|        | Command or Action                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>atm mcpt-timers</b> [timer1-timeout timer2-timeout timer3-timeout]</p> <p><b>Example:</b><br/>Router(config-if)# atm mcpt-timers 100 200 250</p>            | <p>Sets up the cell-packing timers, which specify how long the PE router can wait for cells to be packed into an MPLS packet.</p> <ul style="list-style-type: none"> <li>You can set up to three timers. For each timer, you specify the MCPT. This value gives the cell-packing function a limited amount of time to complete. If the timer expires before the maximum number of cells are packed into an AToM packet, the packet is sent anyway. The timeout's default and range of acceptable values depends on the ATM link speed.</li> <li>The respective default values for the PA-A3 port adapters are: <ul style="list-style-type: none"> <li>OC-3: 30, 60, and 90 microseconds</li> <li>T3: 100, 200, and 300 microseconds</li> <li>E3: 130, 260, and 390 microseconds</li> </ul> </li> <li>You can specify either the number of microseconds or use the default.</li> <li>The respective range of values for the PA-A3 port adapters are: <ul style="list-style-type: none"> <li>OC-3: 10 to 4095 microseconds</li> <li>T3: 30 to 4095 microseconds</li> <li>E3: 40 to 4095 microseconds</li> </ul> </li> </ul> |
| Step 6 | <p><b>no shutdown</b></p> <p><b>Example:</b><br/>Router(config-if)# no shutdown</p>                                                                               | Enables the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 7 | <p><b>atm pvp vpi l2transport</b></p> <p><b>Example:</b><br/>Router(config-if)# atm pvp 1 l2transport</p>                                                         | <p>Specifies that the PVP is dedicated to transporting ATM cells and enters L2transport PVP configuration submode.</p> <ul style="list-style-type: none"> <li>The <b>l2transport</b> keyword indicates that the PVP is for cell relay. This submode is for Layer 2 transport only; it is not for regular PVPs.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 8 | <p><b>xconnect</b> peer-router-id vcid encapsulation mpls</p> <p><b>Example:</b><br/>Router(cfg-if-atm-l2trans-pvp)# xconnect 10.0.0.1 123 encapsulation mpls</p> | <p>Binds the attachment circuit to a pseudowire VC.</p> <ul style="list-style-type: none"> <li>The syntax for this command is the same as for all other Layer 2 transports.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 9 | <p><b>cell-packing</b> [cells] [mcpt-timer timer]</p> <p><b>Example:</b><br/>Router(cfg-if-atm-l2trans-pvp)# cell-packing 10 mcpt-timer 1</p>                     | <p>Enables cell packing and specifies the cell-packing parameters.</p> <ul style="list-style-type: none"> <li>The <i>cells</i> argument represents the maximum number of cells to be packed into an MPLS packet. The range is from 2 to the MTU of the interface divided by 52. The default is MTU/52.</li> <li>The <i>timer</i> argument allows you to specify which timer to use. The default is timer 1.</li> <li>See the <b>cell-packing</b> command page for more information.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring ATM Packed Cell Relay over MPLS in Port Mode

Perform this task to configure ATM packed cell relay over MPLS in port mode.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *atmslot/port*
4. **shutdown**
5. **atm mcpt-timers** [*timer1-timeout timer2-timeout timer3-timeout*]
6. **no shutdown**
7. **cell-packing** [*cells*] [**mcpt-timer** *timer*]
8. **xconnect** *peer-router-id vcid encapsulation mpls*
9. **exit**
10. **exit**
11. **show atm cell-packing**
12. **show atm vp**

### DETAILED STEPS

|        | Command or Action                                                                               | Purpose                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                          | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                  | Enters global configuration mode.                                                                                   |
| Step 3 | <b>interface</b> <i>atmslot/port</i><br><br><b>Example:</b><br>Router(config)# interface atm1/0 | Specifies an ATM interface and enters interface configuration mode.                                                 |
| Step 4 | <b>shutdown</b><br><br><b>Example:</b><br>Router(config-if)# shutdown                           | Shuts down the interface.                                                                                           |

|               |                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <pre>atm mcpt-timers [timer1-timeout timer2-timeout timer3-timeout]</pre> <p><b>Example:</b><br/>Router(config-if)# atm mcpt-timers 100 200 250</p>   | <p>Sets up the cell-packing timers, which specify how long the PE router can wait for cells to be packed into an MPLS packet.</p> <ul style="list-style-type: none"> <li>You can set up to three timers. For each timer, you specify the MCPT. This value gives the cell-packing function a limited amount of time to complete. If the timer expires before the maximum number of cells are packed into an AToM packet, the packet is sent anyway. The timeout's default and range of acceptable values depends on the ATM link speed.</li> <li>The respective default values for the PA-A3 port adapters are: <ul style="list-style-type: none"> <li>OC-3: 30, 60, and 90 microseconds</li> <li>T3: 100, 200, and 300 microseconds</li> <li>E3: 130, 260, and 390 microseconds</li> </ul> </li> <li>You can specify either the number of microseconds or use the default.</li> <li>The respective range of values for the PA-A3 port adapters are: <ul style="list-style-type: none"> <li>OC-3: 10 to 4095 microseconds</li> <li>T3: 30 to 4095 microseconds</li> <li>E3: 40 to 4095 microseconds</li> </ul> </li> </ul> |
| <b>Step 6</b> | <pre>no shutdown</pre> <p><b>Example:</b><br/>Router(config-if)# no shutdown</p>                                                                      | <p>Enables the interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 7</b> | <pre>cell-packing [cells] [mcpt-timer timer]</pre> <p><b>Example:</b><br/>Router(config-if)# cell-packing 10 mcpt-timer 1</p>                         | <p>Enables cell packing and specifies the cell-packing parameters.</p> <ul style="list-style-type: none"> <li>The <i>cells</i> argument represents the maximum number of cells to be packed into an MPLS packet. The range is from 2 to the MTU of the interface divided by 52. The default is MTU/52.</li> <li>The <i>timer</i> argument allows you to specify which timer to use. The default is timer 1.</li> <li>See the cell-packing command page for more information.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 8</b> | <pre>xconnect peer-router-id vcid encapsulation mpls</pre> <p><b>Example:</b><br/>Router(config-if)# xconnect 10.0.0.1 123<br/>encapsulation mpls</p> | <p>Binds the attachment circuit to the interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 9</b> | <pre>exit</pre> <p><b>Example:</b><br/>Router(config-if)# exit</p>                                                                                    | <p>Exits interface configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                |                                                  |                                    |
|----------------|--------------------------------------------------|------------------------------------|
| <b>Step 10</b> | <b>exit</b>                                      | Exits global configuration mode.   |
|                | <b>Example:</b><br>Router(config)# exit          |                                    |
| <b>Step 11</b> | <b>show atm cell-packing</b>                     | Displays cell-packing statistics.  |
|                | <b>Example:</b><br>Router# show atm cell-packing |                                    |
| <b>Step 12</b> | <b>show atm vp</b>                               | Displays cell-packing information. |
|                | <b>Example:</b><br>Router#show atm vp            |                                    |

## Examples

The **show atm cell-packing** command in the following example displays the following statistics:

- The number of cells that are to be packed into an MPLS packet on the local and peer routers
- The average number of cells sent and received
- The timer values associated with the local router

Router# **show atm cell-packing**

|                  | circuit | local | average                         | peer | average                              | MCPT |
|------------------|---------|-------|---------------------------------|------|--------------------------------------|------|
|                  | type    | MNCP  | nbr of cells<br>rcvd in one pkt | MNCP | nbr of cells<br>sent in one pkt (us) |      |
| atm 1/0 vc 1/200 | 20      | 15    | 30                              | 20   | 60                                   |      |
| atm 1/0 vp 2     | 25      | 21    | 30                              | 24   | 100                                  |      |

The **show atm vp** command in the following example displays the cell packing information at the end of the output:

Router# **show atm vp 12**

ATM5/0 VPI: 12, Cell Relay, PeakRate: 149760, CesRate: 0, DataVCs: 1, CesVCs: 0, Status: ACTIVE

| VCD | VCI | Type | InPkts | OutPkts | AAL/Encap | Status |
|-----|-----|------|--------|---------|-----------|--------|
| 6   | 3   | PVC  | 0      | 0       | F4 OAM    | ACTIVE |
| 7   | 4   | PVC  | 0      | 0       | F4 OAM    | ACTIVE |

TotalInPkts: 0, TotalOutPkts: 0, TotalInFast: 0, TotalOutFast: 0,  
 TotalBroadcasts: 0 TotalInPktDrops: 0, TotalOutPktDrops: 0  
 Local MNCP: 5, average number of cells received: 3  
 Peer MNCP: 1, average number of cells sent: 1  
 Local MCPT: 100 us

## Troubleshooting Tips

To debug ATM cell packing, issue the **debug atm cell-packing** command.

## Configuring Ethernet over MPLS in VLAN Mode

A VLAN is a switched network that is logically segmented by functions, project teams, or applications regardless of the physical location of users. Ethernet over MPLS allows you to connect two VLAN networks that are in different locations. You configure the PE routers at each end of the MPLS backbone and add a point-to-point VC. Only the two PE routers at the ingress and egress points of the MPLS backbone know about the VCs dedicated to transporting Layer 2 VLAN traffic. All other routers do not have table entries for those VCs. Ethernet over MPLS in VLAN mode transports Ethernet traffic from a source 802.1Q VLAN to a destination 802.1Q VLAN over a core MPLS network.

### Note

You must configure Ethernet over MPLS (VLAN mode) on the subinterfaces.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface gigabitethernet** *slot/interface.subinterface*
4. **encapsulation dot1q** *vlan-id*
5. **xconnect** *peer-router-id vcid encapsulation mpls*

### DETAILED STEPS

|        | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                       |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                  | Enters global configuration mode.                                                                                                                                                                                                        |
| Step 3 | <b>interface gigabitethernet</b><br><i>slot/interface.subinterface</i><br><br><b>Example:</b><br>Router(config)# interface gigabitethernet4/0.1 | Specifies the Gigabit Ethernet subinterface and enters subinterface configuration mode. <ul style="list-style-type: none"> <li>• Make sure the subinterface on the adjoining CE router is on the same VLAN as this PE router.</li> </ul> |

|               |                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                       |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <code>encapsulation dot1q <i>vlan-id</i></code><br><br><b>Example:</b><br>Router(config-subif)# <code>encapsulation dot1q 100</code>                                                             | Enables the subinterface to accept 802.1Q VLAN packets.<br><br><ul style="list-style-type: none"> <li>The subinterfaces between the CE and PE routers that are running Ethernet over MPLS must be in the same subnet. All other subinterfaces and backbone routers do not.</li> </ul> |

## Configuring Ethernet over MPLS in Port Mode

Port mode allows a frame coming into an interface to be packed into an MPLS packet and transported over the MPLS backbone to an egress interface. The entire Ethernet frame without the preamble or FCS is transported as a single packet. To configure port mode, you use the **xconnect** command in interface configuration mode and specify the destination address and the VC ID. The syntax of the **xconnect** command is the same as for all other transport types. Each interface is associated with one unique pseudowire VC label.

When configuring Ethernet over MPLS in port mode, use the following guidelines:

- The pseudowire VC type is set to Ethernet.
- Port mode and Ethernet VLAN mode are mutually exclusive. If you enable a main interface for port-to-port transport, you cannot also enter commands on a subinterface.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *gigabitethernet**slot*/*interface***
4. **xconnect *peer-router-id* *vcid* encapsulation mpls**
5. **exit**
6. **exit**
7. **show mpls l2transport vc**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                    | Purpose                                                                                                                                                                                                                       |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                       | Enters global configuration mode.                                                                                                                                                                                             |
| Step 3 | <b>interface gigabitethernet</b> <i>slot/interface</i><br><br><b>Example:</b><br>Router(config)# interface gigabitethernet4/0                                        | Specifies the Gigabit Ethernet interface and enters interface configuration mode. <ul style="list-style-type: none"> <li>Make sure the interface on the adjoining CE router is on the same VLAN as this PE router.</li> </ul> |
| Step 4 | <b>xconnect</b> <i>peer-router-id</i> <i>vcid</i><br><b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-if)# xconnect 10.0.0.1 123 encapsulation mpls | Binds the attachment circuit to a pseudowire VC. <ul style="list-style-type: none"> <li>The syntax for this command is the same as for all other Layer 2 transports.</li> </ul>                                               |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                        | Exits interface configuration mode.                                                                                                                                                                                           |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                           | Exits router configuration mode.                                                                                                                                                                                              |
| Step 7 | <b>show mpls l2transport vc</b><br><br><b>Example:</b><br>Router# show mpls l2transport vc                                                                           | Displays information about Ethernet over MPLS port mode.                                                                                                                                                                      |

## Examples

In the following example, the output of the **show mpls l2transport vc detail** command is displayed:

```
Router# show mpls l2transport vc detail
```

```
Local interface: Gi4/0.1 up, line protocol up, Eth VLAN 2 up
Destination address: 10.1.1.1, VC ID: 2, VC status: up
.
.
.
Local interface: Gi8/0/1 up, line protocol up, Ethernet up
Destination address: 10.1.1.1, VC ID: 8, VC status: up
```

## Configuring Ethernet over MPLS with VLAN ID Rewrite

The VLAN ID rewrite feature enables you to use VLAN interfaces with different VLAN IDs at both ends of the tunnel.

The Cisco 12000 series router requires you to configure VLAN ID rewrite manually, as described in the following sections.

The following routers automatically perform VLAN ID rewrite on the disposition PE router. No configuration is required:

- Cisco 7200 series routers.
- Cisco 7500 series routers.
- Cisco 10720 series routers.
- Routers supported on Cisco IOS Release 12.4(11)T. (Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support.)

The following sections explain how to configure the VLAN ID rewrite feature:

- [Guidelines for Configuring Ethernet over MPLS with VLAN ID Rewrite for the Cisco 12000 Series Routers for Cisco IOS Releases 12.0\(29\)S and Earlier Releases, page 48](#)
- [Configuring Ethernet over MPLS with VLAN ID Rewrite for the Cisco 12000 Series Routers for Cisco IOS Releases 12.0\(30\)S and Later Releases, page 49](#)

### Guidelines for Configuring Ethernet over MPLS with VLAN ID Rewrite for the Cisco 12000 Series Routers for Cisco IOS Releases 12.0(29)S and Earlier Releases

Use the following guidelines for the VLAN ID rewrite feature for the Cisco 12000 series routers in Cisco IOS releases earlier than 12.0(29)S:

- The IP Service Engine (ISE) 4-port Gigabit Ethernet line card performs the VLAN ID rewrite on the disposition side at the edge-facing line card.
- The engine 2 3-port Gigabit Ethernet line card performs the VLAN ID rewrite on the imposition side at the edge-facing line card.

The VLAN ID rewrite functionality requires that both ends of the Ethernet over MPLS connections be provisioned with the same line cards. Make sure that both edge-facing ends of the virtual circuit use either the engine 2 or ISE Ethernet line card. The following example shows the system flow with the VLAN ID rewrite feature:

- The ISE 4-port Gigabit Ethernet line card:  
Traffic flows from VLAN1 on CE1 to VLAN2 on CE2. As the frame reaches the edge-facing line card of the disposition router PE2, the VLAN ID in the dot1Q header changes to the VLAN ID assigned to VLAN2.
- The engine 2 3-port Gigabit Ethernet line card:  
Traffic flows from VLAN1 on CE1 to VLAN2 on CE2. As the frame reaches the edge-facing line card of the imposition router PE1, the VLAN ID in the dot1Q header changes to the VLAN ID assigned to VLAN2.

For the Cisco 12000 series router engine 2 3-port Gigabit Ethernet line card, you must issue the **remote circuit id** command as part of the Ethernet over MPLS VLAN ID rewrite configuration.

## Configuring Ethernet over MPLS with VLAN ID Rewrite for the Cisco 12000 Series Routers for Cisco IOS Releases 12.0(30)S and Later Releases

In Cisco IOS Release 12.0(30)S, the following changes to VLAN ID rewrite were implemented:

- The ISE 4-port Gigabit Ethernet line card can perform VLAN ID rewrite at both the imposition and disposition sides of the edge-facing router.
- The **remote circuit id** command is not required as part of the Ethernet over MPLS VLAN ID rewrite configuration, as long as both PE routers are running Cisco IOS Release 12.0(30)S. The VLAN ID rewrite feature is implemented automatically when you configure Ethernet over MPLS.
- The VLAN ID rewrite feature in Cisco IOS Release 12.0(30)S can interoperate with routers that are running earlier releases. If you have a PE router at one end of the circuit that is using an earlier Cisco IOS release and the **remote circuit id** command, the other PE can run Cisco IOS Release 12.0(30)S and still perform VLAN ID rewrite.
- You can mix the line cards on the PE routers, as shown in the following table

**Table 6** Supported Line Cards for VLAN ID Rewrite Feature:

| If PE1 Has These Line Cards                                                               | Then PE2 Can Use These Line Cards                                                         |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| Engine 2 3-port Gigabit Ethernet line card<br>or<br>ISE 4-port Gigabit Ethernet line card | Engine 2 3-port Gigabit Ethernet line card<br>or<br>ISE 4-port Gigabit Ethernet line card |
| ISE 4-port Gigabit Ethernet line card                                                     | Any Cisco 12000 series router line card                                                   |

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface gigabitethernet** *slot/port.subinterface*
4. **encapsulation dot1q** *vlan-id*
5. **xconnect** *peer-router-id vcid encapsulation mpls*
6. **remote circuit id** *remote-vlan-id*
7. **exit**
8. **exit**
9. **exit**
10. **show controllers eompls forwarding-table**

## DETAILED STEPS

| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config-subif)# exit                                                                                       | Exits subinterface configuration mode.                                                                                                                                                                                                                                                                                                             |

|                |                                                                                                                                           |                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| <b>Step 9</b>  | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                | Exits global configuration mode.            |
| <b>Step 10</b> | <b>show controllers eompls forwarding-table</b><br><br><b>Example:</b><br>Router# execute slot 0 show controllers eompls forwarding-table | Displays information about VLAN ID rewrite. |

## Examples

The command output of the **show controllers eompls forwarding-table** command in the following example shows VLAN ID rewrite configured on the Cisco 12000 series routers with an engine 2 3-port Gigabit Ethernet line card. In the following example, the bolded command output show the VLAN ID rewrite information.

### On PE1

```
Router# execute slot 0 show controllers eompls forwarding-table 0 2
```

```
Port # 0, VLAN-ID # 2, Table-index 2
EoMPLS configured: 1

## Configuring per-Subinterface MTU for Ethernet over MPLS

Cisco IOS Release 12.2(33)SRC introduces the ability to specify MTU values in xconnect subinterface configuration mode. When you use xconnect subinterface configuration mode to set the MTU value, you establish a pseudowire connection for situations where the interfaces have different MTU values that cannot be changed.

If you specify an MTU value in xconnect subinterface configuration mode that is outside the range of supported MTU values (64 bytes to the maximum number of bytes supported by the interface), the command might be rejected. If you specify an MTU value that is out of range in xconnect subinterface configuration mode, the router enters the command in subinterface configuration mode.

### Restrictions

Configuring the MTU value in xconnect subinterface configuration mode has the following restrictions:

- The following features do not support MTU values in xconnect subinterface configuration mode:
  - Layer 2 Tunnel Protocol Version 3 (L2TPv3)
  - Virtual Private LAN services (VPLS)
  - L2VPN Pseudowire Switching
- The MTU value can be configured in xconnect subinterface configuration mode only on the following interfaces and subinterfaces:
  - Ethernet
  - FastEthernet
  - Gigabit Ethernet
- The router uses an MTU validation process for remote VCs established through LDP, which compares the MTU value configured in xconnect subinterface configuration mode to the MTU value of the remote customer interface. If an MTU value has not been configured in xconnect subinterface configuration mode, then the validation process compares the MTU value of the local customer interface to the MTU value of the remote xconnect, either explicitly configured or inherited from the underlying interface or subinterface.
- When you configure the MTU value in xconnect subinterface configuration mode, the specified MTU value is not enforced by the dataplane. The dataplane enforces the MTU values of the interface (port mode) or subinterface (VLAN mode).
- Ensure that the interface MTU is larger than the MTU value configured in xconnect subinterface configuration mode. If the MTU value of the customer-facing subinterface is larger than the MTU value of the core-facing interface, traffic may not be able to travel across the pseudowire.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface gigabitethernet *slot/interface***
4. **mtu *mtu-value***
5. **interface gigabitethernet *slot/interface.subinterface***
6. **encapsulation dot1q *vlan-id***
7. **xconnect *peer-router-id vcid* encapsulation mpls**

8. **mtu** *mtu-value*
9. **end**
10. **show mpls l2transport binding**

## DETAILED STEPS

|        | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                   |
| Step 3 | <b>interface gigabitethernet</b> <i>slot/interface</i><br><br><b>Example:</b><br>Router(config)# interface gigabitethernet4/0                                 | Specifies the Gigabit Ethernet interface and enters interface configuration mode.                                                                                                                                                                                                   |
| Step 4 | <b>mtu</b> <i>mtu-value</i><br><br><b>Example:</b><br>Router(config-if)# mtu 2000                                                                             | Specifies the MTU value for the interface. <ul style="list-style-type: none"> <li>The MTU value specified at the interface level can be inherited by a subinterface.</li> </ul>                                                                                                     |
| Step 5 | <b>interface gigabitethernet</b> <i>slot</i><br><i>/interface.subinterface</i><br><br><b>Example:</b><br>Router(config-if)# interface<br>gigabitethernet4/0.1 | Specifies the Gigabit Ethernet subinterface and enters subinterface configuration mode. <ul style="list-style-type: none"> <li>Make sure the subinterface on the adjoining CE router is on the same VLAN as this PE router.</li> </ul>                                              |
| Step 6 | <b>encapsulation dot1q</b> <i>vlan-id</i><br><br><b>Example:</b><br>Router(config-subif)# encapsulation dot1q 100                                             | Enables the subinterface to accept 802.1Q VLAN packets. <ul style="list-style-type: none"> <li>The subinterfaces between the CE and PE routers that are running Ethernet over MPLS must be in the same subnet. All other subinterfaces and backbone routers need not be.</li> </ul> |
| Step 7 | <b>xconnect</b> <i>peer-router-id vcid encapsulation mpls</i><br><br><b>Example:</b><br>Router(config-subif)# xconnect 10.0.0.1 123<br>encapsulation mpls     | Binds the attachment circuit to a pseudowire VC. <ul style="list-style-type: none"> <li>The syntax for this command is the same as for all other Layer 2 transports. Enters xconnect subinterface configuration mode.</li> </ul>                                                    |
| Step 8 | <b>mtu</b> <i>mtu-value</i><br><br><b>Example:</b><br>Router(config-if-xconn)# mtu 1400                                                                       | Specifies the MTU for the VC.                                                                                                                                                                                                                                                       |

|         | Command or Action                                                                                    | Purpose                                                                                  |
|---------|------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| Step 9  | <b>end</b><br><br><b>Example:</b><br>Router(config-if-xconn)# end                                    | Exits xconnect subinterface configuration mode and returns to global configuration mode. |
| Step 10 | <b>show mpls l2transport binding</b><br><br><b>Example:</b><br>Router# show mpls l2transport binding | Displays the MTU values assigned to the local and remote interfaces.                     |

## Configuring Frame Relay over MPLS with DLCI-to-DLCI Connections

Frame Relay over MPLS encapsulates Frame Relay PDUs in MPLS packets and forwards them across the MPLS network. For Frame Relay, you can set up data-link connection identifier (DLCI)-to-DLCI connections or port-to-port connections. With DLCI-to-DLCI connections, the PE routers manipulate the packet by removing headers, adding labels, and copying control word elements from the header to the PDU.

Perform this task to configure Frame Relay over MPLS with DLCI-to-DLCI connections.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **frame-relay switching**
4. **interface serialslot/port**
5. **encapsulation frame-relay [cisco / ietf]**
6. **frame-relay intf-type dce**
7. **exit**
8. **connect connection-name interface dlci l2transport**
9. **xconnect peer-router-id vcid encapsulation mpls**

### DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                                                                            |
|--------|--------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                  |

|        | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>frame-relay switching</b><br><br><b>Example:</b><br>Router(config)# frame-relay switching                                                                        | Enables PVC switching on a Frame Relay device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 4 | <b>interface serialslot/port</b><br><br><b>Example:</b><br>Router(config)# interface serial3/1                                                                      | Specifies a serial interface and enters interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 5 | <b>encapsulation frame-relay [cisco   ietf]</b><br><br><b>Example:</b><br>Router(config-if)# encapsulation frame-relay ietf                                         | Specifies Frame Relay encapsulation for the interface. <ul style="list-style-type: none"> <li>You can specify different types of encapsulations. You can set one interface to Cisco encapsulation and the other interface to IETF encapsulation.</li> </ul>                                                                                                                                                                                                                                                                                                         |
| Step 6 | <b>frame-relay intf-type dce</b><br><br><b>Example:</b><br>Router(config-if)# frame-relay intf-type dce                                                             | Specifies that the interface is a DCE switch. <ul style="list-style-type: none"> <li>You can also specify the interface to support Network-to-Network Interface (NNI) and DTE connections.</li> </ul>                                                                                                                                                                                                                                                                                                                                                               |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                                                       | Exits from interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Step 9 | <b>xconnect peer-router-id vcid</b><br><b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-fr-pw-switching)# xconnect 10.0.0.1 123 encapsulation mpls | Creates the VC to transport the Layer 2 packets. <ul style="list-style-type: none"> <li>In a DLCI-to-DLCI connection type, Frame Relay over MPLS uses the <b>xconnect</b> command in connect configuration submode.</li> </ul>                                                                                                                                                                                                                                                                                                                                      |

## Configuring Frame Relay over MPLS with Port-to-Port Connections

Frame Relay over MPLS encapsulates Frame Relay PDUs in MPLS packets and forwards them across the MPLS network. For Frame Relay, you can set up DLCI-to-DLCI connections or port-to-port connections. With port-to-port connections, you use HDLC mode to transport the Frame Relay

encapsulated packets. In HDLC mode, the whole HDLC packet is transported. Only the HDLC flags and FCS bits are removed. The contents of the packet are not used or changed, including the backward explicit congestion notification (BECN), forward explicit congestion notification (FECN) and discard eligibility (DE) bits.

Perform this task to set up Frame Relay port-to-port connections.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface serial***slot/port*
4. **encapsulation hdlc**
5. **xconnect** *peer-router-id vcid encapsulation mpls*

## DETAILED STEPS

|        | Command or Action                                                                                                                                   | Purpose                                                                                                            |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                      | Enters global configuration mode.                                                                                  |
| Step 3 | <b>interface serial</b> <i>slot/port</i><br><br><b>Example:</b><br>Router(config)# interface serial5/0                                              | Specifies a serial interface and enters interface configuration mode.                                              |
| Step 4 | <b>encapsulation hdlc</b><br><br><b>Example:</b><br>Router(config-if)# encapsulation hdlc                                                           | Specifies that Frame Relay PDUs will be encapsulated in HDLC packets.                                              |
| Step 5 | <b>xconnect</b> <i>peer-router-id vcid encapsulation mpls</i><br><br><b>Example:</b><br>Router(config-if)# xconnect 10.0.0.1 123 encapsulation mpls | Creates the VC to transport the Layer 2 packets.                                                                   |

## Configuring HDLC and PPP over MPLS

With HDLC over MPLS, the whole HDLC packet is transported. The ingress PE router removes only the HDLC flags and FCS bits. The contents of the packet are not used or changed.

With PPP over MPLS, the ingress PE router removes the flags, address, control field, and the FCS.

## Restrictions

The following restrictions pertain to the HDLC over MPLS feature:

- Asynchronous interfaces are not supported.
- You must configure HDLC over MPLS on router interfaces only. You cannot configure HDLC over MPLS on subinterfaces.

The following restrictions pertain to the PPP over MPLS feature:

- Zero hops on one router is not supported. However, you can have back-to-back PE routers.
- Asynchronous interfaces are not supported. The connections between the CE and PE routers on both ends of the backbone must have similar link layer characteristics. The connections between the CE and PE routers must both be synchronous.
- Multilink PPP (MLP) is not supported.
- You must configure PPP on router interfaces only. You cannot configure PPP on subinterfaces.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface serialslot/port**
4. **encapsulation encapsulation-type**
5. **xconnect peer-router-id vcid encapsulation mpls**

## Configuring Tunnel Selection

The tunnel selection feature allows you to specify the path that traffic uses. You can specify either an MPLS TE tunnel or destination IP address or domain name server (DNS) name.

You also have the option of specifying whether the VCs should use the default path (the path LDP uses for signaling) if the preferred path is unreachable. This option is enabled by default; you must explicitly disable it.

You configure tunnel selection when you set up the pseudowire class. You enable tunnel selection with the **preferred-path** command. Then, you apply the pseudowire class to an interface that has been configured to transport AToM packets.

The following guidelines provide more information about configuring tunnel selection:

- The **preferred-path** command is available only if the pseudowire encapsulation type is MPLS.
- This tunnel selection feature is enabled when you exit from pseudowire submode.
- The selected path should be an LSP destined to the peer PE router.
- The selected tunnel must be an MPLS TE tunnel.
- If you select a tunnel, the tunnel tailend must be on the remote PE router.
- If you specify an IP address, that address must be the IP address of the loopback interface on the remote PE router. The address must have a /32 mask. There must be an LSP destined to that selected address. The LSP need not be a TE tunnel.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **pseudowire-class** *name*
4. **encapsulation mpls**

5. **preferred-path** {**interface tunnel** *tunnel-number* | **peer** {*ip-address* / *host-name*}} [**disable-fallback**]
6. **exit**
7. **interface** *slot/port*
8. **encapsulation** *encapsulation-type*
9. **xconnect** *peer-router-id* *vcid* **pw-class** *name*

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                              | Purpose                                                                                                                                   |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

| Step 8 | <b>encapsulation</b> <i>encapsulation-type</i><br><br><b>Example:</b><br>Router(config-if)# encapsulation aal5                           | Specifies the encapsulation for the interface.   |
| Step 9 | <b>xconnect</b> <i>peer-router-id vcid pw-class name</i><br><br><b>Example:</b><br>Router(config-if)# xconnect 10.0.0.1 123 pw-class tsl | Binds the attachment circuit to a pseudowire VC. |

## Examples

In the following example, the **show mpls l2transport vc** command shows the following information about the VCs:

- VC 101 has been assigned a preferred path called Tunnel1. The default path is disabled, because the preferred path specified that the default path should not be used if the preferred path fails.
- VC 150 has been assigned an IP address of a loopback address on PE2. The default path can be used if the preferred path fails.

In the following example, command output that is bolded shows the preferred path information.

Router# **show mpls l2transport vc detail**

