lsp-attr)# affinity 0 mask 0   | (Optional) Specifies attribute flags for links comprising an LSP.<br><ul style="list-style-type: none"><li>The <i>value</i> argument is a value required for links that make up an LSP. Values of the bits are either 0 or 1.</li><li>The <b>mask</b> <i>value</i> keyword argument combination indicates which attribute values should be checked.<ul style="list-style-type: none"><li>If a bit in the mask is 0, an attribute value of the link or that bit is irrelevant.</li><li>If a bit in the mask is 1, the attribute value of that link and the required affinity of the LSP for that bit must match.</li></ul></li></ul> |

|        | Command or Action                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>bandwidth</b> [ <b>sub-pool</b>   <b>global</b> ] <i>kbps</i><br><br><b>Example:</b><br>Router(config-lsp-attr)# bandwidth 1000 | Specifies an LSP bandwidth. <ul style="list-style-type: none"> <li>The <b>sub-pool</b> keyword indicates a subpool path option.</li> <li>The <b>global</b> keyword indicates a global pool path option. Entering this keyword is not necessary, for all path options are from the global pool in the absence of the <b>sub-pool</b> keyword.</li> <li>The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.</li> </ul>                                                                                                             |
| Step 6 | <b>priority</b> <i>setup-priority</i> [ <i>hold-priority</i> ]<br><br><b>Example:</b><br>Router(config-lsp-attr)# priority 2 2     | Specifies the LSP priority. <ul style="list-style-type: none"> <li>The <i>setup-priority</i> argument is used when signaling an LSP to determine which existing LSPs can be preempted. Valid values are from 0 to 7, where a lower number indicates a higher priority. Therefore, an LSP with a setup priority of 0 can preempt any LSP with a non-0 priority.</li> <li>The <i>hold-priority</i> argument is associated with an LSP to determine if it should be preempted by other LSPs that are being signaled. Valid values are from 0 to 7, where a lower number indicates a higher priority.</li> </ul> |
| Step 7 | <b>list</b><br><br><b>Example:</b><br>Router(config-lsp-attr)# list                                                                | (Optional) Displays the contents of the LSP attribute list. <ul style="list-style-type: none"> <li>Use the <b>list</b> command to display the path option attributes added to the attribute list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config-lsp-attr)# exit                                                                | (Optional) Exits LSP Attributes configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                           | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Removing an Attribute from an LSP Attribute List

Perform this task to remove an attribute from an LSP attribute list. The LSP attributes list provides a means to easily remove a path option attribute that is no longer required for your MPLS TE tunnel traffic. LSP Attributes configuration mode is used to display the specific LSP attribute list and for the **no sub-command** command, which is used to remove the specific attribute from the list. Replace the *sub-command* argument with the command that you want to remove from the list.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **mpls traffic-eng lsp attributes** *string*
4. **no** *sub-command*
5. **list**
6. **exit**
7. **end**

|        | Command or Action                                                                                                                | Purpose                                                                                                                                                                                                                   |
|--------|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                           | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                   | Enters global configuration mode.                                                                                                                                                                                         |
| Step 3 | <b>mpls traffic-eng lsp attributes</b> <i>string</i><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng lsp attributes 1 | Configures an LSP attribute list and enters LSP Attributes configuration mode.<br><ul style="list-style-type: none"> <li>The <i>string</i> argument identifies a specific LSP attribute list.</li> </ul>                  |
| Step 4 | <b>no</b> <i>sub-command</i><br><br><b>Example:</b><br>Router(config-lsp-attr)# no priority                                      | Removes a specific attribute from the LSP attribute list.<br><ul style="list-style-type: none"> <li>The <i>sub-command</i> argument names the LSP attribute to remove from the attributes list.</li> </ul>                |
| Step 5 | <b>list</b><br><br><b>Example:</b><br>Router(config-lsp-attr)# list                                                              | (Optional) Displays the contents of the LSP attribute list.<br><ul style="list-style-type: none"> <li>Use the <b>list</b> command to verify that the path option attribute is removed from the attribute list.</li> </ul> |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config-lsp-attr)# exit                                                              | (Optional) Exits LSP Attributes configuration mode.                                                                                                                                                                       |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                         | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                 |

## Modifying an Attribute in an LSP Attribute List

Perform this task to modify an attribute in an LSP attribute list. The LSP attribute list provides a flexible user interface that can be extended or modified any time to meet the requirements of your MPLS TE tunnel traffic. LSP Attributes configuration mode is used to display the specific LSP attributes list and to modify the required path option attribute.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng lsp attributes** *string*
4. **affinity** *value* [**mask** *value*]
5. **list**
6. **affinity** *value* [**mask** *value*]
7. **list**
8. **exit**
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 3 | <b>mpls traffic-eng lsp attributes</b> <i>string</i><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng lsp attributes 1 | Configures an LSP attribute list and enters LSP Attributes configuration mode. <ul style="list-style-type: none"> <li>The <i>string</i> argument identifies a specific LSP attribute list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 4 | <b>affinity</b> <i>value</i> [ <b>mask</b> <i>value</i> ]<br><br><b>Example:</b><br>Router(config-lsp-attr)# affinity 1 mask 1   | Specifies attribute flags for links comprising an LSP. <ul style="list-style-type: none"> <li>The <i>value</i> argument is a value required for links comprising an LSP. Values of bits are either 0 or 1.</li> <li>The <b>mask</b> <i>value</i> keyword argument combination indicates which attribute values should be checked. <ul style="list-style-type: none"> <li>If a bit in the mask is 0, an attribute value of the link or that bit is irrelevant.</li> <li>If a bit in the mask is 1, the attribute value of that link and the required affinity of the tunnel for that bit must match.</li> </ul> </li> </ul> |
| Step 5 | <b>list</b><br><br><b>Example:</b><br>Router(config-lsp-attr)# list                                                              | (Optional) Displays the contents of the LSP attribute list. <ul style="list-style-type: none"> <li>Use the <b>list</b> command to display the path option attributes configured in the attribute list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                          |

|        | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|--------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>affinity</b> <i>value</i> [ <b>mask</b> <i>value</i> ]<br><br><b>Example:</b><br>Router(config-lsp-attr)# affinity 0 mask 0 | Specifies attribute flags for links comprising an LSP. <ul style="list-style-type: none"> <li>The <i>value</i> argument is a value required for links comprising an LSP. Values of bits are either 0 or 1.</li> <li>The <b>mask</b> <i>value</i> keyword argument combination indicates which attribute values should be checked. <ul style="list-style-type: none"> <li>If a bit in the mask is 0, an attribute value of the link or that bit is irrelevant.</li> <li>If a bit in the mask is 1, the attribute value of that link and the required affinity of the tunnel for that bit must match.</li> </ul> </li> </ul> |
| Step 7 | <b>list</b><br><br><b>Example:</b><br>Router(config-lsp-attr)# list                                                            | (Optional) Displays the contents of the LSP attribute list. <ul style="list-style-type: none"> <li>Use the <b>list</b> command to verify that the path option attributes is modified in the attribute list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config-lsp-attr)# exit                                                            | (Optional) Exits LSP Attributes configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                       | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Deleting an LSP Attribute List

Perform this task to delete an LSP attribute list. You would perform this task when you no longer require the LSP attribute path options specified in the LSP attribute list for an MPLS TE tunnel.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **no mpls traffic-eng lsp attributes** *string*
4. **end**
5. **show mpls traffic-eng lsp attributes** [*string*]

## DETAILED STEPS

|        | Command or Action                                                                                                                      | Purpose                                                                                                                                                                                                                                                |
|--------|----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                         | Enters global configuration mode.                                                                                                                                                                                                                      |
| Step 3 | <b>no mpls traffic-eng lsp attributes <i>string</i></b><br><br><b>Example:</b><br>Router(config)# no mpls traffic-eng lsp attributes 1 | Removes a specified LSP attribute list from the device configuration. <ul style="list-style-type: none"> <li>The <i>string</i> argument identifies the specific LSP attribute list to remove.</li> </ul>                                               |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                               | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                              |
| Step 5 | <b>show mpls traffic-eng lsp attributes [<i>string</i>]</b><br><br><b>Example:</b><br>Router# show mpls traffic-eng lsp attributes     | (Optional) Displays information about configured LSP attribute lists. <ul style="list-style-type: none"> <li>Use the <b>show mpls traffic-eng lsp attributes</b> command to verify that the LSP attribute list was deleted from the router.</li> </ul> |

## Verifying Attributes Within an LSP Attribute List

Perform this task to verify attributes within an LSP attribute list.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng lsp attributes *string* list**
4. **exit**
5. **end**

## DETAILED STEPS

|        |                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br>Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:<br><br>Router> <b>enable</b><br>Router# |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|

**Step 2**    **configure terminal**

Use this command to enter global configuration mode. For example:

```
Router# configure terminal
Router(config)#
```

**Step 3**    **mpls traffic-eng lsp attributes *string* list**

Use this command to enter LSP Attributes configuration mode for a specific LSP attribute list and to verify that the contents of the attributes list are as expected. For example:

```
Router(config)# mpls traffic-eng lsp attributes 1 list

LIST 1
  bandwidth 1000
  priority 1 1
```

**Step 4**    **exit**

Use this command to exit LSP Attributes configuration mode. For example:

```
Router(config-lsp-attr)# exit
Router(config)#
```

**Step 5**    **end**

Use this command to exit to privileged EXEC mode. For example:

```
Router(config)# exit
Router#
```

---

## Verifying All LSP Attribute Lists

Perform this task to verify all configured LSP attribute lists. Use this task to display all LSP attribute lists to verify that the attributes lists that you configured are in operation.

### SUMMARY STEPS

1. **enable**
2. **show mpls traffic-eng lsp attributes [*string*] [details]**
3. **show running-config | begin *text-string***
4. **exit**

### DETAILED STEPS

**Step 1**    **enable**

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```
Router> enable
Router#
```

**Step 2**    **show mpls traffic-eng lsp attributes [*string*] [details]**

Use this command to verify that all configured LSP attribute lists are as expected. For example:

```
Router# show mpls traffic-eng lsp attributes
```

```

LIST 1
  affinity 1 mask 1
  bandwidth 1000
  priority 1 1
LIST 2
  bandwidth 5000
LIST hipriority
  priority 0 0
!
```

**Step 3**    **show running-config | begin *text-string***

Use this command to verify that all configured LSP attribute lists are as expected. Use the **begin** command modifier with the **mpls traffic-eng lsp *text-string*** to locate the LSP attributes information in the configuration file. For example:

```

Router# show running-config | begin mpls traffic-eng lsp

mpls traffic-eng lsp attributes 1
  affinity 1 mask 1
  bandwidth 1000
  priority 1 1
!
mpls traffic-eng lsp attributes 2
  bandwidth 5000
!
mpls traffic-eng lsp attributes hipriority
  priority 0 0
.
.
.
Router#
```

**Step 4**    **exit**

Use this command to exit to user EXEC mode. For example:

```

Router# exit
Router>
```

## Associating an LSP Attribute List with a Path Option for an MPLS TE Tunnel

Perform this task to associate an LSP attribute list with a path option for an MPLS TE tunnel. This task is required if you want to apply the LSP attribute list that you configured to path options for your MPLS TE tunnels.

Based on your requirements, you can configure LSP attributes lists with different sets of attributes for different path options. LSP attribute lists also provide an easy way to configure multiple TE tunnels to use the same LSP attributes. That is, you can reference the same LSP attribute list to configure LSP-specific parameters for one or more TE tunnels.

### Default Path Option Attributes for TE Tunnels Using LSP Attribute Lists

Values for path option attributes for a TE tunnel are determined in this manner:

- LSP attribute list values referenced by the path option take precedence over the values configured on the tunnel interface.

- If an attribute is not specified in the LSP attribute list, the device uses the attribute in the tunnel configuration. LSP attribute lists do not have defaults.
- If the attribute is not configured on the tunnel, then the device uses the tunnel default value, as follows:
 

```
{ affinity= affinity 0 mask 0,
  auto-bw= no auto-bw,
  bandwidth= bandwidth 0,
  lockdown= no lockdown,
  priority= priority 7 7,
  protection fast-reroute= no protection fast-reroute,
  record-route= no record-route
.
.
.
}
```

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **tunnel destination** {*hostname* | *ip-address*}
5. **tunnel mode mpls traffic-eng**
6. **tunnel mpls traffic-eng autoroute announce**
7. **tunnel mpls traffic-eng bandwidth** [**sub-pool** | **global**] *kbps*
8. **tunnel mpls traffic-eng priority** *setup-priority* [*hold-priority*]
9. **tunnel mpls traffic-eng path-option** *number* {**dynamic** | **explicit** {**name** *path-name* | *path-number*} [**verbatim**] } [**attributes** *string*] [**bandwidth** [**sub-pool** | **global**] *kbps*] [**lockdown**]
10. **end**

## DETAILED STEPS

|        | Command or Action                             | Purpose                                                                              |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br>Router> enable             | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                    |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                      |

|        | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p><b>interface</b> <i>type number</i></p> <p><b>Example:</b><br/>Router(config)# interface tunnel 1</p>                                                                                | <p>Configures an interface type and enters interface configuration mode.</p> <ul style="list-style-type: none"> <li>The <i>type</i> argument is the type of interface that you want to configure.</li> <li>The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 4 | <p><b>tunnel destination</b> {<i>hostname</i>   <i>ip-address</i>}</p> <p><b>Example:</b><br/>Router(config-if)# tunnel destination 10.10.10.12</p>                                     | <p>Specifies the destination of the tunnel for this path option.</p> <ul style="list-style-type: none"> <li>The <i>hostname</i> argument is the name of the host destination.</li> <li>The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 5 | <p><b>tunnel mode mpls traffic-eng</b></p> <p><b>Example:</b><br/>Router(config-if)# tunnel mode mpls traffic-eng</p>                                                                   | <p>Sets the encapsulation mode for the tunnel for MPLS TE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 6 | <p><b>tunnel mpls traffic-eng autoroute announce</b></p> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng autoroute announce</p>                                       | <p>Specifies that the IGP should use the tunnel (if the tunnel is up) in its enhanced shortest path first (SPF) calculation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 7 | <p><b>tunnel mpls traffic-eng bandwidth</b> [<i>sub-pool</i>   <i>global</i>] <i>bandwidth</i></p> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng bandwidth 1000</p> | <p>Configures the bandwidth required for an MPLS TE tunnel and assigns it either to the subpool or the global pool.</p> <ul style="list-style-type: none"> <li>The <b>sub-pool</b> keyword indicates a subpool tunnel.</li> <li>The <b>global</b> keyword indicates a global pool tunnel. Entering this keyword is not necessary, for all tunnels are in the global pool in the absence of the <b>sub-pool</b> keyword.</li> <li>The <i>kbps</i> argument is the bandwidth, in kilobits per second, set aside for the MPLS TE tunnel. The range is from 1 to 4294967295.</li> </ul>                                                                                                                                                                                |
| Step 8 | <p><b>tunnel mpls traffic-eng priority</b> <i>setup-priority</i> [<i>hold-priority</i>]</p> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng priority 1 1</p>          | <p>Sets the priority to be used when the system determines which existing tunnels are eligible to be preempted.</p> <ul style="list-style-type: none"> <li>The <i>setup-priority</i> argument is the priority used when signaling an LSP for this tunnel to determine which existing tunnels can be preempted.<br/><br/>Valid values are from 0 to 7. A lower number indicates a higher priority. An LSP with a setup priority of 0 can preempt any LSP with a non-0 priority.</li> <li>The <i>hold-priority</i> argument is the priority associated with an LSP for this tunnel to determine if it should be preempted by other LSPs that are being signaled.<br/><br/>Valid values are from 0 to 7, where a lower number indicates a higher priority.</li> </ul> |

| Command or Action                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Modifying a Path Option to Use a Different LSP Attribute List

Perform this task to modify the path option to use a different LSP attribute list.

Based on your requirements, you can configure LSP attributes lists with different sets of attributes for different path options or change the set of attributes associated with a path option. You use the **tunnel mpls traffic-eng path-option** *number* **dynamic attributes** *string* command in interface configuration mode to modify the path option to use a different LSP attribute list. The **attributes** *string* keyword and argument names the new LSP attribute list for the path option specified.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **tunnel destination** {*hostname* | *ip-address*}
5. **tunnel mpls traffic-eng path-option** *number* {**dynamic** | **explicit** {**name** *path-name* | *path-number*} [**verbatim**]} [**attributes** *string*] [**bandwidth** [*sub-pool* | **global**] *kbits*] [**lockdown**]
6. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                        |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                        | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                              |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                              | Configures the interface type and enters interface configuration mode.<br><ul style="list-style-type: none"> <li>• The <i>type</i> argument is the type of interface that you want to configure.</li> <li>• The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.</li> </ul>  |
| Step 4 | <b>tunnel destination</b> { <i>hostname</i>   <i>ip-address</i> }<br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.10.10.12 | Specifies the destination of the tunnel for this path option.<br><ul style="list-style-type: none"> <li>• The <i>hostname</i> argument is the name of the host destination.</li> <li>• The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.</li> </ul> |

| Command or Action                                                                                                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 5</b></p> <pre>tunnel mpls traffic-eng path-option number {dynamic   explicit {name path-name   path-number} [verbatim]} [attributes string] [bandwidth [sub-pool   global] kbps] [lockdown]</pre> <p><b>Example:</b></p> <pre>Router(config-if)# tunnel mpls traffic-eng path-option 1 dynamic attributes 1</pre> | <p>Adds an LSP attribute list to specify LSP-related parameters for a path options for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> <li>The <i>number</i> argument identifies the path option.</li> <li>The <b>dynamic</b> keyword indicates that the path option is dynamically calculated (the router figures out the best path).</li> <li>The <b>explicit</b> keyword indicates that the path option is specified. You specify the IP addresses of the path.</li> <li>The <b>name path-name</b> keyword argument combination identifies the name of the explicit path option.</li> <li>The <i>path-number</i> argument identifies the number of the explicit path option.</li> <li>The <b>verbatim</b> keyword bypasses the topology database verification.</li> </ul> <p><b>Note</b> You can use the <b>verbatim</b> keyword only with the explicit path option.</p> <ul style="list-style-type: none"> <li>The <b>attributes string</b> keyword argument combination names an attribute list to specify path options for the LSP.</li> <li>The <b>bandwidth</b> keyword specifies LSP bandwidth.</li> <li>The <b>sub-pool</b> keyword indicates a subpool path option.</li> <li>The <b>global</b> keyword indicates a global pool path option. Entering this keyword is not necessary, for all path options are from the global pool in the absence of the <b>sub-pool</b> keyword.</li> <li>The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.</li> <li>The <b>lockdown</b> keyword disables reoptimization of the LSP.</li> </ul> |

## Removing a Path Option for an LSP for an MPLS TE Tunnel

Perform this task to remove a path option for an LSP for an MPLS TE tunnel. Use this task to remove a path option for an LSP when your MPLS TE tunnel traffic requirements change.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **tunnel destination** {*hostname* | *ip-address*}
5. **no tunnel mpls traffic-eng path-option** *number* {**dynamic** | **explicit** {**name** *path-name* | *path-number*} [**verbatim**]} [**attributes** *string*] [**bandwidth** [**sub-pool** | **global**] *kbits*] [**lockdown**]
6. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                     |

| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                              | Configures the interface type and enters interface configuration mode.<br><ul style="list-style-type: none"><li>• The <i>type</i> argument is the type of interface that you want to configure.</li><li>• The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.</li></ul>  |
| Step 4 | <b>tunnel destination</b> { <i>hostname</i>   <i>ip-address</i> }<br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.10.10.12 | Specifies the destination of the tunnel for this path option.<br><ul style="list-style-type: none"><li>• The <i>hostname</i> argument is the name of the host destination.</li><li>• The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.</li></ul> |

| Command or Action                                                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 5</b></p> <pre>no tunnel mpls traffic-eng path-option number {dynamic   explicit {name path-name   path-number} [verbatim]} [attributes string] [bandwidth [sub-pool   global] kbps] [lockdown]</pre> <p><b>Example:</b><br/>Router(config-if)# no tunnel mpls traffic-eng<br/>path-option 1 dynamic attributes 1</p> | <p>Removes an LSP attribute list that specifies LSP-related parameters for a path option for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> <li>• The <i>number</i> argument identifies the path option.</li> <li>• The <b>dynamic</b> keyword indicates that the path option is dynamically calculated (the router figures out the best path).</li> <li>• The <b>explicit</b> keyword indicates that the path option is specified. You specify the IP addresses of the path.</li> <li>• The <b>name path-name</b> keyword argument combination identifies the name of the explicit path option.</li> <li>• The <i>path-number</i> argument identifies the number of the explicit path option.</li> <li>• The <b>verbatim</b> keyword bypasses the topology database verification.</li> </ul> <p><b>Note</b> You can use the <b>verbatim</b> keyword only with the explicit path option.</p> <ul style="list-style-type: none"> <li>• The <b>attributes string</b> keyword argument combination names an attribute list to specify path options for the LSP.</li> <li>• The <b>bandwidth</b> keyword specifies LSP bandwidth.</li> <li>• The <b>sub-pool</b> keyword indicates a subpool path option.</li> <li>• The <b>global</b> keyword indicates a global pool path option. Entering this keyword is not necessary, for all path options are from the global pool in the absence of the <b>sub-pool</b> keyword.</li> <li>• The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.</li> <li>• The <b>lockdown</b> keyword disables reoptimization of the LSP.</li> </ul> |
| <p><b>Step 6</b></p> <pre>end</pre> <p><b>Example:</b><br/>Router(config-if)# end</p>                                                                                                                                                                                                                                            | <p>(Optional) Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Verifying that LSP Is Signaled Using the Correct Attributes

Perform this task to verify that the LSP is signaled using the correct attributes.

### SUMMARY STEPS

1. **enable**
2. **show mpls traffic-eng tunnels *tunnel-interface* [brief]**
3. **exit**

### DETAILED STEPS

---

**Step 1 enable**

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```
Router> enable
Router#
```

**Step 2 show mpls traffic-eng tunnels *tunnel-interface* [brief]**

Use this command to verify that the LSP is signaled using the correct attributes for the specified tunnel. For example:

```
Router# show mpls traffic-eng tunnels tunnel1

Name: Router-10-c_t1                               (Tunnel1) Destination: 10.10.10.12
Status:
  Admin: up           Oper: up           Path: valid           Signalling: connected

  path option 2, type explicit path2 (Basis for Setup, path weight 65834)

Config Parameters:
  Bandwidth: 1000      kbps (Global)  Priority: 1 1  Affinity: 0x0/0xFFFF
  Metric Type: IGP (global)
  AutoRoute: enabled   LockDown: disabled Loadshare: 1      bw-based
  auto-bw: disabled

Active Path Option Parameters:
  State: explicit path option 2 is active
  BandwidthOverride: enabled   LockDown: disabled Verbatim: disabled

Bandwidth Override:
  Signalling: 1        kbps (Global)
  Overriding: 1000     kbps (Global) configured on tunnel
```

The output shows that the following attributes are signaled for tunnel tunnel1: affinity 0 mask 0, auto-bw disabled, bandwidth 1000, lockdown disabled, and priority 1 1.

**Step 3 exit**

Use this command to return to user EXEC mode. For example:

```
Router# exit
Router>
```

---

## Configuring a Path Option for Bandwidth Override

This section contains the following tasks for configuring a path option for bandwidth override:

- [Configuring Fallback Bandwidth Path Options for TE Tunnels, page 26](#) (required)
- [Modifying the Bandwidth on a Path Option for Bandwidth Override, page 29](#) (optional)
- [Removing a Path Option for Bandwidth Override, page 31](#) (optional)
- [Verifying that LSP Is Signaled Using the Correct Bandwidth, page 33](#) (optional)

### Note

Once you configure bandwidth as a path-option parameter, you can no longer configure an LSP attribute list as a path-option parameter.

## Configuring Fallback Bandwidth Path Options for TE Tunnels

Perform this task to configure fallback bandwidth path options for a TE tunnel. Use this task to configure path options that reduce the bandwidth constraint each time the headend of a tunnel fails to establish an LSP.

Configuration of the Path Option for Bandwidth Override feature can reduce bandwidth constraints on path options temporarily and improve the chances that an LSP is set up for the TE tunnel. When a TE tunnel uses a path option with bandwidth override, the traffic engineering software attempts every 30 seconds to reoptimize the tunnel to use the preferred path option with the original configured bandwidth. The Path Option for Bandwidth Override feature is designed as a temporary reduction in bandwidth constraint. To force immediate reoptimization of all traffic engineering tunnels, you can use the **mpls traffic-eng reoptimize** command. You can also configure the **lockdown** command with bandwidth override to prevent automatic reoptimization.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **tunnel destination** {*hostname* | *ip-address*}
5. **tunnel mpls traffic-eng path-option** *number* {**dynamic** | **explicit** {**name** *path--name* | *path-number*} [**verbatim**] } [**attributes** *string*] [**bandwidth** [**sub-pool** | **global**] *kbps*] [**lockdown**]
6. **end**

## DETAILED STEPS

|        | Command or Action                                                                 | Purpose                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code>                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                                         |
|        | <b>Example:</b><br><code>Router&gt; enable</code>                                 |                                                                                                                                                                                                                                                        |
| Step 2 | <code>configure terminal</code>                                                   | Enters global configuration mode.                                                                                                                                                                                                                      |
|        | <b>Example:</b><br><code>Router# configure terminal</code>                        |                                                                                                                                                                                                                                                        |
| Step 3 | <code>interface type number</code>                                                | Configures an interface type and enters interface configuration mode.                                                                                                                                                                                  |
|        | <b>Example:</b><br><code>Router(config)# interface tunnel 1</code>                | <ul style="list-style-type: none"><li>The <i>type</i> argument is the type of interface that you want to configure.</li><li>The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.</li></ul>           |
| Step 4 | <code>tunnel destination {hostname   ip-address}</code>                           | Specifies the destination of the tunnel for this path option.                                                                                                                                                                                          |
|        | <b>Example:</b><br><code>Router(config-if)# tunnel destination 10.10.10.12</code> | <ul style="list-style-type: none"><li>The <i>hostname</i> argument is the name of the host destination.</li><li>The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.</li></ul> |

| Command or Action                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 5</b></p> <pre>tunnel mpls traffic-eng path-option number {dynamic   explicit {name path-name   path-number} [verbatim]} [attributes string] [bandwidth [sub-pool   global] kbps] [lockdown]</pre> <p><b>Example:</b></p> <pre>Router(config-if)# tunnel mpls traffic-eng path-option 1 dynamic bandwidth 500</pre> | <p>Adds a path option for bandwidth override to specify a bandwidth fallback for a path option for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> <li>• The <i>number</i> argument identifies the path option.</li> <li>• The <b>dynamic</b> keyword indicates that the path option is dynamically calculated (the router figures out the best path).</li> <li>• The <b>explicit</b> keyword indicates that the path option is specified. You specify the IP addresses of the path.</li> <li>• The <b>name</b> <i>path-name</i> keyword argument combination identifies the name of the explicit path option.</li> <li>• The <i>path-number</i> argument identifies the number of the explicit path option.</li> <li>• The <b>verbatim</b> keyword bypasses the topology database verification.</li> </ul> <p><b>Note</b> You can use the <b>verbatim</b> keyword only with the explicit path option.</p> <ul style="list-style-type: none"> <li>• The <b>attributes</b> <i>string</i> keyword argument combination names an attribute list to specify path options for the LSP.</li> <li>• The <b>bandwidth</b> keyword specifies LSP bandwidth.</li> <li>• The <b>sub-pool</b> keyword indicates a subpool path option.</li> <li>• The <b>global</b> keyword indicates a global pool path option. Entering this keyword is not necessary, for all path options are from the global pool in the absence of the <b>sub-pool</b> keyword.</li> <li>• The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.</li> <li>• The <b>lockdown</b> keyword disables reoptimization of the LSP.</li> </ul> |
| <p><b>Step 6</b></p> <pre>end</pre> <p><b>Example:</b></p> <pre>Router(config-if)# end</pre>                                                                                                                                                                                                                                   | <p>(Optional) Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Modifying the Bandwidth on a Path Option for Bandwidth Override

Perform this task to modify the bandwidth on a path option for bandwidth override. You might need to further reduce or modify the bandwidth constraint for a path option to ensure that the headend of a tunnel establishes an LSP.

The Path Option for Bandwidth Override feature is designed as a temporary reduction in bandwidth constraint. To force immediate reoptimization of all traffic engineering tunnels, you can use the **mpls traffic-eng reoptimize** command. You can also configure the **lockdown** command with bandwidth override to prevent automatic reoptimization.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **tunnel destination** {*hostname* | *ip-address*}
5. **tunnel mpls traffic-eng path-option** *number* {**dynamic** | **explicit** {**name** *path-name* | *path-number*} [**verbatim**]} [**attributes** *string*] [**bandwidth** [*sub-pool* | **global**] *kbps*] [**lockdown**]
6. **end**
7. **show mpls traffic-eng tunnels** *tunnel-interface* [**brief**]

### DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                     |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                           |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                              | Configures the interface type and enters interface configuration mode. <ul style="list-style-type: none"> <li>• The <i>type</i> argument is the type of interface that you want to configure.</li> <li>• The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.</li> </ul>  |
| Step 4 | <b>tunnel destination</b> { <i>hostname</i>   <i>ip-address</i> }<br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.10.10.12 | Specifies the destination of the tunnel for this path option. <ul style="list-style-type: none"> <li>• The <i>hostname</i> argument is the name of the host destination.</li> <li>• The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.</li> </ul> |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>tunnel mpls traffic-eng path-option</b> <i>number</i> {<b>dynamic</b>   <b>explicit</b> {<b>name</b> <i>path-name</i>   <i>path-number</i>} [<b>verbatim</b>] } [<b>attributes</b> <i>string</i>] [<b>bandwidth</b> [<b>sub-pool</b>   <b>global</b>] <i>kbps</i>] [<b>lockdown</b>]</p> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng path-option 2 dynamic bandwidth 500</p> | <p>Adds a path option for bandwidth override to specify a bandwidth fallback for a path option for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> <li>The <i>number</i> argument identifies the path option.</li> <li>The <b>dynamic</b> keyword indicates that the path option is dynamically calculated (the router figures out the best path).</li> <li>The <b>explicit</b> keyword indicates that the path option is specified. You specify the IP addresses of the path.</li> <li>The <b>name</b> <i>path-name</i> keyword argument combination identifies the name of the explicit path option.</li> <li>The <i>path-number</i> argument identifies the number of the explicit path option.</li> <li>The <b>verbatim</b> keyword bypasses the topology database verification.</li> </ul> <p><b>Note</b> You can use the <b>verbatim</b> keyword only with the explicit path option.</p> <ul style="list-style-type: none"> <li>The <b>attributes</b> <i>string</i> keyword argument combination names an attribute list to specify path options for the LSP.</li> <li>The <b>bandwidth</b> keyword specifies LSP bandwidth.</li> <li>The <b>sub-pool</b> keyword indicates a subpool path option.</li> <li>The <b>global</b> keyword indicates a global pool path option. Entering this keyword is not necessary, for all path options are from the global pool in the absence of the <b>sub-pool</b> keyword.</li> <li>The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.</li> <li>The <b>lockdown</b> keyword disables reoptimization of the LSP.</li> </ul> |
| Step 6 | <p><b>end</b></p> <p><b>Example:</b><br/>Router(config-if)# end</p>                                                                                                                                                                                                                                                                                                                                      | <p>(Optional) Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 7 | <p><b>show mpls traffic-eng tunnels</b> <i>tunnel-interface</i> [<b>brief</b>]</p> <p><b>Example:</b><br/>Router# show mpls traffic-eng tunnels tunnel1</p>                                                                                                                                                                                                                                              | <p>(Optional) Displays information about tunnels.</p> <ul style="list-style-type: none"> <li>Use the <b>show mpls traffic-eng tunnels</b> command to verify which bandwidth path option is in use by the LSP.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Removing a Path Option for Bandwidth Override

Perform this task to remove the bandwidth on the path option for bandwidth override. The Path Option for Bandwidth Override feature is designed as a temporary reduction in bandwidth constraint. Use this task to remove the bandwidth override when it is not required.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **tunnel destination** {*hostname* | *ip-address*}
5. **no tunnel mpls traffic-eng path-option** *number* {**dynamic** | **explicit** {**name** *path-name* | *path-number*} [**verbatim**]} [**attributes** *string*] [**bandwidth** [**sub-pool** | **global**] *kbps*] [**lockdown**]
6. **end**
7. **show mpls traffic-eng tunnels** *tunnel-interface* [**brief**]

### DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                        |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                        | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                              |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                              | Configures an interface type and enters interface configuration mode.<br><ul style="list-style-type: none"> <li>• The <i>type</i> argument is the type of interface that you want to configure.</li> <li>• The <i>number</i> argument is the number of the tunnel interface that you want to create or configure.</li> </ul>   |
| Step 4 | <b>tunnel destination</b> { <i>hostname</i>   <i>ip-address</i> }<br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.10.10.12 | Specifies the destination of the tunnel for this path option.<br><ul style="list-style-type: none"> <li>• The <i>hostname</i> argument is the name of the host destination.</li> <li>• The <i>ip-address</i> argument is the IP address of the host destination expressed in decimal in four-part, dotted notation.</li> </ul> |

|        | Command or Action                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <pre>no tunnel mpls traffic-eng path-option number {dynamic   explicit {name path-name   path-number} [verbatim]} [attributes string] [bandwidth [sub-pool   global] kbps] [lockdown]</pre> <p><b>Example:</b><br/>Router(config-if)# no tunnel mpls traffic-eng<br/>path-option 2 dynamic bandwidth 500</p> | <p>Removes a path option for bandwidth override that specifies a bandwidth fallback for a path option for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> <li>The <i>number</i> argument identifies the path option.</li> <li>The <b>dynamic</b> keyword indicates that the path option is dynamically calculated (the router figures out the best path).</li> <li>The <b>explicit</b> keyword indicates that the path option is specified. You specify the IP addresses of the path.</li> <li>The <b>name path-name</b> keyword argument combination identifies the name of the explicit path option.</li> <li>The <i>path-number</i> argument identifies the number of the explicit path option.</li> <li>The <b>verbatim</b> keyword bypasses the topology database verification.</li> </ul> <p><b>Note</b> You can use the <b>verbatim</b> keyword only with the explicit path option.</p> <ul style="list-style-type: none"> <li>The <b>attributes string</b> keyword argument combination names an attribute list to specify path options for the LSP.</li> <li>The <b>bandwidth</b> keyword specifies LSP bandwidth.</li> <li>The <b>sub-pool</b> keyword indicates a subpool path option.</li> <li>The <b>global</b> keyword indicates a global pool path option. Entering this keyword is not necessary, for all path options are from the global pool in the absence of the <b>sub-pool</b> keyword.</li> <li>The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.</li> <li>The <b>lockdown</b> keyword disables reoptimization of the LSP.</li> </ul> |
| Step 6 | <pre>end</pre> <p><b>Example:</b><br/>Router(config-if)# end</p>                                                                                                                                                                                                                                             | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 7 | <pre>show mpls traffic-eng tunnels tunnel-interface [brief]</pre> <p><b>Example:</b><br/>Router# show mpls traffic-eng tunnels tunnel1</p>                                                                                                                                                                   | <p>(Optional) Displays information about tunnels.</p> <ul style="list-style-type: none"> <li>Use the <b>show mpls traffic-eng tunnels</b> command to verify which bandwidth path option is in use by the LSP.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Verifying that LSP Is Signaled Using the Correct Bandwidth

Perform this task to verify that the LSP is signaled with the correct bandwidth.

### SUMMARY STEPS

1. **enable**
2. **show mpls traffic-eng tunnels *tunnel-interface* [brief]**
3. **exit**

### DETAILED STEPS

#### Step 1 **enable**

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```
Router> enable
Router#
```

#### Step 2 **show mpls traffic-eng tunnels *tunnel-interface* [brief]**

Use this command to verify that the LSP is signaled with the correct bandwidth and to verify that the bandwidth configured on the tunnel is overridden. For example:

```
Router# show mpls traffic-eng tunnels tunnel121

Name: Router-15-c_t21                               (Tunnel121) Destination: 10.10.10.12
Status:
  Admin: up           Oper: up           Path: valid           Signalling: connected

  path option 2, type explicit path2 (Basis for Setup, path weight 65834)
  path option 1, type explicit path1

Config Parameters:
  Bandwidth: 1000      kbps (Global) Priority: 1 1 Affinity: 0x0/0xFFFF
  Metric Type: IGP (global)
  AutoRoute: enabled LockDown: disabled Loadshare: 1 bw-based
  auto-bw: disabled

Active Path Option Parameters:
  State: explicit path option 2 is active
  BandwidthOverride: enabled LockDown: disabled Verbatim: disabled

Bandwidth Override:
  Signalling: 500 kbps (Global)
  Overriding: 1000      kbps (Global) configured on tunnel
```

If bandwidth override is actively being signaled, the **show mpls traffic-eng tunnel** command displays the bandwidth override information under the Active Path Option Parameters heading. The example shows that BandwidthOverride is enabled and that the tunnel is signaled using path-option 2. The bandwidth signaled is 500. This is the value configured on the path option 2 and it overrides the 1000 kbps bandwidth configured on the tunnel interface.

#### Step 3 **exit**

Use this command to exit to user EXEC mode. For example:

```
Router# exit
Router>
```

## Troubleshooting Tips

If the tunnel state is down and you configured a path-option with bandwidth override enabled, the **show mpls traffic-eng tunnels** command indicates other reasons why a tunnel is not established. For example:

- The tunnel destination is not in the routing table.
- If the bandwidth override value is not zero, the bandwidth constraint may still be too large.
- Other attributes configured on the tunnel, such as affinity, might prevent the calculation of a path over the existing topology.
- TE might not be configured on all links necessary to reach tunnel destination.

# Configuration Examples for MPLS Traffic Engineering—LSP Attributes

This section contains the following configuration examples for the MPLS Traffic Engineering—LSP Attributes features:

- [Configuring LSP Attribute List: Examples, page 34](#)
- [Configuring a Path Option for Bandwidth Override: Examples, page 37](#)

## Configuring LSP Attribute List: Examples

This section contains the following examples for configuring LSP attribute lists:

- [Configuring an LSP Attribute List: Example, page 34](#)
- [Adding Attributes to an LSP Attribute List: Example, page 35](#)
- [Removing an Attribute from an LSP Attribute List: Example, page 35](#)
- [Modifying an Attribute in an LSP Attribute List: Example, page 35](#)
- [Deleting an LSP Attribute List: Example, page 35](#)
- [Associating an LSP Attribute List with a Path Option for a TE Tunnel: Example, page 36](#)
- [Modifying a Path Option to Use a Different LSP Attribute List: Example, page 36](#)
- [Removing a Path Option for Bandwidth Override: Example, page 39](#)

## Configuring an LSP Attribute List: Example

This example shows the configuration of the affinity, bandwidth, and priority LSP-related attributes in an LSP attribute list identified with the numeral 1:

```
Router(config)# mpls traffic-eng lsp attributes 1
Router(config-lsp-attr)# affinity 7 7
Router(config-lsp-attr)# bandwidth 1000
Router(config-lsp-attr)# priority 1 1
Router(config-lsp-attr)# exit
```

## Adding Attributes to an LSP Attribute List: Example

This example shows the addition of protection attributes to the LSP attribute list identified with the numeral 1:

```
Router(config)# mpls traffic-eng lsp attributes 1
Router(config-lsp-attr)# affinity 7 7
Router(config-lsp-attr)# bandwidth 1000
Router(config-lsp-attr)# priority 1 1
Router(config-lsp-attr)# protection fast-reroute
Router(config-lsp-attr)# exit
```

## Removing an Attribute from an LSP Attribute List: Example

The following example shows removing the priority attribute from the LSP attribute list identified by the string simple:

```
Router(config)# mpls traffic-eng lsp attributes simple
Router(config-lsp-attr)# priority 1 1
Router(config-lsp-attr)# list

LIST simple
  priority 1 1
!
Router(config-lsp-attr)# no priority
Router(config-lsp-attr)# list

LIST simple
!
Router(config-lsp-attr)# exit
```

## Modifying an Attribute in an LSP Attribute List: Example

The following example shows modifying the bandwidth in an LSP attribute list identified by the numeral 5:

```
Router(config)# mpls traffic-eng lsp attributes 5
Router(config-lsp-attr)# bandwidth 1000
Router(config-lsp-attr)# priority 1 1
Router(config-lsp-attr)# list

LIST 5
  bandwidth 1000
  priority 1 1

Router(config-lsp-attr)# bandwidth 500
Router(config-lsp-attr)# list

LIST 5
  bandwidth 500
  priority 1 1

Router(config-lsp-attr)# exit
```

## Deleting an LSP Attribute List: Example

The following example shows the deletion of an LSP attribute list identified by numeral 1:

```
Router(config)# mpls traffic-eng lsp attributes 1
Router(config-lsp-attr)# affinity 7 7
```

```

Router(config-lsp-attr)# bandwidth 1000
Router(config-lsp-attr)# priority 1 1
Router(config-lsp-attr)# exit
!
Router(config)# no mpls traffic-eng lsp attributes 1

```

## Associating an LSP Attribute List with a Path Option for a TE Tunnel: Example

The following example associates the LSP attribute list identified by the numeral 3 with path option 1:

```

Router(config)# mpls traffic-eng lsp attributes 3
Router(config-lsp-attr)# bandwidth 1000
Router(config-lsp-attr)# priority 2 2
Router(config-lsp-attr)# protection fast-reroute
Router(config-lsp-attr)# exit
!
!
Router(config)# interface Tunnel 1
Router(config-if)# ip unnumbered Ethernet4/0/1
Router(config-if)# tunnel destination 10.112.0.12
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng affinity 1
Router(config-if)# tunnel mpls traffic-eng bandwidth 5000
Router(config-if)# tunnel mpls traffic-eng path-option 1 dynamic attributes 3

```

In this configuration, the LSP will have the following attributes:

```

{bandwidth = 1000
 priority = 2 2
 affinity 1
 reroute enabled.
}

```

The LSP attribute list referenced by the path option will take precedence over the values configured on the tunnel interface.

## Modifying a Path Option to Use a Different LSP Attribute List: Example

The following example modifies path option 1 to use an LSP attribute list identified by the numeral 1:

```

Router(config)# mpls traffic-eng lsp attributes 1
Router(config-lsp-attr)# affinity 7 7
Router(config-lsp-attr)# bandwidth 500
Router(config-lsp-attr)# priority 1 1
Router(config-lsp-attr)# exit

Router(config)# mpls traffic-eng lsp attributes 2
Router(config-lsp-attr)# bandwidth 1000
Router(config-lsp-attr)# priority 1 1
Router(config-lsp-attr)# exit

Router(config)# interface Tunnel 1
Router(config-if)# ip unnumbered Ethernet4/0/1
Router(config-if)# tunnel destination 10.112.0.12
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng affinity 1
Router(config-if)# tunnel mpls traffic-eng bandwidth 5000
Router(config-if)# tunnel mpls traffic-eng path-option 1 dynamic attributes 1

```

In this configuration, the LSP will have the following attributes:

```

{affinity = 7 7

```

```
bandwidth = 500
priority = 1 1
}
```

## Removing a Path Option for an LSP for an MPLS TE Tunnel: Example

The following example shows the removal of path option 1 for an LSP for a TE tunnel:

```
Router(config)# interface Tunnel 1
Router(config-if)# ip unnumbered Ethernet4/0/1
Router(config-if)# tunnel destination 10.112.0.12
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng affinity 1
Router(config-if)# tunnel mpls traffic-eng bandwidth 5000
Router(config-if)# tunnel mpls traffic-eng path-option 1 explicit path1 attributes 1
Router(config-if)# tunnel mpls traffic-eng path-option 2 explicit path2 attributes 2
!
!
Router(config-if)# no tunnel mpls traffic-eng path-option 1 explicit path1 attributes 1
```

## Configuring a Path Option for Bandwidth Override: Examples

This section contains the following examples for configuring a path option for bandwidth override:

- [Path Option for Bandwidth Override and LSP Attribute List Configuration Command Examples, page 37](#)
- [Configuring Fallback Bandwidth Path Options for TE Tunnels: Example, page 38](#)
- [Modifying the Bandwidth on a Path Option for Bandwidth Override: Example, page 38](#)
- [Removing a Path Option for Bandwidth Override: Example, page 39](#)

## Path Option for Bandwidth Override and LSP Attribute List Configuration Command Examples

The following are examples of the Cisco IOS command-line interface (CLI) to use when you configure a path option to override the bandwidth:

```
Router(config-if)# tunnel mpls traffic-eng path-option 3 explicit name path1 ?

attributes Specify an LSP attribute list
bandwidth  override the bandwidth configured on the tunnel
lockdown    not a candidate for reoptimization
<cr>

Router(config-if)# tunnel mpls traffic-eng path-option 3 explicit name path1 bandwidth ?

<0-4294967295>  bandwidth requirement in kbps
sub-pool        tunnel uses sub-pool bandwidth

Router(config-if)# tunnel mpls traffic-eng path-option 3 explicit name path1 bandwidth 500
?
lockdown    not a candidate for reoptimization
<cr>
```

### Note

Once you configure bandwidth as a path-option parameter, you can no longer configure an LSP attribute list as a path-option parameter.

## Configuring Fallback Bandwidth Path Options for TE Tunnels: Example

The following example shows multiple path options configured with the **tunnel mpls traffic-eng path-option** command:

```
interface Tunnel 1
 ip unnumbered Loopback0
 tunnel destination 10.10.10.12
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng path-option 1 explicit name path1
 tunnel mpls traffic-eng path-option 2 explicit name path2 bandwidth 500
 tunnel mpls traffic-eng path-option 3 dynamic bandwidth 0
end
```

The device selects a path option for an LSP in order of preference, as follows:

- The device attempts to signal an LSP using path options starting with path-option 1.  
The device attempts to signal an LSP with the 1000 kbps bandwidth configured on the tunnel interface because path-option 1 has no bandwidth configured.
- If 1000 kbps bandwidth is not available over the network, the device attempts to establish an LSP using path-option 2.  
Path-option 2 has a bandwidth of 500 kbps configured. This reduces the bandwidth constraint from the original 1000 kbps configured on the tunnel interface.
- If 500 kbps is not available, the device attempts to establish an LSP using path-option 3.  
Path-option 3 is configured as dynamic and has bandwidth 0. The device establishes the LSP if an IP path exists to the destination and all other tunnel constraints are met.

## Modifying the Bandwidth on a Path Option for Bandwidth Override: Example

The following example shows modifying the bandwidth on a path option for bandwidth override. Path-option 3 is changed to an explicit path with a bandwidth of 100 kbps. Path-option 4 is configured with bandwidth 0.

```
interface Tunnel 1
 ip unnumbered Loopback0
 tunnel destination 10.10.10.12
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng path-option 1 explicit name path1
 tunnel mpls traffic-eng path-option 2 explicit name path2 bandwidth 500
 tunnel mpls traffic-eng path-option 3 dynamic bandwidth 0
!
!
Router(config)# tunnel mpls traffic-eng path-option 3 explicit name path3 bandwidth 100
Router(config)# tunnel mpls traffic-eng path-option 4 dynamic bandwidth 0
```

## Removing a Path Option for Bandwidth Override: Example

The following example shows removing a path option for bandwidth override:

```
interface Tunnel 1
 ip unnumbered Loopback0
 tunnel destination 10.10.10.12
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng path-option 1 explicit name path1
 tunnel mpls traffic-eng path-option 2 explicit name path2 bandwidth 500
 tunnel mpls traffic-eng path-option 3 explicit name path3 bandwidth 100
 tunnel mpls traffic-eng path-option 4 dynamic bandwidth 0
!
Router(config)# no tunnel mpls traffic-eng path-option 3 explicit name path3 bandwidth 100
```

# Feature Information for MPLS Traffic Engineering—LSP Attributes

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering—LSP Attributes

| Feature Name                            | Releases                                             | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# Glossary

**bandwidth**—The difference between the highest and lowest frequencies available for network signals. The term also is used to describe the rated throughput capacity of a given network medium or protocol. The frequency range necessary to convey a signal measured in units of hertz (Hz). For example, voice signals typically require approximately 7 kHz of bandwidth and data traffic typically requires approximately 50 kHz of bandwidth.

**bandwidth reservation**—The process of assigning bandwidth to users and applications served by a network. This process involves assigning priority to different flows of traffic based on how critical and delay-sensitive they are. This makes the best use of available bandwidth, and if the network becomes congested, lower-priority traffic can be dropped. Sometimes called bandwidth allocation

**global pool**—The total bandwidth allocated to an MPLS traffic engineering link.

**label switched path (LSP) tunnel**—A configured connection between two routers, using label switching to carry the packets.

**LSR**—label switch router. A Multiprotocol Label Switching (MPLS) node that can forward native Layer 3 packets. The LSR forwards a packet based on the value of a label attached to the packet.

**MPLS TE**—MPLS traffic engineering (formerly known as “RRR” or Resource Reservation Routing). The use of label switching to improve traffic performance along with an efficient use of network resources.

**subpool**—The more restrictive bandwidth in an MPLS traffic engineering link. The subpool is a portion of the link's overall global pool bandwidth.

**TE**—traffic engineering. The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used. The application of scientific principles and technology to measure, model, and control internet traffic in order to simultaneously optimize traffic performance and network resource utilization.

**traffic engineering tunnel**—A label-switched tunnel used for traffic engineering. Such a tunnel is set up through means other than normal Layer 3 routing; it is used to direct traffic over a path different from the one that Layer 3 routing could cause the tunnel to take.

**tunnel**—A secure communication path between two peers, such as two routers.

# MPLS Traffic Engineering—Autotunnel Primary and Backup

---

**First Published:** January 26, 2004  
**Last Updated:** October 21, 2009

The MPLS Traffic Engineering—Autotunnel Primary and Backup feature enables a router to dynamically build backup tunnels and to dynamically create one-hop primary tunnels on all interfaces that have been configured with Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels.

A router with primary one-hop autotunnels and backup autotunnels can be configured with stateful switchover (SSO) redundancy.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering—Autotunnel Primary and Backup” section on page 17](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Glossary, page 18](#)

## Prerequisites for MPLS Traffic Engineering—Autotunnel Primary and Backup

- Configure TE on the routers.

## Restrictions for MPLS Traffic Engineering—Autotunnel Primary and Backup

- You cannot configure a static route to route traffic over TE autotunnels. For autotunnels, you should use only the autoroute for tunnel selection.

## Information About MPLS Traffic Engineering—Autotunnel Primary and Backup

To configure autotunnels, you need to understand the following concepts:

- [Overview of MPLS Traffic Engineering—Autotunnel Primary and Backup, page 2](#)
- [Benefits of MPLS Traffic Engineering—Autotunnel Primary and Backup Feature, page 3](#)
- [MPLS Traffic Engineering, page 3](#)
- [MPLS Traffic Engineering Backup Autotunnels, page 3](#)
- [MPLS Traffic Engineering Primary Autotunnels, page 5](#)
- [MPLS Traffic Engineering Label-Based Forwarding, page 6](#)
- [Benefits of MPLS Traffic Engineering Protection, page 6](#)
- [SSO Redundancy Overview, page 7](#)

## Overview of MPLS Traffic Engineering—Autotunnel Primary and Backup

The MPLS Traffic Engineering—Autotunnel Primary and Backup feature has the following features:

- Backup autotunnel—Enables a router to dynamically build backup tunnels.
- Primary one-hop autotunnel—Enables a router to dynamically create one-hop primary tunnels on all interfaces that have been configured with MPLS TE tunnels.

If no backup tunnels exist, the following types of backup tunnels are created:

- Next hop (NHOP)
- Next-next hop (NNHOP)

## Benefits of MPLS Traffic Engineering—Autotunnel Primary and Backup Feature

- Backup tunnels are built automatically, eliminating the need for users to preconfigure each backup tunnel and then assign the backup tunnel to the protected interface.
- The dynamic creation of one-hop primary tunnels eliminates the need to configure an MPLS TE tunnel with the Fast Reroute (FRR) option for the tunnel to be protected.
- Protection is expanded; FRR does not protect IP traffic that is not using the TE tunnel or Label Distribution Protocol (LDP) labels that are not using the TE tunnel.

## MPLS Traffic Engineering

MPLS is an Internet Engineering Task Force (IETF)-specified framework that provides for the efficient designation, routing, forwarding, and switching of traffic flows through the network.

TE is the process of adjusting bandwidth allocations to ensure that enough bandwidth is left for high-priority traffic.

In MPLS TE, the upstream router creates a network tunnel for a particular traffic stream, then sets the bandwidth available for that tunnel.

## MPLS Traffic Engineering Backup Autotunnels

MPLS backup autotunnels protect fast reroutable TE label switched paths (LSPs). Without MPLS backup autotunnels to protect a LSP you had to do the following:

- Preconfigure each backup tunnel.
- Assign the backup tunnels to the protected interfaces.

An LSP requests backup protection from Resource Reservation Protocol (RSVP) FRR in the following situations:

- Receipt of the first RSVP Resv message
- Receipt of an RSVP path message with the protection attribute after the LSP has been established without the protection attribute
- Detection that a Record Route Object (RRO) changed

If there was no backup tunnel protecting the interface used by the LSP, the LSP remained unprotected.

Backup autotunnels enable a router to dynamically build backup tunnels when they are needed. This prevents you from having to build MPLS TE tunnels statically.

Backup tunnels may not be available for the following reasons:

- Static backup tunnels are not configured.
- Static backup tunnels are configured, but cannot protect the LSP. The backup tunnel may not have enough available bandwidth, the tunnel may protect a different pool, or the tunnel may be down.

If a backup tunnel is not available, the following two backup tunnels are created dynamically:

- NHOP—Protects against link failure
- NNHOP—Protects against node failure

**Note**

At the penultimate hop, only an NHOP backup tunnel is created.

**Note**

If two LSPs share the same output interface and NHOP, three (not four) backup tunnels are created. They share an NHOP backup tunnel.

## Link Protection

Backup tunnels that bypass only a single link of the LSP's path provide link protection. They protect LSPs if a link along their path fails by rerouting the LSP's traffic to the next hop (bypassing the failed link). These are referred to as NHOP backup tunnels because they terminate at the LSP's next hop beyond the point of failure. [Figure 1](#) illustrates an NHOP backup tunnel.

**Figure 1**      *Next-Hop Backup Tunnel*

## Node Protection

Backup tunnels that bypass next-hop nodes along LSP paths are called NNHOP backup tunnels because they terminate at the node following the next-hop node of the LSPs, thereby bypassing the next-hop node. They protect LSPs by enabling the node upstream of a link or node failure to reroute the LSPs and their traffic around the failure to the next-hop node. NNHOP backup tunnels also provide protection from link failures because they bypass the failed link and the node.

[Figure 2](#) illustrates an NNHOP backup tunnel.

**Figure 2**      **Next-Next Hop Backup Tunnel**

59557

## Explicit Paths

Explicit paths are used to create backup autotunnels as follows:

- NHOP excludes the protected link's IP address.
- NNHOP excludes the NHOP router ID.
- The explicit-path name is `_auto-tunnel_tunnelxxx`, where `xxx` matches the dynamically created backup tunnel ID.
- The interface used for the `ip unnumbered` command defaults to Loopback0. You can configure this to use a different interface.

## Range for Backup Autotunnels

The tunnel range for backup autotunnels is configurable. By default, the last 100 TE tunnel IDs are used; that is 65,436 to 65,535. Autotunnels detect tunnel IDs that are being used. IDs are allocated starting with the lowest number.

For example, if you configure a tunnel range 1000 to 1100 and statically configured TE tunnels are in that range, routers do not use those IDs. If those static tunnels are removed, the MPLS TE dynamic tunnel software can use those IDs.

## MPLS Traffic Engineering Primary Autotunnels

The MPLS Traffic Engineering—Autotunnel Primary and Backup feature enables a router to dynamically create one-hop primary tunnels on all interfaces that have been configured with MPLS traffic. The tunnels are created with zero bandwidth. The constraint-based shortest path first (CSPF) is the same as the shortest path first (SPF) when there is zero bandwidth, so the router's choice of the autorouted one-hop primary tunnel is the same as if there were no tunnel. Because it is a one-hop tunnel, the encapsulation is tag-implicit (that is, there is no tag header).

## Explicit Paths

Explicit paths are used to create autotunnels as follows:

- The explicit path is dynamically created.
- The explicit path includes the IP address for the interface connected to the next hop.
- The explicit-path name is `_auto-tunnel_tunnelxxx`, where `xxx` matches the dynamically created one-hop tunnel ID.
- Interfaces used for the **ip unnumbered** command default to Loopback0. You can configure this to use a different interface.

## Range for Autotunnels

The tunnel range is configurable. By default, the last 100 TE tunnel IDs are used; that is 65,436 to 65,535. Autotunnels detect tunnel IDs that are being used. IDs are allocated starting with the lowest number.

For example, if you configure a tunnel range 100 to 200 and statically configured TE tunnels are in that range, routers do not use those IDs. If those static tunnels are removed, the IDs become available for use by the MPLS TE dynamic tunnel software.

## MPLS Traffic Engineering Label-Based Forwarding

Routers receive a packet, determine where it needs to go by examining some fields in the packet, and send it to the appropriate output device. A label is a short, fixed-length identifier that is used to forward packets. A label switching device normally replaces the label in a packet with a new value before forwarding the packet to the next hop. For this reason, the forwarding algorithm is called label swapping. A label switching device, referred to as an LSR, runs standard IP control protocols (that is, routing protocols, RSVP, and so forth) to determine where to forward packets.

## Benefits of MPLS Traffic Engineering Protection

The following sections describe the benefits of MPLS traffic engineering protection:

- [Delivery of Packets During a Failure, page 6](#)
- [Multiple Backup Tunnels Protecting the Same Interface, page 6](#)
- [Scalability, page 7](#)
- [RSVP Hello, page 7](#)

### Delivery of Packets During a Failure

Backup tunnels that terminate at the NNHOP protect both the downstream link and node. This provides protection for link and node failures.

### Multiple Backup Tunnels Protecting the Same Interface

In addition to being required for node protection, the autotunnel primary and backup feature provides the following benefits:

- Redundancy—If one backup tunnel is down, other backup tunnels protect LSPs.
- Increased backup capacity—If the protected interface is a high-capacity link and no single backup path exists with an equal capacity, multiple backup tunnels can protect that one high-capacity link. The LSPs using this link will fail over to different backup tunnels, allowing all of the LSPs to have adequate bandwidth protection during failure (rerouting). If bandwidth protection is not desired, the router spreads LSPs across all available backup tunnels (that is, there is load balancing across backup tunnels).

## Scalability

A backup tunnel can protect multiple LSPs. Furthermore, a backup tunnel can protect multiple interfaces. This is called many-to-one (N:1) protection. N:1 protection has significant scalability advantages over one-to-one (1:1) protection, where a separate backup tunnel must be used for each LSP needing protection.

An example of N:1 protection is that when one backup tunnel protects 5000 LSPs, each router along the backup path maintains one additional tunnel.

An example of 1:1 protection is that when 5000 backup tunnels protect 5000 LSPs, each router along the backup path must maintain state for an additional 5000 tunnels.

## RSVP Hello

RSVP Hello allows a router to detect when its neighbor has gone down but its interface to that neighbor is still operational. When Layer 2 link protocols are unable to detect that the neighbor is unreachable, Hellos provide the detection mechanism; this allows the router to switch LSPs onto its backup tunnels and avoid packet loss.

## SSO Redundancy Overview

The SSO feature is an incremental step within an overall program to improve the availability of networks constructed with Cisco IOS routers.

SSO is particularly useful at the network edge. It provides protection for network edge devices with dual route processors (RPs) that represent a single point of failure in the network design, and where an outage might result in loss of service for customers.

In specific Cisco networking devices that support dual RPs, SSO takes advantage of RP redundancy to increase network availability. The feature establishes one of the RPs as the active processor while the other RP is designated as the standby processor, and then synchronizes critical state information between them. Following an initial synchronization between the two processors, SSO dynamically maintains RP state information between them.

A switchover from the active to the standby processor occurs when the active RP fails, is removed from the networking device, or is manually taken down for maintenance.

# How to Configure MPLS Traffic Engineering—Autotunnel Primary and Backup

This sections contains the following procedures:

- [Establishing MPLS Backup Autotunnels to Protect Fast Reroutable TE LSPs, page 8](#) (required)
- [Establishing MPLS One-Hop Tunnels to All Neighbors, page 9](#) (required)

## Establishing MPLS Backup Autotunnels to Protect Fast Reroutable TE LSPs

To establish an MPLS backup autotunnel to protect fast reroutable TE LSPs, perform the following task.

  
**Note**

Only Steps 1 through 3 are required. If you perform additional steps, you can perform them in any order after Step 3.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `mpls traffic-eng auto-tunnel backup`
4. `mpls traffic-eng auto-tunnel backup nhop-only`
5. `mpls traffic-eng auto-tunnel backup tunnel-num [min num] [max num]`
6. `mpls traffic-eng auto-tunnel backup timers removal unused sec`
7. `mpls traffic-eng auto-tunnel backup config unnumbered-interface interface`

### DETAILED STEPS

|        | Command or Action                                                                   | Purpose                                                                                                          |
|--------|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code>                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
|        | <b>Example:</b><br><code>Router&gt; enable</code>                                   |                                                                                                                  |
| Step 2 | <code>configure terminal</code>                                                     | Enters global configuration mode.                                                                                |
|        | <b>Example:</b><br><code>Router# configure terminal</code>                          |                                                                                                                  |
| Step 3 | <code>mpls traffic-eng auto-tunnel backup</code>                                    | Automatically builds NHOP and NNHOP backup tunnels.                                                              |
|        | <b>Example:</b><br><code>Router(config)# mpls traffic-eng auto-tunnel backup</code> |                                                                                                                  |

|        | Command or Action                                                                                                                                                                                      | Purpose                                                                                                    |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>mpls traffic-eng auto-tunnel backup nhop-only</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel backup nhop-only                                                           | Enables the creation of dynamic NHOP backup tunnels.                                                       |
| Step 5 | <b>mpls traffic-eng auto-tunnel backup tunnel-num [min num] [max num]</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel backup tunnel-num min 1000 max 1100                   | Configures the range of tunnel interface numbers for backup autotunnels.                                   |
| Step 6 | <b>mpls traffic-eng auto-tunnel backup timers removal unused sec</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel backup timers removal unused 50                            | Configures how frequently a timer will scan backup autotunnels and remove tunnels that are not being used. |
| Step 7 | <b>mpls traffic-eng auto-tunnel backup config unnumbered-interface interface</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel backup config unnumbered-interface ethernet1/0 | Enables IP processing on the specified interface without an explicit address.                              |

## Establishing MPLS One-Hop Tunnels to All Neighbors

To establish MPLS one-hop tunnels to all neighbors, perform the following task.

### Note

Only Steps 1 through 3 are required. If you perform additional steps, you can perform them in any order after Step 3.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng auto-tunnel primary onehop**
4. **mpls traffic-eng auto-tunnel primary tunnel-num [min num] [max num]**
5. **mpls traffic-eng auto-tunnel primary timers removal rerouted sec**
6. **mpls traffic-eng auto-tunnel primary config unnumbered interface**
7. **mpls traffic-eng auto-tunnel primary config mpls ip**
8. **clear mpls traffic-eng auto-tunnel primary**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                      | Purpose                                                                                                          |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                         | Enters global configuration mode.                                                                                |
| Step 3 | <b>mpls traffic-eng auto-tunnel primary onehop</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel primary onehop                                               | Automatically creates primary tunnels to all next hops.                                                          |
| Step 4 | <b>mpls traffic-eng auto-tunnel primary tunnel-num [min num] [max num]</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel primary tunnel-num min 2000 max 2100 | Configures the range of tunnel interface numbers for primary autotunnels.                                        |
| Step 5 | <b>mpls traffic-eng auto-tunnel primary timers removal rerouted sec</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel primary timers removal rerouted 400     | Configures how many seconds after a failure primary autotunnels will be removed.                                 |
| Step 6 | <b>mpls traffic-eng auto-tunnel primary config unnumbered interface</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel primary config unnumbered ethernet1/0   | Enables IP processing on the specified interface without an explicit address.                                    |
| Step 7 | <b>mpls traffic-eng auto-tunnel primary config mpls ip</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel primary config mpls ip                               | Enables LDP on primary autotunnels.                                                                              |
| Step 8 | <b>clear mpls traffic-eng auto-tunnel primary</b><br><br><b>Example:</b><br>Router(config)# clear mpls traffic-eng auto-tunnel primary                                                 | Removes all primary autotunnels and re-creates them.                                                             |

# Configuration Examples for MPLS Traffic Engineering—Autotunnel Primary and Backup

This section contains the following configuration examples:

- [Establishing MPLS Backup Autotunnels to Protect Fast Reroutable TE LSPs: Example, page 11](#)
- [Establishing MPLS One-Hop Tunnels to Neighbors: Example, page 13](#)

## Establishing MPLS Backup Autotunnels to Protect Fast Reroutable TE LSPs: Example

### Note

This example does not include the **mpls traffic-eng auto-tunnel backup nhop-only** command because autotunneling would not be able to create any backup tunnels.

To determine if there are any backup tunnels, enter the **show ip rsvp fast-reroute** command. This example shows that there is a static configured primary tunnel and no backup tunnels.

```
Router(config)# show ip rsvp fast-reroute
```

| Primary Tunnel | Protect I/F | BW BPS>Type | Backup Tunnel:Label | State | Level | Type  |
|----------------|-------------|-------------|---------------------|-------|-------|-------|
| -----          | -----       | -----       | -----               | ----- | ----- | ----- |
| R3-PRP_t0      | PO3/1       | 0:G         | None                | None  | None  |       |

The following command causes autotunnels to automatically configure NHOP and NNHOP backup tunnels:

```
Router(config)# mpls traffic-eng auto-tunnel backup
```

As illustrated in the **show ip interface brief** command output, autotunneling created two backup tunnels that have tunnel IDs 65436 and 65437:

```
Router# show ip interface brief
```

| Interface          | IP-Address | OK? | Method | Status                | Protocol |
|--------------------|------------|-----|--------|-----------------------|----------|
| POS2/0             | 10.0.0.14  | YES | NVRAM  | down                  | down     |
| POS2/1             | 10.0.0.49  | YES | NVRAM  | up                    | up       |
| POS2/2             | 10.0.0.45  | YES | NVRAM  | up                    | up       |
| POS2/3             | 10.0.0.57  | YES | NVRAM  | administratively down | down     |
| POS3/0             | 10.0.0.18  | YES | NVRAM  | down                  | down     |
| POS3/1             | 10.0.0.33  | YES | NVRAM  | up                    | up       |
| POS3/2             | unassigned | YES | NVRAM  | administratively down | down     |
| POS3/3             | unassigned | YES | NVRAM  | administratively down | down     |
| GigabitEthernet4/0 | 10.0.0.37  | YES | NVRAM  | up                    | up       |
| GigabitEthernet4/1 | unassigned | YES | NVRAM  | administratively down | down     |
| GigabitEthernet4/2 | unassigned | YES | NVRAM  | administratively down | down     |
| Loopback0          | 10.0.3.1   | YES | NVRAM  | up                    | up       |
| Tunnel0            | 10.0.3.1   | YES | unset  | up                    | up       |
| Tunnel65436        | 10.0.3.1   | YES | unset  | up                    | up       |
| Tunnel65437        | 10.0.3.1   | YES | unset  | up                    | up       |
| Ethernet0          | 10.3.38.3  | YES | NVRAM  | up                    | up       |
| Ethernet1          | unassigned | YES | NVRAM  | administratively down | down     |

The following command prevents autotunneling from creating NNHOP backup tunnels:

```
Router# mpls traffic-eng auto-tunnel backup nhop-only
```

The “Type” field in the following **show ip rsvp fast-reroute** command shows that there is only an NHOP tunnel:

```
Router# show ip rsvp fast-reroute
```

| Primary Tunnel | Protect I/F | BW BPS:Type | Backup Tunnel:Label | State | Level   | Type |
|----------------|-------------|-------------|---------------------|-------|---------|------|
| R3-PRP_t0      | PO3/1       | 0:G         | Tu65436:24          | Ready | any-unl | Nhop |

The following command changes the minimum and maximum tunnel interface numbers to 1000 and 1100, respectively:

```
Router# mpls traffic-eng auto-tunnel backup tunnel-num min 1000 max 1100
```

You can verify the ID numbers and autotunnel backup range ID by entering the **show ip rsvp fast-reroute** and **show ip interface brief** commands. In this example, only one backup tunnel is protecting the primary tunnel:

```
Router# show ip rsvp fast-reroute
```

| Primary Tunnel | Protect I/F | BW BPS:Type | Backup Tunnel:Label | State | Level   | Type |
|----------------|-------------|-------------|---------------------|-------|---------|------|
| R3-PRP_t0      | PO3/1       | 0:G         | Tu1000:24           | Ready | any-unl | Nhop |

```
Router# show ip interface brief
```

| Interface          | IP-Address | OK? | Method | Status                | Protocol |
|--------------------|------------|-----|--------|-----------------------|----------|
| POS2/0             | 10.0.0.14  | YES | NVRAM  | down                  | down     |
| POS2/1             | 10.0.0.49  | YES | NVRAM  | up                    | up       |
| POS2/2             | 10.0.0.45  | YES | NVRAM  | up                    | up       |
| POS2/3             | 10.0.0.57  | YES | NVRAM  | administratively down | down     |
| POS3/0             | 10.0.0.18  | YES | NVRAM  | down                  | down     |
| POS3/1             | 10.0.0.33  | YES | NVRAM  | up                    | up       |
| POS3/2             | unassigned | YES | NVRAM  | administratively down | down     |
| POS3/3             | unassigned | YES | NVRAM  | administratively down | down     |
| GigabitEthernet4/0 | 10.0.0.37  | YES | NVRAM  | up                    | up       |
| GigabitEthernet4/1 | unassigned | YES | NVRAM  | administratively down | down     |
| GigabitEthernet4/2 | unassigned | YES | NVRAM  | administratively down | down     |
| Loopback0          | 10.0.3.1   | YES | NVRAM  | up                    | up       |
| Tunnel0            | 10.0.3.1   | YES | unset  | up                    | up       |
| Tunnel65436        | 10.0.3.1   | YES | unset  | up                    | up       |
| Ethernet0          | 10.3.38.3  | YES | NVRAM  | up                    | up       |
| Ethernet1          | unassigned | YES | NVRAM  | administratively down | down     |

The default tunnel range for autotunnel backup tunnels is 65,436 through 65,535. The following **show ip rsvp fast-reroute** command changes the tunnel range IDs:

```
Router# show ip rsvp fast-reroute
```

| Primary Tunnel | Protect I/F | BW BPS:Type | Backup Tunnel:Label | State | Level   | Type   |
|----------------|-------------|-------------|---------------------|-------|---------|--------|
| R3-PRP_t0      | PO3/1       | 0:G         | Tu1001:0            | Ready | any-unl | N-Nhop |

The results are shown in the **show ip interface brief** command:

```
Router# show ip interface
```

```
Router# show ip interface brief
```

| Interface | UP-Address | OK? | Method | Status | Protocol |
|-----------|------------|-----|--------|--------|----------|
|-----------|------------|-----|--------|--------|----------|

|            |            |     |       |                       |      |
|------------|------------|-----|-------|-----------------------|------|
| POS2/0     | 10.0.0.14  | YES | NVRAM | down                  | down |
| POS2/1     | 10.0.0.49  | YES | NVRAM | up                    | up   |
| POS2/2     | 10.0.0.45  | YES | NVRAM | up                    | up   |
| POS2/3     | 10.0.0.57  | YES | NVRAM | up                    | up   |
| POS3/0     | 10.0.0.18  | YES | NVRAM | up                    | up   |
| POS3/1     | 10.0.0.33  | YES | NVRAM | up                    | up   |
| POS3/2     | unassigned | YES | NVRAM | administratively down | down |
| POS3/3     | unassigned | YES | NVRAM | administratively down | down |
| Loopback0  | 10.0.3.1   | YES | NVRAM | up                    | up   |
| Tunnel0    | 10.0.3.1   | YES | unset | up                    | up   |
| Tunnel1000 | 10.0.3.1   | YES | unset | up                    | up   |
| Tunnel1001 | 10.0.3.1   | YES | unset | up                    | up   |
| Ethernet0  | 10.3.38.3  | YES | NVRAM | up                    | up   |
| Ethernet1  | unassigned | YES | NVRAM | administratively down | down |

The following **mpls traffic-eng auto-tunnel backup timers removal unused** command specifies that a timer will scan backup autotunnels every 50 seconds and the timer will remove tunnels that are not being used:

```
Router(config)# mpls traffic-eng auto-tunnel backup timers removal unused 50
```

The following **mpls traffic-eng auto-tunnel backup config unnumbered-interface** command enables IP processing on POS interface 3/1:

```
Router(config)# mpls traffic-eng auto-tunnel backup config unnumbered-interface POS3/1
```

To verify that IP processing is enabled on POS3/1, enter the **show interfaces tunnel** command:

```
Router# show interfaces tunnel 1001
```

```
Tunnel1001 is up, line protocol is up
  Hardware is Tunnel
  Interface is unnumbered. Using address of POS3/1 (10.0.0.33)
  MTU 1514 bytes, BW 9 Kbit, DLY 500000 usec, rely 255/255, load 1/255
  Encapsulation TUNNEL, loopback not set
  Keepalive not set
  Tunnel source 10.0.0.0, destination 10.0.5.1
  Tunnel protocol/transport Label Switching, sequencing disabled
  Key disabled
  Checksumming of packets disabled
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Queueing strategy: fifo
  Output queue 0/0, 0 drops; input queue 0/75, 0 drops
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    0 packets output, 0 bytes, 0 underruns
    0 output errors, 0 collisions, 0 interface resets
    0 output buffer failures, 0 output buffers swapped out
```

## Establishing MPLS One-Hop Tunnels to Neighbors: Example

For autotunneling to automatically create primary tunnels to all next hops, you must enter the following command:

```
Router(config)# mpls traffic-eng auto-tunnel primary onehop
```

In this example there are four primary tunnels and no backup tunnels. To verify that configuration, enter the **show ip rsvp fast-reroute** command and the **show ip interface brief** command:

```
Router# show ip rsvp fast-reroute
```

| Primary<br>Tunnel | Protect<br>I/F | BW<br>BPS:Type | Backup<br>Tunnel:Label | State | Level | Type |
|-------------------|----------------|----------------|------------------------|-------|-------|------|
| R3-PRP_t65337     | PO2/2          | 0:G            | None                   | None  | None  |      |
| R3-PRP_t65338     | PO3/1          | 0:G            | None                   | None  | None  |      |
| R3-PRP_t65339     | Gi4/0          | 0:G            | None                   | None  | None  |      |
| R3-PRP_t65336     | PO2/1          | 0:G            | None                   | None  | None  |      |

```
Router# show ip interface brief
```

| Interface          | IP-Address | OK? | Method | Status                | Protocol |
|--------------------|------------|-----|--------|-----------------------|----------|
| POS2/0             | 10.0.0.14  | YES | NVRAM  | down                  | down     |
| POS2/1             | 10.0.0.49  | YES | NVRAM  | up                    | up       |
| POS2/2             | 10.0.0.45  | YES | NVRAM  | up                    | up       |
| POS2/3             | 10.0.0.57  | YES | NVRAM  | administratively down | down     |
| POS3/0             | 10.0.0.18  | YES | NVRAM  | down                  | down     |
| POS3/1             | 10.0.0.33  | YES | NVRAM  | up                    | up       |
| POS3/2             | unassigned | YES | NVRAM  | administratively down | down     |
| POS3/3             | unassigned | YES | NVRAM  | administratively down | down     |
| GigabitEthernet4/0 | 10.0.0.37  | YES | NVRAM  | up                    | up       |
| GigabitEthernet4/1 | unassigned | YES | NVRAM  | administratively down | down     |
| GigabitEthernet4/2 | unassigned | YES | NVRAM  | administratively down | down     |
| Loopback0          | 10.0.3.1   | YES | NVRAM  | up                    | up       |
| Tunnel0            | 10.0.3.1   | YES | unset  | administratively down | down     |
| Tunnel65336        | 10.0.3.1   | YES | unset  | up                    | up       |
| Tunnel65337        | 10.0.3.1   | YES | unset  | up                    | up       |
| Tunnel65338        | 10.0.3.1   | YES | unset  | up                    | up       |
| Tunnel65339        | 10.0.3.1   | YES | unset  | up                    | up       |
| Ethernet0          | 10.3.38.3  | YES | NVRAM  | up                    | up       |
| Ethernet1          | unassigned | YES | NVRAM  | administratively down | down     |

The default tunnel range for primary autotunnels is 65,336 through 65,435. The following **mpls traffic-eng auto-tunnel primary tunnel-num** command changes the range to 2000 through 2100:

```
Router(config)# mpls traffic-eng auto-tunnel primary tunnel-num min 2000 max 2100
```

The following sample output from the **show ip rsvp fast-reroute** command and the **show ip interface brief** command shows that the tunnel IDs are 2000, 2001, 2002, and 2003:

```
Router# show ip rsvp fast-reroute
```

| Primary<br>Tunnel | Protect<br>I/F | BW<br>BPS:Type | Backup<br>Tunnel:Label | State | Level | Type |
|-------------------|----------------|----------------|------------------------|-------|-------|------|
| R3-PRP_t2001      | PO2/2          | 0:G            | None                   | None  | None  |      |
| R3-PRP_t2002      | PO3/1          | 0:G            | None                   | None  | None  |      |
| R3-PRP_t2003      | Gi4/0          | 0:G            | None                   | None  | None  |      |
| R3-PRP_t2000      | PO2/1          | 0:G            | None                   | None  | None  |      |

```
Router# show ip interface brief
```

| Interface          | IP-Address | OK? | Method | Status                | Protocol |
|--------------------|------------|-----|--------|-----------------------|----------|
| POS2/0             | 10.0.0.14  | YES | NVRAM  | down                  | down     |
| POS2/1             | 10.0.0.49  | YES | NVRAM  | up                    | up       |
| POS2/2             | 10.0.0.45  | YES | NVRAM  | up                    | up       |
| POS2/3             | 10.0.0.57  | YES | NVRAM  | administratively down | down     |
| POS3/0             | 10.0.0.18  | YES | NVRAM  | down                  | down     |
| POS3/1             | 10.0.0.33  | YES | NVRAM  | up                    | up       |

The following **mpls traffic-eng auto-tunnel primary timers** command specifies that a timer will scan backup autotunnels every 50 seconds and remove tunnels that are not being used:

```
Router(config)# mpls traffic-eng auto-tunnel primary timers removal rerouted 50
```

The following **mpls traffic-eng auto-tunnel primary config unnumbered** command enables IP processing on POS interface 3/1:

```
Router(config)# mpls traffic-eng auto-tunnel primary config unnumbered POS3/1
```

To specify that autotunneling remove all primary autotunnels and re-create them, enter the following command:

```
Router(config)# clear mpls traffic-eng auto-tunnel primary
```

## Additional References

The following sections provide references related to the MPLS Traffic Engineering—Autotunnel Primary and Backup feature.

# Feature Information for MPLS Traffic Engineering—Autotunnel Primary and Backup

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering—Autotunnel Primary and Backup

# Glossary

**backup tunnel**—An MPLS traffic engineering tunnel used to protect other (primary) tunnel's traffic when a link or node failure occurs.

**egress router**—A router at the edge of the network where packets are leaving.

**Fast Reroute**—Fast Reroute (FRR) is a mechanism for protecting MPLS traffic engineering (TE) LSPs from link and node failure by locally repairing the LSPs at the point of failure, allowing data to continue to flow on them while their headend routers attempt to establish end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or nodes.

**hop**—Passage of a data packet between two network nodes (for example, between two routers).

**interface**—A network connection.

**IP address**—A 32-bit address assigned to hosts using TCP/IP. An IP address belongs to one of five classes (A, B, C, D, or E) and is written as four octets separated by periods (dotted decimal format). Each address consists of a network number, an optional subnetwork number, and a host number. The network and subnetwork numbers together are used for routing, and the host number is used to address an individual host within the network or subnetwork. A subnet mask is used to extract network and subnetwork information from the IP address.

**IP explicit path**—A list of IP addresses, each representing a node or link in the explicit path.

**LDP**—Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets.

**link**—Point-to-point connection between adjacent nodes.

**LSP**—label switched path. A path that is followed by a labeled packet over several hops, starting at an ingress LSR and ending at an egress LSR.

**LSR**—label switch router. A Layer 3 router that forwards a packet based on the value of a label encapsulated in the packet.

**MPLS**—Multiprotocol Label Switching. A method for forwarding packets (frames) through a network. It enables routers at the edge of a network to apply labels to packets. ATM switches or existing routers in the network core can switch packets according to the labels with minimal lookup overhead.

**node**—Endpoint of a network connection or a junction common to two or more lines in a network. Nodes can be interconnected by links, and serve as control points in the network.

**penultimate router**—The second-to-last router; that is, the router that is immediately before the egress router.

**primary tunnel**—An MPLS tunnel whose LSP can be fast rerouted if there is a failure.

**router**—A network layer device that uses one or more metrics to determine the optimal path along which network traffic should be forwarded. Routers forward packets from one network to another based on network layer information.

**router ID**—Something by which a router originating a packet can be uniquely distinguished from all other routers. For example, an IP address from one of the router's interfaces.

**scalability**—An indicator showing how quickly some measure of resource usage increases as a network gets larger.

**traffic engineering**—The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**tunnel**—A secure communication path between two peers, such as two routers. A traffic engineering tunnel is a label-switched tunnel that is used for traffic engineering. Such a tunnel is set up through means other than normal Layer 3 routing; it is used to direct traffic over a path different from the one that Layer 3 routing could cause the tunnel to take.

# MPLS Traffic Engineering—AutoTunnel Mesh Groups

---

**First Published: January 27, 2004**

**Last Updated: October 21, 2009**

The MPLS Traffic Engineering—AutoTunnel Mesh Groups feature allows a network administrator to configure traffic engineering (TE) label switched paths (LSPs) by using a few command-line interface (CLI) commands.

In a network topology where edge TE label switch routers (LSRs) are connected by core LSRs, the MPLS Traffic Engineering—AutoTunnel Mesh Groups feature automatically constructs a mesh of TE LSPs among the provider edge (PE) routers.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering—AutoTunnel Mesh Groups” section on page 18](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Additional References, page 16](#)
- [Feature Information for MPLS Traffic Engineering—AutoTunnel Mesh Groups, page 18](#)
- [Glossary, page 19](#)

## Prerequisites for MPLS Traffic Engineering—AutoTunnel Mesh Groups

- Be knowledgeable about MPLS TE. See the [“Additional References” section on page 16](#).
- Decide how you will set up autotunnels (that is, identify the tunnel commands that you will include in the template interface).
- Identify a block of addresses that you will reserve for mesh tunnel interfaces.

## Restrictions for MPLS Traffic Engineering—AutoTunnel Mesh Groups

- Mesh groups do not support interarea tunnels because the destinations of those tunnels do not exist in the local area TE database.
- You cannot configure a static route to route traffic over autotunnel mesh group TE tunnels. You should use only the autoroute for tunnel selection.
- Intermediate System-to-System (IS-IS) does not support Interior Gateway Protocol (IGP) distribution of mesh group information. For IS-IS, only Access Control Lists (ACLs) can be used.

## Information About MPLS Traffic Engineering—AutoTunnel Mesh Groups

To configure autotunnel mesh groups, you need to understand the following concepts:

- [AutoTunnel Mesh Groups Description and Benefits, page 2](#)
- [Access Lists for Mesh Tunnel Interfaces, page 3](#)
- [AutoTunnel Template Interfaces, page 3](#)
- [OSPF Flooding of Mesh Group Information, page 4](#)

## AutoTunnel Mesh Groups Description and Benefits

An autotunnel mesh group (referred to as a mesh group) is a set of connections between edge LSRs in a network. There are two types of mesh groups:

- Full—All the edge LSRs are connected. Each PE router has a tunnel to each of the other PE routers.
- Partial—Some of the edge LSRs are not connected to each other by tunnels.

In a network topology where edge TE LSRs are connected by core LSRs, the MPLS Traffic Engineering—AutoTunnel Mesh Groups feature automatically constructs a mesh of TE LSPs among the PE routers.

Initially, you must configure each existing TE LSR to be a member of the mesh by using a minimal set of configuration commands. When the network grows (that is, when one or more TE LSRs are added to the network as PE routers), you do not need to reconfigure the existing TE LSR members of that mesh.

Mesh groups have the following benefits:

- Minimize the initial configuration of the network. You configure one template interface per mesh, and it propagates to all mesh tunnel interfaces, as needed.
- Minimize future configurations resulting from network growth. The feature eliminates the need to reconfigure each existing TE LSR to establish a full mesh of TE LSPs whenever a new PE router is added to the network.
- Enable existing routers to configure TE LSPs to new PE routers.
- Enable the construction of a mesh of TE LSPs among the PE routers automatically.

## Access Lists for Mesh Tunnel Interfaces

The access list determines the destination addresses for the mesh tunnel interfaces. It is useful if you preallocate a block of related IP addresses. You can use that block of addresses to control the PE routers to which a full or partial mesh of TE tunnel LSPs is established. The access list allows matches for only the addresses that are learned and stored in the TE topology database.

For example, you can create an access list that matches all 10.1.1.1 IP addresses. You configure a template with the access list, then the template creates mesh tunnel interfaces to destinations within the TE topology database that match destinations in that access list.

Whenever the TE topology database is updated (for example, when a new TE LSR is inserted into the Interior Gateway Protocol (IGP), the destination address is stored in the TE topology database of each router in the IGP. At each update, the Mesh Group feature compares the destination address contained in the database to IP addresses in the access list associated with all template interfaces. If there is a match, the Mesh Group feature establishes a mesh tunnel interface to the tunnel destination IP address.

## AutoTunnel Template Interfaces

An autotunnel template interface is a logical entity; that is, it is a configuration for a tunnel interface that is not tied to specific tunnel interfaces. It can be applied dynamically, when needed.

Mesh tunnel interfaces are tunnel interfaces that are created, configured dynamically (for example, by the applying [or cloning] of a template interface), used, and then freed when they are no longer needed.

A mesh tunnel interface obtains its configuration information from a template, except for the tunnel's destination address, which it obtains from the TE topology database that matches an access list or from the IGP mesh group advertisement.

The template interface allows you to enter commands once per mesh group. These commands specify how mesh tunnel interfaces are created. Each time a new router is added to the network, a new mesh tunnel interface is created. The configuration of the interface is duplicated from the template. Each mesh tunnel interface has the same path constraints and other parameters configured on the template interface. Only the tunnel destination address is different.

## OSPF Flooding of Mesh Group Information

For OSPF to advertise or flood mesh group information, you need to configure a mesh group in OSPF and add that mesh group to an autotemplate interface. When the configuration is complete, OSPF advertises the mesh group IDs to all LSRs. MPLS TE LSPs automatically connect the edge LSRs in each mesh group. For configuration information, see the [“Configuring IGP Flooding for Autotunnel Mesh Groups” section on page 13](#).

OSPF can advertise mesh group IDs for an OSPF area. OSPF is the only IGP supported in the Cisco IOS 12.0(29)S, 12.2(33)SRA, 12.2(33)SXH, and 12.4(20)T releases of the MPLS Traffic Engineering—AutoTunnel Mesh Groups feature.

## How to Configure MPLS Traffic Engineering—AutoTunnel Mesh Groups

This section contains the following procedures:

- [Configuring a Mesh of TE Tunnel LSPs, page 4](#) (required)
- [Specifying the Range of Mesh Tunnel Interface Numbers, page 9](#) (optional)
- [Displaying Configuration Information About Tunnels, page 10](#) (optional)
- [Monitoring the Autotunnel Mesh Network, page 11](#) (required)
- [Configuring IGP Flooding for Autotunnel Mesh Groups, page 13](#) (optional)

## Configuring a Mesh of TE Tunnel LSPs

Perform the following tasks on each PE router in your network to configure a mesh of TE tunnel LSPs:

- [Enabling Autotunnel Mesh Groups Globally, page 4](#)
- [Creating an Access List Using a Name, page 5](#)
- [Creating an Autotunnel Template Interface, page 7](#)

**Note**

You can perform these tasks in any order.

## Enabling Autotunnel Mesh Groups Globally

Perform the following task to enable autotunnel mesh groups globally. Perform this task on all PE routers in your network that you want to be part of an autotunnel mesh group.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng auto-tunnel mesh**
4. **end**

## DETAILED STEPS

|        | Command or Action                                                                 | Purpose                                                                                                           |
|--------|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code>                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
|        | <b>Example:</b><br><code>Router&gt; enable</code>                                 |                                                                                                                   |
| Step 2 | <code>configure terminal</code>                                                   | Enters global configuration mode.                                                                                 |
|        | <b>Example:</b><br><code>Router# configure terminal</code>                        |                                                                                                                   |
| Step 3 | <code>mpls traffic-eng auto-tunnel mesh</code>                                    | Enables autotunnel mesh groups globally.                                                                          |
|        | <b>Example:</b><br><code>Router(config)# mpls traffic-eng auto-tunnel mesh</code> |                                                                                                                   |
| Step 4 | <code>end</code>                                                                  | Exits to privileged EXEC mode.                                                                                    |
|        | <b>Example:</b><br><code>Router(config)# end</code>                               |                                                                                                                   |

## Creating an Access List Using a Name

Perform the following task to create an access list using a name.

The access list determines the destination addresses for the mesh tunnel interfaces. You can use an access list to control the PE routers to which a full or partial mesh of TE tunnel LSPs is established. The access list allows matches for only the addresses that are learned and stored in the TE topology database.

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip access-list {standard / extended} access-list-name`
4. `permit source [source-wildcard]`
5. `end`

## DETAILED STEPS

|--------|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code>                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
|        | <b>Example:</b><br><code>Router&gt; enable</code> |                                                                                                                   |

|        | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# <code>configure terminal</code>                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 3 | <code>ip access-list {standard   extended} access-list-name</code><br><br><b>Example:</b><br>Router(config)# <code>ip access-list standard a1</code> | Defines an IP access list using a name and enters standard named access list configuration mode. <ul style="list-style-type: none"> <li>The <b>standard</b> keyword specifies a standard IP access list.</li> <li>The <b>extended</b> keyword specifies an extended IP access list.</li> <li>The <i>access-list-name</i> argument is the name of the access list. A name cannot contain a space or quotation mark and must begin with an alphabetic character. This prevents confusion with numbered access lists.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 4 | <code>permit source [source-wildcard]</code><br><br><b>Example:</b><br>Router(config-std-nacl)# <code>permit 10.0.0.0 0.255.255.255</code>           | Sets conditions to allow a packet to pass a named IP access list. <ul style="list-style-type: none"> <li>The <i>source</i> argument is the number of the network or host from which the packet is being sent. There are three alternative ways to specify the source: <ul style="list-style-type: none"> <li>Use a 32-bit quantity in four-part dotted decimal format.</li> <li>Use the <b>any</b> keyword as an abbreviation for a source and source-wildcard of 0.0.0.0 255.255.255.255.</li> <li>Use host source as an abbreviation for a source and source-wildcard of source 0.0.0.0.</li> </ul> </li> <li>The <i>source-wildcard</i> argument is the wildcard bits to be applied to source. There are three alternative ways to specify the source wildcard: <ul style="list-style-type: none"> <li>Use a 32-bit quantity in four-part dotted decimal format. Place 1s in the bit positions you want to ignore.</li> <li>Use the <b>any</b> keyword as an abbreviation for a source and source-wildcard of 0.0.0.0 255.255.255.255.</li> <li>Use host source as an abbreviation for a source and source-wildcard of source 0.0.0.0.</li> </ul> </li> </ul> |
| Step 5 | <code>end</code><br><br><b>Example:</b><br>Router(config-std-nacl)# <code>end</code>                                                                 | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Creating an Autotunnel Template Interface

Perform the following task to create an autotunnel template interface. This helps minimize the initial configuration of the network. You configure one template interface per mesh, and it propagates to all mesh tunnel interfaces, as needed.

### Note

You can use the following commands to create a minimal configuration.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface auto-template** *interface-num*
4. **ip unnumbered** *interface-type interface-number*
5. **tunnel mode** {aurp | cayman | dvmrp | eon | gre | ipip | iptalk | mpls | nos}
6. **tunnel mpls traffic-eng autoroute announce**
7. **tunnel mpls traffic-eng priority** *setup-priority* [*hold-priority*]
8. **tunnel mpls traffic-eng auto-bw** [*collect-bw*] [*frequency seconds*] [*max-bw kbps*] [*min-bw kbps*]
9. **tunnel mpls traffic-eng path-option** *number* {dynamic | explicit {name *path-name* | *path-number*}} [*lockdown*]
10. **tunnel destination access-list** *num*
11. **end**

|--------|-----------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>interface auto-template</b> <i>interface-num</i><br><br><b>Example:</b><br>Router(config)# interface auto-template 1           | Creates a template interface and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>interface-num</i> argument is the interface number. Valid values are from 1 to 25.</li> </ul>                                                                                                                       |
| Step 4 | <b>ip unnumbered</b> <i>interface-type interface-number</i><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered Loopback 0 | Enables IP processing on an interface without assigning an explicit IP address to the interface. <ul style="list-style-type: none"> <li>The <i>type</i> and <i>number</i> arguments name the type and number of another interface on which the router has an assigned IP address. It cannot be another unnumbered interface.</li> </ul> |

|        | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <pre>tunnel mode {aurp   cayman   dvmrp   eon   gre   ipip   iptalk   mpls   nos}</pre> <p><b>Example:</b><br/>Router(config-if)# tunnel mode mpls</p>                                    | Sets the encapsulation mode for the tunnel interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 6 | <pre>tunnel mpls traffic-eng autoroute announce</pre> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng<br/>autoroute announce</p>                                        | Specifies that the IGP should use the tunnel (if the tunnel is up) in its enhanced shortest path first algorithm (SPF) calculation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 7 | <pre>tunnel mpls traffic-eng priority setup-priority [hold-priority]</pre> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng<br/>priority 1 1</p>                         | <p>Configures the setup and reservation priority for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> <li>The <i>setup-priority</i> argument is the priority used when an LSP is signaled for this tunnel and determines which existing tunnels can be preempted. Valid values are from 0 to 7, where a lower number indicates a higher priority. Therefore, an LSP with a setup priority of 0 can preempt any LSP with a non-0 priority.</li> <li>The <i>hold-priority</i> argument is the priority associated with an LSP for this tunnel and determines if it should be preempted by other LSPs that are being signaled. Valid values are from 0 to 7, where a lower number indicates a higher priority.</li> </ul>                                                                                                                                                                                                                                                 |
| Step 8 | <pre>tunnel mpls traffic-eng auto-bw [collect-bw] [frequency seconds] [max-bw kbps] [min-bw kbps]</pre> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng<br/>auto-bw</p> | <p>Configures a tunnel for automatic bandwidth adjustment and for control of the manner in which the bandwidth for a tunnel is adjusted.</p> <ul style="list-style-type: none"> <li>The <b>collect-bw</b> keyword collects output rate information for the tunnel, but does not adjust the tunnel's bandwidth.</li> <li>The <b>frequency seconds</b> keyword-argument pair is the interval between bandwidth adjustments. The specified interval can be from 300 to 604800 seconds. Do not specify a value lower than the output rate sampling interval specified in the <b>mpls traffic-eng auto-bw</b> command in global configuration mode.</li> <li>The <b>max-bw kbps</b> keyword-argument pair is the maximum automatic bandwidth, in kbps, for this tunnel. The value can be from 0 to 4294967295.</li> <li>The <b>min-bw kbps</b> keyword-argument pair is the minimum automatic bandwidth, in kbps, for this tunnel. The value can be from 0 to 4294967295.</li> </ul> |

|         | Command or Action                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <pre>tunnel mpls traffic-eng path-option number {dynamic   explicit {name path-name   path-number}} [lockdown]</pre> <p><b>Example:</b></p> <pre>Router(config-if)# tunnel mpls traffic-eng path-option 1 dynamic</pre> | <p>Configures a path option for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> <li>The <i>number</i> argument is the number of the path option. When multiple path options are configured, lower numbered options are preferred.</li> <li>The <b>dynamic</b> keyword specifies that the path of the LSP is dynamically calculated.</li> <li>The <b>explicit</b> keyword specifies that the path of the LSP is an IP explicit path.</li> <li>The <b>name path-name</b> keyword-argument pair is the path name of the IP explicit path that the tunnel uses with this option.</li> <li>The <i>path-number</i> argument is the path number of the IP explicit path that the tunnel uses with this option.</li> <li>The <b>lockdown</b> keyword specifies that the LSP cannot be reoptimized.</li> </ul> |
| Step 10 | <pre>tunnel destination access-list num</pre> <p><b>Example:</b></p> <pre>Router(config-if)# tunnel destination access-list 1</pre>                                                                                     | <p>Specifies the access list that the template interface uses for obtaining the mesh tunnel interface destination address.</p> <ul style="list-style-type: none"> <li>The <i>num</i> argument is the number of the access list.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 11 | <pre>end</pre> <p><b>Example:</b></p> <pre>Router(config)# end</pre>                                                                                                                                                    | <p>Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Specifying the Range of Mesh Tunnel Interface Numbers

Perform the following task to specify the range of mesh tunnel interface numbers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng auto-tunnel mesh tunnel-num min *num* max *num***
4. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> <b>enable</b>                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# <b>configure terminal</b>                                                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 3 | <b>mpls traffic-eng auto-tunnel mesh tunnel-num min num max num</b><br><br><b>Example:</b><br>Router(config)# <b>mpls traffic-eng auto-tunnel mesh tunnel-num min 1000 max 2000</b> | Specifies the range of mesh tunnel interface numbers. <ul style="list-style-type: none"> <li>The <b>min num</b> keyword-argument pair specifies the beginning number of the range of mesh tunnel interface numbers. Valid values are from 1 to 65535.</li> <li>The <b>max num</b> keyword-argument pair specifies the ending number of the range of mesh tunnel interface numbers. Valid values are from 1 to 65535.</li> </ul> |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# <b>end</b>                                                                                                                     | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                  |

## Displaying Configuration Information About Tunnels

Perform the following task to display tunnel configuration information, such as tunnel interface and mesh tunnel configuration.

## SUMMARY STEPS

- enable**
- show running interface auto-template num**
- show interface tunnel num configuration**
- exit**

## DETAILED STEPS

|        |                                                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br>Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:<br>Router> <b>enable</b><br>Router#                                                              |
| Step 2 | <b>show running interface auto-template num</b><br><br>Use this command to display interface configuration information for a tunnel interface. For example:<br>Router# <b>show running interface auto-template 1</b> |

```
interface auto-templ1
 ip unnumbered Loopback0
 no ip directed-broadcast
 no keepalive
 tunnel destination access-list 1
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng path-option 1 dynamic
```

This output shows that autotunnel template interface auto-templ1 uses an access list (access-list 1) to determine the destination addresses for the mesh tunnel interfaces.

**Step 3** **show interface tunnel *num* configuration**

Use this command to display the configuration of the mesh tunnel interface. For example:

```
Router# show interface tunnel 5 configuration
```

```
interface tunnel 5
 ip unnumbered Loopback0
 no ip directed-broadcast
 no keepalive
 tunnel destination access-list 1
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng path-option 1 dynamic
```

**Step 4** **exit**

Use this command to exit to user EXEC mode. For example:

```
Router# exit
Router>
```

---

## Monitoring the Autotunnel Mesh Network

Perform the following task to monitor the autotunnel mesh network.

### SUMMARY STEPS

1. **enable**
2. **show mpls traffic-eng tunnels property auto-tunnel mesh [brief]**
3. **show mpls traffic-eng auto-tunnel mesh**
4. **exit**

### DETAILED STEPS

---

**Step 1** **enable**

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```
Router> enable
Router#
```

**Step 2** **show mpls traffic-eng tunnels property auto-tunnel mesh [brief]**

Use this command to monitor mesh tunnel interfaces. This command restricts the output of the **show mpls traffic-eng tunnels** command to display only mesh tunnel interfaces. For example:

```
Router# show mpls traffic-eng tunnels property auto-tunnel mesh brief

Signalling Summary:
LSP Tunnels Process:      running
RSVP Process:             running
Forwarding:               enabled
Periodic reoptimization:  every 3600 seconds, next in 491 seconds
Periodic FRR Promotion:   Not Running
Periodic auto-bw collection: disabled
TUNNEL NAME               DESTINATION    UP IF    DOWN IF
STATE/PROT
router_t64336              10.2.2.2      -        Se2/0
up/up
router_t64337              10.3.3.3      -        Se2/0
up/up
Displayed 2 (of 2) heads, 0 (of 0) midpoints, 0 (of 0) tails
```

### Step 3 **show mpls traffic-eng auto-tunnel mesh**

Use this command to display the cloned mesh tunnel interfaces of each autotemplate interface and the current range of mesh tunnel interface numbers. For example:

```
Router# show mpls traffic-eng auto-tunnel mesh

Auto-Templatel:

Using access-list 1 to clone the following tunnel interfaces:

Destination  Interface
-----
10.2.2.2     Tunnel64336
10.3.3.3     Tunnel64337

Mesh tunnel interface numbers: min 64336 max 65337
```

### Step 4 **exit**

Use this command to exit to user EXEC mode. For example:

```
Router# exit
Router>
```

## Troubleshooting Tips

You can configure mesh tunnel interfaces directly. However, you cannot delete them manually, and manual configuration is not permanent. The configuration is overwritten when the template changes or the mesh tunnel interface is deleted and re-created. If you attempt to manually delete a mesh tunnel interface, an error message appears.