```
Local interface: Gi0/0/0.1 up, line protocol up, Eth VLAN 222 up
  Destination address: 10.16.16.16, VC ID: 101, VC status: up
    Preferred path: Tunnel1, active
    Default path: disabled
    Tunnel label: 3, next hop point2point
    Output interface: Tu1, imposed label stack {17 16}
  Create time: 00:27:31, last status change time: 00:27:31
  Signaling protocol: LDP, peer 10.16.16.16:0 up
    MPLS VC labels: local 25, remote 16
    Group ID: local 0, remote 6
    MTU: local 1500, remote 1500
    Remote interface description:
  Sequencing: receive disabled, send disabled
  VC statistics:
    packet totals: receive 10, send 10
    byte totals:   receive 1260, send 1300
    packet drops:  receive 0, send 0
```

```
Local interface: AT1/0/0 up, line protocol up, ATM AAL5 0/50 up
  Destination address: 10.16.16.16, VC ID: 150, VC status: up
    Preferred path: 10.18.18.18, active
    Default path: ready
    Tunnel label: 3, next hop point2point
    Output interface: Tu2, imposed label stack {18 24}
  Create time: 00:15:08, last status change time: 00:07:37
  Signaling protocol: LDP, peer 10.16.16.16:0 up
    MPLS VC labels: local 26, remote 24
    Group ID: local 2, remote 0
    MTU: local 4470, remote 4470
    Remote interface description:
  Sequencing: receive disabled, send disabled
  VC statistics:
```

```
packet totals: receive 0, send 0
byte totals:   receive 0, send 0
packet drops:  receive 0, send 0
```

## Troubleshooting Tips

You can use the **debug mpls l2transport vc event** command to troubleshoot tunnel selection. For example, if the tunnel interface that is used for the preferred path is shut down, the default path is enabled. The **debug mpls l2transport vc event** command provides the following output:

```
AToM SMGR [10.2.2.2, 101]: Processing imposition update, vc_handle 62091860, update_action
3, remote_vc_label 16
AToM SMGR [10.2.2.2, 101]: selected route no parent rewrite: tunnel not up
AToM SMGR [10.2.2.2, 101]: Imposition Programmed, Output Interface: Et3/2
```

## Setting Experimental Bits with AToM

MPLS AToM uses the three experimental bits in a label to determine the queue of packets. You statically set the experimental bits in both the VC label and the LSP tunnel label, because the LSP tunnel label might be removed at the penultimate router. The following sections explain the transport-specific implementations of the EXP bits.

### Note

For information about setting EXP bits on the Cisco 12000 series router for Cisco IOS Release 12.0(30)S, see the *AToM: L2 QoS* feature module.

For configuration steps and examples, see the [“Setting Experimental Bits with AToM” section on page 61](#).

## Restrictions

The following restrictions apply to ATM AAL5 over MPLS with EXP bits:

- ATM AAL5 over MPLS allows you to statically set the experimental bits.
- If you do not assign values to the experimental bits, the priority bits in the header’s “tag control information” field are set to zero.
- On the Cisco 7500 series routers, distributed Cisco Express Forwarding must be enabled before you set the experimental bits.

The following restrictions apply to ATM Cell Relay over MPLS with EXP bits:

- ATM Cell Relay over MPLS allows you to statically set the experimental bits in VC, PVP, and port modes.
- If you do not assign values to the experimental bits, the priority bits in the header’s “tag control information” field are set to zero.
- On the Cisco 7500 series routers, distributed Cisco Express Forwarding must be enabled before you set the experimental bits.

The following restrictions apply to Ethernet over MPLS with EXP bits:

### On the Cisco 7200 and 7500 Series Routers

- Ethernet over MPLS allows you to set the EXP bits by using either of the following methods:

- Writing the priority bits into the experimental bit field, which is the default.
- Using the **match any** command with the **set mpls exp** command.
- If you do not assign values to the experimental bits, the priority bits in the 802.1Q header's "tag control information" field are written into the experimental bit fields.
- On the Cisco 7500 series routers, distributed Cisco Express Forwarding must be enabled before you set the experimental bits.

#### On the Cisco 10720 Internet Router

Table 7 lists the commands that are supported on the Cisco 10720 Internet router for Ethernet over MPLS. The letter Y means that the command is supported on that interface. A dash (—) means that command is not supported on that interface.

#### Note

The **match cos** command is supported only on subinterfaces, not main interfaces.

**Table 7** *Commands Supported on the Cisco 10720 Router for Ethernet over MPLS*

| Commands                         | Imposition |     | Disposition |     |
|----------------------------------|------------|-----|-------------|-----|
|                                  | In         | Out | In          | Out |
| <b>Traffic Matching Commands</b> |            |     |             |     |
| <b>match any</b>                 | Y          | Y   | Y           | Y   |
| <b>match cos</b>                 | Y          | —   | —           | —   |
| <b>match input-interface</b>     | —          | —   | Y           | Y   |
| <b>match mpls exp</b>            | —          | Y   | Y           | —   |
| <b>match qos-group</b>           | —          | Y   | —           | Y   |
| <b>Traffic Action Commands</b>   |            |     |             |     |
| <b>set cos</b>                   | —          | —   | —           | Y   |
| <b>set mpls exp</b>              | Y          | —   | —           | —   |
| <b>set qos-group</b>             | Y          | —   | Y           | —   |
| <b>set srp-priority</b>          | —          | Y   | —           | —   |

The following restrictions apply to Frame Relay over MPLS and EXP bits:

- If you do not assign values to the experimental bits, the priority bits in the header's "tag control information" field are set to zero.
- On the Cisco 7500 series routers, distributed Cisco Express Forwarding must be enabled before you set the experimental bits.

The following restrictions apply to HDLC over MPLS and PPP over MPLS and EXP bits:

- If you do not assign values to the experimental bits, zeros are written into the experimental bit fields.
- On the Cisco 7500 series routers, enable distributed Cisco Express Forwarding before setting the experimental bits.

Set the experimental bits in both the VC label and the LSP tunnel label. You set the experimental bits in the VC label, because the LSP tunnel label might be removed at the penultimate router. Perform this task to set the experimental bits.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map** *class-name*
4. **match any**
5. **exit**
6. **policy-map** *policy-name*
7. **class** *class-name*
8. **set mpls experimental** *value*
9. **exit**
10. **exit**
11. **interface** *slot/port*
12. **service-policy input** *policy-name*
13. **exit**
14. **exit**
15. **show policy-map interface** *interface-name* [**vc** [*vpi*/] *vci*] [**dlci** *dlci*] [**input** | **output**]

## DETAILED STEPS

|        | Command or Action                                                                             | Purpose                                                                                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                        | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                | Enters global configuration mode.                                                                                                                                                |
| Step 3 | <b>class-map</b> <i>class-name</i><br><br><b>Example:</b><br>Router(config)# class-map class1 | Specifies the user-defined name of the traffic class and enters class map configuration mode.                                                                                    |
| Step 4 | <b>match any</b><br><br><b>Example:</b><br>Router(config-cmap)# match any                     | Specifies that all packets will be matched.<br><ul style="list-style-type: none"><li>• Use only the <b>any</b> keyword. Other keywords might cause unexpected results.</li></ul> |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-cmap)# exit                               | Exits class map configuration mode.                                                                                                                                              |

|         | Command or Action                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                              |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6  | <b>policy-map</b> <i>policy-name</i><br><br><b>Example:</b><br>Router(config)# <b>policy-map</b> policy1                                                                                                                                     | Specifies the name of the traffic policy to configure and enters policy-map configuration mode.                                                                                                                      |
| Step 7  | <b>class</b> <i>class-name</i><br><br><b>Example:</b><br>Router(config-pmap)# <b>class</b> class1                                                                                                                                            | Specifies the name of the predefined traffic that was configured with the <b>class-map</b> command and was used to classify traffic to the traffic policy specified, and enters policy-map class configuration mode. |
| Step 8  | <b>set mpls experimental</b> <i>value</i><br><br><b>Example:</b><br>Router(config-pmap-c)# <b>set mpls experimental</b> 7                                                                                                                    | Designates the value to which the MPLS bits are set if the packets match the specified policy map.                                                                                                                   |
| Step 9  | <b>exit</b><br><br><b>Example:</b><br>Router(config-pmap-c)# <b>exit</b>                                                                                                                                                                     | Exits policy-map class configuration mode.                                                                                                                                                                           |
| Step 10 | <b>exit</b><br><br><b>Example:</b><br>Router(config-pmap)# <b>exit</b>                                                                                                                                                                       | Exits policy-map configuration mode.                                                                                                                                                                                 |
| Step 11 | <b>interface</b> <i>slot/port</i><br><br><b>Example:</b><br>Router(config)# <b>interface</b> atm4/0                                                                                                                                          | Specifies the interface and enters interface configuration mode.                                                                                                                                                     |
| Step 12 | <b>service-policy input</b> <i>policy-name</i><br><br><b>Example:</b><br>Router(config-if)# <b>service-policy input</b> policy1                                                                                                              | Attaches a traffic policy to an interface.                                                                                                                                                                           |
| Step 13 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# <b>exit</b>                                                                                                                                                                         | Exits interface configuration mode.                                                                                                                                                                                  |
| Step 14 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# <b>exit</b>                                                                                                                                                                            | Exits global configuration mode.                                                                                                                                                                                     |
| Step 15 | <b>show policy-map interface</b> <i>interface-name</i> [ <b>vc</b> [ <i>vpi</i> ]/] [ <i>vci</i> ] [ <b>dlci</b> <i>dlci</i> ] [ <b>input</b>   <b>output</b> ]<br><br><b>Example:</b><br>Router# <b>show policy-map interface</b> serial3/0 | Displays the traffic policy attached to an interface.                                                                                                                                                                |

## Setting the Frame Relay Discard Eligibility Bit on the Cisco 7200 and 7500 Series Routers

You can use the DE bit in the address field of a Frame Relay frame to prioritize frames in congested Frame Relay networks. The Frame Relay DE bit has only one bit and can therefore only have two settings, 0 or 1. If congestion occurs in a Frame Relay network, frames with the DE bit set to 1 are discarded before frames with the DE bit set to 0. Therefore, important traffic should have the DE bit set to 0, and less important traffic should be forwarded with the DE bit set at 1. The default DE bit setting is 0. You can change the DE bit setting to 1 with the **set fr-de** command.

### Note

The **set fr-de** command can be used only in an output service policy.

Perform this task to set the Frame Relay DE bit on the Cisco 7200 and 7500 series routers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** *policy-name*
4. **class** *class-name*
5. **set fr-de**

### DETAILED STEPS

|        | Command or Action                                                                                 | Purpose                                                                                                                                                                                                  |
|--------|---------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                    | Enters global configuration mode.                                                                                                                                                                        |
| Step 3 | <b>policy-map</b> <i>policy-name</i><br><br><b>Example:</b><br>Router(config)# policy-map policy1 | Specifies the name of the traffic policy to configure and enters policy-map configuration mode.<br><ul style="list-style-type: none"><li>Names can be a maximum of 40 alphanumeric characters.</li></ul> |
| Step 4 | <b>class</b> <i>class-name</i><br><br><b>Example:</b><br>Router(config-pmap)# class class1        | Specifies the name of a predefined traffic class and enters policy-map class configuration mode.                                                                                                         |
| Step 5 | <b>set fr-de</b><br><br><b>Example:</b><br>Router(config-pmap-c)# set fr-de                       | Sets the Frame Relay DE bit setting for all packets that match the specified traffic class from 0 to 1.                                                                                                  |

## Matching the Frame Relay DE Bit on the Cisco 7200 and 7500 Series Routers

You can use the **match fr-de** command to enable frames with a DE bit setting of 1 to be considered a member of a defined class and forwarded according to the specifications set in the service policy.

Perform this task to match frames with the FR DE bit set to 1.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map** *class-map-name*
4. **match fr-de**

### DETAILED STEPS

|        | Command or Action                                                                                  | Purpose                                                                                                             |
|--------|----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                             | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                     | Enters global configuration mode.                                                                                   |
| Step 3 | <b>class-map</b> <i>class-map-name</i><br><br><b>Example:</b><br>Router(config)# class-map de-bits | Specifies the name of a predefined traffic class and enters class-map configuration mode.                           |
| Step 4 | <b>match fr-de</b><br><br><b>Example:</b><br>Router(config-cmap)# match fr-de                      | Classifies all frames with the DE bit set to 1.                                                                     |

## Enabling the Control Word

You can enable the control word for dynamic and static pseudowires under a pseudowire class. Use the **control-word** command to enable, disable, or set a control word to autosense mode. If you do not enable a control word, autosense is the default mode for the control word.

Perform this task to enable a control word.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **pseudowire-class** *cw\_enable*

4. **encapsulation mpls**
5. **control-word**
6. **exit**
7. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                      | Purpose                                                                                                                                   |
|--------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                         | Enters global configuration mode.                                                                                                         |
| Step 3 | <b>pseudowire-class cw_enable</b><br><br><b>Example:</b><br>Router(config)# pseudowire-class cw_enable | Enters pseudowire class configuration mode.                                                                                               |
| Step 4 | <b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-pw-class)# encapsulation mpls        | Specifies the tunneling encapsulation. <ul style="list-style-type: none"> <li>For AToM, the encapsulation type is <b>mpls</b>.</li> </ul> |
| Step 5 | <b>control-word</b><br><br><b>Example:</b><br>Router(config-pw-class)# control-word                    | Enables the control word.                                                                                                                 |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config-pw-class)# exit                                    | Exits pseudowire class configuration mode and returns to global configuration mode.                                                       |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                             | Exits global configuration mode.                                                                                                          |

## ATM AAL5 over MPLS: Examples

### ATM AAL5 over MPLS on PVCs

The following example enables ATM AAL5 over MPLS on an ATM PVC:

```
enable
configure terminal
interface atm1/0
pvc 1/200 l2transport
encapsulation aal5
xconnect 10.13.13.13 100 encapsulation mpls
```

### ATM AAL5 over MPLS in VC Class Configuration Mode

The following example configures ATM AAL5 over MPLS in VC class configuration mode. The VC class is then applied to an interface.

```
enable
configure terminal
vc-class atm aal5class
encapsulation aal5
interface atm1/0
class-int aal5class
pvc 1/200 l2transport
xconnect 10.13.13.13 100 encapsulation mpls
```

The following example configures ATM AAL5 over MPLS in VC class configuration mode. The VC class is then applied to a PVC.

```
enable
configure terminal
vc-class atm aal5class
encapsulation aal5
interface atm1/0
pvc 1/200 l2transport
class-vc aal5class
xconnect 10.13.13.13 100 encapsulation mpls
```

## OAM Cell Emulation for ATM AAL5 over MPLS: Examples

### OAM Cell Emulation for ATM AAL5 over MPLS on PVCs

The following example enables OAM cell emulation on an ATM PVC:

```
interface ATM 1/0/0
pvc 1/200 l2transport
encapsulation aal5
xconnect 10.13.13.13 100 encapsulation mpls
oam-ac emulation-enable
oam-pvc manage
```

The following example sets the rate at which an AIS cell is sent every 30 seconds:

```
interface ATM 1/0/0
pvc 1/200 l2transport
encapsulation aal5
xconnect 10.13.13.13 100 encapsulation mpls
oam-ac emulation-enable 30
oam-pvc manage
```

### OAM Cell Emulation for ATM AAL5 over MPLS in VC Class Configuration Mode

The following example configures OAM cell emulation for ATM AAL5 over MPLS in VC class configuration mode. The VC class is then applied to an interface.

```
enable
configure terminal
vc-class atm oamclass
encapsulation aal5
oam-ac emulation-enable 30
oam-pvc manage
interface atm1/0
class-int oamclass
pvc 1/200 l2transport
xconnect 10.13.13.13 100 encapsulation mpls
```

The following example configures OAM cell emulation for ATM AAL5 over MPLS in VC class configuration mode. The VC class is then applied to a PVC.

```
enable
configure terminal
vc-class atm oamclass
encapsulation aal5
oam-ac emulation-enable 30
oam-pvc manage
interface atm1/0
pvc 1/200 l2transport
class-vc oamclass
xconnect 10.13.13.13 100 encapsulation mpls
```

The following example configures OAM cell emulation for ATM AAL5 over MPLS in VC class configuration mode. The VC class is then applied to an interface. One PVC is configured with OAM cell emulation at an AIS rate of 10. That PVC uses the AIS rate of 10 instead of 30.

```
enable
configure terminal
vc-class atm oamclass
encapsulation aal5
oam-ac emulation-enable 30
oam-pvc manage
interface atm1/0
class-int oamclass
```

```
pvc 1/200 l2transport
oam-ac emulation-enable 10
xconnect 10.13.13.13 100 encapsulation mpls
```

## ATM Cell Relay over MPLS: Examples

### ATM Cell Relay over MPLS in VC Mode Using VC Class Configuration Mode

The following example configures ATM cell relay over MPLS in VC class configuration mode. The VC class is then applied to an interface.

```
enable
configure terminal
vc-class atm cellrelay
encapsulation aal0
interface atm1/0
class-int cellrelay
pvc 1/200 l2transport
xconnect 10.13.13.13 100 encapsulation mpls
```

The following example configures ATM cell relay over MPLS in VC class configuration mode. The VC class is then applied to a PVC.

```
enable
configure terminal
vc-class atm cellrelay
encapsulation aal0
interface atm1/0
pvc 1/200 l2transport
class-vc cellrelay
xconnect 10.13.13.13 100 encapsulation mpls
```

### ATM Cell Relay over MPLS in PVP Mode

The following example transports single ATM cells over a virtual path:

```
pseudowire-class vp-cell-relay
encapsulation mpls
interface atm 5/0
atm pvp 1 l2transport
xconnect 10.0.0.1 123 pw-class vp-cell-relay
```

### ATM Cell Relay over MPLS in Port Mode

The following example shows interface ATM 5/0 configured to transport ATM cell relay packets:

```
pseudowire-class atm-cell-relay
encapsulation mpls
interface atm 5/0
xconnect 10.0.0.1 123 pw-class atm-cell-relay
```

The following example shows interface ATM 9/0/0 configured to transport ATM cell relay packets on a Cisco 7600 series router, where you must specify the interface ATM slot, bay, and port:

```
pseudowire-class atm-cell-relay
encapsulation mpls
interface atm 9/0/0
xconnect 10.0.0.1 500 pw-class atm-cell-relay
```

## ATM Single Cell Relay over MPLS: Examples

### ATM Packed Cell Relay over MPLS in VC Mode

The following example shows that ATM PVC 1/100 is an AToM cell relay PVC. There are three timers set up, with values of 1000 milliseconds, 800 milliseconds, and 500 milliseconds, respectively. The **cell-packing** command specifies that five ATM cells are to be packed into an MPLS packet. The **cell-packing** command also specifies that timer 1 is to be used.

```
interface atm 1/0
shutdown
atm mcpt-timer 1000 800 500
no shutdown
pvc 1/100 l2transport
encapsulation aal0
xconnect 10.0.0.1 123 encapsulation mpls
cell-packing 5 mcpt-timer 1
```

### ATM Packed Cell Relay over MPLS in VC Mode Using VC Class Configuration Mode

The following example configures ATM cell relay over MPLS with cell packing in VC class configuration mode. The VC class is then applied to an interface.

```
enable
configure terminal
vc-class atm cellpacking
encapsulation aal0
cell-packing 10 mcpt-timer 1
interface atm1/0
shutdown
atm mcpt-timers 100 200 250
no shutdown
class-int cellpacking
pvc 1/200 l2transport
xconnect 10.13.13.13 100 encapsulation mpls
```

The following example configures ATM cell relay over MPLS in VC class configuration mode. The VC class is then applied to a PVC.

```
enable
configure terminal
vc-class atm cellpacking
encapsulation aal0
cell-packing 10 mcpt-timer 1
interface atm1/0
shutdown
atm mcpt-timers 100 200 250
no shutdown
pvc 1/200 l2transport
class-vc cellpacking
xconnect 10.13.13.13 100 encapsulation mpls
```

### ATM Packed Cell Relay over MPLS in VP Mode

The following example shows packed cell relay enabled on an interface configured for PVP mode. The **cell-packing** command specifies that 10 ATM cells are to be packed into an MPLS packet. The **cell-packing** command also specifies that timer 2 is to be used.

```
interface atm 1/0
shutdown
atm mcpt-timer 1000 800 500
no shutdown
atm pvp 100 l2transport
```

```
xconnect 10.0.0.1 234 encapsulation mpls
cell-packing 10 mcpt-timer 2
```

### ATM Packed Cell Relay over MPLS in Port Mode

The following example shows packed cell relay enabled on an interface set up for port mode. The **cell-packing** command specifies that 10 ATM cells are to be packed into an MPLS packet. The **cell-packing** command also specifies that timer 2 is to be used.

```
interface atm 5/0
shutdown
atm mcpt-timer 1000 800 500
no shutdown
cell-packing 10 mcpt-timer 2
xconnect 10.0.0.1 123 encapsulation mpls
```

## Ethernet over MPLS: Examples

### Ethernet over MPLS in Port Mode

The following example configures VC 123 in Ethernet port mode:

```
pseudowire-class ethernet-port
encapsulation mpls

int gigabitethernet1/0
xconnect 10.0.0.1 123 pw-class ethernet-port
```

### Ethernet over MPLS with VLAN ID Rewrite

The following example configures VLAN ID rewrite on peer PE routers with Cisco 12000 series router engine 2 3-port Gigabit Ethernet line cards.

| PE1                                                                                                                                                               | PE2                                                                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>interface GigabitEthernet0/0.2 encapsulation dot1Q 2 no ip directed-broadcast no cdp enable xconnect 10.5.5.5 2 encapsulation mpls remote circuit id 3</pre> | <pre>interface GigabitEthernet3/0.2 encapsulation dot1Q 3 no ip directed-broadcast no cdp enable xconnect 10.3.3.3 2 encapsulation mpls remote circuit id 2</pre> |

## Tunnel Selection: Examples

The following example sets up two preferred paths for PE1. One preferred path specifies an MPLS traffic engineering tunnel. The other preferred path specifies an IP address of a loopback address on PE2. There is a static route configured on PE1 that uses a TE tunnel to reach the IP address on PE2.

### PE1 Configuration

```
mpls label protocol ldp
mpls traffic-eng tunnels
tag-switching tdp router-id Loopback0
pseudowire-class pw1
  encapsulation mpls
  preferred-path interface Tunnell disable-fallback

## Setting Frame Relay Discard Eligibility Bit on the Cisco 7200 and 7500 Series Routers: Examples

The following example shows how to configure the service policy called set-de and attach it to an interface. In this example, the class map called data evaluates all packets exiting the interface for an IP precedence value of 1. If the exiting packet has been marked with the IP precedence value of 1, the packet's DE bit is set to 1.

```

class-map data
 match ip precedence 1

policy-map set-de

```

```
class data
set fr-de
interface Serial0/0/0
encapsulation frame-relay
interface Serial0/0/0.1 point-to-point
ip address 192.168.249.194 255.255.255.252
frame-relay interface-dlci 100
service output set-de
```

## Matching Frame Relay DE Bit on the Cisco 7200 and 7500 Series Routers: Examples

The following example shows how to configure the service policy called match-de and attach it to an interface. In this example, the class map called data evaluates all packets entering the interface for a DE bit setting of 1. If the entering packet has been a DE bit value of 1, the packet's EXP bit setting is set to 3.

```
class-map data
match fr-de
policy-map match-de
class data
set mpls exp 3
ip routing
ip cef distributed
mpls label protocol ldp
interface Loopback0
 ip address 10.20.20.20 255.255.255.255
interface Ethernet1/0/0
 ip address 10.0.0.2 255.255.255.0
mpls ip
interface Serial4/0/0
 encapsulation frame-relay
service input match-de
connect 100 Serial4/0/0 100 l2transport
xconnect 10.10.10.10 100 encapsulation mpls
```

## ATM over MPLS: Examples

[Example 1](#) shows the configuration of ATM over MPLS on two PE routers.

**Example 1     ATM over MPLS Configuration Example**

| PE1                                                                                                                                                                                                                                                                                                                                                                                                                                   | PE2                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**Ethernet over MPLS with MPLS Traffic Engineering Fast Reroute: Examples**

The following configuration example and [Figure 2](#) show the configuration of Ethernet over MPLS with fast reroute on AToM PE routers.

Routers PE1 and PE2 have the following characteristics:

- A TE tunnel called Tunnel41 is configured between PE1 and PE2, using an explicit path through a link called L1. AToM VCs are configured to travel through the FRR-protected tunnel Tunnel41.
- The link L1 is protected by FRR, the backup tunnel is Tunnel1.
- PE2 is configured to forward the AToM traffic back to PE1 through the L2 link.

**Figure 2     Fast Reroute Configuration**

## Configuring per-Subinterface MTU for Ethernet over MPLS: Example

Figure 3 shows a configuration that enables matching MTU values between VC endpoints.

As shown in Figure 3, PE1 is configured in xconnect subinterface configuration mode with an MTU value of 1500 bytes in order to establish an end-to-end VC with PE2, which also has an MTU value of 1500 bytes. If PE1 was not set with an MTU value of 1500 bytes, in xconnect subinterface configuration mode, the subinterface would inherit the MTU value of 2000 bytes set on the interface. This would cause a mismatch in MTU values between the VC endpoints, and the VC would not come up.

**Figure 3** Configuring MTU Values in xconnect Subinterface Configuration Mode

The following examples show the router configurations in Figure 3:

### CE1 Configuration

```

interface gigabitethernet0/0
mtu 1500
no ip address
!
interface gigabitethernet0/0.1
encapsulation dot1Q 100
ip address 10.181.182.1 255.255.255.0

```

### PE1 Configuration

```

interface gigabitethernet0/0
mtu 2000
no ip address
!
interface gigabitethernet0/0.1
encapsulation dot1Q 100
xconnect 10.1.1.152 100 encapsulation mpls
mtu 1500
!
interface gigabitethernet0/0.2
encapsulation dot1Q 200
ip address 10.151.100.1 255.255.255.0
mpls ip

```

**PE2 Configuration**

```

interface gigabitethernet1/0
  mtu 2000
  no ip address
!
interface gigabitethernet1/0.2
  encapsulation dot1Q 200
  ip address 10.100.152.2 255.255.255.0
  mpls ip
!
interface fastethernet0/0
  no ip address
!
interface fastethernet0/0.1
  description default MTU of 1500 for FastEthernet
  encapsulation dot1Q 100
  xconnect 10.1.1.151 100 encapsulation mpls

```

**CE2 Configuration**

```

interface fastethernet0/0
  no ip address
interface fastethernet0/0.1
  encapsulation dot1Q 100
  ip address 10.181.182.2 255.255.255.0

```

The **show mpls l2transport binding** command, issued from router PE1, shows a matching MTU value of 1500 bytes on both the local and remote routers:

Router# **show mpls l2transport binding**

```

Destination Address: 10.1.1.152,  VC ID: 100
  Local Label: 100
    Cbit: 1,      VC Type: Ethernet,    GroupID: 0
    MTU: 1500,   Interface Desc: n/a
    VCCV: CC Type: CW [1], RA [2]
    CV Type: LSPV [2]
  Remote Label: 202
    Cbit: 1,      VC Type: Ethernet,    GroupID: 0
    MTU: 1500,   Interface Desc: n/a
    VCCV: CC Type: RA [2]
    CV Type: LSPV [2]

```

Router# **show mpls l2transport vc detail**

```

Local interface: Gi0/0.1 up, line protocol up, Eth VLAN 100 up
  Destination address: 10.1.1.152, VC ID: 100, VC status: up
    Output interface: Gi0/0.2, imposed label stack {202}
    Preferred path: not configured
    Default path: active
    Next hop: 10.151.152.2
  Create time: 1d11h, last status change time: 1d11h
  Signaling protocol: LDP, peer 10.1.1.152:0 up
    Targeted Hello: 10.1.1.151(LDP Id) -> 10.1.1.152
    MPLS VC labels: local 100, remote 202
    Group ID: local 0, remote 0
    MTU: local 1500, remote 1500
    Remote interface description:
  Sequencing: receive disabled, send disabled
  VC statistics:
    packet totals: receive 41, send 39
    byte totals:   receive 4460, send 5346
    packet drops:  receive 0, send 0

```

In the following example, you are specifying an MTU of 1501 in xconnect subinterface configuration mode, and that value is out of range, the router enters the command in subinterface configuration mode, where it is accepted:

```
Router# configure terminal
router(config)# interface gigabitethernet0/2.1
router(config-subif)# xconnect 10.10.10.1 100 encapsulation mpls
router(config-subif-xconn)# mtu ?
<64 - 1500> MTU size in bytes
router(config-subif-xconn)# mtu 1501
router(config-subif)# mtu ?
<64 - 17940> MTU size in bytes
```

If the MTU value is not accepted in either xconnect subinterface configuration mode or subinterface configuration mode, then the command is rejected, as shown in the following example:

```
Router# configure terminal
router(config)# interface gigabitethernet0/2.1
router(config-subif)# xconnect 10.10.10.1 100 encapsulation mpls
router(config-subif-xconn)# mtu ?
<64 - 1500> MTU size in bytes
router(config-subif-xconn)# mtu 63
% Invalid input detected at ^ marker
```

## Configuring MTU Values in xconnect Configuration Mode for L2VPN Interworking: Example

The following example shows an L2VPN Interworking example. The PE1 router has a serial interface configured with an MTU value of 1492 bytes. The PE2 router uses xconnect configuration mode to set a matching MTU of 1492 bytes, which allows the two routers to form an interworking VC. If the PE2 router did not set the MTU value in xconnect configuration mode, the interface would be set to 1500 bytes by default and the VC would not come up.

### PE1 Configuration

```
pseudowire-class atom-ipiw
 encapsulation mpls
 interworking ip
!
interface Loopback0
 ip address 10.1.1.151 255.255.255.255
!
interface Serial2/0
 mtu 1492
 no ip address
 encapsulation ppp
 no fair-queue
 serial restart-delay 0
 xconnect 10.1.1.152 123 pw-class atom-ipiw
!
interface Serial4/0
 ip address 10.151.100.1 255.255.255.252
 encapsulation ppp
 mpls ip
 serial restart-delay 0
!
router ospf 1
 log-adjacency-changes
 network 10.1.1.151 0.0.0.0 area 0
 network 10.151.100.0 0.0.0.3 area 0
```

```
!
mpls ldp router-id Loopback0
```

### PE2 Configuration

```
pseudowire-class atom-ipiw
 encapsulation mpls
 interworking ip
!
interface Loopback0
 ip address 10.1.1.152 255.255.255.255
!
interface Ethernet0/0
 no ip address
 xconnect 10.1.1.151 123 pw-class atom-ipiw
 mtu 1492
!
interface Serial4/0
 ip address 10.100.152.2 255.255.255.252
 encapsulation ppp
 mpls ip
 serial restart-delay 0
!
router ospf 1
 log-adjacency-changes
 network 10.1.1.152 0.0.0.0 area 0
 network 10.100.152.0 0.0.0.3 area 0
!
mpls ldp router-id Loopback0
```

The **show mpls l2transport binding** command shows that the MTU value for the local and remote routers is 1492 bytes.

### PE1 Configuration

changed from DONE to END
02:13:56: XC AUTH [Et1/0.3, 1003]: Event: free xconnect authorization request, state
changed from DONE to END
02:13:56: XC AUTH [10.1.1.2, 1234001]: Event: free xconnect authorization request, state
changed from DONE to END
02:13:56: XC AUTH [10.1.2.2, 1234003]: Event: free xconnect authorization request, state
changed from DONE to END
02:13:56: MPLS peer 10.1.1.2 vcid 1234001, VC UP, VC state UP
02:13:56: MPLS peer 10.1.2.2 vcid 1234003, VC UP, VC state UP
02:13:56: MPLS peer 10.1.1.2 vcid 1234000, VC UP, VC state UP
02:13:56: MPLS peer 10.1.2.2 vcid 1234002, VC UP, VC state UP
```

The following example removes all the xconnects associated with peer router 10.1.1.2:

```
Router# clear xconnect peer 10.1.1.2 all
```

```
02:14:08: Xconnect[ac:Et1/0.1(Eth VLAN)]: provisioning fwder with fwd_type=1, sss_role=1
02:14:08: Xconnect[mpls:10.1.1.2:1234000]: provisioning fwder with fwd_type=2, sss_role=2
02:14:08: Xconnect[ac:Et1/0.2(Eth VLAN)]: provisioning fwder with fwd_type=1, sss_role=2
02:14:08: Xconnect[mpls:10.1.1.2:1234001]: provisioning fwder with fwd_type=2, sss_role=1
02:14:08: MPLS peer 10.1.1.2 vcid 1234000, VC DOWN, VC state DOWN
02:14:08: MPLS peer 10.1.1.2 vcid 1234001, VC DOWN, VC state DOWN
02:14:08: XC AUTH [Et1/0.1, 1001]: Event: start xconnect authorization, state changed from
IDLE to AUTHORIZING
02:14:08: XC AUTH [Et1/0.1, 1001]: Event: found xconnect authorization, state changed from
AUTHORIZING to DONE
02:14:08: XC AUTH [10.1.1.2, 1234001]: Event: start xconnect authorization, state changed
from IDLE to AUTHORIZING
```

```

02:14:08: XC AUTH [10.1.1.2, 1234001]: Event: found xconnect authorization, state changed
from AUTHORIZING to DONE
02:14:08: XC AUTH [Et1/0.1, 1001]: Event: free xconnect authorization request, state
changed from DONE to END
02:14:08: XC AUTH [10.1.1.2, 1234001]: Event: free xconnect authorization request, state
changed from DONE to END
02:14:08: MPLS peer 10.1.1.2 vcid 1234001, VC UP, VC state UP
02:14:08: MPLS peer 10.1.1.2 vcid 1234000, VC UP, VC state UP

```

The following example removes the xconnects associated with peer router 10.1.1.2 and VC ID 1234001:

```
Router# clear xconnect peer 10.1.1.2 vcid 1234001
```

```

02:14:23: Xconnect[ac:Et1/0.2(Eth VLAN)]: provisioning fwder with fwd_type=1, sss_role=1
02:14:23: Xconnect[mpls:10.1.1.2:1234001]: provisioning fwder with fwd_type=2, sss_role=2
02:14:23: MPLS peer 10.1.1.2 vcid 1234001, VC DOWN, VC state DOWN
02:14:23: XC AUTH [Et1/0.2, 1002]: Event: start xconnect authorization, state changed from
IDLE to AUTHORIZING
02:14:23: XC AUTH [Et1/0.2, 1002]: Event: found xconnect authorization, state changed from
AUTHORIZING to DONE
02:14:23: XC AUTH [Et1/0.2, 1002]: Event: free xconnect authorization request, state
changed from DONE to END
02:14:23: MPLS peer 10.1.1.2 vcid 1234001, VC UP, VC state UP

```

The following example removes the xconnects associated with interface Ethernet 1/0.1:

```
Router# clear xconnect interface eth1/0.1
```

```

02:14:48: Xconnect[ac:Et1/0.1(Eth VLAN)]: provisioning fwder with fwd_type=1, sss_role=2
02:14:48: Xconnect[mpls:10.1.1.2:1234000]: provisioning fwder with fwd_type=2, sss_role=1
02:14:48: MPLS peer 10.1.1.2 vcid 1234000, VC DOWN, VC state DOWN

# Feature Information for Any Transport over MPLS

[Table 8](#) lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

---

[Table 8](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

---

**Table 8**      **Feature Information for Any Transport over MPLS**

| Feature Name            | Releases    | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Any Transport over MPLS | 12.0(10)ST  | In Cisco IOS Release 12.0(10)ST, Any Transport over MPLS: ATM AAL5 over MPLS was introduced on the Cisco 12000 series routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                         | 12.1(8a)E   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                         | 12.0(21)ST  | In Cisco IOS Release 12.1(8a)E, Ethernet over MPLS was introduced on the Cisco 7600 series Internet router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                         | 12.0(22)S   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                         | 12.0(23)S   | In Cisco IOS Release 12.0(21)ST, Any Transport over MPLS: Ethernet over MPLS was introduced on the Cisco 12000 series routers. ATM AAL5 over MPLS was updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**Table 8**      **Feature Information for Any Transport over MPLS (continued)**

| Feature Name | Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              |          | <p>In Cisco IOS Release 12.0(26)S, the following new features were introduced:</p> <ul style="list-style-type: none"> <li>• Support for connecting disparate attachment circuits. See <i>L2VPN Interworking</i> for more information.</li> <li>• QoS functionality with AToM for the Cisco 7200 series routers.</li> </ul> <p>Support for FECN and BECN marking with Frame Relay over MPLS. (See <a href="#">BECN and FECN Marking for Frame Relay over MPLS</a> for more information.)</p> <p>In Cisco IOS Release 12.0(27)S, the following new features were introduced:</p> <ul style="list-style-type: none"> <li>• ATM Cell Relay over MPLS: Packed Cell Relay for VC, PVP, and port mode for the Cisco 12000 series router.</li> <li>• Support for ATM over MPLS on the Cisco 12000 series 4-port OC-12X/STM-4 ATM ISE line card.</li> </ul> <p>This feature was integrated into Cisco IOS Release 12.2(25)S for the Cisco 7200 and 7500 series routers.</p> <p>In Cisco IOS Release 12.0(29)S, the “Any Transport over MPLS Sequencing Support” feature was added for the Cisco 7200 and 7500 series routers. See the <a href="#">Any Transport over MPLS (AToM) Sequencing Support</a> document for more information.</p> <p>In Cisco IOS Release 12.0(30)S, the following new features were introduced:</p> <ul style="list-style-type: none"> <li>• ATM VC Class Support—You can specify AAL5 and AAL0 encapsulations as part of a VC class. You can also enable cell packing and OAM emulation as part of a VC class. A VC class can be attached to an interface, subinterface, or VC. See the “<a href="#">How to Configure Any Transport over MPLS</a>” section on page 14 for links to the sections that explain the ATM VC Class Support feature.</li> <li>• VLAN ID Rewrite—This feature was enhanced to enable the IP Service Engine (ISE) 4-port Gigabit Ethernet line card to perform VLAN ID rewrite at both the imposition and disposition sides of the edge-facing router. See the “<a href="#">Configuring Ethernet over MPLS with VLAN ID Rewrite</a>” section on page 48 for more information.</li> </ul> <p>In Cisco IOS Release 12.0(31)S, the Cisco 12000 series router introduced the following enhancements:</p> <ul style="list-style-type: none"> <li>• AToM VC Independence—With this enhancement, fast reroute is accomplished in less than 50 milliseconds, regardless of the number of VCs configured. See the “<a href="#">MPLS Traffic Engineering Fast Reroute</a>” section on page 6 for more information.</li> <li>• Support for ISE line cards on the 2.5G ISE SPA Interface Processor (SIP).</li> </ul> <p>In Cisco IOS Release 12.0(32)S, the Cisco 12000 series router added engine 5 line card support for the following transport types:</p> <ul style="list-style-type: none"> <li>• Ethernet over MPLS</li> <li>• Frame Relay over MPLS</li> <li>• HDLC over MPLS</li> <li>• PPP over MPLS</li> </ul> |

**Table 8**      **Feature Information for Any Transport over MPLS (continued)**

| Feature Name | Releases | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# MPLS MTU Command Changes

---

**First Published: August 11, 2004**

**Last Updated: December 8, 2009**

This document explains the change in behavior of the **mpls mtu** command for the following Cisco IOS releases:

- 12.2(27)SBC and later
- 12.2(33)SRA and later
- 12.4(11)T and later
- 12.2(33)SXH and later

You cannot set the MPLS MTU value larger than the interface MTU value. This eliminates problems, such as dropped packets, data corruption, and high CPU rates from occurring when MPLS MTU value settings are larger than interface MTU values. Cisco IOS software allows the MPLS MTU value to be higher than the interface MTU value only for interfaces that have a default interface MTU value of 1580 or less.

## Note

In Cisco IOS Release 15.0(1)M1, you can configure the interface MTU on PA-1FE and PA-2FE port adapters (PAs). The range of values is 1500 -1530. Before this enhancement, the MTU of those interfaces was not configurable. When you attempted to configure the interface MTU, the following message was displayed:

```
% Interface {Interface Name} does not support user settable mtu.
```

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for MPLS MTU Command Changes”](#) section on page 8.

## Finding Support Information for Platforms and Cisco IOS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

- [Information About MPLS MTU Command Changes, page 2](#)
- [How to Configure MPLS MTU Values, page 3](#)
- [Configuration Examples for Setting the MPLS MTU Values, page 5](#)
- [Feature Information for MPLS MTU Command Changes, page 8](#)

## Information About MPLS MTU Command Changes

Before configuring the interface or MPLS MTU values, you should understand the following concepts:

- [MPLS MTU Values During Upgrade, page 2](#)
- [Guidelines for Setting MPLS MTU and Interface MTU Values, page 2](#)
- [MPLS MTU Values for Ethernet Interfaces, page 3](#)

## MPLS MTU Values During Upgrade

If you have configuration files with MPLS MTU values that are larger than the interface MTU values and you upgrade to Cisco IOS Release 12.2(27)SBC, 12.2(33)SRA, 12.4(11)T, 12.2(33)SXH or later releases, the software does not change the MPLS MTU value. When you reboot the router, the software accepts the values that are set for the MPLS MTU and the interface MTU. The following error message is displayed during system initialization:

```
Setting the mpls mtu to xxxx on interface x/x, which is higher than the interface MTU
xxxx. This could lead to packet forwarding problems including packet drops.
```

You must set the MPLS MTU values equal to or lower than the interface MTU values.

**Caution**

If you do not set the MPLS MTU less than or equal to the interface MTU, data corruption, dropped packets, and high CPU conditions can occur.

## Guidelines for Setting MPLS MTU and Interface MTU Values

When configuring the network to use MPLS, set the core-facing interface MTU values greater than the edge-facing interface MTU values, using one of the following methods:

- Set the interface MTU values on the core-facing interfaces to a higher value than the interface MTU values on the customer-facing interfaces to accommodate any packet labels, such as MPLS labels, that an interface might encounter. Make sure that the interface MTUs on the remote end interfaces have the same interface MTU values. The interface MTU values on both ends of the link must match.
- Set the interface MTU values on the customer-facing interfaces to a lower value than the interface MTU on the core-facing interfaces to accommodate any packet labels, such as MPLS labels, than an interface might encounter. When you set the interface MTU on the edge interfaces, ensure that the interface MTUs on the remote end interfaces have the same values. The interface MTU values on both ends of the link must match.

Changing the interface MTU can also modify the IP MTU, Connectionless Network Service (CLNS) MTU, and other MTU values, because they depend on the value of the interface MTU. The Open Shortest Path First (OSPF) routing protocol requires that the IP MTU values match on both ends of the link. Similarly, the Intermediate System-to-Intermediate System (IS-IS) routing protocol requires that the CLNS MTU values match on both ends of the link. If the values on both ends of the link do not match, IS-IS or OSPF cannot complete its initialization.

If the configuration of the adjacent router does not include the **mpls mtu** and **mtu** commands, add these commands to the router.

**Note**

The MPLS MTU setting is displayed only in the show running-config output if the MPLS MTU value is different from the interface MTU value. If the values match, only the interface MTU value is displayed.

If you attempt to set the MPLS MTU value higher than the interface MTU value, the software displays the following error, which reminds you to set the interface MTU to a higher value before you set the MPLS MTU value:

```
% Please increase interface mtu to xxxx and then set mpls mtu
```

**Note**

In Cisco IOS Release 15.0(1)M1, you can configure the interface MTU on PA-1FE and PA-2FE port adapters. The range of values is 1500 -1530. Before this enhancement, the MTU of those interfaces was not configurable.

## MPLS MTU Values for Ethernet Interfaces

If you have an interface with a default interface MTU value of 1580 or less (such as an Ethernet interface), the **mpls mtu** command provides an **override** keyword, which allows you to set the MPLS MTU value higher than the interface MTU value. The **override** keyword is not available for interface types that do not have a default interface MTU value of 1580 or less. For configuration details, see the [“Setting the MPLS MTU Value on an Ethernet Interface” section on page 5](#).

Setting the MPLS MTU value higher than the Ethernet interface MTU value can lead to dropped packets, data corruption, or high CPU rates. When you set the MPLS MTU value higher than the Ethernet interface MTU value, the software displays the following message:

```
%MFI-30-MPLS_MTU_SET: Setting the mpls mtu to xxxx on Ethernet x/x, which is higher than
the interface MTU xxxx. This could lead to packet forwarding problems including packet
drops.
Most drivers will be able to support baby giants and will gracefully drop packets that are
too large. Certain drivers will have packet forwarding problems including data corruption.
Setting the mpls mtu higher than the interface mtu can lead to packet forwarding problems
and may be blocked in a future release.
```

**Note**

The **override** keyword is supported in Cisco IOS Release 12.2(27)SBC, 12.2(33)SRA, 12.4(11)T, 12.2(33)SXH, and later releases, but may not be supported in a future release.

## How to Configure MPLS MTU Values

The following sections explain how to configure MPLS MTU and interface MTU values:

- [Setting the Interface MTU and MPLS MTU Values, page 4](#)

- [Setting the MPLS MTU Value on an Ethernet Interface, page 5](#)

## Setting the Interface MTU and MPLS MTU Values

Use the following steps to set the interface MTU and the MPLS MTU.

### Note

In Cisco IOS Release 15.0(1)M1, you can configure the interface MTU on PA-1FE and PA-2FE port adapters. The range of values is 1500 -1530. Before this enhancement, the MTU of those interfaces was not configurable.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **mtu** *bytes*
5. **mpls mtu** *bytes*

### DETAILED STEPS

## Configuration Examples for Setting the MPLS MTU Values

This section includes the following examples:

- [Setting the Interface MTU and MPLS MTU: Example, page 6](#)
- [Setting the MPLS MTU Value on an Ethernet Interface: Example, page 7](#)

## Setting the Interface MTU and MPLS MTU: Example

The following example shows how to set the interface and MPLS MTU values. The serial interface in the following configuration examples is at the default interface MTU value. The MPLS MTU value is not set. The interface settings are as follows:

```
interface Serial 4/0
  ip unnumbered Loopback0
  mpls traffic-eng tunnels
  mpls ip
  serial restart-delay 0
  ip rsvp bandwidth 2000 2000
end
```

The following example attempts to set the MPLS MTU value to 1520. This returns an error, because the MPLS MTU value cannot be set to a greater value than the interface MTU.

```
Router# configure terminal
```

```
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# interface serial 4/0
```

```
Router(config-if)# mpls mtu 1520
```

```
% Please increase interface mtu to 1520 and then set mpls mtu
```

The following example first sets the interface MTU to 1520 and then sets the MPLS MTU to 1520:

```
Router(config-if)# mtu 1520
Router(config-if)# mpls mtu 1520
```

The following example shows the new interface MTU value. The MPLS MTU value is not displayed, because it is equal to the interface value.

```
Router# show running-config interface serial 4/0
```

```
Building configuration...
interface Serial4/0
  mtu 1520
  ip unnumbered Loopback0
  mpls traffic-eng tunnels
  mpls ip
  serial restart-delay 0
  ip rsvp bandwidth 2000 2000
end
```

The following example sets the MPLS MTU value to 1510:

```
Router(config-if)# mpls mtu 1510
```

The following example shows the new interface MTU value. The MPLS MTU value is displayed, because it is different than the interface MTU value.

```
Router# show running-config interface serial 4/0
```

```
Building configuration...
interface Serial4/0
  mtu 1520
  ip unnumbered Loopback0
  mpls mtu 1510
  mpls traffic-eng tunnels
  mpls ip
  serial restart-delay 0
  ip rsvp bandwidth 2000 2000
```

end

## Setting the MPLS MTU Value on an Ethernet Interface: Example

### Caution

Setting the MPLS MTU value higher than the Ethernet interface MTU value can lead to dropped packets, data corruption, or high CPU rates.

The following example shows how to set the MPLS MTU values on an Ethernet interface. The Ethernet interface in the following configuration examples is at the default interface MTU value. The MPLS MTU value is not set. The interface settings are as follows:

```
interface Ethernet 2/0
 ip unnumbered Loopback0
 mpls traffic-eng tunnels
 mpls ip
 serial restart-delay 0
 ip rsvp bandwidth 2000 2000
end
```

The following example uses the **override** keyword to set the MPLS MTU to 1520, which is higher than the Ethernet interface's MTU value:

```
Router(config-if)# mpls mtu override 1520
```

```
%MFI-30-MPLS_MTU_SET: Setting the mpls mtu to 1520 on Ethernet2/0, which is higher than
the interface MTU 1500. This could lead to packet forwarding problems including packet
drops.
```

The following example shows the new MPLS MTU value:

```
Router# show running-config interface ethernet 2/0
```

```
Building configuration...
interface Ethernet 2/0
 mtu 1500
 ip unnumbered Loopback0
 mpls mtu 1520
 mpls traffic-eng tunnels
 mpls ip
 serial restart-delay 0
 ip rsvp bandwidth 2000 2000
end
```

# Feature Information for MPLS MTU Command Changes

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

CCDE, CCENT, CCSI, Cisco Eos, Cisco HealthPresence, Cisco IronPort, the Cisco logo, Cisco Nurse Connect, Cisco Pulse, Cisco SensorBase,

**Table 1** Feature Information for MPLS MTU Command Changes

| Feature Name             | Releases                                                                          | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

# AToM Static Pseudowire Provisioning

---

**First Published: February 19, 2007**

**Last Updated: November 20, 2009**

The AToM Static Pseudowire Provisioning feature allows provisioning an Any Transport over Multiprotocol Label Switching (MPLS) (AToM) static pseudowire without the use of a directed control connection. In environments that do not or cannot use directed control protocols, this feature provides a means for provisioning the pseudowire parameters statically at the Cisco IOS command-line interface (CLI).

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for AToM Static Pseudowire Provisioning”](#) section on page 9.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for AToM Static Pseudowire Provisioning

The following parameters are exchanged using directed control protocol messages on pseudowires, but cannot be changed using the AToM Static Pseudowire Provisioning feature introduced in Cisco IOS Release 12.33(SRB). Instead, the software has preconfigured defaults.

- The Virtual Circuit Connectivity Verification (VCCV) options used for fault detection, isolation, and verification at both ends of the connection are set as follows:
  - Control channel type 1 sets the control word.
  - Control channel type 2 sets the MPLS router alert label.
  - Connectivity verification type 2 sets the label switched path (LSP) **ping** command.

In order to support cell packing for static pseudowires, both provider-edge routers (PEs) must run Cisco IOS Release 12.2(1)SRE, and the maximum number of cells that can be packed must be set to the same value on each.

Autosensing of the virtual circuit type for Ethernet over MPLS is not supported.

Additionally, the following functionality is not supported for static pseudowires:

- Sequence number resynchronization—configured by the sequencing function in the Cisco IOS **pseudowire-class** command—is not supported because the sequence number resynchronization is done when the Label Distribution Protocol (LDP) software sends an LDP Label Release or Withdraw message followed by a Label Request or Mapping message, and static pseudowires do not use LDP.
- Tunnel stitching is not supported because it requires an extension of the Cisco IOS **neighbor** command to start the mode that allows configuring static pseudowire parameters such as remote and local labels, which is not supported in Cisco IOS Release 12.33(SRB). Note that a tunnel switch point can be configured using a different static label command. The tunnel switch point will not process control words, but label swapping will occur.
- Pseudowire redundancy is not supported because it requires using a directed control protocol between the peer provider edge routers.

## Information About AToM Static Pseudowire Provisioning

To provision an AToM static pseudowire, you should understand the following concepts:

- [Pseudowire Provisioning, page 2](#)
- [Benefits of Statically Provisioned Pseudowires, page 3](#)

## Pseudowire Provisioning

In software prior to Cisco IOS Release 12.33(SRB), pseudowires were dynamically provisioned using LDP, or another directed control protocol such as Resource Reservation Protocol over traffic-engineered tunnels (RSVP-TE), to exchange the various parameters required for these connections. In environments that do not or cannot use directed control protocols, a means for provisioning the pseudowire parameters statically at the Cisco IOS CLI is provided by the AToM Static Pseudowire Provisioning feature.

The AToM Static Pseudowire Provisioning feature is platform-independent, but has been tested on only the Cisco 7600 series routers for Cisco IOS Release 12.33(SRB).

# Benefits of Statically Provisioned Pseudowires

Cisco IOS Release 12.33(SRB) allows provisioning an AToM label switching static pseudowire without the use of a directed control connection. This feature also includes static provisioning of the tunnel label and the pseudowire label.

# How to Provision an AToM Static Pseudowire

This section contains the following procedures:

- [Provisioning an AToM Static Pseudowire, page 3](#)
- [Verifying the AToM Static Pseudowire Configuration, page 5](#)

# Provisioning an AToM Static Pseudowire

In this configuration task, you use options in the **xconnect** Ethernet interface configuration command to specify a static connection, and **mpls** commands in xconnect mode to statically set the following pseudowire parameters:

- Set the local and remote pseudowire labels
- Enable or disable sending the MPLS control word

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *ethernet-type interface-number*
4. **xconnect** *peer-ip-address vcid encapsulation mpls manual pw-class class-name*
5. **mpls label** *local-pseudowire-label remote-pseudowire-label*
6. **[no] mpls control-word**
7. **exit**

## DETAILED STEPS

|        | Command or Action                             | Purpose                                                                              |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br>Router> enable             | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                    |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                      |

|        | Command or Action                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>interface</b> <i>ethernet-type interface-number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet 1/0                                                                                              | Enters interface configuration mode for the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 4 | <b>xconnect</b> <i>peer-ip-address vcid encapsulation</i><br><b>mpls manual pw-class class-name</b><br><br><b>Example:</b><br>Router(config-if)# xconnect 10.131.191.252 100 encapsulation mpls manual pw-class mpls | Configures a static AToM pseudowire and enters xconnect configuration mode where the local and remote pseudowire labels are set.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 5 | <b>mpls label</b> <i>local-pseudowire-label remote-pseudowire-label</i><br><br><b>Example:</b><br>Router(config-if-xconn)# mpls label 100 150                                                                        | Sets the local and remote pseudowire labels. <ul style="list-style-type: none"> <li>The label must be an unused static label within the static label range configured using the <b>mpls label range</b> command.</li> <li>The <b>mpls label</b> command checks the validity of the label entered and displays an error message if it is not valid. The label supplied for the <i>remote-pseudowire-label</i> argument must be the value of the peer PE's local pseudowire label.</li> </ul>                                                                             |
| Step 6 | <b>[no] mpls control-word</b><br><br><b>Example:</b><br>Router(config-if-xconn)# no mpls control-word                                                                                                                | Sets whether the MPLS control word is sent. <ul style="list-style-type: none"> <li>This command must be set for Frame Relay data-link connection identifier (DLCI) and ATM adaptation layer 5 (AAL5) attachment circuits. For other attachment circuits, the control word is included by default.</li> <li>If you enable inclusion of the control word, it must be enabled on both ends of the connection for the circuit to work properly.</li> <li>Inclusion of the control word can be explicitly disabled using the <b>no mpls control-word</b> command.</li> </ul> |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if-xconn)# exit                                                                                                                                                  | Exits the configuration mode. <ul style="list-style-type: none"> <li>Continue entering the <b>exit</b> command at the router prompt until you reach the desired configuration mode.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                          |

## Verifying the AToM Static Pseudowire Configuration

To verify the AToM static pseudowire configuration, use the **show running-config EXEC** command. To verify that the AToM static pseudowire was provisioned correctly, use the **show mpls l2transport vc detail** and **ping mpls pseudowire** EXEC commands as described in the following steps.

### SUMMARY STEPS

1. **show mpls l2transport vc detail**
2. **ping mpls pseudowire *ipv4-address* *vc-id* *vc-id***

### DETAILED STEPS

#### Step 1 **show mpls l2transport vc detail**

For nonstatic pseudowire configurations, this command lists the type of protocol used to send the MPLS labels (such as LDP). For static pseudowire configuration, the value of the signaling protocol field should be Manual. Following is sample output:

```
Router# show mpls l2transport vc detail

Local interface: Et1/0 up, line protocol up, Ethernet up
  Destination address: 10.0.1.1, VC ID: 200, VC status: up
    Output interface: Et3/0, imposed label stack {17}
    Preferred path: not configured
    Default path:
      Next hop: 10.0.0.2
  Create time: 00:27:27, last status change time: 00:27:24
  Signaling protocol: Manual
    MPLS VC labels: local 17, remote 17
    Group ID: local 0, remote 0
    MTU: local 1500, remote 1500
  Sequencing: receive disabled, send disabled
  VC statistics:
    packet totals: receive 193, send 193
    byte totals:   receive 19728, send 23554
    packet drops:  receive 0, send 0
```

#### Step 2 **ping mpls pseudowire *ipv4-address* *vc-id* *vc-id***

Because there is no directed control protocol exchange of parameters on a static pseudowire, both ends of the connection must be correctly configured. One way to detect mismatch of labels or control word options is to send an MPLS pseudowire LSP **ping** command as part of configuration task, and then reconfigure the connection if problems are detected. An exclamation point (!) is displayed when the **ping** command is successfully sent to its destination. An example of command use and output follows:

```
Router# ping mpls pseudowire 10.7.1.2 vc-id 1001

Sending 5, 100-byte MPLS Echos to 10.7.1.2,
  timeout is 2 seconds, send interval is 0 msec:

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
'L' - labeled output interface, 'B' - unlabeled output interface,
'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
'P' - no rx intf label prot, 'p' - premature termination of LSP,
'R' - transit router, 'I' - unknown upstream index,
'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

```
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
```

---

## Configuration Examples for AToM Static Pseudowire Provisioning

This section contains the following example:

- [Provisioning an AToM Pseudowire: Example, page 6](#)

### Provisioning an AToM Pseudowire: Example

The following examples show the configuration commands for an AToM static pseudowire connection between two PEs, PE1 and PE2.

The **mpls label range static** command must be used to configure the static label range prior to provisioning the AToM static pseudowire.