You can enter the **show mpls traffic-eng tunnels destination *address*** command to display information about tunnels that are destined for a specified IP address.

Enter the **show mpls traffic-eng tunnels property auto-tunnel mesh** command to display information about mesh tunnel interfaces.

## Configuring IGP Flooding for Autotunnel Mesh Groups

Perform the following task to configure IGP flooding for autotunnel mesh groups. Use this task to configure an OSPF-based discovery for identifying mesh group members and advertising the mesh group IDs to all LSRs.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng auto-tunnel mesh**
4. **router ospf** *process-id*
5. **mpls traffic-eng mesh-group** *mesh-group-id* *interface-type* *interface-number* **area** *area-id*
6. **exit**
7. Repeat steps 4 and 5 at other LSRs to advertise the mesh group numbers to which they belong.
8. **interface auto-template** *interface-num*
9. **tunnel destination mesh-group** *mesh-group-id*
10. **end**

### DETAILED STEPS

|        | Command or Action                                                    | Purpose                                                                              |
|--------|----------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                        | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br>Router> enable                                    | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                                            | Enters global configuration mode.                                                    |
|        | <b>Example:</b><br>Router# configure terminal                        |                                                                                      |
| Step 3 | <b>mpls traffic-eng auto-tunnel mesh</b>                             | Enables autotunnel mesh groups globally.                                             |
|        | <b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel mesh |                                                                                      |

|         | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4  | <b>router</b> <i>ospf process-id</i><br><br><b>Example:</b><br>Router(config)# router ospf 100                                                                                                           | Enters router configuration mode and configures an OSPF routing process. <ul style="list-style-type: none"> <li>The <i>process-id</i> argument is an internally used identification parameter for an OSPF routing process. It is locally assigned and can be any positive integer. A unique value is assigned for each OSPF routing process.</li> </ul>                                        |
| Step 5  | <b>mpls traffic-eng mesh-group</b> <i>mesh-group-id interface-type interface-number area area-id</i><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng mesh-group 10 loopback 0 area 100 | Advertises the autotunnel mesh group number of an LSR. <ul style="list-style-type: none"> <li>The <i>mesh-group-id</i> is a number that identifies a specific mesh group.</li> <li>The <i>interface-type</i> and <i>interface-number</i> arguments specify a type of interface and an interface number.</li> <li>The <b>area area-id</b> keyword-argument pair identifies the area.</li> </ul> |
| Step 6  | <b>exit</b><br><br><b>Example:</b><br>Router(config-router)# exit                                                                                                                                        | Exits to global configuration mode.                                                                                                                                                                                                                                                                                                                                                            |
| Step 7  | Repeat steps 4 and 5 at other LSRs to advertise the mesh group numbers to which they belong.                                                                                                             | —                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 8  | <b>interface auto-template</b> <i>interface-num</i><br><br><b>Example:</b><br>Router(config)# interface auto-template 1                                                                                  | Creates a template interface and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>interface-num</i> argument identifies the interface number. Valid values are from 1 to 25.</li> </ul>                                                                                                                                                                      |
| Step 9  | <b>tunnel destination mesh-group</b> <i>mesh-group-id</i><br><br><b>Example:</b><br>Router(config-if)# tunnel destination mesh-group 10                                                                  | Specifies a mesh group that a template interface uses to signal tunnels for all mesh group members. <ul style="list-style-type: none"> <li>The <i>mesh-group-id</i> is a number that identifies a specific mesh group.</li> </ul>                                                                                                                                                              |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                                                                                                              | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                 |

## Configuration Examples for MPLS Traffic Engineering—Autotunnel Mesh Groups

This section contains the following configuration examples:

- [Configuring a Mesh of TE Tunnel LSPs: Examples, page 15](#)
- [Specifying the Range of Mesh Tunnel Interface Numbers: Example, page 16](#)
- [Configuring IGP Flooding for Autotunnel Mesh Groups: Example, page 16](#)

## Configuring a Mesh of TE Tunnel LSPs: Examples

This section contains the following configuration examples for configuring a mesh of TE tunnel LSP:

- [Enabling Autotunnel Mesh Groups Globally: Example, page 15](#)
- [Creating an Access List Using a Name: Example, page 15](#)
- [Creating an AutoTunnel Template Interface: Example, page 15](#)

### Enabling Autotunnel Mesh Groups Globally: Example

The following example shows how to enable autotunnel mesh groups globally:

```
configure terminal
!

mpls traffic-eng auto-tunnel mesh
end
```

### Creating an Access List Using a Name: Example

The following examples shows how to create an access list using a name to determine the destination addresses for the mesh tunnel interfaces:

```
configure terminal
!
ip access-list standard a1
 permit 10.0.0.0 0.255.255.255
end
```

In this example, any IP address in the TE topology database that matches access list a1 causes the creation of a mesh tunnel interface with that destination address.

### Creating an AutoTunnel Template Interface: Example

This example shows how to create an AutoTunnel template template interface. In the following example, an AutoTunnel template is created and configured with a typical set of TE commands. The mesh group created from the template consists of mesh tunnel interfaces with destination addresses that match access list a1.

**Note**

---

The following example shows a typical configuration.

---

```
configure terminal
!
interface auto-template 1
 ip unnumbered Loopback0
 tunnel mode mpls
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng auto-bw
 tunnel mpls traffic-eng path-option 1 dynamic
 tunnel destination access-list a1
end
```

## Specifying the Range of Mesh Tunnel Interface Numbers: Example

In the following example, the lowest mesh tunnel interface number can be 1000, and the highest mesh tunnel interface number can be 2000:

```
configure terminal
!
mpls traffic-eng auto-tunnel mesh tunnel-num min 1000 max 2000
end
```

## Configuring IGP Flooding for Autotunnel Mesh Groups: Example

In the following example, OSPF is configured to advertise the router membership in mesh group 10:

```
configure terminal
!
mpls traffic-eng auto-tunnel mesh
router ospf 100
 mpls traffic-eng mesh-group 10 loopback 0 area 100
exit
!
interface auto-template 1
 tunnel destination mesh-group 10
end
```

## Additional References

The following sections provide references related to the MPLS Traffic Engineering—AutoTunnel Mesh Groups feature.

# Feature Information for MPLS Traffic Engineering—AutoTunnel Mesh Groups

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering—AutoTunnel Mesh Groups

| Feature Name                                    | Releases                                                                         | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# Glossary

**CE router**—customer edge router. A router that is part of a customer's network and interfaces to a provider edge (PE) router.

**customer network**—A network that is under the control of an end customer. Private addresses can be used in a customer network. Customer networks are logically isolated from each other and from the service provider's network.

**edge router**—A router at the edge of the network that receives and transmits packets. It can define the boundaries of the Multiprotocol Label Switching (MPLS) network.

**headend**—The label switch router (LSR) where a tunnel originates. The tunnel's "head" or tunnel interface resides at this LSR as well.

**label**—A short, fixed-length data construct that tells switching nodes how to forward data (packets).

**label switched path (LSP) tunnel**—A configured connection between two routers in which label switching is used to carry the packets.

**LSP**—label switched path. A path that a labeled packet follows over several hops, starting at an ingress LSR and ending at an egress LSR.

**LSR**—label switch router. A Layer 3 router that forwards a packet based on the value of a label encapsulated in the packet.

**mesh group**—A set of label switch routers (LSRs) that are members of a full or partial network of traffic engineering (TE) label switched paths (LSPs).

**P router**—provider core router.

**PE router**—provider edge router. A router at the edge of the service provider's network that interfaces to customer edge (CE) routers.

**router**—A network layer device that uses one or more metrics to determine the optimal path along which network traffic should be forwarded. Routers forward packets from one network to another based on network layer information.

**tailend**—The downstream, receive end of a tunnel.

**traffic engineering**—The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**tunnel**—A secure communication path between two peers, such as two routers. A traffic engineering tunnel is a label switched tunnel that is used for traffic engineering. Such a tunnel is set up through means other than normal Layer 3 routing.

# MPLS Traffic Engineering—Verbatim Path Support

---

**First Published: August 26, 2003**

**Last Updated: February 27, 2008**

The MPLS Traffic Engineering—Verbatim Path Support feature allows network nodes to support Resource Reservation Protocol (RSVP) extensions without supporting Interior Gateway Protocol (IGP) extensions for traffic engineering (TE), thereby bypassing the topology database verification process.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering—Verbatim Path Support”](#) section on [page 9](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Command Reference, page 8](#)
- [Glossary, page 10](#)

## Prerequisites for MPLS Traffic Engineering—Verbatim Path Support

- An MPLS TE tunnel must be configured globally.
- MPLS TE must be enabled on all links.

## Restrictions for MPLS Traffic Engineering—Verbatim Path Support

- The **verbatim** keyword can be used only on a label-switched path (LSP) that is configured with the explicit path option.
- This release does not support reoptimization on the verbatim LSP.
- You cannot configure MPLS Traffic Engineering over the logical GRE tunnel interface.

## Information About MPLS Traffic Engineering—Verbatim Path Support

MPLS TE LSPs usually require that all the nodes in the network are TE aware, meaning they have IGP extensions to TE in place. However, some network administrators want the ability to build TE LSPs to traverse nodes that do not support IGP extensions to TE, but that do support RSVP extensions to TE.

Verbatim LSPs are helpful when all or some of the intermediate nodes in a network do not support IGP extensions for TE.

When this feature is enabled, the IP explicit path is not checked against the TE topology database. Because the TE topology database is not verified, a Path message with IP explicit path information is routed using the shortest path first (SPF) algorithm for IP routing.

## How to Configure and Verify MPLS Traffic Engineering—Verbatim Path Support

This section contains the following procedures:

- [Configuring MPLS Traffic Engineering—Verbatim Path Support, page 3](#) (required)
- [Verifying Verbatim LSPs for MPLS TE Tunnels, page 6](#) (optional)

# Configuring MPLS Traffic Engineering—Verbatim Path Support

Perform this task to configure MPLS traffic engineering—verbatim path support.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **ip unnumbered loopback** *number*
5. **tunnel destination** {*host-name* | *ip-address*}
6. **tunnel mode mpls traffic-eng**
7. **tunnel mpls traffic-eng bandwidth** {**sub-pool** *kbps* | *kbps*}
8. **tunnel mpls traffic-eng autoroute announce**
9. **tunnel mpls traffic-eng priority** *setup-priority* [*hold-priority*]
10. **tunnel mpls traffic-eng path-option** *preference-number* {**dynamic** [*attributes string* | **bandwidth** {**sub-pool** *kbps* | *kbps*} | **lockdown** | **verbatim**} | **explicit** {**name** *path-name* | **identifier** *path-number*}}
- or -
- tunnel mpls traffic-eng path-option protect** *preference-number* {**dynamic** [*attributes string* | **bandwidth** {**sub-pool** *kbps* | *kbps*} | **explicit** {**name** *path-name* | **identifier** *path-number*} | *attributes string* | **bandwidth** {**sub-pool** *kbps* | *kbps*} | **verbatim**}]}
11. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                 | Purpose                                                                                                                                                                                                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                 |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                |
| Step 3 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                | Enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>number</i> argument identifies the tunnel number to be configured.</li> </ul>                                                                                                                                 |
| Step 4 | <b>ip unnumbered loopback</b> <i>number</i><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered loopback 1 | Configures an unnumbered IP interface, which enables IP processing without an explicit address. A loopback interface is usually configured with the router ID.<br><br><b>Note</b> An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link. |

|        | Command or Action                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>tunnel destination</b> { <i>host-name</i>   <i>ip-address</i> }<br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.100.100.100                        | Specifies the destination for a tunnel. <ul style="list-style-type: none"> <li>The <i>host-name</i> argument is the name of the host destination.</li> <li>The <i>ip-address</i> argument is the IP Version 4 address of the host destination expressed in decimal in four-part, dotted notation.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 6 | <b>tunnel mode mpls traffic-eng</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng                                                            | Sets the tunnel encapsulation mode to MPLS traffic engineering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 7 | <b>tunnel mpls traffic-eng bandwidth</b> { <i>sub-pool kbps</i>   <i>kbps</i> }<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng bandwidth 1000      | Configures the bandwidth required for an MPLS TE tunnel and assigns it either to the sub-pool or the global pool. <ul style="list-style-type: none"> <li>The <b>sub-pool</b> keyword indicates a subpool tunnel.</li> <li>The <i>kbps</i> argument is the bandwidth, in kilobits per second, set aside for the MPLS TE tunnel. The range is from 1 to 4294967295.</li> </ul>                                                                                                                                                                                                                                                                                                                           |
| Step 8 | <b>tunnel mpls traffic-eng autoroute announce</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng autoroute announce                                | Specifies that IGP should use the tunnel (if the tunnel is up) in its enhanced SPF calculation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 9 | <b>tunnel mpls traffic-eng priority</b> <i>setup-priority</i> [ <i>hold-priority</i> ]<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng priority 1 1 | Configures setup and reservation priority for a tunnel. <ul style="list-style-type: none"> <li>The <i>setup-priority</i> argument is the priority used when signaling an LSP for this tunnel to determine which existing tunnels can be preempted.<br/><br/>Valid values are from 0 to 7. A lower number indicates a higher priority. An LSP with a setup priority of 0 can preempt any LSP with a non-0 priority.</li> <li>The <i>hold-priority</i> argument is the priority associated with an LSP for this tunnel to determine if it should be preempted by other LSPs that are being signaled.<br/><br/>Valid values are from 0 to 7, where a lower number indicates a higher priority.</li> </ul> |

|         | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Step 10 | <pre> <b>tunnel mpls traffic-eng path-option</b>   <i>preference-number</i> {<b>dynamic</b> [<b>attributes</b> <i>string</i>   <b>bandwidth</b> {<b>sub-pool</b> <i>kbps</i>   <i>kbps</i>}   <b>lockdown</b>   <b>verbatim</b>]   <b>explicit</b> {<b>name</b> <i>path-name</i>   <b>identifier</b> <i>path-number</i>}} - or - <b>tunnel mpls traffic-eng path-option protect</b>   <i>preference-number</i> {<b>dynamic</b> [<b>attributes</b> <i>string</i>   <b>bandwidth</b> {<b>sub-pool</b> <i>kbps</i>   <i>kbps</i>}]   <b>explicit</b> {<b>name</b> <i>path-name</i>   <b>identifier</b> <i>path-number</i>} [<b>attributes</b> <i>string</i>   <b>bandwidth</b> {<b>sub-pool</b> <i>kbps</i>   <i>kbps</i>}   <b>verbatim</b>]}  <b>Example:</b> Router(config-if)# tunnel mpls traffic-eng path-option 1 explicit name test verbatim  Router(config-if)# tunnel mpls traffic-eng path-option protect 2 dynamic name test 2 bandwidth sub-pool 34 </pre> | <p>Specifies LSP-related parameters, including the <b>verbatim</b> keyword used with an explicit path option, for an MPLS TE tunnel.</p> <ul style="list-style-type: none"> <li>The <i>preference-number</i> argument identifies the path option.</li> <li>The <b>protect</b> keyword and <i>preference-number</i> argument identify the path option with protection.</li> <li>The <b>dynamic</b> keyword indicates that the path option is dynamically calculated. (The router figures out the best path.)</li> <li>The <b>explicit</b> keyword indicates that the path option is specified. The IP addresses are specified for the path.</li> <li>The <b>name</b> <i>path-name</i> keyword argument combination identifies the name of the explicit path option.</li> <li>The <i>path-number</i> argument identifies the number of the explicit path option.</li> <li>The <b>verbatim</b> keyword bypasses the topology database verification.</li> </ul> <p><b>Note</b> You can use the <b>verbatim</b> keyword only with the explicit path option.</p> <ul style="list-style-type: none"> <li>The <b>attributes</b> <i>string</i> keyword argument combination names an attribute list to specify path options for the LSP.</li> <li>The <b>bandwidth</b> keyword specifies the LSP bandwidth.</li> <li>The <b>sub-pool</b> keyword indicates a subpool path option.</li> <li>The <i>kbps</i> argument is the number of kilobits per second set aside for the path option. The range is from 1 to 4294967295.</li> <li>The <b>lockdown</b> keyword disables reoptimization of the LSP.</li> </ul> |
| Step 11 | <pre> <b>end</b>  <b>Example:</b> Router(config)# end </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>(Optional) Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Verifying Verbatim LSPs for MPLS TE Tunnels

Perform this task to verify that the verbatim option is configured for the LSPs for MPLS TE tunnels.

### SUMMARY STEPS

1. **enable**
2. **show mpls traffic-eng tunnels *tunnel-interface* [brief]**
3. **disable**

### DETAILED STEPS

|        | Command or Action                                                                                                                            | Purpose                                                                                                               |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>show mpls traffic-eng tunnels <i>tunnel-interface</i> [brief]</b><br><br><b>Example:</b><br>Router# show mpls traffic-eng tunnels tunnel1 | Displays information about tunnels including those configured with an explicit path option using verbatim.            |
| Step 3 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                                     | (Optional) Exits to user EXEC mode.                                                                                   |

### Examples

In the following example, the **show mpls traffic-eng tunnels** command displays tunnel information, including whether the explicit path option is using verbatim and the Active Path Options Parameters that show the status of verbatim.

```
Router# show mpls traffic-eng tunnels tunnel100

Name: GSR-2_t100                               (Tunnel100) Destination: 192.168.30.1
Status:
  Admin: up           Oper: up           Path: valid           Signalling: connected

  path option 1, type explicit (verbatim) BACKUP (Basis for Setup, path weight 0)

Config Parameters:
  Bandwidth: 0          kbps (Global)  Priority: 7 7    Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
  AutoRoute: disabled  LockDown: disabled  Loadshare: 0      bw-based
  auto-bw: disabled

Active Path Option Parameters:
  State: explicit path option 1 is active
  BandwidthOverride: disabled  LockDown: disabled  Verbatim: enabled
```

# Configuration Example for MPLS Traffic Engineering—Verbatim Path Support

This section provides the following configuration example:

- [Configuring MPLS Traffic Engineering—Verbatim Path Support, page 7](#)

## Configuring MPLS Traffic Engineering—Verbatim Path Support

The following example shows a tunnel that has been configured with an explicit path option using verbatim:

```
interface tunnel 1
 ip unnumbered loopback 1
 tunnel destination 10.10.100.100
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 1 1
 tunnel mpls traffic-eng path-option 1 explicit name path1 verbatim
```

## Additional References

The following sections provide references related to the MPLS Traffic Engineering—Verbatim Path feature.

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **show mpls traffic-eng tunnels**
- **tunnel mpls traffic-eng path option**

# Feature Information for MPLS Traffic Engineering—Verbatim Path Support

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering—Verbatim Path Support

# Glossary

**Fast Reroute**—Procedures that enable temporary routing around a failed link or node while a new LSP is being established at the head end.

**headend**—The router that originates and maintains a given LSP. This is the first router in the LSP's path.

**IGP**—Interior Gateway Protocol. Internet protocol used to exchange routing information within an autonomous system. Examples of common Internet IGPs include IGRP, OSPF, and RIP.

**LSP**—label-switched path. A configured connection between two routers, in which label switching is used to carry the packets. The purpose of an LSP is to carry data packets.

**LSR**—label switching router. A device that forwards MPLS packets based on the value of a fixed-length label encapsulated in each packet.

**merge point**—The backup tunnel's tail.

**MPLS**—Multiprotocol Label Switching. A method for forwarding packets (frames) through a network. It enables routers at the edge of a network to apply labels to packets (frames). ATM switches or existing routers in the network core can switch packets according to the labels with minimal lookup overhead.

**PLR**—point of local repair. The head-end of the backup tunnel.

**RSVP**—Resource Reservation Protocol. A protocol that supports the reservation of resources across an IP network. Applications running on IP end systems can use RSVP to indicate to other nodes the nature (bandwidth, jitter, maximum burst, and so on) of the packet streams they want to receive.

**SPF**—shortest path first. Routing algorithm that iterates on length of path to determine a shortest-path spanning tree. Commonly used in link-state routing algorithms. Sometimes called Dijkstra's algorithm.

**tailend**—The router upon which an LSP is terminated. This is the last router in the LSP's path.

**traffic engineering**—The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**tunnel**—A secure communications path between two peers, such as routers.

The MPLS Traffic Engineering—RSVP Hello State Timer feature detects when a neighbor is down and quickly triggers a state timeout, which frees resources such as bandwidth that can be reused by other label switched paths (LSPs).

RSVP hellos can be used to detect when a neighboring node is down. The hello state timer then triggers a state timeout. As a result, network convergence time is reduced, and nodes can forward traffic on alternate paths or assist in stateful switchover (SSO) operation.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for MPLS Traffic Engineering—RSVP Hello State Timer](#)” section on page 13.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for MPLS Traffic Engineering—RSVP Hello State Timer

Perform the following tasks on routers before configuring the MPLS Traffic Engineering—RSVP Hello State Timer feature:

- Configure Resource Reservation Protocol (RSVP).
- Enable Multiprotocol Label Switching (MPLS).
- Configure traffic engineering (TE).
- Enable hellos for state timeout.

## Restrictions for MPLS Traffic Engineering—RSVP Hello State Timer

- Hellos for state timeout are dependent on graceful restart, if it is configured; however, graceful restart is independent of hellos for state timeout.
- Unnumbered interfaces are not supported.
- Hellos for state timeout are configured on a per-interface basis.

## Information About MPLS Traffic Engineering—RSVP Hello State Timer

You should understand the following concepts before configuring the MPLS TE—RSVP Hello State Timer feature:

- [Hellos for State Timeout, page 2](#)

### Hellos for State Timeout

When RSVP signals a TE LSP and there is a failure somewhere along the path, the failure can remain undetected for as long as two minutes. During this time, bandwidth is held by the nonfunctioning LSP on the nodes downstream from the point of failure along the path with the state intact. If this bandwidth is needed by headend tunnels to signal or resignal LSPs, tunnels may fail to come up for several minutes thereby negatively affecting convergence time.

Hellos enable RSVP nodes to detect when a neighboring node is not reachable. After a certain number of intervals, hellos notice that a neighbor is not responding and delete its state. This action frees the node's resources to be reused by other LSPs.

Hellos must be configured both globally on the router and on the specific interface to be operational.

## Nonfast-Reroutable TE LSP

Figure 1 shows a nonfast-reroutable TE LSP from Router 1 to Router 3 via Router 2.

**Figure 1** *Nonfast-Reroutable TE LSP*

Assume that the link between Router 1 and Router 2 fails. This type of problem can be detected by various means including interface failure, Interior Gateway Protocol (IGP) (Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS)), and RSVP hellos. However, sometimes interface failure cannot be detected; for example, when Router 1 and Router 2 are interconnected through a Layer 2 switch. The IGP may be slow detecting the failure. Or there may be no IGP running between Router 1 and Router 2; for example, between two Autonomous System Boundary Routers (ASBRs) interconnecting two autonomous systems.

If hellos were running between Router 1 and Router 2, each router would notice that communication was lost and time out the state immediately.

Router 2 sends a delayed PathTear message to Router 3 so that the state can be deleted on all nodes thereby speeding up the convergence time.

### Note

The PathTear message is delayed one second because on some platforms data is being forwarded even after the control plane is down.

Router 1 sends a destructive PathError message upstream to Router 0 with error code ROUTING\_PROBLEM and error value NO\_ROUTE.

LSP1 goes from Router 0 to Router 1 to Router 2 to Router 3; LSP 2 goes from Router 0 to Router 1 to Router 4 to Router 2 to Router 3.

## Hello Instance

A hello instance implements RSVP hellos for a given router interface address and a remote IP address. A hello instance is expensive because of the large number of hello requests that are sent and the strains they put on the router resources. Therefore, you should create a hello instance only when it is needed to time out state and delete the hello instance when it is no longer necessary.

## Fast-Reroutable TE LSP with Backup Tunnel

Figure 2 shows a fast reroutable TE LSP with a backup tunnel from Router 1 to Router 2 to Router 3.

**Figure 2** *Fast Reroutable TE LSP with Backup Tunnel*

This TE LSP has a backup tunnel from Router 1 to Router 3 protecting the fast reroutable TE LSP against a failure in the Router 1 to Router 2 link and node Router 2. However, assume that a failure occurs in the link connecting Router 1 to Router 2. If hellos were running between Router 1 and Router 2, the routers would notice that the link is down, but would not time out the state. Router 2 notices the failure, but cannot time out the TE LSP because Router 2 may be a merge point, or another downstream node may be a merge point. Router 1 notices the failure and switches to the backup LSP; however, Router 1 cannot time out the state either.

### Note

A hello instance is not created in the preceding scenario because the neighbor is down and the hello instance cannot take action.

## Fast-Reroutable TE LSP Without Backup Tunnel

On a fast-reroutable TE LSP with no backup tunnel, a hello instance can be created with the neighbor downstream (next hop (NHOP)). On a nonfast-reroutable TE LSP, a hello instance can be created with the neighbor downstream (NHOP) and the neighbor upstream (previous hop (PHOP)). This is in addition to the existing hellos for Fast Reroute.

### Note

If both Fast Reroute and hellos for state timeout hello instances are needed on the same link, only one hello instance is created. It will have the Fast Reroute configuration including interval, missed refreshes, and differentiated services code point (DSCP). When a neighbor is down, Fast Reroute and the hello state timer take action.

Figure 3 shows a fast-reroutable TE LSP, without a backup tunnel, from Router 1 (the point of local repair (PLR)), to Router 2 to Router 3.

**Figure 3** *Fast Reroutable TE LSP Without Backup Tunnel*

Assume that a failure occurs in the link connecting Router 1 to Router 3. Router 1 can time out the state for the TE LSP because Router 1 knows there is no backup tunnel. However, Router 2 cannot time out the state because Router 2 does not know whether a backup tunnel exists. Also, Router 2 may be a merge point, and therefore cannot time out the state.

**Note**

A hello instance is not created in the preceding scenario because the neighbor is down and the hello instance cannot take action.

## How to Configure MPLS Traffic Engineering—RSVP Hello State Timer

This section contains the following procedures:

**Note**

The following tasks also enable Fast Reroute; however, this section focuses on the RSVP hello state timer.

- [Enabling the Hello State Timer Globally, page 5](#) (required)
- [Enabling the Hello State Timer on an Interface, page 6](#) (required)
- [Setting a DSCP Value on an Interface, page 7](#) (optional)
- [Setting a Hello Request Interval on an Interface, page 8](#) (optional)
- [Setting the Number of Hello Messages that can be Missed on an Interface, page 9](#) (optional)
- [Verifying Hello for State Timer Configuration, page 10](#) (optional)

### Enabling the Hello State Timer Globally

Perform this task to enable the RSVP hello state timer globally to reduce network convergence, allow nodes to forward traffic on alternate paths, or assist in stateful switchover (SSO) operation.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip rsvp signalling hello**
4. **end**

## DETAILED STEPS

|        | Command or Action                                                                                  | Purpose                                                                                                          |
|--------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                     | Enters global configuration mode.                                                                                |
| Step 3 | <b>ip rsvp signalling hello</b><br><br><b>Example:</b><br>Router(config)# ip rsvp signalling hello | Enables hellos for state timeout globally on a router.                                                           |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                           | Exits to privileged EXEC mode.                                                                                   |

## Enabling the Hello State Timer on an Interface

Perform this task to enable the RSVP hello state timer on an interface.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip rsvp signalling hello**
5. **end**

### DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                                                                          |

| Step 5 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                                                                                      | Exits to privileged EXEC mode.                                                                                            |

## Setting a Hello Request Interval on an Interface

Perform this task to set a hello request interval on an interface.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip rsvp signalling hello reroute refresh interval** *interval-value*
5. **end**

### DETAILED STEPS

|        | Command or Action                                                                                    | Purpose                                                                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                       | Enters global configuration mode.                                                                                                                                   |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet 0/0 | Enters interface configuration mode. <ul style="list-style-type: none"> <li>• The <i>type number</i> argument identifies the interface to be configured.</li> </ul> |

|        | Command or Action                                                                                                                                                                | Purpose                                                                                        |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Step 4 | <pre>ip rsvp signalling hello reroute refresh interval interval-value</pre> <p><b>Example:</b><br/>Router(config-if)# ip rsvp signalling hello reroute refresh interval 5000</p> | Sets a hello request interval on an interface of a router with hellos for state timer enabled. |
| Step 5 | <pre>end</pre> <p><b>Example:</b><br/>Router(config-if)# end</p>                                                                                                                 | Exits to privileged EXEC mode.                                                                 |

## Setting the Number of Hello Messages that can be Missed on an Interface

Perform this task to set the number of consecutive hello messages that are lost (missed) before hello declares the neighbor down.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **ip rsvp signalling hello reroute refresh misses msg-count**
5. **end**

### DETAILED STEPS

|        | Command or Action                                                                                  | Purpose                                                                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <pre>enable</pre> <p><b>Example:</b><br/>Router&gt; enable</p>                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                 |
| Step 2 | <pre>configure terminal</pre> <p><b>Example:</b><br/>Router# configure terminal</p>                | Enters global configuration mode.                                                                                                                                  |
| Step 3 | <pre>interface type number</pre> <p><b>Example:</b><br/>Router(config)# interface Ethernet 0/0</p> | Enters interface configuration mode. <ul style="list-style-type: none"> <li>• The <i>type number</i> arguments identify the interface to be configured.</li> </ul> |

|        | Command or Action                                                                                                                                                           | Purpose                                                                                                    |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| Step 4 | <pre>ip rsvp signalling hello reroute refresh misses msg-count</pre> <p><b>Example:</b></p> <pre>Router(config-if)# ip rsvp signalling hello reroute refresh misses 5</pre> | Configures the number of consecutive hello messages that are lost before hello declares the neighbor down. |
| Step 5 | <pre>end</pre> <p><b>Example:</b></p> <pre>Router(config-if)# end</pre>                                                                                                     | Exits to privileged EXEC mode.                                                                             |

## Verifying Hello for State Timer Configuration

Perform this task to verify the hello for state timer configuration.

### SUMMARY STEPS

1. `enable`
2. `show ip rsvp hello`

### DETAILED STEPS

|        | Command or Action                                                                          | Purpose                                                                                                                       |
|--------|--------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <pre>enable</pre> <p><b>Example:</b></p> <pre>Router&gt; enable</pre>                      | (Optional) Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <pre>show ip rsvp hello</pre> <p><b>Example:</b></p> <pre>Router# show ip rsvp hello</pre> | Displays the status of RSVP TE hellos and statistics including hello state timer (reroute).                                   |

## Configuration Examples for MPLS Traffic Engineering—RSVP Hello State Timer

This section provides a configuration example for the MPLS TE—RSVP Hello State Timer feature:

- [MPLS Traffic Engineering—RSVP Hello State Timer: Example, page 10](#)

### MPLS Traffic Engineering—RSVP Hello State Timer: Example

In the following example, the hello state timer is enabled globally and on an interface. Related parameters, including a DSCP value, a refresh interval, and a missed refresh limit, are set on an interface.

```
Router# configure terminal
```

```

Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# ip rsvp signalling hello
Router(config)# interface Ethernet 0/0
Router(config-if)# ip rsvp signalling hello
Router(config-if)# ip rsvp signalling hello reroute dscp 30
Router(config-if)# ip rsvp signalling hello reroute refresh interval 5000
Router(config-if)# ip rsvp signalling hello reroute refresh misses 5
Router(config-if)# end

```

The following example verifies the status of the hello state timer (reroute):

```

Router# show ip rsvp hello

Hello:
  Fast-Reroute/Reroute:Enabled
  Statistics:Enabled
  Graceful Restart:Enabled (help-neighbor only)

```

## Additional References

The following sections provide references related to the MPLS Traffic Engineering—RSVP Hello State Timer feature.

## Feature Information for MPLS Traffic Engineering—RSVP Hello State Timer

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering—RSVP Hello State Timer

# Glossary

**autonomous system**—A collection of networks that share the same routing protocol and that are under the same system administration.

**ASBR**—autonomous system boundary router. A router that connects and exchanges information between two or more autonomous systems.

**backup tunnel**—An MPLS traffic engineering tunnel used to protect other (primary) tunnel traffic when a link or node failure occurs.

**DSCP**—differentiated services code point. Six bits in the IP header, as defined by the IETF. These bits determine the class of service provided to the IP packet.

**Fast Reroute**—A mechanism for protecting MPLS traffic engineering (TE) LSPs from link and node failure by locally repairing the LSPs at the point of failure, allowing data to continue to flow on them while their headend routers attempt to establish end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or nodes.

**graceful restart**—A process for helping a neighboring Route Processor restart after a node failure has occurred.

**headend**—The router that originates and maintains a given LSP. This is the first router in the LSP's path.

**IGP**—Interior Gateway Protocol. Internet protocol used to exchange routing information within an autonomous system. Examples of common Internet IGPs include IGRP, OSPF, and RIP.

**IS-IS**—Intermediate System-to-Intermediate System. OSI link-state hierarchical routing protocol whereby Intermediate System (IS) routers exchange routing information based on a single metric to determine network topology.

**instance**—A mechanism that implements the RSVP hello extensions for a given router interface address and remote IP address. Active hello instances periodically send Hello Request messages, expecting Hello ACK messages in response. If the expected ACK message is not received, the active hello instance declares that the neighbor (remote IP address) is unreachable (that is, it is lost). This can cause LSPs crossing this neighbor to be fast rerouted.

**label**—A short, fixed-length data identifier that tells switching nodes how to forward data (packets or cells).

**LDP**—Label Distribution Protocol. The protocol that supports MPLS hop-by-hop forwarding by distributing bindings between labels and network prefixes. The Cisco proprietary version of this protocol is the Tag Distribution Protocol (TDP).

**LSP**—label switched path is a configured connection between two routers, in which MPLS is used to carry packets. The LSP is created by the concatenation of one or more label-switched hops, allowing a packet to be forwarded by swapping labels from one MPLS node to another MPLS node.

**merge point**—The backup tunnel's tail.

**MPLS**—Multiprotocol Label Switching. A method for forwarding packets (frames) through a network. MPLS enables routers at the edge of a network to apply labels to packets (frames). ATM switches or existing routers in the network core can switch packets according to the labels.

**OSPF**—Open Shortest Path First. A link-state routing protocol used for routing.

**PLR**—point of local repair. The headend of the backup tunnel.

**RSVP**—Resource Reservation Protocol. A protocol that supports the reservation of resources across an IP network. Applications running on IP end systems can use RSVP to indicate to other nodes the nature (bandwidth, jitter, maximum burst, and so on) of the packet streams they want to receive.

**state**—Information that a router must maintain about each LSP. The information is used for rerouting tunnels.

**tailend**—The router upon which an LSP is terminated. This is the last router in the LSP's path.

**TE**—traffic engineering. The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**topology**—The physical arrangement of network nodes and media within an enterprise networking structure.

**tunnel**—Secure communications path between two peers, such as two routers.

# MPLS Traffic Engineering Forwarding Adjacency

---

**First Published: January 29, 2001**

**Last Updated: February 27, 2009**

The MPLS Traffic Engineering Forwarding Adjacency feature allows a network administrator to handle a traffic engineering (TE) label switched path (LSP) tunnel as a link in an Interior Gateway Protocol (IGP) network based on the Shortest Path First (SPF) algorithm.

Both Intermediate System-to-Intermediate System (IS-IS) and Open Shortest Path First (OSPF) are supported.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering Forwarding Adjacency” section on page 11](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Feature Information for MPLS Traffic Engineering Forwarding Adjacency, page 11](#)
- [Glossary, page 12](#)

## Prerequisites for MPLS Traffic Engineering Forwarding Adjacency

Your network must support the following Cisco IOS features:

- Multiprotocol Label Switching (MPLS)
- IP Cisco Express Forwarding
- IS-IS

## Restrictions for MPLS Traffic Engineering Forwarding Adjacency

- Using the MPLS Traffic Engineering Forwarding Adjacency feature increases the size of the IGP database by advertising a TE tunnel as a link.
- When the MPLS Traffic Engineering Forwarding Adjacency feature is enabled on a TE tunnel, the link is advertised in the IGP network as a type, length, value (TLV) 22 object without any TE sub-TLV.
- You must configure MPLS TE forwarding adjacency tunnels bidirectionally.
- You cannot configure MPLS Traffic Engineering over the logical GRE tunnel interface.

## Information About MPLS Traffic Engineering Forwarding Adjacency

To configure MPLS Traffic Engineering Forwarding Adjacency you should understand the following concepts:

- [MPLS Traffic Engineering Forwarding Adjacency Functionality, page 2](#)
- [MPLS Traffic Engineering Forwarding Adjacency Benefits, page 3](#)

## MPLS Traffic Engineering Forwarding Adjacency Functionality

The MPLS Traffic Engineering Forwarding Adjacency feature allows a network administrator to handle a TE LSP tunnel as a link in an IGP network based on the SPF algorithm. A forwarding adjacency can be created between routers regardless of their location in the network. The routers can be located multiple hops from each other, as shown in [Figure 1](#).

**Figure 1 Forwarding Adjacency Topology**

As a result, a TE tunnel is advertised as a link in an IGP network with the link's cost associated with it. Routers outside of the TE domain see the TE tunnel and use it to compute the shortest path for routing traffic throughout the network.

## MPLS Traffic Engineering Forwarding Adjacency Benefits

### TE Tunnel Interfaces Advertised for SPF

TE tunnel interfaces are advertised in the IGP network just like any other links. Routers can then use these advertisements in their IGP's to compute the SPF even if they are not the headend of any TE tunnels.

## How to Configure MPLS Traffic Engineering Forwarding Adjacency

This section contains the following tasks:

- [Configuring a Tunnel Interface for MPLS TE Forwarding Adjacency, page 3](#) (required)
- [Configuring MPLS TE Forwarding Adjacency on Tunnels, page 4](#) (required)
- [Verifying MPLS TE Forwarding Adjacency, page 5](#) (optional)

## Configuring a Tunnel Interface for MPLS TE Forwarding Adjacency

To configure a tunnel interface for an MPLS TE forwarding adjacency, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***

## DETAILED STEPS

|        | Command or Action                                                                                  | Purpose                                                                                                            |

## Configuring MPLS TE Forwarding Adjacency on Tunnels

To configure an MPLS TE forwarding adjacency, perform the following steps.

**Note**

You must configure a forwarding adjacency on two LSP tunnels bidirectionally, from A to B and B to A. Otherwise, the forwarding adjacency is advertised, but not used in the IGP network.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***
4. **tunnel mpls traffic-eng forwarding-adjacency [holdtime *value*]**
5. **isis metric {*metric-value* | maximum} {level-1 | level-2}**

## DETAILED STEPS

|        | Command or Action                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>interface tunnel number</b><br><br><b>Example:</b><br>Router(config)# interface tunnel 0                                                                    | Designates a tunnel interface for the forwarding adjacency, and enters interface configuration mode.                                                                                                                                                                                                                                                         |
| Step 4 | <b>tunnel mpls traffic-eng forwarding-adjacency [holdtime value]</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng forwarding-adjacency | Advertises a TE tunnel as a link in an IGP network.                                                                                                                                                                                                                                                                                                          |
| Step 5 | <b>isis metric {metric-value   maximum} {level-1   level-2}</b><br><br><b>Example:</b><br>Router(config-if)# isis metric 2 level-1                             | Configures the IS-IS metric for a tunnel interface to be used as a forwarding adjacency. <ul style="list-style-type: none"> <li>You should specify the <b>isis metric</b> command with level-1 or level-2 to be consistent with the IGP level at which you are performing traffic engineering. Otherwise, the metric has the default value of 10.</li> </ul> |

## Verifying MPLS TE Forwarding Adjacency

To verify MPLS TE forwarding adjacency on tunnels, perform the following steps.

## SUMMARY STEPS

- show mpls traffic-eng forwarding-adjacency [ip-address]**
- show isis [process-tag] database [level-1] [level-2] [11] [12] [detail] [lspid]**

## DETAILED STEPS

**Step 1** **show mpls traffic-eng forwarding-adjacency [ip-address]**

Use this command to see the current tunnels.

Router# **show mpls traffic-eng forwarding-adjacency**

```
destination 0168.0001.0007.00 has 1 tunnels
Tunnel7      (traffic share 100000, nexthop 192.168.1.7)
              (flags:Announce Forward-Adjacency, holdtime 0)
```

```
Router# show mpls traffic-eng forwarding-adjacency 192.168.1.7

destination 0168.0001.0007.00 has 1 tunnels
Tunnel7      (traffic share 100000, nexthop 192.168.1.7)
              (flags:Announce Forward-Adjacency, holdtime 0)
```

## Step 2 show isis [process-tag] database [level-1] [level-2] [l1] [l2] [detail] [lspid]

Use this command to display information about the IS-IS link-state database.

```
Router# show isis database
```

IS-IS Level-1 Link State Database

# Configuration Examples for MPLS Traffic Engineering Forwarding Adjacency

This section provides the following configuration example for the MPLS Traffic Engineering Forwarding Adjacency feature using an IS-IS metric: [MPLS Traffic Engineering Forwarding Adjacency](#)

## MPLS TE Forwarding Adjacency: Example

The following output shows the configuration of a tunnel interface, a forwarding adjacency, and an IS-IS metric:

```
Router# configure terminal
```

Enter configuration commands, one per line. End with CNTL/Z.

```
Router(config)# interface tunnel 7
Router(config-if)# tunnel mpls traffic-eng forwarding-adjacency
Router(config-if)# isis metric 2 level-1
```

Following is sample command output when a forwarding adjacency has been configured:

```
Router# show running-config
```

```
Building configuration...
Current configuration :364 bytes
!
interface Tunnel7
```

```

ip unnumbered Loopback0
no ip directed-broadcast
tunnel destination 192.168.1.7
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng forwarding-adjacency
tunnel mpls traffic-eng priority 7 7
tunnel mpls traffic-eng path-option 10 explicit name short
isis metric 2 level 1

```

**Note**

Do not specify the **tunnel mpls traffic-eng autoroute announce** command in your configuration when you are using forwarding adjacency.

Following is an example where forwarding adjacency is configured with OSPF:

```
Router# configure terminal
```

```
Router# show running-config
```

```

Building configuration...
Current configuration : 310 bytes
interface tunnel 1
!
interface Tunnell
 ip unnumbered Loopback0
 ip ospf cost 6
 tunnel destination 172.16.255.5
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng forwarding-adjacency tunnel mpls
 traffic-eng priority 7 7
 tunnel mpls traffic-eng bandwidth 1000
 tunnel mpls traffic-eng path-option 10 dynamic
 end

```

```
Router# show mpls traffic-eng forwarding-adjacency
```

```

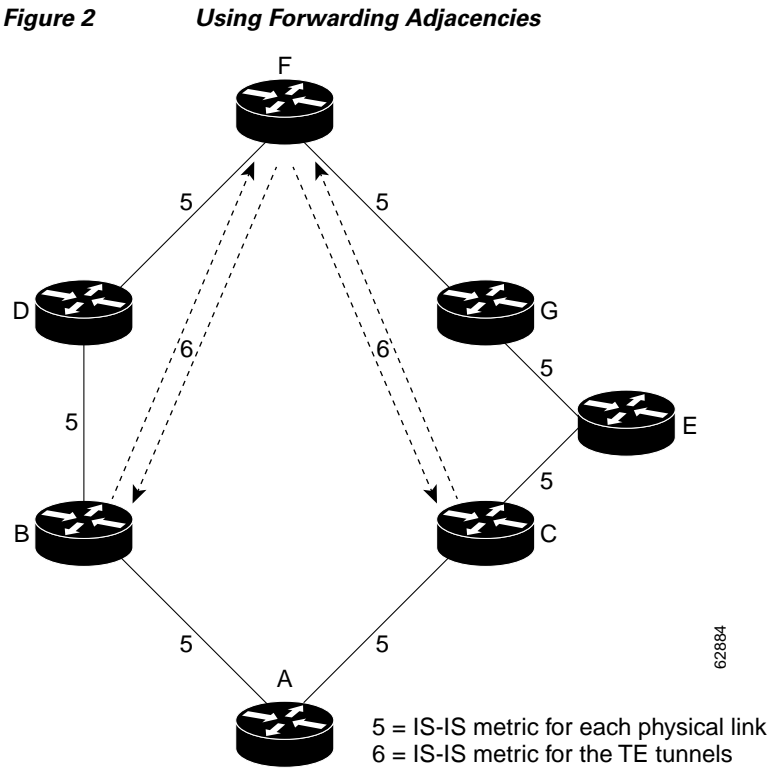

destination 172.16.255.5, area ospf 172 area 0, has 1 tunnels
  Tunnell      (load balancing metric 2000000, nexthop 172.16.255.5)
                (flags: Forward-Adjacency, holdtime 0)

```

```
Router#
```

## Usage Tips

In [Figure 2](#), if you have no forwarding adjacencies configured for the TE tunnels between Band F and C and F, all the traffic that A must forward to F goes through B because B is the shortest path from A to F. (The cost from A to F is 15 through B and 20 through C.)

If you have forwarding adjacencies configured on the TE tunnels between B and F and C and F and also on the TE tunnels between F and B and F and C, then when A computes the SPF algorithm, A sees two equal cost paths of 11 to F. As a result, traffic across the A-B and A-C links is shared.

# Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **debug mpls traffic-eng forwarding-adjacency**
- **show mpls traffic-eng forwarding-adjacency**
- **tunnel mpls traffic-eng forwarding-adjacency**

# Feature Information for MPLS Traffic Engineering Forwarding Adjacency

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering Forwarding Adjacency

| Feature Name                                  | Releases                                                                                      | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

# Glossary

**Cisco Express Forwarding**—A scalable, distributed, Layer 3 switching solution designed to meet the future performance requirements of the Internet and enterprise networks.

**forwarding adjacency**—A traffic engineering link (or LSP) into an IS-IS/OSPF network.

**IGP**—Interior Gateway Protocol. Internet protocol used to exchange routing information within an autonomous system. Examples of common IGPs include Interior Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), and Routing Information Protocol (RIP).

**IS-IS**—Intermediate System-to-Intermediate System. Open System Interconnection (OSI) link-state hierarchical routing protocol whereby Intermediate System (IS) routers exchange routing information based on a single metric to determine network topology.

**label switched path (LSP)**—A sequence of hops ( $R_0 \dots R_n$ ) in which a packet travels from  $R_0$  to  $R_n$  through label switching mechanisms. A switched path can be chosen dynamically, based on normal routing mechanisms, or through configuration.

**label switched path (LSP) tunnel**—A configured connection between two routers, using label switching to carry the packets.

**MPLS**—Multiprotocol Label Switching. A switching method that forwards IP traffic using a label. This label instructs the routers and the switches in the network where to forward the packets based on preestablished IP routing information.

**OSPF**—Open Shortest Path First. A link-state, hierarchical IGP routing algorithm proposed as a successor to RIP in the Internet community. OSPF features include least-cost routing, multipath routing, and load balancing. OSPF was derived from an early version of the IS-IS protocol. *See also* IS-IS.

**SPF**—Shortest Path First. A routing algorithm used as the basis for OSPF operations. When an SPF router is powered up, it initializes its routing-protocol data structures and then waits for indications from lower-layer protocols that its interfaces are functional.

**TLV**—type, length, value. A block of information embedded in Cisco Discovery Protocol advertisements.

**traffic engineering**—The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been applied.

**traffic engineering tunnel**—A label switched tunnel that is used for traffic engineering. Such a tunnel is set up through means other than normal Layer 3 routing; it is used to direct traffic over a path different from the one that Layer 3 routing would cause the tunnel to take.

# MPLS Traffic Engineering : Class-based Tunnel Selection

---

**First Published: November 1, 2003**

**Last Updated: May 9, 2008**

The MPLS Traffic Engineering (TE): Class-based Tunnel Selection feature enables you to dynamically route and forward traffic with different class of service (CoS) values onto different TE tunnels between the same tunnel headend and the same tailend. The TE tunnels can be regular TE or DiffServ-aware TE (DS-TE) tunnels.

The set of TE (or DS-TE) tunnels from the same headend to the same tailend that you configure to carry different CoS values is referred to as a “tunnel bundle.” After configuration, Class-Based Tunnel Selection (CBTS) dynamically routes and forwards each packet into the tunnel that:

- Is configured to carry the CoS of the packet
- Has the right headend for the destination of the packet

Because CBTS offers dynamic routing over DS-TE tunnels and requires minimum configuration, it greatly eases deployment of DS-TE in large-scale networks.

CBTS can distribute all CoS values on eight different tunnels.

CBTS also allows the TE tunnels of a tunnel bundle to exit headend routers through different interfaces.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for MPLS Traffic Engineering : Class-based Tunnel Selection](#)” section on page 30.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Feature Information for MPLS Traffic Engineering : Class-based Tunnel Selection, page 30](#)
- [Glossary, page 31](#)

## Prerequisites for MPLS Traffic Engineering : Class-based Tunnel Selection

- Multiprotocol Label Switching (MPLS) must be enabled on all tunnel interfaces.
- Cisco Express Forwarding or distributed Cisco Express Forwarding must be enabled in global configuration mode.

## Restrictions for MPLS Traffic Engineering : Class-based Tunnel Selection

- For a given destination, all CoS values are carried in tunnels terminating at the same tailend. Either all CoS values are carried in tunnels or no values are carried in tunnels. In other words, for a given destination, you cannot map some CoS values in a DS-TE tunnel and other CoS values in a Shortest Path First (SPF) Label Distribution Protocol (LDP) or SPF IP path.
- CBTS does not allow load-balancing of a given experimental (EXP) value in multiple tunnels. If two or more tunnels are configured to carry a given EXP value, CBTS picks one of those tunnels to carry this EXP value.
- The operation of CBTS is not supported with Any Transport over MPLS (AToM), MPLS TE Automesh, or label-controlled (LC)-ATM.

## Information About MPLS Traffic Engineering : Class-based Tunnel Selection

To configure the MPLS Traffic Engineering (TE): Class-based Tunnel Selection feature, you should understand the following concepts:

- [Incoming Traffic Supported by MPLS TE Class-based Tunnel Selection, page 3](#)
- [CoS Attributes for MPLS TE Class-based Tunnel Selection, page 3](#)

- [Routing Protocols and MPLS TE Class-based Tunnel Selection, page 3](#)
- [Tunnel Selection with MPLS TE Class-based Tunnel Selection, page 4](#)
- [DS-TE Tunnels and MPLS TE Class-based Tunnel Selection, page 10](#)
- [Reoptimization and MPLS TE Class-based Tunnel Selection, page 10](#)
- [Interarea and Inter-AS and MPLS TE Class-based Tunnel Selection, page 10](#)
- [ATM PVCs and MPLS TE Class-based Tunnel Selection, page 10](#)

## Incoming Traffic Supported by MPLS TE Class-based Tunnel Selection

The CBTS feature supports the following kinds of incoming packets:

- At a provider edge (PE) router—Unlabeled packets that enter a Virtual Private Network (VPN) routing and forwarding (VRF) instance interface
- At a provider core (P) router—Unlabeled and MPLS-labeled packets that enter a non-VRF interface
- At a PE router in a Carrier Supporting Carrier (CSC) or interautonomous system (Inter-AS)—MPLS-labeled packets that enter a VRF interface

## CoS Attributes for MPLS TE Class-based Tunnel Selection

CBTS supports tunnel selection based on the value of the EXP field that the headend router imposes on the packet. Before imposing this value, the router considers the input modular quality of service (QoS) command-line interface (CLI) (MQC). If the input MQC modifies the EXP field value, CBTS uses the modified value for its tunnel selection.

Packets may enter the headend from multiple incoming interfaces. These interfaces can come from different customers that have different DiffServ policies. In such cases, service providers generally use input MQC to apply their own DiffServ policies and mark imposed EXP values accordingly. Thus, CBTS can operate consistently for all customers by considering the EXP values marked by the service provider.

### Note

---

If the output MQC modifies the EXP field, CBTS ignores the change in the EXP value.

---

CBTS allows up to eight different tunnels on which it can distribute all classes of service.

## Routing Protocols and MPLS TE Class-based Tunnel Selection

CBTS routes and forwards packets to MPLS TE tunnels for specified destinations through use of the following routing protocols:

- Intermediate System-to-Intermediate System (IS-IS) with Autoroute configured
- Open Shortest Path First (OSPF) with Autoroute configured
- Static routing
- Border Gateway Protocol (BGP) with recursion configured on the BGP next hop with packets forwarded on the tunnel through the use of IS-IS, OSPF, or static routing

## Tunnel Selection with MPLS TE Class-based Tunnel Selection

This section contains the following topics related to tunnel selection:

- [EXP Mapping Configuration, page 4](#)
- [Tunnel Selection for EXP Values, page 4](#)
- [Tunnel Failure Handling, page 7](#)
- [Misordering of Packets, page 9](#)

### EXP Mapping Configuration

With CBTS, you can configure each tunnel with any of the following:

- The same EXP information configured as it was before the CBTS feature was introduced, that is, with no EXP-related information
- One or more EXP values for the tunnel to carry
- A property that allows the carrying of all EXP values not currently allocated to any up-tunnel (default)
- One or more EXP values for the tunnel to carry, and the default property that allows the carrying of all EXP values not currently allocated to any up-tunnel

The default property (the carrying of all EXP values not currently allocated to any up-tunnel) effectively provides a way for the operator to avoid explicitly listing all possible EXP values. Even more important, the default property allows the operator to indicate tunnel preferences onto which to “bump” certain EXP values, should the tunnel carrying those EXP values go down. (See the [tunnel mpls traffic-eng exp](#) command for the command syntax.)

The configuration of each tunnel is independent of the configuration of any other tunnel. CBTS does not attempt to perform any consistency check for EXP configuration.

This feature allows configurations where:

- Not all EXP values are explicitly allocated to tunnels.
- Multiple tunnels have the default property.
- Some tunnels have EXP values configured and others do not have any values configured.
- A given EXP value is configured on multiple tunnels.

### Tunnel Selection for EXP Values

This section contains information about the following topics:

- [Tunnel Selection Process, page 5](#)
- [Tunnel Selection Examples, page 5](#)
- [Multipath with Non-TE Paths and MPLS TE Class-Based Tunnel Selection, page 7](#)
- [MPLS TE Class-Based Tunnel Selection and Policy-Based Routing, page 7](#)

## Tunnel Selection Process

Tunnel selection with this feature is a two-step process:

1. For a given prefix, routing (autoroute, static routes) occurs exactly as it did without the CBTS feature. The router selects the set of operating tunnels that have the best metrics, regardless of the EXP-related information configured on the tunnel.
2. CBTS maps all of the EXP values to the selected set of tunnels:
  - If a given EXP value is configured:
    - On only one of the tunnels in the selected set, CBTS maps the EXP value onto that tunnel.
    - On two or more of the tunnels in the selected set, CBTS arbitrarily maps the EXP value onto one of these tunnels. First CBTS selects the tunnel on which the lowest EXP value is explicitly configured. Then CBTS picks the tunnel that has the lowest tunnel ID.
  - If a given EXP value is not configured on any of the tunnels in the selected set:
    - And only one of the tunnels in the selected set is configured as a default, CBTS maps the EXP value onto that tunnel.
    - And two or more of the tunnels in the selected set are configured as defaults, CBTS arbitrarily maps the EXP value onto one of these tunnels.
    - And no tunnel in the selected set of tunnels is configured as a default, CBTS does not map this EXP value onto any specific tunnel. Instead, CBTS performs CoS-unaware load balancing of that EXP information across all tunnels in the selected set.

CBTS relies on autoroute to select the tunnel bundle. Autoroute selects only tunnels that are on the SPF to the destination. Therefore, similar to Autoroute, CBTS does not introduce any risk of routing loops.

## Tunnel Selection Examples

The following examples show various tunnel configurations that are set up by an operator and indicate how CBTS maps packets carrying EXP values onto these tunnels. Each example describes a different configuration: a default tunnel configured, more than one tunnel configured with the same EXP value, and so on.

### Example 1—Default Tunnel Configured

An operator configures the following parameters on tunnels T1 and T2:

- T1: exp = 5, autoroute
- T2: exp = default, autoroute

If T1 and T2 are next-hop interfaces for prefix P, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 5> onto T1
- Packets with <Dest = P, exp = anything-other-than-5> onto T2

### Example 2—EXP Values Configured on Two Tunnels; One Default Tunnel

An operator configures the following parameters on tunnels T1, T2, and T3:

- T1: exp = 5, autoroute
- T2: exp = 3 and 4, autoroute
- T3: exp = default, autoroute

If T1, T2, and T3 are next-hop interfaces for prefix P, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 5> onto T1
- Packets with <Dest = P, exp = 3 or 4> onto T2
- Packets with <Dest = P, exp = 0, 1, 2, 6, or 7> onto T3

### Example 3—More than One Tunnel with the Same EXP

An operator configures the following parameters on tunnels T1, T2, and T3:

- T1: exp = 5, autoroute
- T2: exp = 5, autoroute
- T3: exp = default, autoroute

If T1, T2, and T3 are next-hop interfaces for prefix P, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 5> onto T1 (arbitrary selection)
- Packets with <Dest = P, exp = anything-other-than-5> onto T3
- No packets onto T2

### Example 4—Static Route Configured

An operator configures the following parameters on tunnels T1 and T2:

- T1: exp = 5, autoroute
- T2: exp = 3
- Static route to P on T2

If prefix P is behind the T1 and T2 tailend router, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = anything> onto T2
- No packets onto T1

Static routes are preferred over dynamic routes; therefore, the router chooses only T2 as the “selected set” of tunnels.

### Example 5—Metrics Configured on Tunnels

An operator configures the following parameters on tunnels T1 and T2:

- T1: exp = 5, autoroute, relative metric –2
- T2: exp = 3, autoroute, relative metric –3

CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = anything> onto T2
- No packets onto T1

The autoroute tunnel selection algorithm selects the tunnel with the best metric. Therefore, the router selects only T2 as the “selected set” of tunnels.

### Example 6—No Default or Metric Configuration

An operator configures the following parameters on tunnels T1 and T2:

- T1: exp = 5, autoroute
- T2: exp = 3, autoroute

If T1 and T2 are the next-hop interfaces for prefix P, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 5> onto T1
- Packets with <Dest = P, exp = 3> onto T2
- Packets with <Dest = P, exp = anything-other-than-3-or-5> onto T2

If a packet arrives with an EXP value that is different from any value configured for a tunnel, the packet goes in to the default tunnel. If no default tunnel is configured, the packet goes in to the tunnel that is configured with the lowest EXP value.

## Multipath with Non-TE Paths and MPLS TE Class-Based Tunnel Selection

For a given prefix in the routing process, the router might select a set of paths that includes both TE tunnels and non-TE-tunnel paths (SPF paths). For example, internal Border Gateway Protocol (iBGP) Multipath might be activated and result in multiple BGP next hops for that prefix, where one BGP next hop is reachable through TE tunnels and other BGP next hops are reachable through non-TE-tunnel paths.

An equal cost IGP path might also exist over TE tunnels and over a non-TE tunnel path. For example, a TE tunnel metric might be modified to be equal to the SPF path.

In these situations, CBTS maps traffic in the following manner:

- If a given EXP value is configured on one or more of the tunnels in the selected set, CBTS maps the EXP value onto that tunnel or one of those tunnels.
- If a given EXP value is not configured on any of the tunnels in the selected set but one or more of the tunnels is configured as a default in the selected set, then CBTS maps the EXP value onto that tunnel or one of those tunnels.
- If a given EXP value is not configured on any of the tunnels from the selected set and no tunnel in the selected set is configured as a default, CBTS performs CoS-unaware load-balancing of that EXP value across all the possible paths, including all of the TE tunnels of the selected set and the non-TE paths.
- If the routing process allocates all EXP values to tunnels or if a default is used, then routing does not use the non-TE paths unless all TE tunnels are down.

## MPLS TE Class-Based Tunnel Selection and Policy-Based Routing

If you configure both policy-based routing (PBR) over TE tunnels (in non-VRF environments) and CBTS, the PBR decision overrides the CBTS decision. PBR is an input process that the router performs ahead of regular forwarding.

## Tunnel Failure Handling

This section contains the following sections:

- [Tunnel Up or Down, page 7](#)
- [Behavior When a Tunnel Goes Down, page 8](#)

### Tunnel Up or Down

For CBTS operation, the important question is whether the tunnel interface is up or down, not whether the current TE label switched path (LSP) is up or down. For example, a TE LSP might go down but is reestablished by the headend because another path option exists. The tunnel interface does not go down during the transient period while the TE LSP is reestablished. Because the tunnel interface does not go down, the corresponding EXP does not get rerouted onto another tunnel during the transient period.

## Behavior When a Tunnel Goes Down

When a tunnel used by CBTS for forwarding goes down, the feature adjusts its tunnel selection for the affected EXP values. It reapplies the tunnel selection algorithm to define the behavior of packets for all EXP values, as shown in the examples that follow.

### Example 1—Tunnel Other than the Default Tunnel Goes Down

An operator configures the following parameters on tunnels T1, T2, and T3:

- T1: exp = 5, autoroute
- T2: exp = 3 and 4, autoroute
- T3: exp = default, autoroute

If T1, T2, and T3 are next-hop interfaces for prefix P and Tunnel T1 goes down, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 3, 4> onto T2 (as before)
- Packets with <Dest = P, exp = 0, 1, 2, 6, or 7> onto T3 (as before)
- Packets with <Dest = P, exp = 5> onto T3

### Example 2—Default Tunnel Goes Down

An operator configures the following parameters on tunnels T1, T2, and T3:

- T1: exp = 5, autoroute
- T2: exp = 3 and 4, autoroute
- T3: exp = default, autoroute

If T1, T2, and T3 are next-hop interfaces for prefix P and Tunnel T3 goes down, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 5> onto T1 (as before)
- Packets with <Dest = P, exp = 3, 4> onto T2 (as before)
- Packets with <Dest = P, exp = 0, 1, 2, 6, or 7> onto T1 and T2, following existing CoS-unaware load balancing

### Example 3—Two Default Tunnels Are Configured

An operator configures the following parameters on tunnels T1, T2, and T3:

- T1: exp = 5, autoroute
- T2: exp = 3, 4, and default, autoroute
- T3: exp = 0, 1, 2, 6, 7, and default, autoroute

If T1, T2, and T3 are next-hop interfaces for prefix P and Tunnel T3 goes down, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 5> onto T1 (as before)
- Packets with <Dest = P, exp = 3, 4> onto T2 (as before)
- Packets with <Dest = P, exp = 0, 1, 2, 6, or 7> onto T2

If tunnel T2 goes down, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 5> onto T1 (as before)
- Packets with <Dest = P, exp = 0, 1, 2, 6, or 7> onto T3 (as before)

- Packets with <Dest = P, exp = 3, or 4> onto T3

If tunnel T1 goes down, CBTS maps the packets onto the tunnels in this way:

- Packets with <Dest = P, exp = 3, or 4> onto T2 (as before)
- Packets with <Dest = P, exp = 0, 1, 2, 6, or 7> onto T3 (as before)
- Packets with <Dest = P, exp = 5> onto either T2 or T3, but not both

In Example 3, the operator configures the EXP default option on two tunnels to ensure that nonvoice traffic is never redirected onto the voice tunnel (T1).

## Misordering of Packets

In DiffServ, packets from a given flow might get marked with EXP values that are different from each other but belong to the same CoS value because of in-contract and out-of-contract marking of packets. We can refer to these values of EXP bits as EXP-in and EXP-out.

If packets for EXP-in are sent on a different tunnel than packets for EXP-out, then misordering of packets within the same flows could occur. For that reason, CBTS allows operators to ensure that EXP-in and EXP-out never get mapped onto different tunnels.

The CBTS feature allows the operator to configure EXP-in and EXP-out to be transported on the same tunnel when that tunnel is up. This ensures that the feature does not introduce misordering of packets. In case of tunnel failure, the tunnel selection algorithm ensures that if EXP-in and EXP-out were carried on the same tunnel before the failure, they are still carried on a single tunnel after the failure. Thus, CBTS protects against nontransient misordering even in the event of tunnel failure.

**Note**

CBTS does not attempt to force EXP-in and EXP-out to be carried on the same tunnel. The operator must configure CBTS so that EXP-in and EXP-out are carried on the same tunnel. This is comparable to the regular DiffServ situation, where the operator must ensure that EXP-in and EXP-out are configured to go in the same queue.

## Fast Reroute and MPLS TE Class-based Tunnel Selection

CBTS allows Fast Reroute (FRR) protection on tunnels for which you configure CoS-based selection.

CBTS operation with FRR does not change the number of or the way in which FRR backup tunnels might be used. The operation of FRR is the same as when CBTS is not activated. After you configure primary tunnels from a given headend to a given tailend, you can use FRR in the same way whether you activate CoS-based tunnel selection or not. This includes the following possibilities:

- None of the tunnels use FRR.
- All of the  $x$  tunnels are FRR-protected and share the same backup tunnel, if the traffic goes out the same interface.
- Some of the  $x$  tunnels are not FRR-protected; the remaining tunnels are FRR-protected and share the same backup tunnel, if the traffic goes out the same interface.
- Some of the  $x$  tunnels are not FRR-protected; the remaining tunnels are FRR-protected and are protected by different backup tunnels (for example, if the traffic goes out different interfaces, or if the traffic goes out the same interface). Bandwidth guarantees exist on the backup tunnels.

The important question for CBTS operation is only whether a tunnel interface goes down or stays up. FRR protects a given tunnel in exactly the same way as if CBTS were not configured on the tunnel.

## DS-TE Tunnels and MPLS TE Class-based Tunnel Selection

CBTS operates over tunnels using DS-TE. Therefore, the tunnels on which CoS-based selection is performed can each arbitrarily and independently use a bandwidth from the global pool or the subpool.

## Reoptimization and MPLS TE Class-based Tunnel Selection

CBTS allows tunnels on which CoS-based selection is performed to be reoptimized. Reoptimization does not affect CBTS operation.

## Interarea and Inter-AS and MPLS TE Class-based Tunnel Selection

The CBTS operates over tunnels that are interarea when the interarea tunnels use static routes on destination prefixes or on the BGP next hops.

## ATM PVCs and MPLS TE Class-based Tunnel Selection

CBTS operates over ATM permanent virtual circuits (PVCs). This means that TE or DS-TE tunnels handled by CBTS can span links that are ATM PVCs. ATM PVCs might be used on the headend router that is running CBTS and on transit label switch routers (LSRs).

# How to Configure MPLS Traffic Engineering : Class-based Tunnel Selection

This section contains the following procedures:

- [Creating Multiple MPLS TE or DS-TE Tunnels from the Same Headend to the Same Tailend, page 10](#)
- [Configuring EXP Values to Be Carried by Each MPLS TE or DS-TE Tunnel, page 13](#)
- [Making the MPLS TE or DS-TE Tunnels Visible for Routing, page 14](#)
- [Verifying That the MPLS TE or DS-TE Tunnels Are Operating and Announced to the IGP, page 15](#)
- [Configuring a Master Tunnel, page 17](#)

You need to configure the CBTS feature only on the tunnel headend. No CBTS configuration is required on the tailend or transit LSR.

## Creating Multiple MPLS TE or DS-TE Tunnels from the Same Headend to the Same Tailend

[Figure 1](#) shows an example of two tunnels, Tunnel 65 and Tunnel 66, transporting different classes of traffic between the same headend and the same tailend.

**Figure 1**      **Tunnels Transporting Different Classes of Service Between the Same Headend and Tailend**

To create multiple MPLS TE or DS-TE tunnels with the same headend and same tailend, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***
4. **ip unnumbered *type number***
5. **tunnel destination {*hostname* | *ip-address*}**
6. **tunnel mode mpls traffic-eng**
7. **tunnel mpls traffic-eng bandwidth [sub-pool | global] *bandwidth***
8. **exit**
9. Repeat steps 3 through 8 on the same headend router to create additional tunnels from this headend to the same tailend.
10. **end**

## DETAILED STEPS

|         | Command or Action                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                     |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1  | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                            |
| Step 2  | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                           |
| Step 3  | <b>interface tunnel <i>number</i></b><br><br><b>Example:</b><br>Router(config)# interface tunnel 65                                                                                      | Configures an interface type and enters interface configuration mode.                                                                                                                                                                                                                                                                                       |
| Step 4  | <b>ip unnumbered <i>type number</i></b><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered loopback 0                                                                            | Enables IP processing on an interface without assigning an explicit IP address to the interface.                                                                                                                                                                                                                                                            |
| Step 5  | <b>tunnel destination {<i>hostname</i>   <i>ip-address</i>}</b><br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.10.10.12                                              | Specifies the destination of the tunnel for this path option.                                                                                                                                                                                                                                                                                               |
| Step 6  | <b>tunnel mode mpls traffic-eng</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng                                                                            | Sets the mode of a tunnel to MPLS for TE.                                                                                                                                                                                                                                                                                                                   |
| Step 7  | <b>tunnel mpls traffic-eng bandwidth [<i>sub-pool</i>   <i>global</i>] <i>bandwidth</i></b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 3000 | Configures the bandwidth for the MPLS TE tunnel. If automatic bandwidth is configured for the tunnel, use the <b>tunnel mpls traffic-eng bandwidth</b> command to configure the initial tunnel bandwidth, which is adjusted by the autobandwidth mechanism.<br><br><b>Note</b> You can configure any existing MPLS TE command on these TE or DS-TE tunnels. |
| Step 8  | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                            | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                       |
| Step 9  | Repeat steps 3 through 8 on the same headend router to create additional tunnels from this headend to the same tailend.                                                                  | —                                                                                                                                                                                                                                                                                                                                                           |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                            |

## Configuring EXP Values to Be Carried by Each MPLS TE or DS-TE Tunnel

To configure EXP values to be carried by each MPLS TE or DS-TE tunnel, perform the following steps. For each tunnel that you create, you must indicate which EXP values the tunnel carries.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **tunnel mpls traffic-eng exp** [*list-of-exp-values*] [**default**]
5. **exit**
6. Repeat steps 3 through 5 for all MPLS TE tunnels that you created in the [“Creating Multiple MPLS TE or DS-TE Tunnels from the Same Headend to the Same Tailend”](#) section on page 10.
7. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                                              | Purpose                                                                                                           |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                 | Enters global configuration mode.                                                                                 |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 65                                                              | Configures an interface type and enters interface configuration mode.                                             |
| Step 4 | <b>tunnel mpls traffic-eng exp</b> [ <i>list-of-exp-values</i> ] [ <b>default</b> ]<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng exp 5 | Specifies the EXP bits that will be forwarded over a member tunnel that is part of the CBTS bundle.               |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                  | Returns to global configuration mode.                                                                             |

|        | Command or Action                                                                                                                                                                                   | Purpose                          |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| Step 6 | Repeat steps 3 through 5 for all MPLS TE tunnels that you created in the <a href="#">“Creating Multiple MPLS TE or DS-TE Tunnels from the Same Headend to the Same Tailend”</a> section on page 10. | —                                |
| Step 7 | <code>end</code><br><br><b>Example:</b><br><code>Router(config-if)# end</code>                                                                                                                      | Returns to privileged EXEC mode. |

## Making the MPLS TE or DS-TE Tunnels Visible for Routing

Perform the following task to make the MPLS TE or DS-TE tunnels visible for routing.

### Note

Alternatively, static routing could be used instead of `autoroute` to make the TE or DS-TE tunnels visible for routing.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `tunnel mpls traffic-eng autoroute announce`
5. `tunnel mpls traffic-eng autoroute metric {absolute | relative} value`
6. `end`

### DETAILED STEPS

|        | Command or Action                                                                                             | Purpose                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br><code>Router&gt; enable</code>                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br><code>Router# configure terminal</code>             | Enters global configuration mode.                                                                                  |
| Step 3 | <code>interface type number</code><br><br><b>Example:</b><br><code>Router(config)# interface tunnel 65</code> | Configures an interface type and enters interface configuration mode.                                              |

|        | Command or Action                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>tunnel mpls traffic-eng autoroute announce</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng autoroute announce                                    | Specifies that the Interior Gateway Protocol (IGP) should use the tunnel (if the tunnel is up) in its enhanced SPF calculation.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 5 | <b>tunnel mpls traffic-eng autoroute metric {absolute   relative} value</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng autoroute metric relative 2 | Specifies the MPLS TE tunnel metric that the IGP enhanced SPF calculation uses.<br><br><b>Note</b> Even though the value for a relative metric can be from -10 to +10, configuring a tunnel metric with a negative value is considered a misconfiguration. If the metric to the tunnel tailend appears to be 4 from the routing table, then the cost to the tunnel tailend router is actually 3 because 1 is added to the cost for getting to the loopback address. In this instance, the lowest value that you can configure for the relative metric is -3. |
| Step 6 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Verifying That the MPLS TE or DS-TE Tunnels Are Operating and Announced to the IGP

To verify that the MPLS TE or DS-TE tunnels are operating and announced to the IGP, perform the following steps.

### SUMMARY STEPS

1. **show mpls traffic-eng topology** {ip-address | igp-id {isis nsap-address | ospf ip-address}} [brief]
2. **show mpls traffic-eng tunnels** number [brief] protect
3. **show ip cef** [vrf vrf-name] [unresolved [detail] | [detail | summary]]
4. **show mpls forwarding-table** [network {mask | length} | labels label [- label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail]
5. **show mpls traffic-eng autoroute**

### DETAILED STEPS

- Step 1** **show mpls traffic-eng topology** {ip-address | igp-id {isis nsap-address | ospf ip-address}} [brief]

Use this command to display the MPLS TE global topology currently known at this node:

```
Router# show mpls traffic-eng topology
```

```
My_System_id: 0000.0025.0003.00
```

```

IGP Id: 0000.0024.0004.00, MPLS TE Id:172.16.4.4 Router Node
  link[0 ]:Intf Address: 10.1.1.4
    Nbr IGP Id: 0000.0024.0004.02,
    admin_weight:10, affinity_bits:0x0
    max_link_bw:10000 max_link_reservable: 10000
  globalpoolsubpool
    total allocatedreservable reservable
  -----
bw[0]: 0 1000500
bw[1]:10 990490
bw[2]: 600 390390
bw[3]: 0 390390
bw[4]: 0 390390
bw[5]: 0 390390

```

## Step 2 show mpls traffic-eng tunnels *number* [brief] [protection]

Use this command to display information for a specified tunneling interface:

```
Router# show mpls traffic-eng tunnels 500 brief protection
```

```

Router#_t500
LSP Head, Tunnel500, Admin: up, Oper: up
Src 172.16.0.5, Dest 172.16.0.8, Instance 17
Fast Reroute Protection: None
Path Protection: 1 Common Link(s) , 1 Common Node(s)
  Primary lsp path:192.168.6.6 192.168.7.7
                  192.168.8.8 192.168.0.8

  Protect lsp path:172.16.7.7 192.168.8.8
                  10.0.0.8
Path Protect Parameters:
  Bandwidth: 50      kbps (Global)  Priority: 7 7  Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
InLabel : -
OutLabel : Serial5/3, 46
RSVP Signalling Info:
  Src 172.16.0.5, Dst 172.16.0.8, Tun_Id 500, Tun_Instance 18
RSVP Path Info:
  My Address: 172.16.0.5
  Explicit Route: 192.168.7.7 192.168.8.8
  Record Route: NONE
  Tspec: ave rate=50 kbits, burst=1000 bytes, peak rate=50 kbits
RSVP Resv Info:
  Record Route: NONE
  Fspec: ave rate=50 kbits, burst=1000 bytes, peak rate=50 kbits

```

## Step 3 show ip cef summary

Use this command to display a summary of the IP CEF table:

```
Router# show ip cef summary
```

```

IP Distributed CEF with switching (Table Version 25), flags=0x0
21 routes, 0 reresolve, 0 unresolved (0 old, 0 new), peak 1
21 leaves, 16 nodes, 19496 bytes, 36 inserts, 15 invalidations
0 load sharing elements, 0 bytes, 0 references
universal per-destination load sharing algorithm, id 5163EC15
3(0) CEF resets, 0 revisions of existing leaves
Resolution Timer: Exponential (currently 1s, peak 1s)
0 in-place/0 aborted modifications
refcounts: 4377 leaf, 4352 node

Table epoch: 0 (21 entries at this epoch)

```

Adjacency Table has 9 adjacencies

**Step 4** **show mpls forwarding-table** [*network {mask | length}*] | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*] [**vrf** *vrf-name*] [**detail**]

Use this command to display the contents of the MPLS Label Forwarding Information Base (LFIB):

Router# **show mpls forwarding-table**

| Local Label | Outgoing Label or VC | Prefix or Tunnel Id | Bytes switched | tag | Outgoing interface | Next Hop    |
|-------------|----------------------|---------------------|----------------|-----|--------------------|-------------|
| 26          | No Label             | 10.253.0.0/16       | 0              |     | Et4/0/0            | 10.27.32.4  |
| 28          | 1/33                 | 10.15.0.0/16        | 0              |     | AT0/0.1            | point2point |
| 29          | Pop Label            | 10.91.0.0/16        | 0              |     | Hs5/0              | point2point |
|             | 1/36                 | 10.91.0.0/16        | 0              |     | AT0/0.1            | point2point |
| 30          | 32                   | 10.250.0.97/32      | 0              |     | Et4/0/2            | 10.92.0.7   |
|             | 32                   | 10.250.0.97/32      | 0              |     | Hs5/0              | point2point |
| 34          | 26                   | 10.77.0.0/24        | 0              |     | Et4/0/2            | 10.92.0.7   |
|             | 26                   | 10.77.0.0/24        | 0              |     | Hs5/0              | point2point |
| 35          | No Label[T]          | 10.100.100.101/32   | 0              |     | Tu301              | point2point |
| 36          | Pop Label            | 10.1.0.0/16         | 0              |     | Hs5/0              | point2point |
|             | 1/37                 | 10.1.0.0/16         | 0              |     | AT0/0.1            | point2point |

[T] Forwarding through a TSP tunnel.  
View additional tagging info with the 'detail' option

**Step 5** **show mpls traffic-eng autoroute**

Use this command to display tunnels that are announced to the IGP, including interface, destination, and bandwidth:

Router# **show mpls traffic-eng autoroute**

```
MPLS TE autorouting enabled
destination 0002.0002.0002.00 has 2 tunnels
  Tunnell021 (traffic share 10000, nexthop 10.2.2.2, absolute metric 11)
  Tunnell022 (traffic share 3333, nexthop 10.2.2.2, relative metric -3)
destination 0003.0003.0003.00 has 2 tunnels
  Tunnell032 (traffic share 10000, nexthop 172.16.3.3)
  Tunnell031 (traffic share 10000, nexthop 172.16.3.3, relative metric -1)
```

## Configuring a Master Tunnel

To configure a master tunnel to which other tunnels can be members, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **ip unnumbered** *type number*
5. **tunnel destination** {*hostname* | *ip-address*}
6. **tunnel mode mpls traffic-eng**
7. **tunnel mpls traffic-eng exp-bundle master**

8. **tunnel mpls traffic-eng exp-bundle member** *tunnel-number*

9. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                    | Purpose                                                                                                             |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                       | Enters global configuration mode.                                                                                   |
| Step 3 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 65                                                                  | Configures an interface type and enters interface configuration mode.                                               |
| Step 4 | <b>ip unnumbered</b> <i>type number</i><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered loopback 0                                                        | Enables IP processing on an interface without assigning an explicit IP address to the interface.                    |
| Step 5 | <b>tunnel destination</b> { <i>hostname</i>   <i>ip-address</i> }<br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.10.10.12                        | Specifies the destination of the tunnel for this path option.                                                       |
| Step 6 | <b>tunnel mode mpls traffic-eng</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng                                                        | Sets the mode of a tunnel to MPLS for TE.                                                                           |
| Step 7 | <b>tunnel mpls traffic-eng exp-bundle master</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng exp-bundle master                              | Configures a master tunnel.                                                                                         |
| Step 8 | <b>tunnel mpls traffic-eng exp-bundle member</b> <i>tunnel-number</i><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng exp-bundle member tunnel1 | Identifies which tunnel is a member of a master tunnel.                                                             |
| Step 9 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                        | Exits to global configuration mode.                                                                                 |

# Configuration Examples for MPLS Traffic Engineering : Class-based Tunnel Selection

This section contains the following configuration examples:

- [Creating Multiple MPLS TE or DS-TE Tunnels from the Same Headend to the Same Tailend: Example, page 19](#)
- [Configuring EXP Values to Be Carried by Each MPLS TE or DS-TE Tunnel: Example, page 19](#)
- [Making the MPLS TE or DS-TE Tunnels Visible for Routing: Example, page 20](#)
- [Verifying That the MPLS TE or DS-TE Tunnels Are Operating and Announced to the IGP: Example, page 20](#)
- [Configuring a Master Tunnel: Example, page 27](#)

## Creating Multiple MPLS TE or DS-TE Tunnels from the Same Headend to the Same Tailend: Example

The following example shows how to create multiple MPLS TE or DS-TE tunnels from the same headend to the same tailend:

```
Router(config)# interface Tunnel 65
Router(config-if)# ip numbered loopback 0
Router(config-if)# tunnel destination 10.1.1.1
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 30000
Router(config-if)# ^Z
Router(config)# interface Tunnel 66
Router(config-if)# ip numbered loopback 0
Router(config-if)# tunnel destination 10.1.1.1
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng bandwidth 50000
Router(config-if)# end
Router#
```

## Configuring EXP Values to Be Carried by Each MPLS TE or DS-TE Tunnel: Example

The following example shows how to configure EXP values to be carried by each MPLS TE or DS-TE tunnel that you created:

```
Router(config)# interface Tunnel 65
Router(config-if)# tunnel mpls traffic-eng exp 5
Router(config-if)# ^Z
Router(config)#
Router(config)# interface Tunnel 66
Router(config-if)# tunnel mpls traffic-eng exp 0 1 2 3 4 6 7
Router(config-if)# end
Router#
```

## Making the MPLS TE or DS-TE Tunnels Visible for Routing: Example

The following example shows how to make the MPLS TE or DS-TE tunnels visible for routing:

```
Router(config)# interface Tunnel 65
Router(config-if)# tunnel mpls traffic-eng autoroute announce
Router(config-if)# tunnel mpls traffic-eng autoroute metric relative -2
Router(config-if)# ^Z
Router(config)#
Router(config)# interface Tunnel 66
Router(config-if)# tunnel mpls traffic-eng autoroute announce
Router(config-if)# tunnel mpls traffic-eng autoroute metric relative -2
Router(config-if)# end
Router#
```

Packets destined beyond 10.1.1.1 are sent on:

- Tunnel 65 if their EXP value after input MQC is 5.
- Tunnel 66 if their EXP value after input MQC is 0, 1, 2, 3, 4, 6, or 7.

## Verifying That the MPLS TE or DS-TE Tunnels Are Operating and Announced to the IGP: Example

The output for each of the following examples helps verify that the MPLS TE or DS-TE tunnels are operating and visible.

The **show mpls traffic-eng topology** command output displays the MPLS TE global topology:

```
Router# show mpls traffic-eng topology 10.0.0.1
```

```

The **show ip cef detail** command output displays detailed FIB entry information for a tunnel:

```
Router# show ip cef tunnel1 detail
```

```

IP CEF with switching (Table Version 46), flags=0x0
 31 routes, 0 reresolve, 0 unresolved (0 old, 0 new), peak 2
 2 instant recursive resolutions, 0 used background process
 8 load sharing elements, 8 references
 6 in-place/0 aborted modifications
34696 bytes allocated to the FIB table data structures
universal per-destination load sharing algorithm, id 9EDD49E1
1(0) CEF resets
Resolution Timer: Exponential (currently 1s, peak 1s)
Tree summary:
 8-8-8-8 stride pattern
short mask protection disabled
31 leaves, 23 nodes using 26428 bytes

Table epoch: 0 (31 entries at this epoch)

Adjacency Table has 13 adjacencies
10.0.0.9/32, version 45, epoch 0, per-destination sharing
0 packets, 0 bytes
  tag information set, all rewrites inherited
    local tag: tunnel head
  via 0.0.0.0, Tunnel1, 0 dependencies
    traffic share 1
    next hop 0.0.0.0, Tunnel1
    valid adjacency
    tag rewrite with Tu1, point2point, tags imposed {12304}
  0 packets, 0 bytes switched through the prefix
tmstats: external 0 packets, 0 bytes
         internal 0 packets, 0 bytes

```

```
Router# show ip cef tunnel2 detail
```

```

IP CEF with switching (Table Version 46), flags=0x0

```
No output feature configured
Per-exp selection: 0 6 7
Router#
```

The **show mpls traffic-eng autoroute** command output displays tunnels that are announced to the IGP:

```
Router# show mpls traffic-eng autoroute

MPLS TE autorouting enabled
destination 10.0.0.9, area ospf 10 area 0, has 4 tunnels
  Tunnel1      (load balancing metric 20000000, nexthop 10.0.0.9)
                (flags: Announce)
  Tunnel2      (load balancing metric 20000000, nexthop 10.0.0.9)
                (flags: Announce)
  Tunnel3      (load balancing metric 20000000, nexthop 10.0.0.9)
                (flags: Announce)
  Tunnel4      (load balancing metric 20000000, nexthop 10.0.0.9)
                (flags: Announce)
Router#
```

## Configuring a Master Tunnel: Example

The following example specifies that there is a master tunnel that includes tunnels Tunnel20000 through Tunnel20005:

```
interface Tunnel 200
 ip unnumbered Loopback 0
 tunnel destination 10.10.10.10
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng exp-bundle master
 tunnel mpls traffic-eng exp-bundle member Tunnel20000
 tunnel mpls traffic-eng exp-bundle member Tunnel20001
 tunnel mpls traffic-eng exp-bundle member Tunnel20002
 tunnel mpls traffic-eng exp-bundle member Tunnel20003
 tunnel mpls traffic-eng exp-bundle member Tunnel20004
 tunnel mpls traffic-eng exp-bundle member Tunnel20005
```

# Feature Information for MPLS Traffic Engineering : Class-based Tunnel Selection

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering : Class-based Tunnel Selection

| Feature Name                                            | Releases                                                           | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

# Glossary

**BGP**—Border Gateway Protocol. Interdomain routing protocol that replaces External Gateway Protocol (EGP). BGP exchanges reachability information with other BGP systems. It is defined by RFC 116.3

**bundled tunnels**—Members of a master tunnel. You define the EXP bits that will be forwarded over each bundled tunnel.

**Cisco Express Forwarding**—An advanced Layer 3 IP switching technology. Cisco Express Forwarding optimizes network performance and scalability for networks with large and dynamic traffic patterns, such as the Internet and networks characterized by intensive web-based applications or interactive sessions.

**CoS**—class of service. An indication of how an upper-layer protocol requires a lower-layer protocol to treat its messages. In Systems Network Architecture (SNA) subarea routing, CoS definitions are used by subarea nodes to determine the optimal route for establishing a given session. A CoS definition comprises a virtual route number and a transmission priority field. Also called type of service (ToS).

**DS-TE**—DiffServ-aware traffic engineering. The configuring of two bandwidth pools on each link, a global pool and a subpool. Multiprotocol Label Switching (MPLS) traffic engineering tunnels using the subpool bandwidth can be configured with quality of service (QoS) mechanisms to deliver guaranteed bandwidth services end-to-end across the network. Simultaneously, tunnels using the global pool can convey DiffServ traffic.