```
Router# configure terminal
Router(config)# mpls label range 200 16000 static 16 199
% Label range changes will take effect at the next reload.
```

The **mpls ip** command must also be configured on the core-facing interface of both PE1 and PE2 (which is also done for directed control protocol signaled pseudowires). Following is a configuration example:

```
Router(config)# interface Ethernet 0/0
Router(config-if)# description Backbone interface
Router(config-if)# ip address 10.0.0.1 255.255.255.0
Router(config-if)# mpls ip
Router(config-if)# exit
```

Following is an example AToM static pseudowire configuration for PE1:

```
Router(config)# interface Ethernet 1/0
Router(config-if)# no ip address
Router(config-if)# xconnect 10.131.191.251 100 encapsulation mpls manual pw-class mpls
Router(config-if-xconn)# mpls label 100 150
Router(config-if-xconn)# exit
```

Following is an example AToM static pseudowire configuration for PE2:

```
Router(config)# interface Ethernet 1/0
Router(config-if)# no ip address
Router(config-if)# xconnect 10.132.192.252 100 encapsulation mpls manual pw-class mpls
Router(config-if-xconn)# mpls label 150 100
Router(config-if-xconn)# exit
```

This feature also allows tunnel labels to be statically configured using the **mpls static binding ipv4 vrf** command. This means that there is no need to use a directed control protocol to provision tunnels and pseudowires. Refer to the [MPLS Static Labels](#) feature module and the [Cisco IOS Multiprotocol Label Switching Command Reference](#) for information about static labels and the **mpls static binding ipv4 vrf** command.

# Feature Information for AToM Static Pseudowire Provisioning

Table 1 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.2(1) or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for AToM Static Pseudowire Provisioning

# MPLS Pseudowire Status Signaling

---

**First Published: December 31, 2007**

**Last Updated: February 27, 2009**

The MPLS Pseudowire Status Signaling feature enables you to configure the router so it can send pseudowire status to a peer router, even when the attachment circuit is down. In releases prior to Cisco IOS 12.2(33)SRC, if the attachment circuit was down, the pseudowire status messages were not sent to the peer.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Pseudowire Status Signaling”](#) section on page 9.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Prerequisites for MPLS Pseudowire Status Signaling

- Before configuring this feature, make sure that both peer routers are capable of sending and receiving pseudowire status messages. Specifically, both routers should be running Cisco IOS Release 12.2(33)SRC and have the supported hardware installed.

## Restrictions for MPLS Pseudowire Status Signaling

- Both peer routers must support the ability to send and receive pseudowire status messages in label advertisement and label notification messages. If both peer routers do not support pseudowire status messages, Cisco recommends that you disable the messages with the **no status** command.
- This feature is not integrated with Any Transport over MPLS (AToM) Virtual Circuit Connection Verification (VCCV).
- This feature is not integrated with Bidirectional Forwarding Detection (BFD).
- The standby and required switchover values from IETF draft-muley-pwe3-redundancy-02.txt are not supported.
- For a list of supported hardware for this feature, see the release notes for your platform.

## Information About MPLS Pseudowire Status Signaling

Before configuring MPLS Pseudowire Status Signaling, you should understand the following concepts:

- [How MPLS Pseudowire Status Signaling Works](#)

## How MPLS Pseudowire Status Signaling Works

In releases prior to Cisco IOS Release 12.2(33)SRC, the control plane for AToM does not have the ability to provide pseudowire status. Therefore, when an attachment circuit (AC) associated with a pseudowire is down (or is forced down as part of the Pseudowire Redundancy functionality), labels advertised to peers are withdrawn. In Cisco IOS Release 12.2(33)SRC, the MPLS Pseudowire Status Signaling feature enables the AC status to be sent to the peer through the Label Distribution Protocol.

The pseudowire status messages are sent in label advertisement and label notification messages if the peer also supports the MPLS Pseudowire Status Signaling feature. You can issue the **show mpls l2transport vc detail** command to show that both the local and remote routers support pseudowire status messages. The following example shows the line of output to look for:

```
Router# show mpls l2transport vc detail
.
.
.
status TLV support (local/remote): enabled/supported
```

## When One Router Does Not Support MPLS Pseudowire Status Signaling

The peer routers must support the ability to send and receive pseudowire status messages in label advertisement and label notification messages. If one router does not support pseudowire status messages, Cisco recommends that you disable the messages with the **no status** command. This returns the router to label withdraw mode.

If the peer does not support the MPLS Pseudowire Status Signaling feature, the local router changes its mode of operation to label withdraw mode. You can issue the **show mpls l2transport vc detail** command to show that the remote router does not support pseudowire status messages. The following example shows the line of output to look for:

```
Router# show mpls l2transport vc detail
.
.
.
status TLV support (local/remote): enabled/not supported
```

When you issue the following **debug mpls l2transport vc** commands, the messages show that the peer router does not support the MPLS Pseudowire Status Signaling feature and that the local router is changing to withdraw mode, as shown in bold in the following example:

```
Router# debug mpls l2transport vc event
Router# debug mpls l2transport vc status event
Router# debug mpls l2transport vc status fsm
Router# debug mpls l2transport vc ldp

*Feb 26 13:41:40.707: ATOM LDP [110.1.1.2]: Sending label withdraw msg
*Feb 26 13:41:40.707: ATOM LDP [110.1.1.2]: VC Type 5, mtu 1500
*Feb 26 13:41:40.707: ATOM LDP [110.1.1.2]: VC ID 100, label 18
*Feb 26 13:41:40.707: ATOM LDP [110.1.1.2]: Status 0x0000000A [PW Status NOT supported]
```

## Status Messages Indicating That the Attachment Circuit Is Down

When the attachment circuit is down between the two routers, the output of the **show mpls l2transport vc detail** command shows the following status:

```
Router# show mpls l2transport vc detail
.
.
.
Last remote LDP TLV      status rcvd: AC DOWN(rx,tx faults)
```

The debug messages also indicate that the attachment circuit is down, as shown in bold in the command output:

```
Router# debug mpls l2transport vc event
Router# debug mpls l2transport vc status event
Router# debug mpls l2transport vc status fsm
Router# debug mpls l2transport vc ldp

*Feb 26 11:51:42.427: ATOM LDP [10.1.1.1]: Received notif msg, id 88
*Feb 26 11:51:42.427: ATOM LDP [10.1.1.1]: Status 0x00000007 [PW Status]
*Feb 26 11:51:42.427: ATOM LDP [10.1.1.1]: PW Status 0x00000006 [AC DOWN(rx,tx faults)]
```

Other pseudowire status messages include not-forwarding, pw-tx-fault, and pw-rx-fault.

## Message Codes in the Pseudowire Status Messages

The **debug mpls l2transport vc** and the **show mpls l2transport vc detail** commands show output that contains message codes. For example:

```
Label/status state machine: established, LruRru
```

```
AToM MGR [10.9.9.9, 100]: S:Evt local up, LndRru->LnuRru
```

The message codes (LruRru, LndRru, and LnuRru) indicate the status of the local and remote routers. You can use the following key to interpret the message codes:

L—local router

R—remote router

r or n—ready (r) or not ready (n)

u or d—up (u) or down (d) status

The output also includes other values:

D—Dataplane

S—Local shutdown

## How to Configure MPLS Pseudowire Status Signaling

This section explains how to perform the following tasks:

- [Enabling MPLS Pseudowire Status Signaling, page 4](#) (required)

### Enabling MPLS Pseudowire Status Signaling

Perform the following task to enable the router to send pseudowire status to a peer router even when the attachment circuit is down. If both routers do not support pseudowire status messages, then disable the messages with the **no status** command.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **pseudowire-class *name***
4. **status**
5. **encapsulation mpls**
6. **exit**
7. **exit**
8. **show mpls l2transport vc detail**

## DETAILED STEPS

|        | Command or Action                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 3 | <b>pseudowire-class name</b><br><br><b>Example:</b><br>Router(config)# pseudowire-class atom             | Establishes a pseudowire class with a name that you specify and enters pseudowire class configuration mode.                                                                                                                                                                                                                                                                                                                        |
| Step 4 | <b>status</b><br><br><b>Example:</b><br>Router(config-pw)# status                                        | (Optional) Enables the router to send pseudowire status messages to the peer router through label advertisement and label notification messages.<br><br><b>Note</b> By default, status messages are enabled. This step is included only in case status messages have been disabled.<br><br>If you need to disable status messages because both peer routers do not support this functionality, enter the <b>no status</b> command. |
| Step 5 | <b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-pw)# encapsulation mpls                | Specifies the tunneling encapsulation.                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config-pw)# exit                                            | Exits pseudowire class configuration mode.                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                               | Exits global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 8 | <b>show mpls l2transport vc detail</b><br><br><b>Example:</b><br>Router# show mpls l2transport vc detail | Validates that pseudowire messages can be sent and received.                                                                                                                                                                                                                                                                                                                                                                       |

## Configuration Examples for MPLS Pseudowire Status Signaling

This section contains the following examples:

[MPLS Pseudowire Status Signaling: Example](#)

[MPLS Pseudowire Status Signaling: Example](#)

## MPLS Pseudowire Status Signaling: Example

The following example configures the MPLS Pseudowire Status Signaling feature on two PE routers. By default, status messages are enabled. The **status** command is included in this example in case status messages have been disabled.

### PE1

```
interface Loopback0
 ip address 10.1.1.1 255.255.255.255
!
pseudowire-class atomstatus
 encapsulation mpls
 status
!
interface GigabitEthernet10/5
 xconnect 10.1.1.2 123 pw-class atomstatus
```

### PE2

```
interface Loopback0
 ip address 10.1.1.2 255.255.255.255
!
pseudowire-class atomstatus
 encapsulation mpls
 status
!
interface GigabitEthernet3/3
 xconnect 10.1.1.1 123 pw-class atomstatus
```

## Verifying That Both Routers Support Pseudowire Status Messages: Example

You can issue the **show mpls l2transport vc detail** command to show that both the local and remote routers support pseudowire status messages. The following example shows the line of output to look for:

```
Router# show mpls l2transport vc detail
.
.
.
status TLV support (local/remote): enabled/supported
```

# Additional References

The following sections provide references related to the MPLS Pseudowire Status Signaling feature.

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup>.

- **debug mpls l2transport vc**
- **show mpls l2transport vc**
- **status (pseudowire class)**

# Feature Information for MPLS Pseudowire Status Signaling

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Pseudowire Status Signaling

| Feature Name | Releases | Feature Information       |
|--------------|----------|---------------------------|
|              |          | Cisco 7600 series router. |

# L2VPN Interworking

---

**First Published: August 26, 2003**

**Last Updated: November 20, 2009**

Layer 2 Virtual Private Network (L2VPN) Interworking allows you to connect disparate attachment circuits. This feature module explains how to configure the following L2VPN Interworking features:

- Ethernet/VLAN to ATM AAL5 Interworking
- Ethernet/VLAN to Frame Relay Interworking
- Ethernet/VLAN to PPP Interworking
- Ethernet to VLAN Interworking
- Frame Relay to ATM AAL5 Interworking
- Frame Relay to PPP Interworking
- Ethernet/VLAN to ATM virtual channel identifier (VPI) and virtual channel identifier (VCI) Interworking
- L2VPN Interworking: VLAN Enable/Disable Option for AToM

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for L2VPN Interworking”](#) section on page 31.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Contents

- [Prerequisites for L2VPN Interworking, page 2](#)

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Restrictions for L2VPN Interworking, page 2](#)
- [Information About L2VPN Interworking, page 11](#)
- [How to Configure L2VPN Interworking, page 15](#)
- [Configuration Examples for L2VPN Interworking, page 21](#)
- [Additional References, page 28](#)
- [Feature Information for L2VPN Interworking, page 31](#)

## Prerequisites for L2VPN Interworking

Before you configure L2VPN Interworking on a router:

- You must enable Cisco Express Forwarding.
- On the Cisco 12000 series Internet router, before you configure Layer 2 Tunnel Protocol version 3 (L2TPv3) for L2VPN Interworking on an IP Services Engine (ISE/Engine 3) or Engine 5 interface, you must also enable the L2VPN feature bundle on the line card.

To enable the feature bundle, enter the **hw-module slot np mode feature** command in global configuration mode as follows:

```
Router# configure terminal
Router(config)# hw-module slot slot-number np mode feature
```

## Restrictions for L2VPN Interworking

The following sections list the L2VPN Interworking restrictions:

- [General Restrictions, page 2](#)
- [Cisco 7600 Series Routers Restrictions, page 3](#)
- [Cisco 12000 Series Router Restrictions, page 5](#)
- [ATM AAL5 Interworking Restrictions, page 7](#)
- [Ethernet/VLAN Interworking Restrictions, page 8](#)
- [L2VPN Interworking: VLAN Enable/Disable Option for AToM Restrictions, page 9](#)
- [Frame Relay Interworking Restrictions, page 10](#)
- [PPP Interworking Restrictions, page 11](#)

## General Restrictions

This section lists general restrictions that apply to L2VPN Interworking. Other restrictions that are platform-specific or device-specific are listed in the following sections.

- The interworking type on one provider edge (PE) router must match the interworking type on the peer PE router.
- The following quality of service (QoS) features are supported with L2VPN Interworking:
  - Static IP type of service (ToS) or Multiprotocol Label Switching (MPLS) experimental bit (EXP) setting in tunnel header

- IP ToS reflection in tunnel header (Layer 2 Tunnel Protocol Version 3 (L2TPv3) only)
- Frame Relay policing
- Frame Relay data-link connection identifier (DLCI)-based congestion management (Cisco 7500/Versatile Interface Processor (VIP))
- One-to-one mapping of VLAN priority bits to MPLS EXP bits
- Only ATM AAL5 VC mode is supported; ATM VP and port mode are not supported.

## Cisco 7600 Series Routers Restrictions

The following line cards are supported on the Cisco 7600 series router. [Table 1](#) shows the line cards that are supported on the WAN (ATM, Frame Relay, or PPP) side of the interworking link. [Table 2](#) shows the line cards that are supported on the Ethernet side of the interworking link. For more details on the Cisco 7600 routers supported shared port adapters and line cards, see the following documents:

- [Cisco 7600 Series Routers Documentation Roadmap](#)
- [Release Notes for Cisco IOS Release 12.2SR for the Cisco 7600 Series Routers](#)

**Table 1** Cisco 7600 Series Routers: Supported Line Cards for the WAN Side

| Interworking Type                           | Core-Facing Line Cards | Customer-Edge Line Cards       |
|---------------------------------------------|------------------------|--------------------------------|
| Ethernet (bridged)<br>(ATM and Frame Relay) | Any                    | EflexWAN<br>SIP-200<br>SIP-400 |
| IP (routed)<br>(ATM, Frame Relay, and PPP)  | Any                    | EflexWAN<br>SIP-200            |

**Table 2** Cisco 7600 Series Routers: Supported Line Cards for the Ethernet Side

| Interworking Type  | Ethernet over MPLS Mode                | Core-Facing Line Cards                                     | Customer-Edge Line Cards                                                                                    |
|--------------------|----------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| Ethernet (bridged) | Policy feature card (PFC) based        | Any, except optical service module (OSM) and ES40          | Catalyst LAN<br>SIP-600                                                                                     |
| Ethernet (bridged) | Switched virtual interface (SVI) based | EflexWAN<br>ES20<br>ES+40<br>SIP-200<br>SIP-400<br>SIP-600 | Catalyst LAN<br>EflexWAN (with MPB)<br>ES20<br>ES+40<br>SIP-200 (with MPB)<br>SIP-400 (with MPB)<br>SIP-600 |
| Ethernet (bridged) | Scalable (with E-MPB)                  | Any, except OSM                                            | ES20<br>SIP-600 and SIP-400 with Gigabit Ethernet (GE) SPA                                                  |

**Table 2** *Cisco 7600 Series Routers: Supported Line Cards for the Ethernet Side (continued)*

| Interworking Type | Ethernet over MPLS Mode | Core-Facing Line Cards                                                                                                                                                                                                                 | Customer-Edge Line Cards                                                                                                                                                            |
|-------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IP (routed)       | PFC-based               | Catalyst LAN SIP-600<br><br><b>Note:</b> PFC-based mode is not supported with routed interworking in Cisco IOS Release 12.2(33)SRD. Use SVI, Scalable, or Ethernet virtual connection (EVC) based Ethernet over MPLS (EoMPLS) instead. | Catalyst LAN SIP-600<br><br><b>Note:</b> PFC-based mode is not supported with routed interworking in Cisco IOS Release 12.2(33)SRD. Use SVI, Scalable, or EVC-based EoMPLS instead. |
| IP (routed)       | SVI-based               | Any, except Catalyst LAN and OSM.                                                                                                                                                                                                      | Catalyst LAN EflexWAN (with MPB) ES20<br>SIP-200 (with MPB)<br>SIP-400 (with MPB)<br>SIP-600                                                                                        |

The following restrictions apply to the Cisco 7600 series routers and L2VPN Interworking:

- OAM Emulation is not supported with L2VPN Interworking on the SIP-200, SIP-400, and Flexwan2 line cards.
- Cisco 7600 series routers support the L2VPN Interworking: VLAN Enable/Disable Option for AToM feature starting in Cisco IOS Release 12.2(33)SRE. This feature has the following restrictions:
  - PFC-based EoMPLS is not supported.
  - Scalable and SVI-based EoMPLS are supported with the SIP-400 line card.
- The Cisco 7600 series routers do not support L2VPN Interworking over L2TPv3.
- Cisco 7600 series routers support only the following interworking types:
  - Ethernet/VLAN to Frame Relay (IP and Ethernet modes)
  - Ethernet/VLAN to ATM AAL5SNAP (IP and Ethernet modes)
  - Ethernet/VLAN to PPP (IP only)
  - Ethernet to VLAN Interworking
- Cisco 7600 series routers do not support the following interworking types:
  - Ethernet/VLAN to ATM AAL5MUX
  - Frame Relay to PPP Interworking
  - Frame Relay to ATM AAL5 Interworking
- Both ends of the interworking link must be configured with the same encapsulation and interworking type:

- If you use Ethernet encapsulation, you must use the Ethernet (bridged) interworking type. If you are not using Ethernet encapsulation, you can use a bridging mechanism, such as routed bridge encapsulation (RBE).
- If you use an IP encapsulation (such as ATM or Frame Relay), you must use the IP (routed) interworking type. The PE routers negotiate the process for learning and resolving addresses.
- You must use the same MTU size on the attachment circuits at each end of the pseudowire.
- PFC-based EoMPLS is not supported on ES40 line cards. SVI and EVC/scalable EoMPLS are the alternative options.
- PFC-based EoMPLS is not supported for Routed/IP interworking in Cisco IOS Release 12.2(33)SRD and later releases. The alternative Routed/IP interworking options are SVI and EVC or scalable EoMPLS. However, PFC-based EoMPLS is supported for Ethernet/Bridged interworking and for like-to-like over AToM.

## Cisco 12000 Series Router Restrictions

For more information about hardware requirements on the Cisco 12000 series routers, see the [Cross-Platform Release Notes for Cisco IOS Release 12.0S](#).

For QoS support on the Cisco 12000 series routers, see [Any Transport over MPLS \(AToM\): Layer 2 QoS \(Quality of Service\) for the Cisco 12000 Series Router](#)

### Frame Relay to PPP and High-Level Data Link Control Interworking

The Cisco 12000 series Internet router does not support L2VPN Interworking with PPP and high-level data link control (HDLC) transport types in Cisco IOS releases earlier than Cisco IOS Release 12.0(32)S.

In Cisco IOS Release 12.0(32)S and later releases, the Cisco 12000 series Internet router supports L2VPN interworking for Frame Relay over MPLS and PPP and HDLC over MPLS only on the following shared port adapters (SPAs):

- ISE/Engine 3 SPAs:
  - SPA-2XCT3/DS0 (2-port channelized T3 to DS0)
  - SPA-4XCT3/DS0 (4-port channelized T3 to DS0)
- Engine 5 SPAs:
  - SPA-1XCHSTM1/OC-3 (1-port channelized STM-1c/OC-3c to DS0)
  - SPA-8XCHT1/E1 (8-port channelized T1/E1)
  - SPA-2XOC-48-POS/RPR (2-port OC-48/STM16 POS/RPR)
  - SPA-OC-192POS-LR (1-port OC-192/STM64 POS/RPR)
  - SPA-OC-192POS-XFP (1-port OC-192/STM64 POS/RPR)

### L2VPN Interworking over L2TPv3

On the Cisco 12000 series Internet router, Ethernet (bridged) interworking is not supported for L2TPv3. Only IP (routed) interworking is supported.

IP (routed) interworking is not supported in an L2TPv3 pseudowire that is configured for data sequencing (using the **sequencing** command).

In Cisco IOS Release 12.0(32)SY and later releases, the Cisco 12000 series Internet router supports L2VPN Interworking over L2TPv3 tunnels in IP mode on ISE and Engine 5 line cards as follows:

- On an ISE interface configured for L2TPv3 tunneling, the following Layer 2 encapsulations are supported:
  - ATM adaptation layer type-5 (AAL5)
  - Ethernet
  - 802.1q (VLAN)
  - Frame Relay DLCI
- On an Engine 5 interface configured for L2TPv3 tunneling, the following Layer 2 encapsulations are supported:
  - Ethernet
  - 802.1q (VLAN)
  - Frame Relay DLCI

For more information, refer to [Layer 2 Tunnel Protocol Version 3](#).

The only frame format supported for L2TPv3 interworking on Engine 5 Ethernet SPAs is Ethernet Version 2 (also known as Ethernet II) with the Ether type 0x0800 value set as Internet Protocol Payload and (optionally) 802.1q VLAN. Ethernet packets with other Ethernet frame formats are dropped.

#### Remote Ethernet Port Shutdown Support

The Cisco Remote Ethernet Port Shutdown feature (which minimizes potential data loss after a remote link failure) is supported only on the following Engine 5 Ethernet SPAs:

- SPA-8XFE (8-port Fast Ethernet)
- SPA-2X1GE (2-port Gigabit Ethernet)
- SPA-5X1GE (5-port Gigabit Ethernet)
- SPA-10X1GE (10-port Gigabit Ethernet)
- SPA-1X10GE (1-port 10-Gigabit Ethernet)

For more information about this feature, refer to [Any Transport over MPLS \(AToM\): Remote Ethernet Port Shutdown](#).

#### L2VPN Any-to-Any Interworking on Engine 5 Line Cards

[Table 3](#) shows the different combinations of transport types supported for L2VPN interworking on Engine 3 and Engine 5 SPA interfaces connected through an attachment circuit over MPLS or L2TPv3.

**Table 3 Engine 3 and Engine 5 Line Cards/SPAs Supported for L2VPN Interworking**

| Attachment Circuit 1 (AC1) | Attachment Circuit 2 (AC2) | Interworking Mode | AC1 Engine Type and Line Card/SPA | AC2 Engine Type and Line Card/SPA |
|----------------------------|----------------------------|-------------------|-----------------------------------|-----------------------------------|
| Frame Relay                | Frame Relay                | IP                | Engine 5<br>POS and channelized   | Engine 3<br>ATM line cards        |
| Frame Relay                | ATM                        | Ethernet          | Engine 5<br>POS and channelized   | Engine 3<br>ATM line cards        |
| Frame Relay                | ATM                        | IP                | Engine 5<br>POS and channelized   | Engine 3<br>ATM line cards        |
| Frame Relay                | Ethernet                   | Ethernet          | Engine 5<br>POS and channelized   | Engine 5<br>Gigabit Ethernet      |

**Table 3**      **Engine 3 and Engine 5 Line Cards/SPAs Supported for L2VPN Interworking**

| <b>Attachment Circuit 1 (AC1)</b> | <b>Attachment Circuit 2 (AC2)</b> | <b>Interworking Mode</b> | <b>AC1 Engine Type and Line Card/SPA</b> | <b>AC2 Engine Type and Line Card/SPA</b> |
|-----------------------------------|-----------------------------------|--------------------------|------------------------------------------|------------------------------------------|
| Frame Relay                       | Ethernet                          | IP                       | Engine 5<br>POS and channelized          | Engine 5<br>Gigabit Ethernet             |
| Frame Relay                       | VLAN                              | Ethernet                 | Engine 5<br>POS and channelized          | Engine 5<br>Gigabit Ethernet             |
| Frame Relay                       | VLAN                              | IP                       | Engine 5<br>POS and channelized          | Engine 5<br>Gigabit Ethernet             |
| Ethernet                          | Ethernet                          | Ethernet                 | Engine 5<br>Gigabit Ethernet             | Engine 5<br>Gigabit Ethernet             |
| Ethernet                          | Ethernet                          | IP                       | Engine 5<br>Gigabit Ethernet             | Engine 5<br>Gigabit Ethernet             |
| Ethernet                          | VLAN                              | Ethernet                 | Engine 5<br>Gigabit Ethernet             | Engine 5<br>Gigabit Ethernet             |
| Ethernet                          | VLAN                              | IP                       | Engine 5<br>Gigabit Ethernet             | Engine 5<br>Gigabit Ethernet             |
| ATM                               | Ethernet                          | Ethernet                 | Engine 3<br>ATM line cards               | Engine 5<br>Gigabit Ethernet             |
| ATM                               | Ethernet                          | IP                       | Engine 3<br>ATM line cards               | Engine 5<br>Gigabit Ethernet             |

On the Cisco 12000 series Engine 3 line card, Network Layer Protocol ID (NLPID) encapsulation is not supported in routed mode; and neither NLPID nor AAL5MUX is supported in bridged mode.

- On the Cisco 12000 series Internet router, Ethernet (bridged) interworking is not supported for L2TPv3.

In an L2VPN Interworking configuration, after you configure L2TPv3 tunnel encapsulation for a pseudowire using the **encapsulation l2tpv3** command, you cannot enter the **interworking ethernet** command.

- On Ethernet SPAs on the Cisco 12000 series Internet router, the only frame format supported for L2TPv3 interworking is Ethernet Version 2 (also known as Ethernet II) with the Ether type 0x0800 value set as Internet Protocol Payload and [optionally] 802.1q VLAN.

Ethernet packets with other Ethernet frame formats are dropped.

## ATM AAL5 Interworking Restrictions

The following restrictions apply to ATM AAL5 Interworking:

- Switched virtual circuits (SVCs) are not supported.
- Inverse Address Resolution Protocol (ARP) is not supported with IP interworking.
- Customer edge (CE) routers must use point-to-point subinterfaces or static maps.
- Both AAL5MUX and AAL5SNAP encapsulation are supported. In the case of AAL5MUX, no translation is needed.
- In the Ethernet end-to-end over ATM scenario, the following translations are supported:

- Ethernet without LAN frame check sequence (FCS) (AAAA030080C200070000)
- Spanning tree (AAAA030080c2000E)

Everything else is dropped.

- In the IP over ATM scenario, the IPv4 (AAAA030000000800) translation is supported. Everything else is dropped.
- Operation, Administration, and Management (OAM) emulation for L2VPN Interworking is the same as like-to-like. The end-to-end F5 loopback cells are looped back on the PE router. When the pseudowire is down, an F5 end-to-end segment Alarm Indication Signal (AIS)/Remote Defect Identification (RDI) is sent from the PE router to the CE router.
- Interim Local Management Interface (ILMI) can manage virtual circuits (VCs) and permanent virtual circuits (PVCs).
- To enable ILMI management, configure ILMI PVC 0/16 on the PE router's ATM interface. If a PVC is provisioned or deleted, an ilmiVCCChange trap is sent to the CE router.
- Only the user side of the User-Network Interface (UNI) is supported; the network side of the UNI is not supported.

## Ethernet/VLAN Interworking Restrictions

The following restrictions apply to Ethernet/VLAN interworking:

- When you configure VLAN to Ethernet interworking, VLAN to Frame Relay (routed), or ATM using Ethernet (bridged) interworking, the PE router on the Ethernet side that receives a VLAN tagged frame from the CE router removes the VLAN tag. In the reverse direction, the PE router adds the VLAN tag to the frame before sending the frame to the CE router.  
(If you enable the L2VPN Interworking: VLAN Enable/Disable Option for AToM feature with the **interworking vlan** command, VLAN ID is included as part of the Ethernet frame. See the [“VLAN Interworking” section on page 13](#) for more information. )
- In bridged interworking from VLAN to Frame Relay, the Frame Relay PE router does not strip off VLAN tags from the Ethernet traffic it receives.
- The Cisco 10720 Internet router supports Ethernet to VLAN Interworking Ethernet only over L2TPv3.
- Ethernet interworking for a raw Ethernet port or a VLAN trunk is not supported. Traffic streams are not kept separate when traffic is sent between transport types.
- In routed mode, only one CE router can be attached to an Ethernet PE router.
- There must be a one-to-one relationship between an attachment circuit and the pseudowire. Point-to-multipoint or multipoint-to-point configurations are not supported.
- Configure routing protocols for point-to-point operation on the CE routers when configuring an Ethernet to non-Ethernet setup.
- In the IP interworking mode, the IPv4 (0800) translation is supported. The PE router captures ARP (0806) packets and responds with its own MAC address (proxy ARP). Everything else is dropped.
- The Ethernet or VLAN must contain only two IP devices: PE router and CE router. The PE router performs proxy ARP and responds to all ARP requests it receives. Therefore, only one CE and one PE router should be on the Ethernet or VLAN segment.
- If the CE routers are doing static routing, you can perform the following tasks:

- The PE router needs to learn the MAC address of the CE router to correctly forward traffic to it. The Ethernet PE router sends an Internet Control Message Protocol (ICMP) Router discovery protocol (RDP) solicitation message with the source IP address as zero. The Ethernet CE router responds to this solicitation message. To configure the Cisco CE router's Ethernet or VLAN interface to respond to the ICMP RDP solicitation message, issue the **ip irdp** command in interface configuration mode. If you do not configure the CE router, traffic is dropped until the CE router sends traffic toward the PE router.
- To disable the CE routers from running the router discovery protocol, issue the **ip irdp maxadvertinterval 0** command in interface mode.
- This restriction applies if you configure interworking between Ethernet and VLAN with Catalyst switches as the CE routers. The spanning tree protocol is supported for Ethernet interworking. Ethernet interworking between an Ethernet port and a VLAN supports spanning tree protocol only on VLAN 1. Configure VLAN 1 as a nonnative VLAN.
- When you change the interworking configuration on an Ethernet PE router, clear the ARP entry on the adjacent CE router so that it can learn the new MAC address. Otherwise, you might experience traffic drops.

## L2VPN Interworking: VLAN Enable/Disable Option for AToM Restrictions

The following restrictions apply to the L2VPN Interworking: VLAN Enable/Disable Option for AToM feature, which allows the VLAN ID to be included as part of the Ethernet frame:

- The L2VPN Interworking: VLAN Enable/Disable Option for AToM feature is supported on the following releases:
  - Cisco IOS release 12.2(52)SE for the Cisco Catalyst 3750 Metro switches
  - Cisco IOS Release 12.2(33)SRE for the Cisco 7600 series routers
- L2VPN Interworking: VLAN Enable/Disable Option for AToM is not supported with L2TPv3. You can configure the feature only with AToM.
- If the interface on the PE router is a VLAN interface, it is not necessary to specify the **interworking vlan** command on that PE router.
- The L2VPN Interworking: VLAN Enable/Disable Option for AToM feature works only with the following attachment circuit combinations:
  - Ethernet to Ethernet
  - Ethernet to VLAN
  - VLAN to VLAN
- If you specify an interworking type on a PE router, that interworking type must be enforced. The interworking type must match on both PE routers. Otherwise, the VC may be in an incompatible state and remain in the down state. If the attachment circuit (AC) is VLAN, the PE router can negotiate (autosense) the VC type using Label Distribution Protocol (LDP).

For example, both PE1 and PE2 use Ethernet interfaces, and VLAN interworking is specified on PE1 only. PE2 is not configured with an interworking type and cannot autosense the interworking type. The result is an incompatible state where the VC remains in the down state.

On the other hand, if PE1 uses an Ethernet interface and VLAN interworking is enabled (which will enforce VLAN as the VC type), and PE2 uses a VLAN interface and interworking is not enabled (which causes PE2 to use Ethernet as its default VC type), PE2 can autosense and negotiate the interworking type and select VLAN as the VC type.

Table 4 summarizes shows the AC types, interworking options, and VC types after negotiation.

**Table 4** *Negotiating Ethernet and VLAN Interworking Types*

| PE1 AC Type | Interworking Option | PE2 AC Type | Interworking Option | VC Type after Negotiation |
|-------------|---------------------|-------------|---------------------|---------------------------|
| Ethernet    | none                | Ethernet    | none                | Ethernet                  |
| Vlan        | none                | Ethernet    | none                | Ethernet                  |
| Ethernet    | none                | Vlan        | none                | Ethernet                  |
| Vlan        | none                | Vlan        | none                | Ethernet                  |
| Ethernet    | Vlan                | Ethernet    | none                | Incompatible              |
| Vlan        | Vlan                | Ethernet    | none                | Incompatible              |
| Ethernet    | Vlan                | Vlan        | none                | Vlan                      |
| Vlan        | Vlan                | Vlan        | none                | Vlan                      |
| Ethernet    | none                | Ethernet    | Vlan                | Incompatible              |
| Vlan        | none                | Ethernet    | Vlan                | Vlan                      |
| Ethernet    | none                | Vlan        | Vlan                | Incompatible              |
| Vlan        | none                | Vlan        | Vlan                | Vlan                      |
| Ethernet    | Vlan                | Ethernet    | Vlan                | Vlan                      |
| Vlan        | Vlan                | Ethernet    | Vlan                | Vlan                      |
| Ethernet    | Vlan                | Vlan        | Vlan                | Vlan                      |
| Vlan        | Vlan                | Vlan        | Vlan                | Vlan                      |

## Frame Relay Interworking Restrictions

The following restrictions apply to Frame Relay interworking:

- The attachment circuit maximum transmission unit (MTU) sizes must match when you connect them over MPLS. By default, the MTU size associated with a Frame Relay DLCI is the interface MTU. This may cause problems, for example, when connecting some DLCIs on a PoS interface (with a default MTU of 4470 bytes) to Ethernet or VLAN (with a default MTU of 1500 bytes) and other DLCIs on the same PoS interface to ATM (with a default MTU of 4470 bytes). To avoid reducing all the interface MTUs to the lowest common denominator (1500 bytes in this case), you can specify the MTU for individual DLCIs using the **mtu** command.
- Only DLCI mode is supported. Port mode is not supported.
- Configure Frame Relay switching to use DCE or Network-to-Network Interface (NNI). DTE mode does not report status in the Local Management Interface (LMI) process. If a Frame Relay over MPLS circuit goes down and the PE router is in DTE mode, the CE router is never informed of the disabled circuit. You must configure the **frame-relay switching** command in global configuration mode in order to configure DCE or NNI.
- Frame Relay policing is non-distributed on the Cisco 7500 series routers. If you enable Frame Relay policing, traffic is sent to the route switch processor for processing.
- Inverse ARP is not supported with IP interworking. CE routers must use point-to-point subinterfaces or static maps.

- The PE router automatically supports translation of both the Cisco encapsulations and the Internet Engineering Task Force (IETF) encapsulations that come from the CE, but translates only to IETF when sending to the CE router. This is not a problem for the Cisco CE router, because it can handle IETF encapsulation on receipt even if it is configured to send Cisco encapsulation.
- With Ethernet interworking, the following translations are supported:
  - Ethernet without LAN FCS (0300800080C20007 or 6558)
  - Spanning tree (0300800080C2000E or 4242)

All other translations are dropped.

- With IP interworking, the IPv4 (03CC or 0800) translation is supported. All other translations are dropped.
- PVC status signaling works the same way as in like-to-like case. The PE router reports the PVC status to the CE router, based on the availability of the pseudowire. PVC status detected by the PE router will also be reflected into the pseudowire. LMI to OAM interworking is supported when you connect Frame Relay to ATM.

## PPP Interworking Restrictions

The following restrictions apply to PPP interworking:

- There must be a one-to-one relationship between a PPP session and the pseudowire. Multiplexing of multiple PPP sessions over the pseudowire is not supported.
- There must be a one-to-one relationship between a PPP session and a Frame Relay DLCI. Each Frame Relay PVC must have only one PPP session.
- Only IP (IPv4 (0021) interworking is supported. Link Control Protocol (LCP) packets and Internet Protocol Control Protocol (IPCP) packets are terminated at the PE router. Everything else is dropped.
- Proxy IPCP is automatically enabled on the PE router when IP interworking is configured on the pseudowire.
- By default, the PE router assumes that the CE router knows the remote CE router's IP address.
- Password Authentication Protocol (PAP) and Challenge-Handshake Authentication Protocol (CHAP) authentication are supported.

## Information About L2VPN Interworking

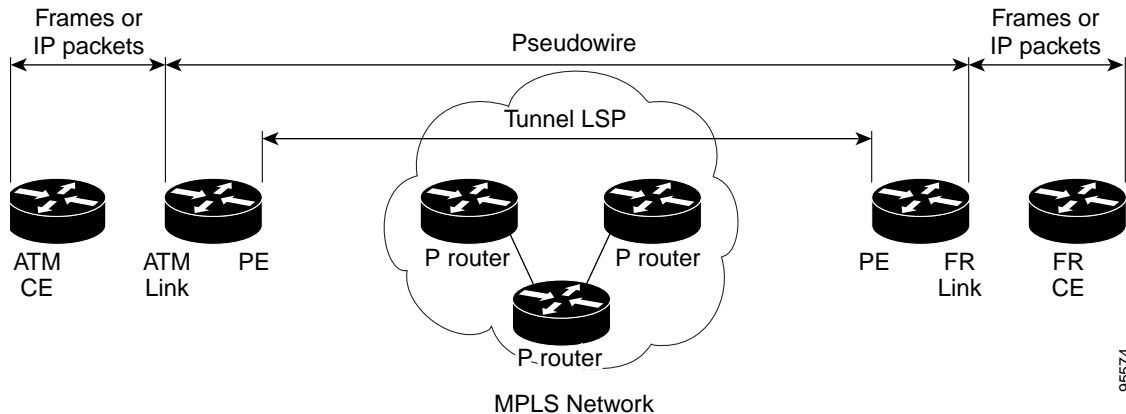

The following sections provide an introduction to L2VPN interworking.

- [Overview of L2VPN Interworking, page 12](#)
- [L2VPN Interworking Modes, page 12](#)
- [L2VPN Interworking: Support Matrix, page 14](#)
- [Static IP Addresses for L2VPN Interworking for PPP, page 14](#)

## Overview of L2VPN Interworking

Layer 2 transport over MPLS and IP already exists for like-to-like attachment circuits, such as Ethernet-to-Ethernet or PPP-to-PPP. L2VPN Interworking builds on this functionality by allowing disparate attachment circuits to be connected. An interworking function facilitates the translation between the different Layer 2 encapsulations. [Figure 1](#) is an example of Layer 2 interworking, where ATM and Frame Relay packets travel over the MPLS cloud.

**Figure 1** *ATM to Frame Relay Interworking Example*

The L2VPN Interworking feature supports Ethernet, 802.1Q (VLAN), Frame Relay, ATM AAL5, and PPP attachment circuits over MPLS and L2TPv3. The features and restrictions for like-to-like functionality also apply to L2VPN Interworking.

## L2VPN Interworking Modes

L2VPN Interworking works in either Ethernet (“bridged”) mode, IP (“routed”), or Ethernet VLAN mode. You specify the mode by issuing the **interworking {ethernet | ip | vlan}** command in pseudowire-class configuration mode.

### Ethernet (Bridged) Interworking

The **ethernet** keyword causes Ethernet frames to be extracted from the attachment circuit and sent over the pseudowire. Ethernet end-to-end transmission is assumed. Attachment circuit frames that are not Ethernet are dropped. In the case of VLAN, the VLAN tag is removed, leaving an untagged Ethernet frame.

Ethernet Interworking is also called bridged interworking. Ethernet frames are bridged across the pseudowire. The CE routers could be natively bridging Ethernet or could be routing using a bridged encapsulation model, such as Bridge Virtual Interface (BVI) or RBE. The PE routers operate in Ethernet like-to-like mode.

This mode is used to offer the following services:

95574

- LAN services—An example is an enterprise that has several sites, where some sites have Ethernet connectivity to the service provider (SP) network and others have ATM connectivity. The enterprise wants LAN connectivity to all its sites. In this case, traffic from the Ethernet or VLAN of one site can be sent through the IP/MPLS network and encapsulated as bridged traffic over an ATM VC of another site.
- Connectivity services—An example is an enterprise that has different sites that are running an Internal Gateway Protocol (IGP) routing protocol, which has incompatible procedures on broadcast and nonbroadcast links. The enterprise has several sites that are running an IGP, such as Open Shortest Path First (OSPF) or Intermediate System to Intermediate System (IS-IS), between the sites. In this scenario, some of the procedures (such as route advertisement or designated router) depend on the underlying Layer 2 protocol and are different for a point-to-point ATM connection versus a broadcast Ethernet connection. Therefore, the bridged encapsulation over ATM can be used to achieve homogenous Ethernet connectivity between the CE routers running the IGP.

## IP (Routed) Interworking

The **ip** keyword causes IP packets to be extracted from the attachment circuit and sent over the pseudowire. Attachment circuit frames that do not contain IPv4 packets are dropped.

IP Interworking is also called routed interworking. The CE routers encapsulate IP on the link between the CE and PE routers. A new VC type is used to signal the IP pseudowire in MPLS and L2TPv3. Translation between the Layer 2 and IP encapsulations across the pseudowire is required. Special consideration needs to be given to address resolution and routing protocol operation, because these are handled differently on different Layer 2 encapsulations.

This mode is used to provide IP connectivity between sites, regardless of the Layer 2 connectivity to these sites. It is different from a Layer 3 VPN because it is point-to-point in nature and the service provider does not maintain any customer routing information.

Address resolution is encapsulation dependent:

- Ethernet uses ARP
- Frame Relay and ATM use Inverse ARP
- PPP uses IPCP

Therefore, address resolution must be terminated on the PE router. End-to-end address resolution is not supported. Routing protocols operate differently over broadcast and point-to-point media. For Ethernet, the CE routers must either use static routing or configure the routing protocols to treat the Ethernet side as a point-to-point network.

## VLAN Interworking

The **vlan** keyword allows the VLAN ID to be included as part of the Ethernet frame. In Cisco IOS Release 12.2(52)SE, you can configure Catalyst 3750 Metro switches to use Ethernet VLAN for Ethernet (bridged) interworking. You can specify the Ethernet VLAN (type 4) by issuing the **interworking vlan** command in pseudowire-class configuration mode. This allows the VLAN ID to be included as part of the Ethernet frame. In releases previous to Cisco IOS Release 12.2(52)SE, the only way to achieve VLAN encapsulation is to ensure the CE router is connected to the PE router through an Ethernet VLAN interface/subinterface.

## L2VPN Interworking: Support Matrix

The supported L2VPN Interworking features are listed in [Table 5](#).

**Table 5** *L2VPN Interworking Supported Features*

| Feature                                                 | MPLS or L2TPv3 Support             | IP or Ethernet Support      |
|---------------------------------------------------------|------------------------------------|-----------------------------|
| Ethernet/VLAN to ATM AAL5                               | MPLS<br>L2TPv3 (12000 series only) | IP<br>Ethernet              |
| Ethernet/VLAN to Frame Relay                            | MPLS<br>L2TPv3                     | IP<br>Ethernet              |
| Ethernet/VLAN to PPP                                    | MPLS                               | IP                          |
| Ethernet to VLAN                                        | MPLS<br>L2TPv3                     | IP<br>Ethernet <sup>1</sup> |
| L2VPN Interworking: VLAN Enable/Disable Option for AToM | MPLS                               | Ethernet VLAN               |
| Frame Relay to ATM AAL5                                 | MPLS<br>L2TPv3 (12000 series only) | IP                          |
| Frame Relay to Ethernet or VLAN                         | MPLS<br>L2TPv3                     | IP<br>Ethernet              |
| Frame Relay to PPP                                      | MPLS<br>L2TPv3                     | IP                          |

**Note:** On the Cisco 12000 series Internet router:

- Ethernet (bridged) interworking is not supported for L2TPv3.
- IP (routed) interworking is not supported in an L2TPv3 pseudowire configured for data sequencing (using the **sequencing** command).

1. With the L2VPN Interworking: VLAN Enable/Disable Option for AToM feature, VLAN interworking can also be supported. For more information, see the [“VLAN Interworking”](#) section on page 13.

## Static IP Addresses for L2VPN Interworking for PPP

If the PE router needs to perform address resolution with the local CE router for PPP, you can configure the remote CE router's IP address on the PE router. Issue the **ppp ipcp address proxy** command with the remote CE router's IP address on the PE router's xconnect PPP interface. The following example shows a sample configuration:

```
pseudowire-class ip-interworking
 encapsulation mpls
 interworking ip

interface Serial2/0
 encapsulation ppp
 xconnect 10.0.0.2 200 pw-class ip-interworking
 ppp ipcp address proxy 10.65.32.14
```

You can also configure the remote CE router's IP address on the local CE router with the **peer default ip address** command if the local CE router performs address resolution.

# How to Configure L2VPN Interworking

The following sections explain the tasks you can perform to configure L2VPN Interworking:

- [Configuring L2VPN Interworking, page 15](#) (required)
- [Verifying the L2VPN Interworking Configuration, page 16](#) (optional)
- [Configuring L2VPN Interworking: VLAN Enable/Disable Option for AToM, page 19](#) (optional)

## Configuring L2VPN Interworking

L2VPN Interworking allows you to connect disparate attachment circuits. Configuring the L2VPN Interworking feature requires that you add the **interworking** command to the list of commands that make up the pseudowire. The steps for configuring the pseudowire for L2VPN Interworking are included in this section. You use the **interworking** command as part of the overall AToM or L2TPv3 configuration. For specific instructions on configuring AToM or L2TPv3, see the following documents:

- [Layer 2 Tunnel Protocol Version 3](#)
- [Any Transport over MPLS](#)

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **hw-module slot *slot-number* np mode feature**
4. **pseudowire-class *name***
5. **encapsulation {mpls | l2tpv3}**
6. **interworking {ethernet | ip | vlan}**

### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                                                            |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
|        | <b>Example:</b><br>Router> enable             |                                                                                                                    |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                                                  |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                                                    |

|               | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <pre>hw-module slot <i>slot-number</i> np mode feature</pre> <p><b>Example:</b><br/>Router(config)# hw-module slot 3 np mode feature</p> | <p>(Optional) Enables L2VPN Interworking functionality on the Cisco 12000 series router.</p> <p><b>Note</b> Enter this command only on a Cisco 12000 series Internet router if you use L2TPv3 for L2VPN Interworking on an ISE (Engine 3) or Engine 5 interface.<br/>In this case, you must first enable the L2VPN feature bundle on the line card by entering the <b>hw-module slot <i>slot-number</i> np mode feature</b> command.</p> |
| <b>Step 4</b> | <pre>pseudowire-class <i>name</i></pre> <p><b>Example:</b><br/>Router(config)# pseudowire-class class1</p>                               | Establishes a pseudowire class with a name that you specify and enters pseudowire class configuration mode.                                                                                                                                                                                                                                                                                                                              |
| <b>Step 5</b> | <pre>encapsulation {mpls   l2tpv3}</pre> <p><b>Example:</b><br/>Router(config-pw)# encapsulation mpls</p>                                | Specifies the tunneling encapsulation, which is either <b>mpls</b> or <b>l2tpv3</b> .                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 6</b> | <pre>interworking {ethernet   ip}   vlan}</pre> <p><b>Example:</b><br/>Router(config-pw)# interworking ip</p>                            | <p>Specifies the type of pseudowire and the type of traffic that can flow across it.</p> <p><b>Note</b> On the Cisco 12000 series Internet router, Ethernet (bridged) interworking is not supported for L2TPv3.<br/>After you configure the L2TPv3 tunnel encapsulation for the pseudowire using the <b>encapsulation l2tpv3</b> command, you cannot enter the <b>interworking ethernet</b> command.</p>                                 |

## Verifying the L2VPN Interworking Configuration

To verify the L2VPN Interworking configuration, you can use the following commands.

### SUMMARY STEPS

1. **enable**
1. **show l2tun session all**
2. **show arp**
3. **ping**
4. **show l2tun session interworking**
5. **show mpls l2transport vc detail**

### DETAILED STEPS

**Step 1**    **enable**

Enables privileged EXEC mode. Enter your password if prompted.

### Step 2 **show l2tun session all** (L2TPv3 only)

For L2TPv3, you can verify the L2VPN Interworking configuration using the **show l2tun session all** command on the PE routers.

In the following example, the interworking type is shown in bold.

| PE1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | PE2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>Router# show l2tun session all  Session Information Total tunnels 1 sessions 1  Session id 15736 is up, tunnel id 35411 Call serial number is 4035100045 Remote tunnel name is PE2   Internet address is 10.9.9.9   Session is L2TP signalled   Session state is established, time since change 1d22h   16 Packets sent, 16 received   1518 Bytes sent, 1230 received   Receive packets dropped:     out-of-order:      0     total:             0   Send packets dropped:     exceeded session MTU: 0     total:             0   Session vcid is 123   Session Layer 2 circuit, type is Ethernet,   name is FastEthernet1/1/0   Circuit state is UP   Remote session id is 26570, remote tunnel   id 46882   DF bit off, ToS reflect disabled, ToS value   0, TTL value 255   No session cookie information available   FS cached header information:     encaps size = 24 bytes     00000000 00000000 00000000 00000000     00000000 00000000   Sequencing is off</pre> | <pre>Router# show l2tun session all  Session Information Total tunnels 1 sessions 1  Session id 26570 is up, tunnel id 46882 Call serial number is 4035100045 Remote tunnel name is PE1   Internet address is 10.8.8.8   Session is L2TP signalled   Session state is established, time since change 1d22h   16 Packets sent, 16 received   1230 Bytes sent, 1230 received   Receive packets dropped:     out-of-order:      0     total:             0   Send packets dropped:     exceeded session MTU: 0     total:             0   Session vcid is 123   Session Layer 2 circuit, type is Ethernet Vlan, name is   FastEthernet2/0.1:10   Circuit state is UP, <b>interworking type is Ethernet</b>   Remote session id is 15736, remote tunnel id 35411   DF bit off, ToS reflect disabled, ToS value 0, TTL   value 255   No session cookie information available   FS cached header information:     encaps size = 24 bytes     00000000 00000000 00000000 00000000     00000000 00000000   Sequencing is off</pre> |

### Step 3 **show arp**

You can issue the **show arp** command between the CE routers to ensure that data is being sent:

```
Router# show arp
```

| Protocol | Address  | Age (min) | Hardware Addr  | Type | Interface       |
|----------|----------|-----------|----------------|------|-----------------|
| Internet | 10.1.1.5 | 134       | 0005.0032.0854 | ARPA | FastEthernet0/0 |
| Internet | 10.1.1.7 | -         | 0005.0032.0000 | ARPA | FastEthernet0/0 |

### Step 4 **ping**

You can issue the **ping** command between the CE routers to ensure that data is being sent:

```
Router# ping 10.1.1.5
```

```
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.1.1.5, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
```

**Step 5 show l2tun session interworking (L2TPv3 only)**

For L2TPv3, you can verify that the interworking type is correctly set using the **show l2tun session interworking** command. Enter the command on the PE routers that are performing the interworking translation.

- In Example 1, the PE router performs the raw Ethernet translation. The command output displays the interworking type with a dash (-).
- In Example 2, the PE router performs the Ethernet VLAN translation. The command output displays the interworking type as ETH.

**Example 1 Command Output for Raw Ethernet Translation**

```
Router# show l2tun session interworking

Session Information Total tunnels 1 sessions 1

LocID      TunID      Peer-address      Type IWrk Username, Intf/Vcid, Circuit
15736      35411      10.9.9.9          ETH  -   123,      Fa1/1/0
```

**Example 2 Command Output for Ethernet VLAN Translation**

```
Router# show l2tun session interworking

Session Information Total tunnels 1 sessions 1

LocID      TunID      Peer-address      Type IWrk Username, Intf/Vcid, Circuit
26570      46882      10.8.8.8          VLAN ETH  123,      Fa2/0.1:10
```

**Step 6 show mpls l2transport vc detail (AToM only)**

You can verify the AToM configuration by using the **show mpls l2transport vc detail** command. In the following example, the interworking type is shown in bold.

| PE1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | PE2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Configuring L2VPN Interworking: VLAN Enable/Disable Option for AToM

You can specify the Ethernet VLAN (type 4) by issuing the **interworking vlan** command in pseudowire-class configuration mode. This allows the VLAN ID to be included as part of the Ethernet frame. In releases previous to Cisco IOS Release 12.2(52)SE and Cisco IOS Release 12.2(33)SRE, the only way to achieve VLAN encapsulation is to ensure the CE router is connected to the PE router through an Ethernet link.

### Restrictions

In Cisco IOS Release 12.2(52)SE and Cisco IOS Release 12.2(33)SRE, the **encapsulation** command supports only the **mpls** keyword. The **l2tpv3** keyword is not supported. The **interworking** command supports only the **ethernet** and **vlan** keywords. The **ip** keyword is not supported.

### Prerequisites

For complete instructions on configuring AToM, see [Any Transport over MPLS](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **pseudowire-class** *name*
4. **encapsulation** { **mpls** | **l2tpv3** }
5. **interworking** { **ethernet** | **ip** | **vlan** }
6. **end**
7. **show mpls l2transport vc** [**vcid** *vc-id* | **vcid** *vc-id-min* *vc-id-max*] [**interface** *type number* [*local-circuit-id*]] [**destination** *ip-address* | *name*] [**detail**]

### DETAILED STEPS

|        | Command or Action                                          | Purpose                                                                                                     |
|--------|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                              | Enables privileged EXEC mode.                                                                               |
|        | <b>Example:</b><br>Router> enable                          | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                        |
| Step 2 | <b>configure terminal</b>                                  | Enters global configuration mode.                                                                           |
|        | <b>Example:</b><br>Router# configure terminal              |                                                                                                             |
| Step 3 | <b>pseudowire-class</b> <i>name</i>                        | Establishes a pseudowire class with a name that you specify and enters pseudowire class configuration mode. |
|        | <b>Example:</b><br>Router(config)# pseudowire-class class1 |                                                                                                             |

|               | Command or Action                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>encapsulation</b> { <b>mpls</b>   <b>l2tpv3</b> }<br><br><b>Example:</b><br>Router(config-pw)# encapsulation mpls                                                                                                                                                                                                       | Specifies the tunneling encapsulation, which is either <b>mpls</b> or <b>l2tpv3</b> . <ul style="list-style-type: none"> <li>For the L2VPN Interworking: VLAN Enable/Disable Option for AToM feature, only MPLS encapsulation is supported.</li> </ul> |
| <b>Step 5</b> | <b>interworking</b> { <b>ethernet</b>   <b>ip</b>   <b>vlan</b> }<br><br><b>Example:</b><br>Router(config-pw)# interworking vlan                                                                                                                                                                                           | Specifies the type of pseudowire and the type of traffic that can flow across it. <ul style="list-style-type: none"> <li>For the L2VPN Interworking: VLAN Enable/Disable Option for AToM feature, specify the <b>vlan</b> keyword.</li> </ul>          |
| <b>Step 6</b> | <b>end</b><br><br><b>Example:</b><br>Router(config-pw)# end                                                                                                                                                                                                                                                                | Exits pseudowire class configuration mode and enters privileged EXEC mode.                                                                                                                                                                             |
| <b>Step 7</b> | <b>show mpls l2transport vc</b> [ <b>vcid</b> <b>vc-id</b>   <b>vcid</b> <b>vc-id-min</b> <b>vc-id-max</b> ] [ <b>interface</b> <i>type number</i> [ <b>local-circuit-id</b> ]] [ <b>destination</b> <i>ip-address</i>   <i>name</i> ] [ <b>detail</b> ]<br><br><b>Example:</b><br>Router# show mpls l2transport vc detail | Displays information about AToM VCs.                                                                                                                                                                                                                   |

## Examples

When the pseudowire on an interface is different from the VC type, the interworking type is displayed in the **show mpls l2transport vc detail** command output. In the following example, the pseudowire is configured on an Ethernet port and VLAN interworking is configured in the pseudowire class. The relevant output is shown in bold:

```

PE1# show mpls l2 vc 34 detail

Local interface: Et0/1 up, line protocol up, Ethernet up
MPLS VC type is Ethernet, interworking type is Eth VLAN
Destination address: 10.1.1.2, VC ID: 34, VC status: down
Output interface: if-?(0), imposed label stack {}
Preferred path: not configured
Default path: no route
No adjacency
Create time: 00:00:13, last status change time: 00:00:13
Signaling protocol: LDP, peer unknown
Targeted Hello: 10.1.1.1(LDP Id) -> 10.1.1.2
Status TLV support (local/remote)   : enabled/None (no remote binding)
LDP route watch                     : enabled
Label/status state machine           : local standby, AC-ready, LnuRnd
Last local dataplane status rcvd: No fault
Last local SSS circuit status rcvd: No fault
Last local SSS circuit status sent: Not sent
Last local LDP TLV status sent: None
Last remote LDP TLV status rcvd: None (no remote binding)
Last remote LDP ADJ status rcvd: None (no remote binding)
MPLS VC labels: local 2003, remote unassigned
Group ID: local 0, remote unknown
MTU: local 1500, remote unknown
Remote interface description:
Sequencing: receive disabled, send disabled

```

```

VC statistics:
  packet totals: receive 0, send 0
  byte totals:   receive 0, send 0
  packet drops:  receive 0, seq error 0, send 0

```

## Configuration Examples for L2VPN Interworking

The following sections show examples of L2VPN Interworking:

- [Ethernet to VLAN over L2TPV3 \(Bridged\): Example, page 21](#)
- [Ethernet to VLAN over AToM \(Bridged\): Example, page 22](#)
- [Frame Relay to VLAN over L2TPV3 \(Routed\): Example, page 22](#)
- [Frame Relay to VLAN over AToM \(Routed\): Example, page 23](#)
- [Frame Relay to ATM AAL5 over AToM \(Routed\): Example, page 24](#)
- [VLAN to ATM AAL5 over AToM \(Bridged\): Example, page 25](#)
- [Frame Relay to PPP over L2TPv3 \(Routed\): Example, page 26](#)
- [Frame Relay to PPP over AToM \(Routed\): Example, page 27](#)
- [Ethernet/VLAN to PPP over AToM \(Routed\): Example, page 28](#)

## Frame Relay to ATM AAL5 over AToM (Routed): Example

**Note**

Frame Relay to ATM AAL5 is available only with AToM in IP mode.

The following example shows the configuration of Frame Relay to ATM AAL5 over AToM:

| PE1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | PE2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# Feature Information for L2VPN Interworking

Table 6 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

Table 6 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 6** Feature Information for L2VPN Interworking

| Feature Name       | Releases                                                                                                                                 | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The L2VPN Pseudowire Redundancy feature lets you configure your network to detect a failure in the network and reroute the Layer 2 (L2) service to another endpoint that can continue to provide service. This feature provides the ability to recover from a failure either of the remote provider edge (PE) router or of the link between the PE and customer edge (CE) routers.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for L2VPN Pseudowire Redundancy” section on page 14](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS, Catalyst OS, and Cisco IOS XE software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for L2VPN Pseudowire Redundancy

- This feature module requires that you understand how to configure basic L2 virtual private networks (VPNs). You can find that information in the following documents:
  - *Any Transport over MPLS*
  - *L2 VPN Interworking*
- The L2VPN Pseudowire Redundancy feature requires that the following mechanisms be in place to enable you to detect a failure in the network:
  - Label-switched paths (LSP) Ping/Traceroute and Any Transport over MPLS Virtual Circuit Connection Verification (AToM VCCV)
  - Local Management Interface (LMI)
  - Operation, Administration, and Maintenance (OAM)

## Restrictions for L2VPN Pseudowire Redundancy

### General Restrictions

- The primary and backup pseudowires must run the same type of transport service. The primary and backup pseudowires must be configured with AToM.
- Only static, on-box provisioning is supported.
- If you use L2VPN Pseudowire Redundancy with L2VPN Interworking, the interworking method must be the same for the primary and backup pseudowires.
- Setting the experimental (EXP) bit on the Multiprotocol Label Switching (MPLS) pseudowire is supported.
- Different pseudowire encapsulation types on the MPLS pseudowire are not supported.
- The **mpls l2transport route** command is not supported. Use the **xconnect** command instead.
- The ability to have the backup pseudowire fully operational at the same time that the primary pseudowire is operational is not supported. The backup pseudowire becomes active only after the primary pseudowire fails.
- The AToM VCCV feature is supported only on the active pseudowire.
- More than one backup pseudowire is not supported.

### Restrictions for Layer 2 Tunnel Protocol Version 3 (L2TPv3) Xconnect Configurations

- Interworking is not supported.
- Local switching backup by pseudowire redundancy is not supported.
- PPP, HDLC, and Frame-Relay attachment circuit (AC) types of L2TPv3 pseudowire redundancy are not supported.
- For the edge interface, only the Cisco 7600 series SPA Interface Processor-400 (SIP-400) linecard with the following shared port adapters (SPAs) is supported:
  - Cisco 2-Port Gigabit Ethernet Shared Port Adapter (SPA-2X1GE)
  - Cisco 2-Port Gigabit Ethernet Shared Port Adapter, Version 2 (SPA-2X1GE-V2)
  - Cisco 5-Port Gigabit Ethernet Shared Port Adapter, Version 2 (SPA-5X1GE-V2)
  - Cisco 10-Port Gigabit Ethernet Shared Port Adapter, Version 2 (SPA-10X1GE-V2)

Cisco 2-Port OC3c/STM1c ATM Shared Port Adapter (SPA-2XOC3-ATM)  
Cisco 4-Port OC3c/STM1c ATM Shared Port Adapter (SPA-4XOC3-ATM)  
Cisco 1-Port OC12c/STM4c ATM Shared Port Adapter (SPA-1XOC12-ATM)  
Cisco 1-Port OC-48c/STM-16 ATM Shared Port Adapter (SPA-1XOC48-ATM)

## Information About L2VPN Pseudowire Redundancy

Make sure that you understand the following concept before configuring the L2VPN Pseudowire Redundancy feature:

- [Introduction to L2VPN Pseudowire Redundancy](#), page 3

## Introduction to L2VPN Pseudowire Redundancy

L2VPNs can provide pseudowire resiliency through their routing protocols. When connectivity between end-to-end PE routers fails, an alternative path to the directed LDP session and the user data can take over. However, there are some parts of the network where this rerouting mechanism does not protect against interruptions in service. [Figure 1](#) shows those parts of the network that are vulnerable to an interruption in service.

**Figure 1**      *Points of Potential Failure in an L2VPN Network*

X1 = End-to-end routing failure  
X2 = PE hardware or software failure  
X3 = Attachment circuit failure from a line break  
X4 = CE hardware or software failure

135057

The L2VPN Pseudowire Redundancy feature provides the ability to ensure that the CE2 router in [Figure 1](#) can always maintain network connectivity, even if one or all the failures in the figure occur.

The L2VPN Pseudowire Redundancy feature enables you to set up backup pseudowires. You can configure the network with redundant pseudowires (PWs) and redundant network elements, which are shown in [Figure 2](#), [Figure 3](#), and [Figure 4](#).

Figure 2 shows a network with redundant pseudowires and redundant attachment circuits.

**Figure 2** L2VPN Network with Redundant PWs and Attachment Circuits

Figure 3 shows a network with redundant pseudowires, attachment circuits, and CE routers.

**Figure 3** L2VPN Network with Redundant PWs, Attachment Circuits, and CE Routers

Figure 4 shows a network with redundant pseudowires, attachment circuits, CE routers, and PE routers.

**Figure 4** L2VPN Network with Redundant PWs, Attachment Circuits, CE Routers, and PE Routers

# How to Configure L2VPN Pseudowire Redundancy

The L2VPN Pseudowire Redundancy feature enables you to configure a backup pseudowire in case the primary pseudowire fails. When the primary pseudowire fails, the PE router can switch to the backup pseudowire. You can have the primary pseudowire resume operation after it comes back up.

The default Label Distribution Protocol (LDP) session hold-down timer will enable the software to detect failures in about 180 seconds. That time can be configured so that the software can detect failures more quickly. See the **mpls ldp holdtime** command for more information.

The following sections explain how to configure the L2VPN Pseudowire Redundancy feature:

- [Configuring the Pseudowire, page 5](#) (required)
- [Configuring L2VPN Pseudowire Redundancy, page 6](#) (required)
- [Forcing a Manual Switchover to the Backup Pseudowire VC, page 8](#) (optional)
- [Verifying the L2VPN Pseudowire Redundancy Configuration, page 8](#) (optional)

## Configuring the Pseudowire

The successful transmission of the Layer 2 frames between PE routers is due to the configuration of the PE routers. You set up the connection, called a pseudowire, between the routers.

The pseudowire-class configuration group specifies the characteristics of the tunneling mechanism, which are:

- Encapsulation type
- Control protocol
- Payload-specific options

You must specify the **encapsulation mpls** command as part of the pseudowire class for the AToM VCs to work properly. If you omit the **encapsulation mpls** command as part of the **xconnect** command, you receive the following error:

```
% Incomplete command.
```

Perform this task to configure a pseudowire class.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **pseudowire-class** *name*
4. **encapsulation mpls**
5. **interworking** {*ethernet* | *ip*}

## DETAILED STEPS

|        | Command or Action                                                                                      | Purpose                                                                                                           |
|--------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                 | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                         | Enters global configuration mode.                                                                                 |
| Step 3 | <b>pseudowire-class</b> <i>name</i><br><br><b>Example:</b><br>Router(config)# pseudowire-class atom    | Establishes a pseudowire class with a name that you specify. Enters pseudowire class configuration mode.          |
| Step 4 | <b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-pw-class)# encapsulation mpls        | Specifies the tunneling encapsulation. For AToM, the encapsulation type is <b>mpls</b> .                          |
| Step 5 | <b>interworking {ethernet   ip}</b><br><br><b>Example:</b><br>Router(config-pw-class)# interworking ip | (Optional) Enables the translation between the different Layer 2 encapsulations.                                  |

## Configuring L2VPN Pseudowire Redundancy

Use the following steps to configure the L2VPN Pseudowire Redundancy feature.

## Prerequisites

For each transport type, the **xconnect** command is configured slightly differently. The following configuration steps use Ethernet VLAN over MPLS, which is configured in subinterface configuration mode. See *Any Transport over MPLS* to determine how to configure the **xconnect** command for other transport types.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *gigabitethernet slot/subslot/interface.subinterface*
4. **encapsulation dot1q** *vlan-id*
5. **xconnect** *peer-router-id vcid {encapsulation mpls | pw-class pw-class-name}*
6. **backup peer** *peer-router-ip-addr vcid [pw-class pw-class-name]*
7. **backup delay** *enable-delay {disable-delay | never}*

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>interface</b> <i>gigabitethernet</i> <i>slot/subslot/interface.subinterface</i><br><br><b>Example:</b><br>Router(config)# interface gigabitethernet0/0/0.1                                              | Specifies the Gigabit Ethernet subinterface and enters subinterface configuration mode.<br><br>Make sure that the subinterface on the adjoining CE router is on the same VLAN as this PE router.                                                                                                                                                                                                                        |
| Step 4 | <b>encapsulation dot1q</b> <i>vlan-id</i><br><br><b>Example:</b><br>Router(config-subif)# encapsulation dot1q 100                                                                                          | Enables the subinterface to accept 802.1Q VLAN packets.<br><br>The subinterfaces between the CE and PE routers that are running Ethernet over MPLS must be in the same subnet. All other subinterfaces and backbone routers do not.                                                                                                                                                                                     |
| Step 5 | <b>xconnect</b> <i>peer-router-id</i> <i>vcid</i> { <b>encapsulation mpls</b>   <b>pw-class</b> <i>pw-class-name</i> }<br><br><b>Example:</b><br>Router(config-subif)# xconnect 10.0.0.1 123 pw-class atom | Binds the attachment circuit to a pseudowire VC.<br><br>The syntax for this command is the same as for all other Layer 2 transports.<br><br>Enters xconnect configuration mode.                                                                                                                                                                                                                                         |
| Step 6 | <b>backup peer</b> <i>peer-router-ip-addr</i> <i>vcid</i> [ <b>pw-class</b> <i>pw-class-name</i> ]<br><br><b>Example:</b><br>Router(config-if-xconn)# backup peer 10.0.0.3 125 pw-class atom               | Specifies a redundant peer for the pseudowire VC.<br><br>The pseudowire class name must match the name you specified when you created the pseudowire class, but you can use a different pw-class in the <b>backup peer</b> command than the name that you used in the primary <b>xconnect</b> command.                                                                                                                  |
| Step 7 | <b>backup delay</b> <i>enable-delay</i> { <i>disable-delay</i>   <b>never</b> }<br><br><b>Example:</b><br>Router(config-if-xconn)# backup delay 5 never                                                    | Specifies how long (in seconds) the backup pseudowire VC should wait to take over after the primary pseudowire VC goes down. The range is 0 to 180.<br><br>Specifies how long the primary pseudowire should wait after it becomes active to take over for the backup pseudowire VC. The range is 0 to 180 seconds. If you specify the <b>never keyword</b> , the primary pseudowire VC never takes over for the backup. |

## Forcing a Manual Switchover to the Backup Pseudowire VC

To force the router switch over to the backup or primary pseudowire, you can enter the **xconnect backup force switchover** command in privileged EXEC mode. You can specify either the interface of the primary attachment circuit (AC) to switch to or the IP-address and VC ID of the peer router.

A manual switchover can be made only if the interface or peer specified in the command is actually available and the xconnect will move to the fully active state when the command is entered.

### SUMMARY STEPS

1. **enable**
2. **xconnect backup force-switchover interface {interface-info | peer ip-address vcid}**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                | Purpose                                                                                                             |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                           | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>xconnect backup force-switchover {interface interface-info   peer ip-address vcid}</b><br><br><b>Example:</b><br>Router# xconnect backup force-switchover peer 10.10.10.1 123 | Specifies that the router should switch to the backup or to the primary pseudowire.                                 |

## Verifying the L2VPN Pseudowire Redundancy Configuration

Use the following commands to verify that the L2VPN Pseudowire Redundancy feature is correctly configured.

### SUMMARY STEPS

1. **show mpls l2transport vc**
2. **show xconnect all**
3. **xconnect logging redundancy**

### DETAILED STEPS

#### Step 1 show mpls l2transport vc

In this example, the primary attachment circuit is up. The backup attachment circuit is available, but not currently selected. The **show** output displays as follows:

```
Router# show mpls l2transport vc
```

| Local intf | Local circuit | Dest address | VC ID | Status |
|------------|---------------|--------------|-------|--------|
| Eth0/0.1   | Eth VLAN 101  | 10.0.0.2     | 101   | UP     |

```
Local interface: Et0/0.1 up, line protocol up, Eth VLAN 101 up
  Destination address 10.0.0.2 VC ID: 101, VC status UP
  .
  .
  .
Local interface: Et0/0.1 down, line protocol down, Eth VLAN 101 down
  Destination address 10.0.0.3 VC ID: 201, VC status down
  .
  .
  .
```

## Step 2 show xconnect all

In this example, the topology is Attachment Circuit 1 to Pseudowire 1 with a Pseudowire 2 as a backup:

```
Router# show xconnect all
```

```

Legend: XC ST=Xconnect State, S1=Segment1 State, S2=Segment2 State
UP=Up, DN=Down, AD=Admin Down, IA=Inactive, NH=No Hardware
XC ST Segment 1 S1 Segment 2 S2
-----+-----+-----+-----+
UP pri ac Et0/0(Ethernet) UP mpls 10.55.55.2:1000 UP
IA sec ac Et0/0(Ethernet) UP mpls 10.55.55.3:1001 DN

```

In this example, the topology is Attachment Circuit 1 to Attachment Circuit 2 with a Pseudowire backup for Attachment Circuit 2:

```
Router# show xconnect all
```

```

Legend: XC ST=Xconnect State, S1=Segment1 State, S2=Segment2 State
UP=Up, DN=Down, AD=Admin Down, IA=Inactive, NH=No Hardware
XC ST Segment 1 S1 Segment 2 S2
-----+-----+-----+-----+
UP pri ac Se6/0:150(FR DLCI) UP ac Se8/0:150(FR DLCI) UP
IA sec ac Se6/0:150(FR DLCI) UP mpls 10.55.55.3:7151 DN

```

### Step 3 xconnect logging redundancy

In addition to the **show mpls l2transport vc** command and the **show xconnect** command, you can use the **xconnect logging redundancy** command to track the status of the xconnect redundancy group:

```
Router(config)# xconnect logging redundancy
```

When this command is configured, the following messages will be generated during switchover events:

Activating the primary member:

```
00:01:07: %XCONNECT-5-REDUNDANCY: Activating primary member 10.55.55.2:1000
```

Activating the backup member:

```

# Configuration Examples for L2VPN Pseudowire Redundancy

The following sections show the L2VPN Pseudowire Redundancy feature examples. These configuration examples show how the L2VPN Pseudowire Redundancy feature can be configured with the AToM (like-to-like), L2VPN Interworking, and Layer 2 Local Switching features.

- [L2VPN Pseudowire Redundancy and AToM \(Like to Like\): Examples, page 10](#)
- [L2VPN Pseudowire Redundancy and L2VPN Interworking: Examples, page 10](#)
- [L2VPN Pseudowire Redundancy with Layer 2 Local Switching: Examples, page 11](#)

Each of the configuration examples refers to one of the following pseudowire classes:

- AToM (like-to-like) pseudowire class:

```
pseudowire-class mpls
encapsulation mpls
```

- L2VPN IP interworking:

```
pseudowire-class mpls-ip
encapsulation mpls
interworking ip
```

## L2VPN Pseudowire Redundancy and AToM (Like to Like): Examples

The following example shows a High-Level Data Link Control (HDLC) attachment circuit xconnect with a backup pseudowire:

```
interface Serial4/0
xconnect 10.55.55.2 4000 pw-class mpls
backup peer 10.55.55.3 4001 pw-class mpls
```

The following example shows a Frame Relay attachment circuit xconnect with a backup pseudowire:

```
connect fr-fr-pw Serial6/0 225 12transport
xconnect 10.55.55.2 5225 pw-class mpls
backup peer 10.55.55.3 5226 pw-class mpls
```

## L2VPN Pseudowire Redundancy and L2VPN Interworking: Examples

The following example shows an Ethernet attachment circuit xconnect with L2VPN IP interworking and a backup pseudowire:

```
interface Ethernet0/0
xconnect 10.55.55.2 1000 pw-class mpls-ip
backup peer 10.55.55.3 1001 pw-class mpls-ip
```

The following example shows an Ethernet VLAN attachment circuit xconnect with L2VPN IP interworking and a backup pseudowire:

```
interface Ethernet1/0.1
encapsulation dot1Q 200
no ip directed-broadcast
xconnect 10.55.55.2 5200 pw-class mpls-ip
backup peer 10.55.55.3 5201 pw-class mpls-ip
```

The following example shows a Frame Relay attachment circuit xconnect with L2VPN IP interworking and a backup pseudowire:

```
connect fr-ppp-pw Serial6/0 250 l2transport
xconnect 10.55.55.2 8250 pw-class mpls-ip
backup peer 10.55.55.3 8251 pw-class mpls-ip
```

The following example shows a PPP attachment circuit xconnect with L2VPN IP interworking and a backup pseudowire:

```
interface Serial7/0
encapsulation ppp
xconnect 10.55.55.2 2175 pw-class mpls-ip
backup peer 10.55.55.3 2176 pw-class mpls-ip
```

## L2VPN Pseudowire Redundancy with Layer 2 Local Switching: Examples

The following example shows an Ethernet VLAN-VLAN local switching xconnect with a pseudowire backup for Ethernet segment E2/0.2. If the subinterface associated with E2/0.2 goes down, the backup pseudowire is activated.

```
connect vlan-vlan Ethernet1/0.2 Ethernet2/0.2
backup peer 10.55.55.3 1101 pw-class mpls
```

The following example shows a Frame Relay-to-Frame Relay local switching connect with a pseudowire backup for Frame Relay segment S8/0 150. If data-link connection identifier (DLCI) 150 on S8/0 goes down, the backup pseudowire is activated.

```
connect fr-fr-ls Serial6/0 150 Serial8/0 150
backup peer 10.55.55.3 7151 pw-class mpls
```

# Additional References

The following sections provide references related to the L2VPN Pseudowire Redundancy feature.

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **backup delay (L2VPN local switching)**
- **backup peer**
- **show xconnect**
- **xconnect backup force-switchover**
- **xconnect logging redundancy**

## Feature Information for L2VPN Pseudowire Redundancy

[Table 1](#) lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS, Catalyst OS, and Cisco IOS XE software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Note**

---

[Table 1](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

# L2VPN Pseudowire Switching

---

**First Published: April 20, 2005**

**Last Updated: November 20, 2009**

This feature module explains how to configure L2VPN Pseudowire Switching, which extends Layer 2 Virtual Private Network (L2VPN) pseudowires across an interautonomous system (inter-AS) boundary or across two separate Multiprotocol Label Switching (MPLS) networks. The feature supports ATM and time-division multiplexing (TDM) attachment circuits (ACs) and Ethernet ACs.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for L2VPN Pseudowire Switching”](#) section on page 15.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Prerequisites for L2VPN Pseudowire Switching

For the Cisco 12000 series routers, the L2VPN Pseudowire Switching feature for Any Transport over MPLS (AToM) is supported on the following engines:

- E2
- E3
- E4+
- E5
- E6

For engines that do not support this feature, the packets are sent to the software and forwarded through the slow path.

**Note**

---

Engines E1 and E4 do not support L2VPN Pseudowire Switching, even in the slow path.

---

## Restrictions for L2VPN Pseudowire Switching

- L2VPN Pseudowire Switching is supported with AToM.
- Only static, on-box provisioning is supported.
- Sequencing numbers in AToM packets are not processed by L2VPN Pseudowire Switching. The feature blindly passes the sequencing data through the xconnect packet paths, a process that is called transparent sequencing. The endpoint provider-edge (PE) to customer-edge (CE) connections enforce the sequencing.
- You can ping the adjacent next-hop PE router. End-to-end label switched path (LSP) pings are not supported.
- Do not configure IP or Ethernet interworking on a router where L2VPN Pseudowire Switching is enabled. Instead, configure interworking on the routers at the edge PEs of the network.
- The control word negotiation results must match. If either segment does not negotiate the control word, the control word is disabled for both segments.
- AToM Graceful Restart is negotiated independently on each pseudowire segment. If there is a transient loss of the label distribution protocol (LDP) session between two AToM PE routers, packets continue to flow.
- Per-pseudowire quality of service (QoS) is not supported. Traffic engineering (TE) tunnel selection is supported.
- Attachment circuit interworking is not supported.

## Information About L2VPN Pseudowire Switching

To configure the L2VPN Pseudowire Switching feature, you should understand the following concepts:

- [How L2VPN Pseudowire Switching Works, page 3](#)
- [How Packets Are Manipulated at the L2VPN Pseudowire Switching Aggregation Point, page 3](#)

## How L2VPN Pseudowire Switching Works

L2VPN Pseudowire Switching allows the user to extend L2VPN pseudowires across two separate MPLS networks or across an inter-AS boundary, as shown in [Figure 1](#) and [Figure 2](#).

L2VPN Pseudowire Switching connects two or more contiguous pseudowire segments to form an end-to-end multihop pseudowire. This end-to-end pseudowire functions as a single point-to-point pseudowire.

As shown in [Figure 2](#), L2VPN Pseudowire Switching enables you to keep the IP addresses of the edge PE routers private across inter-AS boundaries. You can use the IP address of the Autonomous System Boundary Routers (ASBRs) and treat them as pseudowire aggregation (PE-agg) routers. The ASBRs join the pseudowires of the two domains.

L2VPN Pseudowire Switching also enables you to keep different administrative or provisioning domains to manage the end-to-end service. At the boundaries of these networks, PE-agg routers delineate the management responsibilities.

**Figure 1** L2VPN Pseudowire Switching in an Intra-AS Topology

**Figure 2** L2VPN Pseudowire Switching in an Inter-AS Topology

## How Packets Are Manipulated at the L2VPN Pseudowire Switching Aggregation Point

Switching AToM packets between two AToM pseudowires is the same as switching any MPLS packet. The MPLS switching data path switches AToM packets between two AToM pseudowires. The following list explains exceptions:

- The outgoing virtual circuit (VC) label replaces the incoming VC label in the packet. New Internal Gateway Protocol (IGP) labels and Layer 2 encapsulation are added.

- The incoming VC label time-to-live (TTL) field is decremented by one and copied to the outgoing VC label TTL field.
- The incoming VC label EXP value is copied to the outgoing VC label EXP field.
- The outgoing VC label “Bottom of Stack” S bit in the outgoing VC label is set to 1.
- AToM control word processing is not performed at the L2VPN Pseudowire Switching aggregation point. Sequence numbers are not validated. Use the Router Alert label for LSP Ping; do not require control word inspection to determine an LSP Ping packet.

## How to Configure L2VPN Pseudowire Switching

Use the following procedure to configure L2VPN Pseudowire Switching on each of the PE-aggr routers.

### Prerequisites

- This procedure assumes that you have configured basic AToM L2VPNs. This procedure does not explain how to configure basic AToM L2VPNs that transport Layer 2 packets over an MPLS backbone. For information on the basic configuration, see [Any Transport over MPLS](#).
- For interautonomous configurations, ASBRs require a labeled interface.

### Restrictions

In this configuration, you are limited to two **neighbor** commands after entering the **l2 vfi** command.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **l2 vfi *name* point-to-point**
4. **neighbor *ip-address* *vcid* [encapsulation *mpls* | pw-class *pw-class-name*]**
5. **exit**
6. **exit**
7. **show mpls l2transport vc [*vcid* [*vc-id* | *vc-id-min* *vc-id-max*]] [**interface** *name* [*local-circuit-id*]] [**destination** *ip-address* | *name*] [**detail**]**
8. **show vfi [*vfi-name*]**

## 9. ping [protocol] [tag] {host-name | system-address}

### DETAILED STEPS

|         | Command or Action                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                 |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1  | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                        |
| Step 2  | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                       |
| Step 3  | <b>l2 vfi name point-to-point</b><br><br><b>Example:</b><br>Router(config)# l2 vfi atomtunnel point-to-point                                                                                                 | Creates a point-to-point Layer 2 virtual forwarding interface (VFI) and enters VFI configuration mode.                                                                                                                                                                                                                  |
| Step 4  | <b>neighbor ip-address vcid [encapsulation mpls   pw-class pw-class-name]</b><br><br><b>Example:</b><br>Router(config-vfi)# neighbor 10.0.0.1 100 pw-class mpls                                              | Configures an emulated VC. <ul style="list-style-type: none"> <li>Specify the IP address and the VC ID of the remote router.</li> <li>Also specify the pseudowire class to use for the emulated VC.</li> </ul> <b>Note</b> Only two <b>neighbor</b> commands are allowed for each <b>l2 vfi point-to-point</b> command. |
| Step 5  | <b>exit</b><br><br><b>Example:</b><br>Router(config-vfi)# exit                                                                                                                                               | Exits VFI configuration mode.                                                                                                                                                                                                                                                                                           |
| Step 6  | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                   | Exits global configuration mode.                                                                                                                                                                                                                                                                                        |
| Step 7s | <b>show mpls l2transport vc [vcid [vc-id   vc-id-min vc-id-max]] [interface name [local-circuit-id]] [destination ip-address   name] [detail]</b><br><br><b>Example:</b><br>Router# show mpls l2transport vc | Verifies that the L2VPN Pseudowire Switching session has been established.                                                                                                                                                                                                                                              |

|        | Command or Action                                                                                                            | Purpose                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| Step 8 | <code>show vfi [vfi-name]</code><br><br><b>Example:</b><br>Router# <code>show vfi atomtunnel</code>                          | Verifies that a point-to-point VFI has been established.           |
| Step 9 | <code>ping [protocol] [tag] {host-name   system-address}</code><br><br><b>Example:</b><br>Router# <code>ping 10.1.1.1</code> | When issued from the CE routers, verifies end-to-end connectivity. |

## Examples

The following example displays output from the **show mpls l2transport vc** command:

```
Router# show mpls l2transport vc
```

| Local intf | Local circuit | Dest address | VC ID | Status |
|------------|---------------|--------------|-------|--------|
| MPLS PW    | 10.0.1.1:100  | 10.0.1.1     | 100   | UP     |
| MPLS PW    | 10.0.1.1:100  | 10.0.1.1     | 100   | UP     |

The following example displays output from the **show vfi** command:

```
Router# show vfi
```

```
VFI name: test, type: point-to-point
Neighbors connected via pseudowires:
  Router ID      Pseudowire ID
  10.0.1.1       100
  10.0.1.1       100
```

# Configuration Examples for L2VPN Pseudowire Switching

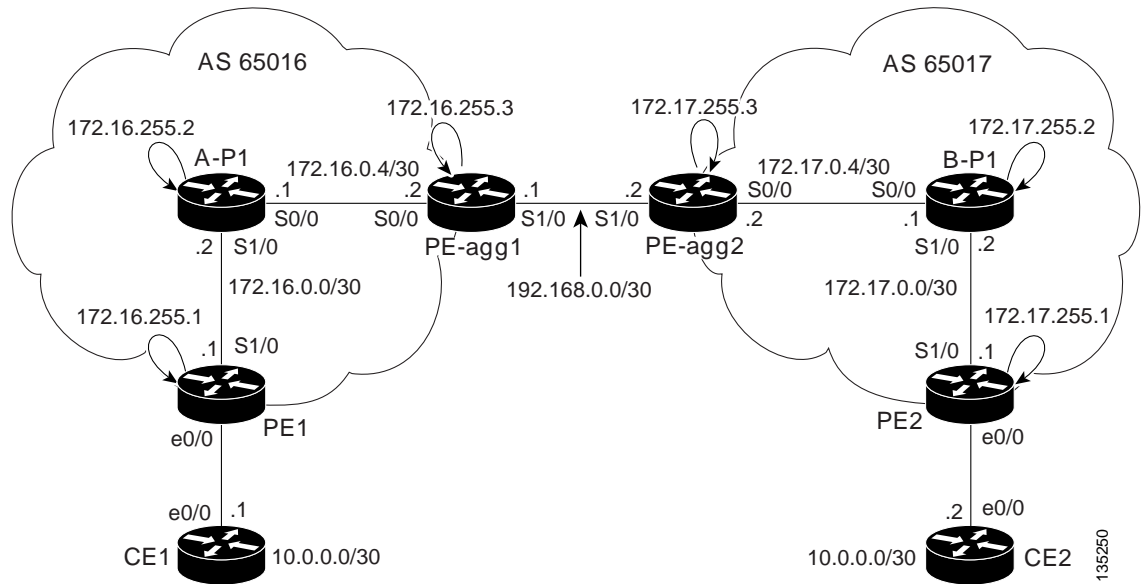

This section provides the following configuration example:

- [L2VPN Pseudowire Switching in an Inter-AS Configuration: Example, page 7](#)

## L2VPN Pseudowire Switching in an Inter-AS Configuration: Example

Two separate autonomous systems are able to pass L2VPN packets, because the two PE-aggr routers have been configured with L2VPN Pseudowire Switching. This example configuration is shown in [Figure 3](#).

# Feature Information for L2VPN Pseudowire Switching

Table 1 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Releases 12.2(28)SB or 12.2(33)SRB or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for L2VPN Pseudowire Switching

| Feature Name               | Releases                                                              | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# VPLS Autodiscovery: BGP Based

---

**First Published: February 19, 2007**

**Last Updated: November 20, 2009**

VPLS Autodiscovery enables each Virtual Private LAN Service (VPLS) provider edge (PE) router to discover which other PE routers are part of the same VPLS domain. VPLS Autodiscovery also automatically detects when PE routers are added to or removed from the VPLS domain. You no longer need to manually configure the VPLS and maintain the configuration when a PE router is added or deleted. VPLS Autodiscovery uses the Border Gateway Protocol (BGP) to discover the VPLS members and to set up and tear down pseudowires in the VPLS.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for VPLS Autodiscovery: BGP Based”](#) section on page 16.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for VPLS Autodiscovery: BGP Based

Before configuring VPLS Autodiscovery, if you are using a Cisco 7600 series router, perform the Cisco 7600 router-specific tasks listed in the section called “Virtual Private LAN Services on the Optical Service Modules” in the *Cisco 7600 Series Router IOS Software Configuration Guide, 12.2SR*.