**EXP**—experimental field or bits. A 3-bit field in the Multiprotocol Label Switching (MPLS) header widely known as the EXP field or EXP bits because, according to RFC 3032, that field is reserved for experimental use. However, the most common use of those bits is for quality of service (QoS) purposes.

**headend**—The upstream, transmitting end of a tunnel. This is the first router in the label switched path (LSP).

**LSP**—label switched path. A sequence of hops (R0...Rn) in which a packet travels from R0 to Rn through label switching mechanisms. A label switched path can be chosen dynamically, based on normal routing mechanisms, or through configuration.

**master tunnel**—A set of tunnels that have the same destination.

**MPLS traffic engineering**—Multiprotocol Label Switching traffic engineering. A constraint-based routing algorithm for routing label switched path (LSP) tunnels.

**MQC**—modular quality of service (QoS) command-line interface (CLI). A CLI structure that allows users to create traffic polices and attach those polices to interfaces.

**PBR**—policy-based routing. A routing scheme in which packets are forwarded to specific interfaces based on user-configured policies. A policy might specify, for example, that traffic sent from a particular network should be forwarded out one interface, and all other traffic should be forwarded out another interface.

**tailend**—The downstream, receiving end of a tunnel. The router that terminates the traffic engineering label switched path (LSP).

**TE**—traffic engineering. The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**ToS**—type of service. See CoS.

**tunnel**—A secure communication path between two peers, such as two routers. A traffic engineering tunnel is a label-switched tunnel that is used for traffic engineering. Such a tunnel is set up through means other than normal Layer 3 routing; it is used to direct traffic over a path different from the one that Layer 3 routing could cause the tunnel to take.

**VCD**—virtual circuit descriptor. A unique number for each ATM interface processor (AIP) that tells the AIP which virtual path identifier (VPI)/virtual channel identifier (VCI) to use for a particular packet. Valid values range from 1 to the value set with the **atm maxvc** command.

# MPLS Traffic Engineering: Interarea Tunnels

---

**First Published: January 16, 2003**

**Last Updated: October 21, 2009**

The MPLS Traffic Engineering: Interarea Tunnels feature allows you to establish Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels that span multiple Interior Gateway Protocol (IGP) areas and levels, removing the restriction that had required the tunnel headend and tailend routers both be in the same area. The IGP can be either Intermediate System-to-Intermediate System (IS-IS) or Open Shortest Path First (OSPF).

**Note**

---

Cisco IOS Release 12.2(33)SRE and later releases support the autoroute destination feature, which automatically routes traffic through TE tunnels instead of through manually configured static routes.

---

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering: Interarea Tunnels”](#) section on [page 25](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for MPLS Traffic Engineering: Interarea Tunnels

Your network must support the following Cisco IOS features:

- MPLS
- IP Cisco Express Forwarding
- IS-IS or OSPF
- TE tunnels

## Restrictions for MPLS Traffic Engineering: Interarea Tunnels

- The dynamic path option feature for TE tunnels (which is specified in the **tunnel mpls traffic-eng path-option *number* dynamic** command) is not supported for interarea tunnels. An explicit path identifying the Area Border Routers (ABRs) is required. When there are choices for the ABRs to be used, multiple explicit paths are recommended, each of which identifies a different sequence of ABRs.
- The MPLS TE AutoRoute feature (which is specified in the **tunnel mpls traffic-eng autoroute announce** command) is not supported for interarea tunnels because you would need to know the network topology behind the tailend router.
- Tunnel affinity (the **tunnel mpls traffic-eng affinity** command) is not supported for interarea tunnels.
- The reoptimization of tunnel paths is not supported for interarea tunnels.
- Cisco IOS Release 12.4(20)T does not support stateful switchover (SSO) recovery of label-switched paths (LSPs) that include loose hops.

## Information About MPLS Traffic Engineering: Interarea Tunnels

Before using the MPLS Traffic Engineering: Interarea Tunnels feature, you need to understand the following concepts:

- [Interarea Tunnels Functionality, page 3](#)
- [Autoroute Destination Functionality, page 4](#)
- [MPLS Traffic Engineering Interarea Tunnels Benefits, page 5](#)

## Interarea Tunnels Functionality

To configure an interarea tunnel, you specify on the headend router a loosely routed explicit path for the tunnel label switched path (LSP) that identifies each ABR the LSP should traverse using the **next-address loose** command. The headend router and the ABRs along the specified explicit path expand the loose hops, each computing the path segment to the next ABR or tunnel destination.

For example, to configure a TE tunnel from router R1 to router R3 in the simple multiarea network shown in [Figure 1](#), you would specify ABR1 and ABR2 as loose hops in the explicit path for the tunnel.

### Note

Rx can be configured as a loose hop as well. In that case, the headend router R1 computes the path to Rx and router Rx computes the path to ABR1.

To signal the tunnel LSP, the headend router (R1) computes the path to ABR1 and sends a Resource Reservation Protocol (RSVP) Path message specifying the path from itself to ABR1 as a sequence of strict hops followed by the path from ABR1 to the tailend as a sequence of loose hops (ABR2, R3). When ABR1 receives the Path message, it expands the path across the backbone area to ABR2 and forwards the Path message specifying the path from itself to ABR2 as a sequence of strict hops followed by the path from ABR2 to the tunnel tailend (R3) as a loose hop. When ABR2 receives the Path message, it expands the path across the tailend area to R3 and propagates the Path message specifying the path from itself to R3 as a sequence of strict hops.

**Figure 1** Multiarea Network

### Note

Cisco IOS Release 12.2(33)SRB supports SSO recovery of LSPs that include loose hops.

Cisco IOS Release 12.4(20)T does not support SSO recovery of LSPs that include loose hops.

### Note

Strictly speaking, IS-IS does not have the notion of an ABR. For the purpose of discussing the MPLS Traffic Engineering: Interarea Tunnels feature, an IS-IS level-1-2 router is considered to be an ABR.

### Note

The explicit path for a TE interarea tunnel may contain any number of non-ABR LSPs. Within an area, a combination of loose and strict next IP addresses is allowed. To specify the next IP address in the explicit path, use the **next-address** command.

**Note**

With OSPF, if an area is connected to the backbone through a virtual link, there may be more than two ABRs in the path.

The following MPLS TE features are supported on interarea traffic engineering LSPs:

- Automatic bandwidth adjustment
- Diff-Serve-aware traffic engineering
- Fast reroute link protection
- Policy-based routing
- Static routing

## Autoroute Destination Functionality

The autoroute destination feature allows you to automatically route traffic through a TE tunnel instead of manually configuring static routes.

You enable this feature on a per-tunnel basis by using the **tunnel mpls traffic-eng autoroute destination** command.

The following sections describe how the autoroute destination feature interacts with other features:

- [CBTS Interaction with Autoroute Destination, page 4](#)
- [Manually Configured Static Routes Interaction with Autoroute Destination, page 4](#)
- [Autoroute Announce Interaction with Autoroute Destination, page 5](#)
- [Forwarding Adjacency Interaction with Autoroute Destination, page 5](#)

## CBTS Interaction with Autoroute Destination

TE tunnels that have the autoroute destination feature enabled can also be configured as class-based traffic shaping (CBTS) tunnel bundle masters or members. Within a CBTS bundle, only the master tunnel with autoroute destination enabled is installed into the Routing Information Base (RIB); that is, the member tunnels are not installed into the RIB.

If member tunnels that have autoroute destination enabled are unconfigured from the bundle, they become regular TE tunnels and TE requests that the static process installs static routes over those tunnels in the RIB. Conversely, when regular TE tunnels with autoroute destination enabled are added to a CBTS bundle as members, TE requests that the static process removes the automatic static routes over those tunnels from the RIB.

## Manually Configured Static Routes Interaction with Autoroute Destination

If there is a manually configured static route to the same destination as a tunnel with autoroute destination enabled via the **tunnel mpls traffic-eng autoroute destination** command, traffic for that destination is load-shared between the static route and the tunnel with autoroute destination enabled.

## Autoroute Announce Interaction with Autoroute Destination

For intra-area tunnels, if a tunnel is configured with both autoroute announce and autoroute destination, the tunnel is announced to the RIB by both the IGP and the static process. RIBs prefer static routes, not IGP routes, so the autoroute destination features takes precedence over autoroute announce.

## Forwarding Adjacency Interaction with Autoroute Destination

If a tunnel is configured with both forwarding adjacency and autoroute destination, the tunnel is announced to the RIB by both the IGP and the static process. The RIB prefers the static route. However, because the IGP was notified about the tunnel via the **forwarding adjacency** command and the tunnel information was flooded, forwarding adjacency continues to function.

## MPLS Traffic Engineering Interarea Tunnels Benefits

- When it is desirable for the traffic from one router to another router in a different IGP area to travel over TE LSPs, the MPLS Traffic Engineering: Interarea Tunnels feature allows you to configure a tunnel that runs from the source router to the destination router. The alternative would be to configure a sequence of tunnels, each crossing one of the areas between source and destination routers such that the traffic arriving on one such tunnel is forwarded into the next such tunnel.
- The autoroute destination feature prevents you from having to manually configure static routes to route traffic over certain interarea tunnels such as ASBRs.

## How to Configure MPLS Traffic Engineering: Interarea Tunnels

This section contains the following tasks:

- [Configuring OSPF for Interarea Tunnels, page 5](#) (optional)
- [Configuring IS-IS for Interarea Tunnels, page 8](#) (optional)
- [Configuring MPLS and RSVP to Support Traffic Engineering, page 12](#) (required)
- [Configuring an MPLS Traffic Engineering Interarea Tunnel, page 14](#) (required)

**Note**

You must configure either OSPF or IS-IS.

## Configuring OSPF for Interarea Tunnels

This section describes the following tasks:

- [Configuring OSPF for ABR Routers, page 6](#)
- [Configuring OSPF for Non-ABR Routers, page 7](#)

## Configuring OSPF for ABR Routers

For each ABR that is running OSPF, perform the following steps to configure traffic engineering on each area you want tunnels in or across. By having multiple areas and configuring traffic engineering in and across each area, the router can contain changes within the network within an area.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router ospf** *process-id*
4. **network** *ip-address wildcard-mask* **area** *area-id*
5. **mpls traffic-eng router-id** *interface-name*
6. **mpls traffic-eng area** **0**
7. **mpls traffic-eng area** *number*
8. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                      |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                            |
| Step 3 | <b>router ospf</b> <i>process-id</i><br><br><b>Example:</b><br>Router(config)# router ospf 1                                                                          | Enables OSPF and enters router configuration mode.<br><br>The <i>process-id</i> argument is an internally used identification parameter for the OSPF routing process. It is logically assigned and can be any positive integer. Assign a unique value for each OSPF routing process.                         |
| Step 4 | <b>network</b> <i>ip-address wildcard-mask</i> <b>area</b> <i>area-id</i><br><br><b>Example:</b><br>Router(config-router)# network 192.168.45.0<br>0.0.255.255 area 1 | Specifies the interfaces on which OSPF is to run and specifies the area to which the interface is connected.                                                                                                                                                                                                 |
| Step 5 | <b>mpls traffic-eng router-id</b> <i>interface-name</i><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng<br>router-id Loopback0                      | Specifies that the traffic engineering router identifier for the node is the IP address associated with a given interface.<br><br>The router identifier is displayed in the <b>show mpls traffic-eng topology path</b> command output.<br><br><b>Note</b> The <i>interface-name</i> value must be Loopback0. |

|        | Command or Action                                                              | Purpose                                                                                                                                 |
|--------|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <code>mpls traffic-eng area 0</code>                                           | Turns on MPLS traffic engineering for OSPF in area 0.                                                                                   |
|        | <b>Example:</b><br>Router(config-router)# <code>mpls traffic-eng area 0</code> | <b>Note</b> To display the MPLS TE global topology currently known at this node, use the <b>show mpls traffic-eng topology</b> command. |
| Step 7 | <code>mpls traffic-eng area number</code>                                      | Configures a router running OSPF MPLS to flood traffic engineering for the indicated OSPF area.                                         |
|        | <b>Example:</b><br>Router(config-router)# <code>mpls traffic-eng area 2</code> |                                                                                                                                         |
| Step 8 | <code>end</code>                                                               | Returns to privileged EXEC mode.                                                                                                        |
|        | <b>Example:</b><br>Router(config-router)# <code>end</code>                     |                                                                                                                                         |

## Configuring OSPF for Non-ABR Routers

For each non-ABR that is running OSPF, perform the following steps to configure OSPF.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospf process-id`
4. `network ip-address wildcard-mask area area-id`
5. `mpls traffic-eng router-id interface-name`
6. `mpls traffic-eng area number`
7. `end`

### DETAILED STEPS

|        | Command or Action                                             | Purpose                                                                                                                                                                                                                  |
|--------|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code>                                           | Enables privileged EXEC mode.                                                                                                                                                                                            |
|        | <b>Example:</b><br>Router> <code>enable</code>                | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                     |
| Step 2 | <code>configure terminal</code>                               | Enters global configuration mode.                                                                                                                                                                                        |
|        | <b>Example:</b><br>Router# <code>configure terminal</code>    |                                                                                                                                                                                                                          |
| Step 3 | <code>router ospf process-id</code>                           | Enables OSPF and enters router configuration mode.                                                                                                                                                                       |
|        | <b>Example:</b><br>Router(config)# <code>router ospf 1</code> | The <i>process-id</i> argument is an internally used identification parameter for the OSPF routing process. It is locally assigned and can be any positive integer. Assign a unique value for each OSPF routing process. |

|        | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                      |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>network</b> <i>ip-address wildcard-mask area area-id</i><br><br><b>Example:</b><br>Router(config-router)# network 192.168.10.10<br>255.255.255.0 area 1 | Specifies the interfaces on which OSPF is to run and specifies the area to which the interface is connected.                                                                                                                                                                                                 |
| Step 5 | <b>mpls traffic-eng router-id interface-name</b><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng<br>router-id Loopback0                  | Specifies that the traffic engineering router identifier for the node is the IP address associated with a given interface.<br><br>The router identifier is displayed in the <b>show mpls traffic-eng topology path</b> command output.<br><br><b>Note</b> The <i>interface-name</i> value must be Loopback0. |
| Step 6 | <b>mpls traffic-eng area number</b><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng area 1                                               | Specifies the area that the router is in.<br><br><b>Note</b> To display the MPLS TE global topology currently known at this node, use the <b>show mpls traffic-eng topology</b> command.                                                                                                                     |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                             |

## Configuring IS-IS for Interarea Tunnels

This section describes the following tasks:

- [Configuring IS-IS for Backbone Routers, page 8](#)
- [Configuring IS-IS for Nonbackbone Routers, page 10](#)
- [Configuring IS-IS for Interfaces, page 11](#)

## Configuring IS-IS for Backbone Routers

To configure IS-IS for background (level-1-2) routers, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router isis**
4. **metric-style wide**
5. **net nn.nnnn.nnnn.nnnn.nnnn**
6. **mpls traffic-eng router-id interface-name**
7. **mpls traffic-eng level-1**
8. **mpls traffic-eng level-2**
9. **interface typeslot/port**
10. **ip router isis**

11. end

## DETAILED STEPS

|        | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                            | Enters global configuration mode.                                                                                                                                                                      |
| Step 3 | <b>router isis</b><br><br><b>Example:</b><br>Router(config)# router isis                                                                  | Enables IS-IS routing and specifies an IS-IS process for IP, and places the router in router configuration mode.                                                                                       |
| Step 4 | <b>metric-style wide</b><br><br><b>Example:</b><br>Router(config-router)# metric-style wide                                               | Configures a router to generate and accept only new-style type, length, value objects (TLVs).                                                                                                          |
| Step 5 | <b>net nn.nnnn.nnnn.nnnn.nnnn</b><br><br><b>Example:</b><br>Router(config-router)# net<br>10.0000.0100.0000.0010                          | Configures the area ID (area address) and the system ID.                                                                                                                                               |
| Step 6 | <b>mpls traffic-eng router-id interface-name</b><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng<br>router-id Loopback0 | Specifies that the traffic engineering router identifier for the node is the IP address associated with interface Loopback0.                                                                           |
| Step 7 | <b>mpls traffic-eng level-1</b><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng level-1                                 | Turns on MPLS traffic engineering for IS-IS at level 1.<br><br><b>Note</b> To display the MPLS TE global topology currently known at this node, use the <b>show mpls traffic-eng topology</b> command. |
| Step 8 | <b>mpls traffic-eng level-2</b><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng level-2                                 | Turns on MPLS traffic engineering for IS-IS at level 2.<br><br><b>Note</b> To display the MPLS TE global topology currently known at this node, use the <b>show mpls traffic-eng topology</b> command. |
| Step 9 | <b>interface typeslot/port</b><br><br><b>Example:</b><br>Router(config-router)# interface POS1/0                                          | Configures an interface type and enters interface configuration mode.                                                                                                                                  |

|         | Command or Action                                                                 | Purpose                                                                                              |
|---------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| Step 10 | <b>ip router isis</b><br><br><b>Example:</b><br>Router(config-if)# ip router isis | Enables IS-IS routing.<br><br>Specify this command on each interface on which you want to run IS-IS. |
| Step 11 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                       | Returns to privileged EXEC mode.                                                                     |

## Configuring IS-IS for Nonbackbone Routers

To configure IS-IS for nonbackbone routers, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router isis**
4. **metric-style wide**
5. **net nn.nnnn.nnnn.nnnn.nnnn**
6. **mpls traffic-eng router-id interface-name**
7. **mpls traffic-eng {level-1 | level-2}**
8. **end**

### DETAILED STEPS

|        | Command or Action                                                                           | Purpose                                                                                                            |
|--------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal              | Enters global configuration mode.                                                                                  |
| Step 3 | <b>router isis</b><br><br><b>Example:</b><br>Router(config)# router isis                    | Enables IS-IS routing and specifies an IS-IS process for IP, and places the router in router configuration mode.   |
| Step 4 | <b>metric-style wide</b><br><br><b>Example:</b><br>Router(config-router)# metric-style wide | Configures a router to generate and accept only new-style TLVs.                                                    |

|        | Command or Action                                                                                                                                | Purpose                                                                                                                                                                                                |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>net</b> <i>nn.nnnn.nnnn.nnnn.nnnn</i><br><br><b>Example:</b><br>Router(config-router)# net<br>10.0000.2000.0100.0001                          | Configures the area ID (area address) and the system ID.                                                                                                                                               |
| Step 6 | <b>mpls traffic-eng router-id</b> <i>interface-name</i><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng<br>router-id Loopback0 | Specifies that the traffic engineering router identifier for the node is the IP address associated with interface Loopback0.                                                                           |
| Step 7 | <b>mpls traffic-eng</b> { <b>level-1</b>   <b>level-2</b> }<br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng level-1            | Turns on MPLS traffic engineering for IS-IS at level 1.<br><br><b>Note</b> To display the MPLS TE global topology currently known at this node, use the <b>show mpls traffic-eng topology</b> command. |
| Step 8 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                       |

## Configuring IS-IS for Interfaces

To configure IS-IS for interfaces, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router isis**
4. **metric-style wide**
5. **net** *nn.nnnn.nnnn.nnnn.nnnn*
6. **mpls traffic-eng router-id** *interface-name*
7. **interface** *typeslot/port*
8. **ip router isis**
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                         | Purpose                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                    | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>            |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                            | Enters global configuration mode.                                                                                            |
| Step 3 | <b>router isis</b><br><br><b>Example:</b><br>Router(config)# router isis                                                                  | Enables IS-IS routing and specifies an IS-IS process for IP. This command places the router in router configuration mode.    |
| Step 4 | <b>metric-style wide</b><br><br><b>Example:</b><br>Router(config-router)# metric-style wide                                               | Configures a router to generate and accept only new-style TLVs.                                                              |
| Step 5 | <b>net nn.nnnn.nnnn.nnnn.nnnn</b><br><br><b>Example:</b><br>Router(config-router)# net<br>10.0000.0100.0000.0010                          | Configures the area ID (area address) and the system ID.                                                                     |
| Step 6 | <b>mpls traffic-eng router-id interface-name</b><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng<br>router-id Loopback0 | Specifies that the traffic engineering router identifier for the node is the IP address associated with interface Loopback0. |
| Step 7 | <b>interface typeslot/port</b><br><br><b>Example:</b><br>Router(config-router)# interface POS1/0                                          | Specifies the interface and enters interface configuration mode.                                                             |
| Step 8 | <b>ip router isis</b><br><br><b>Example:</b><br>Router(config-if)# ip router isis                                                         | Enables IS-IS routing.<br><br>Specify this command on each interface on which you want to run IS-IS.                         |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                                               | Returns to privileged EXEC mode.                                                                                             |

## Configuring MPLS and RSVP to Support Traffic Engineering

To configure MPLS and RSVP to support traffic engineering on the routers, perform the following steps.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip cef**
4. **mpls traffic-eng tunnels**
5. **interface** *typeslot/port*
6. **ip address** *ip-address mask* [**secondary** [**vrf** *vrf-name*]]
7. **ip rsvp bandwidth**
8. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                    | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                       | Enters global configuration mode.                                                                                |
| Step 3 | <b>ip cef</b><br><br><b>Example:</b><br>Router(config)# ip cef                                                                                                                       | Enables Cisco Express Forwarding on the Route Processor card.                                                    |
| Step 4 | <b>mpls traffic-eng tunnels</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng tunnels                                                                                   | Enables MPLS traffic engineering tunnel signaling on a device.                                                   |
| Step 5 | <b>interface</b> <i>typeslot/port</i><br><br><b>Example:</b><br>Router(config)# interface Loopback0                                                                                  | Specifies the interface and enters interface configuration mode.                                                 |
| Step 6 | <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> [ <b>vrf</b> <i>vrf-name</i> ]]<br><br><b>Example:</b><br>Router(config-if)# ip address<br>192.168.10.10 255.255.255.255 | Assigns an IP network address and network mask to the interface.                                                 |

|        | Command or Action                                                                             | Purpose                              |
|--------|-----------------------------------------------------------------------------------------------|--------------------------------------|
| Step 7 | <code>ip rsvp bandwidth</code><br><br><b>Example:</b><br>Router(config-if)# ip rsvp bandwidth | Enables RSVP for IP on an interface. |
| Step 8 | <code>end</code><br><br><b>Example:</b><br>Router(config-if)# end                             | Returns to privileged EXEC mode.     |

## Configuring an MPLS Traffic Engineering Interarea Tunnel

This section includes the following tasks:

- [Configuring an MPLS Traffic Engineering Interarea Tunnel to Use Explicit Paths, page 14](#)
- [Configuring Explicit Paths, page 16](#)

### Configuring an MPLS Traffic Engineering Interarea Tunnel to Use Explicit Paths

To configure an MPLS traffic engineering interarea tunnel to use explicit paths, perform the following steps.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface tunnel-interface`
4. `ip unnumbered type number`
5. `tunnel destination ip-address`
6. `tunnel mode mpls traffic-eng`
7. `tunnel mpls traffic-eng bandwidth bandwidth`
8. `tunnel mpls traffic-eng path-option number explicit { name path-name | identifier path-number } [lockdown]`
9. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                           |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                 |
| Step 3 | <b>interface</b> <i>tunnel-interface</i><br><br><b>Example:</b><br>Router(config)# interface Tunell                                                                                                                                                                  | Configures an interface type and enters interface configuration mode.                                                                                                                                                                                                             |
| Step 4 | <b>ip unnumbered</b> <i>type number</i><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered Loopback 0                                                                                                                                                        | Gives the tunnel interface an IP address.<br><br>An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link.                                                                                                                   |
| Step 5 | <b>tunnel destination</b> <i>ip-address</i><br><br><b>Example:</b><br>Router(config-if)# tunnel destination 192.168.20.20                                                                                                                                            | Specifies the destination for a tunnel.<br><br>You must enter the MPLS traffic engineering router ID of the destination device.                                                                                                                                                   |
| Step 6 | <b>tunnel mode mpls traffic-eng</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng                                                                                                                                                        | Sets the tunnel encapsulation mode to MPLS traffic engineering.                                                                                                                                                                                                                   |
| Step 7 | <b>tunnel mpls traffic-eng bandwidth</b> <i>bandwidth</i><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng bandwidth 300                                                                                                                         | Configures the bandwidth required for the MPLS traffic engineering tunnel.                                                                                                                                                                                                        |
| Step 8 | <b>tunnel mpls traffic-eng path-option</b> <i>number</i> <b>explicit</b> { <i>name path-name</i>   <i>identifier path-number</i> } [ <b>lockdown</b> ]<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng path-option 1 explicit name path-Tunnell | Configures the tunnel to use a named IP explicit path or a path dynamically calculated from the traffic engineering topology database.<br><br>The <b>name</b> keyword must specify the ABRs the tunnel LSP must traverse as loose hops via the <b>next-address loose</b> command. |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                                                                                                                                                                          | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                  |

## Configuring Explicit Paths

To configure explicit paths, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip explicit-path name *pathname***
4. **next-address [loose | strict] *ip-address***
5. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                              | Purpose                                                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                 |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                 | Enters global configuration mode.                                                                                                                   |
| Step 3 | <b>ip explicit-path name <i>pathname</i></b><br><br><b>Example:</b><br>Router(config)# ip explicit-path name path-tunnell                      | Enters IP explicit path configuration mode and creates or modifies the specified path.                                                              |
| Step 4 | <b>next-address [loose   strict] <i>ip-address</i></b><br><br><b>Example:</b><br>Router(config-ip-expl-path)# next-address loose 192.168.40.40 | Specifies the next IP address in the explicit path.<br><br>In a <b>next-address loose</b> command you must specify each ABR the path must traverse. |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Router(config-ip-expl-path)# end                                                                          | Returns to privileged EXEC mode.                                                                                                                    |

## Configuring an MPLS Traffic Engineering Tunnel with Autoroute Destination

To configure an MPLS traffic engineering tunnel with autoroute destination, perform the following steps.

### SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **interface** *tunnel-interface*
4. **ip unnumbered** *type number*
5. **tunnel destination** *ip-address*
6. **tunnel mode mpls traffic-eng**
7. **tunnel mpls traffic-eng bandwidth** *bandwidth*
8. **tunnel mpls traffic-eng path-option** *number explicit* {**name** *path-name* | **identifier** *path-number*} [**lockdown**]
9. **tunnel mpls traffic-eng autoroute destination**
10. **end**

## DETAILED STEPS

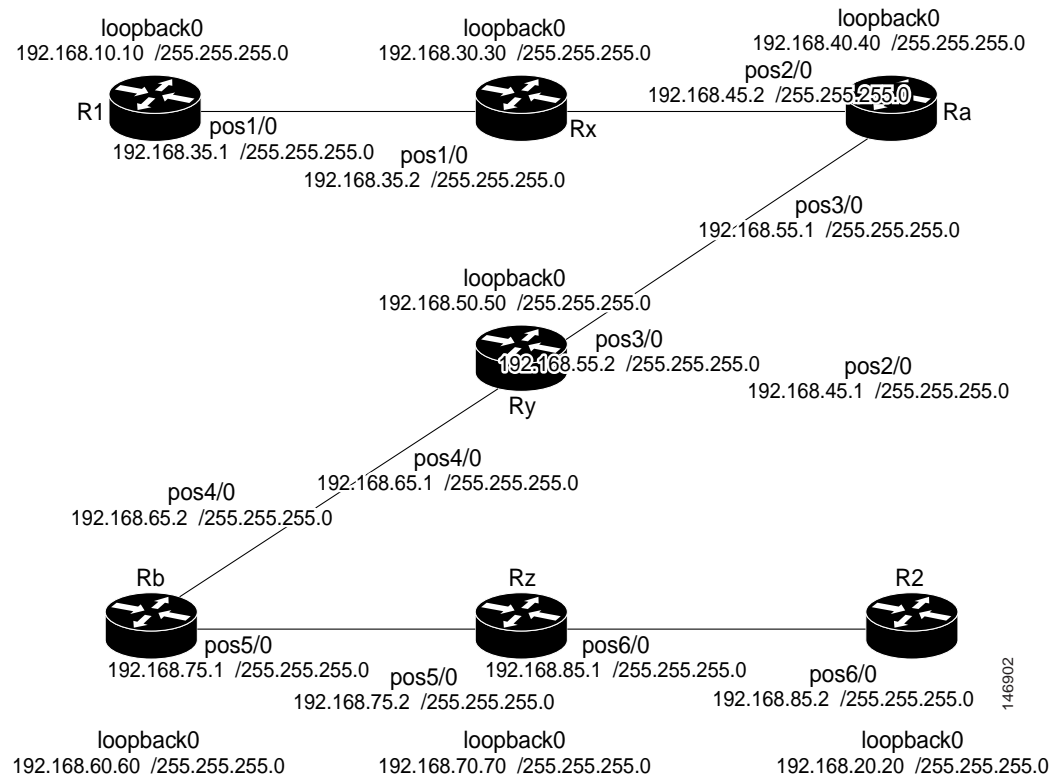

|        | Command or Action                                                                                                                            | Purpose                                                                                                                                                         |

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                               | Enters global configuration mode.                                                                                                                               |
| Step 3 | <b>interface</b> <i>tunnel-interface</i><br><br><b>Example:</b><br>Router(config)# interface Tunnel1                                         | Configures an interface type and enters interface configuration mode.                                                                                           |
| Step 4 | <b>ip unnumbered</b> <i>type number</i><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered Loopback 0                                | Gives the tunnel interface an IP address.<br><br>An MPLS traffic engineering tunnel interface should be unnumbered because it represents a unidirectional link. |
| Step 5 | <b>tunnel destination</b> <i>ip-address</i><br><br><b>Example:</b><br>Router(config-if)# tunnel destination 192.168.20.20                    | Specifies the destination for a tunnel.<br><br>You must enter the MPLS traffic engineering router ID of the destination device.                                 |
| Step 6 | <b>tunnel mode mpls traffic-eng</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng                                | Sets the tunnel encapsulation mode to MPLS traffic engineering.                                                                                                 |
| Step 7 | <b>tunnel mpls traffic-eng bandwidth</b> <i>bandwidth</i><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng bandwidth 300 | Configures the bandwidth required for the MPLS traffic engineering tunnel.                                                                                      |

|         | Command or Action                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                  |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 8  | <pre>tunnel mpls traffic-eng path-option <i>number</i> explicit {<i>name path-name</i>   <i>identifier</i> <i>path-number</i>} [<i>lockdown</i>]</pre> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng<br/>path-option 1 explicit name path-Tunnell</p> | <p>Configures the tunnel to use a named IP explicit path or a path dynamically calculated from the traffic engineering topology database.</p> <p>The <b>name</b> keyword must specify the ABRs the tunnel LSP must traverse as loose hops via the <b>next-address loose</b> command.</p> |
| Step 9  | <pre>tunnel mpls traffic-eng autoroute <i>destination</i></pre> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng<br/>autoroute destination</p>                                                                                                           | Automatically routes traffic through a TE tunnel.                                                                                                                                                                                                                                        |
| Step 10 | <pre>end</pre> <p><b>Example:</b><br/>Router(config-if)# end</p>                                                                                                                                                                                                          | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                         |

## Configuration Examples for MPLS Traffic Engineering: Interarea Tunnels

This section shows how to configure MPLS traffic engineering interarea tunnels for the simple router topology illustrated in [Figure 2](#). It includes configuration fragments that illustrate the configurations shown in the following sections:

- [Configuring OSPF for Interarea Tunnels: Example, page 19](#)
- [Configuring IS-IS for Interarea Tunnels: Example, page 20](#)
- [Configuring MPLS and RSVP to Support Traffic Engineering: Example, page 22](#)
- [Configuring an MPLS Traffic Engineering Interarea Tunnel: Example, page 22](#)
- [Configuring an MPLS Traffic Engineering Tunnel with Autoroute Destination: Example, page 23](#)

**Figure 2 Router Topology**

## Configuring OSPF for Interarea Tunnels: Example

The following configuration fragments show how to configure OSPF for interarea tunnels assuming that:

- Routers R1, Rx, and Ra are in OSPF Area 1
- Routers Ra, Ry, and Rb are in OSPF Area 0
- Routers Rb, Rz, and R2 are in OSPF Area 2
- Router Ra is an ABR for Area 0 and Area 1
- Router Rb is an ABR for Area 0 and Area 2

### Router R1 OSPF Configuration

```
router ospf 1
 network 192.168.10.10 0.0.0.0 area 1
 network 192.168.35.0 0.0.0.255 area 1
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng area 1
```

### Router Rx OSPF Configuration

```
router ospf 1
 network 192.168.30.30 0.0.0.0 area 1
 network 192.168.35.0 0.0.0.255 area 1
 network 192.168.45.0 0.0.0.255 area 1
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng area 1
```

**Router Ra OSPF Configuration**

Ra is an ABR for Area 0 and Area 1. Interface POS2/0 is in Area 1 and interface POS3/0 is in Area 0. The **mpls traffic-eng area** commands configure Ra for IGP TE updates for both areas.

```
router ospf 1
 network 192.168.40.40 0.0.0.0 area 0
 network 192.168.45.0 0.0.0.255 area 1
 network 192.168.55.0 0.0.0.255 area 0
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng area 0
 mpls traffic-eng area 1
```

**Router Rb OSPF Configuration**

Rb is an ABR for Area 0 and Area 2. Interface POS4/0 is in Area 0 and interface POS5/0 is in Area 2. The **mpls traffic-eng area** commands configure Rb for IGP TE updates for both areas.

```
router ospf 1
 network 192.168.60.60 0.0.0.0 area 0
 network 192.168.65.0 0.0.0.255 area 0
 network 192.168.75.0 0.0.0.255 area 2
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng area 0
 mpls traffic-eng area 2
```

**Router Rz OSPF Configuration**

```
router ospf 1
 network 192.168.70.70 0.0.0.0 area 2
 network 192.168.75.0 0.0.0.255 area 2
 network 192.168.85.0 0.0.0.255 area 2
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng area 2
```

**Router R2 OSPF Configuration**

```
router ospf 1
 network 192.168.20.20 0.0.0.0 area 2
 network 192.168.85.0 0.0.0.255 area 2
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng area 2
```

## Configuring IS-IS for Interarea Tunnels: Example

The following configuration fragments illustrate how to configure IS-IS for interarea tunnels assuming that:

- R1 and Rx are level-1 routers
- Ra, Ry, and Rb are level-1-2 routers
- Rz and R2 are level-1 routers

**Router R1 IS-IS Configuration**

```
interface POS1/0
 ip router isis
router isis
 metric-style wide
 net 10.0000.0100.0000.0010
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng level-1
```

**Router Rx IS-IS Configuration**

```
clns routing
interface POS1/0
 ip router isis
interface POS2/0
 ip router isis
router isis
 metric-style wide
 net 10.0000.2000.0100.0001
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng level-1
```

**Router Ra IS-IS Configuration**

```
clns routing
interface POS2/0
 ip router isis
interface POS3/0
 ip router isis
router isis
 metric-style wide
 net 10.0000.2000.0200.0002
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng level-1
 mpls traffic-eng level-2
```

**Router Ry IS-IS Configuration**

```
clns routing
interface POS3/0
 ip router isis
interface POS4/0
 ip router isis
router isis
 metric-style wide
 net 10.0000.2000.0300.0003
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng level-2
```

**Router Rb IS-IS Configuration**

```
clns routing
interface POS4/0
 ip router isis
interface POS5/0
 ip router isis
router isis
 metric-style wide
 net 10.0000.2000.0400.0004
 mpls traffic-eng router-id Loopback0
 mpls traffic-eng level-1
 mpls traffic-eng level-2
```

**Router Rz IS-IS Configuration**

```
clns routing
interface POS5/0
 ip router isis
interface POS6/0
 ip router isis
router isis
 metric-style wide
 net 10.0000.2000.0500.0005
 mpls traffic-eng router-id Loopback0
```

```
mpls traffic-eng level-1
```

### Router R2 IS-IS Configuration

```
clns routing
interface POS6/0
 ip router isis
router isis
 metric-style wide
 net 10.0000.0200.0000.0020
mpls traffic-eng router-id Loopback0
mpls traffic-eng level-1
```

## Configuring MPLS and RSVP to Support Traffic Engineering: Example

The following configuration fragments show how to configure MPLS and RSVP to support traffic engineering on the routers.

### Router R1 Traffic Engineering Configuration

```
ip cef
mpls traffic-eng tunnels
interface Loopback0
 ip address 192.168.10.10 255.255.255.255
interface POS1/0
!Each interface supporting MPLS TE must include the following:
 mpls traffic-eng tunnels
 ip rsvp bandwidth
```

The configuration of routers Rx, Ra, Ry, Rb, Rz, and R2 for traffic engineering operation is similar to that for R1.

## Configuring an MPLS Traffic Engineering Interarea Tunnel: Example

The following configuration fragments show how to configure an MPLS traffic engineering interarea tunnel. Tunnel1 is configured with a path option that is loosely routed through Ra and Rb.

### R1 Interarea Tunnel Configuration

The following commands configure an MPLS TE tunnel to use explicit paths:

```
interface Tunnel1
 ip unnumbered Loopback0
 tunnel destination 192.168.20.20
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng bandwidth 300
 tunnel mpls traffic-eng path-option 1 explicit name path-tunnel1
```

The following commands configure an explicit path:

```
ip explicit-path name path-tunnel1
 next-address loose 192.168.40.40
 next-address loose 192.168.60.60
 next-address loose 192.168.20.20 !Specifying the tunnel tailend in the loosely routed
!path is optional.
```

**Note**

Generally for an interarea tunnel you should configure multiple loosely routed path options that specify different combinations of ABRs (for OSPF) or level-1-2 boundary routers (for IS-IS) to increase the likelihood that the tunnel will be successfully signaled. In this simple topology there are no other loosely routed paths.

## Configuring an MPLS Traffic Engineering Tunnel with Autoroute Destination: Example

The following example shows how to configure an MPLS TE tunnel with autoroute destination:

```
interface Tunnel103
 ip unnumbered Loopback0
 tunnel destination 10.1.0.3
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng path-option 1 explicit name 111-103
 tunnel mpls traffic-eng autoroute destination
```

## Additional References

The following sections provide references related to the MPLS Traffic Engineering: Interarea Tunnels feature.

# Feature Information for MPLS Traffic Engineering: Interarea Tunnels

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering: Interarea Tunnels

| Feature Name                                | Releases                                                                                                                      | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

# Glossary

**ABR**—Area Border Router. A router connecting two areas. In OSPF, ABRs belong to both areas and must maintain separate topological databases for each. When an OSPF router has interfaces in more than one area, it is an Area Border Router.

**area**—A logical set of network segments (for example, one that is OSPF-based) and their attached devices. Areas usually are connected to other areas by routers, making up a single autonomous system. OSPF and IS-IS define their areas differently. OSPF area borders are marked by routers. Some interfaces are in one area, and other interfaces are in another area. With IS-IS, all the routers are completely within an area, and the area borders are on links, not on routers. The routers that connect the areas are level-2 routers, and routers that have no direct connectivity to another area are level-1 routers.

**area ID**—In an IS-IS router, this area address is associated with the entire router rather than an interface. A router can have up to three area addresses. Both the area ID and the system ID are defined on an IS-IS router by a single address, the Network Entry Title (NET).

**autonomous system**—A collection of networks under a common administration sharing a common routing strategy. Autonomous systems are subdivided by areas.

**Cisco Express Forwarding**—An advanced Layer 3 IP switching technology. Cisco Express Forwarding optimizes network performance and scalability for networks that have large and dynamic traffic patterns, such as the Internet, and for networks characterized by intensive Web-based applications or interactive sessions. Cisco Express Forwarding uses a Forwarding Information Base (FIB) to make IP destination prefix-based switching decisions. The FIB is conceptually similar to a routing table or information base. When routing or topology changes occur in the network, the IP routing table is updated, and those changes are reflected in the FIB. The FIB maintains next-hop address information based on the information in the IP routing table.

**headend**—The upstream, transmit end of a tunnel. The router that originates and maintains the traffic engineering LSP.

**IGP**—Interior Gateway Protocol. Internet protocol used to exchange routing information within an autonomous system. Examples of common IGPs include OSPF and Routing Information Protocol (RIP).

**interarea TE**—Ability for a traffic engineering LSP to span multiple areas.

**IS-IS**—Intermediate System-to-Intermediate System. IS-IS is an OSI link-state hierarchical routing protocol based on DECnet Phase V routing, where intermediate system (IS) routers exchange routing information based on a single metric to determine the network topology.

**label switched path (LSP) tunnel**—A configured connection between two routers in which label switching is used to carry the packets.

**level-1 routers**—Routers that are directly connected to other areas. The routers are not in the backbone. MPLS does not run in the background. These routers are also called internal routers.

**level-2 routers**—Routers that connect two areas. These routers let you run MPLS in the background.

**load balancing**—The distribution of traffic among multiple paths to the same destination so that the router uses bandwidth efficiently. Load balancing increases the use of network segments, thus increasing effective network bandwidth.

**LSP**—label switched path. A sequence of hops such as R0...Rn in which a packet travels from R0 to Rn through label switching mechanisms. A label switched path can be chosen dynamically, based on normal routing mechanisms, or through configuration.

**mask**—A bit combination used to describe which part of an address refers to the network or the subnet and which part refers to the host.

**MPLS**—Multiprotocol Label Switching. A method for forwarding packets (frames) through a network. It enables routers at the edge of a network to apply labels to packets. ATM switches or existing routers in the network core can switch packets according to the labels with minimal lookup overhead.

**OSPF**—Open Shortest Path First. Link-state, hierarchical IGP routing algorithm proposed as a successor to Routing Information Protocol (RIP) in the Internet community. OSPF features include least-cost routing, multipath routing, and load balancing.

**process ID**—Distinguishes one process from another within the device. An OSPF process ID can be any positive integer, and it has no significance outside the router on which it is configured.

**router ID**—Something by which a router originating a packet can be uniquely distinguished from all other routers. For example, an IP address from one of the router's interfaces.

**static routing**—A static route is a fixed path preprogrammed by a network administrator. Static routes cannot make use of routing protocols and don't self-update after receipt of routing update messages; they must be updated by hand.

**tailend**—The downstream, receive end of a tunnel. The router that terminates the traffic engineering LSP.

**traffic engineering**—The techniques and processes that cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods were used.

**tunnel**—A secure communication path between two peers, such as two routers. A traffic engineering tunnel is a label switched tunnel that is used for traffic engineering. Such a tunnel is set up through means other than normal Layer 3 routing; it is used to direct traffic over a path different from the one that Layer 3 routing could cause the tunnel to take.

**virtual link**—Ordinarily, each area is directly connected to area 0. A virtual link is used for a connection when an area is connected to an area that is one area away from area 0.

# MPLS TE: Bundled Interface Support

---

**First Published: November 5, 2007**

**Last Updated: December 27, 2007**

The MPLS TE: Bundled Interface Support feature enables Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels over the bundled interfaces EtherChannel and Multilink PPP (MLP).

The Resource Reservation Protocol (RSVP) notifies TE about bandwidth changes that occur when member links are added or deleted, or when links become active or inactive. TE notifies other nodes in the network via IGP flooding. By default, the bandwidth available to TE LSPs is 75% of the interface bandwidth. You can change the percentage of the global bandwidth available for TE LSPs by using an RSVP command on the bundled interface. Bandwidth reservation and preemption are supported.

The Fast Reroute (FRR) feature is supported on the bundled interfaces. FRR is activated when a bundled interface goes down: for example, if you enter the **shut** command to shut down the interface, or fewer than the required minimum number of links are operational.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for MPLS TE: Bundled Interface Support](#)” section on [page 10](#).

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

- [How to Configure MPLS TE: Bundled Interface Support, page 4](#)
- [Configuration Examples for MPLS TE: Bundled Interface Support, page 7](#)
- [Additional References, page 8](#)
- [Command Reference, page 9](#)
- [Feature Information for MPLS TE: Bundled Interface Support, page 10](#)
- [Glossary, page 11](#)

## Prerequisites for MPLS TE: Bundled Interface Support

- Configure MPLS TE tunnels.
- Enable Cisco Express Forwarding in global configuration mode.
- Enable RSVP.
- Configure EtherChannel.
- Configure MLP.

## Restrictions for MPLS TE: Bundled Interface Support

- Traffic engineering over Service Virtual Interfaces (SVIs) is not supported unless the SVI consists of a bundle of links that represent a single point-to-point interface.
- There must be a valid IP address configuration on the bundled interface and there must not be an IP address configuration on the member links.
- To ensure that the Fast Reroute feature functions correctly in MLP, enter the **multilink min-links** command (to specify the preferred minimum number of links) along with the **mandatory** keyword (to deactivate the MLP bundle if the minimum number of links is not present).

## Information About MPLS TE: Bundled Interface Support

To configure the MPLS TE: Bundled Interface Support feature, you should understand the following concepts:

- [MLP Overview, page 2](#)
- [Cisco EtherChannel Overview, page 3](#)
- [Load Balancing and Min-Links in MLP and EtherChannel, page 4](#)

### MLP Overview

MLP provides the capability of splitting and recombining packets to a single end system across a logical pipe (also called a bundle) formed by multiple links. MLP provides bandwidth on demand and reduces transmission latency across WAN links.

MLP allows packets to be fragmented and the fragments to be sent at the same time over multiple point-to-point links to the same remote address. The multiple links come up in response to a dialer load threshold that you define. The load can be calculated on inbound traffic, outbound traffic, or on either, as needed for the traffic between the specific sites. MLP provides bandwidth on demand and reduces transmission latency across WAN links.

MLP is designed to work over single or multiple interfaces of the following types that are configured to support both dial-on-demand rotary groups and PPP encapsulation:

- Asynchronous serial interfaces
- Basic Rate Interfaces
- Primary Rate Interfaces

## Cisco EtherChannel Overview

Cisco EtherChannel technology builds upon standards-based 802.3 full-duplex Fast Ethernet to provide network managers with a reliable, high-speed solution for the campus network backbone. EtherChannel technology provides bandwidth scalability within the campus by providing up to 800 Mbps, 8 Gbps, or 80 Gbps of aggregate bandwidth for a Fast EtherChannel, Gigabit EtherChannel, or 10 Gigabit EtherChannel connection, respectively. Each of these connection speeds can vary in amounts equal to the speed of the links used (100 Mbps, 1 Gbps, or 10 Gbps). Even in the most bandwidth-demanding situations, EtherChannel technology helps aggregate traffic and keep oversubscription to a minimum, while providing effective link-resiliency mechanisms.

### Cisco EtherChannel Benefits

Cisco EtherChannel technology allows network managers to provide higher bandwidth among servers, routers, and switches than single-link Ethernet technology can provide.

Cisco EtherChannel technology provides incremental scalable bandwidth and the following benefits:

- **Standards-based**—Cisco EtherChannel technology builds upon IEEE 802.3-compliant Ethernet by grouping multiple, full-duplex point-to-point links. EtherChannel technology uses IEEE 802.3 mechanisms for full-duplex autonegotiation and autosensing, when applicable.
- **Flexible incremental bandwidth**—Cisco EtherChannel technology provides bandwidth aggregation in multiples of 100 Mbps, 1 Gbps, or 10 Gbps, depending on the speed of the aggregated links. For example, network managers can deploy EtherChannel technology that consists of pairs of full-duplex Fast Ethernet links to provide more than 400 Mbps between the wiring closet and the data center. In the data center, bandwidths of up to 800 Mbps can be provided between servers and the network backbone to provide large amounts of scalable incremental bandwidth.
- **Load balancing**—Cisco EtherChannel technology comprises several Fast Ethernet links and is capable of load balancing traffic across those links. Unicast, broadcast, and multicast traffic is evenly distributed across the links, providing improved performance and redundant parallel paths. When a link fails, traffic is redirected to the remaining links within the channel without user intervention and with minimal packet loss.
- **Resiliency and fast convergence**—When a link fails, Cisco EtherChannel technology provides automatic recovery by redistributing the load across the remaining links. When a link fails, Cisco EtherChannel technology redirects traffic from the failed link to the remaining links in less than one second. This convergence is transparent to the end user—no host protocol timers expire, so no sessions are dropped.

## Load Balancing and Min-Links in MLP and EtherChannel

Load balancing affects the actual and practical bandwidth that can be used for TE. Multilink load balancing uses a per-packet load balancing method. All of the bundle interface bandwidth is available. EtherChannel load balancing has various load balancing methods, depending on the traffic pattern and the load balancing configuration. The total bandwidth available for TE may be limited to the bandwidth of a single member link.

Min-links affects how FRR works. Multilink PPP Minimum Links (min-links) allows you to configure the minimum number of links in an MLP bundle required to keep that bundle active. To configure min-links for MLP, use the **multilink min-links** command. It is *recommended* that you specify the **mandatory** keyword. To use FRR, you *must* specify the **mandatory** keyword. On EtherChannel, min-link is supported only in the Link Aggregation Control Protocol (LACP). For other EtherChannel protocols, the minimum is one link, by default, and it is not configurable. To configure min-link for EtherChannel, use the **port-channel min-links** command.

## How to Configure MPLS TE: Bundled Interface Support

This section contains the following procedures:

- [Configuring MPLS TE on an MLP Interface, page 4](#) (required)
- [Configuring MPLS TE on an EtherChannel Interface, page 6](#) (required)

### Configuring MPLS TE on an MLP Interface

To configure MPLS TE on an MLP interface, perform the following steps.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number* [*name-tag*]
4. **ip address** *ip-address mask* [**secondary**]
5. **mpls traffic-eng tunnels**
6. **mpls traffic-eng backup-path** *tunnel*
7. **ppp multilink** [**ppp**]
8. **multilink min-links** *links* [**mandatory**]
9. **multilink-group** *group-number*
10. **ip rsvp bandwidth** [*interface-kbps*] [*single-flow-kbps*]
11. **keepalive** [*period* [*retries*]]
12. **end**

## DETAILED STEPS

|         | Command or Action                                                                                                               | Purpose                                                                                                                                                                                |
|---------|---------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1  | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                       |
| Step 2  | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                  | Enters global configuration mode.                                                                                                                                                      |
| Step 3  | <b>interface type number [name-tag]</b><br><br><b>Example:</b><br>Router(config)# interface multilink 1                         | Creates a multilink bundle, assigns a group number to the bundle, and enters interface configuration mode.                                                                             |
| Step 4  | <b>ip address ip-address mask [secondary]</b><br><br><b>Example:</b><br>Router(config-if)# ip address 10.0.0.7 255.255.255.0    | Specifies an IP address for the multilink group.                                                                                                                                       |
| Step 5  | <b>mpls traffic-eng tunnels</b><br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng tunnels                           | Enables MPLS traffic engineering tunnel signaling on an interface (assuming that it is enabled on the device).                                                                         |
| Step 6  | <b>mpls traffic-eng backup-path tunnel</b><br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng backup-path Tunnel50   | (Optional) Enables FRR.                                                                                                                                                                |
| Step 7  | <b>ppp multilink [ppp]</b><br><br><b>Example:</b><br>Router(config-if)# ppp multilink                                           | Enables MLP on an interface and, optionally, enables Bandwidth Allocation Control Protocol (BACP) and its Bandwidth Allocation Protocol (BAP) subset for dynamic bandwidth allocation. |
| Step 8  | <b>multilink min-links links [mandatory]</b><br><br><b>Example:</b><br>Router(config-if)# multilink min-links 2 mandatory       | Specifies the preferred minimum number of links in an MLP bundle.<br><br><b>Note</b> To use FRR, you must enter the <b>mandatory</b> keyword.                                          |
| Step 9  | <b>multilink-group group-number</b><br><br><b>Example:</b><br>Router(config-if)# multilink-group 1                              | Restricts a physical link to joining only a designated multilink-group interface.                                                                                                      |
| Step 10 | <b>ip rsvp bandwidth [interface-kbps] [single-flow-kbps]</b><br><br><b>Example:</b><br>Router(config-if)# ip rsvp bandwidth 100 | Enables RSVP for IP on an interface and specifies a percentage of the total interface bandwidth as available in the RSVP bandwidth pool.                                               |

|         | Command or Action                                                                                             | Purpose                                                                                                                                                                                                                                             |
|---------|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 11 | <b>keepalive</b> [ <i>period</i> [ <i>retries</i> ]]<br><br><b>Example:</b><br>Router(config-if)# keepalive 3 | Enables keepalive packets and specifies the number of times that the Cisco IOS software tries to send keepalive packets without a response before bringing down the interface or before bringing the tunnel protocol down for a specific interface. |
| Step 12 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                   | Returns to global configuration mode.                                                                                                                                                                                                               |

## Configuring MPLS TE on an EtherChannel Interface

To configure MPLS TE on an EtherChannel interface, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number* [*name-tag*]
4. **ip address** *ip-address mask* [**secondary**]
5. **mpls traffic-eng tunnels**
6. **mpls traffic-eng backup-path** *tunnel*
7. **port-channel min-links** *min-num*
8. **ip rsvp bandwidth** [*interface-kbps*] [*single-flow-kbps*]
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                           | Purpose                                                                                                                                  |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                              | Enters global configuration mode.                                                                                                        |
| Step 3 | <b>interface type number [name-tag]</b><br><br><b>Example:</b><br>Router(config)# interface port-channel 1                                  | Creates an EtherChannel bundle, assigns a group number to the bundle, and enters interface configuration mode.                           |
| Step 4 | <b>ip address ip-address mask [secondary]</b><br><br><b>Example:</b><br>Router(config-if)# ip address 10.0.0.4 255.255.255.0                | Specifies an IP address for the EtherChannel group.                                                                                      |
| Step 5 | <b>mpls traffic-eng tunnels</b><br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng tunnels                                       | Enables MPLS TE tunnel signaling on an interface (assuming that it is enabled on the device).                                            |
| Step 6 | <b>mpls traffic-eng backup-path tunnel</b><br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng backup-path Tunnel120              | (Optional) Enables FRR.                                                                                                                  |
| Step 7 | <b>port-channel min-links min-num</b><br><br><b>Example:</b><br>Router(config-if)# port-channel min-links 2                                 | Specifies that a minimum number of bundled ports in an EtherChannel is required before the channel can be active.                        |
| Step 8 | <b>ip rsvp bandwidth [interface-kbps]</b><br>[ <i>single-flow-kbps</i> ]<br><br><b>Example:</b><br>Router(config-if)# ip rsvp bandwidth 100 | Enables RSVP for IP on an interface and specifies a percentage of the total interface bandwidth as available in the RSVP bandwidth pool. |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                                                 | Returns to global configuration mode.                                                                                                    |

## Configuration Examples for MPLS TE: Bundled Interface Support

This section contains the following configuration examples:

- [Configuring MPLS TE on an MLP Interface: Example, page 8](#)
- [Configuring MPLS TE on an EtherChannel Interface: Example, page 8](#)

## Configuring MPLS TE on an MLP Interface: Example

The following example shows how to configure MPLS TE on an MLP interface:

```
interface multilink 1
ip address 10.0.0.7 255.255.255.0
mpls traffic-eng tunnels
mpls traffic-eng backup-path Tunnel50
ppp multilink
multilink min-links 2 mandatory
multilink-group 1
ip rsvp bandwidth 100
keepalive 3
```

## Configuring MPLS TE on an EtherChannel Interface: Example

The following example shows how to configure MPLS TE on an EtherChannel interface:

```
interface port-channel 1
ip address 10.0.0.4 255.255.255.0
mpls traffic-eng tunnels
mpls traffic-eng backup-path Tunnel120
port-channel min-links 2
ip rsvp bandwidth 100
```

## Additional References

The following sections provide references related to the MPLS TE: Bundled Interface Support feature.

## Command Reference

This feature uses no new or modified commands.

# Feature Information for MPLS TE: Bundled Interface Support

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS TE: Bundled Interface Support

| Feature Name                       | Releases    | Feature Information                                                                                                                                                                                      |

| MPLS TE: Bundled Interface Support | 12.2(33)SRC | The MPLS TE: Bundled Interface Support feature enables MPLS traffic engineering (TE) tunnels over the bundled interfaces EtherChannel and Multilink MLP.<br>In 12.2(33)SRC, this feature was introduced. |

# Glossary

**bundle**—A group of interfaces that comprise an aggregate interface; for example, MLP and EtherChannel.

**Cisco Express Forwarding**—A means for accelerating the forwarding of packets within a router, by storing route lookup information in several data structures instead of in a route cache.

**EtherChannel**—EtherChannel is a trunking technology that groups multiple full-duplex 802.3 Ethernet interfaces to provide fault-tolerant high-speed links between switches, routers, and servers. EtherChannel is a logical aggregation of multiple Ethernet interfaces. EtherChannel forms a single higher bandwidth routing or bridging endpoint.

**Fast EtherChannel**—Fast EtherChannel is a technology-leveraging, standards-based Fast Ethernet that provides the additional bandwidth network backbones require today. It provides flexible, scalable bandwidth with resiliency and load sharing across links for switches, router interfaces, and servers. It supports up to eight links per channel.

**Gigabit EtherChannel**—Gigabit EtherChannel is high-performance Ethernet technology that provides gigabit per second transmission rates. It provides flexible, scalable bandwidth with resiliency and load sharing across links for switches, router interfaces, and servers. It supports up to eight links per channel.

**member link**—An interface that is part of a bundle.

**min-links**—Minimum number of links in an MLP bundle.

**MLP**—Multilink PPP provides load balancing functionality over multiple WAN links, while providing multivendor interoperability, packet fragmentation, proper sequencing, and load calculation on both inbound and outbound traffic.

**MPLS**—Multiprotocol Label Switching. Switching method that forwards IP traffic using a label. This label instructs the routers and the switches in the network where to forward the packets based on preestablished IP routing information.

**PPP**—Point-to-Point Protocol. A successor to SLIP that provides router-to-router and host-to-network connections over synchronous and asynchronous circuits. PPP was designed to work with several network layer protocols (such as IP, IPX, and ARA). PPP also has built-in security mechanisms (such as CHAP and PAP). PPP relies on two protocols: LCP and NCP.

**RSVP**—Resource Reservation Protocol. Protocol that supports the reservation of resources across an IP network. Applications running on IP end systems can use RSVP to indicate to other nodes the nature (bandwidth, jitter, maximum burst, and so on) of the packet streams they want to receive. RSVP depends on IPv6. Also known as Resource Reservation Setup Protocol.

**traffic engineering**—Techniques and processes that cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods were used.

# MPLS Traffic Engineering (TE)—Automatic Bandwidth Adjustment for TE Tunnels

---

**First Published: February 28, 2006**

**Last Updated: October 21, 2009**

The MPLS Traffic Engineering (TE)—Automatic Bandwidth Adjustment for TE Tunnels feature provides the means to automatically adjust the bandwidth allocation for traffic engineering tunnels based on their measured traffic load. The configured bandwidth in the running configuration is changed due to the automatic bandwidth behavior.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels” section on page 19](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [How to Configure MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels, page 3](#)
- [Configuration Examples for MPLS TE—Automatic Bandwidth Adjustments for TE Tunnels, page 15](#)

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Additional References, page 17](#)
- [Feature Information for MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels, page 19](#)

## Prerequisites for MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels

Your network must support the following:

- Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels
- Cisco Express Forwarding
- Intermediate System-to-Intermediate System (IS-IS) or Open Shortest Path First (OSPF)

MPLS TE must be configured on the interface and on the tunnels.

## Restrictions for MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels

- The automatic bandwidth adjustment feature treats each tunnel for which it has been enabled independently. That is, it adjusts the bandwidth for each such tunnel according to the adjustment frequency configured for the tunnel and the sampled output rate for the tunnel since the last adjustment without regard for any adjustments previously made or pending for other tunnels.
- If a tunnel is brought down to calculate a new label switched path (LSP) because the LSP is not operational, the configured bandwidth is not saved. If the router is reloaded, the last saved automatic bandwidth value is used.
- You cannot configure MPLS TE over the logical generic routing encapsulation (GRE) tunnel interface.

## Information About MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels

Before you configure the MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels feature, you should understand the following:

- [MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels Overview, page 2](#)
- [MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels Benefits, page 3](#)

## MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels Overview

Traffic engineering autobandwidth samples the average output rate for each tunnel marked for automatic bandwidth adjustment. For each marked tunnel, the feature periodically (for example, once per day) adjusts the tunnel's allocated bandwidth to be the largest sample for the tunnel since the last adjustment.

The frequency with which tunnel bandwidth is adjusted and the allowable range of adjustments is configurable on a per-tunnel basis. In addition, the sampling interval and the interval over which to average tunnel traffic to obtain the average output rate is user-configurable on a per-tunnel basis.

## MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels Benefits

The automatic bandwidth feature allows you to configure and monitor the bandwidth for MPLS TE tunnels. If automatic bandwidth is configured for a tunnel, TE automatically adjusts the tunnel's bandwidth.

# How to Configure MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels

This section contains the following tasks to configure MPLS TE automatic bandwidth adjustment for TE tunnels:

- [Configuring a Device to Support Traffic Engineering Tunnels, page 3](#) (required)
- [Configuring IS-IS or OSPF for MPLS Traffic Engineering, page 4](#) (required)
- [Configuring Bandwidth on Each Link That a Tunnel Crosses, page 6](#) (required)
- [Configuring Bandwidth on Each Link That a Tunnel Crosses, page 6](#) (required)
- [Enabling Automatic Bandwidth Adjustment on a Platform, page 10](#) (required)
- [Enabling Automatic Bandwidth Adjustment for a Tunnel, page 11](#) (required)
- [Configuring the Interval for Computing the Tunnel Average Output Rate, page 12](#) (optional)
- [Verifying Automatic Bandwidth Configuration, page 13](#) (optional)

## Configuring a Device to Support Traffic Engineering Tunnels

To configure a device to support TE tunnels, perform the following task.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip cef distributed`
4. `mpls traffic-eng tunnels`
5. `exit`

**DETAILED STEPS**

|               | Command or Action                                                                                  | Purpose                                                                                                           |
|---------------|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
| <b>Step 2</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                     | Enters global configuration mode.                                                                                 |
| <b>Step 3</b> | <b>ip cef distributed</b><br><br><b>Example:</b><br>Router(config)# ip cef distributed             | Enables distributed Cisco Express Forwarding operation.                                                           |
| <b>Step 4</b> | <b>mpls traffic-eng tunnels</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng tunnels | Enables the MPLS traffic engineering tunnel feature on a device.                                                  |
| <b>Step 5</b> | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                         | Exits to privileged EXEC mode.                                                                                    |

**Configuring IS-IS or OSPF for MPLS Traffic Engineering**

Perform one of the follow tasks to configure IS-IS or OSPF for MPLS TE:

- [Configuring IS-IS for MPLS Traffic Engineering, page 4](#) (optional)
- [Configuring OSPF for MPLS Traffic Engineering, page 5](#) (optional)

**Configuring IS-IS for MPLS Traffic Engineering**

To configure IS-IS for MPLS TE, perform the following task.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **router isis**
4. **mpls traffic-eng level-1**
5. **mpls traffic-eng router-id loopback0**
6. **metric-style wide**
7. **exit**
8. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                 | Purpose                                                                                                           |
|--------|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                    | Enters global configuration mode.                                                                                 |
| Step 3 | <b>router isis</b><br><br><b>Example:</b><br>Router(config)# router isis                                                          | Enables IS-IS routing and specifies an IS-IS process for IP, and enters router configuration mode.                |
| Step 4 | <b>mpls traffic-eng level-1</b><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng level-1                         | Turns on MPLS TE for IS-IS level 1.                                                                               |
| Step 5 | <b>mpls traffic-eng router-id loopback0</b><br><br><b>Example:</b><br>Router(config-router)# mpls traffic-eng router-id loopback0 | Specifies that the TE router identifier for the node is the IP address associated with interface loopback0.       |
| Step 6 | <b>metric-style wide</b><br><br><b>Example:</b><br>Router(config-router)# metric-style wide                                       | Configures a router to generate and accept only new-style type, length, value objects (TLVs).                     |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-router)# exit                                                                 | Exits to global configuration mode.                                                                               |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                        | Exits to privileged EXEC mode.                                                                                    |

## Configuring OSPF for MPLS Traffic Engineering

To configure OSPF for MPLS TE, perform the following task.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router ospf process-id**

4. `mpls traffic-eng area number`
5. `mpls traffic-eng router-id loopback0`
6. `exit`
7. `exit`

## DETAILED STEPS

|        | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> <code>enable</code>                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                        |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# <code>configure terminal</code>                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <code>router ospf <i>process-id</i></code><br><br><b>Example:</b><br>Router(config)# <code>router ospf 200</code>                                    | Configures an OSPF routing process for IP and enters router configuration mode. <ul style="list-style-type: none"> <li>The value for the <i>process-id</i> argument is an internally used identification parameter for an OSPF routing process. It is locally assigned and can be any positive integer. Assign a unique value for each OSPF routing process.</li> </ul> |
| Step 4 | <code>mpls traffic-eng area <i>number</i></code><br><br><b>Example:</b><br>Router(config-router)# <code>mpls traffic-eng area 0</code>               | Turns on MPLS TE for the indicated OSPF area.                                                                                                                                                                                                                                                                                                                           |
| Step 5 | <code>mpls traffic-eng router-id loopback0</code><br><br><b>Example:</b><br>Router(config-router)# <code>mpls traffic-eng router-id loopback0</code> | Specifies that the TE router identifier for the node is the IP address associated with interface loopback0.                                                                                                                                                                                                                                                             |
| Step 6 | <code>exit</code><br><br><b>Example:</b><br>Router(config-router)# <code>exit</code>                                                                 | Exits to global configuration mode.                                                                                                                                                                                                                                                                                                                                     |
| Step 7 | <code>exit</code><br><br><b>Example:</b><br>Router(config)# <code>exit</code>                                                                        | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                          |

## Configuring Bandwidth on Each Link That a Tunnel Crosses

To configure bandwidth on each link that a tunnel crosses, perform the following task.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **mpls traffic-eng tunnels**
5. **ip rsvp bandwidth** [*interface-kbps*] [*single-flow-kbps*] [**sub-pool** *kbps*]
6. **exit**
7. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                    | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface FastEthernet 0/0/0                                                                                | Configures an interface type and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 4 | <b>mpls traffic-eng tunnels</b><br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng tunnels                                                                                     | Enables MPLS TE tunnels on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 5 | <b>ip rsvp bandwidth</b> [ <i>interface-kbps</i> ]<br>[ <i>single-flow-kbps</i> ] [ <b>sub-pool</b> <i>kbps</i> ]<br><br><b>Example:</b><br>Router(config-if)# ip rsvp bandwidth 1000 100 | Enables Resource Reservation Protocol (RSVP) for IP on an interface.<br><ul style="list-style-type: none"> <li>The <i>interface-kbps</i> argument specifies the maximum amount of bandwidth (in kbps) that may be allocated by RSVP flows. ## Configuring an MPLS Traffic Engineering Tunnel

To configure an MPLS TE tunnel, perform the following task. The MPLS TE tunnel has two path setup options: a preferred explicit path and a backup dynamic path.

**Note** The configuration applies only to the TE head-end node. The configuration applies to all nodes and interfaces in the network.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **ip unnumbered** *interface-type interface-number*
5. **tunnel destination** *ip-address*
6. **tunnel mode mpls traffic-eng**
7. **tunnel mpls traffic-eng bandwidth** *bandwidth*
8. **tunnel mpls traffic-eng path-option** [**protect**] *preference-number* {**dynamic** | **explicit** | {**name** *path-name* | *path-number*}} [**lockdown**]
9. **exit**
10. **exit**

### DETAILED STEPS

|        | Command or Action                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                | Configures a tunnel interface and enters interface configuration mode.                                                                                                                                                                                                                                                                                  |
| Step 4 | <b>ip unnumbered</b> <i>interface-type interface-number</i><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered loopback 0 | Gives the tunnel interface an IP address that is the same as that of interface Loopback0.<br><ul style="list-style-type: none"> <li>• An MPLS TE tunnel interface should be unnumbered because it represents a unidirectional link.</li> </ul> <p><b>Note</b> This command is not effective until Loopback0 has been configured with an IP address.</p> |

|         | Command or Action                                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Troubleshooting Tips

Each **tunnel mpls traffic-eng auto-bw** command supersedes the previous one. Therefore, if you want to specify multiple options for a tunnel, you must specify them all in a single **tunnel mpls traffic-eng auto-bw** command.

## Enabling Automatic Bandwidth Adjustment on a Platform

To enable automatic bandwidth adjustment on a platform and initiate sampling the output rate for tunnels configured for bandwidth adjustment, perform the following task.

**Note** This task is applicable only to the TE head-end router. The configuration applies to all locally-configured TE head-end interfaces.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng auto-bw timers [frequency *seconds*]**
4. **no mpls traffic-eng auto-bw timers**
5. **exit**

### DETAILED STEPS

| Step 4 | <p><code>no mpls traffic-eng auto-bw timers</code></p> <p><b>Example:</b><br/> Router(config)# no mpls traffic-eng auto-bw timers</p> | <p>(Optional) Disables automatic bandwidth adjustment on a platform.</p> <ul style="list-style-type: none"> <li>Use the <b>no</b> version of the command, which terminates output rate sampling and bandwidth adjustment for tunnels. In addition, the <b>no</b> form of the command restores the configured bandwidth for each tunnel where the configured bandwidth is determined as follows: <ul style="list-style-type: none"> <li>If the tunnel bandwidth was explicitly configured via the <b>tunnel mpls traffic-eng bandwidth</b> command after the running configuration was written to the startup configuration, the configured bandwidth is the bandwidth specified by that command.</li> <li>Otherwise, the configured bandwidth is the bandwidth specified for the tunnel in the startup configuration.</li> </ul> </li> </ul> |
| Step 5 | <p><code>exit</code></p> <p><b>Example:</b><br/> Router(config)# exit</p>                                                             | <p>Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Enabling Automatic Bandwidth Adjustment for a Tunnel

To enable automatic bandwidth adjustment for a tunnel and constrain the range of automatic bandwidth adjustments applied to the tunnel, perform the following task.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***
4. **tunnel mpls traffic-eng auto-bw [collect-bw] [frequency *seconds*] [adjustment-threshold *percent*] [overflow-limit *number* overflow-threshold *percent*] [max-bw *kbps*] [min-bw *kbps*]**
5. **exit**
6. **exit**

|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>               |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                                                                              | Enters global configuration mode.                                                                                              |
| Step 3 | <b>interface tunnel <i>number</i></b><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                                                                                                                                                                                                                                          | Configures a tunnel interface and enters interface configuration mode.                                                         |
| Step 4 | <b>tunnel mpls traffic-eng auto-bw</b> [ <i>collect-bw</i> ] [ <i>frequency seconds</i> ] [ <i>adjustment-threshold percent</i> ] [ <i>overflow-limit number</i> ] [ <i>overflow-threshold percent</i> ] [ <i>max-bw kbps</i> ] [ <i>min-bw kbps</i> ]<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng auto-bw max-bw 2000 min-bw 1000 | Enables automatic bandwidth adjustment for the tunnel and controls the manner in which the bandwidth for a tunnel is adjusted. |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                                                                                                                                                                                               | Exits to global configuration mode.                                                                                            |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                                                                                                                                                                  | Exits to privileged EXEC mode.                                                                                                 |

## Configuring the Interval for Computing the Tunnel Average Output Rate

To specify the interval for computing the average output rate for an MPLS TE tunnel, perform the following task.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***
4. **load-interval *seconds***
5. **exit**
6. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                               |
|--------|----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                     |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                     |
| Step 3 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1 | Configures a tunnel interface and enters interface configuration mode.                                                                                                                                                                                                                                                                                |
| Step 4 | <b>load-interval</b> <i>seconds</i><br><br><b>Example:</b><br>Router(config-if)# load-interval 90  | Configures the interval over which the input and output rates for the interface are averaged.<br><ul style="list-style-type: none"><li>The <i>seconds</i> argument is the length of time for which data is used to compute load statistics. The value is a multiple of 30, from 30 to 600 (30, 60, 90, 120, and so on). The default is 300.</li></ul> |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                      | Exits to global configuration mode.                                                                                                                                                                                                                                                                                                                   |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                         | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                        |

## Verifying Automatic Bandwidth Configuration

To verify the automatic bandwidth configuration, perform the following task.

## SUMMARY STEPS

1. **show mpls traffic-eng tunnels**
2. **show running-config**

## DETAILED STEPS

**Step 1** **show mpls traffic-eng tunnels**

Use this command to display information about tunnels, including automatic bandwidth information for tunnels that have the feature enabled. For example:

```
Router# show mpls traffic-eng tunnels
```

```
Name:tagsw4500-9_t1 (Tunnel1) Destination:10.0.0.4
```

```

Status:
Admin:up Oper:up Path:valid Signalling:connected
path option 1, type explicit pbr_south (Basis for Setup, path weight 30)
path option 2, type dynamic
Config Parameters:
Bandwidth:13 kbps (Global) Priority:7 7 Affinity:0x0/0xFFFF
AutoRoute: disabled LockDown:disabled Loadshare:13 bw-based
auto-bw:(300/265) 53 Bandwidth Requested: 13
    Adjustment threshold: 5%
    Overflow Limit: 4 Overflow Threshold: 25%
    Overflow Threshold Crossed: 1
    Sample Missed: 1 Samples Collected: 1
Active Path Option Parameters:
    State: dynamic path option 1 is active
    BandwidthOverride: disabled LockDown: disabled Verbatim: disabled
InLabel : -
OutLabel : Serial3/0, 18
RSVP Signalling Info:
    Src 10.0.0.1, Dst 10.0.0.4, Tun_Id 2, Tun_Instance 2
RSVP Path Info:
    My Address: 10.105.0.1
    Explicit Route: 10.105.0.2 104.105.0.1 10.0.0.4
    Record Route: NONE
    Tspec: ave rate=13 kbits, burst=1000 bytes, peak rate=13 kbits
Record Route: NONE
    Tspec: ave rate=13 kbits, burst=1000 bytes, peak rate=13 kbits
RSVP Resv Info:
    Record Route: NONE
    Fspec: ave rate=13 kbits, burst=1000 bytes, peak rate=13 kbits
Shortest Unconstrained Path Info:
    Path Weight: 128 (TE)
    Explicit Route: 10.105.0.2 104.105.0.1 10.0.0.4
History:
Tunnel:
    Time since created: 7 minutes, 56 seconds
    Time since path change: 7 minutes, 18 seconds
    Number of LSP IDs (Tun_Instances) used: 2
    Number of Auto-bw Adjustment resize requests: 1
    Time since last Auto-bw Adjustment resize request: 1 minutes, 7 seconds
    Number of Auto-bw Overflow resize requests: 1
    Time since last Auto-bw Overflow resize request: 52 seconds
    Current LSP:
        Uptime: 52 seconds
        Selection: reoptimization
    Prior LSP:
ID: path option 1 [1]
Removal Trigger: configuration changed

```

In the command output:

- The auto-bw line indicates that automatic bandwidth adjustment is enabled for the tunnel.
- 300 is the time, in seconds, between bandwidth adjustments.
- 265 is the time, in seconds, remaining until the next bandwidth adjustment.
- 53 is the largest bandwidth sample since the last bandwidth adjustment.
- 13 is the last bandwidth adjustment and the bandwidth currently requested for the tunnel.
- The adjustment threshold is 5 percent.
- The overflow limit is 4.
- The overflow threshold is 25 percent.

- The overflow crossed is 1.

**Step 2 show running-config**

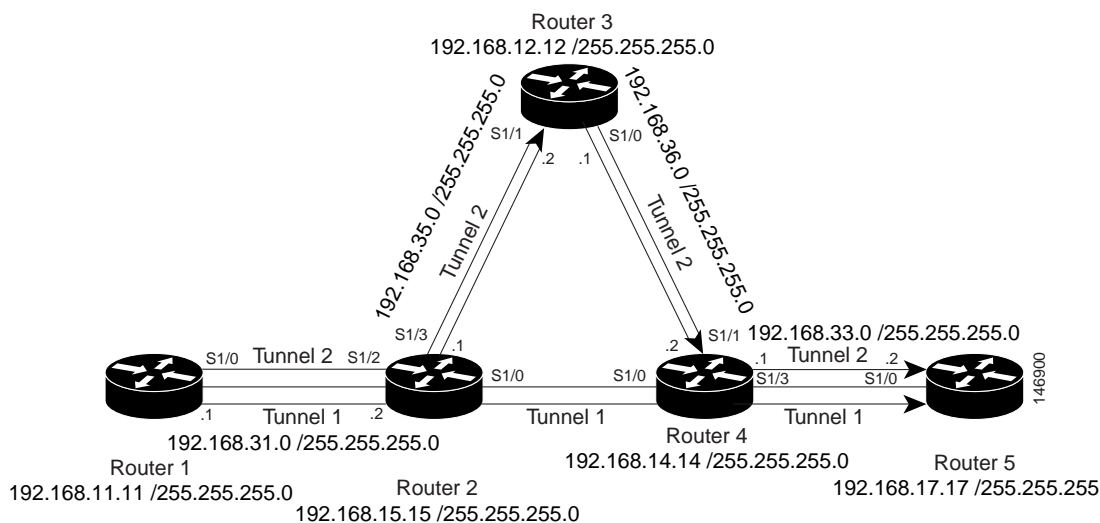

Use this command to verify that the **tunnel mpls traffic-eng auto bw** command is as you expected. For example:

```
Router# show running-config
.
.
.
interface tunnel1
  ip unnumbered loopback 0
  tunnel destination 192.168.17.17 255.255.255.0
  tunnel mode mpls traffic-eng
  tunnel mpls traffic-eng bandwidth 1500
  tunnel mpls traffic-eng priority 1 1
  tunnel mpls traffic-eng path-option 1 dynamic
  tunnel mpls traffic-eng auto bw max-bw 2000 min-bw 1000    !Enable automatic bandwidth
.
.
.
```

The sample output from the **show running-config** command shows that the value 1500, in the **tunnel mpls traffic-eng bandwidth 1500** command, changes after an adjustment is made.

## Configuration Examples for MPLS TE—Automatic Bandwidth Adjustments for TE Tunnels

[Figure 1](#) illustrates a sample MPLS topology. The following sections contain sample configuration examples to configure automatic bandwidth adjustment for MPLS TE tunnels originating on Router 1 and to enable automatic bandwidth adjustment for Tunnel 1.

**Figure 1** Sample MPLS Traffic Engineering Tunnel Configuration

This section provides the following configuration examples based on [Figure 1](#):

- [Configuring MPLS Traffic Engineering Automatic Bandwidth: Example, page 16](#)
- [Tunnel Configuration for Automatic Bandwidth: Example, page 16](#)

The examples omit some configuration required for MPLS TE, such as the required RSVP and Interior Gateway Protocol (IGP) (IS-IS or OSPF) configuration, because the purpose of these examples is to illustrate the configuration for automatic bandwidth adjustment.

## Configuring MPLS Traffic Engineering Automatic Bandwidth: Example

The following example shows how to use the **mpls traffic-eng auto-bw timers** command to enable automatic bandwidth adjustment for Router 1. The command specifies that the output rate is to be sampled every 10 minutes for tunnels configured for automatic bandwidth adjustment.

```
configure terminal
!
ip cef distributed
mpls traffic-eng tunnels
mpls traffic-eng auto-bw timers frequency 600 !Enable automatic bandwidth adjustment
interface loopback 0
ip address 192.168.11.11 255.255.255.0
```

## Tunnel Configuration for Automatic Bandwidth: Example

The following example shows how to use the **tunnel mpls traffic-eng auto-bw** command to enable automatic bandwidth adjustment for Tunnel 1. The command specifies a maximum allowable bandwidth of 2000 kbps, a minimum allowable bandwidth of 1000 kbps, and that the default automatic bandwidth adjustment frequency of once a day be used.

```
interface tunnel1
ip unnumbered loopback 0
tunnel destination 192.168.17.17
tunnel mode mpls traffic-eng
tunnel mpls traffic-eng bandwidth 1500
tunnel mpls traffic-eng priority 1 1
```

```
tunnel mpls traffic-eng path-option 1 dynamic
tunnel mpls traffic-eng auto-bw max-bw 2000 min-bw 1000    !Enable automatic bandwidth
   !adjustment for Tunnell
```

## Additional References

The following sections provide references related to the MPLS Traffic Engineering—Automatic Bandwidth Adjustment for TE Tunnels feature.

# Feature Information for MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS TE—Automatic Bandwidth Adjustment for TE Tunnels

| Feature Name                                                                | Releases            | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

# MPLS Point-to-Multipoint Traffic Engineering

---

**First Published: November 20, 2009**

**Last Updated: November 20, 2009**

The MPLS Point-to-Multipoint Traffic Engineering feature enables you to forward Multiprotocol Label Switching (MPLS) traffic from one source to multiple destinations.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for MPLS Point-to-Multipoint Traffic Engineering](#)” section on [page 34](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Prerequisites for MPLS Point-to-Multipoint Traffic Engineering

Before configuring the MPLS Point-to-Multipoint Traffic Engineering (P2MP TE) feature, configure Resource Reservation Protocol (RSVP) and traffic engineering features on the headend, midpoint, and tailend routers in the MPLS network.

## Restrictions for MPLS Point-to-Multipoint Traffic Engineering

The following functionality is not supported:

- Interior Gateway Protocol (IGP) extensions for P2MP TE signaling, as defined in RFC 5073, are not supported.
- Multiple path options per destination are not supported. The P2MP TE feature allows one path option for each destination.
- P2MP TE is not supported in inter-area and autonomous system networks. All P2MP TE sub-label switched paths (LSPs) must originate and terminate in the same IGP and autonomous system domain.
- Path and node protection for P2MP sub-LSPs is not supported.
- The P2MP TE feature does not support nonstop forwarding/stateful switchover (NSF/SSO). However, NSF/SSO coexistence is supported.
- The P2MP TE feature does not support Protocol Independent Multicast (PIM) sparse mode. Only PIM source-specific multicast (SSM) is supported.
- The P2MP TE feature does not support dynamic adding and removal of destinations. You must manually add and remove destinations at the headend router.
- RFC 4090 describes two FRR methods: Facility and Detour backup. Both point-to-point (P2P) TE and P2MP TE support only the Facility FRR method.
- P2MP TE does not support the MIBs for P2MP tunnels as described in draft-ietf-mpls-p2mp-te-mib-09.txt. The P2MP TE headend interfaces are represented in the mplsTunnelTable of the MPLS-TE-STD-MIB. However, sub-LSP-related information is not supported by the MPLS-TE-STD-MIB.
- The MPLS LSP Ping and MPLS Operations, Administration, and Maintenance (OAM) features are not supported.
- P2MP TE does not support signaling of multiple sub-LSPs in the same Path/Resv message. If multiple sub-LSPs occur in the same message, the router sends a PathErr Unknown Objects message, and the Path/Resv message with multiple sub-LSPs is not forwarded.
- P2MP TE does not support RSVP local policies, which control the resources that RSVP reservations are allowed to use.
- P2MP TE does not support policy-based routing.
- P2MP TE cannot be configured with static IP routes.
- P2MP TE does not support penultimate-hop popping. Therefore, the egress router must allocate an explicit null or non-null label.
- The **tunnel mpls traffic-eng autoroute announce** command is not supported with this feature; it is supported only with IP unicast traffic.
- MPLS P2MP TE tunnels and IP Multicast (MFIB) do not support fragmentation. Configure MTU values on the ingress interface of the headend router.

- The following restrictions apply when port-channels are coupled with MPLS TE Fast Reroute:
  - Active and backup ports must be port-channel interfaces.
  - All members of the primary port-channel interfaces must be on the same slot.
  - All members of the backup port-channel must be on the same slot but different from the primary port-channel.

## Information About MPLS Point-to-Multipoint Traffic Engineering

Before configuring the P2MP TE features, you should understand the following concepts:

- [MPLS Point-to-Multipoint Traffic Engineering Overview, page 3](#)
- [How P2MP TE Sub-LSPs Are Signaled, page 5](#)
- [How P2MP TE Traffic Is Forwarded, page 6](#)
- [Computing the IGP Path Using Dynamic Paths or Explicit Paths, page 7](#)
- [Benefits of MPLS Point-to-Multipoint Traffic Engineering, page 8](#)
- [MPLS Point-to-Multipoint Traffic Engineering—Re-optimizing Traffic, page 9](#)
- [P2P TE Tunnels Coexist with P2MP TE Tunnels, page 9](#)

## MPLS Point-to-Multipoint Traffic Engineering Overview

A P2MP TE network contains the following elements, which are shown in [Figure 1](#):

- The headend router, also called the source or ingress router, is where the label switched path (LSP) is initiated. The headend router can also be a branch point, which means the router performs packet replication and the sub-LSPs split into different directions.
- The midpoint router is where the sub-LSP signaling is processed. The midpoint router can be a branch point.
- The tailend router, also called the destination, egress, or leaf-node router, is where sub-LSP signaling ends.
- A bud router is a midpoint and tailend router at the same time.
- A P2MP tunnel consists of one or more sub-LSPs. All sub-LSPs belonging to the same P2MP tunnel employ the same constraints, protection policies, and so on, which are configured at the headend router.

**Figure 1 Basic P2MP TE Tunnels**

P2MP TE tunnels build on the features that exist in basic point-to-point TE tunnels. The P2MP TE tunnels have the following characteristics:

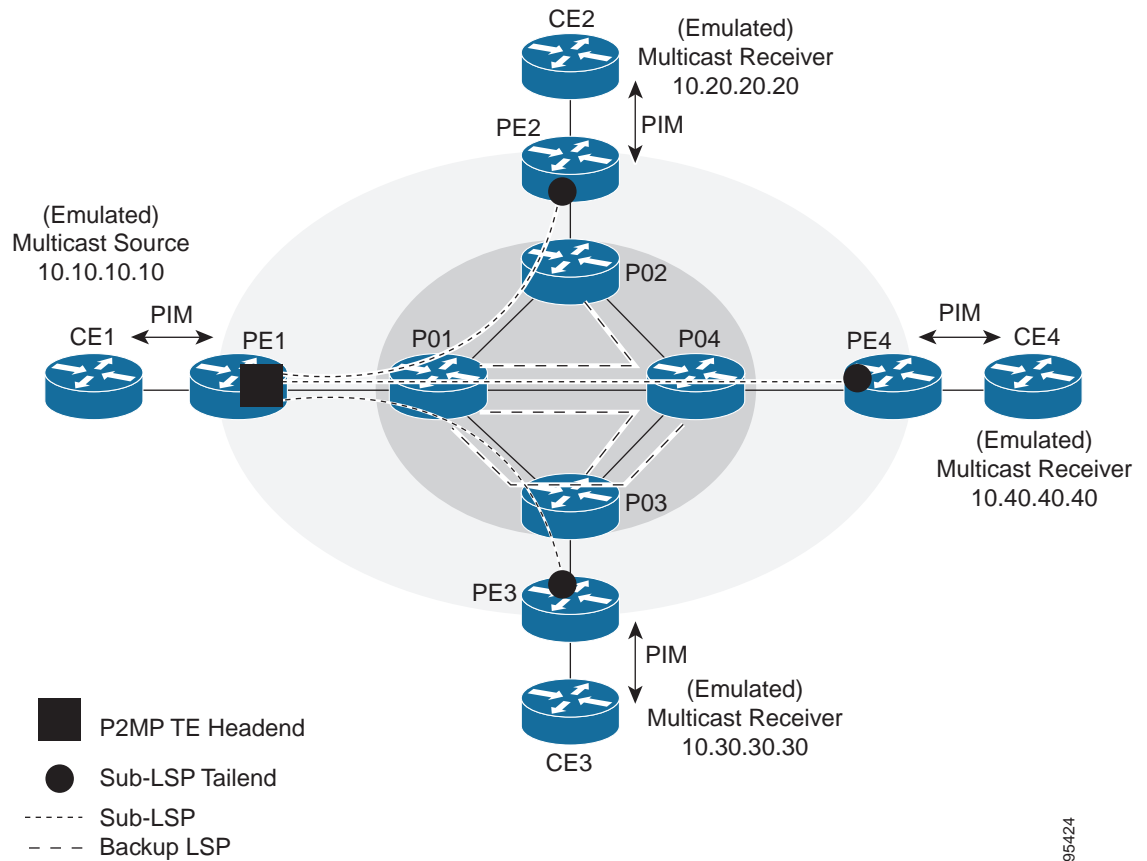

- There is one source (headend) but more than one destination (tailend).
- They are unidirectional.
- They are explicitly routed.
- Multiple sub-LSPs connect the headend router to various tailend routers.

Figure 2 shows a P2MP TE tunnel that has three destinations.

- PE1 is the headend router.
- P01 is a branch point router, where packet replication occurs.
- PE2, PE3, and PE4 are tailend routers, where the sub-LSP ends.

Between the PE and CE routers, PIM is enabled to exchange multicast routing information with the directly connected customer edge (CE) routers. PIM is not enabled across the P2MP TE tunnel.

**Figure 2** Network Topology with P2MP TE Tunnel

195424

## How P2MP TE Sub-LSPs Are Signaled

RSVP TE extensions defined in RFC 4875 allow multiple sub-LSPs to be signaled from the headend router. A P2MP TE tunnel consists of multiple sub-LSPs that connect the headend router to various tailend routers.

The headend router sends one RSVP path message to each destination. The tailend router replies with a RESV message. The Label Forwarding Information Base (LFIB) is populated using the RSVP labels allocated by the RESV messages.

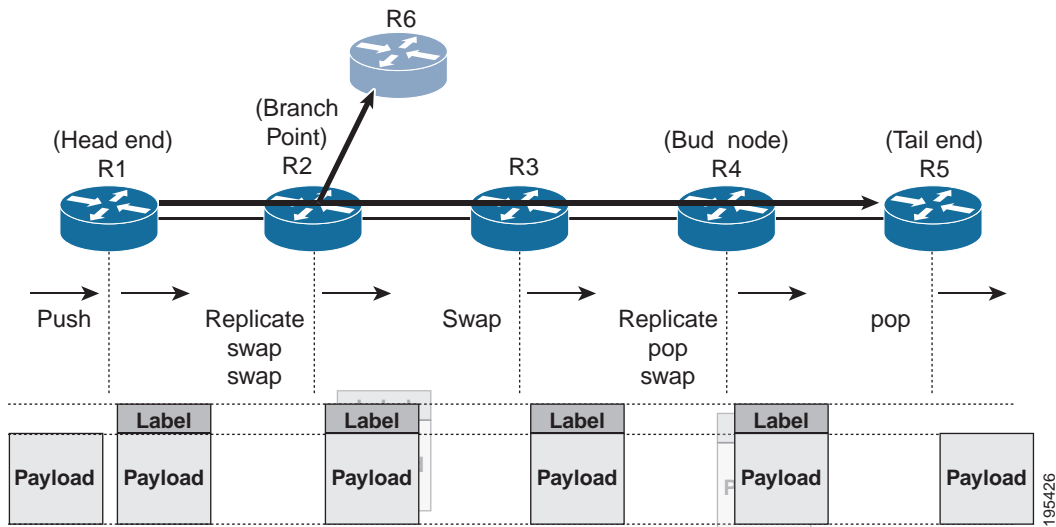

The tailend routers allocate unreserved labels, which are greater than 15 and do not include implicit or explicit null labels. Using unreserved labels allows IP Multicast to perform a Reverse Path Forwarding (RPF) check on the tailend router. Because a sub-LSP tailend router cannot be represented as a regular interface, a special LSP virtual interface (VIF) is automatically created. The LSP VIF represents the originating interface for all IP multicast traffic originating from the P2MP TE tailend router.

Figure 3 shows the LSP signaling process.

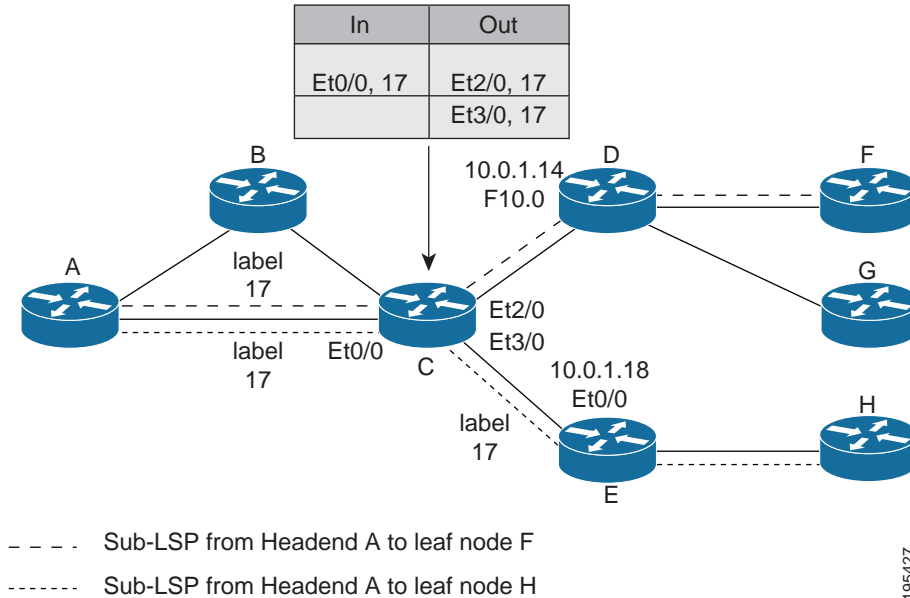

**Figure 3**      **How LSPs Are Signaled**

## How P2MP TE Traffic Is Forwarded

At the headend of the traffic engineering tunnel, through a static Internet Group Management Protocol (IGMP) group-to-tunnel mapping, IP multicast traffic is encapsulated with a unique MPLS label, which is associated with the P2MP TE tunnel. The multicast traffic is label switched in the P2MP tree and replicated at branch and bud nodes along the P2MP tree. When the labeled packet reaches the tailend (a PE router), the MPLS label is removed and forwarded to the IP multicast tree towards the end point. This process is shown in [Figure 4](#).

**Figure 4** How Packets Traverse the P2MP Tree

When sub-LSPs share a common router (branch point) and use the same ingress interface of the router, the same MPLS label is used for forwarding. The multicast state is built by reusing the MPLS labels at the branch points, as shown in Figure 5, where MPLS label 17 is shared by two sub-LSPs that both use router C.

**Figure 5** Reusing MPLS Labels in Branch Points

## Computing the IGP Path Using Dynamic Paths or Explicit Paths

You can either specify explicit paths or allow paths to be created dynamically. You can also specify bandwidth parameters, which are flooded throughout the MPLS network through existing RSVP-TE extensions to Open Shortest Path First (OSPF) and Integrated Intermediate System-to-Intermediate System (IS-IS).

The MPLS core network uses RSVP to enable end-to-end IP multicast connectivity. The tailend router and the end point router use PIM to exchange multicast routing information with directly connected CE routers. PIM is not configured in the MPLS core.

P2MP TE tunnels can co-exist with regular P2P TE tunnels. Existing path calculation and bandwidth preemption rules apply in this case.

You create IGP paths by enabling dynamic path computation, configuring explicit paths through CLI commands, or using both methods in your P2MP TE network.

- Dynamic paths are created using Constrained Shortest Path First (CSPF) to determine the best path to a destination. CSPF uses path constraints, such as bandwidth, affinities, priorities, and so on, as part of the computation.
- Explicit paths allows you to manually specify the path a sub-LSP uses from the headend router to the tailend router. You configure static paths on the headend router.

## Remerge Events

When explicit paths are configured with a limited number of equal cost links or paths, two sub-LSPs might connect at a midpoint router through different ingress interfaces, but use the same egress interface. This is called a remerge event, which can cause duplicate MPLS packets. If a router detects a remerge event, it sends a PathErr Routing Problem: Remerge Detected message toward the headend router and the sub-LSPs are not established. With dynamic paths, the router signals a path that avoids a remerge situation.

## Crossover Events

With a P2MP tunnel, two sibling sub-LSPs (sub-LSPs that share the same link and label) are said to “cross over” when they have different incoming interfaces and different outgoing interfaces on the same intersecting node. The sibling sub-LSPs neither share input label nor output bandwidth. Avoid configuring crossover LSPs, because they waste bandwidth. However, the duplication of sub-LSPs does not result in an error.

## Benefits of MPLS Point-to-Multipoint Traffic Engineering

The P2MP TE feature provides the following benefits:

- You can configure signaling attributes, such as affinities, administrative metrics, fast reroute protection, and bandwidth constraints, when you set up P2MP TE sub-LSPs.
- P2MP TE provides a single point of traffic control. You specify all the signaling and path parameters at the headend router.
- You can configure explicit paths to optimize traffic distribution.
- You can enable Fast Reroute link protection and bandwidth protection for P2MP TE sub-LSPs.
- Protocol Independent Multicast (PIM) is not needed in the MPLS core. Only the nonMPLS interfaces on the tailend routers need to be configured with PIM.

## MPLS Point-to-Multipoint Traffic Engineering—Re-optimizing Traffic

A P2MP TE tunnel is operational (up) when the first sub-LSP has been successfully signaled. The P2MP TE tunnel is not operational (down) when all sub-LSPs are down. Certain events can trigger a tunnel re-optimization:

- One of the sub-LSPs is fast-rerouted to a backup tunnel (for dynamic LSPs).
- A link is operational. (if the command **mpls traffic-eng reoptimize events link-up** is configured).
- A periodic, schedule optimization occurs through the **mpls traffic-eng reoptimize timers frequency** command.
- The network administrator forces a tunnel optimization through the **mpls traffic-eng reoptimize** command.
- A fast reroute protected interface becomes operational.
- A nonfast reroute LSP detects a remerge situation.

When a P2MP tunnel is reoptimized, a new LSP is signaled and traffic is moved to the new LSP.

To determine if a tunnel should be reoptimized, the router considers the following criteria:

- The router compares the number of reachable destinations between the new tree and current tree. If the new tree contains more reachable destinations than the current tree, the router performs a reoptimization. If the new tree contains fewer reachable destinations than the current tree, then the router keeps the current tree.
- The router verifies that the same set of reachable destinations in the current tree are also in the new tree. If the new tree does not contain the same destinations, the router keeps the current tree.
- The router compares the number of destinations in the new tree with the number of destinations in the old tree. If the number of destinations in the new tree is greater than the number of destinations in the current tree, the router switches to the new tree. This guarantees that the new tree will contain all of the existing destinations and more.
- The router compares the metric between the current and new tree to ensure the new tree and current tree contain the same set of reachable destinations.
- The router compares the administrative weights of the old tree and the new tree. The router switches to the new tree if the cumulative administrative weight is lower. This step applies as a tie breaker if all the other conditions are the same.

P2MP TE uses make-before-break reoptimization, which uses the following reoptimization process:

- The new LSP is signaled.
- The headend router initiates a timer to ensure sufficient time elapses before traffic moves from the current LSP to the new LSP.
- Traffic is redirected from the current LSP to the new LSP.
- The timer is started for the purpose of tearing down the old sub-LSPs.

## P2P TE Tunnels Coexist with P2MP TE Tunnels

Both P2P and P2MP TE tunnels share the following characteristics:

- Tunnel bandwidth is configured the same way in both P2P and P2MP tunnels. In P2MP TE tunnels, any bandwidth parameters you configure are applied to all the destination routers. That is, the bandwidth parameters apply to all sub-LSPs. Both P2P and P2MP TE tunnels use the same IGP extension to flood link bandwidth information throughout the network.
- Tunnel setup and hold priorities, attributes flags, affinity and mask, and administrative weight parameters are configured the same way for P2P and P2MP TE tunnels. P2MP TE tunnel parameters apply to all sub-LSPs.
- Fast Reroute-enabled P2MP sub-LSPs coexist with Fast Reroute-enabled P2P LSPs in a network. For P2P TE, node, link, and bandwidth protection is supported. For P2MP TE, only link and bandwidth protection are supported.
- The method of computing the path dynamically through CSPF is the same for P2P and P2MP TE.
- Auto-tunnel backup behaves slightly different with P2P and P2MP tunnels. With P2P tunnels, auto-tunnel backup creates two backup tunnels: one for the node protection and one for the link protection. The node protection backup is preferred for P2P LSP protection. With P2MP tunnels, auto-tunnel backup creates one backup tunnel, which is the link protection. Only the link protection backup can be used for P2MP sub-LSPs. The P2P and P2MP tunnels can coexist and be protected.

**Note**

If P2MP sub-LSPs are signaled from R1->R2->R3 and a P2P tunnel is signaled from R3->R2->R1, then issue the **mpls traffic-eng multicast-intact** command on R3 in IGP configuration mode under router OSPF or IS-IS to ensure to accommodate multicast traffic for R3's sub-LSPs.

## Using Fast Reroute to Protect P2MP TE Links

Fast Reroute applies to P2P LSPs and P2MP sub-LSPs in the same manner. No new protocol extensions are needed to support P2MP.

**Note**

For P2MP TE fast reroute protection, issue the **ip routing protocol purge interface** command on every penultimate hop router. Otherwise, the router can lose up to 6 seconds worth of traffic during a fast reroute cutover event.

Fast Reroute minimizes interruptions in traffic delivery as a result of link or node failure. FRR temporarily fast switches LSP traffic to a backup path around a network failure until the headend router signals a new end-to-end LSP.

Fast Reroute-enabled P2MP sub-LSPs coexist with Fast Reroute-enabled P2P LSPs in a network. For P2MP TE, only link and bandwidth protection is supported. Node, link, and bandwidth protection are supported for P2P TE.

You can configure P2P explicit backup tunnels on point of local repair (PLR) nodes for link protection of P2MP sub-LSPs, similar to LSPs for P2P TE tunnels. You can also enable automatic creation of backup tunnels using the Auto-tunnel Backup feature for P2P TE tunnels. All sibling sub-LSPs that share the same outgoing link are protected by the same backup tunnel. All cousin sub-LSPs that share the same outgoing link can be protected by multiple P2P backup tunnels.

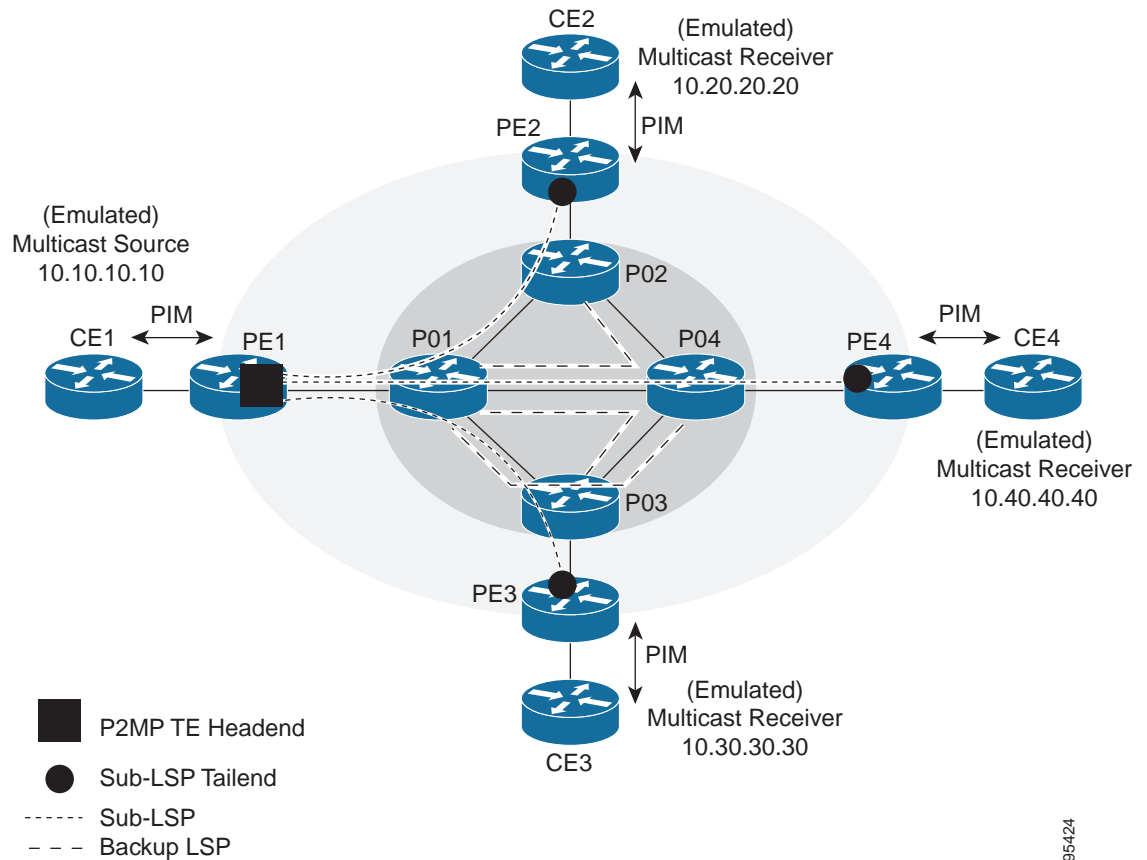

Link protection for a P2MP TE tunnel is illustrated in [Figure 6](#), which shows PE1 as the tunnel headend router and PE2, PE3, and PE4 as tunnel tailend routers. The following sub-LSPs are signaled from PE1 in the network:

- From PE1 to PE2, the sub-LSP travels the following path: PE1 -> P01 -> P02 -> PE2
- From PE1 to PE3, the sub-LSP travels the following path: PE1 -> P01 -> P03 -> PE3

- From PE1 to PE4, the sub-LSP travels the following path: PE1 -> P01 -> P04 -> PE4

Node P01 is a branch node that does packet replication in the MPLS forwarding plane; ingress traffic originating from PE1 will be replicated towards routers P02, P03, and P04.

**Figure 6 P2MP TE Link Protection Example**

To protect the three sub-LSPs, separate point-to-point backup tunnels are signaled. Note that backup tunnels can be created only for links that have an alternative network path. In this example, router P01 is the Point of Local Repair (PLR) and routers P02, P03, and P04 are Merge Points (MPs).

If a link failure occurs between routers P01 and P04, the following events are triggered:

- Router P01 switches traffic destined to PE4 to the backup tunnel associated with P04.
- Router P01 sends RSVP path error messages upstream to the P2MP TE headend router PE1. At the same time, P01 and P04 send IGP updates (link state advertisements (LSAs)) to all adjacent IGP neighbors, indicating that the interfaces associated with links P01 through P04 are down.
- Upon receiving RSVP path error messages and IGP LSA updates, the headend router triggers a P2MP TE tunnel reoptimization and signals a new sub-LSP. (This occurs if you have specified dynamic path creation.)

**Note**

If only one sub-LSP becomes active, it remains down until all the sub-LSPs become active.

## FRR Failure Detection Mechanisms

To detect link failures in a P2MP TE network, you can use native link and interface failure detection mechanisms, such as bidirectional forwarding detection (BFD), loss of signal (LoS) failure events, and RSVP hellos.

### Bidirectional Forwarding Detection

The MPLS Traffic Engineering: BFD-triggered Fast Reroute feature allows you to obtain link and node protection by using the Bidirectional Forwarding Detection (BFD) protocol to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. In addition to fast forwarding path failure detection, BFD provides a consistent failure detection method for network administrators. For more information, see [MPLS Traffic Engineering: BFD-triggered Fast Reroute \(FRR\)](#).

### Loss of Signal Failure Events

Fast Reroute can be triggered by loss of signal events. It is alarm based and dependent upon platform and line card support. For more information, see [MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#)

### RSVP Hellos

You can configure RSVP hellos on interfaces that do not provide FRR cutover notification during a link failure. The behavior for RSVP hellos is similar for both P2MP TE and P2P TE. For every sub-LSP that has a backup tunnel and has RSVP hellos enabled on its output interface, an RSVP hello instance is created to the neighbor, and the sub-LSP is added to the neighbor's FRR tree in the hello database.

Hello instances between an output interface and neighbor address are shared by fast reroutable P2MP sub-LSPs and P2P LSPs. When a hello session to a neighbor is declared down, all P2P LSPs and P2MP sub-LSPs that are protected by a backup LSP or sub-LSP are switched to their respective backups in the control and data planes.

RSVP hello sessions can also be used to inform the P2MP headend router of failures along a sub-LSP's path before the RSVP state for the sub-LSP times out, which leads to faster reoptimization. If a sub-LSP cannot select a backup tunnel but has RSVP hellos enabled on its output interface, it looks for a hello instance to its neighbor. If none exists, a hello state time (HST) hello instance is created. If the neighbor goes down, that sub-LSP is torn down. For more information, see [MPLS Traffic Engineering \(TE\) - Fast Reroute \(FRR\) Link and Node Protection](#).

## Bandwidth Preemption for P2MP TE

Bandwidth Admission Control and preemption mechanisms for P2MP TE sub-LSPs are the same as for LSPs associated with P2P TE tunnels. Any link affinities or constraints defined for the P2MP TE tunnel will be taken into account. The bandwidth signaled for the sub-LSP is removed from the appropriate pool at the appropriate priority, and if needed, lower priority sub-LSPs are preempted with a higher priority sub-LSP.

A P2MP tunnel can be configured to use sub-pool or global-pool bandwidth. When bandwidth is configured, all sub-LSPs of the P2MP tunnel are signaled with the same bandwidth amount and type. If the bandwidth amount or type of a P2MP tunnel is changed, the P2MP tunnel ingress always signals a new set of sub-LSPs (a new P2MP LSP) with the new bandwidth amount and type.

Preemption procedures do not take into account the tunnel type. The same priority rules apply to P2P LSPs and P2MP sub-LSPs. A sub-LSP with a higher setup priority preempts a (sub-)LSP with a lower hold priority, regardless of tunnel type. Thus, a P2MP sub-LSP may preempt a P2P LSP, and vice versa. The determination of which LSPs get preempted is based on hold priority.

You can configure a P2MP TE tunnel to use subpool or global-pool bandwidth. All sub-LSPs associated with the P2MP TE tunnel are signaled with the same bandwidth amount and type. If the bandwidth amount or type is changed, the P2MP tunnel headend router signals a new set of sub-LSPs with the new bandwidth parameters.

Bandwidth sharing is similar for P2MP TE sub-LSPs and P2P TE LSPs. When adding a new sub-LSP, the P2MP-TE headend router determines whether it should share bandwidth with the other sub-LSPs. Two sub-LSPs can share bandwidth as long as they are a “Transit Pair,” meaning the sub-LSPs share the output interface, next-hop and output label.

LSPs and sub-LSPs cannot share bandwidth if they use different bandwidth pools. A change in bandwidth requires reoptimizing P2P or P2MP TE tunnels, which may result in double-counting bandwidth on common links.

Using FRR with Bandwidth Protection has the following requirements:

- A backup tunnel is required to maintain the service level agreement while the new sub-LSP is created.
- The PLR router selects the backup tunnel only if the tunnel has enough bandwidth capacity.
- The backup tunnel might not signal bandwidth.
- The PLR router decides the best backup path to protect the primary path, based on backup bandwidth and class type.

## NSF/SSO Support for MPLS P2MP TE

NSF/SSO coexistence is supported with P2MP TE. State information associated with active P2MP tunnels and associated sub-LSPs is not checkpointed and cannot be recovered after a route processor (RP) failover. When a RP switchover is triggered through NSF/SSO, traffic going to P2MP TE tunnels is lost. P2MP TE sends RSVP path error messages upstream and RSVP RESV error messages downstream to tear down the affected P2MP sub-LSPs. The RSVP error message can also trigger a FRR switchover to backup paths, and the TE headend router can recalculate and resignal a new P2MP TE tunnel.

## How to Configure MPLS Point-to-Multipoint Traffic Engineering

Use the following procedures to configure the P2MP TE feature:

- [Configuring the Headend Routers, page 13](#) (required)
- [Configuring the Midpoint Routers, page 16](#) (required)
- [Configuring the Tailend Routers, page 17](#) (required)
- [Configuring Fast Reroute with P2MP TE Tunnels, page 19](#) (optional)
- [Enabling MPLS Traffic Engineering System Logging of Events, page 19](#) (optional)
- [Verifying the Configuration of MPLS Traffic Engineering Point-to-Multipoint Tunnels, page 19](#) (optional)

### Configuring the Headend Routers

The following steps explain how to configure the headend routers for Multicast and MPLS point-to-multipoint traffic engineering. As part of the configuration, you specify the tailend routers. You can also specify explicit paths that the tunnel should use or request that the paths be dynamically created or have a combination of dynamic and explicit paths.

Because the configuration of the P2MP TE tunnels is done at the headend router, this feature works best in situations where the destinations do not change often. The P2MP feature does not support dynamic grafting and pruning of sub-LSPs.

## Restrictions

- The **tunnel destination** command is not supported with point-to-multipoint traffic engineering tunnels. Instead, use the **mpls traffic-eng destination list** command.
- Multiple path options per sub-LSP (destination) are not supported. The P2MP TE feature allows one path option for each sub-LSP.
- The **tunnel mpls traffic-eng autoroute announce** command is not supported with this feature; it is supported only with IP unicast traffic.
- If P2MP sub-LSPs are signaled from R1->R2->R3 and a P2P tunnel is signaled from R3->R2->R1, then issue the **mpls traffic-eng multicast-intact** command on R3 in IGP configuration mode under router OSPF or IS-IS to ensure accommodate multicast traffic for R3's sub-LSPs.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng tunnels**
4. **ip multicast-routing** [**vrf** *vrf-name*] [**distributed**]
5. **interface tunnel** *number*
6. **tunnel mode mpls traffic-eng point-to-multipoint**
7. **tunnel destination list mpls traffic-eng** {**identifier** *dest-list-id* | **name** *dest-list-name*}
8. **ip igmp static-group** {**\*** | *group-address* [**source** {*source-address* | **ssm-map**}] | **class-map** *class-map-name*}
9. **ip pim** {**dense-mode** [**proxy-register** {**list** *access-list* | **route-map** *map-name*}] | **passive** | **sparse-mode** | **sparse-dense-mode**}
10. **exit**
11. **mpls traffic-eng destination list** {**name** *dest-list-name* | **identifier** *dest-list-id*}
12. **ip** *ip-address* **path-option** *id* {**dynamic** | **explicit** {**name** *name* | **identifier** *id*} [**verbatim**]}
13. **exit**
14. **ip explicit-path** {**name** *word* | **identifier** *number*} [**enable** | **disable**]
15. **next-address** [**loose** | **strict**] *ip-address*
16. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                  |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                           | Enters global configuration mode.                                                                                                                                                                        |
| Step 3 | <b>mpls traffic-eng tunnels</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng tunnels                                                                                                                                                                       | Globally enables MPLS Traffic Engineering. <ul style="list-style-type: none"> <li>Also issue this command on each network interface that supports a traffic engineering tunnel.</li> </ul>               |
| Step 4 | <b>ip multicast-routing</b> [vrf <i>vrf-name</i> ]<br>[ <i>distributed</i> ]<br><br><b>Example:</b><br>Router(config)# ip multicast-routing                                                                                                                              | Globally enables IP multicast routing.                                                                                                                                                                   |
| Step 5 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 100                                                                                                                                                                     | Configures a tunnel and enters interface configuration mode.                                                                                                                                             |
| Step 6 | <b>tunnel mode mpls traffic-eng</b><br><b>point-to-multipoint</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng point-to-multipoint                                                                                                          | Enables MPLS point-to-multipoint traffic engineering on the tunnel.                                                                                                                                      |
| Step 7 | <b>tunnel destination list mpls traffic-eng</b><br>{ <i>identifier</i> <i>dest-list-id</i>   <i>name</i> <i>dest-list-name</i> }<br><br><b>Example:</b><br>Router(config-if)# tunnel destination list mpls traffic-eng name in-list-01                                   | Specifies a destination list to specify the IP addresses of point-to-multipoint destinations.                                                                                                            |
| Step 8 | <b>ip igmp static-group</b> { <i>*</i>   <i>group-address</i> [ <i>source</i> { <i>source-address</i>   <i>ssm-map</i> }]}   <b>class-map</b> <i>class-map-name</i><br><br><b>Example:</b><br>Router(config-if)# ip igmp static-group 239.100.100.101 source 10.11.11.11 | Configures static group membership entries on an interface. <ul style="list-style-type: none"> <li>Configure this on the TE tunnel interface if the source address (S, G) cannot be resolved.</li> </ul> |

|         | Command or Action                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                        |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <pre>ip pim {dense-mode [proxy-register {list access-list   route-map map-name}]   passive   sparse-mode   sparse-dense-mode}</pre> <p><b>Example:</b><br/>Router(config-if)# ip pim passive</p>   | <p>Enable Protocol Independent Multicast (PIM) on an interface.</p> <ul style="list-style-type: none"> <li>An interface configured with passive mode does not pass or forward PIM control plane traffic; it passes or forwards only IGMP traffic.</li> </ul>                                                                   |
| Step 10 | <pre>exit</pre> <p><b>Example:</b><br/>Router(config-if)# exit</p>                                                                                                                                 | Exits interface configuration mode.                                                                                                                                                                                                                                                                                            |
| Step 11 | <pre>mpls traffic-eng destination list {name dest-list-name   identifier dest-list-id}</pre> <p><b>Example:</b><br/>Router(config)# mpls traffic-eng destination<br/>list name in-list-01</p>      | Creates a destination list and enters traffic engineering destination list configuration mode.                                                                                                                                                                                                                                 |
| Step 12 | <pre>ip ip-address path-option id {dynamic   explicit {name name   identifier id} [verbatim]}</pre> <p><b>Example:</b><br/>Router (cfg-te-dest-list)# ip 10.10.10.10<br/>path-option 1 dynamic</p> | <p>Specifies the IP addresses of MPLS point-to-multipoint traffic engineering tunnel destinations.</p> <ul style="list-style-type: none"> <li>If you use the <b>explicit</b> keyword, you must configure explicit paths, using the <b>ip explicit-path</b> command.</li> <li>Repeat this step for each destination.</li> </ul> |
| Step 13 | <pre>exit</pre> <p><b>Example:</b><br/>Router (cfg-te-dest-list)# exit</p>                                                                                                                         | Exits traffic engineering destination list configuration mode.                                                                                                                                                                                                                                                                 |
| Step 14 | <pre>ip explicit-path {name word   identifier number} [enable   disable]</pre> <p><b>Example:</b><br/>Router(config)# ip explicit-path name path1<br/>enable</p>                                   | Specifies the name of an IP explicit path and enters ip explicit path command mode command mode.                                                                                                                                                                                                                               |
| Step 15 | <pre>next-address [loose   strict] ip-address</pre> <p><b>Example:</b><br/>Router(cfg-ip-expl-path)# next-address 10.0.0.2</p>                                                                     | Specifies an explicit path that includes only the addresses specified or loose explicit paths.                                                                                                                                                                                                                                 |
| Step 16 | <pre>end</pre> <p><b>Example:</b><br/>Router(cfg-ip-expl-path)# end</p>                                                                                                                            | Exits the current configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                                      |

## Configuring the Midpoint Routers

No special configuration is needed to support P2MP TE on the midpoint routers. The midpoint routers must have Cisco IOS Release 12.2(33)SRE or later release installed. They must be able to support and implement the P2MP signaling extensions. The MPLS TE configuration of the midpoint routers supports both P2P and P2MP TE. All multicast traffic is label switched. The midpoint routers do not require IPv4 multicast routing or PIM. For information on configuring MPLS TE, see [MPLS Traffic Engineering and Enhancements](#).

## Configuring the Tailend Routers

The tailend routers remove the MPLS labels from the IP multicast packets and send the packets to the MFIB for regular multicast forwarding processing. You must issue the **ip mroute** command to configure a static route back to the headend router, thus enabling RPF checks.

The following task explains how to configure PIM on the egress interface of the PE router. PIM is needed when the egress PE router is connected to a CE router, which is connected to a LAN where one or more multicast receivers are connected.

If the egress PE router is directly connected to a decoder device/system (e.g., DCM), you must configure Internet Group Management Protocol (IGMP) on the egress interface of the PE router. For more information on configuring IGMP, see [Customizing IGMP](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip multicast-routing** [**vrf** *vrf-name*] [**distributed**]
4. **ip multicast mpls traffic-eng** [**range** *access-list-number* | *access-list-name*]
5. **interface** *type slot/port*  
or  
**interface** *type slot/port-adapter/port*

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 3 | <b>ip multicast-routing</b> [ <i>vrf vrf-name</i> ]<br>[ <i>distributed</i> ]<br><br><b>Example:</b><br>Router(config)# ip multicast-routing                                                                                                                        | Enables IP multicast routing globally.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 4 | <b>ip multicast mpls traffic-eng</b> [ <i>range</i><br><i>access-list-number</i>   <i>access-list-name</i> ]<br><br><b>Example:</b><br>Router(config)# ip multicast mpls traffic-eng                                                                                | Enables IP multicast routing for MPLS traffic engineering point-to-multipoint tunnels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 5 | <b>interface type slot/port</b><br><br>or<br><br><b>interface type slot/port-adapter/port</b><br><br><b>Example:</b><br>Router(config)# interface ethernet 1/1<br>or<br>Router(config)# interface fastethernet 1/0/0                                                | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>type</i> argument specifies the type of interface to be configured.</li> <li>The <i>slot/</i> argument specifies the slot number. Refer to the appropriate hardware manual for slot and port information.</li> <li>The <i>port</i> argument specifies the port number. Refer to the appropriate hardware manual for slot and port information.</li> <li>The <i>port-adapter/</i> argument specifies the port adapter number. Refer to the appropriate hardware manual for information about port adapter compatibility.</li> </ul> |
| Step 6 | <b>ip pim</b> { <i>dense-mode</i> [ <i>proxy-register</i> { <i>list</i><br><i>access-list</i>   <i>route-map map-name</i> }]}   <b>passive</b>  <br><i>sparse-mode</i>   <i>sparse-dense-mode</i> }<br><br><b>Example:</b><br>Router(config-if)# ip pim ssm default | Enables Protocol Independent Multicast (PIM) on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                                                                                                       | Exits interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|        | Command or Action                                                                                                                                                                                                                                             | Purpose                                                                                       |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| Step 8 | <pre>ip mroute [vrf vrf-name] source-address mask {fallback-lookup {global   vrf vrf-name}   rpf-address   interface-type interface-number} [distance]</pre> <p><b>Example:</b><br/>Router(config)# ip mroute 10.10.10.10<br/>255.255.255.255 10.11.11.11</p> | Configures a static multicast route (mroute) to the headend router, thus enabling RPF checks. |
| Step 9 | <pre>end</pre> <p><b>Example:</b><br/>Router(config)# end</p>                                                                                                                                                                                                 | (Required) Exits the current configuration mode and returns to privileged EXEC mode.          |

## Configuring Fast Reroute with P2MP TE Tunnels

To enable link protection for sub-LSPs associated with a P2MP TE tunnel, perform the following configuration tasks:

- Enable Fast Reroute on the headend router for each P2MP TE Tunnel.
- Configure P2P backup tunnels for network interfaces that require protection.

See [MPLS Traffic Engineering—Fast Reroute Link and Node Protection](#) for information and configuration instructions.

## Enabling MPLS Traffic Engineering System Logging of Events

MPLS Traffic Engineering system logging allows you to view the following events:

- Setting up and tearing down of LSPs
- RSVP Path and RESV requests
- Sub-LSP status (through path-change messages)

Commands to enable system logging include:

- `mpls traffic-eng logging lsp path-errors`
- `mpls traffic-eng logging lsp preemption`
- `mpls traffic-eng logging lsp reservation-errors`
- `mpls traffic-eng logging lsp setups`
- `mpls traffic-eng logging lsp teardowns`
- `mpls traffic-eng logging tunnel path change`

## Verifying the Configuration of MPLS Traffic Engineering Point-to-Multipoint Tunnels

This section includes the following tasks:

- [Verifying the Configuration of the Headend Router, page 20](#)

- [Verifying the Configuration of the Midpoint Routers, page 22](#)
- [Verifying the Configuration of the Tailend Routers, page 23](#)

## Verifying the Configuration of the Headend Router

At the headend router, use the following steps to verify that:

- All sub-LSPs are enabled.
- IP multicast traffic is being forwarded onto the P2MP TE tunnel.

The following commands may also be helpful in the verification of the headend router:

- **show cef path set** and **show cef path set detail** (when the headend router is also a branch point)
- **show ip mfib** and **show ip mfib verbose**
- **show ip rsvp fast-reroute**
- **show mpls traffic-eng destination list**
- **show mpls traffic-eng fast-reroute database**
- **show mpls traffic-eng tunnels** with the **dest-mode p2mp**, **detail**, and **summary** keywords

## SUMMARY STEPS

1. **enable**
2. **show mpls traffic-eng tunnels brief**
3. **show mpls traffic-eng forwarding path-set brief**
4. **show mpls traffic-eng forwarding path-set detail**
5. **show ip mroute**

## DETAILED STEPS

### Step 1 enable

Issue the **enable** command to enter privileged EXEC mode.

### Step 2 show mpls traffic-eng tunnels brief

Use the **show mpls traffic-eng tunnels brief** command to display the P2MP TE tunnels originating from the headend router. For example:

```
Router# show mpls traffic-eng tunnels brief
```

```
signaling Summary:
```

```
  LSP Tunnels Process:      running
  Passive LSP Listener:     running
  RSVP Process:             running
  Forwarding:               enabled
  Periodic reoptimization:  every 60 seconds, next in 5 seconds
  Periodic FRR Promotion:   Not Running
  Periodic auto-bw collection: disabled
```

```
P2P TUNNELS:
```

| TUNNEL NAME | DESTINATION | UP IF | DOWN IF | STATE/PROT |
|-------------|-------------|-------|---------|------------|
| p2p-LSP     | 10.2.0.1    | -     | Se2/0   | up/up      |

```
Displayed 2 (of 2) heads, 0 (of 0) midpoints, 0 (of 0) tails
```

P2MP TUNNELS:

| INTERFACE | STATE/PROT | UP/CFG | DEST<br>TUNID | CURRENT<br>LSPID |
|-----------|------------|--------|---------------|------------------|
| Tunnel2   | up/up      | 3/10   | 2             | 1                |
| Tunnel5   | up/down    | 1/10   | 5             | 2                |

Displayed 2 (of 2) P2MP heads

P2MP SUB-LSPS:

| SOURCE          | TUNID | LSPID | DESTINATION     | SUBID | ST UP IF | DOWN IF |
|-----------------|-------|-------|-----------------|-------|----------|---------|
| 10.1.0.1        | 2     | 1     | 10.2.0.1        | 1     | up head  | Se2/0   |
| 10.1.0.1        | 2     | 1     | 10.3.0.199      | 2     | up head  | Et2/0   |
| 10.1.0.1        | 2     | 1     | 19.4.0.1        | 2     | up head  | s2/0    |
| 10.1.0.1        | 2     | 2     | 1 9.4.0.1       | 2     | up head  | s2/0    |

| 100.100.100.100 | 1     | 3     | 200.200.200.200 | 1     | up ge2/0 | s2/0    |
| 100.100.100.100 | 1     | 3     | 10.1.0.1        | 1     | up e2/0  | tail    |

Displayed 7 P2MP sub-LSPs:  
5 (of 5) heads, 1 (of 1) midpoints, 1 (of 1) tails

### Step 3 show mpls traffic-eng forwarding path-set brief

Use the **show mpls traffic-eng forwarding path-set brief** command to show the sub-LSPs that originate from the headend router. The following example shows three sub-LSPs originating at the headend router and going to different destinations. All the sub-LSPs belong to the same path set, which is a collection of paths. The path set is given a unique ID, which is shown in the PSID column of the example:

Router# **show mpls traffic-eng forwarding path-set brief**

| Sub-LSP Identifier<br>src_lspid[subid]->dst_tunid | InLabel | Next Hop | I/F   | PSID     |
|---------------------------------------------------|---------|----------|-------|----------|
| 10.0.0.1_19[16]->10.0.0.8_1                       | none    | 10.0.1.2 | Et0/0 | C5000002 |
| 10.0.0.1_19[27]->10.0.0.6_1                       | none    | 10.0.1.2 | Et0/0 | C5000002 |
| 10.0.0.1_19[31]->10.0.0.7_1                       | none    | 10.0.1.2 | Et0/0 | C5000002 |

### Step 4 show mpls traffic-eng forwarding path-set detail

Use the **show mpls traffic-eng forwarding path-set detail** command to show more information about the sub-LSPs that originate from the headend router. For example:

Router# **show mpls traffic-eng forwarding path-set detail**

```
LSP: Source: 10.1.0.1, TunID: 100, LSPID: 7
  Destination: 10.2.0.1, P2MP Subgroup ID: 1
    Path Set ID: 0x30000001
    OutLabel : Serial2/0, 16
    Next Hop : 10.1.3.2
    FRR OutLabel : Tunnel666, 16

LSP: Source: 10.1.0.1, TunID: 100, LSPID: 7
  Destination: 10.3.0.1, P2MP Subgroup ID: 2
    Path Set ID: 0x30000001
    OutLabel : Serial2/0, 16
    Next Hop : 10.1.3.2
    FRR OutLabel : Tunnel666, 16
```

### Step 5 show ip mroute

Use the **show ip mroute** command to verify that IP multicast traffic is being forwarded to the P2MP TE tunnel. In the following example, the output shown in bold shows that Tunnel 1 is part of the outgoing interface list for multicast group 232.0.1.4 with a source address of 10.10.10.10:

```

Router# show ip mroute

IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
       L - Local, P - Pruned, R - RP-bit set, F - Register flag,
       T - SPT-bit set, J - Join SPT, M - MSDP created entry, E - Extranet,
       X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
       U - URD, I - Received Source Specific Host Report,
       Z - Multicast Tunnel, z - MDT-data group sender,
       Y - Joined MDT-data group, y - Sending to MDT-data group,
       V - RD & Vector, v - Vector
Outgoing interface flags: H - Hardware switched, A - Assert winner
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

(10.10.10.10, 232.0.1.4), 1d00h/stopped, flags: sTI
  Incoming interface: Ethernet2/0, RPF nbr 10.10.1.1
  Outgoing interface list:
    Tunnel1, Forward/Sparse-Dense, 1d00h/00:01:17

(*, 224.0.1.40), 1d00h/00:02:48, RP 0.0.0.0, flags: DCL
  Incoming interface: Null, RPF nbr 0.0.0.0
  Outgoing interface list:
    Ethernet2/0, Forward/Sparse, 1d00h/00:02:48

```

## Verifying the Configuration of the Midpoint Routers

At the midpoint router, use the following commands to verify that MPLS forwarding occurs. If the midpoint router is branch router, you can also use **show mpls forwarding-table labels** command to display show specific labels.

### SUMMARY STEP

1. **enable**
2. **show mpls forwarding-table**

### DETAILED STEP

#### Step 1 **enable**

Issue the **enable** command to enter privileged EXEC mode.

#### Step 2 **show mpls forwarding-table**

Use the **show mpls forwarding-table** command to show that MPLS packets are switched at the midpoint routers. For example:

```
Router# show mpls forwarding-table
```

| Local Label | Outgoing Label | Prefix or Tunnel Id | Bytes Switched | Label | Outgoing interface | Next Hop  |
|-------------|----------------|---------------------|----------------|-------|--------------------|-----------|
| 16          | 16             | 10.0.0.1 1 [19]     | 0              |       | Et1/0              | 10.0.1.30 |

```
Router# show mpls forwarding-table detail
```

| Local Label                                 | Outgoing Label | Prefix or Tunnel Id | Bytes Switched | Label | Outgoing interface | Next Hop  |
|---------------------------------------------|----------------|---------------------|----------------|-------|--------------------|-----------|
| 16                                          | 16             | 10.0.0.1 1 [19]     | 0              |       | Et1/0              | 10.0.1.30 |
| MAC/Encaps=14/18, MRU=1500, Label Stack{16} |                |                     |                |       |                    |           |
| AABBCC032800AABBCC0325018847 00010000       |                |                     |                |       |                    |           |

```
No output feature configured
Broadcast
```

## Verifying the Configuration of the Tailend Routers

At the tailend router, use the following steps to verify that:

- MPLS forwarding occurs.
- IP Multicast forwarding occurs.

You can also use the **show ip mfib**, **show mpls traffic-eng destination list**, and **show mpls traffic-eng tunnels dest-mode p2mp** commands for verification.

### SUMMARY STEPS

1. **enable**
2. **show mpls forwarding-table**
3. **show ip mroute**

### DETAILED STEPS

#### Step 1 **enable**

Issue the **enable** command to enter privileged EXEC mode.

#### Step 2 **show mpls forwarding-table**

Use the **show mpls forwarding-table** command to show that MPLS labeled packets are forwarded from the tailend router without any label.

```
Router# show mpls forwarding-table
```

| Local Label | Outgoing Label | Prefix or Tunnel Id | Bytes Label Switched | Outgoing interface | Next Hop |
|-------------|----------------|---------------------|----------------------|--------------------|----------|
| 17          | [T] No Label   | 10.0.0.1 1 [19]     | 342                  | aggregate          |          |

```
[T] Forwarding through a LSP tunnel.
```

```
Router# show mpls forwarding-table detail
```

| Local Label | Outgoing Label | Prefix or Tunnel Id | Bytes Label Switched | Outgoing interface | Next Hop |
|-------------|----------------|---------------------|----------------------|--------------------|----------|
| 17          | No Label       | 10.0.0.1 1 [19]     | 342                  | aggregate          |          |

MAC/Encaps=0/0, MRU=0, Label Stack{}, via Ls0

#### Step 3 **show ip mroute**

Use the **show ip mroute** command to display IP multicast traffic. In the following example, the output in bold shows the incoming interface is Lspvif0 and the outgoing interface is Ethernet1/0 is for multicast group 232.0.1.4 with source address 10.10.10.10:

```
Router# show ip mroute
```

```
IP Multicast Routing Table
```

```
...
```

```
(*, 232.0.1.4), 1d02h/stopped, RP 0.0.0.0, flags: SP
Incoming interface: Null, RPF nbr 0.0.0.0
```

```
Outgoing interface list: Null

(10.10.10.10, 232.0.1.4), 00:01:51/00:01:38, flags:
  Incoming interface: Lspvif0, RPF nbr 10.0.0.1, Mroute
  Outgoing interface list:
    Ethernet1/0, Forward/Sparse, 00:01:51/00:02:37

(*, 224.0.1.40), 1d02h/00:02:57, RP 0.0.0.0, flags: DCL
  Incoming interface: Null, RPF nbr 0.0.0.0
  Outgoing interface list:
    Ethernet1/0, Forward/Sparse, 1d02h/00:02:57
```

## Configuration Examples for MPLS Point-to-Multipoint Traffic Engineering

The following examples show point-to-multipoint traffic engineering configurations on the headend router (PE5), a midpoint router (P1), and a tailend router (PE1):

- [Configuration of the Headend Router \(PE5\): Example, page 25](#)
- [Configuration of the Midpoint Router \(P1\): Example, page 28](#)
- [Configuration of the Tailend Router \(PE1\): Example, page 29](#)

**Figure 7**      **Sample MPLS TE P2MP TE Topology**

## Configuration of the Headend Router (PE5): Example

In the following example configuration of the headend router, note the following:

- IPv4 multicast routing is enabled with the **ip multicast-routing** command.
- Two destination lists are specified, one for dynamic paths and one for explicit paths. The destination list specifies one path-option per destination.
- The **tunnel mode mpls traffic-eng point-to-multipoint** command enables the P2MP tunnel.
- On the tunnel interfaces, the **ip pim passive** command is used.
- On the non-MPLS interfaces, the **ip pim sparse-mode** command is used.
- The **ip igmp static-group** commands map the multicast groups to the P2MP tunnel.
- Fast Reroute is enabled on the router, with tunnel 3 as the backup path. An explicit path called PE5->P1-BKUP provides the alternative path.

## Configuration of the Midpoint Router (P1): Example

In the following example configuration of the midpoint router, note the following:

- MPLS Traffic Engineering is enabled both globally and on the interface connecting to other core routers.
- MPLS TE extensions are enabled through the **mpls traffic-eng router-id** and **mpls traffic-eng level** commands.

```

## Glossary

**Branch router**—An router that has more than one directly connected downstream routers. A router where packet replication occurs.

**Bud router**— An egress router that has one or more directly connected downstream routers. A bud node can be a branch node and a destination.

**Crossover**—A condition that occurs at an intersecting node when two or more incoming sub-LSPs that belong to the same LSP have different input interfaces and different output interfaces.

**Egress router**— One of potentially many destinations of the P2MP TE sub-LSP. Egress routers may also be referred to as tailend routers, leaf nodes, or leaves.

**Data Duplication**—A condition that occurs when an egress router receives duplicate packets. The condition can happen as a result of re-optimization of LSPs, remerge, or crossover. It causes network bandwidth to be wasted and should be minimized.

**Grafting**— The process of adding a new sub-LSP to a P2MP TE tunnel.

**Headend router**— An Ingress PE router that is at the “headend” of a P2MP tunnel.

**Ingress router**— The router that initiates the signaling messages that set up the P2MP TE LSP. Also known as the headend router.

**MDT**— A Multicast Domain/Distribution tree in the core which carries traffic and/or control messages for a given VPN. An MDT implicitly implies that we are discussing the Domain-Model. And MDT can have multiple types of encapsulation in the core, e.g. GRE, IP-in-IP or MPLS.

**MFI**— MPLS Forwarding Infrastructure

**P2MP ID (P2ID)**— A unique identifier of a P2MP TE LSP, which is constant for the whole LSP regardless of the number of branches and/or leaves.

**P2MP LSP**—one or more source to leaf sub-LSPs. It is identified by 5-tuple key:

Session

- P2MP ID
- Tunnel ID
- Extended Tunnel ID

Sender Template

- Tunnel sender address
- LSP ID

**P2MP Sub-LSP**—A segment of a P2MP TE LSP that runs from the headend router to one destination. A sub-LSP is identified by the following 7-tuple key:

P2MP session

- P2MP ID
- Tunnel ID
- Extended Tunnel ID

Sender Template

- Tunnel sender address
- LSP ID
- Sub Group ID originator
- Sub Group ID

**P2MP-TE**—Point to Multipoint Traffic Engineering

**P2MP tree**— The ordered set of routers and TE links that comprise the paths of P2MP TE sub-LSPs from the ingress router to all of the egress routers.

**P2MP tunnel**—A group of one or more P2MP LSPs. A tunnel has the following 3-tuple key:

- P2MP ID
- Tunnel ID
- Extended Tunnel ID.

**PIM**—Protocol Independent Multicast

**PIM-SM**—PIM Sparse Mode, see RFC 4601

**PIM-SSM**—PIM Source Specific Multicast, a subset of PIM-SM. See RFC 4601.

**Pruning**—The process of removing a sub-LSP from a P2MP LSP.

**Receiver**— A recipient of traffic carried on a P2MP service supported by a P2MP sub-LSP. A receiver is not necessarily an egress router of the P2MP LSP. Zero, one, or more receivers may receive data through a given egress router.

**Remerge**—A condition that occurs at an intersecting node when two data streams belonging to the same P2MP LSP merge into onto one data stream as they exit the intersecting node.

**Sibling LSP**—Two LSPs that belong to the same P2MP tunnel, meaning that the session objects are the same for both LSPs.

**Sibling sub-LSP**—Two sub-LSPs that belong to the same P2MP LSP, meaning that the session and sender template objects are the same for both sub-LSPs.

**Source**—The sender of traffic that is carried on a P2MP service supported by a P2MP LSP. The sender is not necessarily the ingress router of the P2MP LSP.

**Tailend router**— An Egress PE router that is at the “tailend” of a P2MP tunnel.

# Feature Information for MPLS Point-to-Multipoint Traffic Engineering

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Point-to-Multipoint Traffic Engineering

## **MPLS Traffic Engineering: DiffServ**

## MPLS Traffic Engineering - DiffServ Aware (DS-TE)

---

This guide presents extensions made to Multiprotocol Label Switching Traffic Engineering (MPLS TE) that make it DiffServ aware. Specifically, the bandwidth reservable on each link for constraint-based routing (CBR) purposes can now be managed through at least two bandwidth pools: a *global pool* (also called BC0) and a *sub-pool* (also called BC1). The sub-pool can be limited to a smaller portion of the link bandwidth. Tunnels using the sub-pool bandwidth can then be used in conjunction with MPLS Quality of Service (QoS) mechanisms to deliver guaranteed bandwidth services end-to-end across the network.

Beginning with Cisco IOS Release 12.2(33)SRB, DS-TE has been augmented to conform to IETF standards that were developed after the initial creation of Cisco DS-TE. Now both the traditional and the IETF versions of DS-TE can be run on your network; the new releases are backwards compatible.

## Background and Overview

MPLS traffic engineering allows constraint-based routing (CBR) of IP traffic. One of the constraints satisfied by CBR is the availability of required bandwidth over a selected path. DiffServ-aware Traffic Engineering extends MPLS traffic engineering to enable you to perform constraint-based routing of “guaranteed” traffic, which satisfies a more restrictive bandwidth constraint than that satisfied by CBR for regular traffic. The more restrictive bandwidth is termed a *sub-pool*, while the regular TE tunnel bandwidth is called the *global pool*. (The sub-pool is a portion of the global pool. In the new IETF-Standard, the global pool is called BC0 and the sub-pool is called BC1. These are two of an

eventually available eight Class Types). This ability to satisfy a more restrictive bandwidth constraint translates into an ability to achieve higher Quality of Service performance in terms of delay, jitter, or loss for the guaranteed traffic.

For example, DS-TE can be used to ensure that traffic is routed over the network so that, on every link, there is never more than 40 per cent (or any assigned percentage) of the link capacity of guaranteed traffic (for example, voice), while there can be up to 100 per cent of the link capacity of regular traffic. Assuming that QoS mechanisms are also used on every link to queue guaranteed traffic separately from regular traffic, it then becomes possible to enforce separate “overbooking” ratios for guaranteed and regular traffic. In fact, for the guaranteed traffic it becomes possible to enforce no overbooking at all—or even an underbooking—so that very high QoS can be achieved end-to-end for that traffic, even while for the regular traffic a significant overbooking continues to be enforced.

Also, through the ability to enforce a maximum percentage of guaranteed traffic on any link, the network administrator can directly control the end-to-end QoS performance parameters without having to rely on over-engineering or on expected shortest path routing behavior. This is essential for transport of applications that have very high QoS requirements such as real-time voice, virtual IP leased line, and bandwidth trading, where over-engineering cannot be assumed everywhere in the network.

The new IETF-Standard functionality of DS-TE expands the means for allocating constrained bandwidth into two distinct models, called the “Russian Dolls Model” and the “Maximum Allocation Model”. They differ from each other as follows:

**Table 1** *Bandwidth Constraint Model Capabilities*

| MODEL                     | Achieves Bandwidth Efficiency | Ensures Isolation across Class Types |                         | Protects against QoS Degradation... |                             |
|---------------------------|-------------------------------|--------------------------------------|-------------------------|-------------------------------------|-----------------------------|
|                           |                               | When Preemption is Not Used          | When Preemption is Used | ...of the Premium Class Type        | ...of all other Class Types |
| <b>Maximum Allocation</b> | Yes                           | Yes                                  | Yes                     | Yes                                 | No                          |
| <b>Russian Dolls</b>      | Yes                           | No                                   | Yes                     | Yes                                 | Yes                         |

Therefore in practice, a Network Administrator might prefer to use:

- the Maximum Allocation Model when s/he needs to ensure isolation across all Class Types without having to use pre-emption, and s/he can afford to risk some QoS degradation of Class Types other than the Premium Class.
- the Russian Dolls Model when s/he needs to prevent QoS degradation of all Class Types and can impose pre-emption.

DS-TE involves extending OSPF (Open Shortest Path First routing protocol), so that the available sub-pool or class-type bandwidth at each preemption level is advertised in addition to the available global pool bandwidth at each preemption level. And DS-TE modifies constraint-based routing to take this more complex advertised information into account during path computation.

With the addition of IETF-Standard functionality (beginning with Cisco IOS Release 12.2(33)SRB), networks may accomplish DS-TE in three different combinations or “modes”, so that they may transition to the IETF-Standard formats in a manner that will not degrade their ongoing traffic service. These three situations or modes are summarized as follows:

1. **The original, or “Traditional” (pre-IETF-Standard) mode.** This describes networks that already operate the form of DS-TE that was introduced by Cisco a few years ago. Such networks can continue to operate in this traditional mode, even when they use the new Release 12.2(33)SRB and subsequent releases.
2. **The “Migration” or combination mode.** Networks already running traditional DS-TE that would like to upgrade to the IETF-Standard should first configure their routers into the Migration mode. This will allow them to continue to operate DS-TE without tunnels being torn down. In Migration mode, routers will continue to generate IGP and tunnel signalling as in the Traditional form, but now these routers will add TE-class mapping and will accept advertisement in both the Traditional and the new IETF-Standard formats.
3. **The “Liberal IETF” mode.** Networks already running in the Migration mode can then move into IETF formats by reconfiguring their routers into this flexible (hence “Liberal”) combination: their routers will henceforth generate IGP advertisement and tunnel signalling according to the new IETF Standard, but they will remain capable of accepting advertisement in the Traditional format, as well as in the new IETF format.

Table 2 summarizes these distinctions among the three modes.

**Table 2** *Summary of DS-TE Mode behaviors*

| MODE                | Uses<br>TE-class<br>mapping | Generates            |                       | Processes                |                       |
|---------------------|-----------------------------|----------------------|-----------------------|--------------------------|-----------------------|
|                     |                             | IGP<br>Advertisement | RSVP-TE<br>Signalling | IGP<br>Advertisement     | RSVP-TE<br>Signalling |
| <b>Traditional</b>  | No                          | traditional          | traditional           | traditional <sup>1</sup> | traditional           |
| <b>Migration</b>    | Yes                         | traditional          | traditional           | traditional &<br>IETF    | traditional &<br>IETF |
| <b>Liberal IETF</b> | Yes                         | IETF                 | traditional &<br>IETF | traditional &<br>IETF    | traditional &<br>IETF |

<sup>1</sup>Note that it is not possible for the Traditional mode to be liberal in what it accepts in terms of IGP, since it does not use TE-Class mapping and therefore cannot interpret the “Unreserved Bandwidth” in the IETF-compliant way when the Subpool Sub-TLV is absent.

## Benefits

DiffServ-aware Traffic Engineering enables service providers to perform separate admission control and separate route computation for discrete subsets of traffic (for example, voice and data traffic).

Therefore, by combining DS-TE with other IOS features such as QoS, the service provider can:

- Develop QoS services for end customers based on *signaled* rather than *provisioned* QoS
- Build the higher-revenue generating “strict-commitment” QoS services, without over-provisioning

- Offer virtual IP leased-line, Layer 2 service emulation, and point-to-point guaranteed bandwidth services including voice-trunking
- Enjoy the scalability properties offered by MPLS.

## Related Features and Technologies

The DS-TE feature is related to OSPF, IS-IS, RSVP (Resource reSerVation Protocol), QoS, and MPLS traffic engineering. Cisco documentation for all of these features is listed in the next section.

## Related Documents

The following sections provide references related to the MPLS Traffic Engineering—DiffServ Aware (DS-TE) feature:

## Supported Standards

The traditional (pre-IETF Standard) version of DiffServ-aware MPLS Traffic Engineering conforms to the descriptions given in the following two documents:

- *Requirements for Support of Diff-Serv-aware MPLS Traffic Engineering* by F. Le Faucheur, T. Nadeau, A. Chiu, W. Townsend, D. Skalecki & M. Tatham
- *Protocol Extensions for Support of Diff-Serv-aware MPLS Traffic Engineering* by F. Le Faucheur, T. Nadeau, J. Boyle, K. Kompella, W. Townsend & D. Skalecki.

The IETF Standard for DiffServ-aware MPLS Traffic Engineering is described in the following four documents:

- [Multi-Protocol Label Switching \(MPLS\) Support of Differentiated Services](#) by F. Le Faucheur, L. Wu, B. Davie, P. Vaananen, R. Krishnan, P. Cheval, & J. Heinanen (RFC 3270)
- [Protocol Extensions for Support of Diffserv-aware MPLS Traffic Engineering](#) ed. by F. Le Faucheur (RFC 4124)
- [Russian Dolls Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering](#) ed. by F. Le Faucheur (RFC 4127)

- [\*Maximum Allocation Bandwidth Constraints Model for Diffserv-aware MPLS Traffic Engineering\*](#) by F. Le Faucheur & W. Lai (RFC 4125).

The new concept of "Class-Type" defined in the IETF Standard corresponds to the prior concept of "bandwidth pool" that was implemented in the original version of DS-TE. Likewise, the two bandwidth pools implemented in the original version of DS-TE (global pool and sub-pool) correspond to two of the IETF Standard's new Class-Types (Class-Type 0 and Class-Type 1, respectively).

## Prerequisites

Your network must support the following Cisco IOS features in order to support guaranteed bandwidth services based on DiffServ-aware Traffic Engineering:

- MPLS
- IP Cisco Express Forwarding (CEF)
- OSPF or ISIS
- RSVP-TE
- QoS

## Configuration Tasks

This section presents the minimum set of commands you need to implement the DiffServ-aware Traffic Engineering feature—in other words, to establish a tunnel that reserves bandwidth to a sub-pool (renamed BC1 by the IETF-Standard).

The subsequent "[Configuration Examples](#)" section ([page 13](#)), presents these same commands in context and shows how, by combining them with QoS commands, you can build guaranteed bandwidth services.

## From Traditional to IETF-Standard Commands

DS-TE commands originally were developed from the then-existing command set that had been used to configure MPLS traffic engineering. The only difference introduced at that time to create DS-TE was the expansion of two commands:

- **ip rsvp bandwidth** was expanded to configure the size of the sub-pool on every link.
- **tunnel mpls traffic-eng bandwidth** was expanded to enable a TE tunnel to reserve bandwidth from the sub-pool.

### The ip rsvp bandwidth command

The early MPLS command had been

```
ip rsvp bandwidth x y
```

where x = the size of the only possible pool, and y = the size of a single traffic flow (ignored by traffic engineering).

Then, to create the original implementation of DS-TE, the command was made into

```
ip rsvp bandwidth x y sub-pool z
```

where x = the size of the global pool, and z = the size of the sub-pool.

With the addition of the IETF-Standard version of DS-TE, the command has been further extended to become:

```
ip rsvp bandwidth x y [ [rdm x {subpool z | bc1 z}] | [mam bc0 x bc1 z]]
```

where **x** = the size of the global pool (now called **bc0**), and **z** = the size of the sub-pool (now called also **bc1**).

Two bandwidth constraint models also have become available, “Russian Dolls” (indicated by the keyword **rdm**) and “Maximum Allocation” (**mam**). The former model allows greater sharing of bandwidth across all Class Types (bandwidth pools), while the latter protects especially the premium Class Type. (The IETF Standard makes possible the future implementation of as many as seven sub-pools within one LSP, instead of just one sub-pool per LSP).

## The tunnel mpls traffic-eng bandwidth command

The pre-DS-TE traffic engineering command was

```
tunnel mpls traffic-eng bandwidth b
```

where **b** = the amount of bandwidth this tunnel requires.

So for the original DS-TE, you specified from which pool (global or sub) the tunnel's bandwidth would come. You could enter

```
tunnel mpls traffic-eng bandwidth sub-pool b
```

to indicate that the tunnel should use bandwidth from the sub-pool. Alternatively, you could enter

```
tunnel mpls traffic-eng bandwidth b
```

to indicate that the tunnel should use bandwidth from the global pool (which was the default).

With the addition of the IETF-Standard version of DS-TE, the command has been extended to become:

```
tunnel mpls traffic-eng bandwidth [sub-pool|class-type 1] b
```

where both **sub-pool** and **class-type 1** indicate the same, smaller bandwidth pool (now called class-type 1). The two keywords can be used interchangeably.

## The mpls traffic-eng ds-te commands

The IETF Standard introduces two new commands, one to indicate the Bandwidth Constraints model

```
mpls traffic-eng ds-te bc-model [rdm | mam]
```

and one to select the DS-TE mode:

```
mpls traffic-eng ds-te mode [migration|ietf]
```

(The concepts of bc-model and DS-TE mode were explained on [page 3](#)).

The first command allows you to select between the Russian Dolls Model (**rdm**) and the Maximum Allocation Model (**mam**) of bandwidth constraints.

The second command allows you to transition a network from traditional DS-TE tunnels to the IETF Standard without disrupting any of the tunnels' operation. To accomplish this, you first put the routers into Migration mode (using the **migration** keyword) and subsequently into the Liberal-IETF mode (using the **ietf** keyword).

## Transitioning a Network to the IETF Standard

Networks already operating DS-TE tunnels by means of the traditional, pre-IETF-Standard software can switch to the IETF-Standard without interrupting their DS-TE service by following this sequence:

1. Install Cisco IOS Release 12.2(33)SRB (or a subsequent release) on each router in the network, gradually, one router at a time, using Cisco's In Service Software Upgrade (ISSU) procedure which protects ongoing network traffic from interruption. (After that installation, DS-TE tunnels in the network will continue to operate by using the pre-IETF-Standard formats.)
2. Enter the global configuration command **mpls traffic-eng ds-te mode migration** on each router in the network, one router at a time. This will enable the routers to receive IETF-format IGP advertisement and RSVP-TE signaling, while the routers will continue to generate and receive the pre-Standard formats for those two functions.
3. After all the routers in the network have begun to operate in Migration mode, enter the global configuration command **mpls traffic-eng ds-te mode ietf** on each router, one at a time. This will cause the router to refresh its TE tunnels with IETF-compliant Path signaling, without disrupting the tunnels' operation. This mode also causes the router to generate IGP advertisement in the IETF-Standard format.

## Configuring DS-TE Tunnels

To establish a sub-pool (BC1) traffic engineering tunnel, you must enter configurations at three levels:

- the device level (router or switch router)
- the physical interface
- the tunnel interface

On the first two levels, you activate traffic engineering; on the third level—the tunnel interface—you establish the sub-pool tunnel. Therefore, it is only at the tunnel headend device that you need to configure all three levels. At the tunnel midpoints and tail, it is sufficient to configure the first two levels.

In the tables below, each command is explained in brief. For a more complete explanation of any command, type it into the Command Lookup Tool at <http://www.cisco.com/cgi-bin/Support/Cmdlookup/home.pl>. (If prompted to log in there, use your Cisco.com account username and password).

### Level 1: Configuring the Device

At this level, you tell the device (router or switch router) to use accelerated packet-forwarding (known as Cisco Express Forwarding or CEF), MultiProtocol Label Switching (MPLS), traffic-engineering tunneling, a bandwidth constraints model, and either the OSPF or IS-IS routing algorithm (Open Shortest Path First or Intermediate System to Intermediate System). This level is called the global configuration mode, because the configuration is applied globally, to the entire device, rather than to a specific interface or routing instance.

You enter the following commands:

|                | Command                                                                              | Purpose                                                                                                                                                                                                                                 |
|----------------|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b>  | Router(config)# <b>ip cef distributed</b>                                            | Enables CEF—which accelerates the flow of packets through the device.                                                                                                                                                                   |
| <b>Step 2</b>  | Router(config)# <b>mpls traffic-eng tunnels</b>                                      | Enables MPLS, and specifically its traffic engineering tunnel capability.                                                                                                                                                               |
| <b>Step 3</b>  | Router(config)# <b>mpls traffic-eng ds-te bc-model [rdm   mam ]</b>                  | Specifies the bandwidth constraints model (see <a href="#">page 3</a> ).                                                                                                                                                                |
| <b>Step 4</b>  | Router(config)# <b>router ospf</b><br><br>[or]<br>Router(config)# <b>router isis</b> | Invokes the OSPF routing process for IP and puts the device into router configuration mode. Proceed now to Steps 10 and 11.<br><br>Alternatively, you may invoke the IS-IS routing process with this command, and continue with Step 5. |
| <b>Step 5</b>  | Router (config-router)# <b>net network-entity-title</b>                              | Specifies the IS-IS network entity title (NET) for the routing process.                                                                                                                                                                 |
| <b>Step 6</b>  | Router (config-router)# <b>metric-style wide</b>                                     | Enables the router to generate and accept IS-IS new-style TLVs (type, length, and value objects).                                                                                                                                       |
| <b>Step 7</b>  | Router (config-router)# <b>is-type level-n</b>                                       | Configures the router to learn about destinations inside its own area or “IS-IS level”.                                                                                                                                                 |
| <b>Step 8</b>  | Router (config-router)# <b>mpls traffic-eng level-n</b>                              | Specifies the IS-IS level (which must be same level as in the preceding step) to which the router will flood MPLS traffic-engineering link information.                                                                                 |
| <b>Step 9</b>  | Router (config-router)# <b>passive-interface loopback0</b>                           | Instructs IS-IS to advertise the IP address of the loopback interface without actually running IS-IS on that interface. Continue with Step 10 but don’t do Step 11—because Step 11 refers to OSPF.                                      |
| <b>Step 10</b> | Router(config-router)# <b>mpls traffic-eng router-id loopback0</b>                   | Specifies that the traffic engineering router identifier is the IP address associated with the <i>loopback0</i> interface.                                                                                                              |
| <b>Step 11</b> | Router(config-router)# <b>mpls traffic-eng area num</b>                              | Turns on MPLS traffic engineering for a particular OSPF area.                                                                                                                                                                           |

## Level 2: Configuring the Physical Interface

Having configured the device, you now must configure the interface on that device through which the tunnel will run. To do that, you first put the router into interface-configuration mode.

You then enable Resource Reservation Protocol (RSVP). This protocol is used to signal (set up) a traffic engineering tunnel, and to tell devices along the tunnel path to reserve a specific amount of bandwidth for the traffic that will flow through that tunnel. It is with this command that you establish the maximum size of the sub-pool (BC1).

Finally, you enable the MPLS traffic engineering tunnel feature on this physical interface—and if you will be relying on the IS-IS routing protocol, you enable that as well.

To accomplish these tasks, you enter the following commands:

|        | Command                                                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                              |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Router(config)# <b>interface</b> <i>interface-id</i>                                                                                                                                                                                                                          | Moves configuration to the interface level, directing subsequent configuration commands to the specific interface identified by the <i>interface-id</i> .                                                                                                                                            |
| Step 2 | Router(config-if)# <b>ip rsvp bandwidth</b> [ <i>interface-kbps</i> ] [ <i>single-flow-kbps</i> ][ <b>rdm</b> <i>kbps</i> { <b>subpool</b> <i>kbps</i> }[ <b>bc1</b> <i>subpool</i> ]}][ <b>max-reservable-bw</b> <i>kbps</i> <b>bc0</b> <i>kbps</i> <b>bc1</b> <i>kbps</i> ] | Enables RSVP on this interface, indicates the Bandwidth Constraints Model to be used (explained on <a href="#">page 3</a> ), and limits the amount of bandwidth RSVP can reserve on this interface. The sum of bandwidth used by all tunnels on this interface cannot exceed <i>interface-kbps</i> . |
| Step 3 | Router(config-if)# <b>mpls traffic-eng tunnels</b>                                                                                                                                                                                                                            | Enables the MPLS traffic engineering tunnel feature on this interface.                                                                                                                                                                                                                               |
| Step 4 | Router(config-if)# <b>ip router isis</b>                                                                                                                                                                                                                                      | Enables the IS-IS routing protocol on this interface. Do not enter this command if you are configuring for OSPF.                                                                                                                                                                                     |

### Level 3: Configuring the Tunnel Interface

Now you create a set of attributes for the tunnel itself; those attributes are configured on the “tunnel interface” (not to be confused with the physical interface just configured above).

You enter the following commands:

|        | Command                                                                                                               | Purpose                                                                                                                                                                                                         |
|--------|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Router(config)# <b>interface</b> <b>tunnel1</b>                                                                       | Creates a tunnel interface (named in this example <b>tunnel1</b> ) and enters interface configuration mode.                                                                                                     |
| Step 2 | Router(config-if)# <b>tunnel destination</b> <i>A.B.C.D</i>                                                           | Specifies the IP address of the tunnel tail device.                                                                                                                                                             |
| Step 3 | Router(config-if)# <b>tunnel mode mpls traffic-eng</b>                                                                | Sets the tunnel’s encapsulation mode to MPLS traffic engineering.                                                                                                                                               |
| Step 4 | Router(config-if)# <b>tunnel mpls traffic-eng bandwidth</b> { <i>sub-pool</i>   <i>class-type1</i> } <i>bandwidth</i> | Configures the tunnel’s bandwidth, and assigns it either to the sub-pool (when you use that keyword or the IETF-Standard keyword <b>class-type1</b> ) or to the global pool (when you leave out both keywords). |
| Step 5 | Router(config-if)# <b>tunnel mpls traffic-eng priority</b>                                                            | Sets the priority to be used when the system determines which existing tunnels are eligible to be preempted.                                                                                                    |
| Step 6 | Router(config-if)# <b>tunnel mpls traffic-eng path-option</b>                                                         | Configures the paths (hops) a tunnel should use. The user can enter an explicit path (can specify the IP addresses of the hops) or can specify a dynamic path (the router figures out the best set of hops).    |

### Verifying the Configuration

To view the complete configuration you have entered, use the EXEC command **show running-config** and check its output display for correctness.

To check *just one tunnel’s* configuration, enter **show interfaces tunnel** followed by the tunnel interface number. And to see that tunnel’s RSVP bandwidth and flow, enter **show ip rsvp interface** followed by the name or number of the physical interface.

Here is an example of the information displayed by these latter two commands. (To see an explanation of each field used in the following displays, enter **show interfaces tunnel** or **show ip rsvp interface** into the Command Lookup Tool at <http://www.cisco.com/cgi-bin/Support/Cmdlookup/home.pl>. If prompted to log in there, use your Cisco.com account username and password.)

```
Router#show interfaces tunnel 4
Tunnel4 is up, line protocol is down
  Hardware is Routing Tunnel
  MTU 1500 bytes, BW 9 Kbit, DLY 500000 usec, rely 255/255, load 1/255
  Encapsulation TUNNEL, loopback not set, keepalive set (10 sec)
  Tunnel source 0.0.0.0, destination 0.0.0.0
  Tunnel protocol/transport GRE/IP, key disabled, sequencing disabled
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Output queue 0/0, 0 drops; input queue 0/75, 0 drops
  Five minute input rate 0 bits/sec, 0 packets/sec
  Five minute output rate 0 bits/sec, 0 packets/sec
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
    0 packets output, 0 bytes, 0 underruns
    0 output errors, 0 collisions, 0 interface resets, 0 restarts

Router#show ip rsvp interface pos4/0
interface    allocated  i/f max  flow max  sub max
PO4/0        300K        466500K  466500K   0M
```

To view *all tunnels at once* on the router you have configured, enter **show mpls traffic-eng tunnels brief**. The information displayed when tunnels are functioning properly looks like this:

```
Router#show mpls traffic-eng tunnels brief
Signalling Summary:
  LSP Tunnels Process:      running
  RSVP Process:             running
  Forwarding:               enabled
  Periodic reoptimization:  every 3600 seconds, next in 3029 seconds
TUNNEL NAME DESTINATION    UP IF    DOWN IF    STATE/PROT
GSR1_t0 192.168.1.13      -        SR3/0      up/up
GSR1_t1 192.168.1.13      -        SR3/0      up/up
GSR1_t2 192.168.1.13      -        PO4/0      up/up
Displayed 3 (of 3) heads, 0 (of 0) midpoints, 0 (of 0) tails
```

When one or more tunnels is not functioning properly, the display could instead look like this. (In the following example, tunnels t0 and t1 are down, as indicated in the far right column).

```
Router#show mpls traffic-eng tunnels brief
Signalling Summary:
  LSP Tunnels Process:      running
  RSVP Process:             running
  Forwarding:               enabled
  Periodic reoptimization:  every 3600 seconds, next in 2279 seconds
TUNNEL NAME DESTINATION    UP IF    DOWN IF    STATE/PROT
GSR1_t0 192.168.1.13      -        SR3/0      up/down
GSR1_t1 192.168.1.13      -        SR3/0      up/down
GSR1_t2 192.168.1.13      -        PO4/0      up/up
Displayed 3 (of 3) heads, 0 (of 0) midpoints, 0 (of 0) tails
```

To find out *why* a tunnel is down, insert its name into this same command, after adding the keyword **name** and omitting the keyword **brief**. For example:

```
Router#show mpls traffic-eng tunnels name GSR1_t0
Name:GSR1_t0                               (Tunnel0) Destination:192.168.1.13
```

```
Status:
Admin:up          Oper:down Path: not valid      Signalling:connected
```

If, as in this example, the Path is displayed as **not valid**, use the **show mpls traffic-eng topology** command to make sure the router has received the needed updates.

Additionally, you can use any of the following **show** commands to inspect particular aspects of the network, router, or interface concerned:

| To see information about... |                                                          |                                                                                           |
|-----------------------------|----------------------------------------------------------|-------------------------------------------------------------------------------------------|
| this level                  | and this item...                                         | Use this command                                                                          |
| Network                     | Advertised bandwidth allocation information              | <b>show mpls traffic-eng link-management advertisements</b>                               |
|                             | Preemptions along the tunnel path                        | <b>debug mpls traffic-eng link-management preemption</b>                                  |
|                             | Available TE link bandwidth on all head routers          | <b>show mpls traffic-eng topology</b> (described on <a href="#">page 41</a> )             |
| Router                      | Status of all tunnels currently signalled by this router | <b>show mpls traffic-eng link-management admission-control</b>                            |
|                             | Tunnels configured on midpoint routers                   | <b>show mpls traffic-eng link-management summary</b>                                      |
| Physical interface          | Detailed information on current bandwidth pools          | <b>show mpls traffic-eng link-management bandwidth-allocation</b> <i>[interface-name]</i> |
|                             | TE RSVP bookkeeping                                      | <b>show mpls traffic-eng link-management interfaces</b>                                   |
|                             | Entire configuration of one interface                    | <b>show run interface</b>                                                                 |

# Configuration Examples

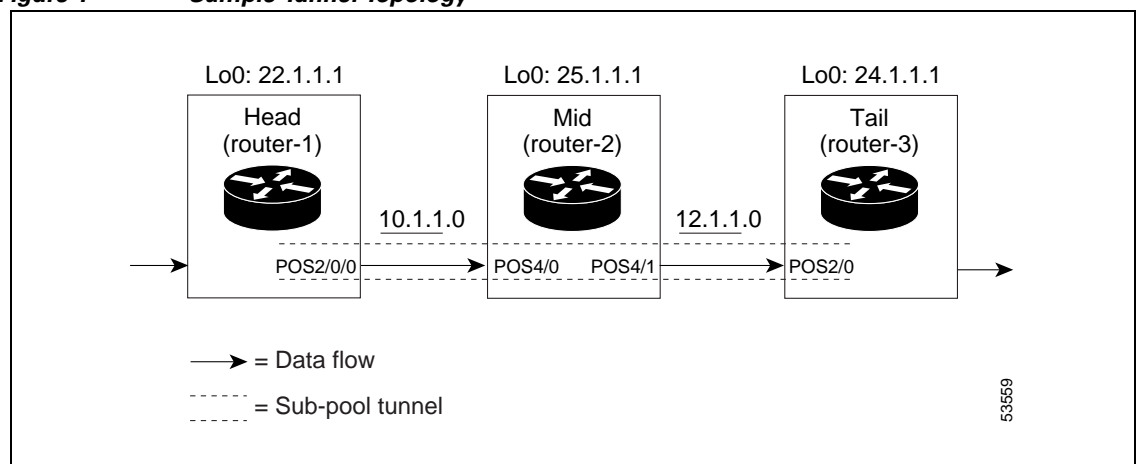

## Note

The following 25 pages of examples illustrate DS-TE in the traditional, pre-IETF-Standard mode. You may update these examples simply by inserting the new Device Level command **mpls traffic-eng ds-te bc-model** as its proper use is shown in Step 3 on [page 9](#), and by applying the updated syntax within the two modified commands as each is shown respectively at the Physical Interface Level in Step 2 on [page 10](#) (**ip rsvp bandwidth**), and at the Tunnel Interface Level in Step 4 on [page 10](#) (**tunnel mpls traffic-eng bandwidth**).

First this section presents the DS-TE configurations needed to create the sub-pool tunnel. Then it presents the more comprehensive design for building end-to-end guaranteed bandwidth service, which involves configuring Quality of Service as well.

As shown in [Figure 1](#), the tunnel configuration involves at least three devices—tunnel head, midpoint, and tail. On each of those devices one or two network interfaces must be configured, for traffic ingress and egress.

**Figure 1**      **Sample Tunnel Topology**

## Tunnel Head

At the device level:

```
router-1# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.

router-1(config)# ip cef distributed
router-1(config)# mpls traffic-eng tunnels
[now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

router-1(config)# router isis
    router-1(config-router)# net
    49.0000.1000.0000.0010.00
    router-1(config-router)# metric-style wide
    router-1(config-router)# is-type level-1
    router-1(config-router)#

router-1(config)# router ospf 100
    router-1(config-router)# redistribute connected
    router-1(config-router)# network 10.1.1.0 0.0.0.255 area 0
    router-1(config-router)# network 22.1.1.1 0.0.0.0 area 0
```

```

router-1(config-router)# mpls traffic-eng
level-1
router-1(config-router)# passive-interface
Loopback0
[now one resumes the common command set]:
router-1(config-router)# mpls traffic-eng router-id Loopback0
router-1(config-router)# exit

router-1(config)# interface Loopback0

```

At the virtual interface level:

```

router-1(config-if)# ip address 22.1.1.1 255.255.255.255
router-1(config-if)# no ip directed-broadcast
router-1(config-if)# exit

```

At the device level:

```

router-1(config)# interface POS2/0/0

```

At the physical interface level (egress):

```

router-1(config-if)# ip address 10.1.1.1 255.255.255.0
router-1(config-if)# mpls traffic-eng tunnels
router-1(config-if)# ip rsvp bandwidth 130000 130000 sub-pool 80000
[and if using IS-IS instead of OSPF]:
router-1(config-if)# ip router isis
[and in all cases]:
router-1(config-if)# exit

```

At the device level:

```

router-1(config)# interface Tunnel1

```

At the tunnel interface level:

```

router-1(config-if)# bandwidth 110000
router-1(config-if)# ip unnumbered Loopback0
router-1(config-if)# tunnel destination 24.1.1.1
router-1(config-if)# tunnel mode mpls traffic-eng
router-1(config-if)# tunnel mpls traffic-eng priority 0 0
router-1(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 30000
router-1(config-if)# tunnel mpls traffic-eng path-option 1 dynamic
router-1(config-if)# exit
router-1(config)#

```

## Midpoint Devices

At the device level:

```

router-2# configure terminal
router-2(config)# ip cef distributed
router-2(config)# mpls traffic-eng tunnels

```

[now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre> router-2(config)# <b>router isis</b> router-2(config-router)# <b>net</b> 49.0000.1000.0000.0012.00 router-2(config-router)# <b>metric-style wide</b> router-2(config-router)# <b>is-type level-1</b> router-2(config-router)# <b>mpls traffic-eng</b> <b>level-1</b> router-2(config-router)# <b>passive-interface</b> <b>Loopback0</b> [now one resumes the common command set]: router-2(config-router)# <b>mpls traffic-eng router-id Loopback0</b> router-2(config-router)# <b>exit</b> </pre> | <pre> router ospf 100 redistribute connected network 11.1.1.0 0.0.0.255 area 0 network 12.1.1.0 0.0.0.255 area 0 network 25.1.1.1 0.0.0.0 area 0 mpls traffic-eng area 0 </pre> |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```

router-2(config)# interface Loopback0

```

At the virtual interface level:

```

router-2(config-if)# ip address 25.1.1.1 255.255.255.255
router-2(config-if)# no ip directed-broadcast
router-2(config-if)# exit

```

At the device level:

```

router-1(config)# interface POS4/0
router-1(config-if)# ip address 11.1.1.2 255.255.255.0
router-1(config-if)# mpls traffic-eng tunnels
router-1(config-if)# ip rsvp bandwidth 130000 130000 sub-pool 80000

```

[If using IS-IS instead of OSPF]:

```

router-1(config-if)# ip router isis
[and in all cases]:
router-1(config-if)# exit

```

At the device level:

```

router-1(config)# interface POS4/1
router-1(config-if)# ip address 12.1.1.2 255.255.255.0
router-1(config-if)# mpls traffic-eng tunnels
router-1(config-if)# ip rsvp bandwidth 130000 130000 sub-pool 80000

```

[If using IS-IS instead of OSPF]:

```

router-1(config-if)# ip router isis
[and in all cases]:
router-1(config-if)# exit

```

Note that there is no configuring of tunnel interfaces at the mid-point devices, only network interfaces and the device globally.

## Tail-End Device

At the device level:

```

router-3# configure terminal
router-3(config)# ip cef distributed

```

```
router-3(config)# mpls traffic-eng tunnels
```

[now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

|                                                                                                                                                                                                                                                                                                               |                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>router-3(config)# router isis   router-3(config-router)# net     49.0000.1000.0000.0013.00   router-3(config-router)# metric-style wide   router-3(config-router)# is-type level-1    router-3(config-router)# mpls traffic-eng level-1   router-3(config-router)# passive-interface     Loopback0</pre> | <pre>router ospf 100   redistribute connected   network 12.1.1.0 0.0.0.255 area 0     network 24.1.1.1 0.0.0.0 area       0   mpls traffic-eng area 0</pre> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|

[now one resumes the common command set]:

```
router-3(config-router)# mpls traffic-eng router-id Loopback0
router-3(config-router)# exit
```

```
router-3(config)# interface Loopback0
```

At the virtual interface level:

```
router-3(config-if)# ip address 24.1.1.1 255.255.255.255
router-3(config-if)# no ip directed-broadcast
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit
```

At the device level:

```
router-1(config)# interface POS4/0
  router-1(config-if)# ip address 12.1.1.3 255.255.255.0
  router-1(config-if)# mpls traffic-eng tunnels
  router-1(config-if)# ip rsvp bandwidth 130000 130000 sub-pool 80000
```

[If using IS-IS instead of OSPF]:

```
router-1(config-if)# ip router isis
[and in all cases]:
router-1(config-if)# exit
```

## Guaranteed Bandwidth Service Configuration

Having configured two bandwidth pools, you now can

- Use one pool, the sub-pool, for tunnels that carry traffic requiring strict bandwidth guarantees or delay guarantees
- Use the other pool, the global pool, for tunnels that carry traffic requiring only Differentiated Service.

Having a separate pool for traffic requiring strict guarantees allows you to limit the amount of such traffic admitted on any given link. Often, it is possible to achieve strict QoS guarantees only if the amount of guaranteed traffic is limited to a portion of the total link bandwidth.

Having a separate pool for other traffic (best-effort or diffserv traffic) allows you to have a separate limit for the amount of such traffic admitted on any given link. This is useful because it allows you to fill up links with best-effort/diffserv traffic, thereby achieving a greater utilization of those links.

## Providing Strict QoS Guarantees Using DS-TE Sub-pool Tunnels

A tunnel using sub-pool bandwidth can satisfy the stricter requirements if you do all of the following:

1. Select a queue—or in diffserv terminology, select a PHB (per-hop behavior)—to be used exclusively by the strict guarantee traffic. This shall be called the “GB queue.”

If delay/jitter guarantees are sought, the diffserv Expedited Forwarding queue (EF PHB) is used. On the Cisco 7500(VIP) it is the "priority" queue. You must configure the bandwidth of the queue to be at least equal to the bandwidth of the sub-pool.

If only bandwidth guarantees are sought, the diffserv Assured Forwarding PHB (AF PHB) is used. On the Cisco 7500 (VIP) you use one of the existing Class-Based Weighted Fair Queuing (CBWFQ) queues.

2. Ensure that the guaranteed traffic sent through the sub-pool tunnel is placed in the GB queue *at the outbound interface of every tunnel hop*, and that no other traffic is placed in this queue.

You do this by marking the traffic that enters the tunnel with a unique value in the mpls exp bits field, and steering only traffic with that marking into the GB queue.

3. Ensure that this GB queue is never oversubscribed; that is, see that no more traffic is sent into the sub-pool tunnel than the GB queue can handle.

You do this by rate-limiting the guaranteed traffic before it enters the sub-pool tunnel. The aggregate rate of all traffic entering the sub-pool tunnel should be less than or equal to the bandwidth capacity of the sub-pool tunnel. Excess traffic can be dropped (in the case of delay/jitter guarantees) or can be marked differently for preferential discard (in the case of bandwidth guarantees).

4. Ensure that the amount of traffic entering the GB queue is limited to an appropriate percentage of the total bandwidth of the corresponding outbound link. The exact percentage to use depends on several factors that can contribute to accumulated delay in your network: your QoS performance objective, the total number of tunnel hops, the amount of link fan-in along the tunnel path, burstiness of the input traffic, and so on.

You do this by setting the sub-pool bandwidth of each outbound link to the appropriate percentage of the total link bandwidth (that is, by adjusting the *z* parameter of the **ip RSVP bandwidth** command).

## Providing Differentiated Service Using DS-TE Global Pool Tunnels

You can configure a tunnel using global pool bandwidth to carry best-effort as well as several other classes of traffic. Traffic from each class can receive differentiated service if you do all of the following:

1. Select a separate queue (a distinct diffserv PHB) for each traffic class. For example, if there are three classes (gold, silver, and bronze) there must be three queues (diffserv AF2, AF3, and AF4).
2. Mark each class of traffic using a unique value in the MPLS experimental bits field (for example gold = 4, silver = 5, bronze = 6).
3. Ensure that packets marked as Gold are placed in the gold queue, Silver in the silver queue, and so on. The tunnel bandwidth is set based on the expected aggregate traffic across all classes of service.

To control the amount of diffserv tunnel traffic you intend to support on a given link, adjust the size of the global pool on that link.

## Providing Strict Guarantees and Differentiated Service in the Same Network

Because DS-TE allows simultaneous constraint-based routing of sub-pool and global pool tunnels, strict guarantees and diffserv can be supported simultaneously in a given network.

## Guaranteed Bandwidth Service Examples

Given the many topologies in which Guaranteed Bandwidth Services can be applied, there is space here only to present two examples. They illustrate opposite ends of the spectrum of possibilities.

In the first example, the guaranteed bandwidth tunnel can be easily specified by its destination. So the forwarding criteria refer to a single destination prefix.

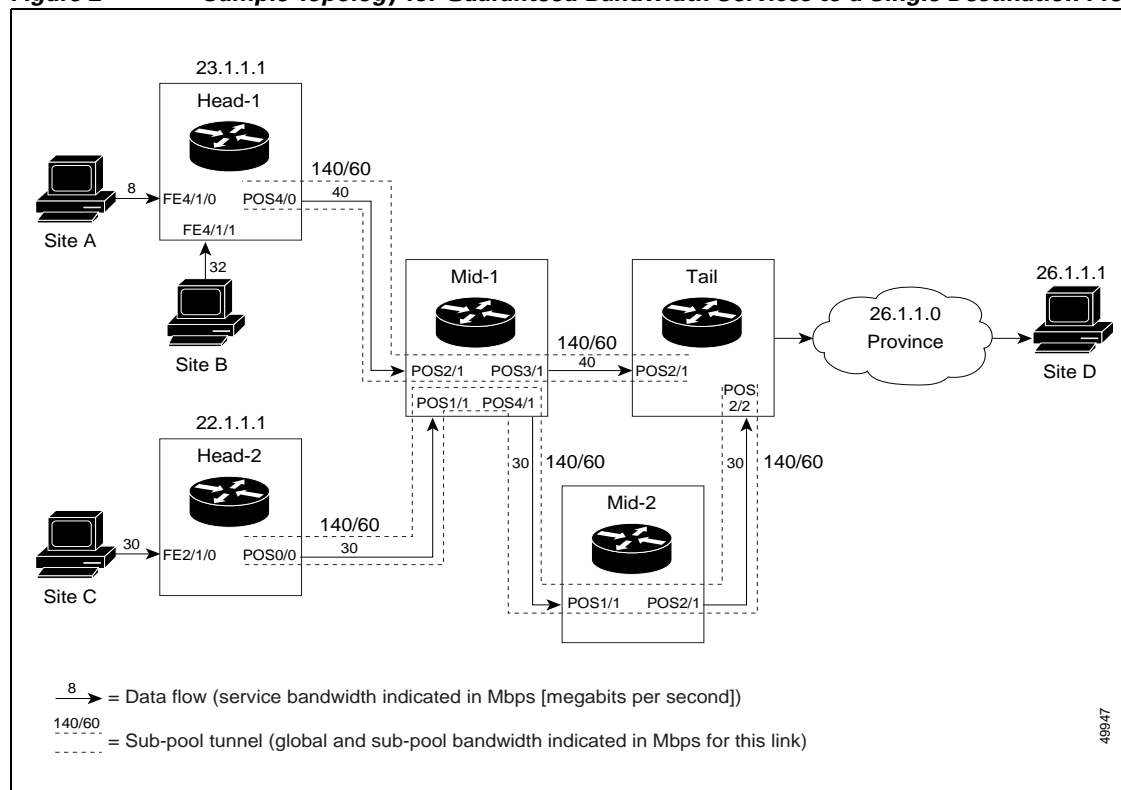

In the second example, there can be many final destinations for the guaranteed bandwidth traffic, including a dynamically changing number of destination prefixes. So the forwarding criteria are specified by Border Gateway Protocol (BGP) policies.

### Example with Single Destination Prefix

**Figure 2 illustrates** a topology for guaranteed bandwidth services whose destination is specified by a single prefix, either Site D (like a voice gateway, here bearing prefix 26.1.1.1) or a subnet (like the location of a web farm, here called “Province” and bearing prefix 26.1.1.0). Three services are offered:

- From Site A (defined as all traffic arriving at interface FE4/1/0): to host 26.1.1.1, 8 Mbps of guaranteed bandwidth with low loss, low delay and low jitter
- From Site B (defined as all traffic arriving at interface FE4/1/1): towards subnet 26.1.1.0, 32 Mbps of guaranteed bandwidth with low loss
- From Site C (defined as all traffic arriving at interface FE2/1/0): 30 Mbps of guaranteed bandwidth with low loss

**Figure 2** Sample Topology for Guaranteed Bandwidth Services to a Single Destination Prefix

These three services run through two sub-pool tunnels:

- From the Head-1 router, 23.1.1.1, to the router-4 tail
- From the Head-2 router, 22.1.1.1, to the router-4 tail

Both tunnels use the same tail router, though they have different heads. (In [Figure 2](#) one midpoint router is shared by both tunnels. In the real world there could of course be many more midpoints.)

All POS interfaces in this example are OC3, whose capacity is 155 Mbps.

## Configuring Tunnel Head-1

First we recapitulate commands that establish two bandwidth pools and a sub-pool tunnel (as presented earlier in this Configuration Examples section). Then we present the QoS commands that guarantee end-to-end service on the subpool tunnel. (With the 7500 router, Modular QoS CLI is used.)

### Configuring the Pools and Tunnel

At the device level:

```

router-1(config)# ip cef distributed
router-1(config)# mpls traffic-eng tunnels
[now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

router-1(config)# router isis                                router ospf 100
router-1(config-router)# net                                 redistribute connected
49.0000.1000.0000.0010.00
router-1(config-router)# metric-style wide                    network 10.1.1.0 0.0.0.255 area 0
router-1(config-router)# is-type level-1                      network 23.1.1.1 0.0.0.0 area
  0
router-1(config-router)# mpls traffic-eng                    mpls traffic-eng area 0
level-1
router-1(config-router)# passive-interface
Loopback0
[now one resumes the common command set]:
router-1(config-router)# mpls traffic-eng router-id Loopback0
router-1(config-router)# exit

```

Create a virtual interface:

```

router-1(config)# interface Loopback0
router-1(config-if)# ip address 23.1.1.1 255.255.255.255
router-1(config-if)# no ip directed-broadcast
router-1(config-if)# exit

```

At the outgoing physical interface:

```

router-1(config)# interface pos4/0
router-1(config-if)# ip address 10.1.1.1 255.0.0.0
router-1(config-if)# mpls traffic-eng tunnels
router-1(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-1(config-if)# ip router isis
[and in all cases]:
router-1(config-if)# exit

```

At the tunnel interface:

```

router-1(config)# interface Tunnell

```

```

router-1(config-if)# bandwidth 110000
router-1(config-if)# ip unnumbered Loopback0
router-1(config-if)# tunnel destination 27.1.1.1
router-1(config-if)# tunnel mode mpls traffic-eng
router-1(config-if)# tunnel mpls traffic-eng priority 0 0
router-1(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 40000
router-1(config-if)# tunnel mpls traffic-eng path-option 1 dynamic

```

To ensure that packets destined to host 26.1.1.1 and subnet 26.1.1.0 are sent into the sub-pool tunnel, we create a static route. At the device level:

```

router-1(config)# ip route 26.1.1.0 255.255.255.0 Tunnel1
router-1(config)# exit

```

And in order to make sure that the Interior Gateway Protocol (IGP) will not send any other traffic down this tunnel, we disable autoroute announce:

```

router-1(config)# no tunnel mpls traffic-eng autoroute announce

```

## For Service from Site A to Site D

At the inbound physical interface (FE4/1/0):

1. In global configuration mode, create a class of traffic matching ACL 100, called "sla-1-class":

```

class-map match-all sla-1-class
  match access-group 100

```

2. Create an ACL 100 to refer to all packets destined to 26.1.1.1:

```

access-list 100 permit ip any host 26.1.1.1

```

3. Create a policy named "sla-1-input-policy", and according to that policy:

- a. Packets in the class called "sla-1-class" are rate-limited to:

– a rate of 8 million bits per second

– a normal burst of 1 million bytes

– a maximum burst of 2 million bytes

- b. Packets which conform to this rate are marked with MPLS experimental bit 5 and are forwarded.

- c. Packets which exceed this rate are dropped.

- d. All other packets are marked with experimental bit 0 and are forwarded.

```

policy-map sla-1-input-policy
  class sla-1-class
    police 8000000 1000000 2000000 conform-action set-mpls-exp-transmit 5 \
    exceed-action drop
  class class-default
    set-mpls-exp-transmit 0

```

4. The policy is applied to packets entering interface FE4/1/0.

```

interface FastEthernet4/1/0
  service-policy input sla-1-input-policy

```

## For Service from Site B to Subnet “Province”

At the inbound physical interface (FE4/1/1):

1. In global configuration mode, create a class of traffic matching ACL 120, called "sla-2-class":

```
class-map match-all sla-2-class
  match access-group 120
```

2. Create an ACL, 120, to refer to all packets destined to subnet 26.1.1.0:

```
access-list 120 permit ip any 26.1.1.0 0.0.0.255
```

3. Create a policy named “sla-2-input-policy”, and according to that policy:

- a. Packets in the class called “sla-2-class” are rate-limited to:

– a rate of 32 million bits per second

– a normal burst of 1 million bytes

– a maximum burst of 2 million bytes

- b. Packets which conform to this rate are marked with MPLS experimental bit 5 and are forwarded.

- c. Packets which exceed this rate are dropped.

- d. All other packets are marked with experimental bit 0 and are forwarded.

```
policy-map sla-2-input-policy
  class sla-2-class
    police 32000000 1000000 2000000 conform-action set-mpls-exp-transmit 5 \
    exceed-action drop
  class class-default
    set-mpls-exp-transmit 0
```

4. The policy is applied to packets entering interface FE4/1/1.

```
interface FastEthernet4/1/1
  service-policy input sla-2-input-policy
```

## For Both Services

The outbound interface (POS4/0) is configured as follows:

1. In global configuration mode, create a class of traffic matching experimental bit 5, called "exp-5-traffic".

```
class-map match-all exp-5-traffic
  match mpls experimental 5
```

2. Create a policy named “output-interface-policy”. According to that policy, packets in the class “exp-5-traffic” are put in the priority queue (which is rate-limited to 62 kbits/sec).

```
policy-map output-interface-policy
  class exp-5-traffic
    priority 32
```

3. The policy is applied to packets exiting interface POS4/0.

```
interface POS4/0
  service-policy output output-interface-policy
```

The result of the above configuration lines is that packets entering the Head-1 router via interface FE4/1/0 destined to host 26.1.1.1, or entering the router via interface FE4/1/1 destined to subnet 26.1.1.0, will have their MPLS experimental bit set to 5. We assume that no other packets entering the

router (on any interface) are using this value. (If this cannot be assumed, an additional configuration must be added to mark all such packets to another experimental value.) Packets marked with experimental bit 5, when exiting the router via interface POS4/0, will be placed into the priority queue.

**Note**

Packets entering the router via FE4/1/0 or FE4/1/1 and exiting POS4/0 enter as IP packets and exit as MPLS packets.

## Configuring Tunnel Head-2

First we recapitulate commands that establish two bandwidth pools and a sub-pool tunnel (as presented earlier in this Configuration Examples section). Then we present the QoS commands that guarantee end-to-end service on the sub-pool tunnel.