## Restrictions for VPLS Autodiscovery: BGP Based

- VPLS Autodiscovery supports only IPv4 addresses.
- VPLS Autodiscovery uses Forwarding Equivalence Class (FEC) 129 to convey endpoint information. Manually configured pseudowires use FEC 128.
- VPLS Autodiscovery is not supported with Layer 2 Tunnel Protocol Version 3 (L2TPv3).
- VPLS Autodiscovery is not supported with interautonomous system configurations.
- You can configure both autodiscovered and manually configured pseudowires in a single virtual forwarding instance (VFI). However, the pseudowires cannot go to the same peer PE router.
- If you manually configure a neighbor using the **neighbor (VPLS)** command after you have enabled VPLS Autodiscovery and both peers are in autodiscovery mode, manually configure the route target (RT) values to prevent each peer from receiving discovery data for that VPLS.
- If you manually configure multiple pseudowires and target different IP addresses on the same PE router for each pseudowire, do not use the same virtual circuit identifier (VC ID) to identify the pseudowires terminated at the same PE router.
- You cannot configure a pseudowire by manually configuring a neighbor on one PE router and using autodiscovery on the other PE router to configure the same pseudowire in the other direction.
- Tunnel selection is not supported with autodiscovered neighbors.
- You can have up to 16 route targets only per VFI.
- The same RT is not allowed in multiple VFIs in the same PE router.
- The BGP autodiscovery process does not support dynamic hierarchical VPLS. User-facing PE (U-PE) routers cannot discover the network-facing PE (N-PE) routers, and N-PE routers cannot discover U-PE routers.
- Pseudowires for autodiscovered neighbors are provisioned with split horizon enabled. Therefore, manually configure the pseudowires for hierarchical VPLS. Make sure the U-PE routers do not participate in BGP autodiscovery for those pseudowires.
- Do not disable split horizon on autodiscovered neighbors. Split horizon is required with VPLS Autodiscovery.
- The provisioned peer address must be a /32 address bound to the peer's Label Distribution Protocol (LDP) router ID.
- The peer PE router must be able to access the IP address that is used as the local LDP router ID. Even though the IP address need not be used in the **xconnect** command on the peer PE router, that IP address must be reachable.
- VPLS Autodiscovery is supported on the Cisco 7600 router hardware. For details on supported shared port adapters and line cards, see the following documents:
  - *Cisco 7600 Series Router Cisco IOS Software Configuration Guide*
  - *Release Notes for Cisco IOS Release 12.2SR for the Cisco 7600 Series Routers*

# Information About VPLS Autodiscovery: BGP Based

To understand VPLS Autodiscovery, you should understand the following concepts:

- [How the VPLS Feature Works, page 3](#)
- [How the VPLS Autodiscovery: BGP Based Feature Works, page 3](#)
- [How Enabling VPLS Autodiscovery Differs from Manually Configuring VPLS, page 3](#)
- [Show Commands Affected by VPLS Autodiscovery: BGP Based, page 4](#)
- [BGP VPLS Autodiscovery Support on a Route Reflector, page 4](#)

## How the VPLS Feature Works

VPLS allows Multiprotocol Label Switching (MPLS) networks to provide multipoint Ethernet LAN services, also known as Transparent LAN Services (TLS). All customer sites in a VPLS appear to be on the same LAN, even though those sites might be in different geographic locations.

## How the VPLS Autodiscovery: BGP Based Feature Works

VPLS Autodiscovery enables each VPLS PE router to discover the other PE routers that are part of the same VPLS domain. VPLS Autodiscovery also tracks when PE routers are added to or removed from the VPLS domain. The autodiscovery and signaling functions use BGP to find and track the PE routers.

BGP uses the L2VPN Routing Information Base (RIB) to store endpoint provisioning information, which is updated each time any Layer 2 VFI is configured. Prefix and path information is stored in the L2VPN database, allowing BGP to make decisions on the best path. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, the endpoint information is used to configure a pseudowire mesh to support L2VPN-based services.

The BGP autodiscovery mechanism facilitates the configuration of L2VPN services, which are an integral part of the Cisco IOS Virtual Private LAN Service (VPLS) feature. VPLS enables flexibility in deploying services by connecting geographically dispersed sites as a large LAN over high-speed Ethernet in a robust and scalable IP MPLS network. For more information about BGP and the L2VPN address family in relation to VPLS Autodiscovery, see the following documents:

- The section called “L2VPN Address Family” in the [Cisco BGP Overview](#).
- The document called [BGP Support for the L2VPN Address Family](#)

## How Enabling VPLS Autodiscovery Differs from Manually Configuring VPLS

With VPLS Autodiscovery, you no longer need to manually set up the VPLS. The commands you use to set up VPLS Autodiscovery are similar to those you use to manually configure a VPLS, as shown in [Table 1](#). VPLS Autodiscovery uses **neighbor** commands in L2VPN address family mode to distribute endpoint information to configure a pseudowire.

**Table 1** VPLS Autodiscovery Configuration versus Manual VPLS Configuration

| Manual Configuration of VPLS                                                                                                 | VPLS Autodiscovery: BGP Based                                                                                                                                                                                                                                                                                                                |
|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>l2 vfi vpls1 manual vpn id 100 neighbor 10.10.10.1 encapsulation mpls neighbor 10.10.10.0 encapsulation mpls exit</pre> | <pre>l2 vfi vpls1 autodiscovery vpn id 100 exit  router bgp 1 no bgp default ipv4-unicast bgp log-neighbor-changes bgp update-delay 1 neighbor 10.1.1.2 remote-as 1 neighbor 10.1.1.2 update-source Loopback1 . . . address-family l2vpn vpls neighbor 10.1.1.2 activate neighbor 10.1.1.2 send-community extended exit-address-family</pre> |

When you configure VPLS Autodiscovery, you enter the **l2vfi autodiscovery** command. This command allows the VFI to learn and advertise the pseudowire endpoints. As a result, you no longer need to enter the **neighbor (VPLS)** command in L2 VFI configuration mode.

However, the **neighbor (VPLS)** command is still supported with VPLS Autodiscovery in L2 VFI command mode. You can use the **neighbor (VPLS)** command to allow PE routers that do not participate in the autodiscovery process to join the VPLS. You can also use the **neighbor (VPLS)** command with PE routers that have been configured using the Tunnel Selection feature. You can also use the **neighbor (VPLS)** command in hierarchical VPLS configurations that have U-PE routers that do not participate in the autodiscovery process and have split-horizon forwarding disabled.

## Show Commands Affected by VPLS Autodiscovery: BGP Based

VPLS Autodiscovery changes the following show commands:

- The **show mpls l2transport vc** command with the **detail** keyword has been updated to include FEC 129 signaling information for the autodiscovered VPLS pseudowires.
- The **show vfi** command now displays information related to autodiscovered VFIs. The new information includes the VPLS ID, the route distinguisher (RD), the RT, and the router IDs of the discovered peers.
- The **show xconnect** command has been updated with the **rib** keyword to provide RIB information about the pseudowires.

## BGP VPLS Autodiscovery Support on a Route Reflector

VPLS Autodiscovery is normally run on PE routers to support endpoint discovery and the setup of pseudowires between the PEs (typically a full mesh). VPLS does not normally run on a BGP route reflector. In Cisco IOS Release 12.2(33)SRE, VPLS Autodiscovery support was added to route reflectors. The BGP route reflector can be used to reflect the BGP VPLS prefixes without having VPLS explicitly configured on the route reflector.

The route reflector does not participate in the autodiscovery, meaning that no pseudowires are set up between the route reflector and the PEs. The route reflector reflects the VPLS prefixes to other PEs, so that the PEs do not need to have a full mesh of BGP sessions. The network administrator configures only the BGP VPLS address family on the route reflector. For an example configuration of VPLS autodiscovery support on a route reflector, see the [“BGP VPLS Autodiscovery Support on Route Reflector: Example” section on page 13](#).

## How to Configure VPLS Autodiscovery: BGP Based

To configure VPLS Autodiscovery, perform the following tasks:

- [Enabling VPLS Autodiscovery: BGP Based, page 5](#) (required)
- [Configuring BGP to Enable VPLS Autodiscovery, page 6](#) (required)
- [Customizing the VPLS Autodiscovery Settings, page 9](#) (optional)

### Enabling VPLS Autodiscovery: BGP Based

Perform the following task to enable each VPLS PE router to discover the other PE routers that are part of the same VPLS domain.

#### Prerequisites

Before configuring VPLS Autodiscovery, perform the Cisco 7600 router-specific tasks listed in the “Virtual Private LAN Services on the Optical Services Modules” chapter in the [Cisco 7600 Series Router Cisco IOS Software Configuration Guide](#), Release 12.2SR.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **l2 vfi vfi-name autodiscovery**
4. **vpn id vpn-id**
5. **exit**

#### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                                                          |
|--------|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
|        | <b>Example:</b><br>Router> enable             |                                                                                                                  |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                                                |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                                                  |

|        | Command or Action                                                                                         | Purpose                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| Step 3 | <b>l2 vfi vfi-name autodiscovery</b><br><br><b>Example:</b><br>Router(config)# l2 vfi vpls1 autodiscovery | Enables VPLS Autodiscovery on the PE router and enters L2 VFI configuration mode.                       |
| Step 4 | <b>vpn id vpn-id</b><br><br><b>Example:</b><br>Router(config-vfi)# vpn id 10                              | Configures a VPN ID for the VPLS domain.                                                                |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-vfi)# exit                                            | Exits L2 VFI configuration mode. Commands take effect after the router exits L2 VFI configuration mode. |

## Configuring BGP to Enable VPLS Autodiscovery

In Cisco IOS Release 12.2(33)SRB, the BGP L2VPN address family was introduced with a separate L2VPN RIB that contains endpoint provisioning information for VPLS Autodiscovery. BGP learns the endpoint provisioning information from the L2VPN database which is updated each time a Layer 2 virtual forwarding instance (VFI) is configured. When BGP distributes the endpoint provisioning information in an update message to all its BGP neighbors, the endpoint information is used to configure a pseudowire mesh to support aL2VPN-based services.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp autonomous-system-number**
4. **no bgp default ipv4-unicast**
5. **bgp log-neighbor-changes**
6. **neighbor {ip-address | peer-group-name} remote-as autonomous-system-number**
7. **neighbor {ip-address | peer-group-name} update-source interface**
8. Repeat Step 6 and Step 7 to configure other BGP neighbors.
9. **address-family l2vpn [vpls]**
10. **neighbor {ip-address | peer-group-name} activate**
11. **neighbor {ip-address | peer-group-name} send-community [both | standard | extended]**
12. Repeat Step 10 and Step 11 to activate other BGP neighbors under L2VPN address family.
13. **exit-address-family**
14. **exit**
15. **exit**
16. **show vfi**
17. **show ip bgp l2vpn vpls {all | rd vpn-rd}**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>router bgp <i>autonomous-system-number</i></b><br><br><b>Example:</b><br>Router(config)# router bgp 65000                                                                                          | Enters router configuration mode for the specified routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 4 | <b>no bgp default ipv4-unicast</b><br><br><b>Example:</b><br>Router(config-router)# no bgp default ipv4-unicast                                                                                       | Disables the IPv4 unicast address family for the BGP routing process. <p><b>Note</b> Routing information for the IPv4 unicast address family is advertised by default for each BGP routing session configured with the <b>neighbor remote-as</b> router configuration command unless you configure the <b>no bgp default ipv4-unicast</b> router configuration command before configuring the <b>neighbor remote-as</b> command. Existing neighbor configurations are not affected.</p>                                                                                                                                                                       |
| Step 5 | <b>bgp log-neighbor-changes</b><br><br><b>Example:</b><br>Router(config-router)# bgp log-neighbor-changes                                                                                             | Enables logging of BGP neighbor resets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 6 | <b>neighbor {<i>ip-address</i>   <i>peer-group-name</i>}</b><br><b>remote-as <i>autonomous-system-number</i></b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.10.10.1 remote-as 65000 | Adds the IP address or peer group name of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local router. <ul style="list-style-type: none"> <li>If the <i>autonomous-system-number</i> argument matches the autonomous system number specified in the <b>router bgp</b> command, the neighbor is an internal neighbor.</li> <li>If the <i>autonomous-system-number</i> argument does not match the autonomous system number specified in the <b>router bgp</b> command, the neighbor is an external neighbor.</li> <li>In this example, the neighbor at 10.10.10.1 is an internal BGP neighbor.</li> </ul> |

|         | Command or Action                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                 |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>update-source</b> <i>interface-type interface-number</i><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.10.10.1<br>update-source loopback1                  | (Optional) Configures a router to select a specific source or interface to receive routing table updates. <ul style="list-style-type: none"> <li>This example uses a loopback interface. The advantage to this configuration is that the loopback interface is not affected by the effects of a flapping interface.</li> </ul>          |
| Step 8  | Repeat Step 6 and Step 7 to configure other BGP neighbors                                                                                                                                                                                      | —                                                                                                                                                                                                                                                                                                                                       |
| Step 9  | <b>address-family</b> l2vpn [ <b>vpls</b> ]<br><br><b>Example:</b><br>Router(config-router)# address-family l2vpn<br>vpls                                                                                                                      | Specifies the L2VPN address family and enters address family configuration mode. <ul style="list-style-type: none"> <li>The optional <b>vpls</b> keyword specifies that VPLS endpoint provisioning information is to be distributed to BGP peers.</li> <li>In this example, an L2VPN VPLS address family session is created.</li> </ul> |
| Step 10 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.10.10.1<br>activate                                                                          | Enables the neighbor to exchange information for the L2VPN VPLS address family with the local router.                                                                                                                                                                                                                                   |
| Step 11 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>send-community</b> { <b>both</b>   <b>standard</b>   <b>extended</b> }<br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.10.10.1<br>send-community extended | Specifies that a communities attribute should be sent to a BGP neighbor. <ul style="list-style-type: none"> <li>In this example, an extended communities attribute is sent to the neighbor at 10.10.10.1.</li> </ul>                                                                                                                    |
| Step 12 | Repeat Step 10 and Step 11 to activate other BGP neighbors under an L2VPN address family.                                                                                                                                                      | —                                                                                                                                                                                                                                                                                                                                       |
| Step 13 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                                                                                                             | Exits address family configuration mode and returns to router configuration mode.                                                                                                                                                                                                                                                       |
| Step 14 | <b>exit</b><br><br><b>Example:</b><br>Router(config-router)# exit                                                                                                                                                                              | Exits router configuration mode.                                                                                                                                                                                                                                                                                                        |
| Step 15 | <b>exit</b><br><br><b>Example:</b><br>Router(config)# exit                                                                                                                                                                                     | Exits privileged EXEC mode.                                                                                                                                                                                                                                                                                                             |

|         | Command or Action                                                                                                 | Purpose                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Step 16 | <pre>show vfi</pre> <p><b>Example:</b><br/>Router# show vfi</p>                                                   | (Optional) Displays information about the configured VFI instances.       |
| Step 17 | <pre>show ip bgp l2vpn vpls {all   rd vpn-rd}</pre> <p><b>Example:</b><br/>Router# show ip bgp l2vpn vpls all</p> | (Optional) Displays information about the Layer2 VPN VPLS address family. |

## Customizing the VPLS Autodiscovery Settings

Several commands allow you to customize the VPLS environment. You can specify identifiers for the VPLS domain, the route distinguisher, the route target, and the PE router. Perform the following steps to customize these settings.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **l2 vfi vfi-name autodiscovery**
4. **vpn id vpn-id**
5. **vpls-id {autonomous-system-number:nn | ip-address:nn}**
6. **rd {autonomous-system-number:nn | ip-address:nn}**
7. **route-target [import | export | both] {autonomous-system-number:nn | ip-address:nn}**
8. **l2 router-id ip-address**
9. **exit**

### DETAILED STEPS

|        | Command or Action                                                                                              | Purpose                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| Step 1 | <pre>enable</pre> <p><b>Example:</b><br/>Router&gt; enable</p>                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <pre>configure terminal</pre> <p><b>Example:</b><br/>Router# configure terminal</p>                            | Enters global configuration mode.                                                                                  |
| Step 3 | <pre>l2 vfi vfi-name autodiscovery</pre> <p><b>Example:</b><br/>Router(config)# l2 vfi vpls1 autodiscovery</p> | Enables VPLS Autodiscovery on the PE router and enters L2 VFI configuration mode.                                  |

|        | Command or Action                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>vpn id</b> <i>vpn-id</i><br><br><b>Example:</b><br>Router(config-vfi)# vpn id 10                                                                                                                   | Configures a VPN ID for the VPLS domain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 5 | <b>vpls-id</b> { <i>autonomous-system-number:nn</i>   <i>ip-address:nn</i> }<br><br><b>Example:</b><br>Router(config-vfi)# vpls-id 5:300                                                              | (Optional) Specifies the VPLS domain. This command is optional, because VPLS Autodiscovery automatically generates a VPLS ID using the BGP autonomous system number and the configured VFI VPN ID. You can use this command to change the automatically generated VPLS ID.<br><br>There are two formats for configuring the VPLS ID argument. It can be configured in the <i>autonomous-system-number:network number (ASN:nn)</i> format, as shown in the example, or it can be configured in the <i>IP-address:network number (IP-address:nn)</i> format.                                               |
| Step 6 | <b>rd</b> { <i>autonomous-system-number:nn</i>   <i>ip-address:nn</i> }<br><br><b>Example:</b><br>Router(config-vfi)# rd 2:3                                                                          | (Optional) Specifies the RD to distribute endpoint information. This command is optional, because VPLS Autodiscovery automatically generates an RD using the BGP autonomous system number and the configured VFI VPN ID. You can use this command to change the automatically generated route distinguisher.<br><br>There are two formats for configuring the route distinguisher argument. It can be configured in the <i>autonomous-system-number:network number (ASN:nn)</i> format, as shown in the example, or it can be configured in the <i>IP-address:network number (IP-address:nn)</i> format. |
| Step 7 | <b>route-target</b> [ <b>import</b>   <b>export</b>   <b>both</b> ] { <i>autonomous-system-number:nn</i>   <i>ip-address:nn</i> }<br><br><b>Example:</b><br>Router(config-vfi)# route-target 600:2222 | (Optional) Specifies the route target (RT). This command is optional, because VPLS Autodiscovery automatically generates a route target using the lower 6 bytes of the RD and VPLS ID. You can use this command to change the automatically generated route target.<br><br>There are two formats for configuring the route target argument. It can be configured in the <i>autonomous-system-number:network number (ASN:nn)</i> format, as shown in the example, or it can be configured in the <i>IP-address:network number (IP-address:nn)</i> format.                                                 |
| Step 8 | <b>12 router-id</b> <i>ip-address</i><br><br><b>Example:</b><br>Router(config-vfi)# 12 router-id 10.10.10.10                                                                                          | (Optional) Specifies a unique identifier for the PE router. This command is optional, because VPLS Autodiscovery automatically generates a Layer 2 router ID using the MPLS global router ID. You can use this command to change the automatically generated ID.                                                                                                                                                                                                                                                                                                                                         |
| Step 9 | <b>exit</b><br><br><b>Example:</b><br>Router(config-vfi)# exit                                                                                                                                        | Exits L2 VFI configuration mode. Commands take effect after the router exits L2 VFI configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

# Configuration Examples for VPLS Autodiscovery: BGP Based

The following examples show the configuration of a network using VPLS Autodiscovery and VPLS Autodiscovery supported on a route reflector:

- [VPLS Autodiscovery: BGP Based: Basic Example, page 11](#)
- [BGP VPLS Autodiscovery Support on Route Reflector: Example, page 13](#)

## VPLS Autodiscovery: BGP Based: Basic Example

Figure 1 shows a basic configuration of VPLS Autodiscovery.

**Figure 1 Basic VPLS Autodiscovery Configuration**

**BGP VPLS Autodiscovery Support on Route Reflector: Example**

In the following example, a host named PE-RR (indicating Provider Edge-Route Reflector) is configured as a route reflector capable of reflecting VPLS prefixes. The VPLS address family is configured by **address-family l2vpn vpls** below.

```

hostname PE-RR
!
router bgp 1
  bgp router-id 1.1.1.3
  no bgp default route-target filter
  bgp log-neighbor-changes
  neighbor iBGP_PEERS peer-group
  neighbor iBGP_PEERS remote-as 1
  neighbor iBGP_PEERS update-source Loopback1
  neighbor 1.1.1.1 peer-group iBGP_PEERS
  neighbor 1.1.1.2 peer-group iBGP_PEERS
!

```

```

address-family l2vpn vpls
  neighbor iBGP_PEERS send-community extended
  neighbor iBGP_PEERS route-reflector-client
  neighbor 1.1.1.1 peer-group iBGP_PEERS
  neighbor 1.1.1.2 peer-group iBGP_PEERS
exit-address-family

```

# Feature Information for VPLS Autodiscovery: BGP Based

Table 2 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Cisco IOS software images are specific to a Cisco IOS software release, a feature set, and a platform. Use Cisco Feature Navigator to find information about platform support and Cisco IOS software image support. Access Cisco Feature Navigator at <http://www.cisco.com/go/fn>. You must have an account on Cisco.com. If you do not have an account or have forgotten your username or password, click **Cancel** at the login dialog box and follow the instructions that appear.

## Note

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2** Feature Information for VPLS Autodiscovery: BGP Based

# H-VPLS N-PE Redundancy for QinQ and MPLS Access

---

**First Published: November 15, 2007**

**Last Updated: December 21, 2007**

The H-VPLS N-PE Redundancy for QinQ and MPLS Access feature enables two network provider edge (N-PE) routers to provide failover services to a user provider edge (U-PE) router in a hierarchical virtual private LAN service (H-VPLS). Having redundant N-PE routers provides improved stability and reliability against link and node failures. This document explains how to implement this feature.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for H-VPLS N-PE Redundancy for QinQ and MPLS Access](#)” section on page 13.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Glossary, page 14](#)

## Prerequisites for H-VPLS N-PE Redundancy for QinQ and MPLS Access

- Before configuring the H-VPLS N-PE Redundancy for QinQ and MPLS Access feature, configure your H-VPLS network and make sure it is operating correctly. For more information about configuring the H-VPLS network, see the “Configuring VPLS” chapter of the [Configuring Multiprotocol Label Switching on the Optical Services Modules](#).
- Make sure that the PE-to-CE interface is configured the switchport trunk with a list of allowed VLANs. For more information, see the “Configuring VPLS” chapter of the “Configuring VPLS” chapter of the [Configuring Multiprotocol Label Switching on the Optical Services Modules](#).
- To provide faster convergence, you can optionally enable the MPLS Traffic Engineering: Fast Reroute feature in the Multiprotocol Label Switching (MPLS) core. See the [MPLS Traffic Engineering \(TE\)—Fast Reroute \(FRR\) Link and Node Protection](#) documentation.
- Enable the L2VPN Pseudowire Redundancy feature on the U-PE routers for MPLS access. For information about configuring the L2VPN Pseudowire Redundancy feature, see the [L2VPN Pseudowire Redundancy](#) documentation.

- When configuring MSTP, specify that one of N-PEs routers is the root by assigning it the lowest priority, using the following command:

```
spanning-tree mst instance-id priority priority
```

For information about configuring MSTP, see the “Configuring MST Instance Parameters” chapter of the [Cisco 7600 Series Cisco IOS Software Configuration Guide, 12.1E](#).

- When configuring MSTP, make sure each of the routers participating in the spanning-tree are in the same region and are the same revision by issuing the **revision**, **name**, and **instance** commands in MST configuration mode. For more information on configuring these MSTP parameters, see the “Configuring IEEE 802.1s MST” chapter of the [Cisco 7600 Series Cisco IOS Software Configuration Guide, 12.1E](#).

## Restrictions for H-VPLS N-PE Redundancy for QinQ and MPLS Access

- H-VPLS N-PE Redundancy for QinQ and MPLS Access cannot be used with the VPLS Autodiscovery feature on the pseudowires that attach to the U-PE routers. When you create the VPLS, manually create the virtual forwarding interface (VFI).
- You cannot configure more than one pseudowire (PW) to carry the bridge protocol data unit (BPDU) information between the N-PE routers. If you attempt to enter the **forward permit l2protocol all** command for multiple VFIs, you receive an error message.
- You cannot configure a local loopback address as a neighbor when you configure the H-VPLS N-PE Redundancy for QinQ and MPLS Access feature on the N-PE routers. If you do, the following error is displayed:

```
VPLS local switching to peer address not supported
```

- Only two N-PE routers can be connected to each U-PE router.
- For a list of supported hardware for this feature, see the [Release Notes for Cisco IOS Release 12.2SR for the Cisco 7600 Series Routers](#).
- The spanning tree mode must be MSTP for the H-VPLS N-PE Redundancy for QinQ and MPLS Access feature. If the spanning tree mode changes, the H-VPLS N-PE Redundancy for QinQ and MPLS Access feature may not work correctly, even though the pseudowire that carries the BPDUs information still exists and the H-VPLS N-PE Redundancy is still configured.

## Information About H-VPLS N-PE Redundancy for QinQ and MPLS Access

Before configuring the H-VPLS N-PE Redundancy for QinQ and MPLS Access feature, you should understand the following concepts:

- [How H-VPLS N-PE Redundancy for QinQ and MPLS Access Works](#), page 3
- [MAC Address Withdrawal](#), page 5

## How H-VPLS N-PE Redundancy for QinQ and MPLS Access Works

In a network configured with the H-VPLS N-PE Redundancy for QinQ and MPLS Access feature, the U-PE router is connected to two N-PE routers, which provides a level of redundancy that can tolerate both link or device faults. If a failure occurs in the network that disables one N-PE router from transmitting data, the other N-PE router will take over. This feature works with both QinQ access based on Multiple Spanning Tree Protocol (MSTP) and MPLS access based on pseudowire redundancy.

### H-VPLS N-PE Redundancy with QinQ Access Based on MSTP

H-VPLS N-PE redundancy with QinQ access uses MSTP running on the N-PE routers and U-PE routers in an H-VPLS network. A pseudowire running between N-PE routers carries only MSTP BPDUs. The pseudowire running between the N-PE routers is always up and is used to create a loop path between N-PE routers so that MSTP will block one of the redundant paths between the U-PE router and the N-PE routers. If the primary N-PE router or the path to it fails, MSTP will enable the path to the backup N-PE router.

[Figure 1](#) shows an H-VPLS network with redundant access. Each U-PE router has two trunk connections, one to each N-PE router. Between the two N-PE routers is a pseudowire to provide a loop path for MSTP BPDUs. The network topology shown in [Figure 1](#) allows for the backup N-PE router to take over if the primary N-PE router or the path to it fails.

**Figure 1** *H-VPLS N-PE Redundancy with QinQ access Based on MSTP*

186183

## H-VPLS N-PE Redundancy with MPLS Access Based on Pseudowire Redundancy

For H-VPLS redundancy with MPLS access based on pseudowire redundancy, the MPLS network has pseudowires to the VPLS core N-PE routers.

As shown in [Figure 2](#), one pseudowire transports data between the U-PE router and its peer N-PE routers. When a failure occurs along the path of the U-PE router, the backup pseudowire and the redundant N-PE router become active and start transporting data.

**Figure 2** *H-VPLS N-PE Redundancy for QinQ and MPLS Access with MPLS Access Based On Pseudowire Redundancy*

186184

## MAC Address Withdrawal

PE routers learn the remote MAC addresses and directly attached MAC addresses on customer-facing ports by deriving topology and forwarding information from packets originating at customer sites. To display the number of MAC address withdrawal messages, enter the **show mpls l2transport vc detail** command, as shown in the following example. The MAC address withdrawal message is shown in bold.

```
Router# show mpls l2transport vc detail

Local interface: VFI TEST VFI up
MPLS VC type is VFI, interworking type is Ethernet
Destination address: 10.1.1.1, VC ID: 1000, VC status: up
Output interface: Se2/0, imposed label stack {17}
Preferred path: not configured
Default path: active
Next hop: point2point
Create time: 00:04:34, last status change time: 00:04:15
Signaling protocol: LDP, peer 10.1.1.1:0 up
Targeted Hello: 10.1.1.1(LDP Id) -> 10.1.1.1
MPLS VC labels: local 16, remote 17
Group ID: local 0, remote 0
MTU: local 1500, remote 1500
Remote interface description:
MAC Withdraw: sent 5, received 3
Sequencing: receive disabled, send disabled
VC statistics:
packet totals: receive 0, send 0
byte totals:   receive 0, send 0
packet drops:  receive 0, send 0
```

### How MAC Address Withdrawal Works with H-VPLS N-PE Redundancy with QinQ Access

If a failure occurs in the customer switched network, a spanning tree Topology Change Notification (TCN) is issued to the U-PE router, which issues an LDP-based MAC address withdrawal message to the peer N-PE routers and flushes its MAC address table.

### How MAC Address Withdrawal Works with H-VPLS N-PE Redundancy with MPLS Access

If the pseudowire between the U-PE router and N-PE router fails, then the L2VPN Pseudowire Redundancy feature on the U-PE router activates the standby pseudowire. In addition, the U-PE router sends a Label Distribution Protocol (LDP) MAC address withdrawal request to the new N-PE router, which forwards the message to all pseudowires in the VPLS core and flushes its MAC address table.

If a switched virtual interface (SVI) on the N-PE router fails, the L2VPN Pseudowire Redundancy feature activates the standby pseudowire and the U-PE router sends a MAC withdrawal message to the newly active N-PE router.

For information about the L2VPN Pseudowire Redundancy feature, see the [L2VPN Pseudowire Redundancy](#) feature.