### Configuring the Pools and Tunnel

At the device level:

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <pre> router-2(config)# ip cef distributed router-2(config)# mpls traffic-eng tunnels [now one uses either the IS-IS commands on the left or the OSPF commands on the right]:  router-2(config)# router isis router-2(config-router)# net 49.0000.1000.0000.0011.00 router-2(config-router)# metric-style wide router-2(config-router)# is-type level-1  router-2(config-router)# mpls traffic-eng level-1 router-2(config-router)# passive-interface Loopback0 [now one resumes the common command set]: router-2(config-router)# mpls traffic-eng router-id Loopback0 router-2(config-router)# exit </pre> | <pre> router ospf 100 redistribute connected network 11.1.1.0 0.0.0.255 area 0 network 22.1.1.1 0.0.0.0 area 0 mpls traffic-eng area 0 </pre> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|

Create a virtual interface:

```

router-2(config)# interface Loopback0
router-2(config-if)# ip address 22.1.1.1 255.255.255.255
router-2(config-if)# no ip directed broadcast
router-2(config-if)# exit

```

At the outgoing physical interface:

```

router-2(config)# interface pos0/0
router-2(config-if)# ip address 11.1.1.1 255.0.0.0
router-2(config-if)# mpls traffic-eng tunnels
router-2(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-2(config-if)# ip router isis
[and in all cases]:
router-2(config-if)# exit

```

At the tunnel interface:

```

router-2(config)# interface Tunnel2

```

```

router-2(config-if)# ip unnumbered Loopback0
router-2(config-if)# tunnel destination 27.1.1.1
router-2(config-if)# tunnel mode mpls traffic-eng
router-2(config-if)# tunnel mpls traffic-eng priority 0 0
router-2(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 30000
router-2(config-if)# tunnel mpls traffic-eng path-option 1 dynamic
router-2(config-if)# exit

```

And to ensure that packets destined to subnet 26.1.1.0 are sent into the sub-pool tunnel, we create a static route, at the device level:

```

router-2(config)# ip route 26.1.1.0 255.255.255.0 Tunnel2
router-2(config)# exit

```

Finally, in order to make sure that the Interior Gateway Protocol (IGP) will not send any other traffic down this tunnel, we disable autoroute announce:

```

router-2(config)# no tunnel mpls traffic-eng autoroute announce

```

### For Service from Site C to Subnet "Province"

At the inbound physical interface (FE2/1/0):

1. In global configuration mode, create a class of traffic matching ACL 130, called "sla-3-class":

```

class-map match-all sla-3-class
  match access-group 130

```

2. Create an ACL, 130, to refer to all packets destined to subnet 26.1.1.0:

```

access-list 130 permit ip any 26.1.1.0 0.0.0.255

```

3. Create a policy named "sla-3-input-policy", and according to that policy:

- a. Packets in the class called "sla-3-class" are rate-limited to:

– a rate of 30 million bits per second

– a normal burst of 1 million bytes

– a maximum burst of 2 million bytes

- b. Packets which conform to this rate are marked with MPLS experimental bit 5 and are forwarded.

- c. Packets which exceed this rate are dropped.

- d. All other packets are marked with experimental bit 0 and are forwarded.

```

policy-map sla-3-input-policy
  class sla-3-class
    police 30000000 1000000 2000000 conform-action set-mpls-exp-transmit 5 \
    exceed-action drop
  class class-default
    set-mpls-exp-transmit 0

```

4. The policy is applied to packets entering interface FE2/1/0.

```

interface FastEthernet2/1/0
  service-policy input sla-3-input-policy

```

The outbound interface POS0/0 is configured as follows:

1. In global configuration mode, create a class of traffic matching experimental bit 5, called "exp-5-traffic".

```

class-map match-all exp-5-traffic

```

```
match mpls experimental 5
```

2. Create a policy named “output-interface-policy”. According to that policy, packets in the class “exp-5-traffic” are put in the priority queue (which is rate-limited to 32 kbits/sec).

```
policy-map output-interface-policy
  class exp-5-traffic
    priority 32
```

3. The policy is applied to packets exiting interface POS0/0:

```
interface POS0/0
  service-policy output output-interface-policy
```

As a result of all the above configuration lines, packets entering the Head-2 router via interface FE2/1/0 and destined for subnet 26.1.1.0 have their IP precedence field set to 5. It is assumed that no other packets entering this router (on any interface) are using this precedence. (If this cannot be assumed, an additional configuration must be added to mark all such packets with another precedence value.) When exiting this router via interface POS0/0, packets marked with precedence 5 are placed in the priority queue.

**Note**

Packets entering the router via FE2/1/0 and exiting through POS0/0 enter as IP packets and exit as MPLS packets.

## Tunnel Midpoint Configuration [Mid-1]

All four interfaces on the midpoint router are configured identically to the outbound interface of the head router (except, of course, for the IDs of the individual interfaces):

### Configuring the Pools and Tunnels

At the device level:

```
router-3(config)# ip cef distributed
router-3(config)# mpls traffic-eng tunnels
```

[now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

```
router-3(config)# router isis
```

```
router-3(config-router)# net
49.0000.2400.0000.0011.00
```

```
router-3(config-router)# metric-style wide
```

```
router-3(config-router)# is-type level-1
```

```
router-3(config-router)# mpls traffic-eng
level-1
```

```
router-3(config-router)# passive-interface
Loopback0
```

```
router-3(config-router)#
```

```
router-3(config-router)#
```

[now one resumes the common command set]:

```
router-3(config-router)# mpls traffic-eng router-id Loopback0
router-3(config-router)# exit
```

```
router ospf 100
```

```
redistribute connected
```

```
network 10.1.1.0 0.0.0.255 area 0
```

```
network 11.1.1.0 0.0.0.255
area 0
```

```
network 24.1.1.1 0.0.0.0 area
0
```

```
network 12.1.1.0 0.0.0.255 area 0
```

```
network 13.1.1.0 0.0.0.255 area 0
```

```
mpls traffic-eng area 0
```

Create a virtual interface:

```

router-3(config)# interface Loopback0
router-3(config-if)# ip address 24.1.1.1 255.255.255.255
router-3(config-if)# exit

```

At the physical interface level (ingress):

```

router-3(config)# interface pos2/1
router-3(config-if)# ip address 10.1.1.2 255.0.0.0
router-3(config-if)# mpls traffic-eng tunnels
router-3(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit

router-3(config)# interface pos1/1
router-3(config-if)# ip address 11.1.1.2 255.0.0.0
router-3(config-if)# mpls traffic-eng tunnels
router-3(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit

```

At the physical interface level (egress):

```

router-3(config)# interface pos3/1
router-3(config-if)# ip address 12.1.1.1 255.0.0.0
router-3(config-if)# mpls traffic-eng tunnels
router-3(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit

router-3(config)# interface pos4/1
router-3(config-if)# ip address 13.1.1.1 255.0.0.0
router-3(config-if)# mpls traffic-eng tunnels
router-3(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit

```

## Tunnel Midpoint Configuration [Mid-2]

Both interfaces on the midpoint router are configured identically to the outbound interface of the head router (except, of course, for the IDs of the individual interfaces):

### Configuring the Pools and Tunnel

At the device level:

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <pre> router-5(config)# ip cef distributed router-5(config)# mpls traffic-eng tunnels [now one uses either the IS-IS commands on the left or the OSPF commands on the right]:  router-5(config)# router isis                                 router ospf 100                                 redistribute connected router-5(config-router)# net                                 49.2500.1000.0000.0012.00                                 49.2500.1000.0000.0012.00 </pre> |  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|

```

router-5(config-router)# metric-style wide
router-5(config-router)# is-type level-1

router-5(config-router)# mpls traffic-eng
level-1
router-5(config-router)# passive-interface
Loopback0
[now one resumes the common command set]:

router-5(config-router)# mpls traffic-eng router-id Loopback0
router-5(config-router)# exit

```

```

network 13.1.1.0 0.0.0.255 area 0
network 14.1.1.0 0.0.0.255
area 0
network 25.1.1.1 0.0.0.0 area
0
mpls traffic-eng area 0

```

Create a virtual interface:

```

router-5(config)# interface Loopback0
router-5(config-if)# ip address 25.1.1.1 255.255.255.255
router-5(config-if)# exit

```

At the physical interface level (ingress):

```

router-5(config)# interface pos1/1
router-5(config-if)# ip address 13.1.1.2 255.0.0.0
router-5(config-if)# mpls traffic-eng tunnels
router-5(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-5(config-if)# ip router isis
[and in all cases]:
router-5(config-if)# exit

```

At the physical interface level (egress):

```

router-5(config)# interface pos2/1
router-5(config-if)# ip address 14.1.1.1 255.0.0.0
router-5(config-if)# mpls traffic-eng tunnels
router-5(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-5(config-if)# ip router isis
[and in all cases]:
router-5(config-if)# exit

```

## Tunnel Tail Configuration

The inbound interfaces on the tail router are configured identically to the inbound interfaces of the midpoint routers (except, of course, for the ID of each particular interface):

### Configuring the Pools and Tunnels

At the device level:

```

router-4(config)# ip cef distributed
router-4(config)# mpls traffic-eng tunnels
[now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

router-4(config)# router isis
router-4(config-router)# net
49.0000.2700.0000.0000.00
router-4(config-router)# metric-style wide

```

```

router ospf 100
redistribute connected
network 12.1.1.0 0.0.0.255 area 0

```

```

router-4(config-router)# is-type level-1
router-4(config-router)# mpls traffic-eng level-1
router-4(config-router)# passive-interface Loopback0
[now one resumes the common command set]:
router-4(config-router)# mpls traffic-eng router-id Loopback0
router-4(config-router)# exit

```

```

network 14.1.1.0 0.0.0.255
area 0
network 27.1.1.1 0.0.0.0 area
0
mpls traffic-eng area 0

```

Create a virtual interface:

```

router-4(config)# interface Loopback0
router-4(config-if)# ip address 27.1.1.1 255.255.255.255
router-4(config-if)# exit

```

At the physical interface (ingress):

```

router-4(config)# interface pos2/1
router-4(config-if)# ip address 12.1.1.2 255.0.0.0
router-4(config-if)# mpls traffic-eng tunnels
router-4(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-4(config-if)# ip router isis
[and in all cases]:
router-4(config-if)# exit

router-4(config)# interface pos2/2
router-4(config-if)# ip address 14.1.1.2 255.0.0.0
router-4(config-if)# mpls traffic-eng tunnels
router-4(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-4(config-if)# ip router isis
[and in all cases]:
router-4(config-if)# exit

```

Because the tunnel ends on the tail (does not include any outbound interfaces of the tail router), no outbound QoS configuration is used.

## Example with Many Destination Prefixes

Figure 3 illustrates a topology for guaranteed bandwidth services whose destinations are a set of prefixes. Those prefixes usually share some common properties such as belonging to the same Autonomous System (AS) or transiting through the same AS. Although the individual prefixes may change dynamically because of route flaps in the downstream autonomous systems, the properties the prefixes share will not change. Policies addressing the destination prefix set are enforced through Border Gateway Protocol (BGP), which is described in the following documents:

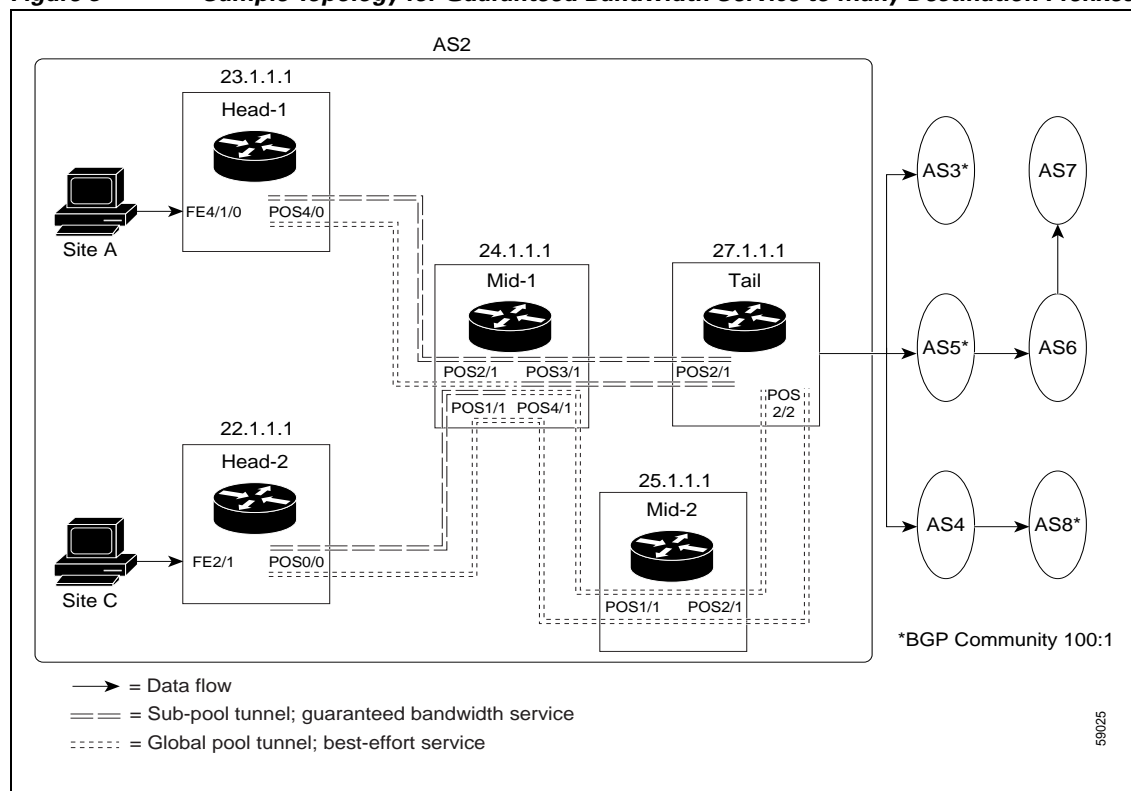

- “Configuring QoS Policy Propagation via Border Gateway Protocol” in the *Cisco IOS Quality of Service Solutions Configuration Guide*, Release 12.1 ([http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/qos\\_c/qcprt1/qcdprop.htm](http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/qos_c/qcprt1/qcdprop.htm))
- “Configuring BGP” in the *Cisco IOS IP and IP Routing Configuration Guide*, Release 12.1 ([http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/ip\\_c/ipcprt2/1cdbgp.htm](http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/ip_c/ipcprt2/1cdbgp.htm))

- “BGP Commands” in the *Cisco IOS IP and IP Routing Command Reference*, Release 12.1 ([http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/ip\\_r/1rprpt2/1rdbgp.htm](http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/ip_r/1rprpt2/1rdbgp.htm))
- “BGP-Policy Command” in the *Cisco IOS Quality of Service Solutions Command Reference*, Release 12.1 ([http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/qos\\_r/qrdcmd1.htm#xtocid89313](http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/qos_r/qrdcmd1.htm#xtocid89313))

In this example, three guaranteed bandwidth services are offered, each coming through a 7500 or a 12000 edge device:

- Traffic coming from Site A (defined as all traffic arriving at interface FE4/1/0) and from Site C (defined as all traffic arriving at interface FE2/1) destined to AS5
- Traffic coming from Sites A and C that transits AS5 but is not destined to AS5. (In the figure, the transiting traffic will go to AS6 and AS7)
- Traffic coming from Sites A and C destined to prefixes advertised with a particular BGP community attribute (100:1). In this example, Autonomous Systems #3, #5, and #8 are the BGP community assigned the attribute 100:1.

**Figure 3 Sample Topology for Guaranteed Bandwidth Service to Many Destination Prefixes**

The applicability of guaranteed bandwidth service is not limited to the three types of multiple destination scenarios described above. There is not room in this document to present all possible scenarios. These three were chosen as representative of the wide range of possible deployments.

The guaranteed bandwidth services run through two sub-pool tunnels:

- From the Head-1 router, 23.1.1.1, to the tail

- From the Head-2 router, 22.1.1.1, to that same tail

In addition, a global pool tunnel has been configured from each head end, to carry best-effort traffic to the same destinations. All four tunnels use the same tail router, even though they have different heads and differ in their passage through the midpoints. (Of course in the real world there would be many more midpoints than just the two shown here.)

All POS interfaces in this example are OC3, whose capacity is 155 Mbps.

Configuring a multi-destination guaranteed bandwidth service involves:

- Building a sub-pool MPLS-TE tunnel
- Configuring DiffServ QoS
- Configuring QoS Policy Propagation via BGP (QPPB)
- Mapping traffic onto the tunnels

All of these tasks are included in the following example.

## Configuration of Tunnel Head-1

First we recapitulate commands that establish a sub-pool tunnel (commands presented earlier on page 13) and now we also configure a global pool tunnel. Additionally, we present QoS and BGP commands that guarantee end-to-end service on the sub-pool tunnel. (With the 7500(VIP) router, Modular QoS CLI is used).

### Configuring the Pools and Tunnels

At the device level:

```
router-1(config)# ip cef distributed
router-1(config)# mpls traffic-eng tunnels
[now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

router-1(config)# router isis                                router ospf 100
router-1(config-router)# net                                 redistribute connected
49.0000.1000.0000.0010.00                                    network 10.1.1.0 0.0.0.255 area 0
router-1(config-router)# metric-style wide                    network 23.1.1.1 0.0.0.0 area
router-1(config-router)# is-type level-1                      0
  mpls traffic-eng area 0

router-1(config-router)# mpls traffic-eng
level-1
[now one resumes the common command set]:

router-1(config-router)# mpls traffic-eng router-id Loopback0
router-1(config-router)# exit
```

Create a virtual interface:

```
router-1(config)# interface Loopback0
router-1(config-if)# ip address 23.1.1.1 255.255.255.255
router-1(config-if)# exit
```

At the outgoing physical interface:

```
router-1(config)# interface pos4/0
router-1(config-if)# ip address 10.1.1.1 255.0.0.0
router-1(config-if)# mpls traffic-eng tunnels
router-1(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
```

```
router-1(config-if)# ip router isis
[and in all cases]:
router-1(config-if)# exit
```

At one tunnel interface, create a sub-pool tunnel:

```
router-1(config)# interface Tunnel1
router-1(config-if)# ip unnumbered Loopback0
router-1(config-if)# tunnel destination 27.1.1.1
router-1(config-if)# tunnel mode mpls traffic-eng
router-1(config-if)# tunnel mpls traffic-eng priority 0 0
router-1(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 40000
router-1(config-if)# tunnel mpls traffic-eng path-option 1 explicit name gbs-path1
router-1(config-if)# exit
```

and at a second tunnel interface, create a global pool tunnel:

```
router-1(config)# interface Tunnel2
router-1(config-if)# ip unnumbered Loopback0
router-1(config-if)# tunnel destination 27.1.1.1
router-1(config-if)# tunnel mode mpls traffic-eng
router-1(config-if)# tunnel mpls traffic-eng priority 0 0
router-1(config-if)# tunnel mpls traffic-eng bandwidth 80000
router-1(config-if)# tunnel mpls traffic-eng path-option 1 explicit name \
best-effort-path1
router-1(config-if)# exit
```

In this example explicit paths are used instead of dynamic, to ensure that best-effort traffic and guaranteed bandwidth traffic will travel along different paths.

At the device level:

```
router-1(config)# ip explicit-path name gbs-path1
router-1(config-ip-expl-path)# next-address 24.1.1.1
router-1(config-ip-expl-path)# next-address 27.1.1.1
router-1(config-ip-expl-path)# exit
router-1(config)# ip explicit-path name best-effort-path1
router-1(config-ip-expl-path)# next-address 24.1.1.1
router-1(config-ip-expl-path)# next-address 25.1.1.1
router-1(config-ip-expl-path)# next-address 27.1.1.1
router-1(config-ip-expl-path)# exit
```

Note that autoroute is not used, as that could cause the Interior Gateway Protocol (IGP) to send other traffic down these tunnels.

## Configuring DiffServ QoS

At the inbound physical interface (in [Figure 3](#) this is FE4/1/0), packets received are rate-limited to:

- a rate of 30 Mbps
- a normal burst of 1 MB
- a maximum burst of 2 MB

Packets that are mapped to qos-group 6 and that conform to the rate-limit are marked with experimental value 5 and the BGP destination community string, and are forwarded; packets that do not conform (exceed action) are dropped:

```
router-1(config)# interface FastEthernet4/1/0
router-1(config-if)# rate-limit input qos-group 6 30000000 1000000 2000000 \
conform-action set-mpls-exp-transmit 5 exceed-action drop
router-1(config-if)# bgp-policy destination ip-qos-map
router-1(config-if)# exit
```

At the device level create a class of traffic called “exp5-class” that has MPLS experimental bit set to 5:

```
router-1(config)# class-map match-all exp5-class
router-1(config-cmap)# match mpls experimental 5
router-1(config-cmap)# exit
```

Create a policy that creates a priority queue for “exp5-class”:

```
router-1(config)# policy-map core-out-policy
router-1(config-pmap)# class exp5-class
router-1(config-pmap-c)# priority 100000
router-1(config-pmap-c)# exit
router-1(config-pmap)# class class-default
router-1(config-pmap-c)# bandwidth 55000
router-1(config-pmap-c)# exit
router-1(config-pmap)# exit
```

The policy is applied to packets exiting the outbound interface POS4/0.

```
router-1(config)# interface POS4/0
router-1(config-if)# service-policy output core-out-policy
```

## Configuring QoS Policy Propagation via BGP

### For All GB Services

Create a table map under BGP to map (tie) the prefixes to a qos-group. At the device level:

```
router-1(config)# ip bgp-community new-format
router-1(config)# router bgp 2
router-1(config-router)# no synchronization
router-1(config-router)# table-map set-qos-group
router-1(config-router)# bgp log-neighbor-changes
router-1(config-router)# neighbor 27.1.1.1 remote-as 2
router-1(config-router)# neighbor 27.1.1.1 update-source Loopback0
router-1(config-router)# no auto-summary
router-1(config-router)# exit
```

### For GB Service Destined to AS5

Create a distinct route map for this service. This includes setting the next-hop of packets matching 29.1.1.1 so they will be mapped onto Tunnel #1 (the guaranteed bandwidth service tunnel). At the device level:

```
router-1(config)# route-map set-qos-group permit 10
router-1(config-route-map)# match as-path 100
router-1(config-route-map)# set ip qos-group 6
router-1(config-route-map)# set ip next-hop 29.1.1.1
router-1(config-route-map)# exit
router-1(config)# ip as-path access-list 100 permit ^5$
```

### For GB Service Transiting through AS5

Create a distinct route map for this service. (Its traffic will go to AS6 and AS7).

At the device level:

```
router-1(config)# route-map set-qos-group permit 10
router-1(config-route-map)# match as-path 101
router-1(config-route-map)# set ip qos-group 6
router-1(config-route-map)# set ip next-hop 29.1.1.1
router-1(config-route-map)# exit
```

```
router-1(config)# ip as-path access-list 101 permit _5_
```

### For GB Service Destined to Community 100:1

Create a distinct route map for all traffic destined to prefixes that have community value 100:1. This traffic will go to AS3, AS5, and AS8.

At the device level:

```
router-1(config)# route-map set-qos-group permit 10
router-1(config-route-map)# match community 20
router-1(config-route-map)# set ip qos-group 6
router-1(config-route-map)# set ip next-hop 29.1.1.1
router-1(config-route-map)# exit
router-1(config)# ip community-list 20 permit 100:1
```

### Mapping Traffic onto the Tunnels

Map all guaranteed bandwidth traffic onto Tunnel #1:

```
router-1(config)# ip route 29.1.1.1 255.255.255.255 Tunnel1
```

Map all best-effort traffic onto Tunnel #2:

```
router-1(config)# ip route 30.1.1.1 255.255.255.255 Tunnel2
```

## Configuration of Tunnel Head-2

As with the Head-1 device and interfaces, the following Head-2 configuration first presents commands that establish a sub-pool tunnel (commands presented earlier on page 13) and then also configures a global pool tunnel. After that it presents QoS and BGP commands that guarantee end-to-end service on the sub-pool tunnel. (Because this is a 7500 (VIP) router, Modular QoS CLI is used).

### Configuring the Pools and Tunnels

At the device level:

|                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>router-2(config)# ip cef distributed router-2(config)# mpls traffic-eng tunnels [now one uses either the IS-IS commands on the left or the OSPF commands on the right]:  router-2(config)# router isis router-2(config-router)# net 49.0000.1000.0000.0011.00 router-2(config-router)# metric-style wide router-2(config-router)# is-type level-1  router-2(config-router)# mpls traffic-eng level-1</pre> | <pre>router ospf 100 redistribute connected network 11.1.1.0 0.0.0.255 area 0 network 22.1.1.1 0.0.0.0 area 0 mpls traffic-eng area 0</pre> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|

[now one resumes the common command set]:

```
router-2(config-router)# mpls traffic-eng router-id Loopback0
router-2(config-router)# exit
```

Create a virtual interface:

```
router-2(config)# interface Loopback0
router-2(config-if)# ip address 22.1.1.1 255.255.255.255
```

```
router-2(config-if)# exit
```

At the outgoing physical interface:

```
router-2(config)# interface pos0/0
router-2(config-if)# ip address 11.1.1.1 255.0.0.0
router-2(config-if)# mpls traffic-eng tunnels
router-2(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 60000
[and if using IS-IS instead of OSPF]:
router-2(config-if)# ip router isis
[and in all cases]:
router-2(config-if)# exit
```

At one tunnel interface, create a sub-pool tunnel:

```
router-2(config)# interface Tunnel3
router-2(config-if)# ip unnumbered Loopback0
router-2(config-if)# tunnel destination 27.1.1.1
router-2(config-if)# tunnel mode mpls traffic-eng
router-2(config-if)# tunnel mpls traffic-eng priority 0 0
router-2(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 30000
router-2(config-if)# tunnel mpls traffic-eng path-option 1 explicit name gbs-path2
router-2(config-if)# exit
```

and at a second tunnel interface, create a global pool tunnel:

```
router-2(config)# interface Tunnel4
router-2(config-if)# ip unnumbered Loopback0
router-2(config-if)# tunnel destination 27.1.1.1
router-2(config-if)# tunnel mode mpls traffic-eng
router-2(config-if)# tunnel mpls traffic-eng priority 0 0
router-2(config-if)# tunnel mpls traffic-eng bandwidth 70000
router-2(config-if)# tunnel mpls traffic-eng path-option 1 explicit name \
best-effort-path2
router-2(config-if)# exit
```

In this example explicit paths are used instead of dynamic, to ensure that best-effort traffic and guaranteed bandwidth traffic will travel along different paths.

At the device level:

```
router-2(config)# ip explicit-path name gbs-path2
router-2(config-ip-expl-path)# next-address 24.1.1.1
router-2(config-ip-expl-path)# next-address 27.1.1.1
router-2(config-ip-expl-path)# exit
router-2(config)# ip explicit-path name best-effort-path2
router-2(config-ip-expl-path)# next-address 24.1.1.1
router-2(config-ip-expl-path)# next-address 25.1.1.1
router-2(config-ip-expl-path)# next-address 27.1.1.1
router-2(config-ip-expl-path)# exit
```

Note that autoroute is not used, as that could cause the Interior Gateway Protocol (IGP) to send other traffic down these tunnels.

## Configuring DiffServ QoS

At the inbound physical interface (in [Figure 3](#) this is FE2/1), packets received are rate-limited to:

- a. a rate of 30 Mbps
- b. a normal burst of 1 MB
- c. a maximum burst of 2 MB

Packets that are mapped to qos-group 6 and that conform to the rate-limit are marked with experimental value 5 and the BGP destination community string, and are forwarded; packets that do not conform (exceed action) are dropped:

```
router-2(config)# interface FastEthernet2/1
router-2(config-if)# rate-limit input qos-group 6 30000000 1000000 2000000 \
conform-action set-mpls-exp-transmit 5 exceed-action drop
router-2(config-if)# bgp-policy destination ip-qos-map
router-1(config-if)# exit
```

At the device level create a class of traffic called “exp5-class” that has MPLS experimental bit set to 5:

```
router-2(config)# class-map match-all exp5-class
router-2(config-cmap)# match mpls experimental 5
router-2(config-cmap)# exit
```

Create a policy that creates a priority queue for “exp5-class”:

```
router-2(config)# policy-map core-out-policy
router-2(config-pmap)# class exp5-class
router-2(config-pmap-c)# priority 100000
router-2(config-pmap-c)# exit
router-2(config-pmap)# class class-default
router-2(config-pmap-c)# bandwidth 55000
router-2(config-pmap-c)# exit
router-2(config-pmap)# exit
```

The policy is applied to packets exiting interface POS0/0:

```
interface POS0/0
 service-policy output core-out-policy
```

As a result of all the above configuration lines, packets entering the Head-2 router via interface FE2/1 and destined for AS5, BGP community 100:1, or transiting AS5 will have their experimental field set to 5. It is assumed that no other packets entering this router (on any interface) are using this exp bit value. (If this cannot be assumed, an additional configuration must be added to mark all such packets with another experimental value.) When exiting this router via interface POS0/0, packets marked with experimental value 5 are placed into the priority queue.

#### Note

Packets entering the router via FE2/1 and exiting through POS0/0 enter as IP packets and exit as MPLS packets.

## Configuring QoS Policy Propagation via BGP

### For All GB Services

Create a table map under BGP to map (tie) the prefixes to a qos-group. At the device level:

```
router-2(config)# ip bgp-community new-format
router-2(config)# router bgp 2
router-2(config-router)# no synchronization
router-2(config-router)# table-map set-qos-group
router-2(config-router)# bgp log-neighbor-changes
router-2(config-router)# neighbor 27.1.1.1 remote-as 2
router-2(config-router)# neighbor 27.1.1.1 update-source Loopback0
router-2(config-router)# no auto-summary
router-2(config-router)# exit
```

### For GB Service Destined to AS5

Create a distinct route map for this service. This includes setting the next-hop of packets matching 29.1.1.1 so they will be mapped onto Tunnel #3 (the guaranteed bandwidth service tunnel). At the device level:

```
router-2(config)# route-map set-qos-group permit 10
router-2(config-route-map)# match as-path 100
router-2(config-route-map)# set ip qos-group 6
router-2(config-route-map)# set ip next-hop 29.1.1.1
router-2(config-route-map)# exit
router-2(config)# ip as-path access-list 100 permit ^5$
```

### For GB Service Transiting through AS5

Create a distinct route map for this service. (Its traffic will go to AS6 and AS7).

At the device level:

```
router-2(config)# route-map set-qos-group permit 10
router-2(config-route-map)# match as-path 101
router-2(config-route-map)# set ip qos-group 6
router-2(config-route-map)# set ip next-hop 29.1.1.1
router-2(config-route-map)# exit
router-2(config)# ip as-path access-list 101 permit _5_
```

### For GB Service Destined to Community 100:1

Create a distinct route map for all traffic destined to prefixes that have community value 100:1. This traffic will go to AS3, AS5, and AS8.

At the device level:

```
router-2(config)# route-map set-qos-group permit 10
router-2(config-route-map)# match community 20
router-2(config-route-map)# set ip qos-group 6
router-2(config-route-map)# set ip next-hop 29.1.1.1
router-2(config-route-map)# exit
router-2(config)# ip community-list 20 permit 100:1
```

### Mapping the Traffic onto the Tunnels

Map all guaranteed bandwidth traffic onto Tunnel #3:

```
router-2(config)# ip route 29.1.1.1 255.255.255.255 Tunnel3
```

Map all best-effort traffic onto Tunnel #4:

```
router-2(config)# ip route 30.1.1.1 255.255.255.255 Tunnel4
```

## Tunnel Midpoint Configuration [Mid-1]

All four interfaces on the midpoint router are configured very much like the outbound interface of the head router. The strategy is to have all mid-point routers in this Autonomous System ready to carry future as well as presently configured sub-pool and global pool tunnels.

### Configuring the Pools and Tunnels

At the device level:

```
router-3(config)# ip cef distributed
```

router-3(config)# **mpls traffic-eng tunnels**  
 [now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

|                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre> router-3(config)# <b>router isis</b> router-3(config-router)# <b>net</b> <b>49.0000.2400.0000.0011.00</b> router-3(config-router)# <b>metric-style wide</b> router-3(config-router)# <b>is-type level-1</b>  router-3(config-router)# <b>mpls traffic-eng</b> <b>level-1</b> router-3(config-router)# router-3(config-router)# router-3(config-router)# router-3(config-router)# </pre> | <pre> router ospf 100 redistribute connected network 10.1.1.0 0.0.0.255 area 0 network 11.1.1.0 0.0.0.255 area 0 network 24.1.1.1 0.0.0.0 area 0 network 12.1.1.0 0.0.0.255 area 0 network 13.1.1.0 0.0.0.255 area 0 mpls traffic-eng area 0 </pre> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

[now one resumes the common command set]:

```

router-3(config-router)# mpls traffic-eng router-id Loopback0
router-3(config-router)# exit

```

Create a virtual interface:

```

router-3(config)# interface Loopback0
router-3(config-if)# ip address 24.1.1.1 255.255.255.255
router-3(config-if)# exit

```

At the physical interface level (ingress):

```

router-3(config)# interface pos2/1
router-3(config-if)# ip address 10.1.1.2 255.0.0.0
router-3(config-if)# mpls traffic-eng tunnels
router-3(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 70000
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit

router-3(config)# interface pos1/1
router-3(config-if)# ip address 11.1.1.2 255.0.0.0
router-3(config-if)# mpls traffic-eng tunnels
router-3(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 70000
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit

```

At the physical interface level (egress), through which two sub-pool tunnels currently exit:

```

router-3(config)# interface pos3/1
router-3(config-if)# ip address 12.1.1.1 255.0.0.0
router-3(config-if)# mpls traffic-eng tunnels
router-3(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 70000
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit

```

At the physical interface level (egress), through which two global pool tunnels currently exit:

```

router-3(config)# interface pos4/1
router-3(config-if)# ip address 13.1.1.1 255.0.0.0
router-3(config-if)# mpls traffic-eng tunnels
router-3(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 70000

```

```
[and if using IS-IS instead of OSPF]:
router-3(config-if)# ip router isis
[and in all cases]:
router-3(config-if)# exit
```

## Tunnel Midpoint Configuration [Mid-2]

Both interfaces on this midpoint router are configured like the outbound interfaces of the Mid-1 router.

### Configuring the Pools and Tunnels

At the device level:

```
router-5(config)# ip cef distributed
router-5(config)# mpls traffic-eng tunnels
```

[now one uses either the IS-IS commands on the left or the OSPF commands on the right]:

|                                                   |                                   |
|---------------------------------------------------|-----------------------------------|
| router-5(config)# <b>router isis</b>              | router ospf 100                   |
| router-5(config-router)# <b>net</b>               | redistribute connected            |
| <b>49.2500.1000.0000.0012.00</b>                  |                                   |
| router-5(config-router)# <b>metric-style wide</b> | network 13.1.1.0 0.0.0.255 area 0 |
| router-5(config-router)# <b>is-type level-1</b>   | network 14.1.1.0 0.0.0.255        |
|                                                   | area 0                            |
| router-5(config-router)# <b>mpls traffic-eng</b>  | network 25.1.1.1 0.0.0.0 area     |
| <b>level-1</b>                                    | 0                                 |
| router-5(config-router)#                          | mpls traffic-eng area 0           |

[now one resumes the common command set]:

```
router-5(config-router)# mpls traffic-eng router-id Loopback0
router-5(config-router)# exit
```

Create a virtual interface:

```
router-5(config)# interface Loopback0
router-5(config-if)# ip address 25.1.1.1 255.255.255.255
router-5(config-if)# exit
```

At the physical interface level (ingress):

```
router-5(config)# interface pos1/1
router-5(config-if)# ip address 13.1.1.2 255.0.0.0
router-5(config-if)# mpls traffic-eng tunnels
router-5(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 70000
[and if using IS-IS instead of OSPF]:
router-5(config-if)# ip router isis
[and in all cases]:
router-5(config-if)# exit
```

At the physical interface level (egress):

```
router-5(config)# interface pos2/1
router-5(config-if)# ip address 14.1.1.1 255.0.0.0
router-5(config-if)# mpls traffic-eng tunnels
router-5(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 70000
[and if using IS-IS instead of OSPF]:
router-5(config-if)# ip router isis
[and in all cases]:
router-5(config-if)# exit
```

## Tunnel Tail Configuration

The inbound interfaces on the tail router are configured much like the outbound interfaces of the midpoint routers:

### Configuring the Pools and Tunnels

At the device level:

```
router-4(config)# ip cef distributed
router-4(config)# mpls traffic-eng tunnels
```

[now one uses either the IS-IS commands on the left or the OSPF commands on the right. In the case of OSPF, one must advertise two new loopback interfaces—29.1.1.1 and 30.1.1.1 in our example—which are defined in the QoS Policy Propagation section, further along on this page]:

|                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>router-4(config)# router isis router-4(config-router)# net 49.0000.2700.0000.0000.00 router-4(config-router)# metric-style wide router-4(config-router)# is-type level-1  router-4(config-router)# mpls traffic-eng level-1  router-4(config-router)#  router-4(config-router)#  router-4(config-router)#</pre> | <pre>router ospf 100 redistribute connected  network 12.1.1.0 0.0.0.255 area 0 network 14.1.1.0 0.0.0.255 area 0 network 27.1.1.1 0.0.0.0 area 0 network 29.1.1.1 0.0.0.0 area 0 network 30.1.1.1 0.0.0.0 area 0  mpls traffic-eng area 0</pre> |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

[now one resumes the common command set, taking care to include the two additional loopback interfaces]:

```
router-4(config-router)# mpls traffic-eng router-id Loopback0
router-4(config-router)# mpls traffic-eng router-id Loopback1
router-4(config-router)# mpls traffic-eng router-id Loopback2
router-4(config-router)# exit
```

Create a virtual interface:

```
router-4(config)# interface Loopback0
router-4(config-if)# ip address 27.1.1.1 255.255.255.255
router-4(config-if)# exit
```

At the physical interface (ingress):

```
router-4(config)# interface pos2/1
router-4(config-if)# ip address 12.1.1.2 255.0.0.0
router-4(config-if)# mpls traffic-eng tunnels
router-4(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 70000
[and if using IS-IS instead of OSPF]:
router-4(config-if)# ip router isis
[and in all cases]:
router-4(config-if)# exit

router-4(config)# interface pos2/2
router-4(config-if)# ip address 14.1.1.2 255.0.0.0
router-4(config-if)# mpls traffic-eng tunnels
router-4(config-if)# ip rsvp bandwidth 140000 140000 sub-pool 70000
[and if using IS-IS instead of OSPF]:
router-4(config-if)# ip router isis
```

```
[and in all cases]:  
router-4(config-if)# exit
```

## Configuring QoS Policy Propagation

On the tail device, one must configure a separate virtual loopback IP address for each class-of-service terminating here. The headend routers need these addresses to map traffic into the proper tunnels. In the current example, four tunnels terminate on the same tail device but they represent only two service classes, so only two additional loopback addresses are needed:

Create two virtual interfaces:

```
router-4(config)# interface Loopback1  
router-4(config-if)# ip address 29.1.1.1 255.255.255.255  
[and if using IS-IS instead of OSPF]:  
router-4(config-if)# ip router isis  
[and in all cases]:  
router-4(config-if)# exit  
router-4(config)# interface Loopback2  
router-4(config-if)# ip address 30.1.1.1 255.255.255.255  
[and if using IS-IS instead of OSPF]:  
router-4(config-if)# ip router isis  
[and in all cases]:  
router-4(config-if)# exit
```

At the device level, configure BGP to send the community to each tunnel head:

```
router-4(config)# ip bgp-community new-format  
router-4(config)# router bgp 2  
router-4(config-router)# neighbor 23.1.1.1 send-community  
router-4(config-router)# neighbor 22.1.1.1 send-community  
router-4(config-router)# exit
```

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the *Cisco IOS Master Commands List*.

- **ip rsvp bandwidth**
- **mpls traffic-eng ds-te bc-model**
- **mpls traffic-eng ds-te mode**
- **show mpls traffic-eng topology**
- **tunnel mpls traffic-eng bandwidth**

# Glossary

This section defines acronyms and words that may not be readily understood.

**AS**—Autonomous System. A collection of networks under a common administration, sharing a common routing strategy and identified by a unique 16-bit number (assigned by the Internet Assigned Numbers Authority).

**BGP**—Border Gateway Protocol. The predominant interdomain routing protocol. It is defined by RFC 1163. Version 4 uses route aggregation mechanisms to reduce the size of routing tables.

**CBR**—Constraint Based Routing. The computation of traffic paths that simultaneously satisfy label-switched path attributes and current network resource limitations.

**CEF**—Cisco Express Forwarding. A means for accelerating the forwarding of packets within a router, by storing route lookup information in several data structures instead of in a route cache.

**CLI**—Command Line Interface. Cisco's interface for configuring and managing its routers.

**DS-TE**—Diff Serv-aware Traffic Engineering. The capability to configure two bandwidth pools on each link, a *global pool* and a *sub-pool*. MPLS traffic engineering tunnels using the sub-pool bandwidth can be configured with Quality of Service mechanisms to deliver guaranteed bandwidth services end-to-end across the network. Simultaneously, tunnels using the global pool can convey DiffServ traffic.

**flooding**—A traffic passing technique used by switches and bridges in which traffic received on an interface is sent out through all of the interfaces of that device except the interface on which the information was originally received.

**GB queue**—Guaranteed Bandwidth queue. A per-hop behavior (PHB) used exclusively by the strict guarantee traffic. If delay/jitter guarantees are sought, the diffserv Expedited Forwarding queue (EF PHB) is used. If only bandwidth guarantees are sought, the diffserv Assured Forwarding PHB (AF PHB) is used.

**Global Pool**—The total bandwidth allocated to an MPLS traffic engineering link.

**IGP**—Interior Gateway Protocol. An internet protocol used to exchange routing information within an autonomous system. Examples of common internet IGP include IGRP, OSPF, and RIP.

**label-switched path (LSP) tunnel**—A configured connection between two routers, using label switching to carry the packets.

**IS-IS**—Intermediate System-to-Intermediate System. A link-state hierarchical routing protocol, based on DECnet Phase V routing, whereby nodes exchange routing information based on a single metric, to determine network topology.

**LCAC**—Link-level (per-hop) call admission control.

**LSP**—Label-switched path (see above).

*Also* Link-state packet—A broadcast packet used by link-state protocols that contains information about neighbors and path costs. LSPs are used by the receiving routers to maintain their routing tables. Also called link-state advertisement (LSA).

**MPLS**—Multi-Protocol Label Switching (formerly known as Tag Switching). A method for directing packets primarily through Layer 2 switching rather than Layer 3 routing, by assigning the packets short fixed-length labels at the ingress to an MPLS cloud, using the concept of forwarding equivalence classes. Within the MPLS domain, the labels are used to make forwarding decisions mostly without recourse to the original packet headers.

**MPLS TE**—MPLS Traffic Engineering (formerly known as “RRR” or Resource Reservation Routing). The use of label switching to improve traffic performance along with an efficient use of network resources.

**OSPF**—Open Shortest Path First. A link-state, hierarchical IGP routing algorithm, derived from the IS-IS protocol. OSPF features include least-cost routing, multipath routing, and load balancing.

**RSVP**—Resource reSerVation Protocol. An IETF protocol used for signaling requests (to set aside internet services) by a customer before that customer is permitted to transmit data over that portion of the network.

**Sub-pool**—The more restrictive bandwidth in an MPLS traffic engineering link. The sub-pool is a portion of the link's overall global pool bandwidth.

**TE**—Traffic engineering. The application of scientific principles and technology to measure, model, and control internet traffic in order to simultaneously optimize traffic performance and network resource utilization.

**Note**

See [Internetworking Terms and Acronyms](#) for terms not included in this glossary.

## **MPLS Traffic Engineering: Path, Link, and Node Protection**

# MPLS Traffic Engineering: Inter-AS TE

---

**First Published: August 09, 2004**

**Last Updated: July 11, 2008**

The MPLS Traffic Engineering: Inter-AS TE feature provides Autonomous System Boundary Router (ASBR) node protection, loose path reoptimization, stateful switchover (SSO) recovery of label-switched paths (LSPs) that include loose hops, ASBR forced link flooding, Cisco IOS Resource Reservation Protocol (RSVP) local policy extensions for interautonomous system (Inter-AS), and per-neighbor keys:

- ASBR node protection—Protects interarea and Inter-AS TE label-switched paths (LSPs) from the failure of an Area Border Router (ABR) or ASBR.
- Loose path reoptimization—Allows a Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnel's LSPs to traverse hops that are not in the tunnel headend router's topology database (that is, they are not in the same Open Shortest Path First (OSPF) area, Intermediate System-to-Intermediate System (IS-IS) level, or autonomous system as the tunnel's headend router).
- Loose hop recovery—Supports SSO recovery of LSPs that include loose hops.
- ASBR forced link flooding—Helps an LSP cross a boundary into another domain when information in the other domain is not available to the headend router.
- Cisco IOS RSVP local policy extensions for Inter-AS—Allows network administrators to create controlled policies for TE tunnels that function across multiple autonomous systems.
- Per-neighbor keys—Allows cryptographic authentication to be accomplished on a per-neighbor basis.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for MPLS Traffic Engineering: Inter-AS TE”](#) section on [page 27](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for MPLS Traffic Engineering: Inter-AS TE

- Enable MPLS.
- Configure TE on routers.
- Ensure that your network supports the following Cisco IOS features:
  - MPLS
  - Cisco Express Forwarding
  - IS-IS or OSPF
- For loose path reoptimization, know how to configure the following:
  - IP explicit paths for MPLS TE tunnels
  - Loose hops
  - Interarea and Inter-AS tunnels

## Restrictions for MPLS Traffic Engineering: Inter-AS TE

### Loose Path Reoptimization

- Midpoint reoptimization is not supported.

### ASBR Forced Link Flooding

- The TE metric and affinity attributes that are known at a headend router (and used as constraints when an LSP's path is computed) are not currently signaled. Consequently, explicit router (ERO) expansions do not consider these constraints.
- Each node in an autonomous system must have a unique router ID.
- The router ID configured on a link must not conflict with the router ID within the autonomous system.

- If a link is configured for forced link flooding, the link's neighbors are not learned by regular Interior Gateway Protocol (IGP) updates. If a link is already learned about neighbors by IGP on a link, you cannot configure the link as passive. Therefore, to configure a link for forced flooding, be sure that the node does not already have a neighbor on that link.

## Information About MPLS Traffic Engineering: Inter-AS TE

To configure the MPLS Traffic Engineering: Inter-AS TE feature, you need to understand the following concepts:

- [MPLS Traffic Engineering Tunnels, page 3](#)
- [Multiarea Network Design, page 3](#)
- [Fast Reroute, page 4](#)
- [ASBR Node Protection, page 4](#)
- [Loose Path Reoptimization, page 7](#)
- [ASBR Forced Link Flooding, page 9](#)
- [Link Flooding, page 11](#)

## MPLS Traffic Engineering Tunnels

MPLS TE lets you build LSPs across your network that you then forward traffic down.

MPLS TE LSPs, also called TE tunnels, let the headend of a TE tunnel control the path its traffic takes to a particular destination. This method is more flexible than forwarding traffic based only on a destination address.

Interarea tunnels allow you to do the following:

- Build TE tunnels between areas (interarea tunnels)
- Build TE tunnels that start and end in the same area, on multiple areas on a router (intra-area tunnels)

Some tunnels are more important than others. For example, you may have tunnels carrying Voice over IP (VoIP) traffic and tunnels carrying data traffic that are competing for the same resources. Or you may simply have some data tunnels that are more important than others. MPLS TE allows you to have some tunnels preempt others. Each tunnel has a priority, and more-important tunnels take precedence over less-important tunnels.

## Multiarea Network Design

You can establish MPLS TE tunnels that span multiple IGP areas and levels. The tunnel headend routers and tailend routers do not have to be in the same area. The IGP can be either IS-IS or OSPF.

To configure an interarea tunnel, use the **next-address loose** command to specify on the headend router a loosely routed explicit path of the LSP that identifies each ABR the LSP should traverse. The headend router and the ABRs along the specified explicit path expand the loose hops, each computing the path segment to the next ABR or tunnel destination.

## Fast Reroute

MPLS Fast Reroute (FRR) is a fast recovery local protection technique that protects TE LSPs from link, shared risk link group (SRLG), and node failure. One or more TE LSPs (called backup LSPs) are preestablished to protect against the failure of a link, node, or SRLG. If there is a failure, each protected TE LSP traversing the failed resource is rerouted onto the appropriate backup tunnels.

The backup tunnel must meet the following requirements:

- It should not pass through the element it protects.
- It should intersect with a primary tunnel at a minimum of two nodes: point of local repair (PLR) and merge point (MP). The PLR should be the headend LSR of the backup tunnel, and the MP should be the tailend LSR of the backup tunnel. The PLR is where FRR is triggered when a link, node, or SRLG failure occurs.
- FRR protection can be performed for an Inter-AS tunnel only if the backup tunnel's merge point can route packets to the PLR's backup tunnel's egress interface. You can configure a static route or you can configure Border Gateway Protocol (BGP) to export the backup tunnel's egress interface to other autonomous systems.
- If the preferred link is a passive link, you must assign an administrative-weight for it. To assign an administrative weight, use the **mpls traffic-eng administrative-weight** command in interface configuration mode.
- Each router must be configured with the **mpls traffic-eng reoptimize events link-up** command in global configuration mode.

## ASBR Node Protection

A TE LSP that traverses an ASBR needs a special protection mechanism (ASBR node protection) because the MP and PLR will be in different autonomous systems that have different IGPs.

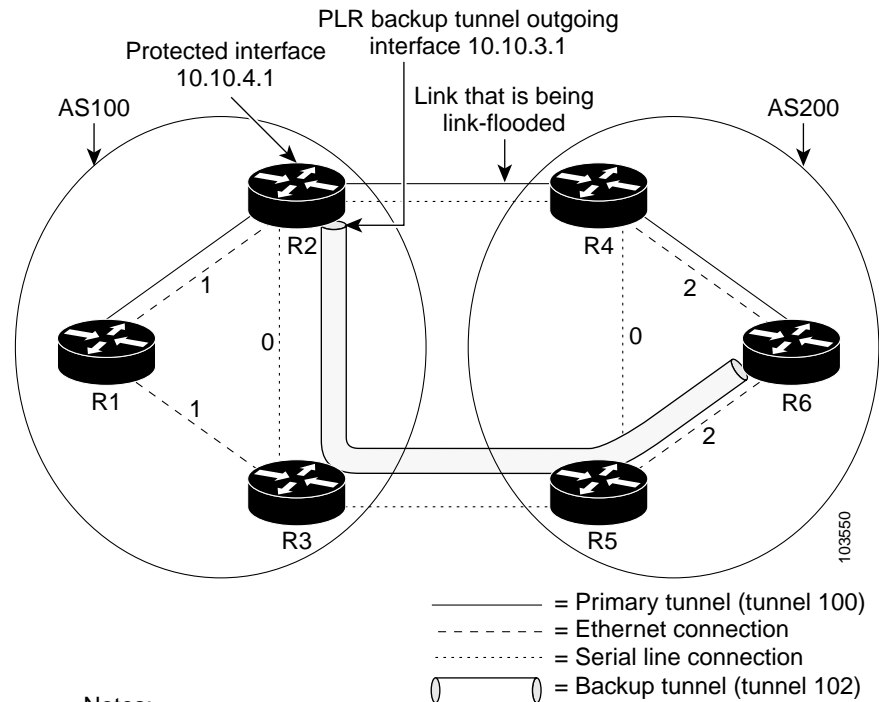

A PLR ensures that the backup tunnel intersects with the primary tunnel at the MP by examining the Record Route Object (RRO) of the primary tunnel to see if any addresses specified in the RRO match the destination of the backup tunnel.

Addresses specified in RRO IPv4 and IPv6 subobjects can be node-IDs and interface addresses. The traffic engineering RFC 3209 specifies that you can use a router address or interface address, but recommends using the interface address of outgoing path messages. Therefore, in [Figure 1](#) router R2 is more likely to specify interface addresses in the RRO objects carried in the resv messages of the primary tunnel (T1) and the backup tunnel.

Node IDs allow the PLR to select a suitable backup tunnel by comparing node IDs in the resv RRO to the backup tunnel's destination.

RSVP messages that must be routed and forwarded to the appropriate peer (for example, an resv message) require a route from the MP back to the PLR for the RSVP messages to be delivered. The MP needs a route to the PLR backup tunnel's outgoing interface for the resv message to be delivered. Therefore, you must configure a static route from the MP to the PLR. For the configuration procedure, see the [“Configuring a Static Route from the MP to the PLR”](#) section on page 14.

[Figure 1](#) illustrates ASBR node protection. Router R4 is node-protected with a backup tunnel from R2-R3-R5-R6.

**Figure 1 ASBR Node Protection****Notes:**

There are two autonomous systems.  
 The numbers within the Ethernet serial connection indicate the OSPF area number.  
 There is no IGP between R2 and R4, and R3 and R5.

In this configuration, IP addresses are as follows:

- R1—Loopback0 10.10.0.1
  - Ethernet 0—IP address of 10.10.1.1 is connected to R2 Ethernet 0
  - Ethernet 1—IP address of 10.10.2.1 is connected to R3 Ethernet 1
- R2—Loopback0 10.10.0.2
  - Ethernet 0—IP address of 10.10.1.2 is connected to R1 Ethernet 0
  - Ethernet 1—IP address of 10.10.3.1 is connected to R3 Ethernet 1
  - Serial 2—IP address of 10.10.4.1 is connected to R4 serial 2
- R3—Loopback0 10.10.0.3
  - Ethernet 0—IP address of 10.10.2.2 is connected to R1 Ethernet 1
  - Ethernet 1—IP address of 10.10.3.2 is connected to R2 Ethernet 1
  - Serial 2—IP address of 10.10.5.1 is connected to R5 serial 2
- R4—Loopback0 10.10.0.4
  - Ethernet 0—IP address of 10.10.7.1 is connected to R6 Ethernet 0
  - Ethernet 1—IP address of 10.10.6.1 is connected to R5 Ethernet 1
  - Serial 2—IP address of 10.10.4.2 is connected to R2 serial 2
- R5—Loopback0 10.10.0.5

- Ethernet 0—IP address of 10.10.8.1 is connected to R6 Ethernet 0
- Ethernet 1—IP address of 10.10.6.2 is connected to R4 Ethernet 1
- Serial 2—IP address of 10.10.5.2 is connected to R3 serial 2
- R6—Loopback0 10.10.0.6
  - Ethernet 0—IP address of 10.10.7.2 is connected to R4 Ethernet 0
  - Ethernet 1—IP address of 10.10.8.2 is connected to R5 Ethernet 1

In [Figure 1](#), the following situations exist:

- Routers R1, R2, and R3 are in AS 100. The R1-R2 and R1-R3 links are in OSPF area 1.
- Routers R4, R5, and R6 are in AS200. The R4-R6 and R5-R6 links are in OSPF area 2.
- The link R2-R3 is in AS100, and link R4-R5 is in AS200. The links R2-R3 and R4-R5 are in OSPF area 0.
- The links R2-R4 and R3-R5 are not running an IGP because they cross the Inter-AS boundary between AS100 and AS200. Because they are not running IGP, you must configure an administrative weight for each passive interface for FRR to work. Use the **mpls traffic-eng administrative-weight** command in interface configuration mode.
- There is a primary tunnel, tunnel 100, from R1-R2-R4-R6.
- There is a backup tunnel, tunnel 102, from R2-R3-R5-R6.
- There is a TE tunnel, tunnel 101, from R6-R5-R3-R1 for returning data traffic for tunnel 100.
- There is a TE tunnel, tunnel 103, from R6-R5-R3-R2 for returning data traffic for tunnel 102.
- The explicit paths of all the tunnels use loose hops.
- The R2-R4 link is configured to be link flooded in both R2's and R4's IGP. The R3-R5 link is configured to be link flooded in both R3's and R5's IGP.

Router R2 needs to ensure the following:

- Backup tunnel intersects with the primary tunnel at the MP, and therefore has a valid MP address. In [Figure 1](#), R2 needs to determine that tunnel 100 and backup tunnel 102 share MP node R6.
- Backup tunnel satisfies the request of the primary LSP for bandwidth protection. For example, the amount of bandwidth guaranteed for the primary tunnel during a failure, and the type of protection (preferably protecting against a node failure rather than a link failure).

### Node-IDs Signaling in RROs

ASBR node protection includes a node-ID flag (0x20), which is also called a node-ID subobject. When it is set, the flag indicates that the address specified in the RRO object in the resv message is the node-ID address. The node-ID address refers to the traffic engineering router ID.

A node must always use the same address in the RRO (that is, it must use IPv4 or IPv6, but not both).

To display all the hops, enter the following command on the headend router. Sample command output is as follows:

```
Router(config)# show ip rsvp reservations detail
```

```
Reservation:
```

```
Tun Dest: 10.10.0.6 Tun ID: 100 Ext Tun ID: 10.10.0.1
Tun Sender: 10.10.0.1 LSP ID: 31
Next Hop: 10.10.1.2 on Ethernet0/0
Label: 17 (outgoing)
Reservation Style is Shared-Explicit, QoS Service is Controlled-Load
Average Bitrate is 10K bits/sec, Maximum Burst is 1K bytes
```

```

Min Policed Unit: 0 bytes, Max Pkt Size: 0 bytes
RRO:
  10.10.0.2/32, Flags:0x29 (Local Prot Avail/to NNHOP, Is Node-id)
  10.10.4.1/32, Flags:0x9 (Local Prot Avail/to NNHOP)
    Label subobject: Flags 0x1, C-Type 1, Label 17
  10.10.0.4/32, Flags:0x20 (No Local Protection, Is Node-id)
  10.10.7.1/32, Flags:0x0 (No Local Protection)
    Label subobject: Flags 0x1, C-Type 1, Label 17
  10.10.0.6/32, Flags:0x20 (No Local Protection, Is Node-id)
  10.10.7.2/32, Flags:0x0 (No Local Protection)
    Label subobject: Flags 0x1, C-Type 1, Label 0
Resv ID handle: 0100040E.
Status:
Policy: Accepted. Policy source(s): MPLS/TE

```

For a description of the fields, see the *Cisco IOS Quality of Service Solutions Command Reference*.

### Addition of the Node-ID Subobject

When a fast reroutable LSP is signaled, the following actions occur:

- An LSR adds a node-ID subobject and an incoming label subobject in the resv message.
- If there is an RRO object in the path message, an LSR adds a node-ID subobject, an RRO IPv4 subobject that records the interface address, and an incoming label subobject in the resv message.

If you enable record-route on the headend LSR, the interface addresses for the LSP are included in the RRO object of the resv message.

To enable record-route, enter the following command with the **record-route** keyword:

```
tunnel mpls traffic-eng record-route
```

### Processing of an RRO with Node-ID Subobjects

The node-ID subobject is added to the RECORD\_ROUTE object before the label route subobject. If RECORD\_ROUTE is turned on, the RRO object consists of the following in this order: node-ID, interface address, and label.

### Merge Point Location

The destination of the backup tunnel is the node-ID of the MP. A PLR can find the MP and appropriate backup tunnel by comparing the destination address of the backup tunnel with the node-ID subobjects included in the resv RRO for the primary tunnel.

When both the IPv4 node-ID and IPv6 node-ID subobjects are present, a PLR can use either or both of them to find the MP address.

### Determination of Backward Compatibility

To remain compatible with nodes that do not support RRO IPv4 or IPv6 node-ID subobjects, a node can ignore those objects. Those nodes cannot be the MP in a network with interarea or Inter-AS traffic engineering.

## Loose Path Reoptimization

### Interarea and Inter-AS LSPs

If the LSP of an MPLS TE tunnel traverses hops that are not in the headend router's topology database (that is, the hops are in a different OSPF area or IS-IS level), the LSP is called an *interarea TE LSP*.

If the LSP of the tunnel traverses hops that are in a different autonomous system (AS) from the tunnel's headend router, the LSP is called an *Inter-AS TE LSP*.

Interarea LSPs and Inter-AS TE LSPs can be signaled using loose hop subobjects in their EROs. The headend does not have “strict” knowledge of hops beyond its area, so the LSP's path is “loosely” specified at the headend. Downstream routers processing these loose hop subobjects (which do have the knowledge) are relied upon to expand them into strict hops.

### Loose Hop Configuration

Beyond the headend area, configure hops as loose hops. Typically you specify only the ABRs and the tailend router of a tunnel, but any other combination is allowed.

### Loose Hop Expansion

Loose hop expansion is the conversion of a single ERO loose hop subobject into one or more strict hop subobjects.

Interarea and Inter-AS TE LSPs can be signaled using loose hop subobjects in their EROs. When a router receives a path message containing an ERO that has a loose hop as the next address, the router typically expands the ERO by converting the single loose hop subobject into one or more strict hop subobjects. The router typically has the knowledge, in its topology database, of the best way to reach the loose hop and computes this path by using constraint-based shortest path first (CSPF). So the router substitutes this more specific information for the loose hop subobject found in the ERO. This process is called loose hop expansion or ERO expansion.

Loose hop expansions can occur at one or more hops along an LSP's path. This process is referred to as loose path reoptimization.

### Tunnel Reoptimization Procedure

Tunnel reoptimization is the signaling of an LSP that is more optimal than the LSP a TE tunnel is currently using (for example, it may be shorter or may have a lower cost), and the switching over of the tunnel's data to use this new LSP.

The new more optimal TE LSP is always established and the data moved onto it before the original LSP is torn down (so it is called the “make before break” procedure). This ensures that no data packets are lost during the transition to the new LSP.

For tunnel reoptimization to function:

- Each router must be configured with the **mpls traffic-eng reoptimize events link-up** command.
- Each passive link must have an assigned administrative weight. To configure an administrative weight, use the **mpls traffic-eng administrative-weight** command in interface configuration mode.

The TE LSPs reoptimization process is triggered under the following circumstances:

- Periodically (based on a timer)
- User entered a command (**mpls traffic-eng reoptimize**) requesting reoptimization
- Network event, such as a link-up

Regardless of how reoptimization is triggered, the headend router reoptimizes a tunnel only if it can find a better path than the one the tunnel currently uses. If there is not a better path in the local topology database, no new LSP is signaled and reoptimization does not occur.

Prior to the addition of loose path reoptimization, interarea TE LSPs were not reoptimized if a better path became available in any area beyond the headend area. This is because the headend router was not capable of finding a better path when the better path existed in an area beyond its view (that is, it was not in its local topology database).

With the addition of loose path reoptimization, a tunnel's headend can reoptimize LSPs even if they span multiple areas, levels, or autonomous systems. This is done via the implementation of a query and response protocol defined in *draft-vasseur-mpls-loose-path-reopt-02.txt*. This draft defines a protocol whereby a tunnel's headend may query downstream routers to perform ERO expansion for this tunnel's LSP. These downstream routers respond in the affirmative if they can find a more optimal path than the one in use. (This is done via a new ERO expansion.) Having received an affirmative answer to its query, a headend signals a new LSP for the tunnel, and the new LSP benefits from a new ERO expansion along the better path.

Loose path reoptimization is on by default, and cannot be disabled. Whenever an LSP reoptimization is attempted but the headend fails to find a better path, if the LSP contains loose ERO subobjects, a query is sent downstream to determine whether downstream routers can find a better path. If an affirmative answer comes back, the LSP is reoptimized. That is, a new LSP is signaled (which will follow the better path), the tunnel's data packets are switched over to use this new LSP, and the original LSP is torn down.

For details on this query and response protocol, see *draft-vasseur-mpls-loose-path-reopt-02.txt*.

## ASBR Forced Link Flooding

When you configure forced link flooding on an interface, the MPLS TE link management module advertises the link to all nodes. As a result of this advertisement, the TE topology database on all the nodes within the Inter-AS is updated with this information.

ASBR forced link flooding allows the links to be advertised even if IGP adjacencies are not running over these links. TE LSPs can traverse these links at the edge of a network between two nodes running BGP (or static routes) even if the exit ASBR is not listed in the IP explicit path. Therefore, a headend LSR can consider that link when it computes its TE LSP path.

### Configuration of ASBR Forced Link Flooding

To activate ASBR forced link flooding, configure a link as passive and provide neighbor information (that is, the neighbor IGP ID and the neighbor TE ID). The required configuration tasks are described in the [“Configuring a Static Route from the MP to the PLR”](#) section on page 14.

### Link Flooding

A passive link is configured on an interface of an ASBR. The link is flooded in the ASBR's IGP. All the links are flooded as point-to-point links.

Flooding notifications are also sent when there is a change to a link's property.

### OSPF Flooding

OSPF floods opaque link-state advertisement (LSA) Type 10 link information.

If a multiaccess link has more than one neighbor, a Type 10 LSA is advertised for each neighbor. In the topology database, neighbors are represented by point-to-point neighbor relationships.

### Link TLV

A link TLV describes a single link and contains multiple sub-TLVs.

An opaque LSA contains a single link TLV.

For each ASBR-to-ASBR link, an ASBR must flood an opaque LSA containing one link TLV that has the link's attributes.

A link TLV comprises the following sub-TLVs:

- Link type (1 octet)—(Required) Defines the type of the link. The link type of a passive interface always is 1 (point-to-point), even for a multiaccess subnetwork.
- Link ID (4 octets)—(Required) Identifies the other end of the link for a point-to-point link. Includes the system ID of the neighbor, requires static configuration for a multiaccess ASBR-to-ASBR link, and includes the system ID of the neighbor.
- Local interface IP address (4 octets)—Specifies the IP addresses of the neighbor's interface corresponding to this link.
- Remote interface IP address (4 octets)—Specifies the IP addresses of the neighbor's interface corresponding to this link. The remote interface IP address is set to the router ID of the next hop. There must be a static configuration for the ASBR-to-ASBR link.
- Traffic engineering metric (4 octets)
- Maximum bandwidth (4 octets)
- Maximum reservable bandwidth (4 octets)
- Unreserved bandwidth (32 octets)
- Administrative group (4 octets)

### IS-IS TLV

In IS-IS, when autonomous system A1 floods its LSP, it includes the system ID and a pseudonode number.

If three autonomous systems are connected to a multiaccess network LAN, each link is considered to be a point-to-point link. The links are marked with the maximum metric value so that the inter-ASBR links are considered by CSPF and not by shortest path first (SPF).

TE uses the protocol TLV type 22, which has the following data structure:

- System ID and pseudonode number node (7 octets)
- Default metric (3 octets)
- Length of sub-TLVs (1 octet)
- Sub-TLVs (0 to 244 octets), where each sub-TLV consists of a sequence of the following: 1 octet for subtype, 1 octet for the length of the value field of the sub-TLV, and 0 to 242 octets for the value

Table 1 defines the sub-TLVs.

**Table 1**                      **Sub-TLVs**

| Sub-TLV | Length (Octets) | Name                                                                                                   |
|---------|-----------------|--------------------------------------------------------------------------------------------------------|
| 3       | 4               | Administrative group (color).                                                                          |
| 6       | 4               | IPv4 address for the interface described by the main TLV.                                              |
| 8       | 4               | IPv4 address for a neighboring router on this link. This will be set to the router ID of the next hop. |
| 9       | 4               | Maximum link bandwidth.                                                                                |
| 10      | 4               | Reservable link bandwidth.                                                                             |
| 11      | 32              | Unreserved bandwidth.                                                                                  |
| 18      | 3               | TE default metric.                                                                                     |

**Table 1**      **Sub-TLVs (continued)**

| Sub-TLV    | Length (Octets) | Name                                    |
|------------|-----------------|-----------------------------------------|
| 250 to 254 | —               | Reserved for Cisco-specific extensions. |
| 255        | —               | Reserved for future expansion.          |

**Note**

The TE router ID is TLV type 134.

**Topology Database**

When the topology database module receives a link-state advertisement (LSA), the module scans the LSA to find the neighbors of the links. The ASBR link is part of the same LSA and is installed in the TE topology database like any other link.

During the CSPF operation, the TE headend module uses the TE topology database to find a path to the destination. Because the Inter-AS links are part of the TE topology database, the CSPF operation uses these links to compute the LSP path.

## Link Flooding

The IGP floods information about a link in the following situations:

- When a link goes down
- When a link's configuration is changed (for example, when the link cost is modified)
- When it is time to periodically reflood the router's IGP information
- When link bandwidth changes significantly

Flooding is a little different in IS-IS and OSPF. In OSPF, only information about the link that has changed is flooded, because a Type 10 LSA contains a single link advertisement. In IS-IS, information about all links on a node is flooded even if only one has changed, because the Type 22 TLV contains a list of all links on the router.

## How to Configure MPLS Traffic Engineering: Inter-AS TE

This section contains the following procedures for configuring MPLS Traffic Engineering: Inter-AS TE:

- [Configuring Loose Hops, page 12](#)
- [Configuring a Static Route from the MP to the PLR, page 14](#)
- [Configuring ASBR Forced Link Flooding, page 15](#)

**Note**

There is no configuration procedure for loose path reoptimization.

## Configuring Loose Hops

The section describes how to do the following so that there can be loose hops:

- [Configuring an Explicit Path on the Tunnel That Will Cross the Inter-AS Link, page 12](#) (required)
- [Configuring a Route to Reach the Remote ASBR, page 14](#) (required)

### Configuring an Explicit Path on the Tunnel That Will Cross the Inter-AS Link

If you want a tunnel to span multiple networks, configure an explicit path on the tunnel that will cross the Inter-AS link by performing the following steps.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip explicit-path {name *path-name* | identifier *number*} [enable | disable]**
4. **next-address loose *A.B.C.D***
5. **interface tunnel *number***
6. **tunnel mpls traffic-eng fast-reroute**
7. **mpls traffic-eng reoptimize events link-up**

#### DETAILED STEPS

|        | Command or Action                                                                                                                                                            | Purpose                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                     |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                               | Enters global configuration mode.                                                                                                                                                                                                       |
| Step 3 | <b>ip explicit-path {name <i>path-name</i>   identifier <i>number</i>} [enable   disable]</b><br><br><b>Example:</b><br>Router(config)# ip explicit-path identifier 2 enable | Enters the subcommand mode for IP explicit paths and creates or modifies the explicit path. This command places the router in IP explicit path configuration mode.                                                                      |
| Step 4 | <b>next-address loose <i>A.B.C.D</i></b><br><br><b>Example:</b><br>Router(cfg-ip-expl-path)# next-address loose 10.10.0.2                                                    | Specifies the next loose IP address in the explicit path. Each area border router (ABR) the path must traverse should be specified in a <b>next-address loose</b> command. This command places the router in global configuration mode. |

|        | Command or Action                                                                                                                      | Purpose                                                                                                        |
|--------|----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>interface tunnel <i>number</i></b><br><br><b>Example:</b><br>Router(config)# interface tunnel 100                                   | Configures a tunnel interface. This command places the router in interface configuration mode.                 |
| Step 6 | <b>tunnel mpls traffic-eng fast-reroute</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng fast-reroute          | Enables an MPLS traffic engineering tunnel to use an established backup tunnel in the event of a link failure. |
| Step 7 | <b>mpls traffic-eng reoptimize events link-up</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng reoptimize events link-up | Enables automatic reoptimization of MPLS traffic engineering when an interface becomes operational.            |

## Configuring a Route to Reach the Remote ASBR

To configure a route to reach the remote ASBR, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip route prefix mask {ip-address | interface-type interface-number}**

### DETAILED STEPS

|        | Command or Action                                                                   | Purpose                                                                                                               |
|--------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
|        | <b>Example:</b><br>Router> enable                                                   |                                                                                                                       |
| Step 2 | <b>configure terminal</b>                                                           | Enters global configuration mode.                                                                                     |
|        | <b>Example:</b><br>Router# configure terminal                                       |                                                                                                                       |
| Step 3 | <b>ip route prefix mask {ip-address   interface-type interface-number}</b>          | Establishes static routes.                                                                                            |
|        | <b>Example:</b><br>Router(config)# ip route 10.10.0.1<br>255.255.255.255 tunnel 101 |                                                                                                                       |

## Configuring a Static Route from the MP to the PLR

To enable Fast Reroute protection that spans across different autonomous systems, configure a static route from the MP to the PLR by performing the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip route prefix mask ip-address outgoing-interface**

## DETAILED STEPS

|        | Command or Action                                                                                                                                               | Purpose                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                  | Enters global configuration mode.                                                                                |
| Step 3 | <b>ip route prefix mask ip-address outgoing-interface</b><br><br><b>Example:</b><br>Router(config)# ip route 10.10.3.1 255.255.255.255 10.0.0.0 FastEthernet0/0 | Establishes static routes.<br><br><b>Note</b> Enter this command on the MP. The destination is the PLR.          |

## Configuring ASBR Forced Link Flooding

This section describes how to do the following so that you can configure ASBR forced link flooding:

- [Configuring the Inter-AS Link as a Passive Interface Between Two ASBRs, page 15](#) (required)
- [Creating LSPs Traversing the ASBRs, page 16](#)(required)
- [Configuring Multiple Neighbors on a Link, page 18](#) (optional)

## Configuring the Inter-AS Link as a Passive Interface Between Two ASBRs

To configure the Inter-AS link as a passive interface between two ASBRs, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type slot/port**
4. **ip address ip-address mask [secondary]**
5. **mpls traffic-eng passive-interface nbr-te-id te-router-id [nbr-if-addr if-addr] [nbr-igp-id {isis sysid | ospf sysid}]**
6. **mpls traffic-eng administrative-weight weight**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                  | Purpose                                                                                                                                                       |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> <code>enable</code>                                                                                                                                                                                                          | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                             |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# <code>configure terminal</code>                                                                                                                                                                                  | Enters global configuration mode.                                                                                                                             |
| Step 3 | <code>interface type slot/port</code><br><br><b>Example:</b><br>Router(config)# <code>interface serial 2/0</code>                                                                                                                                                                  | Specifies an interface and enters interface configuration mode.                                                                                               |
| Step 4 | <code>ip address ip-address mask [secondary]</code><br><br><b>Example:</b><br>Router(config-if)# <code>ip address 10.10.4.1 255.255.255.0</code>                                                                                                                                   | Sets a primary or secondary IP address for an interface.                                                                                                      |
| Step 5 | <code>mpls traffic-eng passive-interface nbr-te-id te-router-id [nbr-if-addr if-addr] [nbr-igp-id {isis sysid   ospf sysid}]</code><br><br><b>Example:</b><br>Router(config-if)# <code>mpls traffic-eng passive-interface nbr-te-id 10.10.11.12 nbr-igp-id ospf 10.10.15.18</code> | Configures a link as a passive interface between two ASBRs.<br><br><b>Note</b> For an RSVP Hello configuration on the Inter-AS link, all fields are required. |
| Step 6 | <code>mpls traffic-eng administrative-weight weight</code><br><br><b>Example:</b><br>Router(config-if)# <code>mpls traffic-eng administrative-weight 20</code>                                                                                                                     | Overrides the Interior Gateway Protocol (IGP) administrative weight (cost) of the link and assigns a specific weight for the link.                            |

## Creating LSPs Traversing the ASBRs

To create LSPs traversing the ASBRs, perform the following steps.

**Note**

Perform Steps 3 through 7 for the primary LSP and then for the backup LSP.

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip explicit path name enable`
4. `next-address loose A.B.C.D`
5. `interface tunnel number`

6. **tunnel mpls traffic-eng fast-reroute**
7. **tunnel mpls traffic-eng path-option** *number* { **dynamic** | **explicit** | { **name** *path-name* | *path-number* } } [**lockdown**]

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                   | Purpose                                                                                                          |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                      | Enters global configuration mode.                                                                                |
| Step 3 | <b>ip explicit path name enable</b><br><br><b>Example:</b><br>Router(config)# ip explicit path routel enable                                                                                                                                                        | Specifies the name of the explicit path and enables the path.                                                    |
| Step 4 | <b>next-address loose A.B.C.D</b><br><br><b>Example:</b><br>Router(config)# next-address loose 10.10.10.2                                                                                                                                                           | Configures a loose hop.                                                                                          |
| Step 5 | <b>interface tunnel number</b><br><br><b>Example:</b><br>Router(config)# interface tunnel 100                                                                                                                                                                       | Configures a tunnel interface and enters interface configuration mode.                                           |
| Step 6 | <b>tunnel mpls traffic-eng fast-reroute</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng fast-reroute                                                                                                                                       | Enables an MPLS traffic engineering tunnel to use an established backup tunnel in the event of a link failure.   |
| Step 7 | <b>tunnel mpls traffic-eng path-option</b> <i>number</i> { <b>dynamic</b>   <b>explicit</b>   { <b>name</b> <i>path-name</i>   <i>path-number</i> } } [ <b>lockdown</b> ]<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng path-option 1 routel | Configures a path option for an MPLS traffic engineering tunnel.                                                 |

## Configuring Multiple Neighbors on a Link

To configure multiple neighbors on a link, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **mpls traffic-eng passive-interface** [*nbr-te-id*] [*router-id | te-id*] [*nbr-igp-id*] [*isis sysid | ospf sysid*]
5. **mpls traffic-eng administrative-weight** *weight*

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                     | Purpose                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                        | Enters global configuration mode.                                                                                                  |
| Step 3 | <b>interface</b> <i>type slot/port</i><br><br><b>Example:</b><br>Router(config)# interface serial 2/0                                                                                                                                                                                 | Specifies an interface and enters interface configuration mode.                                                                    |
| Step 4 | <b>mpls traffic-eng passive-interface</b> [ <i>nbr-te-id</i> ] [ <i>router-id   te-id</i> ] [ <i>nbr-igp-id</i> ] [ <i>isis sysid   ospf sysid</i> ]<br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng passive-interface nbr-te-id 10.10.0.4<br>nbr-igp-id ospf 10.10.0.4 | Configures a link as a passive link.                                                                                               |
| Step 5 | <b>mpls traffic-eng administrative-weight</b> <i>weight</i><br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng administrative-weight 20                                                                                                                                    | Overrides the Interior Gateway Protocol (IGP) administrative weight (cost) of the link and assigns a specific weight for the link. |

### Troubleshooting Tips

The following debug commands are useful for troubleshooting issues with MPLS Traffic Engineering: Inter-AS TE.

**Note**

The **debug** commands are described in detail in the *Cisco IOS Debug Command Reference*, Release 12.4.

**Debugging Headend of TE LSPs**

```
debug mpls traffic-eng path lookup
debug mpls traffic-eng path verify
debug mpls traffic-eng path spf
```

**Debugging Head and Midpoint (Link-Related Debugs)**

```
debug mpls traffic-eng link-management igp-neighbors
debug mpls traffic-eng link-management advertisements
debug mpls traffic-eng link-management bandwidth-allocation
debug mpls traffic-eng link-management routing
```

## Verifying the Inter-AS TE Configuration

To verify the Inter-AS TE configuration, perform the following steps.

**Note**

Perform Step 1 for Fast Reroute ready, and Step 2 for Fast Reroute active.

### SUMMARY STEPS

1. **show ip rsvp sender detail**
2. **show ip rsvp sender detail**
3. **show mpls traffic-eng link-management advertisements**

### DETAILED STEPS

#### Step 1 **show ip rsvp sender detail**

Use this command to display the MP sender display for the primary tunnel when Fast Reroute is ready.

```
Router# show ip rsvp sender detail
```

```
PATH:
Tun Dest: 10.10.0.6 Tun ID: 100 Ext Tun ID: 10.10.0.1
Tun Sender: 10.10.0.1 LSP ID: 31
Path refreshes:
  arriving: from PHOP 10.10.7.1 on Et0/0 every 30000 msecs
Session Attr:
  Setup Prio: 7, Holding Prio: 7
  Flags: (0x7) Local Prot desired, Label Recording, SE Style
  session Name: Rl_t100
ERO: (incoming)
  10.10.7.2 (Strict IPv4 Prefix, 8 bytes, /32)
  10.10.0.6 (Strict IPv4 Prefix, 8 bytes, /32)
RRO:
  10.10.7.1/32, Flags:0x0 (No Local Protection)
  10.10.4.1/32, Flags:0x9 (Local Prot Avail/to NNHOP) !Available to NNHOP
  10.10.1.1/32, Flags:0x0 (No Local Protection)
Traffic params - Rate: 10K bits/sec, Max. burst: 1K bytes
Min Policed Unit: 0 bytes, Max Pkt Size 4294967295 bytes
```

```
Fast-Reroute Backup info:
  Inbound FRR: Not active
  Outbound FRR: No backup tunnel selected
Path ID handle: 50000416.
Incoming policy: Accepted. Policy source(s): MPLS/TE
Status: Proxy-terminated
```

## Step 2 show ip rsvp sender detail

Use this command to display the MP sender display when the primary tunnel is Fast Reroute active:

```
Router# show ip rsvp sender detail
```

```
PATH:
Tun Dest: 10.10.0.6 Tun ID: 100 Ext Tun ID: 10.10.0.1
Tun Sender: 10.10.0.1 LSP ID: 31
Path refreshes:
  arriving: from PHOP 10.10.3.1 on Et1/0 every 30000 msec
Session Attr:
  Setup Prio: 7, Holding Prio: 7
  Flags: (0x7) Local Prot desired, Label Recording, SE Style
  Session Name: R1_t100
ERO: (incoming)
  10.10.0.4 (Strict IPv4 Prefix, 8 bytes, /32)
  10.10.0.6 (Loose IPv4 Prefix, 8 bytes, /32)
RRO:
  10.10.3.1/32, Flags:0xB (Local Prot Avail/In Use/to NNHOP) !Ready
  10.10.1.1/32, Flags:0x0 (No Local Protection)
Traffic params - Rate: 10K bits/sec, Max. burst: 1K bytes
Min Policed Unit: 0 bytes, Max Pkt Size 4294967295 bytes
Fast-Reroute Backup info:
  Inbound FRR: Active
  Orig Input I/F: Et0/0
  Orig PHOP: 10.10.7.1
  Now using Bkup Filterspec w/ sender: 10.10.3.1 LSP ID: 31
  Outbound FRR: No backup tunnel selected
Path ID handle: 50000416.
Incoming policy: Accepted. Policy source(s): MPLS/TE
Status: Proxy-terminated
```

## Step 3 show mpls traffic-eng link-management advertisements

Use this command to display the influence of a passive link. On R2, the passive link to R4 is in the Link ID:: 1 section.

```
Router# show mpls traffic-eng link-management advertisements
```

```
Flooding Status: ready
Configured Areas: 2
IGP Area[1] ID:: ospf 1 area 0
System Information::
  Flooding Protocol: OSPF
Header Information::
  IGP System ID: 10.10.0.2
  MPLS TE Router ID: 10.10.0.2

## Configuration Examples for MPLS Traffic Engineering: Inter-AS TE

This section provides the following configuration examples for MPLS Traffic Engineering: Inter-AS TE:

- [Configuring Loose Hops: Examples, page 21](#)
- [Configuring a Static Route from the MP to the PLR: Example, page 22](#)
- [Configuring ASBR Forced Link Flooding: Examples, page 22](#)

### Configuring Loose Hops: Examples

This section includes the following:

- [Configuring an Explicit Path on the Tunnel That Will Cross the Inter-AS Link: Example, page 22](#)
- [Configuring a Route to Reach the Remote ASBR in the IP Routing Table: Example, page 22](#)

## Configuring an Explicit Path on the Tunnel That Will Cross the Inter-AS Link: Example

The following commands configure a loose IP explicit path named `route1` suitable for use as a path option with Inter-AS TE with the destination 10.10.10.6 that is to traverse ABRs 10.10.0.2 and 10.10.0.4. The tunnel headend and the specified ABRs will find a path from the source AS100 to the destination 10.10.0.6 in AS200. See [Figure 1](#).

```
Router(config)# ip explicit-path name route1 enable
Router(cfg-ip-expl-path)# next-address loose 10.10.0.2
Router(cfg-ip-expl-path)# next-address loose 10.10.0.4
Router(cfg-ip-expl-path)# next-address loose 10.10.0.6
```

Note that the explicit path for an interarea TE tunnel need not specify the destination router because the tunnel configuration specifies it in the tunnel destination command. The following commands configure an explicit path named `path-without-tailend` that would work equally well for the interarea tunnel created in the previous example:

```
Router(config)# ip explicit-path name path-without-tailend
Router(cfg-ip-expl-path)# next-address loose 10.10.0.2
Router(cfg-ip-expl-path)# next-address loose 10.10.0.4
```

## Configuring a Route to Reach the Remote ASBR in the IP Routing Table: Example

In the following example, packets for the ASBR whose router ID is 10.10.0.1 will be forwarded via tunnel 101:

```
Router> enable
Router# configure terminal
Router(config)# ip route 10.10.0.1 255.255.255.255 tunnel 101
```

## Configuring a Static Route from the MP to the PLR: Example

In the following example, a static route is configured from the MP to the PLR. The outgoing interface is tunnel 103.

```
Router> enable
Router# configure terminal
Router(config)# ip route 10.10.3.1 255.255.255.255 tunnel 103
```

## Configuring ASBR Forced Link Flooding: Examples

This section includes the following ASBR forced link flooding examples:

- [Configuring the Inter-AS Link as a Passive Interface: Example, page 23](#)
- [Creating LSPs Traversing the ASBRs: Example, page 24](#)
- [Configuring Multiple Neighbors on a Link: Example, page 24](#)

## Configuring the Inter-AS Link as a Passive Interface: Example

For this example, see [Figure 1](#).

Routers R2 and R4 have the following router IDs:

- Router R2—10.10.0.2
- Router R4—10.10.0.4

```
Router> enable
Router# configure terminal
Router(config)# interface serial 2/0
```

### Configures OSPF on Router R2 When Its Neighbor Is Running OSPF Too

```
Router(config-if)# mpls traffic-eng passive-interface nbr-te-id 10.10.0.4
```

#### Note

Because both routers are running OSPF, the **nbr-igp-id** keyword is not specified.

### Specifies That Both Router R2 and Its Neighbor Are Running OSPF (the nbr-igp-id Keyword Is Specified)

```
Router(config-if)# mpls traffic-eng passive-interface nbr-te-id 10.10.0.4 nbr-igp-id ospf 10.10.0.4
```

### Configures IS-IS on Router R1

```
Router(config-if)# mpls traffic-eng passive-interface nbr-te-id 10.10.0.4 nbr-igp-id isis 40.0000.0002.0001.00
```

### Configures the Neighbor IGP ID (nbr-igp-id) When There Is More than One Neighbor Specified on a Link

```
Router(config-if)# mpls traffic-eng passive-interface nbr-te-id 10.10.0.4 nbr-igp-id ospf 10.10.0.4
```

```
Router(config-if)# mpls traffic-eng passive-interface nbr-te-id 10.10.0.7 nbr-igp-id ospf 10.10.0.7
```

### Overrides the Interior Gateway Protocol (IGP) Administrative Weight of the Link and Assigns a Specific Weight

```
Router(config-if)# mpls traffic-eng administrative-weight 20
```

#### Note

The ID is unique for each neighbor.

### Configures a Link as a Passive Interface (Includes Global TE Commands)

```
interface serial 2/0
 ip address 10.10.4.1.255.255.255.0
 mpls traffic-eng tunnels
 mpls traffic-eng administrative-weight 10
 mpls traffic-eng passive-interface nbr-te-id 10.10.0.4 nbr-igp-id ospf 10.10.0.4
 ip rsvp bandwidth 1000
 mpls traffic-eng administrative-weight 20
```

## Creating LSPs Traversing the ASBRs: Example

In the following example, a primary LSP is created:

```
Router> enable
Router# configure terminal
Router(config)# ip explicit path route1 enable
Router(config)# next-address loose 10.10.0.2
Router(config)# next-address loose 10.10.0.4
Router(config)# next-address loose 10.10.0.6
Router(config)# interface tunnel 100
Router(config-if)# tunnel mpls traffic-eng fast reroute
Router(config-if)# tunnel mpls traffic-eng path-option 1 route1
```

In the following example, a backup LSP is created:

```
Router> enable
Router# configure terminal
Router(config)# ip explicit path backpath1 enable
Router(config)# next-address loose 10.10.0.3
Router(config)# next-address loose 10.10.0.5
Router(config)# next-address loose 10.10.0.6
Router(config)# interface tunnel 102
Router(config)# mpls traffic-eng backup path tunnel 102
Router(config-if)# tunnel mpls traffic-eng path-option 1 backpath1
```

## Configuring Multiple Neighbors on a Link: Example

In the following example, there is more than one neighbor on a link:

```
Router> enable
Router# configure terminal
Router(config)# interface ethernet 2/0
Router(config-if)# mpls traffic-eng passive-interface nbr-te-id 10.10.0.4 nbr-igp-id ospf
10.10.0.4
Router(config-if)# mpls traffic-eng administrative-weight 20
```

# Additional References

The following sections provide references related to the MPLS Traffic Engineering: Inter-AS TE feature.

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html).

For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **mpls traffic-eng passive-interface**

# Feature Information for MPLS Traffic Engineering: Inter-AS TE

Table 2 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/cfn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release. Unless noted otherwise, subsequent releases of that Cisco IOS software release also support that feature.

**Table 2** Feature Information for MPLS Traffic Engineering: Inter-AS TE

| Feature Name                          | Releases                                                            | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

# Glossary

**ABR**—Area Border Router. A routers connecting two areas.

**adjacency**—The MPLS TE Forwarding Adjacency feature allows a network administrator to handle a traffic engineering, label-switched path (LSP) tunnel as a link in an Interior Gateway Protocol (IGP) network based on the Shortest Path First (SPF) algorithm. A forwarding adjacency can be created between routers regardless of their location in the network. The routers can be located multiple hops from each other.

**area**—A logical set of network segments (for example, one that is OSPF-based) and their attached devices. Areas usually are connected to other areas by routers, making up a single autonomous system. OSPF and IS-IS define their areas differently. OSPF area borders are marked by routers. Some interfaces are in one area, and other interfaces are in another area. With IS-IS, all the routers are completely within an area, and the area borders are on links, not on routers. The routers that connect the areas are level-2 routers, and routers that have no direct connectivity to another area are level-1 routers.

**ASBR**—Autonomous System Boundary Router. The router is located between an OSPF autonomous system and a non-OSPF network. ASBRs run both OSPF and another routing protocol, such as RIP. ASBRs must reside in a nonstub OSPF area.

**autonomous system**—A collection of networks under a common administration sharing a common routing strategy. Autonomous systems are subdivided by areas.

**backup tunnel**—An MPLS traffic engineering tunnel used to protect other (primary) tunnel's traffic when a link or node failure occurs.

**BGP**—Border Gateway Protocol. Interdomain routing protocol that replaces EGP. BGP exchanges reachability information with other BGP systems.

**border router**—A router at the edge of a provider network that interfaces to another provider's border router using extended BGP procedures.

**Cisco Express Forwarding**—A means for accelerating the forwarding of packets within a router, by storing route lookup information in several data structures instead of in a route cache.

**Fast Reroute**—A mechanism for protecting MPLS traffic engineering (TE) LSPs from link and node failure by locally repairing the LSPs at the point of failure, allowing data to continue to flow on them while their headend routers attempt to establish end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or nodes.

**flooding**—A traffic-passing technique used by switches and bridges in which traffic received on an interface is sent out all the interfaces of that device except the interface on which the information was received originally.

**forwarding adjacency**—A traffic engineering link (or LSP) into an IS-IS or OSPF network.

**headend**—The router that originates and maintains a given LSP. This is the first router in the LSP's path.

**hop**—Passage of a data packet between two network nodes (for example, between two routers).

**IGP**—Interior Gateway Protocol. Internet protocol used to exchange routing information within an autonomous system. Examples of common IGPs include Interior Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), and Routing Information Protocol (RIP).

**Inter-AS LSP**—An MPLS traffic engineering label-switched path (LSP) that traverses hops that are not in the headend's topology database (that is, it is not in the same OSPF area, IS-IS area, or autonomous system as the headend).

**interface**—A network connection.

**IP explicit path**—A list of IP addresses, each representing a node or link in the explicit path.

**IS-IS**—Intermediate System-to-Intermediate System. OSI link-state hierarchical routing protocol based on DECnet Phase V routing, where intermediate system (IS) routers exchange routing information based on a single metric to determine the network topology.

**link**—A point-to-point connection between adjacent nodes.

**LSA**—link-state advertisement. A broadcast packet used by link-state protocols that contains information about neighbors and path costs. LSAs are used by the receiving routers to maintain their routing tables.

**LSP**—label-switched path. A configured connection between two routers, in which MPLS is used to carry packets. An LSP is a path created by the concatenation of one or more label-switched hops, allowing a packet to be forwarded by swapping labels from an MPLS node to another MPLS node.

**midpoint**—A transit router for a given LSP.

**midpoint reoptimization**—Ability of a midpoint to trigger a headend reoptimization.

**MP**—merge point. The LSR where one or more backup tunnels rejoin the path of the protected LSP, downstream of the potential failure. An LSR can be both an MP and a PLR simultaneously.

**MPLS**—Multiprotocol Label Switching. Packet-forwarding technology, used in the network core, that applies data link layer labels to tell switching nodes how to forward data, resulting in faster and more scalable forwarding than network layer routing normally can do.

**multicast**—Single packets are copied by the network and sent to a specific subset of network addresses. These addresses are specified in the Destination address field. (Multicast is an efficient paradigm for transmitting the same data to multiple receivers, because of its concept of a Group address. This allows a group of receivers to listen to the single address.)

**node**—Endpoint of a network connection or a junction common to two or more lines in a network. Nodes can be interconnected by links, and serve as control points in the network.

**OSPF**—Open Shortest Path First. A link-state, hierarchical Interior Gateway Protocol routing algorithm, derived from the IS-IS protocol. OSPF features include least-cost routing, multipath routing, and load balancing.

**opaque LSA**—If a router understands LSA Type 10 link information, the router continues flooding the link throughout the network.

**passive link**—When IGP is not running on the link between two ASBRs, traffic engineering informs the IGP to flood link information on behalf of that link (that is, it advertises that link).

**PLR**—point of local repair. The headend LSR of a backup tunnel.

**router**—A network layer device that uses one or more metrics to determine the optimal path along which network traffic should be forwarded. Routers forward packets from one network to another based on network layer information.

**RSVP**—Resource Reservation Protocol. An IETF protocol used for signaling requests (setting up reservations) for Internet services by a customer before that customer is permitted to transmit data over that portion of the network.

**SPF**—shortest path first. A routing algorithm used as the basis for OSPF operations. When an SPF router is powered up, it initializes its routing-protocol data structures and then waits for indications from lower-layer protocols that its interfaces are functional.

**SRLG**—Shared Risk Link Group. Sets of links that are likely to go down together (for example, because they have the same underlying fiber).

**tailend**—The router upon which an LSP is terminated. This is the last router in the LSP's path.

**TE**—traffic engineering. The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**TLV**—type, length, values. A block of information embedded in Cisco Discovery Protocol advertisements.

# MPLS Traffic Engineering: Shared Risk Link Groups

---

**First Published: May 6, 2004**

**Last Updated: July 11, 2008**

The MPLS Traffic Engineering: Shared Risk Link Groups feature enhances backup tunnel path selection so that a backup tunnel avoids using links that are in the same Shared Risk Link Group (SRLG) as interfaces the backup tunnel is protecting.

SRLGs refer to situations where links in a network share a common fiber (or a common physical attribute). If one link fails, other links in the group may fail too. Links in the group have a shared risk.

This document contains information about and instructions for configuring the MPLS Traffic Engineering: Shared Risk Link Groups feature.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for MPLS Traffic Engineering: Shared Risk Link Groups” section on page 20](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Feature Information for MPLS Traffic Engineering: Shared Risk Link Groups, page 20](#)
- [Glossary, page 22](#)

## Prerequisites for MPLS Traffic Engineering: Shared Risk Link Groups

- You must configure Fast Reroutable tunnels.
- You must enable the autotunnel backup.

## Restrictions for MPLS Traffic Engineering: Shared Risk Link Groups

- The backup tunnel must be within a single area.
- Manually created backup tunnels do not automatically avoid SRLGs of protected interfaces.
- A primary tunnel cannot be specified to avoid links belonging to specified SRLGs.

## Information About MPLS Traffic Engineering: Shared Risk Link Groups

To configure MPLS traffic engineering (MPLS TE) SRLGs, you need to understand the following concepts:

- [MPLS Traffic Engineering Brief Overview, page 2](#)
- [MPLS Traffic Engineering Shared Risk Link Groups, page 3](#)
- [Fast Reroute Protection for MPLS TE SRLGs, page 4](#)
- [Autotunnel Backup for MPLS TE SRLGs, page 5](#)

## MPLS Traffic Engineering Brief Overview

Multiprotocol Label Switching (MPLS) is an Internet Engineering Task Force (IETF)-specified framework that provides for the efficient designation, routing, forwarding, and switching of traffic flows through the network.

Traffic engineering (TE) is the process of adjusting bandwidth allocations to ensure that enough is left for high-priority traffic.

In MPLS TE, the upstream router creates a network tunnel for a particular traffic stream, then fixes the bandwidth available for that tunnel.

## MPLS Traffic Engineering Shared Risk Link Groups

SRLGs refer to situations where links in a network share a common fiber (or a common physical attribute). If one link fails, other links in the group may fail too. Links in the group have a shared risk.

Backup tunnels should avoid using links in the same SRLG as interfaces they are protecting. Otherwise, when the protected link fails the backup tunnel fails too.

Figure 1 shows a primary label-switched path (LSP) from router R1 to router R5. The LSP protects against the failure of the R2-R3 link at R2 via a backup tunnel to R4. If the R2-R3 link fails, link protection reroutes the LSP along the backup tunnel. However, the R2-R3 link and one of the backup tunnel links are in the same SRLG. So if the R2-R3 link fails, the backup tunnel may fail too.

**Figure 1 Backup Tunnel in the Same SRLG as the Interface It Is Protecting**

The MPLS TE SRLG feature enhances backup tunnel path selection so a backup tunnel can avoid using links that are in the same SRLG as the interfaces it is protecting.

There are two ways for a backup tunnel to avoid the SRLGs of its protected interface:

- The router does not create the backup tunnel unless it avoids SRLGs of the protected interface.
- The router *tries* to avoid SRLGs of the protected interface, but if that is not possible the router creates the backup tunnel anyway. In this case there are two explicit paths. The first explicit path *tries* to avoid the SRLGs of the protected interface. If that does not work, the backup tunnel uses the second path (which ignores SRLGs).

### Note

Only backup tunnels that routers create automatically (called autotunnel backup) can avoid SRLGs of protected interfaces. For more information about these backup tunnels, see the [“Autotunnel Backup for MPLS TE SRLGs” section on page 5](#).

To activate the MPLS TE SRLG feature, you must do the following:

- Configure the SRLG membership of each link that has a shared risk with another link.
- Configure the routers to automatically create backup tunnels that avoid SRLGs of the protected interfaces.

For a detailed explanation of the configuration steps, see the [“How to Configure MPLS Traffic Engineering: Shared Risk Link Groups” section on page 7](#).

Open Shortest Path First (OSPF) and Intermediate System-to-Intermediate System (IS-IS) flood the SRLG membership information (including other TE link attributes such as bandwidth availability and affinity) so that all routers in the network have the SRLG information for each link. With this topology information, routers can compute backup tunnel paths that exclude links having SRLGs in common with their protected interfaces. As shown in [Figure 2](#), the backup tunnel avoids the link between R2 and R3, which shares an SRLG with the protected interface.

**Figure 2** Backup Tunnel That Avoids SRLG of Protected Interface

## Fast Reroute Protection for MPLS TE SRLGs

Fast Reroute (FRR) protects MPLS TE LSPs from link and node failures by locally repairing the LSPs at the point of failure. This protection allows data to continue to flow on LSPs while their headend routers attempt to establish new end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or nodes.

Backup tunnels that bypass only a single link of the LSP's path provide link protection. They protect LSPs if a link along their path fails by rerouting the LSP's traffic to the next hop (bypassing the failed link). These are referred to as next-hop (NHOP) backup tunnels because they terminate at the LSP's next hop beyond the point of failure. [Figure 3](#) illustrates an NHOP backup tunnel.

**Figure 3** *NHOP Backup Tunnel*

FRR provides node protection for LSPs. Backup tunnels that bypass next-hop nodes along LSP paths are called next-next-hop (NNHOP) backup tunnels because they terminate at the node following the next-hop node of the LSP paths, thereby bypassing the next-hop node. They protect LSPs if a node along their path fails by enabling the node upstream of the failure to reroute the LSPs and their traffic around the failed node to the next-next hop. FRR supports the use of Resource Reservation Protocol (RSVP) hellos to accelerate the detection of node failures. NNHOP backup tunnels also provide protection from link failures, because they bypass the failed link and the node.

Figure 4 illustrates an NNHOP backup tunnel.

**Figure 4** *NNHOP Backup Tunnel*

## Autotunnel Backup for MPLS TE SRLGs

Autotunnel backup is the ability of routers to create backup tunnels automatically. Therefore, you do not need to preconfigure each backup tunnel and then assign the backup tunnel to the protected interface. Only automatically created backup tunnels can avoid SRLGs or their protected interfaces.

For information about backup tunnels, see the “[Fast Reroute Protection for MPLS TE SRLGs](#)” section on page 4.

For detailed information about autotunnel backup and how you can change the default command values, see [MPLS Traffic Engineering \(TE\)--AutoTunnel Primary and Backup](#).

To globally activate the autotunnel backup feature, enter the **mpls traffic-eng auto-tunnel backup** command.

[Figure 5](#) illustrates an NNHOP automatically generated backup tunnel that excludes the router 192.168.1.1 and terminates at router R4. The backup tunnel must avoid touching any links of 192.168.1.1.

**Figure 5** Autotunnel Backup for NNHOP

[Figure 6](#) illustrates an NHOP automatically generated backup tunnel that terminates at router R3 and avoids the link 10.1.1.1, not the entire node.

**Figure 6** Autotunnel Backup for NHOP

**Note**

NNHOP excludes the router ID (the entire router must be excluded; that is, no link of the router can be included in the backup tunnel's path). NHOP excludes only the link when the backup tunnel's path is computed.

## How to Configure MPLS Traffic Engineering: Shared Risk Link Groups

This section contains the following procedures for configuring the MPLS Traffic Engineering: Shared Risk Link Groups feature:

- [Configuring MPLS TE SRLG Membership of Each Link That Has a Shared Risk with Another Link, page 7](#) (required)
- [Configuring the Routers That Automatically Create Backup Tunnels to Avoid MPLS TE SRLGs of Their Protected Interfaces, page 8](#) (required)
- [Verifying the MPLS Traffic Engineering: Shared Risk Link Groups Configuration, page 9](#) (optional)

### Configuring MPLS TE SRLG Membership of Each Link That Has a Shared Risk with Another Link

Perform the following task to configure MPLS TE SRLG membership of each link that has a shared risk with another link. Configuring SRLG membership enhances backup tunnel path selection so that a backup tunnel avoids using links that are in the same SRLG as interfaces the backup tunnel is protecting.

Enter the commands on the physical interface.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **mpls traffic-eng srlg** [*number*]
5. **end**

#### DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                                                                          |

Valid values are 0 to 4,294,967,295.</li> </ul> <p><b>Note</b> To make the link a member of multiple SRLGs, enter the <b>mpls traffic-eng srlg</b> command multiple times.</p>                                                                                                                                                 |
| Step 5 | <pre>end</pre> <p><b>Example:</b><br/>Router(config-if)# end</p>                                                | <p>Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring the Routers That Automatically Create Backup Tunnels to Avoid MPLS TE SRLGs of Their Protected Interfaces

Perform the following task to configure routers that automatically create backup tunnels to avoid MPLS TE SRLGs of their protected interfaces. Backup tunnels provide link protection by rerouting traffic to the next hop bypassing failed links or in this instance by avoiding SRLGs.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng auto-tunnel backup srlg exclude [force | preferred]**
4. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>mpls traffic-eng auto-tunnel backup srlg</b><br><b>exclude [force   preferred]</b><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng auto-tunnel<br>backup srlg exclude force | Specifies that autocreated backup tunnels should avoid SRLGs of its protected interface. <ul style="list-style-type: none"> <li>The <b>force</b> keyword forces the backup tunnel to avoid SRLGs of its protected interface or interfaces.</li> <li>The <b>preferred</b> keyword causes the backup tunnel to <i>try</i> to avoid SRLGs of its protected interface or interfaces, but the backup tunnel can be created if SRLGs cannot be avoided.</li> </ul> |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Verifying the MPLS Traffic Engineering: Shared Risk Link Groups Configuration

Perform the following task to verify the MPLS traffic engineering SRLG configurations.

## SUMMARY STEPS

- enable
- show running-config
- show mpls traffic-eng link-management interfaces *interface slot/port*
- show mpls traffic-eng topology
- show mpls traffic-eng topology srlg
- show mpls traffic-eng topology brief
- show mpls traffic-eng link-management advertisements
- show ip rsvp fast-reroute
- mpls traffic-eng auto-tunnel backup srlg exclude force
- show ip explicit-paths
- show mpls traffic-eng tunnels tunnel *num*
- mpls traffic-eng auto-tunnel backup srlg exclude preferred
- show ip explicit-paths

14. **show ip rsvp fast-reroute**

15. **exit**

## DETAILED STEPS

### Step 1 **enable**

Use this command to enable privileged EXEC mode. Enter your password, if prompted. For example:

```
Router> enable
Router#
```

### Step 2 **show running config**

Use the following commands to configure the SRLG membership of the interface pos 3/1 and to verify that the configuration is as expected. For example:

```
Router# configure terminal
Router(config)# interface pos 3/1
Router(config-if)# mpls traffic-eng srlg 1
Router(config-if)# mpls traffic-eng srlg 2
Router(config-if)# end

Router# show running-config

interface POS 3/1
 ip address 10.0.0.33 255.255.255.255
 no ip directed-broadcast
 ip router isis
 encapsulation ppp
 no ip mroute-cache
 mpls traffic-eng tunnels
 mpls traffic-eng backup-path Tunnel5000
 mpls traffic-eng srlg 1
 mpls traffic-eng srlg 2
 tag-switching ip
 crc 32
 clock source internal
 pos ais-shut
 pos report rdool
 pos report lais
 pos report lrldi
 pos report pais
 pos report prdi
 pos report sd-ber
 isis circuit-type level-2-only
 ip rsvp bandwidth 20000 20000 sub-pool 5000
```

This verifies that the Packet over SONET (POS) interface pos 3/1 is associated that SRLG 1 and SRLG 2.

### Step 3 **show mpls traffic-eng link-management interfaces *interface slot/port***

Use this command to show the SRLG membership configured on interface pos 3/1. For example:

```
Router# show mpls traffic-eng link-management interfaces pos 3/1

System Information::
  Links Count:          11
Link ID:: PO3/1 (10.0.0.33)
  Link Status:
    SRLGs:               1 2
    Physical Bandwidth:  2488000 kbits/sec
    Max Res Global BW:   20000 kbits/sec (reserved:0% in, 0% out)
```

```

Max Res Sub BW:      5000 kbits/sec (reserved:0% in, 0% out)
MPLS TE Link State:  MPLS TE on, RSVP on, admin-up, flooded
Inbound Admission:   allow-all
Outbound Admission:  allow-if-room
Admin. Weight:       10 (IGP)
IGP Neighbor Count:  1
IGP Neighbor:        ID 0000.0000.0004.00, IP 10.0.0.34 (Up)
Flooding Status for each configured area [1]:
IGP Area[1]: isis level-2: flooded

```

#### Step 4 show mpls traffic-eng topology

Use this command to show the SRLG link membership flooded via the Interior Gateway Protocol (IGP). For example:

```

Router# show mpls traffic-eng topology

My_System_id:0000.0000.0003.00 (isis level-2)

Signalling error holddown:10 sec Global Link Generation 9

IGP Id:0000.0000.0003.00, MPLS TE Id:10.0.3.1 Router Node (isis
level-2)
  link[0]:Point-to-Point, Nbr IGP Id:0000.0000.0004.00,
nbr_node_id:2, gen:9
    frag_id 0, Intf Address:10.0.0.33, Nbr Intf Address:10.0.0.34
    TE metric:10, IGP metric:10, attribute_flags:0x0
    SRLGs:1 2
    physical_bw:2488000 (kbps), max_reservable_bw_global:20000
(kbps)
    max_reservable_bw_sub:5000 (kbps)

```

|        | Total Allocated<br>BW (kbps) | Global Pool<br>Reservable<br>BW (kbps) | Sub Pool<br>Reservable<br>BW (kbps) |
|--------|------------------------------|----------------------------------------|-------------------------------------|
|        | -----                        | -----                                  | -----                               |
| bw[0]: | 0                            | 20000                                  | 5000                                |
| bw[1]: | 0                            | 20000                                  | 5000                                |
| bw[2]: | 0                            | 20000                                  | 5000                                |
| bw[3]: | 0                            | 20000                                  | 5000                                |
| bw[4]: | 0                            | 20000                                  | 5000                                |
| bw[5]: | 0                            | 20000                                  | 5000                                |

#### Step 5 show mpls traffic-eng topology srlg

Use this command to display all the links in the network that are members of a given SRLG. For example:

```

Router# show mpls traffic-eng topology srlg

MPLS TE Id:0000.0000.0003.00 (isis level-2)
  SRLG:1
    10.0.0.33
  SRLG:2
    10.0.0.33

```

The following command shows that there are two links in SRLG 1:

```

Router# show mpls traffic-eng topology srlg

MPLS TE Id:0000.0000.0003.00 (isis level-2)
  SRLG:1
    10.0.0.33
    10.0.0.49

```

**Step 6 show mpls traffic-eng topology brief**

Use this command to display brief topology information:

```
Router# show mpls traffic-eng topology brief

My_System_id:0000.0000.0003.00 (isis level-2)

Signalling error holddown:10 sec Global Link Generation 9

IGP Id:0000.0000.0003.00, MPLS TE Id:10.0.3.1 Router Node (isis
level-2)
  link[0]:Point-to-Point, Nbr IGP Id:0000.0000.0004.00,
nbr_node_id:2, gen:9
    frag_id 0, Intf Address:10.0.0.33, Nbr Intf Address:10.0.0.34
    TE metric:10, IGP metric:10, attribute_flags:0x0
    SRLGs:1 2
```

**Step 7 show mpls traffic-eng link-management advertisements**

Use this command to show local link information that MPLS TE link management is currently flooding into the global TE topology. For example:

```
Router# show mpls traffic-eng link-management advertisements

Flooding Status:      ready
Configured Areas:     1
IGP Area[1] ID:: isis level-2
System Information::
  Flooding Protocol:   ISIS
Header Information::
  IGP System ID:       0000.0000.0003.00
  MPLS TE Router ID:   10.0.3.1
  Flooded Links:       2
Link ID:: 0
  Link Subnet Type:    Point-to-Point
  Link IP Address:     10.0.0.49
  IGP Neighbor:        ID 0000.0000.0007.00, IP 10.0.0.50

  Link IP Address:     10.0.0.33
  IGP Neighbor:        ID 0000.0000.0004.00, IP 10.0.0.34
  TE metric:           10
  IGP metric:          10
  SRLGs:               1
  Physical Bandwidth:  2488000 kbits/sec
  Res. Global BW:      20000 kbits/sec
```

```

Res. Sub BW:          5000 kbits/sec
Downstream::
                        Global Pool  Sub Pool
                        -----
Reservable Bandwidth[0]: 20000      5000 kbits/sec
Reservable Bandwidth[1]: 20000      5000 kbits/sec
Reservable Bandwidth[2]: 20000      5000 kbits/sec
Reservable Bandwidth[3]: 20000      5000 kbits/sec
Reservable Bandwidth[4]: 20000      5000 kbits/sec
Reservable Bandwidth[5]: 20000      5000 kbits/sec
Reservable Bandwidth[6]: 20000      5000 kbits/sec
Reservable Bandwidth[7]: 20000      5000 kbits/sec
Attribute Flags:      0x00000000

```

**Step 8 show ip rsvp fast-reroute**

Use this command to show that the primary tunnel is going over Pos3/1 on R3, on which SRLG 1 is configured. For example:

```
Router# show ip rsvp fast-reroute
```

| Primary Tunnel | Protect I/F | BW BPS | Type | Backup Tunnel:Label | State | Level | Type |
|----------------|-------------|--------|------|---------------------|-------|-------|------|
| R3-PRP_t0      | PO3/1       | 0:G    | None | None                | None  | None  | None |

**Step 9 mpls traffic-eng auto-tunnel backup srlg exclude force**

Use the following commands to configure autotunnel backup with the **force** keyword. For example:

```

Router# configure terminal
Router(config)# mpls traffic-eng auto-tunnel backup
Router(config)# mpls traffic-eng auto-tunnel backup srlg exclude force
Router(config)# exit

```

**Step 10 show ip explicit-paths**

Use the following command to verify that the **force** keyword is configured with the pos3/1 link excluded from the IP explicit path. For example:

```

Router# show ip explicit-paths

PATH __dynamic_tunnel65436 (loose source route, path complete,
generation 24, status non-configured)
  1:exclude-address 10.0.0.33
  2:exclude-srlg    10.0.0.33

```

**Step 11 show mpls traffic-eng tunnels tunnel num**

Use the following command to show that autotunnel backup is configured but is down because the headend router does not have any other path to signal and it cannot use pos2/1 because it belongs in the same SRLG; that is, SRLG 1. For example:

```

Router# show mpls traffic-eng tunnels tunnel 65436

Name:R3-PRP_t65436 (Tunnel65436) Destination:
10.0.4.1
Status:
  Admin:up      Oper:down  Path:not valid  Signalling:Down
  path option 1, type explicit __dynamic_tunnel65436

Config Parameters:
  Bandwidth:0      kbps (Global)  Priority:7 7  Affinity:
0x0/0xFFFF
  Metric Type:TE (default)

```

```

AutoRoute: disabled LockDown:disabled Loadshare:0
bw-based
auto-bw:disabled

Shortest Unconstrained Path Info:
Path Weight:10 (TE)
Explicit Route:10.0.0.34 10.0.4.1
History:
Tunnel:
Time since created:5 minutes, 29 seconds
Path Option 1:
Last Error:PCALC::No path to destination, 0000.0000.0004.00

```

### Step 12 **mpls traffic-eng auto-tunnel backup srlg exclude preferred**

The following commands configure autotunnel backup with the **preferred** keyword. For example:

```

Router# configure terminal
Router(config)# mpls traffic-eng auto-tunnel backup
Router(config)# mpls traffic-eng auto-tunnel backup srlg exclude preferred
Router(config)# exit

```

### Step 13 **show ip explicit-paths**

The following command shows two explicit paths. The first path avoids the SRLGs of the protected interface. The second path does not avoid the SRLGs. For example:

```

Router# show ip explicit-paths

PATH __dynamic_tunnel65436 (loose source route, path complete,
generation 30, status non-configured)
  1:exclude-address 10.0.0.33
  2:exclude-srlg    10.0.0.33
PATH __dynamic_tunnel65436_pathopt2 (loose source route, path complete,
generation 33, status non-configured)
  1:exclude-address 10.0.0.33

```

### Step 14 **show ip rsvp fast-reroute**

The following command shows that the primary tunnel is protected with autotunnel backup using the second path option (see Step 10) that does not avoid the SRLGs. For example:

```

Router# show ip rsvp fast-reroute

Primary    Protect    BW          Backup
Tunnel     I/F        BPS:Type    Tunnel:Label  State  Level  Type
-----
R3-PRP_t0  PO3/1 0:G  0:G         Tu65436:0    Ready  any-unl nhop

```

The following command shows the path options for the tunnel Tu65436:

```

Router# show mpls traffic-eng tunnels tunnel 65436

Name:R3-PRP_t65436                               (Tunnel65436) Destination:
10.0.4.1
Status:
  Admin:up          Oper:up          Path:valid          Signalling:connected

  path option 2, type explicit __dynamic_tunnel65436_pathopt2 (Basis
for Setup, path weight 80020)
  path option 1, type explicit __dynamic_tunnel65436
Config Parameters:
  Bandwidth:0          kbps (Global) Priority:7 7 Affinity:
0x0/0xFFFF
  Metric Type:TE (default)

```

```

    AutoRoute: disabled LockDown:disabled Loadshare:0
bw-based
    auto-bw:disabled
Active Path Option Parameters:
    State:explicit path option 2 is active
    BandwidthOverride:disabled LockDown:disabled Verbatim:disabled

InLabel : -
OutLabel :POS2/1, 23
RSVP Signalling Info:
    Src 10.0.3.1, Dst 10.0.4.1, Tun_Id 65436, Tun_Instance 3
RSVP Path Info:
    My Address:10.0.3.1
    Explicit Route:10.0.0.50 10.0.0.66 10.0.0.113 10.0.4.1
    Record Route: NONE
    Tspec:ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits
RSVP Resv Info:
    Record Route: NONE
    Fspec:ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits
Shortest Unconstrained Path Info:
    Path Weight:10 (TE)
    Explicit Route:10.0.0.34 10.0.4.1

```

**Step 15 exit**

Use this command to exit to user EXEC mode. For example:

```

Router# exit
Router>

```

## Configuration Examples for MPLS Traffic Engineering: Shared Risk Link Groups

This section provides the following configuration examples:

- [Configuring the SRLG Membership of Each Link That Has a Shared Risk with Another Link: Example, page 15](#)
- [Configuring the Routers That Automatically Create Backup Tunnels to Avoid SRLGs of Their Protected Interfaces: Example, page 16](#)

### Configuring the SRLG Membership of Each Link That Has a Shared Risk with Another Link: Example

The following example shows how to specify that the SRLG membership of each link has a shared risk with another link.

As shown in [Figure 7](#) and in the following commands:

- link R2-R3 = SRLG5
- link R2-R3 = SRLG6
- link R7-R4 = SRLG5
- link R1-R2 = SRLG6

```

Router1# configure terminal
Router1# interface pos 1/0
Router1(config-if)# mpls traffic-eng srlg 6

Router2# configure terminal
Router2# interface pos 1/1
Router2(config-if)# mpls traffic-eng srlg 5
Router2(config-if)# mpls traffic-eng srlg 6

Router7# configure terminal
Router7# interface pos 3/0
Router7(config-if)# mpls traffic-eng srlg 5

```

**Figure 7** SRLG Membership

## Configuring the Routers That Automatically Create Backup Tunnels to Avoid SRLGs of Their Protected Interfaces: Example

The following example shows how to specify that automatically created backup tunnels are forced to avoid SRLGs of their protected interfaces:

```

Router# configure terminal
Router(config)# mpls traffic-eng auto-tunnel backup
Router(config)# mpls traffic-eng auto-tunnel backup srlg exclude force

```

[Figure 8](#) illustrates the automatically created NNHOP backup tunnel that would be created to avoid SRLGs of the protected interface if the following conditions exist:

The exclude address is 192.168.1.1.

The link at R2 has an IP address of 10.1.1.1.

The backup tunnel's explicit path avoids links that have a membership in the same SRLG as the link whose IP address is 10.1.1.1.

**Figure 8** *srlg exclude force—NNHOP Autobackup Tunnel*

Figure 9 illustrates the automatically created NHOP backup tunnel that would be created.

**Figure 9** *srlg exclude force—NHOP Autobackup Tunnel*

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **mpls traffic-eng auto-tunnel backup srlg exclude**
- **mpls traffic-eng srlg**
- **show ip explicit-paths**
- **show mpls traffic-eng link-management advertisements**
- **show mpls traffic-eng link-management interfaces**
- **show mpls traffic-eng topology**

# Feature Information for MPLS Traffic Engineering: Shared Risk Link Groups

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering: Shared Risk Link Groups

| Feature Name                                      | Releases                                                          | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

# Glossary

**Fast Reroute**—A mechanism for protecting MPLS traffic engineering (TE) LSPs from link and node failure by locally repairing the LSPs at the point of failure. This protection allows data to continue to flow on them while their headend routers attempt to establish end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or nodes.

**hop**—Passage of a data packet between two network nodes (for example, between two routers).

**IGP**—Interior Gateway Protocol. An Internet protocol used to exchange routing information within an autonomous system.

**interface**—A network connection.

**IP address**—A 32-bit address assigned to hosts using TCP/IP. An IP address belongs to one of five classes (A, B, C, D, or E) and is written as four octets separated by periods (dotted decimal format). Each address consists of a network number, an optional subnetwork number, and a host number. The network and subnetwork numbers together are used for routing, and the host number is used to address an individual host within the network or subnetwork. A subnet mask is used to extract network and subnetwork information from the IP address.

**IP explicit path**—A list of IP addresses, each representing a node or link in the explicit path.

**IS-IS**—Intermediate System-to-Intermediate System. OSI link-state hierarchical routing protocol based on DECnet Phase V routing, where intermediate system (IS) routers exchange routing information based on a single metric to determine the network topology.

**LDP**—Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets.

**link**—A point-to-point connection between adjacent nodes.

**LSP**—label-switched path. A path that is followed by a labeled packet over several hops, starting at an ingress LSR and ending at an egress LSR.

**LSR**—label switching router. A Layer 3 router that forwards a packet based on the value of a label encapsulated in the packet.

**MPLS**—Multiprotocol Label Switching. A method for forwarding packets (frames) through a network. It enables routers at the edge of a network to apply labels to packets. ATM switches or existing routers in the network core can switch packets according to the labels with minimal lookup overhead.

**node**—An endpoint of a network connection or a junction common to two or more lines in a network. Nodes can be interconnected by links, and serve as control points in the network.

**OSPF**—Open Shortest Path First. A link-state hierarchical Interior Gateway Protocol (IGP) routing algorithm, derived from the IS-IS protocol. OSPF features include least-cost routing, multipath routing, and load balancing.

**router**—A network layer device that uses one or more metrics to determine the optimal path along which network traffic should be forwarded. Routers forward packets from one network to another based on network layer information.

**router ID**—Something by which a router originating a packet can be uniquely distinguished from all other routers; for example, an IP address from one of the router's interfaces.

**traffic engineering**—The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**tunnel**—A secure communication path between two peers, such as two routers. A traffic engineering tunnel is a label-switched tunnel that is used for traffic engineering. Such a tunnel is set up through means other than normal Layer 3 routing; it is used to direct traffic over a path different from the one that Layer 3 routing could cause the tunnel to take.

# MPLS Traffic Engineering (TE): Path Protection

---

**First Published: January 1, 2004**

**Last Updated: October 21, 2009**

The MPLS Traffic Engineering (TE): Path Protection feature provides an end-to-end failure recovery mechanism (that is, full path protection) for Multiprotocol Label Switching (MPLS) traffic engineering (TE) tunnels.

## Note

---

Cisco IOS Release 12.3(33)SRE and later releases support enhanced path protection, which is the ability to configure up to eight secondary path options for a given primary path option.

---

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering \(TE\): Path Protection”](#) section on [page 31](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Additional References, page 29](#)
- [Feature Information for MPLS Traffic Engineering \(TE\): Path Protection, page 31](#)
- [Glossary, page 32](#)

## Prerequisites for MPLS Traffic Engineering (TE): Path Protection

- Ensure that your network supports MPLS TE, Cisco Express Forwarding, and Intermediate System-to-Intermediate System (IS-IS) or Open Shortest Path First (OSPF).
- Enable MPLS.
- Configure TE on the routers.
- Configure a TE tunnel with a primary path option by using the **tunnel mpls traffic-eng path-option** command.
- If your router supports stateful switchover (SSO), configure Resource Reservation Protocol (RSVP) Graceful Restart in full mode on the routers.
- If your router supports SSO, for Cisco nonstop forwarding (NSF) operation you must have configured SSO on the device.

## Restrictions for MPLS Traffic Engineering (TE): Path Protection

- The secondary path will not be signaled with the FRR flag.
- Dynamic diverse paths are not supported.
- Do not use link and node protection with path protection on the headend router.
- Do not configure path protection on an automesh tunnel template because the destinations are different and you cannot use the same path option to reach multiple destinations.

## Information About MPLS Traffic Engineering (TE): Path Protection

To configure the MPLS Traffic Engineering (TE): Path Protection feature, you should understand the following concepts:

- [Traffic Engineering Tunnels, page 3](#)
- [Path Protection, page 3](#)
- [Enhanced Path Protection, page 3](#)
- [ISSU, page 4](#)
- [NSF/SSO, page 4](#)

## Traffic Engineering Tunnels

MPLS TE lets you build label switched paths (LSPs) across your network for forwarding traffic.

MPLS TE LSPs let the headend of a TE tunnel control the path its traffic takes to a particular destination. This method is more flexible than forwarding traffic based only on a destination address.

Interarea tunnels allow you to do the following:

- Build TE tunnels between areas (interarea tunnels)
- Build TE tunnels that start and end in the same area, on multiple areas on a router (intra-area tunnels)

Some tunnels are more important than others. For example, you may have tunnels carrying VoIP traffic and tunnels carrying data traffic that are competing for the same resources. MPLS TE allows you to have some tunnels preempt others. Each tunnel has a priority, and more-important tunnels take precedence over less-important tunnels.

## Path Protection

Path protection provides an end-to-end failure recovery mechanism (that is, full path protection) for MPLS TE tunnels. A secondary LSP is established, in advance, to provide failure protection for the protected LSP that is carrying a tunnel's TE traffic. When there is a failure on the protected LSP, the headend router immediately enables the secondary LSP to temporarily carry the tunnel's traffic. If there is a failure on the secondary LSP, the tunnel no longer has path protection until the failure along the secondary path is cleared. Path protection can be used with a single area (OSPF or IS-IS), interarea (OSPF or IS-IS), or Inter-AS (Border Gateway Protocol (BGP), external BGP (eBGP), and static).

The failure detection mechanisms that trigger a switchover to a secondary tunnel include the following:

- Path error or resv tear from RSVP signaling
- Notification from the RSVP hello that a neighbor is lost
- Notification from the Bidirectional Forwarding Detection (BFD) protocol that a neighbor is lost
- Notification from the Interior Gateway Protocol (IGP) that the adjacency is down
- Local teardown of the protected tunnel's LSP due to preemption in order to signal higher priority LSPs, a Packet over SONET (POS) alarm, online insertion and removal (OIR), and so forth

An alternate recovery mechanism is Fast Reroute (FRR), which protects MPLS TE LSPs only from link and node failures by locally repairing the LSPs at the point of failure.

Although not as fast as link or node protection, presignaling a secondary LSP is faster than configuring a secondary primary path option or allowing the tunnel's headend router to dynamically recalculate a path. The actual recovery time is topology-dependent, and affected by delay factors such as propagation delay or switch fabric latency.

## Enhanced Path Protection

Enhanced path protection provides support of multiple backup path options per primary path option. You can configure up to eight backup path options for a given primary path option. Only one of the configured backup path options is actively signaled at any time.

After you enter the **mpls traffic-eng path-option list** command, you can enter the backup path priority in the *number* argument of the **path-option** command. A lower identifier represents a higher priority. Priorities are configurable for each backup path option. Multiple backup path options and a single backup path option cannot coexist to protect a primary path option.

## ISSU

Cisco In Service Software Upgrade (ISSU) allows you to perform a Cisco IOS software upgrade or downgrade while the system continues to forward packets. ISSU takes advantage of the Cisco IOS high availability infrastructure—Cisco nonstop forwarding (NSF) with stateful switchover (SSO) and hardware redundancy—and eliminates downtime associated with software upgrades or version changes by allowing changes while the system remains in service. Cisco ISSU lowers the impact that planned maintenance activities have on network service availability; there is less downtime and better access to critical systems.

When path protection is enabled and an ISSU upgrade is performed, path protection performance is similar to that of other TE features.

## NSF/SSO

Cisco NSF with SSO provides continuous packet forwarding, even during a network processor hardware or software failure.

SSO takes advantage of Route Processor (RP) redundancy to increase network availability by establishing one of the RPs as the active processor while the other RP is designated as the secondary processor, and then synchronizing critical state information between them. Following an initial synchronization between the two processors, SSO dynamically maintains RP state information between them. A switchover from the active to the secondary processor occurs when the active RP fails, is removed from the networking device, or is manually taken down for maintenance.

Cisco NSF works with SSO to minimize the amount of time a network is unavailable to users after a switchover. The main purpose of NSF is to continue forwarding IP packets after an RP switchover. Cisco NSF helps to suppress routing flaps in SSO-enabled devices, thus reducing network instability.

The MPLS Traffic Engineering: Path Protection feature can recover after SSO. A tunnel configured for path protection may have two LSPs signaled simultaneously: the primary LSP that is carrying the traffic and the secondary LSP that carries traffic in case there is a failure along the primary path. Only information associated with one of those LSPs, the one that is currently carrying traffic, is synched to the standby RP. The standby RP, upon recovery, can determine from the checkpointed information whether the LSP was the primary or secondary.

If the primary LSP was active during the switchover, only the primary LSP is recovered. The secondary LSP that was signaled and that provided path protection is resignaled after the TE recovery period is complete. This does not impact traffic on the tunnel because the secondary LSP was not carrying traffic.

# How to Configure MPLS Traffic Engineering (TE): Path Protection

This section contains the following configuration procedures:

- [Regular Path Protection Configuration Tasks, page 5](#)

- [Enhanced Path Protection Configuration Tasks, page 10](#)

In enhanced path protection you create and assign a path option list.

## Regular Path Protection Configuration Tasks

This section contains the following tasks which are shown in [Figure 1](#).

- [Configuring Explicit Paths for Secondary Paths, page 5](#) (required)
- [Assigning a Secondary Path Option to Protect a Primary Path Option, page 6](#) (required)
- [Verifying the Configuration of MPLS Traffic Engineering Regular Path Protection, page 7](#) (optional)

**Figure 1**      **Network Topology—Path Protection**

## Configuring Explicit Paths for Secondary Paths

To specify a secondary path that does not include common links or nodes associated with the primary path in case those links or nodes go down, configure an explicit path by performing the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip explicit-path {name *path-name* | identifier *number*} [enable | disable]**
4. **index *index command* *ip-address***
5. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                             | Purpose                                                                                                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                | Enters global configuration mode.                                                                                                                                                                   |
| Step 3 | <b>ip explicit-path</b> { <b>name</b> <i>path-name</i>   <b>identifier</b> <i>number</i> } [ <b>enable</b>   <b>disable</b> ]<br><br><b>Example:</b><br>Router(config)# ip explicit-path name path3441 enable | Creates or modifies the explicit path and enters IP explicit path configuration mode.                                                                                                               |
| Step 4 | <b>index</b> <i>index</i> <i>command</i> <i>ip-address</i><br><br><b>Example:</b><br>Router(cfg-ip-expl-path)# index 1 next-address 10.0.0.1                                                                  | Inserts or modifies a path entry at a specific index. <ul style="list-style-type: none"> <li>The IP address represents the node ID.</li> </ul> <b>Note</b> Enter this command once for each router. |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(cfg-ip-expl-path)# exit                                                                                                                                          | Exits IP explicit path configuration mode and enters global configuration mode.                                                                                                                     |

## Assigning a Secondary Path Option to Protect a Primary Path Option

Assign a secondary path option in case there is a link or node failure along a path and all interfaces in your network are not protected.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel***number*
4. **tunnel mpls traffic-eng path-option protect** *number* [**attributes** *lsp-attributes* | **bandwidth** {*kpbs* | *subpool kpbs*} | **explicit** {**identifier** *path-number* | **name** *path-name*} | **list** {**name** *pathlist-name* | **identifier** *pathlist-identifier*}]

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                           |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br><code>Router&gt; enable</code>                                                                                                                                                                                                                                                                                                                                                                                                   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br><code>Router# configure terminal</code>                                                                                                                                                                                                                                                                                                                                                                              | Enters global configuration mode.                                                                                 |
| Step 3 | <code>interface tunnelnumber</code><br><br><b>Example:</b><br><code>Router(config)# interface tunnel500</code>                                                                                                                                                                                                                                                                                                                                                                 | Configures a tunnel interface and enters interface configuration mode.                                            |
| Step 4 | <code>tunnel mpls traffic-eng path-option protect</code><br><code>number [attributes lsp-attributes   bandwidth</code><br><code>{kbps   subpool kbps}   explicit {identifier</code><br><code>path-number   name path-name}   list {name</code><br><code>pathlist-name   identifier</code><br><code>pathlist-identifier}]</code><br><br><b>Example:</b><br><code>Router(config-if)# tunnel mpls traffic-eng</code><br><code>path-option protect 10 explicit name path344</code> | Configures a secondary path option for an MPLS TE tunnel.                                                         |

## Verifying the Configuration of MPLS Traffic Engineering Regular Path Protection

To verify the configuration of regular path protection, perform the following steps. In Steps 1 and 2, refer to [Figure 2](#).

**Figure 2** Network Topology Verification

## SUMMARY STEPS

1. **show running interface tunnel***tunnel-number*
2. **show mpls traffic-eng tunnels tunnel** *tunnel-interface*
3. **show mpls traffic-eng tunnels tunnel** *number* [**brief**] [**protection**]
4. **show ip rsvp high-availability database** {**hello** | **link-management** {**interfaces** | **system**} | **lsp** [**filter destination** *ip-address* / **filter lsp-id** *lsp-id* / **filter source** *ip-address* / **filter tunnel-id** *tunnel-id*] | **lsp-head** [**filter number**] | **summary**}

## DETAILED STEPS

### Step 1 **show running interface tunnel***tunnel-number*

This command shows the configuration of the primary path and protection path options.

#### Note

To show the status of both LSPs (that is, both the primary path and the protected path), use the **show mpls traffic-eng tunnels** command with the **protection** keyword.

```
Router# show running interface tunnel500

Building configuration...

Current configuration : 497 bytes
!
interface Tunnel500
 ip unnumbered Loopback0
 tunnel destination 10.0.0.9
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 7 7
 tunnel mpls traffic-eng bandwidth 100
 tunnel mpls traffic-eng path-option 10 explicit name path344
 tunnel mpls traffic-eng path-option 20 explicit name path345
 tunnel mpls traffic-eng path-option protect 10 explicit name path3441
 tunnel mpls traffic-eng path-option protect 20 explicit name path348
end
```

### Step 2 **show mpls traffic-eng tunnels** *tunnel-interface*

This command shows tunnel path information.

The Common Link(s) field shows the number of links shared by both the primary and secondary paths, from the headend router to the tailend router.

The Common Node(s) field shows the number of nodes shared by both the primary and secondary paths, excluding the headend and tailend routers.

As shown in the following output, there are no common links or nodes:

```
Router# show mpls traffic-eng tunnels tunnel500

Name: R1_t500 (Tunnel500) Destination: 10.0.0.9
Status:
  Admin: up Oper: up Path: valid Signalling: connected
  path option 10, type explicit path344 (Basis for Setup, path weight 20)
  path option 20, type explicit path345
```

```

Path Protection: 0 Common Link(s), 0 Common Node(s)
path protect option 10, type explicit path3441 (Basis for Protect, path weight 20)
path protect option 20, type explicit path348

```

Config Parameters:

```

Bandwidth: 100 kb/s (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
Metric Type: TE (default)
AutoRoute: enabled LockDown: disabled Loadshare: 100 bw-based
auto-bw: disabled

```

Active Path Option Parameters:

```

State: explicit path option 10 is active
BandwidthOverride: disabled LockDown: disabled Verbatim: disabled

```

InLabel : -

OutLabel : Ethernet1/0, 16

RSVP Signalling Info:

```

Src 10.1.1.1, Dst 10.0.0.9, Tun_Id 500, Tun_Instance 19

```

RSVP Path Info:

```

My Address: 10.2.0.1

```

```

Explicit Route: 10.2.0.2 10.10.0.1 10.10.0.2 10.0.0.9

```

```

Record Route: NONE

```

```

Tspec: ave rate=100 kbits, burst=1000 bytes, peak rate=100 kbits

```

RSVP Resv Info:

```

Record Route: NONE

```

```

Fspec: ave rate=100 kbits, burst=1000 bytes, peak rate=100 kbits

```

Shortest Unconstrained Path Info:

```

Path Weight: 20 (TE)

```

```

Explicit Route: 10.2.0.1 10.2.0.2 10.10.0.1 10.10.0.2 10.0.0.9

```

History:

Tunnel:

```

Time since created: 11 minutes, 17 seconds

```

```

Time since path change: 8 minutes, 5 seconds

```

```

Number of LSP IDs (Tun_Instances) used: 19

```

Current LSP:

```

Uptime: 8 minutes, 5 seconds

```

### Step 3 **show mpls traffic-eng tunnels tunnel *number* [brief] [protection]**

Use this command, with the **protection** keyword specified, to show the status of both LSPs (that is, both the primary path and the protected path).

#### Note

Deleting a primary path option has the same effect as shutting down a link. Traffic will move to the protected path in use.

The following command output shows that the primary LSP is up, and the secondary LSP is up and providing protection:

```

Router# show mpls traffic-eng tunnels tunnel500 protection

```

```

R1_t500

```

```

LSP Head, Tunnel500, Admin: up, Oper: up

```

```

Src 10.1.1.1, Dest 10.0.0.9, Instance 19

```

```

Fast Reroute Protection: None

```

```

Path Protection: 0 Common Link(s), 0 Common Node(s)

```

```

Primary lsp path:10.2.0.1 10.2.0.2
                  10.10.0.1 10.10.0.2
                  10.0.0.9

```

```

Protect lsp path:10.0.0.1 10.0.0.2
                  10.0.1.1 10.0.1.2
                  10.0.0.9

```

```

Path Protect Parameters:

```

```

Bandwidth: 100 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
Metric Type: TE (default)
InLabel : -
OutLabel : Ethernet0/0, 16
RSVP Signalling Info:
  Src 10.1.1.1, Dst 10.0.0.9, Tun_Id 500, Tun_Instance 27
RSVP Path Info:
  My Address: 10.0.0.1
  Explicit Route: 10.0.0.2 10.0.1.1 10.0.1.2 10.0.0.9
  Record Route: NONE
  Tspec: ave rate=100 kbits, burst=1000 bytes, peak rate=100 kbits
RSVP Resv Info:
  Record Route: NONE
  Fspec: ave rate=100 kbits, burst=1000 bytes, peak rate=100 kbits

```

The following command output shows that the primary LSP is down, and the secondary LSP is up and is actively carrying traffic:

```

Router# show mpls traffic-eng tunnels tunnel500 protection

R1_t500
LSP Head, Tunnel500, Admin: up, Oper: up
Src 10.1.1.1, Dest 10.0.0.9, Instance 27
Fast Reroute Protection: None
Path Protection: Backup lsp in use.

```

**Step 4** **show ip rsvp high-availability database {hello | link-management {interfaces [fixed | variable] | system} | lsp [filter destination ip-address / filter lsp-id lsp-id / filter source ip-address / filter tunnel-id tunnel-id] | lsp-head [filter number] | summary}**

The **show ip rsvp high-availability database** command displays the contents of the RSVP high availability (HA) read and write databases used in TE. If you specify the **lsp-head** keyword, the command output includes path protection information.

```

Router# show ip rsvp high-availability database lsp-head

LSP_HEAD WRITE DB
Tun ID: 500
Header:
  State: Checkpointed Action: Add
  Seq #: 3              Flags: 0x0
Data:
  lsp_id: 5, bandwidth: 100, thead_flags: 0x1, popt: 1
  feature_flags: path protection active
  output_if_num: 5, output_nhop: 10.0.0.1
RRR path setup info
  Destination: 10.0.0.9, Id: 10.0.0.9 Router Node (ospf) flag:0x0
  IGP: ospf, IGP area: 0, Number of hops: 5, metric: 2
  Hop 0: 10.0.0.1, Id: 10.0.0.1 Router Node (ospf), flag:0x0
  Hop 1: 10.0.0.2, Id: 10.0.0.7 Router Node (ospf), flag:0x0

  Hop 3: 10.0.1.2, Id: 10.0.0.9 Router Node (ospf), flag:0x0
  Hop 4: 10.0.0.9, Id: 10.0.0.9 Router Node (ospf), flag:0x0

```

## Enhanced Path Protection Configuration Tasks

This section contains the following tasks which are shown in [Figure 3](#).

- [Creating a Path Option List, page 11](#) (required)

- [Assigning a Path Option List to Protect a Primary Path Option, page 12](#) (required)
- [Verifying the Configuration of MPLS TE Enhanced Path Protection, page 13](#) (optional)

**Figure 3**      *Network Topology - Enhanced Path Protection in Cisco IOS Release 12.2(33)SRE*

## Creating a Path Option List

In Cisco IOS Release 12.2(33)SRE, perform the following task to create a path option list of backup paths for a primary path option.

### Note

To use a secondary path instead, perform the steps in the [“Configuring Explicit Paths for Secondary Paths”](#) section on page 5.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls traffic-eng path-option list** [**name** *pathlist-name* | **identifier** *pathlist-number*]
4. **path-option** *number* **explicit** [**name** *pathoption-name* | **identifier** *pathoption-number*]
5. **list**
6. **no** [*pathoption-name* / *pathoption-number*]
7. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                              |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                    |
| Step 3 | <b>mpls traffic-eng path-option list</b> [name pathlist-name   <b>identifier</b> pathlist-number]<br><br><b>Example:</b><br>Router(config)# mpls traffic-eng path-option list name pathlist-01       | Configures a path option list, and enters path-option list configuration mode.<br><ul style="list-style-type: none"><li>You can enter the following commands: <b>path-option</b>, <b>list</b>, <b>no</b>, and <b>exit</b>.</li></ul> |
| Step 4 | <b>path-option</b> number <b>explicit</b> [name pathoption-name   <b>identifier</b> pathoption-number]<br><br><b>Example:</b><br>Router(cfg-pathoption-list)# path-option 10 explicit identifier 200 | (Optional) Specifies the name or identification number of the path option to add, edit, or delete. The <i>pathoption-number</i> value can be from 1 through 65535.                                                                   |
| Step 5 | <b>list</b><br><br><b>Example:</b><br>Router(cfg-pathoption-list)# list                                                                                                                              | (Optional) Lists all of the path options.                                                                                                                                                                                            |
| Step 6 | <b>no</b> [pathoption-name   pathoption-number]<br><br><b>Example:</b><br>Router(cfg-pathoption-list)# no 10                                                                                         | (Optional) Deletes a specified path option.                                                                                                                                                                                          |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(cfg-pathoption-list)# exit                                                                                                                              | (Optional) Exits path-option list configuration mode and enters global configuration mode.                                                                                                                                           |

## Assigning a Path Option List to Protect a Primary Path Option

Assign a path option list in case there is a link or node failure along a path and all interfaces in your network are not protected. See [Figure 3](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **interface** *tunnelnumber*
4. **tunnel mpls traffic-eng path-option protect** *number* [**attributes** *lsp-attributes* | **bandwidth** {*kbits* | *subpool kbps*} | **explicit** {**identifier** *path-number* | **name** *path-name*} | **list** {**name** *pathlist-name* | **identifier** *pathlist-identifier*}]
5. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                                                                                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                                                                                                                                                                                                      | Enters global configuration mode.                                                                                |
| Step 3 | <b>interface</b> <i>tunnelnumber</i><br><br><b>Example:</b><br>Router(config)# interface tunnel500                                                                                                                                                                                                                                                                                                                                                                                  | Configures a tunnel interface and enters interface configuration mode.                                           |
| Step 4 | <b>tunnel mpls traffic-eng path-option protect</b> <i>number</i> [ <b>attributes</b> <i>lsp-attributes</i>   <b>bandwidth</b> { <i>kbits</i>   <i>subpool kbps</i> }   <b>explicit</b> { <b>identifier</b> <i>path-number</i>   <b>name</b> <i>path-name</i> }   <b>list</b> { <b>name</b> <i>pathlist-name</i>   <b>identifier</b> <i>pathlist-identifier</i> }]<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng path-option protect 10 list name pathlist-01 | Configures a path option list to protect primary path option 10.                                                 |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                                                                                                                                                                                                                                                                                                                       | (Optional) Exits interface configuration mode and enters global configuration mode.                              |

## Verifying the Configuration of MPLS TE Enhanced Path Protection

To verify the configuration of MPLS TE enhanced path protection, refer to [Figure 4](#) and perform the following steps.

**Figure 4** Network Topology Verification for Enhanced Path Protection

## SUMMARY STEPS

1. `show running interface tunnel tunnel-number`
2. `show mpls traffic-eng tunnels tunnel-number`
3. `show mpls traffic-eng tunnels tunnel number [brief] [protection]`
4. `show ip rsvp high-availability database {hello | link-management {interfaces [fixed | variable] | system} | lsp [filter destination ip-address / filter lsp-id lsp-id / filter source ip-address / filter tunnel-id tunnel-id] | lsp-head [filter number] | summary}`

## DETAILED STEPS

### Step 1 `show running interface tunnel tunnel-number`

This command shows the configuration of the path option and backup path option.

#### Note

To show the status of both LSPs (that is, both the primary path and the protected path), use the `show mpls traffic-eng tunnels` command with the **protection** keyword.

```
Router# show running interface tunnel2
```

```
Building configuration..
```

```
Current configuration : 296 bytes
```

```
!
```

```
interface Tunnel2
```

```
ip unnumbered Loopback0
```

```
tunnel mode mpls traffic-eng
```

```
tunnel destination 10.10.0.2
```

```
tunnel mpls traffic-eng autoroute announce
```

```
tunnel mpls traffic-eng path-option 10 explicit name primary1
```

```
tunnel mpls traffic-eng path-option protect 10 list name pathlist-01
end
```

## Step 2 **show mpls traffic-eng tunnels tunnel *number***

This command shows tunnel path information.

The Common Link(s) field shows the number of links shared by both the primary and secondary paths, from the headend router to the tailend router.

The Common Node(s) field shows the number of nodes shared by both the primary and secondary paths, excluding the headend and tailend routers.

As shown in the following output, there are no common links or nodes:

```
Router# show mpls traffic-eng tunnels tunnel2
```

```
Name: iou-100_t2 (Tunnel2) Destination: 10.10.0.2
Status:
  Admin: up Oper: up Path: valid Signalling: connected
  path option 10, type explicit primary1 (Basis for Setup, path weight 10)
  Path Protection: 0 Common Link(s), 0 Common Node(s)
  path protect option 10, type list name secondary-list
  Inuse path-option 10, type explicit secondary1 (Basis for Protect, path weight 20)

Config Parameters:
  Bandwidth: 0 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
  AutoRoute announce: enabled LockDown: disabled Loadshare: 0 bw-based
  auto-bw: disabled
Active Path Option Parameters:
  State: explicit path option 10 is active
  BandwidthOverride: disabled LockDown: disabled Verbatim: disabled

InLabel : -
OutLabel : Ethernet7/0, implicit-null
RSVP Signalling Info:
  Src 100.100.100.100, Dst 10.10.0.2, Tun_Id 2, Tun_Instance 188
RSVP Path Info:
  My Address: 10.1.0.1
  Explicit Route: 10.1.0.2 10.10.0.2
  Record Route: NONE
  Tspec: ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits
RSVP Resv Info:
  Record Route: NONE
  Fspec: ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits
Shortest Unconstrained Path Info:
  Path Weight: 10 (TE)
  Explicit Route: 10.1.0.1 10.1.0.2 10.10.0.2
History:
Tunnel:
  Time since created: 1 hours, 34 minutes
  Time since path change: 1 minutes, 50 seconds
  Number of LSP IDs (Tun_Instances) used: 188
Current LSP:
  Uptime: 1 minutes, 50 seconds
Prior LSP:
  ID: path option 10 [44]
  Removal Trigger: label reservation removed
```

## Step 3 **show mpls traffic-eng tunnels tunnel *number* [brief] [protection]**

Use this command, with the **protection** keyword specified, to show the status of both LSPs (that is, both the primary path and the protected path).

The following command output shows that the primary LSP is up, and the secondary LSP is up and providing protection:

```
Router# show mpls traffic-eng tunnels tunnel2 protection

iou-100_t2
LSP Head, Tunnel2, Admin: up, Oper: up
Src 100.100.100.100, Dest 10.10.0.2, Instance 188
Fast Reroute Protection: None
Path Protection: 0 Common Link(s), 0 Common Node(s)
Primary lsp path:10.1.0.1 10.1.0.2
                  10.10.0.2
Protect lsp path:10.0.0.1 10.0.0.2
                  10.0.1.1 10.0.1.2
                  10.10.0.2
Path Protect Parameters:
  Bandwidth: 0 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
InLabel : -
OutLabel : Ethernet5/0, 16
RSVP Signalling Info:
  Src 100.100.100.100, Dst 10.10.0.2, Tun_Id 2, Tun_Instance 189
RSVP Path Info:
  My Address: 10.0.0.1
  Explicit Route: 10.0.0.2 10.0.1.1 10.0.1.2 10.10.0.2
  Record Route: NONE
  Tspec: ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits
RSVP Resv Info:
  Record Route: NONE
  Fspec: ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits
```

The following command output shows that the primary LSP is down, and the secondary LSP is up and is actively carrying traffic:

```
Router# show mpls traffic-eng tunnels tunnel500 protection

R1_t500
LSP Head, Tunnel500, Admin: up, Oper: up
Src 10.1.1.1, Dest 10.0.0.9, Instance 27
Fast Reroute Protection: None
Path Protection: Backup lsp in use.
```

**Step 4** **show ip rsvp high-availability database {hello | link-management {interfaces [fixed | variable]} | system} | lsp [filter destination ip-address / filter lsp-id lsp-id / filter source ip-address / filter tunnel-id tunnel-id] | lsp-head [filter number] | summary}**

The **show ip rsvp high-availability database** command displays the contents of the RSVP HA read and write databases used in TE. If you specify the **lsp-head** keyword, the command output includes path protection information.

```
Router# show ip rsvp high-availability database lsp-head

LSP_HEAD WRITE DB
Tun ID: 2
Header:
  State: Checkpointed Action: Add
  Seq #: 2 Flags: 0x0
Data:
  lsp_id: 6, bandwidth: 0, thead_flags: 0x1, popt: 10
  feature flags: none
  output_if_num: 31, output_nhop: 10.1.0.2
RRR path setup info

```

```

IGP: ospf, IGP area: 0, Number of hops: 3, metric: 10
Hop 0: 10.1.0.1, Id: 10.100.100.100 Router Node (ospf), flag:0x0
Hop 1: 10.1.0.2, Id: 10.10.0.2 Router Node (ospf), flag:0x0
Hop 2: 10.103.103.103, Id: 10.10.0.2 Router Node (ospf), flag:0x0

```

## Configuration Examples for MPLS Traffic Engineering (TE): Regular Path Protection

This section provides the following configuration examples for MPLS TE regular path protection:

- [Creating a Path Option List: Example, page 23](#)
- [Assigning a Path Option List to Protect a Primary Path Option: Example, page 24](#)
- [Configuring Tunnels Before and After Path Protection: Example, page 24](#)

### Configuring Explicit Paths for Secondary Paths: Example

Figure 5 illustrates a primary path and a secondary path. If there is a failure, the secondary path is used.

**Figure 5** Primary Path and Secondary Path

In the following example the explicit path is named path3441. There is an **index** command for each router. If there is failure, the secondary path is used.

```

Router(config)# ip explicit-path name path3441 enable
Router(cfg-ip-expl-path)# index 1 next 10.0.0.1
Explicit Path name path3441:
  1: next-address 10.0.0.1

Router(cfg-ip-expl-path)# index 2 next 10.0.0.2
Explicit Path name path3441:
  1: next-address 10.0.0.1

```

```

2: next-address 10.0.0.2

Router(cfg-ip-expl-path)# index 3 next 10.0.1.1
Explicit Path name path3441:
  1: next-address 10.0.0.1
  2: next-address 10.0.0.2
  3: next-address 10.0.1.1

Router(cfg-ip-expl-path)# index 4 next 10.0.1.2
Explicit Path name path3441:
  1: next-address 10.0.0.1
  2: next-address 10.0.0.2
  3: next-address 10.0.1.1
  4: next-address 10.0.1.2

Router(cfg-ip-expl-path)# exit

```

## Assigning a Secondary Path Option to Protect a Primary Path Option: Example

In the following example a traffic engineering tunnel is configured:

```

Router> enable
Router# configure terminal
Router(config-if)# interface tunnel500
Router(config-if)# tunnel mpls traffic-eng path-option protect 10 explicit name path344

```

The following **show running interface** command output shows that path protection has been configured. Tunnel 500 has path option 10 using path344 and protected by path 3441, and path option 20 using path345 and protected by path348.

```

Router# show running interface tunnel500

Router# interface tunnel 500

Building configuration...

Current configuration : 497 bytes
!
interface Tunnel500
 ip unnumbered Loopback0
 tunnel destination 10.0.0.9
 tunnel mode mpls traffic-eng
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng priority 7 7
 tunnel mpls traffic-eng bandwidth 100
 tunnel mpls traffic-eng path-option 10 explicit name path344
 tunnel mpls traffic-eng path-option 20 explicit name path345
 tunnel mpls traffic-eng path-option protect 10 explicit name path3441
 tunnel mpls traffic-eng path-option protect 20 explicit name path348
end

```

## Configuring Tunnels Before and After Path Protection: Example

The **show mpls traffic-eng tunnels** command shows information about the primary (protected) path. The following sample output shows that path protection has been configured.

```

Router# show mpls traffic-eng tunnels tunnel500

```

```

Name: R1_t500    (Tunnel500)    Destination: 10.0.0.9
Status:
  Admin: up  Oper: up  Path: valid  Signalling: connected
  path option 10, type explicit path344 (Basis for Setup, path weight 20)
  path option 20, type explicit path345
  Path Protection: 0 Common Link(s), 0 Common Node(s)
  path protect option 10, type explicit path3441 (Basis for Protect, path weight 20)
  path protect option 20, type explicit path348

Config Parameters:
  Bandwidth: 100 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
  Metric Type: TE (default)
  AutoRoute: enabled LockDown: disabled Loadshare: 100 bw-based
  auto-bw: disabled
Active Path Option Parameters:
  State: explicit path option 10 is active
BandwidthOverride: disabled LockDown: disabled Verbatim: disabled

InLabel : -
OutLabel : Ethernet1/0, 16
RSVP Signalling Info:
  Src 10.1.1.1, Dst 10.0.0.9, Tun_Id 500, Tun_Instance 43
RSVP Path Info:
  My Address: 10.2.0.1
  Explicit Route: 10.2.0.2 10.10.0.1 10.10.0.2 10.0.0.9
  Record Route: NONE
  Tspec: ave rate=100 kbits, burst=1000 bytes, peak rate=100 kbits
RSVP Resv Info:
  Record Route: NONE
  Fspec: ave rate=100 kbits, burst=1000 bytes, peak rate=100 kbits
Shortest Unconstrained Path Info:
  Path Weight: 20 (TE)
  Explicit Route: 10.0.0.1 10.0.0.2 10.0.1.1 10.0.1.2
                  10.0.0.9

History:
Tunnel:
  Time since created: 18 minutes, 22 seconds
  Time since path change: 19 seconds
  Number of LSP IDs (Tun_Instances) used: 43
Current LSP:
  Uptime: 22 seconds
  Selection: reoptimization
Prior LSP:
  ID: path option 10 [27]
  Removal Trigger: reoptimization completed

```

The following **show mpls traffic-eng tunnels** command output shows information about the secondary path. Tunnel500 is protected. The protection path is used, and the primary path is down. The command output shows the IP explicit paths of the primary LSP and the secondary LSP.

```
Router# show mpls traffic-eng tunnels tunnel500 protection
```

```

R1_t500
LSP Head, Tunnel500, Admin: up, Oper: up
Src 10.1.1.1, Dest 10.0.0.9, Instance 43
Fast Reroute Protection: None
Path Protection: 0 Common Link(s), 0 Common Node(s)
Primary lsp path:10.2.0.1 10.2.0.2
                  10.10.0.1 10.10.0.2
                  10.0.0.9
Protect lsp path:10.0.0.1 10.0.0.2
                  10.0.1.1 10.0.1.2
                  10.0.0.9

```

```

Path Protect Parameters:
  Bandwidth: 100 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF

  Last Error: PCALC:: Explicit path has unknown address, 10.2.0.1
R1#

```

The **up** value in the Oper field of the **show mpls traffic-eng tunnels** command, with the **protection** keyword specified, shows that protection is enabled:

```

Router# show mpls traffic-eng tunnels tunnel500 protection

R1_t500
  LSP Head, Tunnel500, Admin: up, Oper: up
  Src 10.1.1.1, Dest 10.0.0.9, Instance 44
  Fast Reroute Protection: None
  Path Protection: Backup lsp in use.
R1#

```

The **no shutdown** command in the following command sequence causes the interface to be up again and activates the primary path:

```

Router> enable
Router# configure terminal

Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# interface ethernet1/0
Router(config-if)# no shutdown
Router(config-if)# end

```

The following command output shows that path protection has been reestablished and the primary path is being used:

```

Router# show mpls traffic-eng tunnels tunnel500

Name: R1_t500 (Tunnel500) Destination: 10.0.0.9
Status:

# Configuration Examples for MPLS Traffic Engineering (TE): Enhanced Path Protection

This section provides the following configuration examples for MPLS TE path protection:

- [Creating a Path Option List: Example, page 23](#)
- [Assigning a Path Option List to Protect a Primary Path Option: Example, page 24](#)
- [Configuring Tunnels Before and After Path Protection: Example, page 24](#)

## Creating a Path Option List: Example

Figure 6 shows the network topology for enhanced path protection.

**Figure 6** Network Topology for Enhanced Path Protection

The following example configures two explicit paths named **secondary1** and **secondary2**.

```
Router(config)# ip explicit-path name secondary1
Router(cfg-ip-expl-path)# index 1 next 10.0.0.2
Explicit Path name secondary1:
  1: next-address 10.0.0.2

Router(cfg-ip-expl-path)# index 2 next 10.0.1.2
Explicit Path name secondary1:
  1: next-address 10.0.0.2
  2: next-address 10.0.1.2

Router(cfg-ip-expl-path)# ip explicit-path name secondary2
Router(cfg-ip-expl-path)# index 1 next 10.2.0.2
Explicit Path name secondary2:
  1: next-address 10.2.0.2
```

```
Router(cfg-ip-expl-path)# index 2 next 10.10.0.2
Explicit Path name secondary2:
  1: next-address 10.2.0.2
  2: next-address 10.10.0.2
```

```
Router(cfg-ip-expl-path)# exit
```

In the following example a path option list of backup paths is created. You define the path option list by using the explicit paths.

```
Router(config)# mpls traffic-eng path-option list name pathlist-01
Router(cfg-pathoption-list)# path-option 10 explicit name secondary1
path-option 10 explicit name secondary1
```

```
Router(cfg-pathoption-list)# path-option 20 explicit name secondary2
path-option 10 explicit name secondary1
path-option 20 explicit name secondary2
```

```
Router(cfg-pathoption-list)# exit
```

## Assigning a Path Option List to Protect a Primary Path Option: Example

In the following example, a traffic engineering tunnel is configured:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# interface tunnel 2
Router(config-if)# tunnel mpls traffic-eng path-option protect 10 list name secondary-list
```

The following **show running interface** command output shows that path protection has been configured. Tunnel 2 has path option 10 using path primary1 and protected by secondary-list.

```
Router# show running-config interface tunnel 2

Building configuration...

Current configuration : 296 bytes
!
interface Tunnel2
 ip unnumbered Loopback0
 tunnel mode mpls traffic-eng
 tunnel destination 103.103.103.103
 tunnel mpls traffic-eng autoroute announce
 tunnel mpls traffic-eng path-option 10 explicit name primary1
 tunnel mpls traffic-eng path-option protect 10 list name secondary-list
```

## Configuring Tunnels Before and After Path Protection: Example

The **show mpls traffic-eng tunnels** command shows information about the primary (protected) path. The following sample output shows that path protection has been configured:

```
Router# show mpls traffic-eng tunnels tunnel 2

Name: Router_t2 (Tunnel2) Destination: 103.103.103.103
Status:
  Admin: up Oper: up Path: valid Signalling: connected
```

```

path option 10, type explicit primary1 (Basis for Setup, path weight 10)
Path Protection: 0 Common Link(s), 0 Common Node(s)
path protect option 10, type list name secondary-list
Inuse path-option 10, type explicit secondary1 (Basis for Protect, path weight 20)

```

Config Parameters:

```

Bandwidth: 0 kbps (Global) Priority: 7 7 Affinity: 0x0/0xFFFF
Metric Type: TE (default)
AutoRoute announce: enabled LockDown: disabled Loadshare: 0 bw-based
auto-bw: disabled

```

Active Path Option Parameters:

```

State: explicit path option 10 is active
BandwidthOverride: disabled LockDown: disabled Verbatim: disabled

```

InLabel : -

OutLabel : Ethernet7/0, implicit-null

RSVP Signalling Info:

```

Src 100.100.100.100, Dst 103.103.103.103, Tun_Id 2, Tun_Instance 11

```

RSVP Path Info:

```

My Address: 10.1.0.1
Explicit Route: 10.1.0.2 103.103.103.103
Record Route: NONE
Tspec: ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits

```

RSVP Resv Info:

```

Record Route: NONE
Fspec: ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits

```

Shortest Unconstrained Path Info:

```

Path Weight: 10 (TE)
Explicit Route: 10.1.0.1 10.1.0.2 103.103.103.103

```

History:

Tunnel:

```

Time since created: 24 minutes, 15 seconds
Time since path change: 23 minutes, 30 seconds
Number of LSP IDs (Tun_Instances) used: 11
Current LSP:
Uptime: 23 minutes, 30 seconds

```

The following **show mpls traffic-eng tunnels** command output shows information about the secondary path. Tunnel 2 is protected.

Router# **show mpls traffic-eng tunnels tunnel 2 protection**

Router\_t2

```

LSP Head, Tunnel2, Admin: up, Oper: up
Src 100.100.100.100, Dest 103.103.103.103, Instance 11
Fast Reroute Protection: None
Path Protection: 0 Common Link(s), 0 Common Node(s)
Primary lsp path:10.1.0.1 10.1.0.2
                  103.103.103.103
Protect lsp path:10.0.0.1 10.0.0.2
                  10.0.1.1 10.0.1.2
                  103.103.103.103
Path Protect Parameters:

```

```

RSVP Resv Info:
  Record Route: NONE
  Fspec: ave rate=0 kbits, burst=1000 bytes, peak rate=0 kbits

```

The following **shutdown** command shuts down the interface to use path protection:

```

Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# interface e7/0
Router(config-if)# shutdown
Router(config-if)# end

```

The following **show mpls traffic-eng tunnels** command shows that the protection path is used, and the primary path is down:

```

Router# show mpls traffic-eng tunnels tunnel 2

Name: Router_t2 (Tunnel2) Destination: 103.103.103.103
Status:
  Admin: up Oper: up Path: valid Signalling: connected

# Feature Information for MPLS Traffic Engineering (TE): Path Protection

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering (TE): Path Protection

| Feature Name                                   | Releases                                                             | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# Glossary

**autotunnel mesh group**—An autotunnel mesh group (referred to as a mesh group) is a set of connections between edge LSRs in a network.

**backup LSP**—The LSP that is signaled to provide path protection. A backup LSP carries traffic only after failure of the primary LSP.

**backup tunnel**—An MPLS TE tunnel used to protect other (primary) tunnels' traffic when a link or node failure occurs.

**BGP**—Border Gateway Protocol. An interdomain routing protocol designed to provide loop-free routing between separate routing domains that contain independent routing policies (autonomous systems).

**Cisco Express Forwarding**—A means for accelerating the forwarding of packets within a router, by storing route lookup.

**Fast Reroute**—Procedures that enable temporary routing around a failed link or node while a new LSP is being established at the headend.

**graceful restart**—A process for helping an RP restart after a node failure has occurred.

**headend**—The router that originates and maintains a given LSP. This is the first router in the LSP's path.

**hop**—Passage of a data packet between two network nodes (for example, between two routers).

**interface**—A network connection.

**IS-IS**—Intermediate System-to-Intermediate System. Link-state hierarchical routing protocol that calls for intermediate system (IS) routers to exchange routing information based on a single metric to determine network topology.

**ISSU**—In Service Software Upgrade. The ISSU process allows Cisco IOS software at the router level to be updated or otherwise modified while packet forwarding continues. At the line-card level, an enhanced Fast Software Upgrade (eFSU) process minimizes line-card downtime during such upgrades to between 30 and 90 seconds by preloading the new line-card image before the ISSU switchover occurs from the active to the standby Route Processor.

**link**—A point-to-point connection between adjacent nodes. There can be more than one link between adjacent nodes. A link is a network communications channel consisting of a circuit or transmission path and all related equipment between a sender and a receiver. Sometimes referred to as a line or a transmission link.

**LSP**—label switched path. A configured connection between two routers, in which label switching is used to carry the packets. The purpose of an LSP is to carry data packets.

**MPLS**—Multiprotocol Label Switching. Packet-forwarding technology, used in the network core, that applies data link layer labels to tell switching nodes how to forward data, resulting in faster and more scalable forwarding than network layer routing normally can do.

**NHOP**—next hop. The next downstream node along an LSP's path.

**NHOP backup tunnel**—next-hop backup tunnel. The backup tunnel terminating at the LSP's next hop beyond the point of failure, and originating at the hop immediately upstream of the point of failure. It bypasses a failed link, and is used to protect primary LSPs that were using this link before the failure.

**NNHOP**—next-next hop. The node after the next downstream node along an LSP's path.

**NNHOP backup tunnel**—next-next-hop backup tunnel. The backup tunnel terminating at the LSP's next-next hop beyond the point of failure, and originating at the hop immediately upstream of the point of failure. It bypasses a failed link or node, and is used to protect primary LSPs that were using this link or node before the failure.

**node**—The endpoint of a network connection or a junction common to two or more lines in a network. Nodes can be interconnected by links, and serve as control points in the network. Nodes can be processors, controllers, or workstations.

**NSF**—Cisco nonstop forwarding. Cisco NSF always runs with stateful switchover (SSO) and provides redundancy for Layer 3 traffic. NSF works with SSO to minimize the amount of time that a network is unavailable to its users following a switchover. The main purpose of NSF is to continue forwarding IP packets following a supervisor engine switchover.

**OSPF**—Open Shortest Path First. A link-state hierarchical Interior Gateway Protocol routing algorithm, derived from the IS-IS protocol. OSPF features include least-cost routing, multipath routing, and load balancing.

**path option**—A path that a TE tunnel uses to reach a destination.

**path option list**—A list of backup paths as a secondary path option to protect a primary path option.

**primary LSP**—The last LSP originally signaled over the protected interface before the failure. A primary LSP is signaled by configuring a primary path option.

**primary path option**—A path that a TE tunnel uses originally to transport packets.

**primary tunnel**—A tunnel whose LSP may be fast rerouted if there is a failure. Backup tunnels cannot be primary tunnels.

**protected interface**—An interface that has one or more backup tunnels associated with it.

**router**—A network layer device that uses one or more metrics to determine the optimal path along which network traffic should be forwarded. Routers forward packets from one network to another based on network layer information.

**RP**—Route Processor. A generic term for the centralized control unit in a chassis.

**RSVP**—Resource Reservation Protocol. An IETF protocol used for signaling requests (setting up reservations) for Internet services by a customer before that customer is permitted to transmit data over that portion of the network.

**secondary LSP**—The LSP signaled over the protected interface before the failure. A secondary LSP is signaled by configuring a secondary path option or a path option list.

**secondary path**—A path that a TE tunnel uses to protect a primary path.

**secondary path option**—Configuration of the path option that provides protection.

**SRLG**—Shared Risk Link Group. Sets of links that are likely to go down together (for example, because they have the same underlying fiber).

**state**—Information that a router must maintain about each LSP. The information is used for rerouting tunnels.

**tailend**—The router upon which an LSP is terminated. This is the last router in the LSP's path.

**TE**—traffic engineering. The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**topology**—The physical arrangement of network nodes and media within an enterprise networking structure.

**traffic engineering**—The techniques and processes used to cause routed traffic to travel through the network on a path other than the one that would have been chosen if standard routing methods had been used.

**tunnel**—Secure communications path between two peers, such as two routers.

**VoIP**—Voice over IP. The capability of a router to carry voice traffic (for example, telephone calls and faxes) over an IP network. Cisco's voice support is implemented by using voice packet technology.

# MPLS Traffic Engineering—Fast Reroute Link and Node Protection

---

**First Published:** January 16, 2003

**Last Updated:** February 27, 2009

The MPLS Traffic Engineering—Fast Reroute Link and Node Protection feature provides link protection (backup tunnels that bypass only a single link of the label-switched path (LSP)), node protection (backup tunnels that bypass next-hop nodes along LSPs), and the following Fast Reroute (FRR) features:

- Backup tunnel support
- Backup bandwidth protection
- Resource Reservation Protocol (RSVP) Hellos

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering—Fast Reroute Link and Node Protection”](#) section on page 37.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Restrictions for MPLS Traffic Engineering—Fast Reroute Link and Node Protection](#), page 2
- [Information About MPLS Traffic Engineering—Fast Reroute Link and Node Protection](#), page 3

---

**Americas Headquarters:**

Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

- [How to Configure MPLS Traffic Engineering—Fast Reroute \(FRR\) Link and Node Protection, page 17](#)
- [Configuration Examples for MPLS Traffic Engineering—Fast Reroute \(FRR\) Link and Node Protection, page 31](#)
- [Additional References, page 34](#)
- [Command Reference, page 36](#)
- [Feature Information for MPLS Traffic Engineering—Fast Reroute Link and Node Protection, page 37](#)
- [Glossary, page 39](#)

## Prerequisites for MPLS Traffic Engineering—Fast Reroute Link and Node Protection

Your network must support the following Cisco IOS features:

- IP Cisco Express Forwarding
- Multiprotocol Label Switching (MPLS)

Your network must support at least one of the following protocols:

- Intermediate System-to-Intermediate System (IS-IS)
- Open Shortest Path First (OSPF)

Before configuring FRR link and node protection, it is assumed that you have done the following tasks but you do not have to already have configured MPLS traffic engineering (TE) tunnels:

- Enabled MPLS TE on all relevant routers and interfaces
- Configured MPLS TE tunnels

## Restrictions for MPLS Traffic Engineering—Fast Reroute Link and Node Protection

- Interfaces must use MPLS Global Label Allocation.
- Backup tunnel headend and tailend routers must implement FRR as described in draft-pan-rsvp-fastreroute-00.txt.
- Backup tunnels are not protected. If an LSP is actively using a backup tunnel and the backup tunnel fails, the LSP is torn down.
- LSPs that are actively using backup tunnels are not considered for promotion. If an LSP is actively using a backup tunnel and a better backup tunnel becomes available, the active LSP is not switched to the better backup tunnel.
- You cannot enable FRR Hellos on a router that also has Resource Reservation Protocol (RSVP) Graceful Restart enabled.

- (Applicable only to Release 12.2.) You cannot enable primary one-hop autotunnels, backup autotunnels, or autotunnel mesh groups on a router that is also configured with stateful switchover (SSO) redundancy. This restriction does not prevent an MPLS TE tunnel that is automatically configured by TE autotunnel from being successfully recovered by any midpoint router along the LSP's path if the router experiences an SSO switchover.
- MPLS TE LSPs that are fast reroutable cannot be successfully recovered if the LSPs are FRR active and the Point of Local Repair (PLR) router experiences an SSO.

## Information About MPLS Traffic Engineering—Fast Reroute Link and Node Protection

To configure MPLS Traffic Engineering—Fast Reroute Link and Node Protection, you need to understand the following concepts:

- [Fast Reroute, page 3](#)
- [Link Protection, page 3](#)
- [Node Protection, page 4](#)
- [Bandwidth Protection, page 5](#)
- [RSVP Hello, page 5](#)
- [Features of MPLS Traffic Engineering—Fast Reroute Link and Node Protection, page 6](#)
- [Fast Reroute Operation, page 8](#)

### Fast Reroute

Fast Reroute (FRR) is a mechanism for protecting MPLS TE LSPs from link and node failures by locally repairing the LSPs at the point of failure, allowing data to continue to flow on them while their headend routers attempt to establish new end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or node.

### Link Protection

Backup tunnels that bypass only a single link of the LSP's path provide link protection. They protect LSPs if a link along their path fails by rerouting the LSP's traffic to the next hop (bypassing the failed link). These are referred to as next-hop (NHOP) backup tunnels because they terminate at the LSP's next hop beyond the point of failure. [Figure 1](#) illustrates an NHOP backup tunnel.

**Figure 1** *NHOP Backup Tunnel*

## Node Protection

FRR provides node protection for LSPs. Backup tunnels that bypass next-hop nodes along LSP paths are called next-next-hop (NNHOP) backup tunnels because they terminate at the node following the next-hop node of the LSP paths, thereby bypassing the next-hop node. They protect LSPs if a node along their path fails by enabling the node upstream of the failure to reroute the LSPs and their traffic around the failed node to the next-next hop. FRR supports the use of RSVP Hellos to accelerate the detection of node failures. NNHOP backup tunnels also provide protection from link failures, because they bypass the failed link and the node.

Figure 2 illustrates an NNHOP backup tunnel.

**Figure 2** *NNHOP Backup Tunnel*

If an LSP is using a backup tunnel and something changes so that the LSP is no longer appropriate for the backup tunnel, the LSP is torn down. Such changes are the following:

- Backup bandwidth of the backup tunnel is reduced.
- Backup bandwidth type of backup tunnel is changed to a type that is incompatible with the primary LSP.

- Primary LSP is modified so that FRR is disabled. (The **no mpls traffic-eng fast-reroute** command is entered.)

## Bandwidth Protection

NHOP and NNNHOP backup tunnels can be used to provide bandwidth protection for rerouted LSPs. This is referred to as backup bandwidth. You can associate backup bandwidth with NHOP or NNNHOP backup tunnels. This informs the router of the amount of backup bandwidth a particular backup tunnel can protect. When a router maps LSPs to backup tunnels, bandwidth protection ensures that an LSP uses a given backup tunnel only if there is sufficient backup bandwidth. The router selects which LSPs use which backup tunnels in order to provide maximum bandwidth protection. That is, the router determines the best way to map LSPs onto backup tunnels in order to maximize the number of LSPs that can be protected. For information about mapping tunnels and assigning backup bandwidth, see the [“Backup Tunnel Selection Procedure”](#) section on page 10.

LSPs that have the “bandwidth protection desired” bit set have a higher right to select backup tunnels that provide bandwidth protection; that is, those LSPs can preempt other LSPs that do not have that bit set. For more information, see the [“Prioritizing Which LSPs Obtain Backup Tunnels with Bandwidth Protection”](#) section on page 8.

## RSVP Hello

### RSVP Hello Operation

RSVP Hello enables RSVP nodes to detect when a neighboring node is not reachable. This provides node-to-node failure detection. When such a failure is detected, it is handled in a similar manner as a link-layer communication failure.

RSVP Hello can be used by FRR when notification of link-layer failures is not available (for example, with Ethernet), or when the failure detection mechanisms provided by the link layer are not sufficient for the timely detection of node failures.

A node running Hello sends a Hello Request to a neighboring node every interval. If the receiving node is running Hello, it responds with Hello Ack. If four intervals pass and the sending node has not received an Ack or it receives a bad message, the sending node declares that the neighbor is down and notifies FRR.

There are two configurable parameters:

- Hello interval—Use the **ip rsdp signalling hello refresh interval** command.
- Number of acknowledgment messages that are missed before the sending node declares that the neighbor is down—Use the **ip rsdp signalling hello refresh misses** command

### Hello Instance

A Hello instance implements RSVP Hello for a given router interface IP address and remote IP address. A large number of Hello requests are sent; this puts a strain on the router resources. Therefore, create a Hello instance only when it is necessary and delete it when it is no longer needed.

There are two types of Hello instances:

- [Active Hello Instances](#)

- [Passive Hello Instances](#)

#### Active Hello Instances

If a neighbor is unreachable when an LSP is ready to be fast rerouted, an active Hello instance is needed. Create an active Hello instance for each neighbor with at least one LSP in this state.

Active Hello instances periodically send Hello Request messages, and expect Hello Ack messages in response. If the expected Ack message is not received, the active Hello instance declares that the neighbor (remote IP address) is unreachable (lost). LSPs traversing that neighbor may be fast rerouted.

If there is a Hello instance with no LSPs for an unreachable neighbor, do not delete the Hello instance. Convert the active Hello instance to a passive Hello instance because there may be an active instance on the neighboring router that is sending Hello requests to this instance.

#### Passive Hello Instances

Passive Hello instances respond to Hello Request messages (sending Ack messages), but do not initiate Hello Request messages and do not cause LSPs to be fast rerouted. A router with multiple interfaces can run multiple Hello instances to different neighbors or to the same neighbor.

A passive Hello instance is created when a Hello Request is received from a neighbor with a source IP address/destination IP address pair in the IP header for which a Hello instance does not exist.

Delete passive instances if no Hello messages are received for this instance within 10 minutes.

## Features of MPLS Traffic Engineering—Fast Reroute Link and Node Protection

MPLS Traffic Engineering—Fast Reroute Link and Node Protection has the following features:

- [Backup Tunnel Support, page 6](#)
- [Backup Bandwidth Protection, page 7](#)
- [RSVP Hello, page 8](#)

### Backup Tunnel Support

Backup tunnel support has the following capabilities:

- [Backup Tunnels Can Terminate at the Next-Next Hop to Support FRR, page 6](#)
- [Multiple Backup Tunnels Can Protect the Same Interface, page 6](#)
- [Backup Tunnels Provide Scalability, page 7](#)

#### Backup Tunnels Can Terminate at the Next-Next Hop to Support FRR

Backup tunnels that terminate at the next-next hop protect both the downstream link and node. This provides protection for link and node failures. For more detailed information, see the [“Node Protection” section on page 4](#).

#### Multiple Backup Tunnels Can Protect the Same Interface

There is no limit (except memory limitations) to the number of backup tunnels that can protect a given interface. In many topologies, support for node protection requires supporting multiple backup tunnels per protected interface. These backup tunnels can terminate at the same destination or at different destinations. That is, for a given protected interface, you can configure multiple NHOP or NNHOP backup tunnels. This allows redundancy and load balancing.

In addition to being required for node protection, the protection of an interface by multiple backup tunnels provides the following benefits:

- **Redundancy**—If one backup tunnel is down, other backup tunnels protect LSPs.
- **Increased backup capacity**—If the protected interface is a high-capacity link and no single backup path exists with an equal capacity, multiple backup tunnels can protect that one high-capacity link. The LSPs using this link will fail over to different backup tunnels, allowing all of the LSPs to have adequate bandwidth protection during failure (rerouting). If bandwidth protection is not desired, the router spreads LSPs across all available backup tunnels (that is, there is load balancing across backup tunnels). For a more detailed explanation, see the [“Backup Tunnel Selection Procedure” section on page 10](#).

Examples are shown in the [“Backup Tunnels Terminating at Different Destinations” section on page 9](#) and the [“Backup Tunnels Terminating at the Same Destination” section on page 9](#).

### Backup Tunnels Provide Scalability

A backup tunnel can protect multiple LSPs. Furthermore, a backup tunnel can protect multiple interfaces. This is called many-to-one (N:1) protection. An example of N:1 protection is when one backup tunnel protects 5000 LSPs, each router along the backup path maintains one additional tunnel.

One-to-one protection is when a separate backup tunnel must be used for each LSP needing protection. N:1 protection has significant scalability advantages over one-to-one (1:1) protection. An example of 1:1 protection is when 5000 backup tunnels protect 5000 LSPs, each router along the backup path must maintain state for an additional 5000 tunnels.

## Backup Bandwidth Protection

Backup bandwidth protection allows you to give LSPs carrying certain kinds of data (such as voice) priority for using backup tunnels. Backup bandwidth protection has the following capabilities:

- [Bandwidth Protection on Backup Tunnels, page 7](#)
- [Bandwidth Pool Specifications for Backup Tunnels, page 7](#)
- [Semidynamic Backup Tunnel Paths, page 7](#)
- [Prioritizing Which LSPs Obtain Backup Tunnels with Bandwidth Protection, page 8](#)

### Bandwidth Protection on Backup Tunnels

Rerouted LSPs not only have their packets delivered during a failure, but the quality of service can also be maintained.

### Bandwidth Pool Specifications for Backup Tunnels

You can restrict the types of LSPs that can use a given backup tunnel. Backup tunnels can be restricted so that only LSPs using subpool bandwidth can use them or only LSPs that use global-pool bandwidth can use them. This allows different backup tunnels to be used for voice and data. Example: The backup tunnel used for voice could provide bandwidth protection, and the backup tunnel used for data could not provide bandwidth protection.

### Semidynamic Backup Tunnel Paths

The path of a backup tunnel can be configured to be determined dynamically. This can be done by using the IP explicit address exclusion feature that was added in Release 12.0(14)ST. If you use this feature, semidynamic NHOP backup tunnel paths can be specified simply by excluding the protected link; semidynamic NNHOP backup tunnel paths can be configured simply by excluding the protected node.

### Prioritizing Which LSPs Obtain Backup Tunnels with Bandwidth Protection

In case there are not enough NHOP or NNHOP backup tunnels or they do not have enough backup bandwidth to protect all LSPs, you can give an LSP priority in obtaining backup tunnels with bandwidth protection. This is especially useful if you want to give LSPs carrying voice a higher priority than those carrying data.

To activate this feature, enter the **tunnel mpls traffic-eng fast-reroute bw-protect** command to set the “bandwidth protection desired” bit. See the [“Enabling Fast Reroute on LSPs” section on page 17](#).

The LSPs do not necessarily *receive* bandwidth protection. They have a higher *chance* of receiving bandwidth protection if they need it.

LSPs that do not have the bandwidth protection bit set can be demoted. Demotion is when one or more LSPs are removed from their assigned backup tunnel to provide backup to an LSP that has its bandwidth protection bit set. Demotion occurs only when there is a scarcity of backup bandwidth.

When an LSP is demoted, it becomes unprotected (that is, it no longer has a backup tunnel). During the next periodic promotion cycle, an attempt is made to find the best possible backup tunnels for all LSPs that do not currently have protection, including the LSP that was demoted. The LSP may get protection at the same level or a lower level, or it may get no protection.

For information about how routers determine which LSPs to demote, see the [“Backup Protection Preemption Algorithms” section on page 14](#).

## RSVP Hello

RSVP Hello enables a router to detect when a neighboring node has gone down but its interface to that neighbor is still operational. This feature is useful when next-hop node failure is not detectable by link layer mechanisms, or when notification of link-layer failures is not available (for example, Gigabit Ethernet). This allows the router to switch LSPs onto its backup tunnels and avoid packet loss.

For a more detailed description of RSVP Hello, see the [“RSVP Hello” section on page 5](#).

## Fast Reroute Operation

This section describes the following:

- [Fast Reroute Activation, page 8](#)
- [Backup Tunnels Terminating at Different Destinations, page 9](#)
- [Backup Tunnels Terminating at the Same Destination, page 9](#)
- [Backup Tunnel Selection Procedure, page 10](#)
- [Bandwidth Protection, page 11](#)
- [Load Balancing on Limited-Bandwidth Backup Tunnels, page 11](#)
- [Load Balancing on Unlimited-Bandwidth Backup Tunnels, page 12](#)
- [Pool Type and Backup Tunnels, page 12](#)
- [Tunnel Selection Priorities, page 12](#)
- [Bandwidth Protection Considerations, page 14](#)

## Fast Reroute Activation

Two mechanisms cause routers to switch LSPs onto their backup tunnels:

- Interface down notification
- RSVP Hello neighbor down notification

When a router's link or neighboring node fails, the router often detects this failure by an interface down notification. On a GSR Packet over SONET (PoS) interface, this notification is very fast. When a router notices that an interface has gone down, it switches LSPs going out that interface onto their respective backup tunnels (if any).

RSVP Hellos can also be used to trigger FRR. If RSVP Hellos are configured on an interface, messages are periodically sent to the neighboring router. If no response is received, Hellos declare that the neighbor is down. This causes any LSPs going out that interface to be switched to their respective backup tunnels.

## Backup Tunnels Terminating at Different Destinations

Figure 3 illustrates an interface that has multiple backup tunnels terminating at different destinations and demonstrates why, in many topologies, support for node protection requires supporting multiple backup tunnels per protected interface.

**Figure 3** Backup Tunnels That Terminate at Different Destinations

In this illustration, a single interface on R1 requires multiple backup tunnels. LSPs traverse the following routes:

- R1, R2, R3
- R1, R2, R4

To provide protection if node R2 fails, two NNHOP backup tunnels are required: one terminating at R3 and one terminating at R4.

## Backup Tunnels Terminating at the Same Destination

Figure 4 shows how backup tunnels terminating at the same location can be used for redundancy and load balancing. Redundancy and load balancing work for both NHOP and NNHOP backup tunnels.

**Figure 4 Backup Tunnels That Terminate at the Same Destination**

In this illustration, there are three routers: R1, R2, and R3. At R1 two NNHOP backup tunnels (T1 and T2) go from R1 to R3 without traversing R2.

**Redundancy**—If R2 fails or the link from R1 to R2 fails, either backup tunnel can be used. If one backup tunnel is down, the other can be used. LSPs are assigned to backup tunnels when the LSPs are first established. This is done before a failure.

**Load balancing**—If neither backup tunnel has enough bandwidth to back up all LSPs, both tunnels can be used. Some LSPs will use one backup tunnel, other LSPs will use the other backup tunnel. The router decides the best way to fit the LSPs onto the backup tunnels.

## Backup Tunnel Selection Procedure

When an LSP is signaled, each node along the LSP path that provides FRR protection for the LSP selects a backup tunnel for the LSP to use if either of the following events occurs:

- The link to the next hop fails.
- The next hop fails.

By having the node select the backup tunnel for an LSP before a failure occurs, the LSP can be rerouted onto the backup tunnel quickly if there is a failure.

For an LSP to be mapped to a backup tunnel, all of the following conditions must exist:

- The LSP is protected by FRR; that is, the LSP is configured with the **tunnel mpls traffic-eng fast-reroute** command.
- The backup tunnel is up.
- The backup tunnel is configured to have an IP address, typically a loopback address.
- The backup tunnel is configured to protect this LSP's outgoing interface; that is, the interface is configured with the **mpls traffic-eng backup-path** command.
- The backup tunnel does not traverse the LSP's protected interface.
- The backup tunnel terminates at the LSP's NHOP or NNHOP. If it is an NNHOP tunnel, it does not traverse the LSP's NHOP.
- The bandwidth protection requirements and constraints, if any, for the LSP and backup tunnel are met. For information about bandwidth protection considerations, see the [“Bandwidth Protection” section on page 11](#).

## Bandwidth Protection

A backup tunnel can be configured to protect two types of backup bandwidth:

- **Limited backup bandwidth**—A backup tunnel provides bandwidth protection. The sum of the bandwidth of all LSPs using this backup tunnel cannot exceed the backup tunnel's backup bandwidth. When you assign LSPs to this type of backup tunnel, sufficient backup bandwidth must exist.
- **Unlimited backup bandwidth**—The backup tunnel does not provide any bandwidth protection (that is, best-effort protection exists). There is no limit to the amount of bandwidth used by the LSPs that are mapped to this backup tunnel. LSPs that allocate zero bandwidth can use only backup tunnels that have unlimited backup bandwidth.

## Load Balancing on Limited-Bandwidth Backup Tunnels

There may be more than one backup tunnel that has sufficient backup bandwidth to protect a given LSP. In this case, the router chooses the one that has the least amount of backup bandwidth available. This algorithm limits fragmentation, maintaining the largest amount of backup bandwidth available.

Specifying limited backup bandwidth does not “guarantee” bandwidth protection if there is a link or node failure. For example, the set of NHOP and NNHOP backup tunnels that gets triggered when an interface fails may all share some link on the network topology, and this link may not have sufficient bandwidth to support all LSPs using this set of backup tunnels.

In [Figure 5](#), both backup tunnels traverse the same links and hop. When the link between routers R1 and R4 fails, backup tunnels for primary tunnel 1 and primary tunnel 2 are triggered simultaneously. The two backup tunnels may share a link in the network.

**Figure 5** Backup Tunnels Share a Link

In [Figure 6](#), the backup tunnel for primary tunnel 1 may traverse routers R1-R2-R3-R4, and the backup tunnel for primary tunnel 2 may traverse routers R4-R2-R3-R1. In this case, the link R2-R3 may get overloaded if R1-R4 fails.

**Figure 6**      **Overloaded Link**

## Load Balancing on Unlimited-Bandwidth Backup Tunnels

More than one backup tunnel, each having unlimited backup bandwidth, can protect a given interface. In this case, when choosing a backup tunnel for a given LSP, the router chooses the backup tunnel that has the least amount of backup bandwidth in use. This algorithm evenly distributes the LSPs across backup tunnels based on an LSP's bandwidth. If an LSP is requesting zero bandwidth, the router chooses the backup tunnel that is protecting the fewest LSPs.

## Pool Type and Backup Tunnels

By default, a backup tunnel provides protection for LSPs that allocate from any pool (that is, global or subpool). However, a backup tunnel can be configured to protect only LSPs that use global-pool bandwidth, or only those that use subpool bandwidth.

## Tunnel Selection Priorities

This section describes the following:

- [NHOP Versus NNHOP Backup Tunnels](#), page 12
- [Promotion](#), page 14
- [Backup Protection Preemption Algorithms](#), page 14

### NHOP Versus NNHOP Backup Tunnels

More than one backup tunnel can protect a given LSP, where one backup tunnel terminates at the LSP's NNHOP, and the other terminates at the LSP's NHOP. In this case, the router chooses the backup tunnel that terminates at the NNHOP (that is, FRR prefers NNHOP over NHOP backup tunnels).

[Table 1](#) lists the tunnel selection priorities. The first choice is an NNHOP backup tunnel that acquires its bandwidth from a subpool or global pool, and has limited bandwidth. If there is no such backup tunnel, the next choice (2) is a next-next hop backup tunnel that acquires a limited amount of bandwidth from any pool. The preferences go from 1 (best) to 8 (worst), where choice 3 is for an NNHOP backup tunnel with an unlimited amount of subpool or global-pool bandwidth.

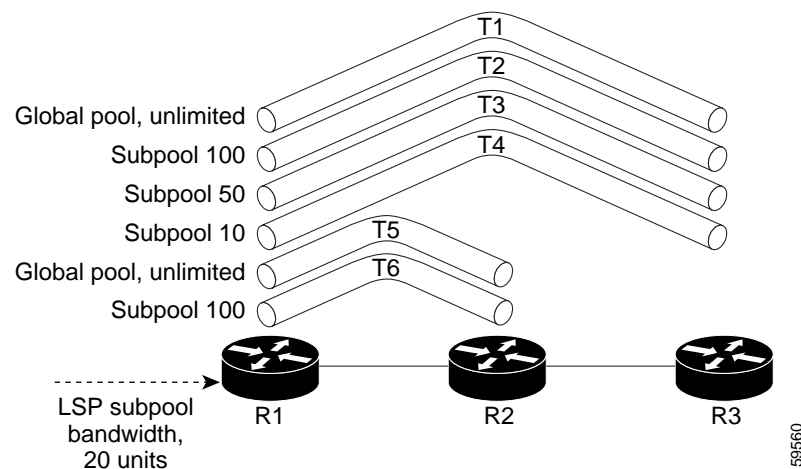

**Table 1** Tunnel Selection Priorities

| Preference | Backup Tunnel Destination | Bandwidth Pool         | Bandwidth Amount |
|------------|---------------------------|------------------------|------------------|
| 1 (Best)   | NNHOP                     | Subpool or global pool | Limited          |
| 2          | NNHOP                     | Any                    | Limited          |
| 3          | NNHOP                     | Subpool or global pool | Unlimited        |
| 4          | NNHOP                     | Any                    | Unlimited        |
| 5          | NHOP                      | Subpool or global pool | Limited          |
| 6          | NHOP                      | Any                    | Limited          |
| 7          | NHOP                      | Subpool or global pool | Unlimited        |
| 8 (Worst)  | NHOP                      | Any                    | Unlimited        |

Figure 7 shows an example of the backup tunnel selection procedure based on the designated amount of global pool and subpool bandwidth currently available.

**Note**

If NHOP and NNHOP backup tunnels do not have sufficient backup bandwidth, no consideration is given to the type of data that the LSP is carrying. For example, a voice LSP may not be protected unless it is signaled before a data LSP. To prioritize backup tunnel usage, see the “[Backup Protection Preemption Algorithms](#)” section on page 14.

**Figure 7** Choosing from Among Multiple Backup Tunnels

In this example, an LSP requires 20 units (kilobits per second) of sub-pool backup bandwidth. The best backup tunnel is selected as follows:

1. Backup tunnels T1 through T4 are considered first because they terminate at the NNHOP.
2. Tunnel T4 is eliminated because it has only ten units of sub-pool backup bandwidth.
3. Tunnel T1 is eliminated because it protects only LSPs using global-pool bandwidth.

4. Tunnel T3 is chosen over T2 because, although both have sufficient backup bandwidth, T3 has the least backup bandwidth available (leaving the most backup bandwidth available on T2).
5. Tunnels T5 and T6 need not be considered because they terminate at an NHOP, and therefore are less desirable than T3, which terminates at an NNHOP.

### Promotion

After a backup tunnel has been chosen for an LSP, conditions may change that will cause us to reevaluate this choice. This reevaluation, if successful, is called promotion. Such conditions may include:

1. A new backup tunnel comes up.
2. The currently chosen backup tunnel for this LSP goes down.
3. A backup tunnel's available backup bandwidth increases. For example, an LSP protected by the tunnel has been reoptimized by the headend to use another path.

For cases 1 and 2, the LSP's backup tunnel is evaluated immediately. Case 3 is addressed by periodically reevaluating LSP-to-backup tunnel mappings. By default, background reevaluation is performed every 5 minutes. This interval is configurable via the **mpls traffic-eng fast-reroute timers** command.

### Backup Protection Preemption Algorithms

When you set the “bandwidth protection desired” bit for an LSP, the LSP has a higher right to select backup tunnels that provide bandwidth protection and it can preempt other LSPs that do not have that bit set.

If there is insufficient backup bandwidth on NNHOP backup tunnels but not on NHOP backup tunnels, the bandwidth-protected LSP does not preempt NNHOP LSPs; it uses NHOP protection.

If there are multiple LSPs using a given backup tunnel and one or more must be demoted to provide bandwidth, there are two user-configurable methods (algorithms) that the router can use to determine which LSPs are demoted:

- Minimize amount of bandwidth that is wasted.
- Minimize the number of LSPs that are demoted.

For example, If you need ten units of backup bandwidth on a backup tunnel, you can demote one of the following:

- A single LSP using 100 units of bandwidth—Makes available more bandwidth than needed, but results in lots of waste
- Ten LSPs, each using one unit of bandwidth—Results in no wasted bandwidth, but affects more LSPs

The default algorithm is to minimize the number of LSPs that are demoted. To change the algorithm to minimize the amount of bandwidth that is wasted, enter the **mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw** command.

## Bandwidth Protection Considerations

There are numerous ways in which bandwidth protection can be ensured. [Table 2](#) describes the advantages and disadvantages of three methods.

**Table 2**      **Bandwidth Protection Methods**

| Method                                                    | Advantages                                                                                                                            | Disadvantages                                                                                                                                                                             |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reserve bandwidth for backup tunnels explicitly.          | It is simple.                                                                                                                         | It is a challenge to allow bandwidth sharing of backup tunnels protecting against independent failures.                                                                                   |
| Use backup tunnels that are signaled with zero bandwidth. | It provides a way to share bandwidth used for protection against independent failures, so it ensures more economical bandwidth usage. | It may be complicated to determine the proper placement of zero bandwidth tunnels.                                                                                                        |
| Backup bandwidth protection.                              | It ensures bandwidth protection for voice traffic.                                                                                    | An LSP that does not have backup bandwidth protection can be demoted at any time if there is not enough backup bandwidth and an LSP that has backup bandwidth protection needs bandwidth. |

Cisco implementation of FRR does not mandate a particular approach, and it provides the flexibility to use any of the above approaches. However, given a range of configuration choices, be sure that the choices are constant with a particular bandwidth protection strategy.

The following sections describe some important issues in choosing an appropriate configuration:

- [Using Backup Tunnels with Explicitly Signaled Bandwidth, page 15](#)
- [Using Backup Tunnels Signaled with Zero Bandwidth, page 16](#)

### Using Backup Tunnels with Explicitly Signaled Bandwidth

Two bandwidth parameters must be set for a backup tunnel:

- Actual signaled bandwidth
- Backup bandwidth

To signal bandwidth requirements of a backup tunnel, configure the bandwidth of the backup tunnel by using the **tunnel mpls traffic-eng bandwidth** command.

To configure the backup bandwidth of the backup tunnel, use the **tunnel mpls traffic-eng backup-bw** command.

The signaled bandwidth is used by the LSRs on the path of the backup tunnel to perform admission control and do appropriate bandwidth accounting.

The backup bandwidth is used by the point of local repair (PLR) (that is, the headend of the backup tunnel) to decide how much primary traffic can be rerouted to this backup tunnel if there is a failure.

Both parameters need to be set to ensure proper operation. The numerical value of the signaled bandwidth and the backup bandwidth should be the same.

### Protected Bandwidth Pools and the Bandwidth Pool from Which the Backup Tunnel Reserves Its Bandwidth

The **tunnel mpls traffic-eng bandwidth** command allows you to configure the following:

- Amount of bandwidth a backup tunnel reserves

- The DS-TE bandwidth pool from which the bandwidth needs to be reserved

**Note**

Only one pool can be selected (that is, the backup tunnel can explicitly reserve bandwidth from either the global pool or the subpool, but not both).

The **tunnel mpls traffic-eng backup-bw** command allows you to specify the bandwidth pool to which the traffic must belong for the traffic to use this backup tunnel. Multiple pools are allowed.

There is no direct correspondence between the bandwidth pool that is protected and the bandwidth pool from which the bandwidth of the backup tunnel draws its bandwidth.

Bandwidth protection for 10 Kbps of subpool traffic on a given link can be achieved by configuring any of the following command combinations:

- **tunnel mpls traffic-eng bandwidth sub-pool 10**  
**tunnel mpls traffic-eng backup-bw sub-pool 10**
- **tunnel mpls traffic-eng bandwidth global-pool 10**  
**tunnel mpls traffic-eng backup-bw sub-pool 10 global-pool unlimited**
- **tunnel mpls traffic-eng bandwidth global-pool 40**  
**tunnel mpls traffic-eng backup-bw sub-pool 10 global-pool 30**

**Using Backup Tunnels Signaled with Zero Bandwidth**

Frequently it is desirable to use backup tunnels with zero signaled bandwidth, even when bandwidth protection is required. It may seem that if no bandwidth is explicitly reserved, no bandwidth guarantees can be provided. However, that is not necessarily true.

In the following situation:

- Only link protection is desired.
- Bandwidth protection is desired only for sub-pool traffic.

For each protected link AB with a maximum reservable subpool value of  $n$ , there may be a path from node A to node B such that the difference between the maximum reservable global and the maximum reservable subpool is at least the value of  $n$ . If it is possible to find such paths for each link in the network, you can establish all the backup tunnels along such paths without any bandwidth reservations. If there is a single link failure, only one backup tunnel will use any link on its path. Because that path has at least  $n$  available bandwidth (in the global pool), assuming that marking and scheduling is configured to classify the subpool traffic into a priority queue, the subpool bandwidth is guaranteed.

This approach allows sharing of the global pool bandwidth between backup tunnels protecting independent link failures. The backup tunnels are expected to be used for only a short period of time after a failure (until the headends of affected LSPs reroute those LSPs to other paths with available subpool bandwidth). The probability of multiple unrelated link failures is very small (in the absence of node or shared risk link group (SRLG) failures, which result in multiple link failures). Therefore, it is reasonable to assume that link failures are in practice independent with high probability. This “independent failure assumption” in combination with backup tunnels signaled without explicit bandwidth reservation enables efficient bandwidth sharing that yields substantial bandwidth savings.

Backup tunnels protecting the subpool traffic do now draw bandwidth from any pool. Primary traffic using the global pool can use the entire global pool, and primary traffic using the subpool can use the entire subpool. Yet, subpool traffic has a complete bandwidth guarantee if there is a single link failure.

A similar approach can be used for node and SRLG protection. However, the decision of where to put the backup tunnels is more complicated because both node and SRLG failures effectively result in the simultaneous failure of several links. Therefore, the backup tunnels protecting traffic traversing all affected links cannot be computed independently of each other. The backup tunnels protecting groups of links corresponding to different failures can still be computed independently of each other, which results in similar bandwidth savings.

#### Signaled Bandwidth Versus Backup Bandwidth

Backup bandwidth is used locally (by the router that is the headend of the backup tunnel) to determine which, and how many, primary LSPs can be rerouted on a particular backup tunnel. The router ensures that the combined bandwidth requirement of these LSPs does not exceed the backup bandwidth.

Therefore, even when the backup tunnel is signaled with zero bandwidth, the backup bandwidth must be configured with the value corresponding to the actual bandwidth requirement of the traffic protected by this backup tunnel. Unlike the case when bandwidth requirements of the backup tunnels are explicitly signaled, the value of the signaled bandwidth (which is zero) is not the same value as the backup bandwidth.

## How to Configure MPLS Traffic Engineering—Fast Reroute (FRR) Link and Node Protection

This section assumes that you want to add FRR protection to a network in which MPLS TE LSPs are configured.

This section contains the following procedures:

- [Enabling Fast Reroute on LSPs](#) (required)
- [Creating a Backup Tunnel to the Next Hop or to the Next-Next Hop](#) (required)
- [Assigning Backup Tunnels to a Protected Interface](#) (required)
- [Associating Backup Bandwidth and Pool Type with a Backup Tunnel](#) (optional)
- [Configuring Backup Bandwidth Protection](#) (optional)
- [Configuring an Interface for Fast Link and Node Failure Detection](#) (optional)
- [Verifying That Fast Reroute Is Operational](#) (optional)

### Enabling Fast Reroute on LSPs

LSPs can use backup tunnels only if they have been configured as fast reroutable. To do this, enter the following commands at the headend of each LSP.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***
4. **tunnel mpls traffic-eng fast-reroute [bw-protect]**

## DETAILED STEPS

|        | Command                                                                                                                                               | Purpose                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                        | Enters global configuration mode.                                                                                 |
| Step 3 | <b>interface tunnel <i>number</i></b><br><br><b>Example:</b><br>Router(config)# interface tunnel 1000                                                 | Enters interface configuration mode for the specified tunnel.                                                     |
| Step 4 | <b>tunnel mpls traffic-eng fast-reroute [bw-protect]</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect | Enables an MPLS TE tunnel to use an established backup tunnel if there is a link or node failure.                 |

## Creating a Backup Tunnel to the Next Hop or to the Next-Next Hop

Creating a backup tunnel is basically no different from creating any other tunnel. To create a backup tunnel to the next hop or to the next-next hop, enter the following commands on the node that will be the headend of the backup tunnel (that is, the node whose downstream link or node may fail). The node on which you enter these commands must be a supported platform. See the [“Finding Feature Information” section on page 1](#).

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***
4. **ip unnumbered *interface-type interface-number***
5. **tunnel destination *ip-address***
6. **tunnel mode mpls traffic-eng**
7. **tunnel mpls traffic-eng path-option [protect] *number* {dynamic | explicit | {name *path-name* | *path-number*}}** [lockdown]
8. **ip explicit-path name *word***
9. **exclude-address *ip-address***

## DETAILED STEPS

|        | Command                                                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                              | Enters global configuration mode.                                                                                                                                                                  |
| Step 3 | <b>interface tunnel <i>number</i></b><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                                                                                                                                                                          | Creates a new tunnel interface and enters interface configuration mode.                                                                                                                            |
| Step 4 | <b>ip unnumbered <i>interface-type interface-number</i></b><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered loopback 0                                                                                                                                                           | Gives the tunnel interface an IP address that is the same as that of interface Loopback0.<br><br><b>Note</b> This command is not effective until Loopback0 has been configured with an IP address. |
| Step 5 | <b>tunnel destination <i>ip-address</i></b><br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.3.3.3                                                                                                                                                                        | Specifies the IP address of the device where the tunnel will terminate. This address should be the router ID of the device that is the NHOP or NNHOP of LSPs to be protected.                      |
| Step 6 | <b>tunnel mode mpls traffic-eng</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng                                                                                                                                                                               | Sets the encapsulation mode of the tunnel to MPLS TE.                                                                                                                                              |
| Step 7 | <b>tunnel mpls traffic-eng path-option [<i>protect</i>] <i>preference-number</i> {dynamic   explicit   {name <i>path-name</i>   <i>path-number</i>}}[<i>lockdown</i>]</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng path-option 10 explicit avoid-protected-link | Configures a path option for an MPLS TE tunnel.<br>Enters router configuration mode.                                                                                                               |

|        | Command                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|-------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 8 | <code>ip explicit-path name word</code><br><br><b>Example:</b><br>Router(config-router)# ip explicit-path name avoid-protected-link | Enters the command mode for IP explicit paths and creates the specified path. Enters explicit path command mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 9 | <code>exclude-address ip-address</code><br><br><b>Example:</b><br>Router(config-ip-expl-path)# exclude-address 3.3.3.3              | <p>For link protection, specify the IP address of the link to be protected. For node protection, specify the router ID of the node to be protected.</p> <p><b>Note</b> Backup tunnel paths can be dynamic or explicit and they do not have to use <code>exclude-address</code>. Because backup tunnels must avoid the protected link or node, it is convenient to use the <b>exclude-address</b> command.</p> <p><b>Note</b> When using the <b>exclude-address</b> command to specify the path for a backup tunnel, you must exclude an interface IP address to avoid a link (for creating an NHOP backup tunnel), or a router ID address to avoid a node (for creating an NNHOP backup tunnel).</p> |

## Assigning Backup Tunnels to a Protected Interface

To assign one or more backup tunnels to a protected interface, enter the following commands on the node that will be the headend of the backup tunnel (that is, the node whose downstream link or node may fail). The node on which you enter these commands must be a supported platform. See the “[Finding Feature Information](#)” section on page 1.

### Note

You must configure the interface to have an IP address and to enable the MPLS TE tunnel feature.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **mpls traffic-eng backup-path tunnel** *interface*

## DETAILED STEPS

|        | Command                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 3 | <b>interface</b> <i>type slot/port</i><br><br><b>Example:</b><br>Router(config)# interface POS 5/0                                             | Moves configuration to the physical interface level, directing subsequent configuration commands to the specific physical interface identified by the <i>type</i> value. The <i>slot</i> and <i>port</i> identify the slot and port being configured. The interface must be a supported interface. See the <a href="#">“Finding Feature Information” section on page 1</a> . Enters interface configuration mode. |
| Step 4 | <b>mpls traffic-eng backup-path tunnel</b> <i>interface</i><br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng backup-path tunnel 2 | Allows LSPs going out this interface to use this backup tunnel if there is a link or node failure.<br><br><b>Note</b> You can enter this command multiple times to associate multiple backup tunnels with the same protected interface.                                                                                                                                                                           |

## Associating Backup Bandwidth and Pool Type with a Backup Tunnel

To associate backup bandwidth with a backup tunnel and designate the type of LSP that can use a backup tunnel, enter the following commands.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *tunnel number*
4. **tunnel mpls traffic-eng backup-bw** {*bandwidth* | [**sub-pool** {*bandwidth* | **Unlimited**}] [**global-pool** {*bandwidth* | **Unlimited**}]}

## DETAILED STEPS

|        | Command                                                                                                                                                                                                                      | Purpose                                                                                                                                   |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                               | Enters global configuration mode.                                                                                                         |
| Step 3 | <b>interface tunnel number</b><br><br><b>Example:</b><br>Router(config)# interface tunnel 2                                                                                                                                  | Enters interface configuration mode for the specified tunnel.                                                                             |
| Step 4 | <b>tunnel mpls traffic-eng backup-bw {bandwidth   [sub-pool {bandwidth   Unlimited}] [global-pool {bandwidth   Unlimited}]}</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng backup-bw sub-pool 1000 | Associates bandwidth with a backup tunnel and designates whether LSPs that allocate bandwidth from the specified pool can use the tunnel. |

## Configuring Backup Bandwidth Protection

To configure backup bandwidth protection, enter the following commands.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **tunnel mpls traffic-eng-fast-reroute [bw-protect]**
4. **mpls traffic-eng fast-reroute backup-prot-preemption [optimize-bw]**

## DETAILED STEPS

|        |                                                                                |                                                                                                                   |
|--------|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters interface configuration mode.                                                                              |

|               |                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <pre>tunnel mpls traffic-eng fast-reroute [bw-protect]</pre> <p><b>Example:</b><br/>Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect</p>                                | <p>Enables an MPLS TE tunnel to use an established backup tunnel in the event of a link or node failure.</p> <ul style="list-style-type: none"> <li>The <b>bw-protect</b> keyword gives an LSP priority for using backup tunnels with bandwidth protection. Enters global configuration mode.</li> </ul> |
| <b>Step 4</b> | <pre>mpls traffic-eng fast-reroute backup-prot-preemption [optimize-bw]</pre> <p><b>Example:</b><br/>Router(config)# mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw</p> | <p>Changes the backup protection preemption algorithm from minimize the number of LSPs that are demoted to minimize the amount of bandwidth that is wasted.</p>                                                                                                                                          |

## Configuring an Interface for Fast Link and Node Failure Detection

To configure an interface for fast link and node failure detection, enter the following commands.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **pos ais-shut**
5. **pos report** {b1-tca | b2-tca | b3-tca | lais | lrldi | pais | plop | prdi | rdool | sd-ber | sf-ber | slof | slos}

### DETAILED STEPS

|               |                                                                                                 |                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <pre>enable</pre> <p><b>Example:</b><br/>Router&gt; enable</p>                                  | <p>Enables privileged EXEC mode.</p> <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |

| <b>Step 3</b> | <pre>interface type slot/port</pre> <p><b>Example:</b><br/>Router(config)# interface pos0/0</p> | <p>Configures an interface type and enters interface configuration mode.</p>                                            |

|               |                                                                                                                                                                                           |                                                                                                                      |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <pre>pos ais-shut</pre> <p><b>Example:</b><br/>Router(config-if)# pos ais-shut</p>                                                                                                        | Sends the line alarm indication signal (LAIS) when the POS interface is placed in any administrative shutdown state. |
| <b>Step 5</b> | <pre>pos report {b1-tca   b2-tca   b3-tca   lais   lrdi   pais   plop   prdi   rdool   sd-ber   sf-ber   slof   slos}</pre> <p><b>Example:</b><br/>Router(config-if)# pos report lrdi</p> | Permits selected SONET alarms to be logged to the console for a POS interface.                                       |

## Verifying That Fast Reroute Is Operational

To verify that FRR can function, perform the following steps.

### SUMMARY STEPS

#### Note

To determine if FRR has been configured correctly, perform Steps 1 and 2.

#### Note

If you created LSPs and performed the required configuration tasks but do not have operational backup tunnels (that is, the backup tunnels are not up or the LSPs are not associated with those backup tunnels), perform Step 3.

1. **show mpls traffic-eng tunnels brief**
2. **show ip rsvp sender detail**
3. **show mpls traffic-eng fast-reroute database**
4. **show mpls traffic-eng tunnels backup**
5. **show mpls traffic-eng fast-reroute database**
6. **show ip rsvp reservation**

### DETAILED STEPS

#### Step 1 show mpls traffic-eng tunnels brief

Use this command to verify that backup tunnels are up:

```
Router# show mpls traffic-eng tunnels brief
```

Following is sample output from the **show mpls traffic-eng tunnels brief** command:

```
Signalling Summary:
  LSP Tunnels Process:      running
  RSVP Process:            running
  Forwarding:              enabled
  Periodic reoptimization:  every 3600 seconds, next in 1706 seconds
TUNNEL NAME                DESTINATION    UP IF    DOWN IF    STATE/PROT
Router_t1                  10.112.0.12    -        PO4/0/1    up/up
```

```

Router_t2                10.112.0.12      -      unknown    up/down
Router_t3                10.112.0.12      -      unknown    admin-down
Router_t1000             10.110.0.10      -      unknown    up/down
Router_t2000             10.110.0.10      -      PO4/0/1    up/up
Displayed 5 (of 5) heads, 0 (of 0) midpoints, 0 (of 0) tails

```

## Step 2 show ip rsvp sender detail

Use this command to verify that LSPs are protected by the appropriate backup tunnels.

Following is sample output from the **show ip rsvp sender detail** command when the command is entered at the PLR before a failure.

```
Router# show ip rsvp sender detail
```

```

PATH:
Tun Dest:  10.10.0.6  Tun ID: 100  Ext Tun ID: 10.10.0.1
Tun Sender: 10.10.0.1  LSP ID: 31
Path refreshes:
  arriving: from PHOP 10.10.7.1 on Et0/0 every 30000 msecs
Session Attr:
  Setup Prio: 7, Holding Prio: 7
  Flags: (0x7) Local Prot desired, Label Recording, SE Style
  session Name: Rl_t100
ERO: (incoming)
  10.10.7.2 (Strict IPv4 Prefix, 8 bytes, /32)
  10.10.0.6 (Strict IPv4 Prefix, 8 bytes, /32)
RRO:
  10.10.7.1/32, Flags:0x0 (No Local Protection)
  10.10.4.1/32, Flags:0x9 (Local Prot Avail/to NNHOP) !Available to NNHOP
  10.10.1.1/32, Flags:0x0 (No Local Protection)
Traffic params - Rate: 10K bits/sec, Max. burst: 1K bytes
  Min Policed Unit: 0 bytes, Max Pkt Size 4294967295 bytes
Fast-Reroute Backup info:
  Inbound FRR: Not active
  Outbound FRR: No backup tunnel selected
Path ID handle: 50000416.
Incoming policy: Accepted. Policy source(s): MPLS/TE
Status: Proxy-terminated

```

## Step 3 show mpls traffic-eng fast-reroute database

Enter the **clear ip rsvp hello instance counters** command to verify the following:

- MPLS TE FRR node protection has been enabled.
- A certain type of LSP can use a backup tunnel.

The following command output displays the LSPs that are protected:

```
Router# show mpls traffic-eng fast-reroute database
```

```

Tunnel head end item frr information:
Protected Tunnel      In-label  intf/label      FRR intf/label      Status
Tunnel10             Tun       pos5/0:Untagged  Tu0:12304            ready

Prefix item frr information:
Prefix              Tunnel  In-label  Out intf/label  FRR intf/label      Status
10.0.0.11/32      Tu110   Tun hd    pos5/0:Untagged  Tu0:12304            ready

LSP midpoint frr information:
LSP identifier      In-label  Out intf/label  FRR intf/label      Status
10.0.0.12 1 [459]   16        pos0/1:17       Tu2000:19            ready

```

If LDP is not enabled, separate prefix items are not shown because all prefixes then use a single rewrite. To confirm that a particular IP prefix is FRR protected, even though it is not shown in this display, enter it within the **show mpls forwarding-table ip-address detail** command. The final line of the display will tell whether that prefix is protected:

```
Router# show mpls forwarding-table 10.0.0.11 detail
```

| Local tag                                               | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop    |
|---------------------------------------------------------|--------------------|---------------------|--------------------|--------------------|-------------|
| Tun hd                                                  | Untagged           | 10.0.0.11/32        | 48                 | pos5/0             | point2point |
| MAC/Encaps=4/8, MTU=1520, Tag Stack{22}                 |                    |                     |                    |                    |             |
| 48D18847 00016000                                       |                    |                     |                    |                    |             |
| No output feature configured                            |                    |                     |                    |                    |             |
| Fast Reroute Protection via (Tu0, outgoing label 12304) |                    |                     |                    |                    |             |

#### Step 4 show mpls traffic-eng tunnels backup

For backup tunnels to be operational, the LSP must be reroutable. At the headend of the LSP, enter the **show run int tunnel tunnel-number** command. The output should include the **tunnel mpls traffic-eng fast-reroute** command. If it does not, enter this command for the tunnel.

On the router where the backup tunnels originate, enter the **show mpls traffic-eng tunnels backup** command. Following is sample command output:

```
Router# show mpls traffic-eng tunnels backup
```

```
Router_t578
LSP Head, Tunnel578, Admin: up, Oper: up
Src 10.55.55.55, Dest 10.88.88.88, Instance 1
Fast Reroute Backup Provided:
  Protected i/fs: PO1/0, PO1/1, PO3/3
  Protected lsps: 1
  Backup BW: any pool unlimited; inuse: 100 kbps
Router_t5710
LSP Head, Tunnel5710, Admin: admin-down, Oper: down
Src 10.55.55.55, Dest 10.7.7.7, Instance 0
Fast Reroute Backup Provided:
  Protected i/fs: PO1/1
  Protected lsps: 0
  Backup BW: any pool unlimited; inuse: 0 kbps
Router_t5711
LSP Head, Tunnel5711, Admin up, Oper: up
Src 10.55.55.55,, Dest 10.7.7.7, Instance 1
Fast Reroute Backup Provided:
  Protected i/fs: PO1/0
  Protected lsps: 2
  Backup BW: any pool unlimited; inuse: 6010 kbps
```

The command output will allow you to verify the following:

- Backup tunnel exists—Verify that there is a backup tunnel that terminates at this LSP's NHOP or NNHOP. Look for the LSP's NHOP or NNHOP in the Dest field.
- Backup tunnel is up—To verify that the backup tunnel is up, look for “Up” in the State field.
- Backup tunnel is associated with LSP's interface—Verify that the interface for the LSP is allowed to use this backup tunnel. Look for the LSP's output interface in the “protects” field list.
- Backup tunnel has sufficient bandwidth—If you restricted the amount of bandwidth a backup tunnel can hold, verify that the backup tunnel has sufficient bandwidth to hold the LSPs that would use this backup tunnel if there is a failure. The bandwidth of an LSP is defined by the line **tunnel mpls traffic-eng bandwidth** at the headend of the LSP. To determine the available bandwidth on a backup tunnel, look at the “cfg” and “inuse” fields. If there is insufficient backup bandwidth to

accommodate the LSPs that would use this backup tunnel in the event of a failure, create an additional backup tunnel or increase the backup bandwidth of the existing tunnel by using the **tunnel mpls traffic-eng bandwidth** command.

**Note**

To determine the sufficient amount of bandwidth, offline capacity planning may be required.

- Backup tunnel has appropriate bandwidth type—If you restricted the type of LSPs (subpool or global pool) that can use this backup tunnel, verify that the LSP is the appropriate type for the backup tunnel. The type of the LSP is defined by the line **tunnel mpls traffic-eng bandwidth** at the headend of this LSP. If this line contains the word “subpool”, then it uses sub-pool bandwidth; otherwise, it uses global pool bandwidth. Verify that the type matches the type the backup tunnel can hold by looking in the output of the **tunnel mpls traffic-eng bandwidth** command.

You also can enable debug by entering the **debug ip rsvp fast-reroute** command and the **debug mpls traffic-eng fast-reroute** command on the router that is the headend of the backup tunnel. Then do the following:

1. Enter the **shutdown** command for the primary tunnel.
2. Enter the **no shutdown** command for the primary tunnel.
3. View the debug output.

**Step 5** **show mpls traffic-eng fast-reroute database**

Enter the **clear ip rsvp hello instance counters** command to verify the following:

- MPLS TE FRR node protection has been enabled.
- A certain type of LSP can use a backup tunnel.

The following command output displays the LSPs that are protected:

```
Router# show mpls traffic-eng fast-reroute database
```

```
Tunnel head end item frr information:
```

| Protected Tunnel | In-label | intf/label      | FRR intf/label | Status |
|------------------|----------|-----------------|----------------|--------|
| Tunnell0         | Tun      | pos5/0:Untagged | Tu0:12304      | ready  |

```
Prefix item frr information:
```

| Prefix       | Tunnel | In-label | Out intf/label  | FRR intf/label | Status |
|--------------|--------|----------|-----------------|----------------|--------|
| 10.0.0.11/32 | Tu10   | Tun hd   | pos5/0:Untagged | Tu0:12304      | ready  |

```
LSP midpoint frr information:
```

| LSP identifier    | In-label | Out intf/label | FRR intf/label | Status |
|-------------------|----------|----------------|----------------|--------|
| 10.0.0.12 1 [459] | 16       | pos0/1:17      | Tu2000:19      | ready  |

**Note**

If LDP is not enabled, separate prefix items are not shown because all prefixes then use a single rewrite. To confirm that a particular IP prefix is FRR protected, even though it is not shown in this display, enter it within the **show mpls forwarding-table ip-address detail** command. The final line of the display will tell whether that prefix is protected:

```
Router# show mpls forwarding-table 10.0.0.11 detail
```

| Local tag                               | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop    |
|-----------------------------------------|--------------------|---------------------|--------------------|--------------------|-------------|
| Tun hd                                  | Untagged           | 10.0.0.11/32        | 48                 | pos5/0             | point2point |

Fast Reroute Protection via (Tu0, outgoing label 12304)

### Step 6 show ip rsvp reservation

Following is sample output from the **show ip rsvp reservation** command entered at the headend of a primary LSP. Entering the command at the headend of the primary LSP shows, among other things, the status of FRR (that is, local protection) at each hop this LSP traverses. The per-hop information is collected in the Record Route Object (RRO) that travels with the Resv message from the tail to the head.

Router# **show ip rsvp reservation detail**

```
Reservation:
  Tun Dest: 10.1.1.1  Tun ID: 1  Ext Tun ID: 172.16.1.1
  Tun Sender: 172.16.1.1  LSP ID: 104
  Next Hop: 172.17.1.2 on POS1/0
  Label: 18 (outgoing)
  Reservation Style is Shared-Explicit, QoS Service is Controlled-Load
  Average Bitrate is 0 bits/sec, Maximum Burst is 1K bytes
  Min Policed Unit: 0 bytes, Max Pkt Size: 0 bytes
RRO:
  172.18.1.1/32, Flags:0x1 (Local Prot Avail/to NHOP)
    Label subobject: Flags 0x1, C-Type 1, Label 18
  172.19.1.1/32, Flags:0x0 (Local Prot Avail/In Use/Has BW/to NHOP)
    Label subobject: Flags 0x1, C-Type 1, Label 16
  172.19.1.2/32, Flags:0x0 (No Local Protection)
    Label subobject: Flags 0x1, C-Type 1, Label 0
  Resv ID handle: CD000404.
  Policy: Accepted. Policy source(s): MPLS/TE
```

Notice the following about the primary LSP:

- It has protection that uses a NHOP backup tunnel at its first hop.
- It has protection and is actively using an NHOP backup tunnel at its second hop.
- It has no local protection at its third hop.

The RRO display shows the following information for each hop:

- Whether local protection is available (that is, whether the LSP has selected a backup tunnel)
- Whether local protection is in use (that is, whether the LSP is currently using its selected backup tunnel)
- Whether the selected backup tunnel is an NHOP or NNHOP backup tunnel
- Whether the backup tunnel used at this hop provides bandwidth protection

## Troubleshooting Tips

This section describes the following:

- [LSPs Do Not Become Active; They Remain Ready](#)
- [Primary Tunnel Does Not Select Backup Tunnel That Is Up](#)
- [Enhanced RSVP Commands Display Useful Information](#)
- [RSVP Hello Detects When a Neighboring Node Is Not Reachable](#)
- [Hello Instances Have Not Been Created](#)
- [“No entry at index” \(error may self-correct, RRO may not yet have propagated from downstream node of interest\)” Error Message Is Printed at the Point of Local Repair](#)

- “Couldn’t get rsbs” (error may self-correct when Resv arrives)” Error Message Is Printed at the Point of Local Repair

### LSPs Do Not Become Active; They Remain Ready

At a PLR, LSPs transition from Ready to Active if one of the following events occurs:

- Primary interface goes down—If the primary interface (LSP’s outbound interface) goes down and the LSP is ready to use a backup tunnel, the LSP will transition to the active state causing its data to flow over the backup tunnel. On some platforms and interface types (for example, GSR POS interfaces), there is fast interface-down logic that detects this event very quickly. On other platforms where this logic does not exist, detection time is slower. On such platforms, it may be desirable to enable RSVP Hello (see the next bulleted item, “Hellos detect next hop is down”).
- Hellos detect next hop is down—If Hellos are enabled on the primary interface (LSP’s outbound interface), and the LSP’s next hop is no longer reachable, the next hop is declared down. This event will cause the LSP to begin actively using its backup tunnel. Notice that a next hop will be declared down even if the primary interface does not go down. For example, if the next hop stops responding due to a reboot or software or hardware problem, Hellos will trigger the LSPs using this next hop to switch to their backup tunnels. Hellos can also help trigger FRR on interfaces such as Gigabit Ethernet where the interface remains up but is unusable (due to lack of link-layer liveness detection mechanisms).

### Primary Tunnel Does Not Select Backup Tunnel That Is Up

If a backup tunnel is up, but it is not selected as a backup tunnel by the primary tunnel (LSP), enter the following commands for the backup tunnel:

- **shutdown**
- **no shutdown**

**Note** If you change the status of a backup tunnel, the backup tunnel selection algorithm is rerun for the backup tunnel. LSPs that have currently selected (that is, are ready to use) that backup tunnel will be disassociated from it, and then reassociated with that backup tunnel or another backup tunnel. This is generally harmless and usually results in mapping the same LSPs to that backup tunnel. However, if any LSPs are actively using that backup tunnel, shutting down the backup tunnel will tear down those LSPs.

### Enhanced RSVP Commands Display Useful Information

The following RSVP commands have been enhanced to display information that can be helpful when you are examining the FRR state or troubleshooting FRR:

- **show ip rsvp request**—Displays upstream reservation state (that is, information related to the Resv messages that this node will send upstream).
- **show ip rsvp reservation**—Displays information about Resv messages received.
- **show ip rsvp sender**—Displays information about path messages being received.

These commands show control plane state; they do not show data state. That is, they show information about RSVP messages (Path and Resv) used to signal LSPs. For information about the data packets being forwarded along LSPs, use the **show mpls forwarding** command.

### RSVP Hello Detects When a Neighboring Node Is Not Reachable

The RSVP Hello feature enables RSVP nodes to detect when a neighboring node is not reachable. Use this feature when notification of link-layer failures is not available and unnumbered links are not used, or when the failure detection mechanisms provided by the link layer are not sufficient for timely node failure detection. Hello must be configured both globally on the router and on the specific interface to be operational.

### Hello Instances Have Not Been Created

If Hello instances have not been created, do the following:

- Determine if RSVP Hello has been enabled globally on the router. Enter the **ip rsvp signalling hello** (configuration) command.
- Determine if RSVP Hello has been enabled on an interface that the LSPs traverse. Enter the **ip rsvp signalling hello** (interface) command.
- Verify that at least one LSP has a backup tunnel by displaying the output of the **show ip rsvp sender** command. A value of “Ready” indicates that a backup tunnel has been selected.

### “No entry at index” (error may self-correct, RRO may not yet have propagated from downstream node of interest) Error Message Is Printed at the Point of Local Repair

FRR relies on a RRO in Resv messages arriving from downstream. Routers receiving path messages with the SESSION\_ATTRIBUTE bit indicating that the LSP is fast-reroutable should include an RRO in the corresponding Resv messages.

If an LSP is configured for FRR, but the Resv arriving from a downstream router contains an incomplete RRO, the “No entry at index (error may self-correct, RRO may not yet have propagated from downstream node of interest)” message is printed. An incomplete RRO is one in which the NHOP or the NNHOP did not include an entry in the RRO.

This error typically means that backup tunnels to the NHOP or the NNHOP cannot be selected for this LSP because there is insufficient information about the NHOP or NNHOP due to the lack of an RRO entry.

Occasionally there are valid circumstances in which this situation occurs temporarily and the problem is self-corrected. If subsequent Resv messages arrive with a complete RRO, ignore the error message.

To determine whether the error has been corrected, display the RRO in Resv messages by entering the **clear ip rsvp hello instance counters** command. Use an output filter keyword to display only the LSP of interest.

### “Couldn’t get rsbs” (error may self-correct when Resv arrives) Error Message Is Printed at the Point of Local Repair

The PLR cannot select a backup tunnel for an LSP until a Resv message has arrived from downstream.

When this error occurs, it typically means that something is wrong. For example, no reservation exists for this LSP. You can troubleshoot this problem by using the **debug ip rsvp reservation** command to enable debug.

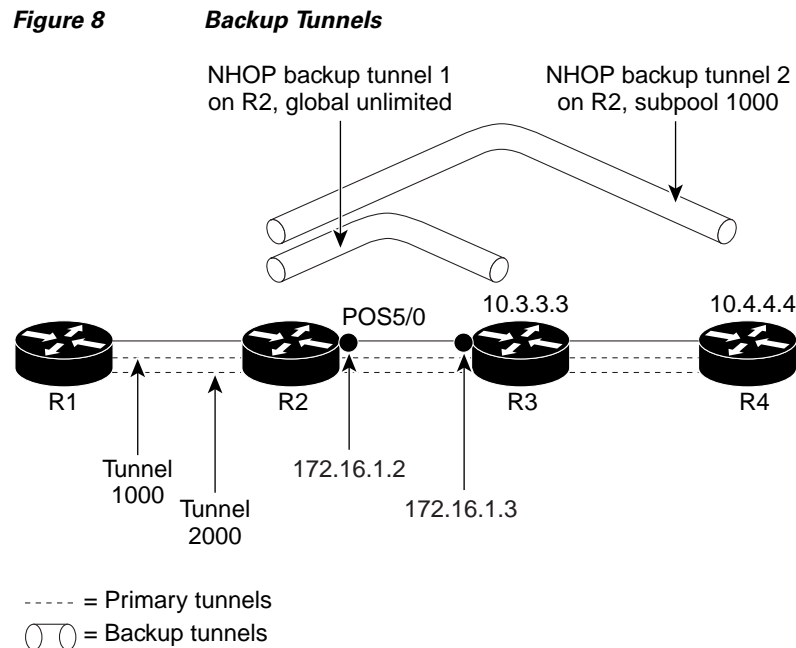

Occasionally there are valid circumstances in which this error message occurs and there is no need for concern. One such circumstance is when an LSP experiences a change before any Resv message has arrived from downstream. Changes can cause a PLR to try to select a backup tunnel for an LSP, and the selection will fail (causing this error message) if no Resv message has arrived for this LSP.

# Configuration Examples for MPLS Traffic Engineering—Fast Reroute (FRR) Link and Node Protection

This section provides the following configuration examples:

- [Enabling Fast Reroute for all Tunnels: Example, page 31](#)
- [Creating an NHOP Backup Tunnel: Example, page 32](#)
- [Creating an NNHOP Backup Tunnel: Example, page 32](#)
- [Assigning Backup Tunnels to a Protected Interface: Example, page 32](#)
- [Associating Backup Bandwidth and Pool Type with Backup Tunnels: Example, page 33](#)
- [Configuring Backup Bandwidth Protection: Example, page 33](#)
- [Configuring an Interface for Fast Link and Node Failure Detection: Example, page 33](#)
- [Configuring RSVP Hello and POS Signals: Example, page 33](#)

The examples relate to the illustration shown in [Figure 8](#).

## Enabling Fast Reroute for all Tunnels: Example

On router R1, enter interface configuration mode for each tunnel to be protected (Tunnel 1000 and Tunnel 2000). Enable these tunnels to use a backup tunnel in case of a link or node failure along their paths.

Tunnel 1000 will use 10 units of bandwidth from the subpool.

Tunnel 2000 will use five units of bandwidth from the global pool. The “bandwidth protection desired” bit has been set by specifying **bw-prot** in the **tunnel mpls traffic-eng fast-reroute** command.

```
Router(config)# interface Tunnel 1000
Router(config-if)# tunnel mpls traffic-eng fast-reroute
Router(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 10

Router(config)# interface Tunnel2000
Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-prot
Router(config-if)# tunnel mpls traffic-eng bandwidth 5
```

## Creating an NHOP Backup Tunnel: Example

On router R2, create an NHOP backup tunnel to R3. This backup tunnel should avoid using the link 172.1.1.2.

```
Router(config)# ip explicit-path name avoid-protected-link
Router(cfg-ip-expl-path)# exclude-address 172.1.1.2
Explicit Path name avoid-protected-link:
___1: exclude-address 172.1.1.2
Router(cfg-ip-expl-path)# end

Router(config)# interface Tunnel 1
Router(config-if)# ip unnumbered loopback0
Router(config-if)# tunnel destination 10.3.3.3
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng path-option 10 explicit avoid-protected-link
```

## Creating an NNHOP Backup Tunnel: Example

On router R2, create an NNHOP backup tunnel to R4. This backup tunnel should avoid R3.

```
Router(config)# ip explicit-path name avoid-protected-node
Router(cfg-ip-expl-path)# exclude-address 10.3.3.3
Explicit Path name avoid-protected-node:
___1: exclude-address 10.3.3.3
Router(cfg-ip-expl-path)# end

Router(config)# interface Tunnel 2
Router(config-if)# ip unnumbered loopback0
Router(config-if)# tunnel destination 10.4.4.4
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng path-option 10 explicit avoid-protected-node
```

## Assigning Backup Tunnels to a Protected Interface: Example

On router R2, associate both backup tunnels with interface POS 5/0:

```
Router(config)# interface POS 5/0
Router(config-if)# mpls traffic-eng backup-path tunnel 1
Router(config-if)# mpls traffic-eng backup-path tunnel 2
```

## Associating Backup Bandwidth and Pool Type with Backup Tunnels: Example

Backup tunnel 1 is to be used only by LSPs that take their bandwidth from the global pool. It does not provide bandwidth protection. Backup tunnel 2 is to be used only by LSPs that take their bandwidth from the subpool. Backup tunnel 2 provides bandwidth protection for up to 1000 units.

```
Router(config)# interface Tunnel 1
Router(config-if)# tunnel mpls traffic-eng backup-bw global-pool Unlimited

Router(config)# interface Tunnel 2
Router(config-if)# tunnel mpls traffic-eng backup-bw sub-pool 1000
```

## Configuring Backup Bandwidth Protection: Example

In the following example, backup bandwidth protection is configured:

**Note**

This global configuration is required only to change the backup protection preemption algorithm from minimize the number of LSPs that are demoted to minimize the amount of bandwidth that is wasted.

```
Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect
Router(config)# mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw
```

## Configuring an Interface for Fast Link and Node Failure Detection: Example

In the following example, pos ais-shut is configured:

```
Router(config)# interface pos 0/0
Router(config-if)# pos ais-shut
```

In the following example, report lrdi is configured on OS interfaces:

```
Router(config)# interface pos 0/0
Router(config-if)# pos report lrdi
```

## Configuring RSVP Hello and POS Signals: Example

Hello must be configured both globally on the router and on the specific interface on which you need FRR protection. To configure Hello, use the following configuration commands:

- **ip rsvp signalling hello** (configuration)—Enables Hello globally on the router.
- **ip rsvp signalling hello** (interface)—Enables Hello on an interface where you need FRR protection.

The following configuration commands are optional:

- **ip rsvp signalling hello dscp**—Sets the differentiated services code point (DSCP) value that is in the IP header of the Hello message.
- **ip rsvp signalling hello refresh misses**—Specifies how many acknowledgments a node can miss in a row before the node considers that communication with its neighbor is down.
- **ip rsvp signalling hello refresh interval**—Configures the Hello request interval.
- **ip rsvp signalling hello statistics**—Enables Hello statistics on the router.

For configuration examples, see the Hello command descriptions in the “Command Reference” section of *MPLS Traffic Engineering (TE): Link and Node Protection, with RSVP Hellos Support*, Release 12.0(24)S.

To configure POS signaling for detecting FRR failures, enter the **pos report all** command or enter the following commands to request individual reports:

```
pos ais-shut
pos report rdool
pos report lais
pos report lrldi
pos report pais
pos report prdi
pos report sd-ber
```

# Feature Information for MPLS Traffic Engineering—Fast Reroute Link and Node Protection

Table 3 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 3 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 3** Feature Information for MPLS Traffic Engineering—Fast Reroute Link and Node Protection

| Feature Name                                                   | Releases                                                                                                 | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# Glossary

**backup bandwidth**—The usage of NHOP and NNHOP backup tunnels to provide bandwidth protection for rerouted LSPs.

**backup tunnel**—An MPLS TE tunnel used to protect other (primary) tunnels' traffic when a link or node failure occurs.

**bandwidth**—The available traffic capacity of a link.

**Cisco Express Forwarding**—A means for accelerating the forwarding of packets within a router, by storing route lookup.

**enterprise network**—A large and diverse network connecting most major points in a company or other organization.

**Fast Reroute**—Procedures that enable temporary routing around a failed link or node while a new LSP is being established at the headend.

**global pool**—The total bandwidth allocated to an MPLS traffic engineering link or node.

**headend**—The router that originates and maintains a given LSP. This is the first router in the LSP's path.

**hop**—Passage of a data packet between two network nodes (for example, between two routers).

**instance**—A Hello instance implements the RSVP Hello extensions for a given router interface address and remote IP address. Active Hello instances periodically send Hello Request messages, expecting Hello ACK messages in response. If the expected ACK message is not received, the active Hello instance declares that the neighbor (remote IP address) is unreachable (that is, it is lost). This can cause LSPs crossing this neighbor to be fast rerouted.

**interface**—A network connection.

**Intermediate System-to-Intermediate System**—IS-IS. Link-state hierarchical routing protocol that calls for intermediate system (IS) routers to exchange routing information based on a single metric to determine network topology.

**link**—A point-to-point connection between adjacent nodes. There can be more than one link between adjacent nodes. A link is a network communications channel consisting of a circuit or transmission path and all related equipment between a sender and a receiver. Sometimes referred to as a line or a transmission link.

**limited backup bandwidth**—Backup tunnels that provide bandwidth protection.

**load balancing**—A configuration technique that shifts traffic to an alternative link if a certain threshold is exceeded on the primary link. Load balancing is similar to redundancy in that if an event causes traffic to shift directions, alternative equipment must be present in the configuration. In load balancing, the alternative equipment is not necessarily redundant equipment that operates only in the event of a failure.

**LSP**—label-switched path. A connection between two routers in which MPLS forwards the packets.

**merge point**—The backup tunnel's tail.

**MPLS**—Multiprotocol Label Switching. Packet-forwarding technology, used in the network core, that applies data link layer labels to tell switching nodes how to forward data, resulting in faster and more scalable forwarding than network layer routing normally can do.

**MPLS global label allocation**—There is one label space for all interfaces in the router. For example, label 100 coming in one interface is treated the same as label 100 coming in a different interface.

**NHOP**—next hop. The next downstream node along an LSP's path.

**NHOP backup tunnel**—next-hop backup tunnel. Backup tunnel terminating at the LSP's next hop beyond the point of failure, and originating at the hop immediately upstream of the point of failure. It bypasses a failed link, and is used to protect primary LSPs that were using this link before the failure.

**NNHOP**—next-next hop. The node after the next downstream node along an LSP's path.

**NNHOP backup tunnel**—next-next-hop backup tunnel. Backup tunnel terminating at the LSP's next-next hop beyond the point of failure, and originating at the hop immediately upstream of the point of failure. It bypasses a failed link or node, and is used to protect primary LSPs that were using this link or node before the failure.

**node**—Endpoint of a network connection or a junction common to two or more lines in a network. Nodes can be interconnected by links, and serve as control points in the network. Nodes can be processors, controllers, or workstations.

**OSPF**—Open Shortest Path First. A link-state hierarchical Interior Gateway Protocol routing algorithm, derived from the IS-IS protocol. OSPF features include least-cost routing, multipath routing, and load balancing.

**primary LSP**—The last LSP originally signaled over the protected interface before the failure. The primary LSP is the LSP before the failure.

**primary tunnel**—Tunnel whose LSP may be fast rerouted if there is a failure. Backup tunnels cannot be primary tunnels.

**promotion**—Conditions, such as a new backup tunnel comes up, cause a reevaluation of a backup tunnel that was chosen for an LSP. If the reevaluation is successful, it is called a promotion.

**protected interface**—An interface that has one or more backup tunnels associated with it.

**redundancy**—The duplication of devices, services, or connections so that, in the event of a failure, the redundant devices, services, or connections can perform the work of those that failed.

**RSVP**—Resource Reservation Protocol. A protocol used for signaling requests (setting up reservations) for Internet services by a customer before that customer is permitted to transmit data over that portion of the network.

**scalability**—An indicator showing how quickly some measure of resource usage increases as a network gets larger.

**SRLG**—shared risk link group. Sets of links that are likely to go down together.

**state**—Information that a router must maintain about each LSP. The information is used for rerouting tunnels.

**sub-pool**—The more restrictive bandwidth in an MPLS traffic engineering link or node. The subpool is a portion of the link or node's overall global pool bandwidth.

**tailend**—The router upon which an LSP is terminated. This is the last router in the LSP's path.

**topology**—The physical arrangement of network nodes and media within an enterprise networking structure.

**tunnel**—Secure communications path between two peers, such as two routers.

**unlimited backup bandwidth**—Backup tunnels that provide no bandwidth (best-effort) protection (that is, they provide best-effort protection).

# MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)

---

**First Published: October 10, 2004**

**Last Updated: February 27, 2009**

The MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection) feature provides the following Fast Reroute (FRR) capabilities:

- Backup tunnel that terminates at the next-next hop router to protect both the downstream link and node in order to protect link and node failures. There is no limit (except memory limitations) to the number of backup tunnels that can protect a given interface. A backup tunnel is scalable because it can protect multiple label switched paths (LSPs) and multiple interfaces.
- Backup bandwidth protection allows a priority to be assigned to backup tunnels for LSPs carrying certain kinds of data (such as voice).
- Fast Tunnel Interface Down detection, which forces a “generic” interface tunnel (not specifically a Fast Reroute tunnel) to become disabled immediately if the headend router detects a failed link on an LSP.
- Resource Reservation Protocol (RSVP) Hellos, which are used to accelerate the detection of node failures.

## Note

If the Multiprotocol Label Switching (MPLS) TE FRR Link Protection feature is planned to be used in releases earlier than Cisco IOS Release 12.0(24)S, contact the Cisco Technical Assistance Center for important deployment and upgrade information.

---

For information about shared risk link groups (SRLGs), which are sets of links that are likely to go down together, refer to [MPLS Traffic Engineering: Shared Risk Link Groups](#).

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#)” section on page 39.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Contents

- [Restrictions for MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#), page 3
- [Information About MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#), page 3
- [How to Configure MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#), page 18
- [Configuration Examples for MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#), page 33
- [Additional References](#), page 37
- [Command Reference](#), page 38
- [Feature Information for MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#), page 39
- [Glossary](#), page 41

## Prerequisites for MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)

Your network must support the following Cisco IOS features in order to support features described in this document:

- IP Cisco Express Forwarding
- MPLS

Your network must support at least one of the following protocols:

- Intermediate System-to-Intermediate System (IS-IS)
- Open Shortest Path First (OSPF)

# Restrictions for MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)

- Interfaces must use MPLS Global Label Allocation.
- Backup tunnel headend and tailend routers must implement FRR as described in this document.
- Backup tunnels are not protected. If an LSP is actively using a backup tunnel and the backup tunnel fails, the LSP is torn down.
- LSPs that are actively using backup tunnels are not considered for promotion. So, if an LSP is actively using a backup tunnel and a better backup tunnel becomes available, the active LSP is not switched to the better backup tunnel.

## Information About MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)

To configure the MPLS TE Link and Node Protection with RSVP Hellos Support (with Fast Tunnel Interface Down Detection) feature, you need to understand the following concepts:

- [Fast Reroute, page 3](#)
- [Link Protection, page 4](#)
- [Node Protection, page 4](#)
- [Bandwidth Protection, page 5](#)
- [Fast Tunnel Interface Down Detection, page 5](#)
- [RSVP Hello, page 5](#)
- [Features of MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\), page 7](#)
- [Fast Reroute Operation, page 9](#)

## Fast Reroute

Fast Reroute (FRR) is a mechanism for protecting MPLS TE LSPs from link and node failures by locally repairing the LSPs at the point of failure, allowing data to continue to flow on them while their headend routers attempt to establish new end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or nodes.

For information about how FRR protects TE LSPs from shared risk link group (SRLG) failure, refer to *MPLS Traffic Engineering: Shared Risk Link Groups*.

## Link Protection

Backup tunnels that bypass only a single link of the LSP's path provide Link Protection. They protect LSPs if a link along their path fails by rerouting the LSP's traffic to the next hop (bypassing the failed link). These are referred to as next-hop (NHOP) backup tunnels because they terminate at the LSP's next hop beyond the point of failure. [Figure 1](#) illustrates an NHOP backup tunnel.

**Figure 1** *NHOP Backup Tunnel*

## Node Protection

FRR provides Node Protection for LSPs. Backup tunnels that bypass next-hop nodes along LSP paths are called next-next-hop (NNHOP) backup tunnels because they terminate at the node following the next-hop node of the LSP paths, thereby bypassing the next-hop node. They protect LSPs if a node along their path fails by enabling the node upstream of the failure to reroute the LSPs and their traffic around the failed node to the next-next hop. FRR supports the use of RSVP Hellos to accelerate the detection of node failures. NNHOP backup tunnels also provide protection from link failures, because they bypass the failed link in addition to the node.

[Figure 2](#) illustrates an NNHOP backup tunnel.

**Figure 2** *NNHOP Backup Tunnel*

If an LSP is using a backup tunnel and something changes so that the LSP is no longer appropriate for the backup tunnel, the LSP is torn down. Such changes include the following:

- Backup bandwidth of the backup tunnel is reduced.
- Backup bandwidth type of backup tunnel is changed to a type that is incompatible with the primary LSP.
- Primary LSP is modified so that FRR is disabled. (The **no mpls traffic-eng fast-reroute** command is entered.)

## Bandwidth Protection

NHOP and NNHOP backup tunnels can be used to provide bandwidth protection for rerouted LSPs. This is referred to as backup bandwidth. You can associate backup bandwidth with NHOP or NNHOP backup tunnels. This informs the router of the amount of backup bandwidth a particular backup tunnel can protect. When a router maps LSPs to backup tunnels, bandwidth protection ensures that an LSP uses a given backup tunnel only if there is sufficient backup bandwidth. The router selects which LSPs use which backup tunnels in order to provide maximum bandwidth protection. That is, the router determines the best way to map LSPs onto backup tunnels in order to maximize the number of LSPs that can be protected. For information about mapping tunnels and assigning backup bandwidth, see the [“Backup Tunnel Selection Procedure” section on page 11](#).

LSPs that have the “bandwidth protection desired” bit set have a higher right to select backup tunnels that provide bandwidth protection; that is, those LSPs can preempt other LSPs that do not have that bit set. For more information, see the [“Prioritizing Which LSPs Obtain Backup Tunnels with Bandwidth Protection” section on page 9](#).

## Fast Tunnel Interface Down Detection

Fast Tunnel Interface Down detection forces a “generic” interface tunnel (not specifically a Fast Reroute tunnel) to become disabled immediately if the headend router detects a failed link on an LSP.

This feature is configured with the **tunnel mpls traffic-eng interface down delay** command. If this feature is not configured, there is a delay before the tunnel becomes unoperational and before the traffic uses an alternative path chosen by the headend/midpoint router to forward the traffic. This is acceptable for data traffic, but not for voice traffic because it relies on the TE tunnel to go down as soon as the LSP goes down.

## RSVP Hello

RSVP Hellos are described in the following sections:

- [RSVP Hello Operation, page 6](#)
- [Hello Instance, page 6](#)
- [Hello Commands, page 7](#)

## RSVP Hello Operation

- `ip rsvp signalling hello refresh interval`
- `ip rsvp signalling hello refresh misses`

### Note

## Features of MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)

- 
- 
- 

## Backup Tunnel Support

- 
- 
- 

**Backup Tunnels Can Terminate at the Next-Next Hop to Support FRR**

**Multiple Backup Tunnels Can Protect the Same Interface**

- Redundancy—If one backup tunnel is down, other backup tunnels protect LSPs.

- Increased backup capacity—If the protected interface is a high-capacity link and no single backup path exists with an equal capacity, multiple backup tunnels can protect that one high-capacity link. The LSPs using this link will fail over to different backup tunnels, allowing all of the LSPs to have adequate bandwidth protection during failure (rerouting). If bandwidth protection is not desired, the router spreads LSPs across all available backup tunnels (that is, there is load balancing across backup tunnels). For a more detailed explanation, see the [“Backup Tunnel Selection Procedure” section on page 11](#).

Examples are shown in the [“Backup Tunnels Terminating at Different Destinations” section on page 10](#) and the [“Backup Tunnels Terminating at the Same Destination” section on page 11](#).

### Scalability

A backup tunnel is scalable because it can protect multiple LSPs and multiple interfaces. It provides many-to-one (N:1) protection, which has significant scalability advantages over one-to-one (1:1) protection, where a separate backup tunnel must be used for each LSP needing protection.

Example of 1:1 protection: When 5,000 backup tunnels protect 5,000 LSPs, each router along the backup path must maintain state for an additional 5,000 tunnels.

Example of N:1 protection: When one backup tunnel protects 5,000 LSPs, each router along the backup path maintains one additional tunnel.

## Backup Bandwidth Protection

Backup bandwidth protection has the following capabilities:

- [Bandwidth Protection on Backup Tunnels, page 8](#)
- [Bandwidth Pool Specifications for Backup Tunnels, page 8](#)
- [Semidynamic Backup Tunnel Paths, page 8](#)
- [Prioritizing Which LSPs Obtain Backup Tunnels with Bandwidth Protection, page 9](#)

### Bandwidth Protection on Backup Tunnels

Rerouted LSPs not only have their packets delivered during a failure, but the quality of service can also be maintained.

### Bandwidth Pool Specifications for Backup Tunnels

You can restrict the types of LSPs that can use a given backup tunnel. Backup tunnels can be restricted so that only LSPs using subpool bandwidth can use them or only LSPs that use global pool bandwidth can use them. This allows different backup tunnels to be used for voice and data. Example: The backup tunnel used for voice could provide bandwidth protection, and the backup tunnel used for data could (optionally) not provide bandwidth protection.

### Semidynamic Backup Tunnel Paths

The path of a backup tunnel can be configured to be determined dynamically. This can be done by using the IP explicit address exclusion feature that was added in Release 12.0(14)ST. Using this feature, semidynamic NHOP backup tunnel paths can be specified simply by excluding the protected link; semidynamic NNHOP backup tunnel paths can be configured simply by excluding the protected node.

**Prioritizing Which LSPs Obtain Backup Tunnels with Bandwidth Protection**

In case there are not enough NHOP or NNHOP backup tunnels or they do not have enough backup bandwidth to protect all LSPs, you can give an LSP priority in obtaining backup tunnels with bandwidth protection. This is especially useful if you want to give LSPs carrying voice a higher priority than those carrying data.

To activate this feature, enter the **tunnel mpls traffic-eng fast-reroute bw-protect**

*receive*

*chance*

### Protected Bandwidth Pools and the Bandwidth Pool from Which the Backup Tunnel Reserves Its Bandwidth

#### `tunnel mpls traffic-eng bandwidth`

- 
- 

#### Note

#### `tunnel mpls traffic-eng backup-bw`

- 
- 

Bandwidth protection for 10 Kbps of subpool traffic on a given link can be achieved by any of the following combinations:

- `tunnel mpls traffic-eng bandwidth sub-pool 10`  
`tunnel mpls traffic-eng backup-bw sub-pool 10`
- `tunnel mpls traffic-eng bandwidth global-pool 10`  
`tunnel mpls traffic-eng backup-bw sub-pool 10 global-pool unlimited`
- `tunnel mpls traffic-eng bandwidth global-pool 40`  
`tunnel mpls traffic-eng backup-bw sub-pool 10 global-pool 30`

### Using Backup Tunnels Signaled with Zero Bandwidth

Frequently it is desirable to use backup tunnels with zero signaled bandwidth, even when bandwidth protection is required. It may seem that if no bandwidth is explicitly reserved, no bandwidth guarantees can be provided. However, that is not necessarily true.

In the following situation:

- Only link protection is desired.
- Bandwidth protection is desired only for subpool traffic.

For each protected link AB with a max reservable subpool value of  $S$ , there may be a path from node A to node B such that the difference between max reservable global and max reservable subpool is at least  $S$ . If it is possible to find such paths for each link in the network, you can establish all the backup tunnels along such paths without any bandwidth reservations. If there is a single link failure, only one backup tunnel will use any link on its path. Because that path has at least  $S$  of available bandwidth (in the global pool), assuming that marking and scheduling is configured to classify the subpool traffic into a priority queue, the subpool bandwidth is guaranteed.

The above approach allows sharing of the global pool bandwidth between backup tunnels protecting independent link failures. The backup tunnels are expected to be used for only a short period of time after a failure (until the headends of affected LSPs reroute those LSPs to other paths with available

subpool bandwidth). The probability of multiple unrelated link failures is very small (in the absence of node or SRLG failures, which result in multiple link failures). Therefore, it is reasonable to assume that link failures are in practice independent with high probability. This “independent failure assumption” in combination with backup tunnels signaled without explicit bandwidth reservation enables efficient bandwidth sharing that yields substantial bandwidth savings.

Backup tunnels protecting the subpool traffic do now draw bandwidth from any pool. Primary traffic using the global pool can use the entire global pool, and primary traffic using the subpool can use the entire subpool. Yet, subpool traffic has a complete bandwidth guarantee if there is a single link failure.

A similar approach can be used for node and SRLG protection. However, the decision of where to put the backup tunnels is more complicated because both node and SRLG failures effectively result in the simultaneous failure of several links. Therefore, the backup tunnels protecting traffic traversing all affected links cannot be computed independently of each other. The backup tunnels protecting groups of links corresponding to different failures can still be computed independently of each other, which results in similar bandwidth savings.

### Signaled Bandwidth Versus Backup Bandwidth

Backup bandwidth is used locally (by the router that is the headend of the backup tunnel) to determine which, and how many, primary LSPs can be rerouted on a particular backup tunnel. The router ensures that the combined bandwidth requirement of these LSPs does not exceed the backup bandwidth.

Therefore, even when the backup tunnel is signaled with zero bandwidth, the backup bandwidth must be configured with the value corresponding to the actual bandwidth requirement of the traffic protected by this backup tunnel. Unlike the case when bandwidth requirements of the backup tunnels are explicitly signaled, the value of the signaled bandwidth (which is zero) is not the same value as the backup bandwidth.

## How to Configure MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)

This section assumes that you want to add FRR protection to a network in which MPLS TE LSPs are configured.

Make sure that the following tasks have been performed before you perform the configuration tasks, but you do not have to already have configured MPLS TE tunnels:

- Enabled MPLS TE on all relevant routers and interfaces
- Configured MPLS TE tunnels

The following sections describe how to use FRR to protect LSPs in your network from link or node failures. Each task is identified as either required or optional.

- [Enabling Fast Reroute on LSPs, page 19](#) (required)
- [Creating a Backup Tunnel to the Next Hop or to the Next-Next Hop, page 20](#) (required)
- [Assigning Backup Tunnels to a Protected Interface, page 21](#) (required)
- [Associating Backup Bandwidth and Pool Type with a Backup Tunnel, page 22](#) (optional)
- [Configuring Backup Bandwidth Protection, page 23](#) (optional)
- [Configuring an Interface for Fast Link and Node Failure Detection, page 24](#) (optional)

- [Configuring an Interface for Fast Tunnel Interface Down, page 25](#) (optional)
- [Verifying That Fast Reroute Is Operational, page 25](#) (optional)

Note

You can perform the configuration tasks in any order.

Note

An NNHOP backup tunnel must      go via the NHOP.

## Enabling Fast Reroute on LSPs

LSPs can use backup tunnels only if they have been configured as fast reroutable. To do this, enter the following commands at the headend of each LSP.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel *number***
4. **tunnel mpls traffic-eng fast-reroute [bw-protect] [node-protect]**

### DETAILED STEPS

|        | Command                                                                         | Purpose                                                                                           |
|--------|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                                   | Enables privileged EXEC mode.<br><br>Enter your password if prompted.                             |
|        | <b>Example:</b><br>Router> enable                                               |                                                                                                   |
|        | <b>configure terminal</b>                                                       | Enters global configuration mode.                                                                 |
|        | Router# configure terminal                                                      |                                                                                                   |
|        | <b>interface tunnel <i>number</i></b>                                           | Enters interface configuration mode for the specified tunnel.                                     |
|        | Router(config)# interface tunnel 1000                                           |                                                                                                   |
|        | <b>tunnel mpls traffic-eng fast-reroute [bw-protect] [node-protect]</b>         | Enables an MPLS TE tunnel to use an established backup tunnel if there is a link or node failure. |

| <p><b>ip explicit-path name</b> <i>name</i></p> <p>Router(config)# ip explicit-path name avoid-protected-link</p>                                                                                                                                                             |                                                                                                                                                                                               |
| <p><b>exclude-address</b> <i>address</i></p> <p>Router(cfg-ip-expl-path)# exclude-address 10.3.3.3</p>                                                                                                                                                                        |                                                                                                                                                                                               |

## Assigning Backup Tunnels to a Protected Interface

To assign one or more backup tunnels to a protected interface, enter the following commands on the node that will be the headend of the backup tunnel (that is, the node whose downstream link or node may fail). The node on which you enter these commands must be a supported platform. See the [“Finding Feature Information”](#) section on page 2.

#### Note

You must configure the interface to have an IP address and to enable the MPLS TE tunnel feature.

|        | Command                                                                                                                         | Purpose                                                                                                                                     |

**show ip rsvp reservation**

Following is sample output from the **show ip rsvp reservation** command entered at the headend of a primary LSP. Entering the command at the head-end of the primary LSP

collected in the Record Route Object (RRO) that travels with the Resv message from the tail to the head.

Router# **show ip rsvp reservation detail**

Reservation:

Tun Dest: 10.1.1.1 Tun ID: 1 Ext Tun ID: 10.1.1.1  
Tun Sender: 10.1.1.1 LSP ID: 104  
Next Hop: 10.1.1.2 on POS1/0  
Label: 18 (outgoing)

Reservation Style is Shared-Explicit, QoS Service is Controlled-Load  
Average Bitrate is 0 bits/sec, Maximum Burst is 1K bytes  
Min Policed Unit: 0 bytes, Max Pkt Size: 0 bytes  
RRO:  
  10.1.1.1/32, Flags:0x1 (Local Prot Avail/to NHOP)  
    Label subobject: Flags 0x1, C-Type 1, Label 18  
  10.1.1.1/32, Flags:0x0 (Local Prot Avail/In Use/Has BW/to NHOP)  
    Label subobject: Flags 0x1, C-Type 1, Label 16  
  10.1.1.2/32, Flags:0x0 (No Local Protection)  
    Label subobject: Flags 0x1, C-Type 1, Label 0  
Resv ID handle: CD000404.  
Policy: Accepted. Policy source(s): MPLS/TE

Notice the following about the primary LSP:

It has protection that uses a NHOP backup tunnel at its first hop.

It has protection and is actively using an NHOP backup tunnel at its second hop.

It has no local protection at its third hop.

The RRO display shows the following information for each hop:

Whether local protection is available (that is, whether the LSP has selected a backup tunnel)

Whether local protection is in use (that is, whether the LSP is currently using its selected backup tunnel)

Whether the selected backup tunnel is an NHOP or NNHOP backup tunnel

Whether the backup tunnel used at this hop provides bandwidth protection

---

This section describes the following:

[LSPs Do Not Become Active; They Remain Ready, page 31](#)

[Primary Tunnel Does Not Select Backup Tunnel That Is Up, page 32](#)

[Enhanced RSVP Commands, page 32](#)

[RSVP Hello, page 32](#)

[Hello Instances Have Not Been Created, page 32](#)

[No entry at index \(error may self-correct, RRO may not yet have propagated from downstream node of interest\)" Error Message Is Printed at the Point of Local Repair, page 33](#)

[Couldn't get rsbs \(error may self-correct when Resv arrives\)" Error Message Is Printed at the Point of Local Repair, page 33](#)

### **LSPs Do Not Become Active; They Remain Ready**

-

- 

### Primary Tunnel Does Not Select Backup Tunnel That Is Up

- shutdown
- no shutdown

#### Note

### Enhanced RSVP Commands

- show ip rsvp request
- show ip rsvp reservation
- show ip rsvp sender

show mpls forwarding

### RSVP Hello

### Hello Instances Have Not Been Created

- (configuration) ip rsvp signalling hello
- signalling hello (interface) ip rsvp
- show ip rsvp sender

**No entry at index (error may self-correct, RRO may not yet have propagated from downstream node of interest)" Error Message Is Printed at the Point of Local Repair**

receiving Path messages with the SESSION\_ATTRIBUTE bit indicating that the LSP is fast-reroutable should include an RRO in the corresponding Resv messages.

If an LSP is configured for FRR, but the Resv arriving from a downstream router contains an incomplete RRO, the "No entry at index (error may self-correct, RRO may not yet have propagated from downstream node of interest)" message is printed. An incomplete RRO is one in which the NHOP or the NNHOP did not include an entry in the RRO.

This error typically means that backup tunnels to the NHOP or the NNHOP cannot be selected for this LSP because there is insufficient information about the NHOP or NNHOP due to the lack of an RRO entry.

Occasionally there are valid circumstances in which this situation occurs temporarily and the problem is self-corrected. If subsequent Resv messages arrive with a complete RRO, ignore the error message.

To determine whether the error has been corrected, view the RRO in Resv messages by entering the **clear ip rsvp hello instance counters** command. Use an output filter keyword to view only the LSP of interest.

**Couldn't get rsbs (error may self-correct when Resv arrives)" Error Message Is Printed at the Point of Local Repair**

The PLR cannot select a backup tunnel for an LSP until a Resv message has arrived from downstream.

When this error occurs, it typically means that something is truly wrong. For example, no reservation exists for this LSP. You can troubleshoot this problem by using the **debug ip rsvp reservation** command to enable debug.

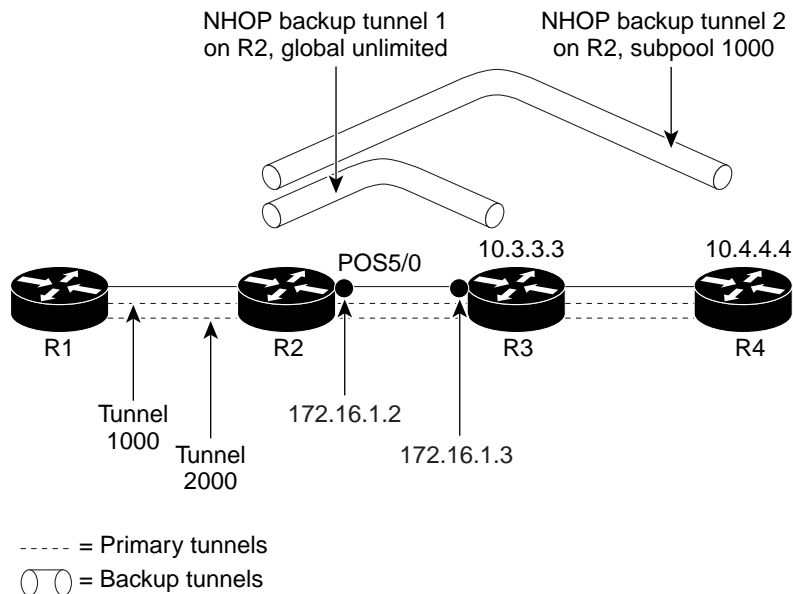

Occasionally there are valid circumstances in which this error message occurs and there is no need for concern. One such circumstance is when an LSP experiences a change before any Resv message has arrived from downstream. Changes can cause a PLR to try to select a backup tunnel for an LSP, and the selection will fail (causing this error message) if no Resv message has arrived for this LSP.

## Configuration Examples for MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)

This section provides the following configuration examples:

- [Enabling Fast Reroute for All Tunnels: Example, page 34](#)
- [Creating an NNHOP Backup Tunnel: Example, page 35](#)
- [Assigning Backup Tunnels to a Protected Interface: Example, page 35](#)
- [Associating Backup Bandwidth and Pool Type with Backup Tunnels: Example, page 35](#)
- [Configuring Backup Bandwidth Protection: Example, page 35](#)
- [Configuring an Interface for Fast Link and Node Failure Detection: Example, page 36](#)
- [Configuring an Interface for Fast Tunnel Interface Down: Example, page 36](#)
- [Configuring RSVP Hello and POS Signals: Example, page 36](#)

The examples relate to the illustration shown in [Figure 9](#).

**Figure 9 Backup Tunnels**

59561

## Enabling Fast Reroute for All Tunnels: Example

```

tunnel mpls traffic-eng fast-reroute                                bw-prot    node-prot

Router(config)# interface Tunnel1000
    tunnel mpls traffic-eng fast-reroute
    tunnel mpls traffic-eng bandwidth sub-pool 10

interface Tunnel2000
    tunnel mpls traffic-eng fast-reroute bw-prot node-prot
    tunnel mpls traffic-eng bandwidth 5
  
```

## Creating an NHOP Backup Tunnel: Example

```

ip explicit-path name avoid-protected-link
    exclude-address 10.1.1.2

end

interface Tunnel1
    ip unnumbered loopback0
  
```

```
tunnel destination 10.3.3.3
tunnel mode mpls traffic-eng0
unnel mpls traffic-eng path-option explicit avoid-protected-link
```

## Creating an NNHOP Backup Tunnel: Example

```
ip explicit-path name avoid-protected-node
    exclude-address 10.3.3.3

end

interface Tunnel2
    ip unnumbered loopback0
    tunnel destination 10.4.4.4
    tunnel mode mpls traffic-eng0
    tunnel mpls traffic-eng path-option explicit avoid-protected-node
```

## Assigning Backup Tunnels to a Protected Interface: Example

```
interface POS5/0
    mpls traffic-eng backup-path tunnel1
    mpls traffic-eng backup-path tunnel2
```

## Associating Backup Bandwidth and Pool Type with Backup Tunnels: Example

```
interface Tunnel1
    tunnel mpls traffic-eng backup-bw global-pool Unlimited

interface Tunnel2
    tunnel mpls traffic-eng backup-bw sub-pool 1000
```

## Configuring Backup Bandwidth Protection: Example

### Note

```
tunnel mpls traffic-eng fast-reroute bw-protect
mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw
```

## Configuring an Interface for Fast Link and Node Failure Detection: Example

```
interface pos0/0
 pos ais-shut
```

```
interface pos0/0
 pos report lrld
```

## Configuring an Interface for Fast Tunnel Interface Down: Example

```
interface tunnel 1000
 tunnel mpls traffic-eng interface down delay 0
```

## Configuring RSVP Hello and POS Signals: Example

- ip rsvp signalling hello
- ip rsvp signalling hello
- ip rsvp signalling hello dscp
- ip rsvp signalling hello refresh misses
- ip rsvp signalling hello refresh interval
- ip rsvp signalling hello statistics

*MPLS Traffic Engineering (TE): Link and Node Protection, with RSVP Hellos Support*

```
pos ais-shut
pos report rdool
pos report lais
pos report lrld
pos report pais
pos report prdi
pos report sd-ber
```

# MPLS Traffic Engineering: BFD-triggered Fast Reroute

---

**First Published:** January 8, 2008

**Last Updated:** February 18, 2009

The MPLS Traffic Engineering: BFD-triggered Fast Reroute feature allows you to obtain link and node protection by using the Bidirectional Forwarding Detection (BFD) protocol to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. In addition to fast forwarding path failure detection, BFD provides a consistent failure detection method for network administrators.

To obtain link and node protection by using the Resource Reservation Protocol (RSVP) with Hellos support, refer to the [MPLS TE: Link and Node Protection, with RSVP Hellos Support \(with Fast Tunnel Interface Down Detection\)](#) process module. RSVP Hellos enable a router to detect when a neighboring node has gone down but its interface to that neighbor is still operational.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Traffic Engineering: BFD-triggered Fast Reroute”](#) section on page 25.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [How to Configure MPLS Traffic Engineering: BFD-triggered Fast Reroute](#), page 4
- [Configuration Examples for MPLS Traffic Engineering: BFD-triggered Fast Reroute](#), page 19
- [Additional References](#), page 22
- [Command Reference](#), page 24
- [Feature Information for MPLS Traffic Engineering: BFD-triggered Fast Reroute](#), page 25
- [Glossary](#), page 26

## Prerequisites for MPLS Traffic Engineering: BFD-triggered Fast Reroute

- Configure BFD. Refer to the *Bidirectional Forwarding Detection* process module.
- Enable MPLS TE on all relevant routers and interfaces.
- Configure MPLS TE tunnels.
- For additional prerequisites, refer to the *MPLS TE: Link and Node Protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)* process module.

## Restrictions for MPLS Traffic Engineering: BFD-triggered Fast Reroute

- You cannot configure BFD and RSVP Hellos on the same interface.
- BFD may not be supported on some interfaces.
- For additional restrictions, refer to the *MPLS TE: Link and Node protection, with RSVP Hellos Support (with Fast Tunnel Interface Down Detection)* process module.

## Information About MPLS Traffic Engineering: BFD-triggered Fast Reroute

To configure the MPLS Traffic Engineering: BFD-triggered Fast Reroute feature, you need to understand the following concepts:

- [BFD](#), page 3
- [Fast Reroute](#), page 3
- [Link Protection](#), page 3
- [Node Protection](#), page 3
- [Bandwidth Protection](#), page 3

## BFD

BFD is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. In addition to fast forwarding path failure detection, BFD provides a consistent failure detection method for network administrators. Because the network administrator can use BFD to detect forwarding path failures at a uniform rate, rather than the variable rates for different routing protocol Hello mechanisms, network profiling and planning will be easier, and reconvergence time will be consistent and predictable.

## Fast Reroute

Fast Reroute (FRR) is a mechanism for protecting Multiprotocol Label Switching (MPLS) traffic engineering (TE) label switched paths (LSPs) from link and node failures by locally repairing the LSPs at the point of failure, allowing data to continue to flow on them while their headend routers attempt to establish new end-to-end LSPs to replace them. FRR locally repairs the protected LSPs by rerouting them over backup tunnels that bypass failed links or nodes.

## Link Protection

Backup tunnels that bypass only a single link of the LSP's path provide link protection. They protect LSPs if a link along their path fails by rerouting the LSP's traffic to the next hop (bypassing the failed link). These are referred to as next-hop (NHOP) backup tunnels because they terminate at the LSP's next hop beyond the point of failure.

## Node Protection

FRR provides node protection for LSPs. Backup tunnels that bypass next-hop nodes along LSP paths are called next-next-hop (NNHOP) backup tunnels because they terminate at the node following the next-hop node of the LSP paths, thereby bypassing the next-hop node. They protect LSPs if a node along their path fails by enabling the node upstream of the failure to reroute the LSPs and their traffic around the failed node to the next-next hop. FRR supports the use of RSVP Hellos to accelerate the detection of node failures. NNHOP backup tunnels also provide protection from link failures, because they bypass the failed link as well as the node.

## Bandwidth Protection

NHOP and NNHOP backup tunnels can be used to provide bandwidth protection for rerouted LSPs. This is referred to as backup bandwidth. You can associate backup bandwidth with NHOP or NNHOP backup tunnels. This informs the router of the amount of backup bandwidth a particular backup tunnel can protect. When a router maps LSPs to backup tunnels, bandwidth protection ensures that an LSP uses a given backup tunnel only if there is sufficient backup bandwidth. The router selects which LSPs use which backup tunnels in order to provide maximum bandwidth protection. That is, the router determines the best way to map LSPs onto backup tunnels in order to maximize the number of LSPs that can be protected.

# How to Configure MPLS Traffic Engineering: BFD-triggered Fast Reroute

This section assumes that you want to add FRR protection to a network in which MPLS TE LSPs are configured.

To review how to configure MPLS TE tunnels, see the [MPLS Traffic Engineering: Interarea Tunnels](#) process module.

The following sections describe how to use FRR to protect LSPs in your network from link or node failures. Each task is identified as either required or optional.

**Note**

You can perform the configuration tasks in any order.

**Note**

An NNHOP backup tunnel must *not* go via the NHOP backup tunnel.

- [Enabling BFD Support on the Router, page 4](#) (required)
- [Enabling Fast Reroute on LSPs, page 5](#) (required)
- [Creating a Backup Tunnel to the Next Hop or to the Next-Next Hop, page 6](#) (required)
- [Assigning Backup Tunnels to a Protected Interface, page 8](#) (required)
- [Enabling BFD on the Protected Interface, page 10](#) (required)
- [Associating Backup Bandwidth and Pool Type with a Backup Tunnel, page 10](#) (optional)
- [Configuring Backup Bandwidth Protection, page 11](#) (optional)
- [Verifying That Fast Reroute Is Operational, page 12](#) (optional)

## Enabling BFD Support on the Router

To enable support for Bidirectional Forwarding on the router, enter the following commands.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip rsvp signalling hello bfd**

## DETAILED STEPS

|        | Command                                                                                                    | Purpose                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                             | Enters global configuration mode.                                                                                |
| Step 3 | <b>ip rsvp signalling hello bfd</b><br><br><b>Example:</b><br>Router(config)# ip rsvp signalling hello bfd | Enables the BFD protocol on the router for MPLS TE link and node protection.                                     |

## Enabling Fast Reroute on LSPs

LSPs can use backup tunnels only if the LSPs have been configured as fast reroutable. To enable FRR on the LSP, enter the following commands at the headend of each LSP.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **tunnel mpls traffic-eng fast-reroute [bw-protect] [node-protect]**

## DETAILED STEPS

|        | Command                                                                        | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                |

|        | Command                                                                                                         | Purpose                                                                                           |
|--------|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Step 3 | <code>interface tunnel <i>number</i></code>                                                                     | Enters interface configuration mode for the specified tunnel.                                     |
|        | <b>Example:</b><br><code>Router(config)# interface tunnel 1000</code>                                           |                                                                                                   |
| Step 4 | <code>tunnel mpls traffic-eng fast-reroute [bw-protect] [node-protect]</code>                                   | Enables an MPLS TE tunnel to use an established backup tunnel if there is a link or node failure. |
|        | <b>Example:</b><br><code>Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect node-protect</code> |                                                                                                   |

## Creating a Backup Tunnel to the Next Hop or to the Next-Next Hop

To create a backup tunnel to the next hop or to the next-next hop, enter the following commands on the node that will be the headend of the backup tunnel (that is, the node whose downstream link or node may fail). The node on which you enter these commands must be a supported platform. See the [“Finding Feature Information”](#) section on page 1.

Creating a backup tunnel is basically no different from creating any other tunnel.

### Note

When using the **exclude-address** command to specify the path for a backup tunnel, you must exclude an interface address to avoid a link (for creating an NHOP backup tunnel), or a router-ID address to avoid a node (for creating an NNHOP backup tunnel).

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface tunnel number`
4. `ip unnumbered type number`
5. `tunnel destination A.B.C.D`
6. `tunnel mode mpls traffic-eng`
7. `tunnel mpls traffic-eng path-option number {dynamic | explicit {name path-name | path-number}} [lockdown]`
8. `exit`
9. `ip explicit-path name name`
10. `exclude-address address`

## DETAILED STEPS

|        | Command                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                     |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                         | Enters global configuration mode.                                                                                                                                                                    |
| Step 3 | <b>interface tunnel number</b><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                                                                                                                            | Creates a new tunnel interface and enters interface configuration mode.                                                                                                                              |
| Step 4 | <b>ip unnumbered type number</b><br><br><b>Example:</b><br>Router(config-if)# ip unnumbered loopback 0                                                                                                                                 | Gives the tunnel interface an IP address that is the same as that of interface loopback 0.<br><br><b>Note</b> This command is not effective until loopback 0 has been configured with an IP address. |
| Step 5 | <b>tunnel destination A.B.C.D</b><br><br><b>Example:</b><br>Router(config-if)# tunnel destination 10.3.3.3                                                                                                                             | Specifies the IP address of the device where the tunnel will terminate. That address should be the router ID of the device that is the NHOP or NNHOP of LSPs to be protected.                        |
| Step 6 | <b>tunnel mode mpls traffic-eng</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mode mpls traffic-eng                                                                                                                          | Sets encapsulation mode of the tunnel to MPLS TE.                                                                                                                                                    |
| Step 7 | <b>tunnel mpls traffic-eng path-option number {dynamic   explicit {name path-name   path-number}}[lockdown]</b><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng path-option 10 explicit name avoid-protected-link | Configures a path option for an MPLS TE tunnel                                                                                                                                                       |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                                                                          | Exits interface configuration mode.                                                                                                                                                                  |

|         | Command                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                            |
|---------|----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <code>ip explicit-path name <i>name</i></code><br><br><b>Example:</b><br>Router(config)# ip explicit-path name<br>avoid-protected-link | Enters IP explicit path mode for IP explicit paths to create the named path.                                                                                                                                                                                                                                                                                                       |
| Step 10 | <code>exclude-address <i>address</i></code><br><br><b>Example:</b><br>Router(cfg-ip-expl-path)# exclude-address 10.3.3.3               | For link protection, specifies the IP address of the link to be protected. For node protection, specifies the router ID of the node to be protected.<br><br><b>Note</b> Backup tunnel paths can be dynamic or explicit and they do not have to use an excluded address. Because backup tunnels must avoid the protected link or node, it is convenient to use an excluded address. |

## Assigning Backup Tunnels to a Protected Interface

To assign one or more backup tunnels to a protected interface, enter the following commands on the node that will be the headend of the backup tunnel (that is, the node whose downstream link or node may fail). The node on which you enter these commands must be a supported platform. See the [“Finding Feature Information”](#) section on page 1.

### Note

You must configure the interface to have an IP address and to enable the MPLS TE tunnel feature.

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type slot/port`
4. `mpls traffic-eng backup-path tunnel tunnel-id`

## DETAILED STEPS

|        | Command                                                                              | Purpose                                                                                                               |
|--------|--------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |

|        | Command                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>interface</b> <i>type slot/port</i><br><br><b>Example:</b><br>Router(config)# interface Gi 9/1                                             | Moves configuration to the physical interface level, directing subsequent configuration commands to the specific physical interface identified by the <i>type</i> value, and enters interface configuration mode. The <i>slot</i> and <i>port</i> values identify the slot and port being configured. The interface must be a supported interface. See the <a href="#">“Finding Feature Information” section on page 1</a> . |
| Step 4 | <b>mpls traffic-eng backup-path tunnel</b> <i>tunnel-id</i><br><br><b>Example:</b><br>Router(config-if)# mpls traffic-eng backup-path tunnel2 | Allows LSPs going out this interface to use this backup tunnel if there is a link or node failure.<br><br><b>Note</b> You can enter this command multiple times to associate multiple backup tunnels with the same protected interface.                                                                                                                                                                                      |

# Enabling BFD on the Protected Interface

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip rsvp signalling hello bfd**
5. **bfd interval** *milliseconds* **min\_rx** *milliseconds* **multiplier** *interval-multiplier*

## DETAILED STEPS

|        | Command                                                                                                                                                                                                      | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                               | Enters global configuration mode.                                                                                |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Gi9/1                                                                                                                | Enters interface configuration mode.                                                                             |
| Step 4 | <b>ip rsvp signalling hello bfd</b><br><br><b>Example:</b><br>Router(config-if)# ip rsvp signalling hello bfd                                                                                                | Enables the BFD protocol on the interface for MPLS TE link and node protection.                                  |
| Step 5 | <b>bfd interval</b> <i>milliseconds</i> <b>min_rx</b> <i>milliseconds</i> <b>multiplier</b> <i>interval-multiplier</i><br><br><b>Example:</b><br>Router(config-if)# bfd interval 100 min_rx 100 multiplier 4 | Sets the BFD interval.                                                                                           |

# Associating Backup Bandwidth and Pool Type with a Backup Tunnel

To associate backup bandwidth with a backup tunnel and designate the type of LSP that can use a backup tunnel, enter the following commands.

## SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **interface tunnel** *number*
4. **tunnel mpls traffic-eng backup-bw** {*bandwidth* | [**sub-pool** {*bandwidth* | **Unlimited**}] [**global-pool** {*bandwidth* | **Unlimited**}] [**any** {*bandwidth* | **Unlimited**}]

## DETAILED STEPS

|        | Command                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                                                            | Enters global configuration mode.                                                                                                         |
| Step 3 | <b>interface tunnel</b> <i>number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 2                                                                                                                                                                                                                                        | Enters interface configuration mode for the specified tunnel.                                                                             |
| Step 4 | <b>tunnel mpls traffic-eng backup-bw</b> { <i>bandwidth</i>   [ <b>sub-pool</b> { <i>bandwidth</i>   <b>Unlimited</b> }] [ <b>global-pool</b> { <i>bandwidth</i>   <b>Unlimited</b> }] [ <b>any</b> { <i>bandwidth</i>   <b>Unlimited</b> }]<br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng backup-bw sub-pool 1000 | Associates bandwidth with a backup tunnel and designates whether LSPs that allocate bandwidth from the specified pool can use the tunnel. |

## Configuring Backup Bandwidth Protection

To configure the backup bandwidth protection, perform the following steps.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *number*
4. **tunnel mpls traffic-eng fast-reroute** [bw-protect]
5. **exit**
6. **mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw**

## DETAILED STEPS

|        |                                                                                                                                                                                          |                                                                                                                                                                                                               |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> enable                                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                              |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# configure terminal                                                                                                     | Enters global configuration mode.                                                                                                                                                                             |
| Step 3 | <code>interface tunnel number</code><br><br><b>Example:</b><br>Router(config)# interface tunnel 2                                                                                        | Enters interface configuration mode for the specified tunnel.                                                                                                                                                 |
| Step 4 | <code>tunnel mpls traffic-eng fast-reroute [bw-protect]</code><br><br><b>Example:</b><br>Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect                              | Enables an MPLS TE tunnel to use an established backup tunnel in the event of a link or node failure. The <b>bw-protect</b> keyword gives an LSP priority for using backup tunnels with bandwidth protection. |
| Step 5 | <code>exit</code><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                      | Exits interface configuration mode.                                                                                                                                                                           |
| Step 6 | <code>mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw</code><br><br><b>Example:</b><br>Router(config)# mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw | Changes the backup protection preemption algorithm from minimize the number of LSPs that are demoted to minimize the amount of bandwidth that is wasted.                                                      |

## Verifying That Fast Reroute Is Operational

To verify that FRR can function, perform the following steps.

## SUMMARY STEPS

## Note

To determine if FRR has been configured correctly, perform Steps 1 and 2.

## Note

If you created LSPs and performed the required configuration tasks but do not have operational backup tunnels (that is, the backup tunnels are not up or the LSPs are not associated with those backup tunnels), perform Step 3.

**Note**

To determine the status of BFD, perform Steps 9 through 11.

1. **show mpls traffic-eng tunnels brief**
2. **show ip rsvp sender detail**
3. **show mpls traffic-eng fast-reroute database**
4. **show mpls traffic-eng tunnels backup**
5. **show mpls traffic-eng fast-reroute database**
6. **show ip rsvp reservation**
7. **show ip rsvp hello**
8. **show ip rsvp interface detail**
9. **show ip rsvp hello bfd nbr**
10. **show ip rsvp hello bfd nbr detail**
11. **show ip rsvp hello bfd nbr summary**

**DETAILED STEPS****Step 1 show mpls traffic-eng tunnels brief**

Use this command to verify that backup tunnels are up:

```
Router# show mpls traffic-eng tunnels brief
```

```

Signalling Summary:
  LSP Tunnels Process:      running
  RSVP Process:            running
  Forwarding:              enabled
  Periodic reoptimization:  every 3600 seconds, next in 1706 seconds

TUNNEL NAME      DESTINATION    UP IF    DOWN IF    STATE/PROT
Router_t1        10.112.0.12    -        Gi4/0/1    up/up
Router_t2        10.112.0.12    -        unknown    up/down
Router_t3        10.112.0.12    -        unknown    admin-down
Router_t1000     10.110.0.10    -        unknown    up/down
Router_t2000     10.110.0.10    -        Gi4/0/1    up/up
Displayed 5 (of 5) heads, 0 (of 0) midpoints, 0 (of 0) tails

```

**Step 2 show ip rsvp sender detail**

Use this command to verify that LSPs are protected by the appropriate backup tunnels.

Following is sample output from the **show ip rsvp sender detail** command when the command is entered at the router acting as the point of local repair (PLR) before a failure:

```
Router# show ip rsvp sender detail
```

```

PATH:
Tun Dest:  10.10.0.6  Tun ID: 100  Ext Tun ID: 10.10.0.1
Tun Sender: 10.10.0.1  LSP ID: 31
Path refreshes:
  arriving: from PHOP 10.10.7.1 on Et0/0 every 30000 msecs
Session Attr:
  Setup Prio: 7, Holding Prio: 7
  Flags: (0x7) Local Prot desired, Label Recording, SE Style
  session Name: Rl_t100
  ERO: (incoming)

```

```

10.10.7.2 (Strict IPv4 Prefix, 8 bytes, /32)
10.10.0.6 (Strict IPv4 Prefix, 8 bytes, /32)
RRO:
  10.10.7.1/32, Flags:0x0 (No Local Protection)
  10.10.4.1/32, Flags:0x9 (Local Prot Avail/to NNHOP) !Available to NNHOP
  10.10.1.1/32, Flags:0x0 (No Local Protection)
Traffic params - Rate: 10K bits/sec, Max. burst: 1K bytes
Min Policed Unit: 0 bytes, Max Pkt Size 4294967295 bytes
Fast-Reroute Backup info:
  Inbound FRR: Not active
  Outbound FRR: No backup tunnel selected
Path ID handle: 50000416.
Incoming policy: Accepted. Policy source(s): MPLS/TE
Status: Proxy-terminated

```

### Step 3 show mpls traffic-eng fast-reroute database

Enter the **clear ip rsvp hello instance counters** command to verify the following:

- MPLS TE FRR Node Protection has been enabled.
- A certain type of LSP can use a backup tunnel.

The following command output displays the LSPs that are protected:

Router# **show mpls traffic-eng fast-reroute database**

Tunnel head end item frr information:

| Protected tunnel | In-label | Out intf/label   | FRR intf/label | Status |
|------------------|----------|------------------|----------------|--------|
| Tunnel500        | Tun hd   | AT4/0.100:Untagg | Tu501:20       | ready  |

Prefix item frr information:

| Prefix      | Tunnel | In-label | Out intf/label   | FRR intf/label | Status |
|-------------|--------|----------|------------------|----------------|--------|
| 10.0.0.8/32 | Tu500  | 18       | AT4/0.100:Pop ta | Tu501:20       | ready  |
| 10.0.8.8/32 | Tu500  | 19       | AT4/0.100:Untagg | Tu501:20       | ready  |
| 10.8.9.0/24 | Tu500  | 22       | AT4/0.100:Untagg | Tu501:20       | ready  |

LSP midpoint item frr information:

| LSP identifier | In-label | Out | intf/label | FRR intf/label | Status |
|----------------|----------|-----|------------|----------------|--------|
|----------------|----------|-----|------------|----------------|--------|

If Label Distribution Protocol (LDP) is not enabled, separate prefix items are not shown because all prefixes then use a single rewrite. To confirm that a particular IP prefix is FRR protected, even though it is not shown in this display, enter it within the **show mpls forwarding-table ip-address detail** command. The final line of the display will tell whether that prefix is protected:

Router# **show mpls forwarding-table 10.0.0.11 32 detail**

| Local tag                                               | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop    |
|---------------------------------------------------------|--------------------|---------------------|--------------------|--------------------|-------------|
| Tun hd                                                  | Untagged           | 10.0.0.11/32        | 48 5/0             | Gi5/0              | point2point |
| MAC/Encaps=4/8, MTU=1520, Tag Stack{22}                 |                    |                     |                    |                    |             |
| 48D18847 00016000                                       |                    |                     |                    |                    |             |
| No output feature configured                            |                    |                     |                    |                    |             |
| Fast Reroute Protection via (Tu0, outgoing label 12304) |                    |                     |                    |                    |             |

The following command output displays the LSPs that are protected when the FRR primary tunnel is over a Gigabit Ethernet interface and the backup tunnel is over a Gigabit Ethernet interface. As shown in [Figure 1](#), interface Gigabit Ethernet 9/1 is protected by backup tunnel 501.

**Figure 1**      **Protected LSPs**

Figure 1 shows the following:

- Primary tunnel 500—Path is R1 via Gigabit Ethernet9/1 to R2 to R3 to R4.
- FRR backup tunnel 501—Path is R1 via Gigabit Ethernet7/1 to R2.
- Interface Gigabit Ethernet9/1—Protected by backup tunnel 501.

```
Router# show mpls traffic-eng fast-reroute database
```

```
Tunnel head end item frr information:
Protected tunnel In-label Out intf/label FRR intf/label Status
Tunnel500 Tun hd AT4/0.100:Untagg Tu501:20 ready
Prefix item frr information:
```

```
Prefix Tunnel In-label Out intf/label FRR intf/label Status
10.0.0.8/32 Tu500 18 AT4/0.100:Pop ta Tu501:20 ready
10.0.8.8/32 Tu500 19 AT4/0.100:Untagg Tu501:20 ready
10.8.9.0/24 Tu500 22 AT4/0.100:Untagg Tu501:20 ready
```

```
LSP midpoint item frr information:
LSP identifier In-label Out intf/label FRR intf/label Status
```

The following command output displays the LSPs that are protected when the FRR backup tunnel is over a Gigabit Ethernet interface.

```
Router# show mpls traffic-eng fast-reroute database
```

```
Tunnel head end item frr information:
Protected tunnel In-label Out intf/label FRR intf/label Status
Tunnel500 Tun hd PO2/0:Untagged Tu501:20 ready
```

```
Prefix item frr information:
Prefix Tunnel In-label Out intf/label FRR intf/label Status
10.0.0.8/32 Tu500 18 PO2/0:Pop tag Tu501:20 ready
10.0.8.8/32 Tu500 19 PO2/0:Untagged Tu501:20 ready
10.8.9.0/24 Tu500 22 PO2/0:Untagged Tu501:20 ready
```

```
LSP midpoint item frr information:
LSP identifier In-label Out intf/label FRR intf/label Status
```

#### Step 4 **show mpls traffic-eng tunnels backup**

For backup tunnels to be operational, the LSP must be reroutable. At the headend of the LSP, enter the **show run interface tunnel *tunnel-number*** command. The output should include the **tunnel mpls traffic-eng fast-reroute** command. If it does not, enter this command for the tunnel.

On the router where the backup tunnels originate, enter the **show mpls traffic-eng tunnels backup** command. Following is sample command output:

```
Router# show mpls traffic-eng tunnels backup

Router_t578
  LSP Head, Tunnel578, Admin: up, Oper: up
  Src 10.55.55.55, Dest 10.88.88.88, Instance 1
  Fast Reroute Backup Provided:
    Protected i/fs: PO1/0, PO1/1, PO3/3
    Protected lsp: 1
    Backup BW: any pool unlimited; inuse: 100 kbps

Router_t5710
  LSP Head, Tunnel5710, Admin: admin-down, Oper: down
  Src 10.55.55.55, Dest 10.7.7.7, Instance 0
  Fast Reroute Backup Provided:
    Protected i/fs: PO1/1
    Protected lsp: 0
    Backup BW: any pool unlimited; inuse: 0 kbps

Router_t5711
  LSP Head, Tunnel5711, Admin: up, Oper: up
  Src 10.55.55.55, Dest 10.7.7.7, Instance 1
  Fast Reroute Backup Provided:
    Protected i/fs: PO1/0
    Protected lsp: 2
    Backup BW: any pool unlimited; inuse: 6010 kbps
```

The command output will allow you to verify the following:

- Backup tunnel exists—Verify that there is a backup tunnel that terminates at this LSP’s NHOP or NNHOP. Look for the LSP’s NHOP or NNHOP in the Dest field.
- Backup tunnel is up—To verify that the backup tunnel is up, look for “Up” in the Oper field.
- Backup tunnel is associated with the LSP’s interface—Verify that the interface for the LSP is allowed to use this backup tunnel. Look for the LSP’s output interface in the protected i/fs field list.
- Backup tunnel has sufficient bandwidth—If you restricted the amount of bandwidth a backup tunnel can hold, verify that the backup tunnel has sufficient bandwidth to hold the LSPs that would use this backup tunnel if there is a failure. The bandwidth of an LSP is defined by the line **tunnel mpls traffic-eng bandwidth** at the headend of the LSP. To determine the available bandwidth on a backup tunnel, look at the “cfg” and “inuse” fields. If there is insufficient backup bandwidth to accommodate the LSPs that would use this backup tunnel in the event of a failure, create an additional backup tunnel or increase the backup bandwidth of the existing tunnel by using the **tunnel mpls traffic-eng bandwidth** command.

#### Note

In order to determine how much bandwidth is sufficient, offline capacity planning may be required.

Backup tunnel has appropriate bandwidth type—If you restricted the type of LSPs (subpool or global pool) that can use this backup tunnel, verify that the LSP is the appropriate type for the backup tunnel. The type of the LSP is defined by the line **tunnel mpls traffic-eng bandwidth** at the headend of this LSP. If this line contains the word “sub pool”, then it uses subpool bandwidth; otherwise, it uses global pool bandwidth. Verify that the type matches the type the backup tunnel can hold by looking in the output of the **tunnel mpls traffic-eng bandwidth** command.

If none of the verification actions described succeed, enable debug by entering the **debug ip rsvp fast-reroute** command and the **debug mpls traffic-eng fast-reroute** command on the router that is the headend of the backup tunnel. Then do the following:

1. Enter the **shutdown** command for the primary tunnel.

2. Enter the **no shutdown** command for the primary tunnel.
3. View the debug output.

#### Step 5 show mpls traffic-eng fast-reroute database

Enter the **clear ip rsvp hello instance counters** command to verify the following:

- MPLS TE FRR node protection has been enabled.
- A certain type of LSP can use a backup tunnel.

The following command output displays the LSPs that are protected:

```
Router# show mpls traffic-eng fast-reroute database
```

Tunnel head end item frr information:

| Protected Tunnel | In-label | intf/label     | FRR intf/label | Status |
|------------------|----------|----------------|----------------|--------|
| Tunnell0         | Tun      | Gi5/0:Untagged | Tu0:12304      | ready  |

Prefix item frr information:

| Prefix       | Tunnel | In-label | Out intf/label | FRR intf/label | Status |
|--------------|--------|----------|----------------|----------------|--------|
| 10.0.0.11/32 | Tu10   | Tun hd   | Gi5/0:Untagged | Tu0:12304      | ready  |

LSP midpoint frr information:

| LSP identifier    | In-label | Out intf/label | FRR intf/label | Status |
|-------------------|----------|----------------|----------------|--------|
| 10.0.0.12 1 [459] | 16       | Gi0/1:17       | Tu2000:19      | ready  |

#### Note

If Label Distribution Protocol (LDP) is not enabled, separate prefix items are not shown because all prefixes then use a single rewrite. To confirm that a particular IP prefix is FRR protected, even though it is not shown in this display, enter it within the **show mpls forwarding-table ip-address detail** command. The final line of the display will tell whether that prefix is protected.

```
Router# show mpls forwarding-table 10.0.0.11 32 detail
```

| Local                                                   | Outgoing  | Prefix       | Bytes tag | Outgoing    | Next Hop |
|---------------------------------------------------------|-----------|--------------|-----------|-------------|----------|
| tag                                                     | tag or VC | or Tunnel Id | switched  | interface   |          |
| Tun hd                                                  | Untagged  | 10.0.0.11/32 | 48 Gi5/0  | point2point |          |
| MAC/Encaps=4/8, MTU=1520, Tag Stack{22}                 |           |              |           |             |          |
| 48D18847 00016000                                       |           |              |           |             |          |
| No output feature configured                            |           |              |           |             |          |
| Fast Reroute Protection via (Tu0, outgoing label 12304) |           |              |           |             |          |

#### Step 6 show ip rsvp reservation detail

Following is sample output from the **show ip rsvp reservation detail** command entered at the headend of a primary LSP. Entering the command at the headend of the primary LSP shows, among other things, the status of FRR (that is, local protection) at each hop this LSP traverses. The per-hop information is collected in the Record Route Object (RRO) that travels with the Resv message from the tail to the head.

```
Router# show ip rsvp reservation detail
```

Reservation:

Tun Dest: 10.1.1.1 Tun ID: 1 Ext Tun ID: 10.1.1.1

Tun Sender: 10.1.1.1 LSP ID: 104

Next Hop: 10.1.1.2 on Gi1/0

Label: 18 (outgoing)

Reservation Style is Shared-Explicit, QoS Service is Controlled-Load

Average Bitrate is 0 bits/sec, Maximum Burst is 1K bytes

Min Policed Unit: 0 bytes, Max Pkt Size: 0 bytes

RRO:

10.1.1.1/32, Flags:0x1 (Local Prot Avail/to NHOP)

```

    Label subobject: Flags 0x1, C-Type 1, Label 18
10.1.1.1/32, Flags:0x0 (Local Prot Avail/In Use/Has BW/to NHOP)
    Label subobject: Flags 0x1, C-Type 1, Label 16
10.1.1.2/32, Flags:0x0 (No Local Protection)
    Label subobject: Flags 0x1, C-Type 1, Label 0
Resv ID handle: CD000404.
Policy: Accepted. Policy source(s): MPLS/TE

```

Notice the following about the primary LSP:

- It has protection that uses an NHOP backup tunnel at its first hop.
- It has protection and is actively using an NHOP backup tunnel at its second hop.
- It has no local protection at its third hop.

The RRO display shows the following information for each hop:

- Whether local protection is available (that is, whether the LSP has selected a backup tunnel)
- Whether local protection is in use (that is, whether the LSP is using its selected backup tunnel)
- Whether the selected backup tunnel is an NHOP or NNHOP backup tunnel
- Whether the backup tunnel used at this hop provides bandwidth protection

#### Step 7 show ip rsvp hello

Use this command to display hello status and statistics for FRR, reroute (hello state timer), and graceful restart. Following is sample output:

```

Router# show ip rsvp hello

Hello:
  RSVP Hello for Fast-Reroute/Reroute: Enabled
  Statistics: Disabled
  BFD for Fast-Reroute/Reroute: Enabled
  RSVP Hello for Graceful Restart: Disabled

```

#### Step 8 show ip rsvp interface detail

Use this command to display the interface configuration for Hello. Following is sample output:

```

Router# show ip rsv interface detail

Gi9/47:
  RSVP: Enabled
  Interface State: Up
  Bandwidth:
    Curr allocated: 0 bits/sec
    Max. allowed (total): 0 bits/sec
    Max. allowed (per flow): 0 bits/sec
    Max. allowed for LSP tunnels using sub-pools (pool 1): 0 bits/sec
    Set aside by policy (total): 0 bits/sec
  Signalling:
    DSCP value used in RSVP msgs: 0x3F
    Number of refresh intervals to enforce blockade state: 4
  Authentication: disabled
  Key chain: <none>
  Type: md5
  Window size: 1
  Challenge: disabled
  FRR Extension:
    Backup Path: Configured (or "Not Configured")
  BFD Extension:
    State: Disabled

```

```
Interval: Not Configured
RSVP Hello Extension:
State: Disabled
Refresh Interval: FRR: 200 , Reroute: 2000
Missed Acks:      FRR: 4 , Reroute: 4
DSCP in HELLOs:   FRR: 0x30 , Reroute: 0x30
```

**Step 9 show ip rsvp hello bfd nbr**

Use this command to display information about all MPLS traffic engineering link and node protected neighbors that use the BFD protocol. Following is sample output. The command output is the same as the **show ip rsvp hello bfd nbr summary** command output.

```
Router# show ip rsvp hello bfd nbr
```

| Client | Neighbor | I/F    | State | LostCnt | LSPs |
|--------|----------|--------|-------|---------|------|
| FRR    | 10.0.0.6 | Gi9/47 | Up    | 0       | 1    |

**Step 10 show ip rsvp hello bfd nbr detail**

Use this command to display detailed information about all MPLS traffic engineering link and node protected neighbors that use the BFD protocol:

```
Router# show ip rsvp hello bfd nbr detail
```

```
Hello Client Neighbors
```

```
Remote addr 10.0.0.6, Local addr 10.0.0.7
Type: Active
I/F: Gi9/47
State: Up (for 00:09:41)
Clients: FRR
LSPs protecting: 1 (frr: 1, hst upstream: 0 hst downstream: 0)
Communication with neighbor lost: 0
```

**Step 11 show ip rsvp hello bfd nbr summary**

Use this command to display summarized information about all MPLS traffic engineering link and node protected neighbors that use the BFD protocol. The command output is the same as the **show ip rsvp hello bfd nbr summary** command output.

```
Router# show ip rsvp hello bfd nbr summary
```

| Client | Neighbor | I/F    | State | LostCnt | LSPs |
|--------|----------|--------|-------|---------|------|
| FRR    | 10.0.0.6 | Gi9/47 | Up    | 0       | 1    |

## Configuration Examples for MPLS Traffic Engineering: BFD-triggered Fast Reroute

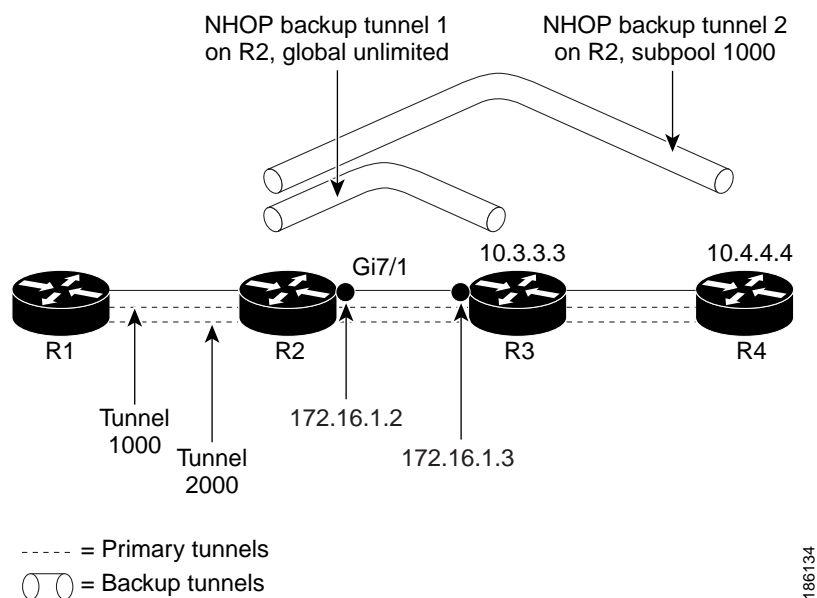

This section provides the following configuration examples:

- [Enabling BFD Support on the Router: Example, page 20](#)
- [Enabling Fast Reroute on LSPs: Example, page 20](#)
- [Creating a Backup Tunnel to the Next Hop: Example, page 21](#)
- [Assigning Backup Tunnels to a Protected Interface: Example, page 21](#)

- [Enabling BFD on the Protected Interface: Example, page 21](#)
- [Associating Backup Bandwidth and Pool Type with Backup Tunnels: Example, page 21](#)
- [Configuring Backup Bandwidth Protection: Example, page 22](#)

The examples relate to the illustration shown in [Figure 2](#).

**Figure 2 Backup Tunnels**

## Enabling BFD Support on the Router: Example

The following example enables the BFD protocol on the router:

```
Router(config)# ip rsvp signalling hello bfd
```

## Enabling Fast Reroute on LSPs: Example

On router R1, enter interface configuration mode for each tunnel to be protected (Tunnel 1000 and Tunnel 2000). Enable these tunnels to use a backup tunnel in case of a link or node failure along their paths.

Tunnel 1000 will use ten units of bandwidth from the subpool.

Tunnel 2000 will use five units of bandwidth from the global pool. The “bandwidth protection desired” bit and the “node protection desired bit” have been set by specifying **bw-prot** and **node-prot**, respectively, in the **tunnel mpls traffic-eng fast-reroute** command.

```
Router(config)# interface tunnel 1000
Router(config-if)# tunnel mpls traffic-eng fast-reroute
Router(config-if)# tunnel mpls traffic-eng bandwidth sub-pool 10
```

```
Router(config)# interface tunnel 2000
Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect node-protect
Router(config-if)# tunnel mpls traffic-eng bandwidth 5
```

## Creating a Backup Tunnel to the Next Hop: Example

On router R2, create an NHOP backup tunnel to R3. This backup tunnel should avoid using the link 10.1.1.2.

```
Router(config)# ip explicit-path name avoid-protected-link
Router(cfg-ip-expl-path)# exclude-address 10.1.1.2
Explicit Path name avoid-protected-link:
____1: exclude-address 10.1.1.2
Router(cfg-ip-expl-path)# end

Router(config)# interface tunnel 1
Router(config-if)# ip unnumbered loopback 0
Router(config-if)# tunnel destination 10.3.3.3
Router(config-if)# tunnel mode mpls traffic-eng
Router(config-if)# tunnel mpls traffic-eng path-option 1 explicit avoid-protected-link
```

## Creating an NNHOP Backup Tunnel: Example

On router R2, create an NNHOP backup tunnel to R4. This backup tunnel should avoid R3.

```
Router(config)# ip explicit-path name avoid-protected-node
Router(cfg-ip-expl-path)# exclude-address 10.3.3.3
Explicit Path name avoid-protected-node:
____1: exclude-address 10.3.3.3
Router(cfg-ip-expl-path)# end

Router(config)# interface tunnel2
Router(config-if)# ip unnumbered loopback0
Router(config-if)# tunnel destination 10.4.4.4
Router(config-if)# tunnel mode mpls traffic-eng0
Router(config-if)# tunnel mpls traffic-eng path-option 1 explicit avoid-protected-node
```

## Assigning Backup Tunnels to a Protected Interface: Example

On router R2, associate both backup tunnels with interface Gigabit Ethernet 5/0:

```
Router(config)# interface Gi5/0
Router(config-if)# mpls traffic-eng backup-path tunnel 1
Router(config-if)# mpls traffic-eng backup-path tunnel 2
```

## Enabling BFD on the Protected Interface: Example

BFD is enabled on interface Gigabit Ethernet 9/47:

```
Router(config)# interface Gi9/47
Router(config-if)# ip rsvp signalling hello bfd
Router(config-if)# bfd interval 100 min_rx 100 multiplier 4
```

## Associating Backup Bandwidth and Pool Type with Backup Tunnels: Example

Backup tunnel 1 is to be used only by LSPs that take their bandwidth from the global pool. It does not provide bandwidth protection. Backup tunnel 2 is to be used only by LSPs that take their bandwidth from the subpool. Backup tunnel 2 provides bandwidth protection for up to 1000 units.

```
Router(config)# interface tunnel 1
Router(config-if)# tunnel mpls traffic-eng backup-bw global-pool Unlimited

Router(config)# interface tunnel 2
Router(config-if)# tunnel mpls traffic-eng backup-bw sub-pool 1000
```

## Configuring Backup Bandwidth Protection: Example

In the following example, backup bandwidth protection is configured:

**Note**

---

This global configuration is required only to change the backup protection preemption algorithm from minimize the number of LSPs that are demoted to minimize the amount of bandwidth that is wasted.

---

```
Router(config-if)# tunnel mpls traffic-eng fast-reroute bw-protect
Router(config)# mpls traffic-eng fast-reroute backup-prot-preemption optimize-bw
```

## Additional References

The following sections provide references related to the MPLS Traffic Engineering: BFD-triggered Fast Reroute feature.

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup>.

- **clear ip rsvp hello bfd**
- **ip rsvp signalling hello bfd** (configuration)
- **ip rsvp signalling hello bfd** (interface)
- **show ip rsvp hello**
- **show ip rsvp hello bfd nbr**
- **show ip rsvp hello bfd nbr detail**
- **show ip rsvp hello bfd nbr summary**
- **show ip rsvp interface detail**

# Feature Information for MPLS Traffic Engineering: BFD-triggered Fast Reroute

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS, Catalyst OS, and Cisco IOS XE software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Traffic Engineering: BFD-triggered Fast Reroute

| Feature Name                                         | Releases                                   | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# Glossary

**backup bandwidth**—The usage of NHOP and NNHOP backup tunnels to provide bandwidth protection for rerouted LSPs.

**backup tunnel**—An MPLS TE tunnel used to protect other (primary) tunnels' traffic when a link or node failure occurs.

**bandwidth**—The available traffic capacity of a link.

**fast reroute**—Procedures that enable temporary routing around a failed link or node while a new LSP is being established at the headend.

**global pool**—The total bandwidth allocated to an MPLS traffic engineering link or node.

**headend**—The router that originates and maintains a given LSP. This is the first router in the LSP's path.

**hop**—Passage of a data packet between two network nodes (for example, between two routers).

**instance**—A Hello instance implements the RSVP Hello extensions for a given router interface address and remote IP address. Active Hello instances periodically send Hello Request messages, expecting Hello ACK messages in response. If the expected Ack message is not received, the active Hello instance declares that the neighbor (remote IP address) is unreachable (that is, it is lost). This can cause LSPs crossing this neighbor to be fast rerouted.

**interface**—A network connection.

**link**—A point-to-point connection between adjacent nodes. There can be more than one link between adjacent nodes. A network communications channel consisting of a circuit or transmission path and all related equipment between a sender and a receiver. Sometimes referred to as a line or a transmission link.

**LSP**—label-switched path. A configured connection between two routers, in which label switching is used to carry the packets. The purpose of an LSP is to carry data packets.

**MPLS**—Multiprotocol Label Switching. Packet-forwarding technology, used in the network core, that applies data link layer labels to tell switching nodes how to forward data, resulting in faster and more scalable forwarding than network layer routing normally can do.

**NHOP**—next hop. The next downstream node along an LSP's path.

**NHOP backup tunnel**—next-hop backup tunnel. Backup tunnel terminating at the LSP's next hop beyond the point of failure, and originating at the hop immediately upstream of the point of failure. It bypasses a failed link, and is used to protect primary LSPs that were using this link before the failure.

**NNHOP**—next-next hop. The node after the next downstream node along an LSP's path.

**NNHOP backup tunnel**—next-next-hop backup tunnel. Backup tunnel terminating at the LSP's next-next hop beyond the point of failure, and originating at the hop immediately upstream of the point of failure. It bypasses a failed link or node, and is used to protect primary LSPs that were using this link or node before the failure.

**node**—Endpoint of a network connection or a junction common to two or more lines in a network. Nodes can be interconnected by links, and serve as control points in the network. Computers on a network, or any endpoint or a junction common to two or more lines in a network. Nodes can be processors, controllers, or workstations.

**primary LSP**—The last LSP originally signaled over the protected interface before the failure. The LSP before the failure.

**primary tunnel**—Tunnel whose LSP may be fast rerouted if there is a failure. Backup tunnels cannot be primary tunnels.

**protected interface**—An interface that has one or more backup tunnels associated with it.

**redundancy**—The duplication of devices, services, or connections so that, in the event of a failure, the redundant devices, services, or connections can perform the work of those that failed.

**RSVP**—Resource Reservation Protocol. An IETF protocol used for signaling requests (setting up reservations) for Internet services by a customer before that customer is permitted to transmit data over that portion of the network.

**state**—Information that a router must maintain about each LSP. The information is used for rerouting tunnels.

**subpool**—The more restrictive bandwidth in an MPLS traffic engineering link or node. The subpool is a portion of the link or node's overall global pool bandwidth.

**tailend**—The router upon which an LSP is terminated. This is the last router in the LSP's path.

**tunnel**—Secure communications path between two peers, such as two routers.

**unlimited backup bandwidth**—Backup tunnels that provide no bandwidth (best-effort) protection (that is, they provide best-effort protection).

## **MPLS Layer 2 VPNs**

# Any Transport over MPLS

---

**First Published: January 1, 2001**

**Last Updated: November 20, 2009**

This document describes the Any Transport over MPLS (AToM) feature, which provides the following capabilities:

- Transport data link layer (Layer2) packets over a Multiprotocol Label Switching (MPLS) backbone.
- Enable service providers to connect customer sites with existing Layer 2 networks by using a single, integrated, packet-based network infrastructure—a Cisco MPLS network. Instead of using separate networks with network management environments, service providers can deliver Layer 2 connections over an MPLS backbone.
- Provide a common framework to encapsulate and transport supported Layer 2 traffic types over an MPLS network core.

AToM supports the following like-to-like transport types:

- ATM Adaptation Layer Type-5 (AAL5) over MPLS
- ATM Cell Relay over MPLS
- Ethernet over MPLS (VLAN and port modes)
- Frame Relay over MPLS
- PPP over MPLS
- High-Level Data Link Control (HDLC) over MPLS

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for Any Transport over MPLS” section on page 88](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Configuration Examples for Any Transport over MPLS, page 67](#)
- [Additional References, page 85](#)
- [Feature Information for Any Transport over MPLS, page 88](#)

## Prerequisites for Any Transport over MPLS

Before configuring AToM, ensure that the network is configured as follows:

- Configure IP routing in the core so that the provider edge (PE) routers can reach each other via IP.
- Configure MPLS in the core so that a label-switched path (LSP) exists between the PE routers.
- Enable Cisco Express Forwarding or distributed Cisco Express Forwarding before configuring any Layer 2 circuits.
- Configure a loopback interface for originating and terminating Layer 2 traffic. Make sure the PE routers can access the other router's loopback interface. Note that the loopback interface is not needed in all cases. For example, tunnel selection does not need a loopback interface when AToM is directly mapped to a traffic engineering (TE) tunnel.
- AToM is supported on the Cisco 7200 and 7500 series routers. For details on supported hardware, see the following documents:
  - [Cross-Platform Release Notes for Cisco IOS Release 12.0S](#)
  - [Cross-Platform Release Notes for Cisco IOS Release 12.4T, Part 2: Platform-Specific Information](#)
- AToM is supported on the Cisco 7600 routers. For details on supported shared port adapters and line cards, see the following documents:
  - [Guide to Supported Hardware for Cisco 7600 Series Routers with Release 12.2SR](#)
  - [Cross-Platform Release Notes for Cisco IOS Release 12.2SR for the Cisco 7600 Series Routers](#)
- The Cisco 7600 router has platform-specific instructions for configuring some AToM features. Platform-specific configuration information is included in the following documents:
  - The “Configuring PFC3BXL and PFC3B Mode Multiprotocol Label Switching” module of the [Cisco 7600 Series Cisco IOS Software Configuration Guide](#), Release 12.2SR
  - The “Configuring Multiprotocol Label Switching on the Optical Services Modules” module of the [OSM Configuration Note](#), Release 12.2SR
  - The “Configuring Multiprotocol Label Switching on FlexWAN and Enhanced FlexWAN Modules” module of the [FlexWAN and Enhanced FlexWAN Modules Installation and Configuration Guides of Cisco 7600 Series Routers](#).
  - The “Configuring Any Transport over MPLS on a SIP” section of the [Cisco 7600 Series Router SIP, SSC, and SPA Software Configuration Guide](#)

- The “Configuring AToM VP Cell Mode Relay Support” section of the *Cisco 7600 Series Router SIP, SSC, and SPA Software Configuration Guide*
  - The *Cross-Platform Release Notes for Cisco IOS Release 12.2SR*
- AToM is supported on the Cisco 10000 series routers. For details on supported hardware, see the “Configuring Any Transport over MPLS” section of the *Cisco 10000 Series Router Software Configuration Guide*.
- The Cisco 10000 series router has platform-specific instructions for configuring some AToM features. Platform-specific configuration information is contained in the “Configuring Any Transport over MPLS” section of the *Cisco 10000 Series Router Broadband Aggregation, Leased-Line, and MPLS Configuration Guide*.
- AToM is supported on the Cisco 12000 series routers. For information about hardware requirements, see the *Cross-Platform Release Notes for Cisco IOS Release 12.0S*.

## Restrictions for Any Transport over MPLS

The following general restrictions pertain to all transport types under AToM:

- Address format: Configure the Label Distribution Protocol (LDP) router ID on all PE routers to be a loopback address with a /32 mask. Otherwise, some configurations might not function properly.
- Layer 2 virtual private networks (L2VPN) features (AToM and Layer 2 Tunnel Protocol Version 3 (L2TPv3)) are not supported on an ATM interface.
- Distributed Cisco Express Forwarding is the only forwarding model supported on the Cisco 12000 series routers and is enabled by default. Disabling distributed Cisco Express Forwarding on the Cisco 12000 series routers disables forwarding.
- Distributed Cisco Express Forwarding mode is supported on the Cisco 7500 series routers for Frame Relay, HDLC, and PPP. In distributed Cisco Express Forwarding mode, the switching process occurs on the Versatile Interface Processors (VIPs) that support switching. When distributed Cisco Express Forwarding is enabled, VIP port adapters maintain identical copies of the Forwarding Information Base (FIB) and adjacency tables. The port adapters perform the express forwarding between port adapters, relieving the Route Switch Processor (RSP) from performing the switching. Distributed Cisco Express Forwarding uses an interprocess communications (IPC) mechanism to ensure synchronization of FIBs and adjacency tables between the RSP and port adapters.

The following restrictions pertain to ATM Cell Relay over MPLS:

- For ATM Cell Relay over MPLS, if you have TE tunnels running between the PE routers, you must enable LDP on the tunnel interfaces.
- Configuring ATM Relay over MPLS with the Cisco 12000 Series Router engine 2 8-port OC-3 STM-1 ATM line card: In Cisco IOS Release 12.0(25)S, there were special instructions for configuring ATM cell relay on the Cisco 12000 series router with an engine 2 8-port OC-3 STM-1 ATM line card. The special configuration instructions do not apply in releases later than Cisco IOS Release 12.0(25)S and you do not need to use the **atm mode cell-relay** command.

In Cisco IOS Release 12.0(25)S, when you configured the Cisco 12000 series 8-port OC-3 STM-1 ATM line card for ATM Cell Relay over MPLS, two ports were reserved. In releases later than Cisco IOS Release 12.0(25)S, only one port is reserved.

In addition, in Cisco IOS Release 12.0(25)S, if you configured an 8-port OC-3 STM-1 ATM port for ATM AAL5 over MPLS and then configured ATM single cell relay over MPLS on that port, the VCs and VPs for AAL5 on the port and its corresponding port were removed. Starting in Cisco IOS Release 12.0(26)S, this behavior no longer occurs. ATM AAL5 over MPLS and ATM single cell

relay over MPLS are supported on the same port. The Cisco 12000 series 8-port OC-3 STM-1 ATM line cards now support, by default, the ATM single cell relay over MPLS feature in both VP and VC modes and ATM AAL5 over MPLS on the same port.

- The F4 end-to-end OAM cells are transparently transported along with the ATM cells. When a permanent virtual path (PVP) or PVC is down on one PE router, the label associated with that PVP or PVC is withdrawn. Subsequently, the peer PE router detects the label withdrawal and sends an F4 AIS/RDI signal to its corresponding CE router. The PVP or PVC on the peer PE router remains in the up state.

The following restrictions pertain to the Ethernet over MPLS feature:

- Ethernet over MPLS supports VLAN packets that conform to the IEEE 802.1Q standard. The 802.1Q specification establishes a standard method for inserting VLAN membership information into Ethernet frames. The Inter-Switch Link (ISL) protocol is not supported between the PE and CE routers.
- The AToM control word is supported. However, if the peer PE does not support a control word, the control word is disabled. This negotiation is done by LDP label binding.
- Ethernet packets with hardware-level cyclic redundancy check (CRC) errors, framing errors, and runt packets are discarded on input.
- In Cisco IOS Release 12.2(25)S, the behavior of the **mpls mtu** command changed. If the interface MTU is less than 1524 bytes, you can set the maximum MPLS MTU to 24 bytes more than the interface MTU. For example, if the interface MTU is set to 1510 bytes, then you can set the maximum MPLS MTU to 1534 bytes (1510 + 24).

**Caution**

Although you can set the MPLS MTU to a value greater than the interface MTU, set the MPLS MTU less than or equal to the interface MTU to prevent data corruption, dropped packets, and high CPU rates.

If the interface MTU is greater than or equal to 1524 bytes, then you can set the maximum MPLS MTU as high as the interface MTU. For example, if the interface MTU is set to 1600 bytes, then you can set the MPLS MTU to a maximum of 1600 bytes. If you set the MPLS MTU higher than the interface MTU, traffic is dropped.

For interfaces that do not allow you to configure the interface MTU value and the interface MTU is 1500 bytes, the MPLS MTU range is 64 to 1524 bytes.

If you upgrade to Cisco IOS Release 12.2(25)S from an earlier release and you have an MPLS MTU setting that does not conform to these guidelines, the command is rejected. See the [“Maximum Transmission Unit Guidelines for Estimating Packet Size” section on page 7](#) for more information.

The following restrictions pertain to the Frame Relay over MPLS feature:

- Frame Relay traffic shaping is not supported with AToM switched VCs.
- If you configure Frame Relay over MPLS on the Cisco 12000 series router and the core-facing interface is an engine 4 or 4+ line card and the edge-facing interface is an engine 0 or 2 line card, then the BECN, FECN, control word (CW), and DE bit information is stripped from the PVC.

# Information About Any Transport over MPLS

To configure AToM, you must understand the following concepts:

- [How AToM Transports Layer 2 Packets, page 5](#)
- [AToM Configuration Commands Prior to Cisco IOS Release 12.0\(25\)S, page 6](#)
- [Benefits of AToM, page 6](#)
- [MPLS Traffic Engineering Fast Reroute, page 6](#)
- [Maximum Transmission Unit Guidelines for Estimating Packet Size, page 7](#)
- [Frame Relay over MPLS and DTE, DCE, and NNI Connections, page 9](#)
- [QoS Features Supported with AToM, page 11](#)

## How AToM Transports Layer 2 Packets

AToM encapsulates Layer 2 frames at the ingress PE and sends them to a corresponding PE at the other end of a pseudowire, which is a connection between the two PE routers. The egress PE removes the encapsulation and sends out the Layer 2 frame.

The successful transmission of the Layer 2 frames between PE routers is due to the configuration of the PE routers. You set up the connection, called a pseudowire, between the routers. You specify the following information on each PE router:

- The type of Layer 2 data that will be transported across the pseudowire, such as Ethernet, Frame Relay, or ATM
- The IP address of the loopback interface of the peer PE router, which enables the PE routers to communicate
- A unique combination of peer PE IP address and VC ID that identifies the pseudowire

The following example shows the basic configuration steps on a PE router that enable the transport of Layer 2 packets. Each transport type has slightly different steps.

Step 1 defines the interface or subinterface on the PE router:

```
Router# interface interface-type interface-number
```

Step 2 specifies the encapsulation type for the interface, such as dot1q:

```
Router(config-if)# encapsulation encapsulation-type
```

Step 3 does the following:

- Makes a connection to the peer PE router by specifying the LDP router ID of the peer PE router.
- Specifies a 32-bit unique identifier, called the VC ID, which is shared between the two PE routers.  
The combination of the peer router ID and the VC ID must be unique on the router. Two circuits cannot use the same combination of peer router ID and VC ID.
- Specifies the tunneling method used to encapsulate data in the pseudowire. AToM uses MPLS as the tunneling method.

```
Router(config-if)# xconnect peer-router-id vcid encapsulation mpls
```

As an alternative, you can set up a pseudowire class to specify the tunneling method and other characteristics. See the [“Configuring the Pseudowire Class” section on page 15](#) for more information.

## AToM Configuration Commands Prior to Cisco IOS Release 12.0(25)S

In releases of AToM previous to Cisco IOS 12.0(25)S, the command used to configure AToM circuits was **mpls l2 transport route**. This command has been replaced with the **xconnect** command.

No enhancements will be made to the **mpls l2transport route** command. Enhancements will be made to either the **xconnect** command or **pseudowire-class** command. Therefore, Cisco recommends that you use the **xconnect** command to configure AToM circuits.

Configurations from releases previous to Cisco IOS 12.0(25)S that use the **mpls l2transport route** command are still supported.

## Benefits of AToM

The following list explains some of the benefits of enabling Layer 2 packets to be sent in the MPLS network:

- The AToM product set accommodates many types of Layer 2 packets, including Ethernet and Frame Relay, across multiple Cisco router platforms, such as the Cisco 7200 and 7500 series routers. This enables the service provider to transport all types of traffic over the backbone and accommodate all types of customers.
- AToM adheres to the standards developed for transporting Layer 2 packets over MPLS. (See the [“Standards” section on page 86](#) for the specific standards that AToM follows.) This benefits the service provider that wants to incorporate industry-standard methodologies in the network. Other Layer 2 solutions are proprietary, which can limit the service provider’s ability to expand the network and can force the service provider to use only one vendor’s equipment.
- Upgrading to AToM is transparent to the customer. Because the service provider network is separate from the customer network, the service provider can upgrade to AToM without disruption of service to the customer. The customers assume that they are using a traditional Layer 2 backbone.

## MPLS Traffic Engineering Fast Reroute

AToM can use MPLS traffic engineering (TE) tunnels with fast reroute (FRR) support. AToM VCs can be rerouted around a failed link or node at the same time as MPLS and IP prefixes.

Enabling fast reroute on AToM does not require any special commands; you can use standard fast reroute commands. At the ingress PE, an AToM tunnel is protected by fast reroute when it is routed to an FRR-protected TE tunnel. Both link and node protection are supported for AToM VCs at the ingress PE. For more information on configuring MPLS TE fast reroute, see the following document:

[\*MPLS Traffic Engineering \(TE\)—Link and Node Protection, with RSVP Hellos Support\*](#)

### Note

The AToM VC independence feature was introduced in Cisco IOS Release 12.0(31)S and enables the Cisco 12000 series router to perform fast reroute in fewer than 50 milliseconds, regardless of the number of VCs configured. In previous releases, the fast reroute time depended on the number of VCs inside the protected TE tunnel.

For the Cisco 12000 series routers, fast reroute uses three or more labels, depending on where the TE tunnel ends:

- If the TE tunnel is from a PE router to a PE router, three labels are used.

- If the TE tunnel is from a PE router to the core router, four labels are used.

Engine 0 ATM line cards support three or more labels, although performance degrades. Engine 2 Gigabit Ethernet line cards and engine 3 line cards support three or more labels and can work with the fast reroute feature.

You can issue the **debug mpls l2transport fast-reroute** command to debug fast reroute with AToM.

#### Note

This command does not display output on platforms where AToM fast reroute is implemented in the forwarding code. The command does display output on Cisco 10720 Internet router line cards and Cisco 12000 series line cards. This command does not display output for the Cisco 7500 (both Route Processor (RP) and VIP) series routers, Cisco 7200 series routers, and Cisco 12000 series RP.

In the following example, the primary link is disabled, which causes the backup tunnel (Tunnel 1) to become the primary path. In the following example, bolded output shows the status of the tunnel:

```
Router# execute-on slot 3 debug mpls l2transport fast-reroute
```

```
===== Line Card (Slot 3) =====
AToM fast reroute debugging is on

```

## Maximum Transmission Unit Guidelines for Estimating Packet Size

The following calculation helps you determine the size of the packets traveling through the core network. You set the maximum transmission unit (MTU) on the core-facing interfaces of the P and PE routers to accommodate packets of this size. The MTU should be greater than or equal to the total bytes of the items in the following equation:

*Core MTU >= (Edge MTU + Transport header + AToM header + (MPLS label stack \* MPLS label size))*

The following sections describe the variables used in the equation:

### Edge MTU

The edge MTU is the MTU for the customer-facing interfaces.

### Transport Header

The Transport header depends on the transport type. [Table 1](#) lists the specific sizes of the headers.

**Table 1** Header Size of Packets

| Transport Type | Packet Size |
|----------------|-------------|
| AAL5           | 0–32 bytes  |
| Ethernet VLAN  | 18 bytes    |
| Ethernet Port  | 14 bytes    |

**Table 1**      **Header Size of Packets (continued)**

| Transport Type   | Packet Size                                                                                       |
|------------------|---------------------------------------------------------------------------------------------------|
| Frame Relay DLCI | 2 bytes for Cisco encapsulation, 8 bytes for Internet Engineering Task Force (IETF) encapsulation |
| HDLC             | 4 bytes                                                                                           |
| PPP              | 4 bytes                                                                                           |

**AToM Header**

The AToM header is 4 bytes (control word). The control word is optional for Ethernet, PPP, HDLC, and cell relay transport types. However, the control word is required for Frame Relay and ATM AAL5 transport types.

**MPLS Label Stack**

The MPLS label stack size depends on the configuration of the core MPLS network:

- AToM uses one MPLS label to identify the AToM VCs (VC label). Therefore, the minimum MPLS label stack is one for directly connected AToM PEs, which are PE routers that do not have a P router between them.
- If LDP is used in the MPLS network, the label stack size is two (the LDP label and the VC label).
- If a TE tunnel instead of LDP is used between PE routers in the MPLS network, the label stack size is two (the TE label and the VC label).
- If a TE tunnel and LDP are used in the MPLS network (for example, a TE tunnel between P routers or between P and PE routers, with LDP on the tunnel), the label stack is three (TE label, LDP label, VC label).
- If you use MPLS fast reroute in the MPLS network, you add a label to the stack. The maximum MPLS label stack in this case is four (FRR label, TE label, LDP label, VC label).
- If AToM is used by the customer carrier in an MPLS VPN Carrier Supporting Carrier environment, you add a label to the stack. The maximum MPLS label stack in the provider carrier network is five (FRR label, TE label, LDP label, VPN label, VC label).
- If an AToM tunnel spans different service providers that exchange MPLS labels using IPv4 Border Gateway Protocol (BGP) (RFC 3107), you add a label to the stack. The maximum MPLS label stack is five (FRR label, TE label, Border Gateway Protocol (BGP) label, LDP label, VC label).

Other circumstances can increase the MPLS label stack size. Therefore, analyze the complete data path between the AToM tunnel endpoints and determine the maximum MPLS label stack size for your network. Then multiply the label stack size by the size of the MPLS label.

**Estimating Packet Size: Example**

The size of packets is estimate in the following example, which uses the following assumptions:

- The edge MTU is 1500 bytes.
- The transport type is Ethernet VLAN, which designates 18 bytes for the transport header.
- The AToM header is 0, because the control word is not used.
- The MPLS label stack is 2, because LDP is used. The MPLS label is 4 bytes.

```
Edge MTU + Transport header + ATOM header + (MPLS label stack * MPLS label) = Core MTU
1500      + 18                + 0          + (2                * 4                ) = 1526
```

You must configure the P and PE routers in the core to accept packets of 1526 bytes.

Once you determine the MTU size to set on your P and PE routers, you can issue the **mtu** command on the routers to set the MTU size. The following example specifies an MTU of 1526 bytes:

```
Router(config-if)# mtu 1526
```

## mpls mtu Command Changes

Some interfaces (such as FastEthernet) require the **mpls mtu** command to change the MTU size. In Cisco IOS Release 12.2(25)S, the behavior of the **mpls mtu** command changed.

If the interface MTU is fewer than 1524 bytes, you can set the maximum MPLS MTU to 24 bytes more than the interface MTU. For example, if the interface MTU is set to 1510 bytes, then you can set the maximum MPLS MTU to 1534 bytes (1510 + 24).

### Caution

Although you can set the MPLS MTU to a value greater than the interface MTU, set the MPLS MTU less than or equal to the interface MTU to prevent data corruption, dropped packets, and high CPU rates.

If the interface MTU is greater than or equal to 1524 bytes, then you can set the maximum MPLS MTU as high as the interface MTU. For example, if the interface MTU is set to 1600 bytes, then you can set the MPLS MTU to a maximum of 1600 bytes. If you set the MPLS MTU higher than the interface MTU, traffic is dropped.

For interfaces that do not allow you to configure the interface MTU value and the interface MTU is 1500 bytes, the MPLS MTU range is 64 to 1524 bytes.

If you upgrade to Cisco IOS Release 12.2(25)S and you have an MPLS MTU setting that does not conform to these guidelines, the command is rejected.

For Cisco IOS Release 12.2(27)SBC, 12.2(33)SRA, 12.4(11)T, 12.2(33)SXH, and later releases, you cannot set the MPLS MTU greater than the interface MTU. This eliminates problems, such as dropped packets, data corruption, and high CPU rates. See the [MPLS MTU Command Changes](#) document for more information.

## Frame Relay over MPLS and DTE, DCE, and NNI Connections

You can configure an interface as a DTE device or a DCE switch, or as a switch connected to a switch with network-to-network interface (NNI) connections. Use the following command in interface configuration mode:

```
frame-relay intf-type [dce | dte | nni]
```

The keywords are explained in [Table 2](#).

**Table 2** *frame-relay intf-type Command Keywords*

| Keyword    | Description                                                                          |
|------------|--------------------------------------------------------------------------------------|
| <b>dce</b> | Enables the router or access server to function as a switch connected to a router.   |
| <b>dte</b> | Enables the router or access server to function as a DTE device. DTE is the default. |
| <b>nni</b> | Enables the router or access server to function as a switch connected to a switch.   |

## Local Management Interface and Frame Relay over MPLS

Local Management Interface (LMI) is a protocol that communicates status information about PVCs. When a PVC is added, deleted, or changed, the LMI notifies the endpoint of the status change. LMI also provides a polling mechanism that verifies that a link is up.

### How LMI Works

To determine the PVC status, LMI checks that a PVC is available from the reporting device to the Frame Relay end-user device. If a PVC is available, LMI reports that the status is “Active,” which means that all interfaces, line protocols, and core segments are operational between the reporting device and the Frame Relay end-user device. If any of those components is not available, the LMI reports a status of “Inactive.”

#### Note

Only the DCE and NNI interface types can report LMI status.

Figure 1 is a sample topology that helps illustrate how LMI works.

**Figure 1 Sample Topology**

In Figure 1, note the following:

- CE1 and PE1 and PE2 and CE2 are Frame Relay LMI peers.
- CE1 and CE2 can be Frame Relay switches or end-user devices.
- Each Frame Relay PVC comprises multiple segments.
- The DLCI value is local to each segment and is changed as traffic is switched from segment to segment. Two Frame Relay PVC segments exist in Figure 1; one is between PE1 and CE1 and the other is between PE2 and CE2.

The LMI protocol behavior depends on whether you have DLCI-to-DLCI or port-to-port connections.

#### DLCI-to-DLCI Connections

If you have DLCI-to-DLCI connections, LMI runs locally on the Frame Relay ports between the PE and CE devices:

- CE1 sends an active status to PE1 if the PVC for CE1 is available. If CE1 is a switch, LMI checks that the PVC is available from CE1 to the user device attached to CE1.
- PE1 sends an active status to CE1 if the following conditions are met:
  - A PVC for PE1 is available.
  - PE1 received an MPLS label from the remote PE router.
  - An MPLS tunnel label exists between PE1 and the remote PE.

For DTE or DCE configurations, the following LMI behavior exists: The Frame Relay device accessing the network (DTE) does not report PVC status. Only the network device (DCE) or NNI can report status. Therefore, if a problem exists on the DTE side, the DCE is not aware of the problem.

#### Port-to-Port Connections

If you have port-to-port connections, the PE routers do not participate in the LMI status-checking procedures. LMI operates between the CE routers only. The CE routers must be configured as DCE-DTE or NNI-NNI.

For information about LMI, including configuration instructions, see the “Configuring the LMI” section of the [Configuring Frame Relay](#) document.

## QoS Features Supported with AToM

For information about configuring QoS features on the Cisco 12000 series routers, see the following feature module:

*Any Transport over MPLS (AToM): Layer 2 QoS for the Cisco 12000 Series Router (Quality of Service)*

The following tables list the QoS features supported by AToM on the Cisco 7200 and 7500 series routers:

- [Table 3, QoS Features Supported with Ethernet over MPLS on the Cisco 7200 and 7500 Series Routers](#)
- [Table 4, QoS Features Supported with Frame Relay over MPLS on the Cisco 7200 and 7500 Series Routers](#)
- [Table 5, QoS Features Supported with ATM Cell Relay and AAL5 over MPLS on the Cisco 7200 and 7500 Series Routers](#)

**Table 3** *QoS Features Supported with Ethernet over MPLS on the Cisco 7200 and 7500 Series Routers*

| QoS Feature    | Ethernet over MPLS                                                                                                                                                                                                                                                                                             |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service policy | Can be applied to: <ul style="list-style-type: none"> <li>• Interface (input and output)</li> <li>• Subinterface (input and output)</li> </ul>                                                                                                                                                                 |
| Classification | Supports the following commands: <ul style="list-style-type: none"> <li>• <b>match cos</b> (on interfaces and subinterfaces)</li> <li>• <b>match mpls experimental</b> (on interfaces and subinterfaces)</li> <li>• <b>match qos-group</b> (on interfaces) (output policy)</li> </ul>                          |
| Marking        | Supports the following commands: <ul style="list-style-type: none"> <li>• <b>set cos</b> (output policy)</li> <li>• <b>set discard-class</b> (input policy)</li> <li>• <b>set mpls experimental</b> (input policy) (on interfaces and subinterfaces)</li> <li>• <b>set qos-group</b> (input policy)</li> </ul> |

**Table 3** *QoS Features Supported with Ethernet over MPLS on the Cisco 7200 and 7500 Series Routers (continued)*

| QoS Feature          | Ethernet over MPLS                                                                                                                                                                                            |

## Configuring the Pseudowire Class

The successful transmission of the Layer 2 frames between PE routers is due to the configuration of the PE routers. You set up the connection, called a pseudowire, between the routers.

### Note

In simple configurations, this task is optional. You do not need to specify a pseudowire class if you specify the tunneling method as part of the **xconnect** command.

The pseudowire-class configuration group specifies the following characteristics of the tunneling mechanism:

- Encapsulation type
- Control protocol
- Payload-specific options

For more information about the **pseudowire-class** command, see the following feature module: [Layer 2 Tunnel Protocol Version 3](#).

You must specify the **encapsulation mpls** command as part of the pseudowire class or as part of the **xconnect** command for the AToM VCs to work properly. If you omit the **encapsulation mpls** command as part of the **xconnect** command, you receive the following error:

```
% Incomplete command.
```

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **pseudowire-class** *name*
4. **encapsulation mpls**

## DETAILED STEPS

|        | Command or Action                                                                                   | Purpose                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                      | Enters global configuration mode.                                                                                |
| Step 3 | <b>pseudowire-class</b> <i>name</i><br><br><b>Example:</b><br>Router(config)# pseudowire-class atom | Establishes a pseudowire class with a name that you specify and enters pseudowire class configuration mode.      |
| Step 4 | <b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-pw-class)#<br>encapsulation mpls  | Specifies the tunneling encapsulation.                                                                           |

## Changing the Encapsulation Type and Removing a Pseudowire

To change the type of encapsulation, remove the pseudowire with the **no pseudowire-class** command and reestablish the pseudowire and specify the new encapsulation type.

Once you specify the **encapsulation mpls** command, you cannot remove it using the **no encapsulation mpls** command. Nor can you change the command's setting using the **encapsulation l2tpv3** command. Those methods result in the following error message:

```
Encapsulation changes are not allowed on an existing pw-class.
```

To remove a pseudowire, use the **clear xconnect** command in privileged EXEC command. You can remove all pseudowires or specific pseudowires on an interface or peer router.

## Configuring ATM AAL5 over MPLS on PVCs

ATM AAL5 over MPLS for permanent virtual circuits encapsulates ATM AAL5 service data unit (SDUs) in MPLS packets and forwards them across the MPLS network. Each ATM AAL5 SDU is transported as a single packet.

### Restrictions

AAL5 over MPLS is supported only in SDU mode.

### SUMMARY STEPS

1. **enable**

2. **configure terminal**
  - a. **interface** *typeslot/port*
3. **pvc** [*name*] *vpi/vci* **l2transport**
4. **encapsulation aal5**
5. **xconnect** *peer-router-id vcid* **encapsulation mpls**
6. **exit**
7. **exit**
8. **exit**
9. **show mpls l2transport vc**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                             | Purpose                                                                                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                | Enters global configuration mode.                                                                                                                                                                                                         |
| Step 3 | <b>interface</b> <i>typeslot/port</i><br><br><b>Example:</b><br>Router(config)# interface atml/0                                                                              | Specifies the interface by type, slot, and port number, and enters interface configuration mode.                                                                                                                                          |
| Step 4 | <b>pvc</b> [ <i>name</i> ] <i>vpi/vci</i> <b>l2transport</b><br><br><b>Example:</b><br>Router(config-if)# pvc 1/200 l2transport                                               | Creates or assigns a name to an ATM PVC and enters L2transport configuration mode. <ul style="list-style-type: none"> <li>The <b>l2transport</b> keyword indicates that the PVC is a switched PVC instead of a terminated PVC.</li> </ul> |
| Step 5 | <b>encapsulation aal5</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# encapsulation aal5                                                                     | Specifies ATM AAL5 encapsulation for the PVC. <ul style="list-style-type: none"> <li>Make sure that you specify the same encapsulation type on the PE and customer edge (CE) routers.</li> </ul>                                          |
| Step 6 | <b>xconnect</b> <i>peer-router-id vcid</i> <b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# xconnect 10.13.13.13 100 encapsulation mpls | Binds the attachment circuit to a pseudowire VC.                                                                                                                                                                                          |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# exit                                                                                                 | Exits L2transport configuration mode.                                                                                                                                                                                                     |

|         |                                                                                                 |                                                                       |
|---------|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| Step 8  | <pre>exit</pre> <p><b>Example:</b><br/>Router(config-if)# exit</p>                              | Exits interface configuration mode.                                   |
| Step 9  | <pre>exit</pre> <p><b>Example:</b><br/>Router(config)# exit</p>                                 | Exits global configuration mode.                                      |
| Step 10 | <pre>show mpls l2transport vc</pre> <p><b>Example:</b><br/>Router# show mpls l2transport vc</p> | Displays output that shows ATM AAL5 over MPLS is configured on a PVC. |

## Examples

The following is sample output from the **show mpls l2transport vc** command, which shows that ATM AAL5 over MPLS is configured on a PVC:

```
Router# show mpls l2transport vc
```

| Local intf | Local circuit  | Dest address | VC ID | Status |
|------------|----------------|--------------|-------|--------|
| -----      | -----          | -----        | ----- | -----  |
| ATM1/0     | ATM AAL5 1/100 | 10.4.4.4     | 100   | UP     |

## Configuring ATM AAL5 over MPLS in VC Class Configuration Mode

You can create a VC class that specifies the AAL5 encapsulation and then attach the encapsulation type to an interface, subinterface, or PVC. The following task creates a VC class and attaches it to a main interface.

## Restrictions

AAL5 over MPLS is supported only in SDU mode.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vc-class atm** *vc-class-name*
4. **encapsulation** *layer-type*
5. **exit**
6. **interface** *typeslot/port*
7. **class-int** *vc-class-name*
8. **pvc** [*name*] *vpi/vci* **l2transport**
9. **xconnect** *peer-router-id* *vcid* **encapsulation mpls**
10. **exit**

11. **exit**
12. **exit**
13. **show atm class-links**

## DETAILED STEPS

|        | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                      |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                  | Enters global configuration mode.                                                                                                                                                                                                            |
| Step 3 | <b>vc-class atm vc-class-name</b><br><br><b>Example:</b><br>Router(config)# vc-class atm aal5class                                                              | Creates a VC class and enters VC class configuration mode.                                                                                                                                                                                   |
| Step 4 | <b>encapsulation layer-type</b><br><br><b>Example:</b><br>Router(config-vc-class)# encapsulation aal5                                                           | Configures the AAL and encapsulation type.                                                                                                                                                                                                   |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-vc-class)# exit                                                                                             | Exits VC class configuration mode.                                                                                                                                                                                                           |
| Step 6 | <b>interface typeslot/port</b><br><br><b>Example:</b><br>Router(config)# interface atm1/0                                                                       | Specifies the interface by type, slot, and port number, and enters interface configuration mode.                                                                                                                                             |
| Step 7 | <b>class-int vc-class-name</b><br><br><b>Example:</b><br>Router(config-if)# class-int aal5class                                                                 | Applies a VC class to the ATM main interface or subinterface.<br><br><b>Note</b> You can also apply a VC class to a PVC.                                                                                                                     |
| Step 8 | <b>pvc [name] vpi/vci l2transport</b><br><br><b>Example:</b><br>Router(config-if)# pvc 1/200 l2transport                                                        | Creates or assigns a name to an ATM PVC and enters L2transport VC configuration mode. <ul style="list-style-type: none"> <li>The <b>l2transport</b> keyword indicates that the PVC is a switched PVC instead of a terminated PVC.</li> </ul> |
| Step 9 | <b>xconnect peer-router-id vcid encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# xconnect 10.13.13.13 100 encapsulation mpls | Binds the attachment circuit to a pseudowire VC.                                                                                                                                                                                             |

|                |                                                                         |                                                                                       |
|----------------|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Step 10</b> | <code>exit</code>                                                       | Exits L2transport configuration mode.                                                 |
|                | <b>Example:</b><br><code>Router(config-if-atm-l2trans-pvc)# exit</code> |                                                                                       |
| <b>Step 11</b> | <code>exit</code>                                                       | Exits interface configuration mode.                                                   |
|                | <b>Example:</b><br><code>Router(config-if)# exit</code>                 |                                                                                       |
| <b>Step 12</b> | <code>exit</code>                                                       | Exits global configuration mode.                                                      |
|                | <b>Example:</b><br><code>Router(config)# exit</code>                    |                                                                                       |
| <b>Step 13</b> | <code>show atm class-links</code>                                       | Displays the type of encapsulation and that the VC class was applied to an interface. |
|                | <b>Example:</b><br><code>Router# show atm class-links</code>            |                                                                                       |

## Examples

In the following example, the command output of the **show atm class-links** command verifies that ATM AAL5 over MPLS is configured as part of a VC class. The command output shows the type of encapsulation and that the VC class was applied to an interface.

```
Router# show atm class-links 1/100
```

```
Displaying vc-class inheritance for ATM1/0.0, vc 1/100:
no broadcast - Not configured - using default
encapsulation aal5 - VC-class configured on main interface
```

## Configuring OAM Cell Emulation for ATM AAL5 over MPLS

If a PE router does not support the transport of Operation, Administration, and Maintenance (OAM) cells across a label switched path (LSP), you can use OAM cell emulation to locally terminate or loop back the OAM cells. You configure OAM cell emulation on both PE routers, which emulates a VC by forming two unidirectional LSPs. You use the **oam-ac emulation-enable** and **oam-pvc manage** commands on both PE routers to enable OAM cell emulation.

After you enable OAM cell emulation on a router, you can configure and manage the ATM VC in the same manner as you would a terminated VC. A VC that has been configured with OAM cell emulation can send loopback cells at configured intervals toward the local CE router. The endpoint can be either of the following:

- End-to-end loopback, which sends OAM cells to the local CE router.
- Segment loopback, which responds to OAM cells to a device along the path between the PE and CE routers.

The OAM cells include the following cells:

- Alarm indication signal (AIS)
- Remote defect indication (RDI)

These cells identify and report defects along a VC. When a physical link or interface failure occurs, intermediate nodes insert OAM AIS cells into all the downstream devices affected by the failure. When a router receives an AIS cell, it marks the ATM VC down and sends an RDI cell to let the remote end know about the failure.

This section contains two tasks:

- [Configuring OAM Cell Emulation for ATM AAL5 over MPLS on PVCs, page 21](#)
- [Configuring OAM Cell Emulation for ATM AAL5 over MPLS in VC Class Configuration Mode, page 23](#)

## Configuring OAM Cell Emulation for ATM AAL5 over MPLS on PVCs

Perform this task to configure OAM cell emulation for ATM AAL5 over MPLS on a PVC.

### Note

For AAL5 over MPLS, you can configure the **oam-pvc manage** command only after you issue the **oam-ac emulation-enable** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *typeslot/port*
4. **pvc** [*name*] *vpi/vci* **l2transport**
5. **encapsulation aal5**
6. **xconnect** *peer-router-id* *vcid* **encapsulation mpls**
7. **oam-ac emulation-enable** [*ais-rate*]
8. **oam-pvc manage** [*frequency*]
9. **exit**
10. **exit**
11. **exit**
12. **show atm pvc**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                       |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>interface</b> <i>typeslot/port</i><br><br><b>Example:</b><br>Router(config)# interface atm1/0                                                                                     | Specifies the interface by type, slot, and port number, and enters interface configuration mode.                                                                                                                                                                                                                              |
| Step 4 | <b>pvc</b> [ <i>name</i> ] <i>vpi/vci</i> <b>l2transport</b><br><br><b>Example:</b><br>Router(config-if)# pvc 1/200 l2transport                                                      | Creates or assigns a name to an ATM PVC and enters L2transport VC configuration mode. <ul style="list-style-type: none"> <li>The <b>l2transport</b> keyword indicates that the PVC is a switched PVC instead of a terminated PVC.</li> </ul>                                                                                  |
| Step 5 | <b>encapsulation aal5</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# encapsulation aal5                                                                            | Specifies ATM AAL5 encapsulation for the PVC. <ul style="list-style-type: none"> <li>Make sure you specify the same encapsulation type on the PE and CE routers.</li> </ul>                                                                                                                                                   |
| Step 6 | <b>xconnect</b> <i>peer-router-id</i> <i>vcid</i> <b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# xconnect 10.13.13.13 100 encapsulation mpls | Binds the attachment circuit to a pseudowire VC.                                                                                                                                                                                                                                                                              |
| Step 7 | <b>oam-ac emulation-enable</b> [ <i>ais-rate</i> ]<br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# oam-ac emulation-enable 30                                           | Enables OAM cell emulation for AAL5 over MPLS. <ul style="list-style-type: none"> <li>The <i>ais-rate</i> argument lets you specify the rate at which AIS cells are sent. The default is one cell every second. The range is 0 to 60 seconds.</li> </ul>                                                                      |
| Step 8 | <b>oam-pvc manage</b> [ <i>frequency</i> ]<br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# oam-pvc manage                                                               | Enables the PVC to generate end-to-end OAM loopback cells that verify connectivity on the virtual circuit. <ul style="list-style-type: none"> <li>The optional <i>frequency</i> argument is the interval between transmission of loopback cells and ranges from 0 to 600 seconds. The default value is 10 seconds.</li> </ul> |
| Step 9 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# exit                                                                                                        | Exits L2transport configuration mode.                                                                                                                                                                                                                                                                                         |

|                |                                                                    |                                                                          |
|----------------|--------------------------------------------------------------------|--------------------------------------------------------------------------|
| <b>Step 10</b> | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit      | Exits interface configuration mode.                                      |
| <b>Step 11</b> | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit         | Exits global configuration mode.                                         |
| <b>Step 12</b> | <b>show atm pvc</b><br><br><b>Example:</b><br>Router# show atm pvc | Displays output that shows OAM cell emulation is enabled on the ATM PVC. |

## Examples

The output of the **show atm pvc** command in the following example shows that OAM cell emulation is enabled on the ATM PVC:

```
Router# show atm pvc 5/500
```

```

```

## Configuring OAM Cell Emulation for ATM AAL5 over MPLS in VC Class Configuration Mode

The following steps explain how to configure OAM cell emulation as part of a VC class. You can then apply the VC class to an interface, a subinterface, or a VC. When you configure OAM cell emulation in VC class configuration mode and then apply the VC class to an interface, the settings in the VC class apply to all the VCs on the interface, unless you specify a different OAM cell emulation value at a lower level, such as the subinterface or VC level. For example, you can create a VC class that specifies OAM cell emulation and sets the rate of AIS cells to every 30 seconds. You can apply the VC class to an interface. Then, for one PVC, you can enable OAM cell emulation and set the rate of AIS cells to every 15 seconds. All the PVCs on the interface use the cell rate of 30 seconds, except for the one PVC that was set to 15 seconds.

Perform this task to enable OAM cell emulation as part of a VC class and apply it to an interface.

**Note**

For AAL5 over MPLS, you can configure the **oam-pvc manage** command only after you issue the **oam-ac emulation-enable** command.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **vc-class atm *name***
4. **encapsulation *layer-type***
5. **oam-ac emulation-enable [*ais-rate*]**
6. **oam-pvc manage [*frequency*]**
7. **exit**
8. **interface *typeslot/port***
9. **class-int *vc-class-name***
10. **pvc [*name*] vpi/vci l2transport**
11. **xconnect *peer-router-id vcid encapsulation mpls***

**DETAILED STEPS**

|        | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                   |

| Step 3 | <b>vc-class atm <i>name</i></b><br><br><b>Example:</b><br>Router(config)# vc-class atm oamclass                                | Creates a VC class and enters VC class configuration mode.                                                                                                                                                                                                |
| Step 4 | <b>encapsulation <i>layer-type</i></b><br><br><b>Example:</b><br>Router(config-vc-class)# encapsulation aal5                   | Configures the AAL and encapsulation type.                                                                                                                                                                                                                |
| Step 5 | <b>oam-ac emulation-enable [<i>ais-rate</i>]</b><br><br><b>Example:</b><br>Router(config-vc-class)# oam-ac emulation-enable 30 | Enables OAM cell emulation for AAL5 over MPLS.<br><ul style="list-style-type: none"><li>The <i>ais-rate</i> argument lets you specify the rate at which AIS cells are sent. The default is one cell every second. The range is 0 to 60 seconds.</li></ul> |

|                |                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <code>oam-pvc manage [frequency]</code><br><br><b>Example:</b><br>Router(config-vc-class)# oam-pvc manage                                                             | Enables the PVC to generate end-to-end OAM loopback cells that verify connectivity on the virtual circuit. <ul style="list-style-type: none"> <li>The optional <i>frequency</i> argument is the interval between transmission of loopback cells and ranges from 0 to 600 seconds. The default value is 10 seconds.</li> </ul> |
| <b>Step 7</b>  | <code>exit</code><br><br><b>Example:</b><br>Router(config-vc-class)# exit                                                                                             | Exits VC class configuration mode.                                                                                                                                                                                                                                                                                            |
| <b>Step 8</b>  | <code>interface typeslot/port</code><br><br><b>Example:</b><br>Router(config)# interface atm1/0                                                                       | Specifies the interface by type, slot, and port number, and enters interface configuration mode.                                                                                                                                                                                                                              |
| <b>Step 9</b>  | <code>class-int vc-class-name</code><br><br><b>Example:</b><br>Router(config-if)# class-int oamclass                                                                  | Applies a VC class to the ATM main interface or subinterface.<br><br><b>Note</b> You can also apply a VC class to a PVC.                                                                                                                                                                                                      |
| <b>Step 10</b> | <code>pvc [name] vpi/vci l2transport</code><br><br><b>Example:</b><br>Router(config-if)# pvc 1/200 l2transport                                                        | Creates or assigns a name to an ATM PVC and enters L2transport VC configuration mode. <ul style="list-style-type: none"> <li>The <b>l2transport</b> keyword indicates that the PVC is a switched PVC instead of a terminated PVC.</li> </ul>                                                                                  |
| <b>Step 11</b> | <code>xconnect peer-router-id vcid encapsulation mpls</code><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# xconnect 10.13.13.13 100 encapsulation mpls | Binds the attachment circuit to a pseudowire VC.                                                                                                                                                                                                                                                                              |

## Configuring ATM Cell Relay over MPLS in VC Mode

Perform this task to configure ATM cell relay on the permanent virtual circuits.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm***slot/port*
4. **pvc** *vpi/vci* **l2transport**
5. **encapsulation aal0**
6. **xconnect** *peer-router-id vcid* **encapsulation mpls**
7. **exit**
8. **exit**
9. **exit**
10. **show atm vc**

## DETAILED STEPS

|         | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                         |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1  | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                                                                  |
| Step 2  | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                  | Enters global configuration mode.                                                                                                                                                                                                                                               |
| Step 3  | <b>interface atmslot/port</b><br><br><b>Example:</b><br>Router(config)# interface atm1/0                                                                        | Specifies an ATM interface and enters interface configuration mode.                                                                                                                                                                                                             |
| Step 4  | <b>pvc vpi/vci l2transport</b><br><br><b>Example:</b><br>Router(config-if)# pvc 0/100 l2transport                                                               | Assigns a virtual path identifier (VPI) and virtual circuit identifier (VCI) and enters L2transport VC configuration mode. <ul style="list-style-type: none"><li>The <b>l2transport</b> keyword indicates that the PVC is a switched PVC instead of a terminated PVC.</li></ul> |
| Step 5  | <b>encapsulation aal0</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# encapsulation aal0                                                       | For ATM cell relay, specifies raw cell encapsulation for the interface. <ul style="list-style-type: none"><li>Make sure you specify the same encapsulation type on the PE and CE routers.</li></ul>                                                                             |
| Step 6  | <b>xconnect peer-router-id vcid encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# xconnect 10.13.13.13 100 encapsulation mpls | Binds the attachment circuit to a pseudowire VC.                                                                                                                                                                                                                                |
| Step 7  | <b>exit</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# exit                                                                                   | Exits L2transport configuration mode.                                                                                                                                                                                                                                           |
| Step 8  | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                   | Exits interface configuration mode.                                                                                                                                                                                                                                             |
| Step 9  | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                      | Exits global configuration mode.                                                                                                                                                                                                                                                |
| Step 10 | <b>show atm vc</b><br><br><b>Example:</b><br>Router# show atm vc                                                                                                | Verifies that OAM cell emulation is enabled on the ATM VC.                                                                                                                                                                                                                      |

## Examples

The output of the **show atm vc** command shows that the interface is configured for VC mode cell relay:

```
Router# show atm vc 7

ATM3/0: VCD: 7, VPI: 23, VCI: 100
UBR, PeakRate: 149760
AAL0-Cell Relay, etype:0x10, Flags: 0x10000C2D, VCmode: 0x0
OAM Cell Emulation: not configured
InBytes: 0, OutBytes: 0
Status: UP
```

## Configuring ATM Cell Relay over MPLS in VC Mode Using VC Class Configuration Mode

You can create a VC class that specifies the ATM cell relay encapsulation and then attach the VC class to an interface, subinterface, or VC. The following task creates a VC class that specifies the ATM cell relay encapsulation and attaches it to a main interface.

### Note

You can configure VC class configuration mode only in VC mode. VC class configuration mode is not supported on VP or port mode.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vc-class atm** *name*
4. **encapsulation** *layer-type*
5. **exit**
6. **interface** *typeslot/port*
7. **class-int** *vc-class-name*
8. **pvc** [*name*] *vpi/vci* **l2transport**
9. **xconnect** *peer-router-id* *vcid* **encapsulation mpls**

### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                              |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br>Router> enable             | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                    |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                      |

|               |                                                                                                   |                                                                                                                                                        |
|---------------|---------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>vc-class</b> <i>atm name</i>                                                                   | Creates a VC class and enters VC class configuration mode.                                                                                             |
|               | <b>Example:</b><br>Router(config)# vc-class atm cellrelay                                         |                                                                                                                                                        |
| <b>Step 4</b> | <b>encapsulation</b> <i>layer-type</i>                                                            | Configures the AAL and encapsulation type.                                                                                                             |
|               | <b>Example:</b><br>Router(config-vc-class)# encapsulation aal0                                    |                                                                                                                                                        |
| <b>Step 5</b> | <b>exit</b>                                                                                       | Exits VC class configuration mode.                                                                                                                     |
|               | <b>Example:</b><br>Router(config-vc-class)# exit                                                  |                                                                                                                                                        |
| <b>Step 6</b> | <b>interface</b> <i>typeslot/port</i>                                                             | Specifies the interface by type, slot, and port number, and enters interface configuration mode.                                                       |
|               | <b>Example:</b><br>Router(config)# interface atm1/0                                               |                                                                                                                                                        |
| <b>Step 7</b> | <b>class-int</b> <i>vc-class-name</i>                                                             | Applies a VC class to the ATM main interface or subinterface.                                                                                          |
|               | <b>Example:</b><br>Router(config-if)# class-int cellrelay                                         | <b>Note</b> You can also apply a VC class to a PVC.                                                                                                    |
| <b>Step 8</b> | <b>pvc</b> [ <i>name</i> ] <i>vpi/vci</i> <b>l2transport</b>                                      | Creates or assigns a name to an ATM PVC and enters L2transport VC configuration mode.                                                                  |
|               | <b>Example:</b><br>Router(config-if)# pvc 1/200 l2transport                                       | <ul style="list-style-type: none"> <li>The <b>l2transport</b> keyword indicates that the PVC is a switched PVC instead of a terminated PVC.</li> </ul> |
| <b>Step 9</b> | <b>xconnect</b> <i>peer-router-id vcid</i> <b>encapsulation mpls</b>                              | Binds the attachment circuit to a pseudowire VC.                                                                                                       |
|               | <b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# xconnect 10.13.13.13 100 encapsulation mpls |                                                                                                                                                        |

## Configuring ATM Cell Relay over MPLS in PVP Mode

VP mode allows cells coming into a predefined PVP on the ATM interface to be transported over the MPLS backbone to a predefined PVP on the egress ATM interface. You can use VP mode to send single cells or packed cells over the MPLS backbone.

To configure VP mode, you must specify the following:

- The VP for transporting cell relay cells.
- The IP address of the peer PE router and the VC ID.

When configuring ATM cell relay over MPLS in VP mode, use the following guidelines:

- You do not need to enter the **encapsulation aal0** command in VP mode.
- One ATM interface can accommodate multiple types of ATM connections. VP cell relay, VC cell relay, and ATM AAL5 over MPLS can coexist on one ATM interface. On the Cisco 12000 series router, this is true only on the engine 0 ATM line cards.
- If a VPI is configured for VP cell relay, you cannot configure a PVC using the same VPI.

- VP trunking (mapping multiple VPs to one emulated VC label) is not supported. Each VP is mapped to one emulated VC.
- Each VP is associated with one unique emulated VC ID. The AToM emulated VC type is ATM VP cell transport.
- The AToM control word is supported. However, if a peer PE does not support the control word, it is disabled. This negotiation is done by LDP label binding.
- VP mode (and VC mode) drop idle cells.

Perform this task to configure ATM cell relay in PVP mode.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm***slot/port*
4. **atm pvp** *vpi* **l2transport**
5. **xconnect** *peer-router-id* **vcid** **encapsulation mpls**
6. **exit**
7. **exit**
8. **exit**
9. **show atm vp**

| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# exit                                                                                                                  | Exits L2 transport configuration mode.                                                                                                                                          |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                                                  | Exits interface configuration mode.                                                                                                                                             |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                     | Exits global configuration mode.                                                                                                                                                |
| Step 9 | <b>show atm vp</b><br><br><b>Example:</b><br>Router# show atm vp                                                                                                                               | Displays output that shows OAM cell emulation is enabled on the ATM VP.                                                                                                         |

## Examples

The following **show atm vp** command in the following example shows that the interface is configured for VP mode cell relay:

```
Router# show atm vp 1
```

```
ATM5/0 VPI: 1, Cell Relay, PeakRate: 149760, CesRate: 0, DataVCs: 1, CesVCs: 0, Status:
ACTIVE
```

| VCD | VCI | Type | InPkts | OutPkts | AAL/Encap | Status |
|-----|-----|------|--------|---------|-----------|--------|
| 6   | 3   | PVC  | 0      | 0       | F4 OAM    | ACTIVE |
| 7   | 4   | PVC  | 0      | 0       | F4 OAM    | ACTIVE |

```
TotalInPkts: 0, TotalOutPkts: 0, TotalInFast: 0, TotalOutFast: 0,
TotalBroadcasts: 0 TotalInPktDrops: 0, TotalOutPktDrops: 0
```

## Configuring ATM Cell Relay over MPLS in Port Mode

Port mode cell relay allows cells coming into an ATM interface to be packed into an MPLS packet and transported over the MPLS backbone to an egress ATM interface.

To configure port mode, issue the **xconnect** command from an ATM main interface and specify the destination address and the VC ID. The syntax of the **xconnect** command is the same as for all other transport types. Each ATM port is associated with one unique pseudowire VC label.

When configuring ATM cell relay over MPLS in port mode, use the following guidelines:

- The pseudowire VC type is set to ATM transparent cell transport (AAL0).
- The AToM control word is supported. However, if the peer PE does not support a control word, the control word is disabled. This negotiation is done by LDP label binding.

**Note** The AToM control word is not supported for port mode cell relay on Cisco 7600 series routers.

- Port mode and VP and VC mode are mutually exclusive. If you enable an ATM main interface for cell relay, you cannot enter any PVP or PVC commands.
- If the pseudowire VC label is withdrawn due to an MPLS core network failure, the PE router sends a line AIS to the CE router.
- For the Cisco 7600 series routers, you must specify the interface ATM slot, bay, and port for the SIP400 or SIP200.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *atmslot/port*  
or  
**interface** *atmslot/bay/port*
4. **xconnect** *peer-router-id vcid encapsulation mpls*
5. **exit**
6. **exit**
7. **show atm route**
8. **show mpls l2transport vc**

|        | Command or Action                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                    |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                          |
| Step 3 | <b>interface</b> <i>atmslot/port</i><br>or<br><b>interface</b> <i>atmslot/bay/port</i><br><br><b>Example:</b><br>Router(config)# interface atm1/0<br>or<br>Router(config)# interface atm4/3/0 | Specifies an ATM interface and enters interface configuration mode. <ul style="list-style-type: none"> <li>• For the Cisco 7600 series routers, you must specify the interface ATM slot, bay, and port for the SIP400 or SIP200. In the example the slot is 4, the bay is 3, and the port is 0.</li> </ul> |

|               |                                                                                                                                                       |                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <b>Step 4</b> | <code>xconnect peer-router-id vcid encapsulation mpls</code><br><br><b>Example:</b><br>Router(config-if)# xconnect 10.0.0.1 123<br>encapsulation mpls | Binds the attachment circuit to the interface.                           |
| <b>Step 5</b> | <code>exit</code><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                   | Exits interface configuration mode.                                      |
| <b>Step 6</b> | <code>exit</code><br><br><b>Example:</b><br>Router(config)# exit                                                                                      | Exits global configuration mode.                                         |
| <b>Step 7</b> | <code>show atm route</code><br><br><b>Example:</b><br>Router# show atm route                                                                          | Displays output that shows ATM cell relay in port mode has been enabled. |
| <b>Step 8</b> | <code>show mpls l2transport vc</code><br><br><b>Example:</b><br>Router# show mpls l2transport vc                                                      | Displays the attachment circuit and the interface.                       |

## Examples

The **show atm route** command in the following example displays port mode cell relay state. The following example shows that atm interface 1/0 is for cell relay, the VC ID is 123 and the tunnel is down.

Router# **show atm route**

| Input Intf | Output Intf | Output VC | Status |
|------------|-------------|-----------|--------|
| ATM1/0     | ATOM Tunnel | 123       | DOWN   |

The **show mpls l2transport vc** command in the following example also shows configuration information:

Router# **show mpls l2transport vc**

| Local intf | Local circuit   | Dest address | VC ID | Status |
|------------|-----------------|--------------|-------|--------|
| AT1/0      | ATM CELL ATM1/0 | 10.1.1.121   | 1121  | UP     |

## Troubleshooting Tips

The **debug atm l2transport** and **debug mpls l2transport vc** display troubleshooting information.

## Configuring ATM Single Cell Relay over MPLS

The single cell relay feature allows you to insert one ATM cell in each MPLS packet. You can use single cell relay in both VP and VC mode. The configuration steps show how to configure single cell relay in VC mode. For VP mode, see the [“Configuring ATM Cell Relay over MPLS in PVP Mode”](#) section on page 28.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm<sup>slot/port</sup>**
4. **pvc vpi/vci l2transport**
5. **encapsulation aal0**
6. **xconnect peer-router-id vcid encapsulation mpls**

### DETAILED STEPS

|        | Command or Action                                                                                                                                            | Purpose                                                                                                                                                                                                                         |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                       | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                           |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                               | Enters global configuration mode.                                                                                                                                                                                               |
| Step 3 | <b>interface atm<sup>slot/port</sup></b><br><br><b>Example:</b><br>Router(config)# interface atm1/0                                                          | Specifies an ATM interface and enters interface configuration mode.                                                                                                                                                             |
| Step 4 | <b>pvc vpi/vci l2transport</b><br><br><b>Example:</b><br>Router(config-if)# pvc 1/100 l2transport                                                            | Assigns a VPI and VCI and enters L2transport VC configuration mode.<br><ul style="list-style-type: none"> <li>• The <b>l2transport</b> keyword indicates that the PVC is a switched PVC instead of a terminated PVC.</li> </ul> |
| Step 5 | <b>encapsulation aal0</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# encapsulation aal0                                                    | Specifies raw cell encapsulation for the interface.<br><ul style="list-style-type: none"> <li>• Make sure you specify the same encapsulation type on the PE and CE routers.</li> </ul>                                          |
| Step 6 | <b>xconnect peer-router-id vcid encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# xconnect 10.0.0.1 123 encapsulation mpls | Binds the attachment circuit to a pseudowire VC.                                                                                                                                                                                |

## Configuring ATM Packed Cell Relay over MPLS

The packed cell relay feature allows you to insert multiple concatenated ATM cells in an MPLS packet. The packed cell relay feature is more efficient than single cell relay, because each ATM cell is 52 bytes, and each AToM packet is at least 64 bytes.

At a high level, packed cell relay configuration consists of the following steps:

1. You specify the amount of time a PE router can wait for cells to be packed into an MPLS packet. You can set up three timers by default with different amounts of time attributed to each timer.
2. You enable packed cell relay, specify how many cells should be packed into each MPLS packet, and choose which timer to use during the cell packing process.

### Restrictions

- The **cell-packing** command is available only if you use AAL0 encapsulation in VC mode. If the command is configured with ATM AAL5 encapsulation, the command is not valid.
- Only cells from the same VC, VP, or port can be packed into one MPLS packet. Cells from different connections cannot be concatenated into the same MPLS packet.
- When you change, enable, or disable the cell-packing attributes, the ATM VC, VP, or port and the MPLS emulated VC are reestablished.
- If a PE router does not support packed cell relay, the PE router sends only one cell per MPLS packet.
- The number of packed cells does not need to match between the PE routers. The two PE routers agree on the lower of the two values. For example, if PE1 is allowed to pack 10 cells per MPLS packet and PE2 is allowed to pack 20 cells per MPLS packet, the two PE routers would agree to send no more than 10 cells per packet.
- If the number of cells packed by the peer PE router exceeds the limit, the packet is dropped.
- Issue the **atm mcpt-timers** command on an ATM interface before issuing the **cell-packing** command.

See the following sections for configuration information:

- [Configuring ATM Packed Cell Relay over MPLS in VC Mode, page 34](#)
- [Configuring ATM Packed Cell Relay over MPLS in VC Mode Using VC Class Configuration Mode, page 37](#)
- [Configuring ATM Packed Cell Relay over MPLS in VP Mode, page 40](#)
- [Configuring ATM Packed Cell Relay over MPLS in Port Mode, page 42](#)

### Configuring ATM Packed Cell Relay over MPLS in VC Mode

Perform this task to configure the ATM packed cell relay over MPLS feature in VC mode.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm***slot/port*
4. **shutdown**

5. **atm mcpt-timers** [*timer1-timeout timer2-timeout timer3-timeout*]
6. **no shutdown**
7. **pvc vpi/vci l2transport**
8. **encapsulation aal0**
9. **xconnect peer-router-id vcid encapsulation mpls**
10. **cell-packing** [*cells*] [**mcpt-timer** *timer*]

## DETAILED STEPS

|        | Command or Action                                   | Purpose                                                                            |
|--------|-----------------------------------------------------|------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                       | Enables privileged EXEC mode.                                                      |
|        | <b>Example:</b><br>Router> enable                   | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                           | Enters global configuration mode.                                                  |
|        | <b>Example:</b><br>Router# configure terminal       |                                                                                    |
| Step 3 | <b>interface atm slot/port</b>                      | Defines the interface and enters interface configuration mode.                     |
|        | <b>Example:</b><br>Router(config)# interface atm1/0 |                                                                                    |
| Step 4 | <b>shutdown</b>                                     | Shuts down the interface.                                                          |
|        | <b>Example:</b><br>Router(config-if)# shutdown      |                                                                                    |

|        | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>atm mcpt-timers</b> [<i>timer1-timeout timer2-timeout timer3-timeout</i>]</p> <p><b>Example:</b><br/>Router(config-if)# atm mcpt-timers 100 200 250</p> | <p>Sets up the cell-packing timers, which specify how long the PE router can wait for cells to be packed into an MPLS packet.</p> <ul style="list-style-type: none"> <li>You can set up to three timers. For each timer, you specify the maximum cell-packing timeout (MCPT). This value gives the cell-packing function a limited amount of time to complete. If the timer expires before the maximum number of cells are packed into an AToM packet, the packet is sent anyway. The timeout's default and range of acceptable values depends on the ATM link speed.</li> <li>The respective default values for the PA-A3 port adapters are: <ul style="list-style-type: none"> <li>OC-3: 30, 60, and 90 microseconds</li> <li>T3: 100, 200, and 300 microseconds</li> <li>E3: 130, 260, and 390 microseconds</li> </ul> </li> <li>You can specify either the number of microseconds or use the default.</li> <li>The respective range of values for the PA-A3 port adapters are: <ul style="list-style-type: none"> <li>OC-3: 10 to 4095 microseconds</li> <li>T3: 30 to 4095 microseconds</li> <li>E3: 40 to 4095 microseconds</li> </ul> </li> </ul> |
| Step 6 | <p><b>no shutdown</b></p> <p><b>Example:</b><br/>Router(config-if)# no shutdown</p>                                                                           | Enables the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 7 | <p><b>pvc vpi/vci l2transport</b></p> <p><b>Example:</b><br/>Router(config-if)# pvc 1/100 l2transport</p>                                                     | <p>Assigns a VPI and VCI and enters L2transport VC configuration mode.</p> <ul style="list-style-type: none"> <li>The <b>l2transport</b> keyword indicates that the PVC is a switched PVC instead of a terminated PVC.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 8 | <p><b>encapsulation aa10</b></p> <p><b>Example:</b><br/>Router(config-if-atm-l2trans-pvc)# encapsulation aa10</p>                                             | <p>Specifies raw cell encapsulation for the interface.</p> <ul style="list-style-type: none"> <li>Make sure you specify the same encapsulation type on the PE routers.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|         | Command or Action                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Step 9  | <b>xconnect</b> <i>peer-router-id</i> <i>vcid</i> <b>encapsulation mpls</b>                       | Binds the attachment circuit to a pseudowire VC.                                                                                                                                                                                                                                                                                                                                                                        |
|         | <b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# xconnect<br>10.0.0.1 123 encapsulation mpls |                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 10 | <b>cell-packing</b> [ <i>cells</i> ] [ <b>mcpt-timer</b> <i>timer</i> ]                           | Enables cell packing and specifies the cell-packing parameters.                                                                                                                                                                                                                                                                                                                                                         |
|         | <b>Example:</b><br>Router(config-if-atm-l2trans-pvc)# cell-packing<br>10 mcpt-timer 1             | <ul style="list-style-type: none"> <li>The <i>cells</i> argument represents the maximum number of cells to be packed into an MPLS packet. The range is from 2 to the MTU of the interface divided by 52. The default is MTU/52.</li> <li>The <i>timer</i> argument allows you to specify which timer to use. The default is timer 1.</li> <li>See the <b>cell-packing</b> command page for more information.</li> </ul> |

## Configuring ATM Packed Cell Relay over MPLS in VC Mode Using VC Class Configuration Mode

You can create a VC class that specifies the ATM cell relay encapsulation and the cell packing parameters and then attach the VC class to an interface, subinterface, or VC. The following task creates a VC class that specifies the ATM cell relay encapsulation and cell packing and attaches it to a main interface.

### Note

You can configure VC class configuration mode only in VC mode. VC class configuration mode is not supported on VP or port mode.

When you configure cell packing in VC class configuration mode and then apply the VC class to an interface, the settings in the VC class apply to all the VCs on the interface, unless you specify a different cell packing value at a lower level, such as the subinterface or VC level. For example, you can create a VC class that specifies three cells to be packed. You can apply the VC class to an interface. Then, for one PVC, you can specify two cells to be packed. All the PVCs on the interface pack three cells, except for the one PVC that was set to set two cells.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vc-class atm** *name*
4. **encapsulation** *layer-type*
5. **cell-packing** [*cells*] [**mcpt-timer** *timer*]
6. **exit**
7. **interface** *typeslot/port*
8. **shutdown**
9. **atm mcpt-timers** [*timer1-timeout timer2-timeout timer3-timeout*]

10. **no shutdown**
11. **class-int** *vc-class-name*
12. **pvc** [*name*] *vpi/vci* **l2transport**
13. **xconnect** *peer-router-id* *vcid* **encapsulation mpls**

## DETAILED STEPS

|        | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Configuring ATM Packed Cell Relay over MPLS in VP Mode

Perform this task to configure the ATM cell-packing feature in VP mode.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm $\textit{slot}$ /port**
4. **shutdown**
5. **atm mcpt-timers** [*timer1-timeout timer2-timeout timer3-timeout*]
6. **no shutdown**
7. **atm pvp vpi l2transport**
8. **xconnect peer-router-id vcid encapsulation mpls**
9. **cell-packing** [*cells*] [**mcpt-timer** *timer*]

### DETAILED STEPS

|        | Command or Action                                                                                              | Purpose                                                                                                               |
|--------|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                 | Enters global configuration mode.                                                                                     |
| Step 3 | <b>interface atm<math>\textit{slot}</math>/port</b><br><br><b>Example:</b><br>Router(config)# interface atml/0 | Defines the interface and enters interface configuration mode.                                                        |
| Step 4 | <b>shutdown</b><br><br><b>Example:</b><br>Router(config-if)# shutdown                                          | Shuts down the interface.                                                                                             |