# How to Configure H-VPLS N-PE Redundancy for QinQ and MPLS Access

This section contains the following procedures:

- [Configuring the VPLS Pseudowire Between the N-PE Routers, page 6](#) (required)
- [Configuring the SVI for the Native VLAN, page 7](#) (required)
- [Verifying the H-VPLS N-PE Redundancy for QinQ and MPLS Access Configuration, page 8](#) (optional)

## Configuring the VPLS Pseudowire Between the N-PE Routers

Configuring N-PE redundancy in an H-VPLS network requires two steps. First you define the VPLS pseudowire for transporting BPDU data. Then, you connect that pseudowire to the native VLAN. This provides a redundancy that provides improved reliability against link and node failures.

### Prerequisites

- Before configuring the H-VPLS N-PE Redundancy for QinQ and MPLS Access feature, configure your H-VPLS network and make sure it is operating correctly. For more information about configuring the H-VPLS network, see the “Configuring VPLS” chapter of the [Configuring Multiprotocol Label Switching on the Optical Services Modules](#).
- Make sure that the PE-to-CE interface is configured the switchport trunk with a list of allowed VLANs. For more information, see the “Configuring VPLS” chapter of the “Configuring VPLS” chapter of the [Configuring Multiprotocol Label Switching on the Optical Services Modules](#).
- To provide faster convergence, you can optionally enable the MPLS Traffic Engineering: Fast Reroute feature in the Multiprotocol Label Switching (MPLS) core. See the [MPLS Traffic Engineering \(TE\)—Fast Reroute \(FRR\) Link and Node Protection](#) documentation.
- Enable the L2VPN Pseudowire Redundancy feature on the U-PE routers for MPLS access. For information about configuring the L2VPN Pseudowire Redundancy feature, see the [L2VPN Pseudowire Redundancy](#) documentation.
- When configuring MSTP, specify that one of N-PEs routers is the root by assigning it the lowest priority, using the following command:

**spanning-tree mst instance-id priority priority**

For information about configuring MSTP, see the “Configuring MST Instance Parameters” chapter of the [Cisco 7600 Series Cisco IOS Software Configuration Guide, 12.1E](#).

- When configuring MSTP, make sure each of the routers participating in the spanning-tree are in the same region and are the same revision by issuing the **revision**, **name**, and **instance** commands in MST configuration mode. For more information on configuring these MSTP parameters, see the “Configuring IEEE 802.1s MST” chapter of the [Cisco 7600 Series Cisco IOS Software Configuration Guide, 12.1E](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **l2 vfi** *name* **manual**
4. **vpn id** *id-number*
5. **forward permit l2protocol all**
6. **neighbor** *remote-router-id* *vc-id* {**encapsulation** *encapsulation-type* | **pw-class** *pw-name*}  
[**no-split-horizon**]
7. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                               | Purpose                                                                                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                  | Enters global configuration mode.                                                                                        |
| Step 3 | <b>l2 vfi</b> <i>name</i> <b>manual</b><br><br><b>Example:</b><br>Router(config)# l2 vfi vfitest1 manual                                                                                                                                                        | Creates a Layer 2 VFI and enters Layer 2 VFI manual configuration mode.                                                  |
| Step 4 | <b>vpn id</b> <i>id-number</i><br><br><b>Example:</b><br>Router(config-vfi)# vpn id 200                                                                                                                                                                         | Specifies the VPN ID.                                                                                                    |
| Step 5 | <b>forward permit l2protocol all</b><br><br><b>Example:</b><br>Router(config-vfi)# forward permit l2protocol all                                                                                                                                                | Creates a pseudowire that is to be used to transport BPDU data between the two N-PE routers.                             |
| Step 6 | <b>neighbor</b> <i>remote-router-id</i> <i>vc-id</i> { <b>encapsulation</b> <i>encapsulation-type</i>   <b>pw-class</b> <i>pw-name</i> }<br>[ <b>no-split-horizon</b> ]<br><br><b>Example:</b><br>Router(config-vfi)# neighbor 10.2.2.2 3<br>encapsulation mpls | Specifies the peer IP address of the redundant N-PE router and the type of tunnel signaling and encapsulation mechanism. |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config-vfi)# end                                                                                                                                                                                                    | Ends the current configuration session and returns to privileged EXEC mode.                                              |

## Configuring the SVI for the Native VLAN

Perform the following task to configure the switch virtual interface for the native VLAN.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface vlan** *vlanid*
4. **xconnect vfi** *vfi-name*

**DETAILED STEPS**

|        | Command or Action                                                                                   | Purpose                                                                                                             |
|--------|-----------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                              | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                      | Enters global configuration mode.                                                                                   |
| Step 3 | <b>interface vlan</b> <i>vlanid</i><br><br><b>Example:</b><br>Router(config)# interface vlan 23     | Creates a dynamic SVI.                                                                                              |
| Step 4 | <b>xconnect vfi</b> <i>vfi-name</i><br><br><b>Example:</b><br>Router(config)# xconnect vfi vfitest1 | Specifies the Layer 2 VFI that you are binding to the VLAN port.                                                    |

## Verifying the H-VPLS N-PE Redundancy for QinQ and MPLS Access Configuration

To ensure that the H-VPLS N-PE Redundancy for QinQ and MPLS Access feature is correctly configured, perform the following task.

**SUMMARY STEPS**

1. **show vfi** *vfi-name*

**DETAILED STEPS****Step 1** **show vfi** *vfi-name*

Use this command on the pseudowire between the two N-PE routers to displays information about the pseudowire, as shown in the following example:

```
Router# show vfi VPLS-2
```

```
VFI name: VPLS-2, state: up
VPN ID: 100
```

```

Local attachment circuits:
  Vlan2
Neighbors connected via pseudowires:
Peer Address      VC ID      Split-horizon
10.1.1.1          2          Y
10.1.1.2          2          Y
10.2.2.3          2          N

```

## Configuration Examples for H-VPLS N-PE Redundancy for QinQ and MPLS Access

This section provides the following example for configuring H-VPLS redundancy:

- [H-VPLS N-PE Redundancy for QinQ Access: Example](#)

### H-VPLS N-PE Redundancy for QinQ Access: Example

Figure 3 shows a configuration that is set up for H-VPLS N-PE redundancy with QinQ access.

**Figure 3** H-VPLS N-PE Redundancy with QinQ Access Topology

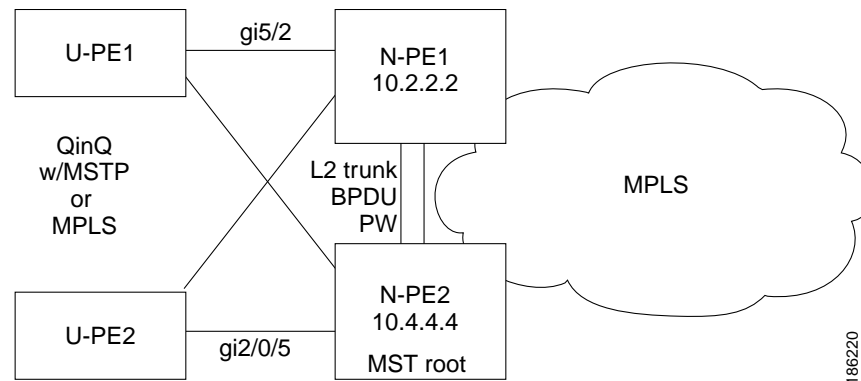

Table 1 shows the configuration of two N-PE routers for H-VPLS N-PE redundancy with QinQ access.

**Table 1** H-VPLS N-PE Redundancy for QinQ Access: Example

| N-PE1                                                                                                                                                                                                                                                                                                                                                                                                                                                     | N-PE2                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module.

- **forward permit l2protocol**
- **show mpls l2transport vc**

For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html).

For information about all Cisco IOS commands, go to the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or to the Cisco IOS Master Commands List.

# Feature Information for H-VPLS N-PE Redundancy for QinQ and MPLS Access

Table 2 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2** Feature Information for H-VPLS N-PE Redundancy for QinQ and MPLS Access

| Feature Name                                    | Releases    | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| H-VPLS N-PE Redundancy for QinQ and MPLS Access | 12.2(33)SRC | <p>The H-VPLS N-PE Redundancy for QinQ and MPLS Access feature enables two network provider edge (N-PE) routers to provide redundancy to a user provider edge (U-PE) router in a hierarchical virtual private LAN service (VPLS). Having redundant N-PE routers provides improved stability and reliability against link and node failures.</p> <p>In Release 12.2(33)SRC, this feature was introduced on the Cisco Series 7600 router.</p> <p>The following commands were introduced or modified by this feature: <b>forward permit l2protocol</b> and <b>show mpls l2transport vc</b>.</p> |

# Glossary

**CE router**—Customer edge router. A router that belongs to a customer network, which connects to a PE router to utilize MPLS VPN network services.

**LAN**—Local area network. High-speed, low-error data network covering a relatively small geographic area. LANs connect workstations, peripherals, terminals, and other devices in a single building or other geographically limited area.

**MPLS**—Multiprotocol Label Switching. Packet-forwarding technology, used in the network core, that applies data link layer labels to tell switching nodes how to forward data, resulting in faster and more scalable forwarding than network layer routing normally can do.

**MSTP**—Multiple Spanning Tree Protocol. The MSTP enables multiple VLANs to be mapped to the same spanning-tree instance, reducing the number of spanning-tree instances needed to support a large number of VLANs.

**PE router**—Provider edge router. The PE router is the entry point into the Service Provider network. The PE router is typically deployed on the edge of the network and is administered by the Service Provider.

**PW**—Pseudowire.

**N-PE**—Network-facing PE router. This router acts as a gateway between the MPLS core and edge domains.

**pseudowire**—A pseudowire is a virtual connection that, in the context of VPLS, connects two VSIs. A pseudowire is bidirectional and consists of a pair of uni-directional MPLS Virtual Circuits (VCs). A pseudowire can be used to connect a point-to-point circuit.

**PW**—Pseudowire. A mechanism that carries the elements of an emulated service from one PE router to one or more PEs over a packet switched network (PSN).

**QinQ**—An IEEE 802.1Q VLAN tunnel.

**redundancy**—The duplication of devices, services, or connections so that, in the event of a failure, the redundant devices, services, or connections can perform the work of those that failed.

**router**—A network layer device that uses one or more metrics to determine the optimal path along which network traffic should be forwarded. Routers forward packets from one network to another based on network layer information.

**U-PE**—Customer-facing PE router. This router connects Customer Edge (CE) routers to the service.

**QinQ**—A mechanism for constructing multipoint Layer 2 VPN using Ethernet switches.

**spanning tree**—Loop-free subset of a network topology.

**VFI**—Virtual forwarding instance. A VFI is a collection of data structures used by the data plane, software-based or hardware-based, to forward packets to one or more VCs.

**VLAN**—Virtual LAN. Group of devices on one or more LANs that are configured (using management software) so that they can communicate as if they were attached to the same wire, when in fact they are located on a number of different LAN segments.

**VPLS**—Virtual Private LAN Service. VPLS describes an architecture that delivers Layer 2 service that emulates an Ethernet LAN across a Wide Area Network (WAN) and inherits the scaling characteristics of a LAN.

**VPLS redundancy**—Also called N-PE redundancy. Allows U-PEs to be dual-homed (to their N-PEs) in a loop-free topology with MPLS or QinQ as the access or aggregation domain.

**VPN**—Virtual Private Network. Allows IP traffic to travel securely over public TCP/IP networks and the Internet by encapsulating and encrypting all IP packets. VPN uses a tunnel to encrypt all information at the IP level.

# L2VPN Multisegment Pseudowires

---

**First Published: February 27, 2009**

**Last Updated: November 20, 2009**

The L2VPN Multisegment Pseudowires feature enables you to configure two or more Layer 2 pseudowire segments that function as a single pseudowire. The feature spans multiple cores or autonomous systems of the same or different carrier networks.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for L2VPN Multisegment Pseudowires”](#) section on page 12.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for L2VPN Multisegment Pseudowires

Before configuring this feature, see the following documents:

- [Any Transport over MPLS](#)
- [L2VPN Pseudowire Switching](#)
- [MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV](#)
- [Pseudowire Setup and Maintenance Using the Label Distribution Protocol \(LDP\)](#) (RFC 4447)

## Restrictions for L2VPN Multisegment Pseudowires

- Only Multiprotocol Label Switching (MPLS) Layer 2 pseudowires are supported.
- Only manual configuration of the pseudowires (including S-PE and T-PE routers) is supported.
- The L2VPN Pseudowire Switching feature is supported for pseudowires advertised with FEC 128. FEC 129 is not supported. See the [“Restrictions” section on page 8](#) for specific restrictions on ping mpls and trace mpls operations.
- The S-PE router is limited to 1600 pseudowires.

## Information About L2VPN Multisegment Pseudowires

Before configuring the L2VPN Multisegment Pseudowires feature, you should understand the following concepts:

- [L2VPN Pseudowire Defined, page 2](#)
- [L2VPN Multisegment Pseudowire Defined, page 3](#)

## L2VPN Pseudowire Defined

An L2VPN pseudowire (PW) is a tunnel established between two provider edge (PE) routers across the core carrying the Layer 2 payload encapsulated as MPLS data, as shown in [Figure 1](#). This helps carriers migrate from traditional Layer 2 networks such as Frame Relay and ATM to an MPLS core. In the L2VPN pseudowire shown in [Figure 2](#), the PWs between two PE routers are located within the same autonomous system. Routers PE1 and PE2 are called terminating PE routers (T-PEs). Attachment circuits are bounded to the PW on these PE routers.

**Figure 1** *An L2VPN Pseudowire*

## L2VPN Multisegment Pseudowire Defined

An L2VPN multisegment pseudowire (MS-PW) is a set of two or more PW segments that function as a single PW. It is also known as switched PW. MS-PWs span multiple cores or autonomous systems of the same or different carrier networks. An L2VPN MS-PW can include up to 254 PW segments.

The end routers are called terminating PE routers (T-PEs), and the switching routers are called S-PE routers. The S-PE router terminates the tunnels of the preceding and succeeding PW segments in an MS-PW. The S-PE router can switch the control and data planes of the preceding and succeeding PW segments of the MS-PW. An MS-PW is declared to be up when all the single-segment PWs are up. For more information, see the [L2VPN Pseudowire Switching](#) document.

**Figure 2** *A Multisegment Pseudowire*

# How to Configure L2VPN Multisegment Pseudowires

The following sections outline the tasks for creating and maintaining L2VPN multisegment pseudowires:

- [Configuring L2VPN Multisegment Pseudowires, page 4](#) (required)
- [Displaying Information About the L2VPN Multisegment Pseudowires, page 6](#) (optional)
- [Performing ping mpls and trace mpls Operations on L2VPN Multisegment Pseudowires, page 7](#) (optional)

## Configuring L2VPN Multisegment Pseudowires

Perform the following steps on the S-PE routers to create L2VPN multisegment pseudowires.

### Cisco 7600 Router-Specific Instructions

If the Cisco 7600 router is the penultimate hop router connected to the S-PE or T-PE router, issue the following commands on the S-PE or T-PE routers:

- **mpls ldp explicit-null**
- **no mls mpls explicit-null propagate-ttl**

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls label protocol ldp**
4. **mpls ldp router-id *interface* force**
5. **pseudowire-class *name***
6. **encapsulation mpls**
7. **switching tlv**
8. **exit**
9. **l2 vfi *name* point-to-point**
10. **description *string***
11. **neighbor *ip-address* *vcid* {encapsulation mpls | pw-class *pw-class-name*}**

## DETAILED STEPS

|        | Command or Action                                                                                                      | Purpose                                                                                                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                         | Enters global configuration mode.                                                                                                                                                                  |
| Step 3 | <b>mpls label protocol ldp</b><br><br><b>Example:</b><br>Router(config)# mpls label protocol ldp                       | Configures the use of Label Distribution Protocol (LDP) on all interfaces.                                                                                                                         |
| Step 4 | <b>mpls ldp router-id interface force</b><br><br><b>Example:</b><br>Router(config)# mpls ldp router-id loopback0 force | Specifies the preferred interface for determining the LDP router ID.                                                                                                                               |
| Step 5 | <b>pseudowire-class name</b><br><br><b>Example:</b><br>Router(config)# pseudowire-class atom                           | Establishes a pseudowire class with a name that you specify, and enters pseudowire class configuration mode.                                                                                       |
| Step 6 | <b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-pw-class)# encapsulation mpls                        | Specifies the tunneling encapsulation. <ul style="list-style-type: none"> <li>For MPLS L2VPNs, the encapsulation type is <b>mpls</b>.</li> </ul>                                                   |
| Step 7 | <b>switching tlv</b><br><br><b>Example:</b><br>Router(config-pw-class)# switching tlv                                  | (Optional) Enables the advertisement of the switching point type-length variable (TLV) in the label binding. <ul style="list-style-type: none"> <li>This command is enabled by default.</li> </ul> |
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config-pw-class)# exit                                                    | Exits pseudowire class configuration mode.                                                                                                                                                         |
| Step 9 | <b>l2 vfi name point-to-point</b><br><br><b>Example:</b><br>Router(config)# l2 vfi atomtunnel point-to-point           | Creates a point-to-point Layer 2 virtual forwarding interface (VFI) and enters VFI configuration mode.                                                                                             |

|                | Command or Action                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                          |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 10</b> | <b>description</b> <i>string</i><br><br><b>Example:</b><br>Router(config-vfi)# <b>description</b> segment1                                                                                                            | Provides a description of the switching provider edge router for a multisegment pseudowire.                                                                                                                                                                                                                      |
| <b>Step 11</b> | <b>neighbor</b> <i>ip-address vcid</i><br>{ <b>encapsulation</b> <b>mpls</b>   <b>pw-class</b> <i>pw-class-name</i> }<br><br><b>Example:</b><br>Router(config-vfi)# <b>neighbor</b> 10.0.0.1 100 <b>pw-class</b> mpls | Sets up an emulated VC.<br><br><ul style="list-style-type: none"> <li>Specify the IP address and the VC ID of the peer router. Also specify the pseudowire class to use for the emulated VC.</li> </ul> <b>Note</b> Only two <b>neighbor</b> commands are allowed for each <b>l2 vfi point-to-point</b> command. |

## Displaying Information About the L2VPN Multisegment Pseudowires

Perform the following task to display the status of L2VPN multisegment pseudowires.

### SUMMARY STEPS

1. **show mpls l2transport binding**
2. **show mpls l2transport vc detail**

### DETAILED STEPS

#### Step 1 **show mpls l2transport binding**

Use the **show mpls l2transport binding** command to display information about the pseudowire switching point, as shown in bold in the output. (In the following examples PE1 and PE4 are the T-PE routers.)

Router# **show mpls l2transport binding**

```

Destination Address: 10.1.1.1,  VC ID: 102
Local Label:  17
  Cbit: 1,    VC Type: Ethernet,    GroupID: 0
  MTU: 1500,  Interface Desc: n/a
  VCCV: CC Type: CW [1], RA [2], TTL [3]
    CV Type: LSPV [2]
Remote Label: 16
  Cbit: 1,    VC Type: Ethernet,    GroupID: 0
  MTU: 1500,  Interface Desc: n/a
  VCCV: CC Type: CW [1], RA [2], TTL [3]
    CV Type: LSPV [2]
PW Switching Point:
    Vcid  local IP addr    remote IP addr    Description
    101   10.11.11.11      10.20.20.20      PW Switching Point PE3
    100   10.20.20.20      10.11.11.11      PW Switching Point PE2

```

#### Step 2 **show mpls l2transport vc detail**

Use the **show mpls l2transport vc detail** command to display status of the pseudowire switching point. In the following example, the output (shown in bold) displays the segment that is the source of the fault of the multisegment pseudowire:

```

Router# show mpls l2transport vc detail

Local interface: Se3/0 up, line protocol up, HDLC up
  Destination address: 12.1.1.1, VC ID: 100, VC status: down
  Output interface: Se2/0, imposed label stack {23}
  Preferred path: not configured
  Default path: active
  Next hop: point2point
Create time: 00:03:02, last status change time: 00:01:41
Signaling protocol: LDP, peer 10.1.1.1:0 up
  Targeted Hello: 10.1.1.4(LDP Id) -> 10.1.1.1, LDP is UP
  Status TLV support (local/remote)   : enabled/supported
    LDP route watch                   : enabled
    Label/status state machine        : established, LruRrd
  Last local dataplane status rcvd: No fault
  Last local SSS circuit status rcvd: No fault
  Last local SSS circuit status sent: DOWN(PW-tx-fault)
  Last local LDP TLV status sent: No fault
  Last remote LDP TLV status rcvd: DOWN(PW-tx-fault)
  PW Switching Point:
    Fault type Vcid local IP addr remote IP addr Description
    PW-tx-fault 101 10.1.1.1      10.1.1.1      S-PE2
  Last remote LDP ADJ status rcvd: No fault
MPLS VC labels: local 19, remote 23
Group ID: local 0, remote 0
MTU: local 1500, remote 1500
Remote interface description:
Sequencing: receive disabled, send disabled
VC statistics:
  packet totals: receive 16, send 27
  byte totals:   receive 2506, send 3098
  packet drops:  receive 0, seq error 0, send 0

```

## Performing ping mpls and trace mpls Operations on L2VPN Multisegment Pseudowires

You can use the **ping mpls** and **trace mpls** commands to verify that all the segments of the MPLS multisegment pseudowire are operating.

You can use the **ping mpls** command to verify connectivity at the following pseudowire points:

- From one end of the pseudowire to the other
- From one of the pseudowires to a specific segment
- The segment between two adjacent S-PE routers

You can use the **trace mpls** command to verify connectivity at the following pseudowire points:

- From one end of the pseudowire to the other
- From one of the pseudowires to a specific segment
- The segment between two adjacent S-PE routers
- A range of segments

## Restrictions

Some **ping mpls** and **trace mpls** keywords that are available with IPv4 LDP or traffic engineering (TE), are not available with pseudowire.

The following keywords are not available with the **ping mpls pseudowire** command:

- **dsmap**
- **flags**
- **force-explicit-null**
- **output**
- **revision**
- **ttl**

The following keywords are not available with the **trace mpls pseudowire** command:

- **flags**
- **force-explicit-null**
- **output**
- **revision**
- **ttl**

## SUMMARY STEPS

1. **ping mpls pseudowire** *destination-address* *vc-id* [**segment** *segment-number*]
2. **trace mpls pseudowire** *destination-address* *vc-id* **segment** *segment-number* [*segment-number*]

## DETAILED STEPS

---

**Step 1** **ping mpls pseudowire** *destination-address* *vc-id* [**segment** *segment-number*]

Where:

- *destination-address* is the address of the S-PE router, which is the end of the segment from the direction of the source.
- *vc-id* is the VC ID of the segment from the source to the next PE router.
- **segment** *segment-number* is optional and specifies the segment you want to ping.

The following examples use the topology shown in [Figure 2](#):

- To perform an end-to-end ping operation from T-PE1 to T-PE2, enter the following command. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

**ping mpls pseudowire** *destination-address* *vc-id*

- To perform a ping operation from T-PE1 to segment 2, enter the following command. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

**ping mpls pseudowire** *destination-address* *vc-id* **segment** 2

**Step 2** **trace mpls pseudowire** *destination-address* *vc-id* **segment** *segment-number* [*segment-number*]

Where:

- *destination-address* is the address of the next S-PE router from the origin of the trace.

- *vc-id* is the VC ID of the segment from which the **trace** command is issued.
- *segment-number* indicates the segment upon which the trace operation will act. If you enter two segment numbers, the traceroute operation will perform a trace on that range of routers.

The following examples use the topology shown in [Figure 2](#):

- To perform a trace operation from T-PE1 to segment 2 of the multisegment pseudowire, enter the following command. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

**trace mpls pseudowire destination-address vc-id segment 2**

This example performs a trace from T-PE1 to S-PE2.

- To perform a trace operation on a range of segments, enter the following command. This example performs a trace from S-PE2 to T-PE2. *destination-address* is S-PE1 and *vc-id* is the VC between T-PE1 and S-PE1.

**trace mpls pseudowire destination-address vc-id segment 2 4**

The following commands perform trace operations on S-PE router 10.10.10.9, first on segment 1, then on segment 2.

Segment 1 trace:

```
Router# trace mpls pseudowire 10.10.10.9 220 segment 1
```

Tracing MS-PW segments within range [1-1] peer address 10.10.10.9 and timeout 2 seconds

```
Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
        'L' - labeled output interface, 'B' - unlabeled output interface,
        'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
        'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
        'P' - no rx intf label prot, 'p' - premature termination of LSP,
        'R' - transit router, 'I' - unknown upstream index,
        'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

```
L 1 10.10.9.9 0 ms [Labels: 18 Exp: 0]
    local 10.10.10.22 remote 10.10.10.9 vc id 220
```

Segment 2 trace:

```
Router# trace mpls pseudowire 10.10.10.9 220 segment 2
```

Tracing MS-PW segments within range [1-2] peer address 10.10.10.9 and timeout 2 seconds

```
Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
        'L' - labeled output interface, 'B' - unlabeled output interface,
        'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
        'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
        'P' - no rx intf label prot, 'p' - premature termination of LSP,
        'R' - transit router, 'I' - unknown upstream index,
        'X' - unknown return code, 'x' - return code 0
```

Type escape sequence to abort.

```
L 1 10.10.9.9 4 ms [Labels: 18 Exp: 0]
    local 10.10.10.22 remote 10.10.10.9 vc id 220
```

```
! 2 10.10.3.3 4 ms [Labels: 16 Exp: 0]
    local 10.10.10.9 remote 10.10.10.3 vc id 220
```

# Feature Information for L2VPN Multisegment Pseudowires

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for L2VPN Multisegment Pseudowires

| Feature Name                   | Releases    | Feature Information                                                                                                                                                                                                   |
|--------------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| L2VPN Multisegment Pseudowires | 12.2(33)SRE | This feature enables you to configure two or more Layer 2 pseudowire segments that function as a single pseudowire. The feature spans multiple cores or autonomous systems of the same or different carrier networks. |

# QoS Policy Support for L2VPN ATM PVPs

---

**First Published: February 27, 2009**

**Last Updated: November 20, 2009**

This document explains how to configure Quality of Service (QoS) Policy Support for Layer 2 Virtual Private Network (L2VPN) ATM permanent virtual paths (PVPs). That is, it explains how to configure QoS policies in ATM PVP mode for L2VPNs.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for QoS Policy Support for L2VPN ATM PVPs”](#) section on page 10.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for QoS Policy Support for L2VPN ATM PVPs

Before configuring QoS policies on L2VPN ATM PVPs, you should understand the concepts and configuration instructions in the following document:

- [Any Transport over MPLS](#)

## Restrictions for QoS Policy Support for L2VPN ATM PVPs

The following restrictions apply to the QoS Policy Support for L2VPN ATM PVPs feature:

- The Cisco 7600 series router does not support any queueing features in ATM PVP mode.
- When you enable a policy in PVP mode, do not configure ATM rates on the VCs that are part of the PVP. The VCs should be unspecified bit rate (UBR) VCs only.
- If VCs are part of a PVP that has a policy configured, you cannot configure ATM VC traffic shaping.
- Cisco IOS Release 12.2(33)SRE does not support cell-based ATM shaping per PVP.
- You cannot configure a queueing policy on an ATM PVP with UBR.
- You cannot configure queueing-based policies with UBR traffic shaping.

## Information About QoS Policy Support for L2VPN ATM PVPs

Before configuring the QoS Policy Support for L2VPN ATM PVPs feature, you should understand the following concepts:

- [MQC Structure, page 2](#)
- [Elements of a Traffic Class, page 3](#)
- [Elements of a Traffic Policy, page 3](#)

## MQC Structure

The modular QoS command-line interface (CLI) (MQC) structure allows you to define a traffic class, create a traffic policy, and attach the traffic policy to an interface.

The MQC structure is the result of the following three high-level steps.

1. Define a traffic class by using the **class-map** command. A traffic class is used to classify traffic.
2. Create a traffic policy by using the **policy-map** command. (The terms traffic policy and policy map are often synonymous.) A traffic policy (policy map) contains a traffic class and one or more QoS features that will be applied to the traffic class. The QoS features in the traffic policy determine how to treat the classified traffic.
3. Attach the traffic policy (policy map) to the interface by using the **service-policy** command.

## Elements of a Traffic Class

A traffic class contains three major elements: a traffic class name, a series of match commands, and, if more than one match command is used in the traffic class, instructions on how to evaluate these match commands.

The match commands are used for classifying packets. Packets are checked to determine whether they meet the criteria specified in the match commands; if a packet meets the specified criteria, that packet is considered a member of the class. Packets that fail to meet the matching criteria are classified as members of the default traffic class.

## Elements of a Traffic Policy

A traffic policy contains three elements: a traffic policy name, a traffic class (specified with the **class** command), and the command used to enable the QoS feature.

The traffic policy (policy map) applies the enabled QoS feature to the traffic class once you attach the policy map to the interface (by using the **service-policy** command).

**Note**

A packet can match only one traffic class within a traffic policy. If a packet matches more than one traffic class in the traffic policy, the first traffic class defined in the policy will be used.

## How to Configure QoS Policy Support for L2VPN ATM PVPs

The following sections explain how to configure QoS operations in ATM PVP mode:

- [Enabling a Service Policy in ATM PVP Mode, page 3](#) (required)
- [Enabling Traffic Shaping in ATM PVP Mode, page 5](#) (required)
- [Enabling Matching of ATM VCIs, page 6](#) (required)

## Enabling a Service Policy in ATM PVP Mode

You can enable a service policy in ATM PVP mode. You can also enable a service policy on PVP on a multipoint subinterface.

### Restrictions

- The Cisco 7600 series router does not support a service policy that uses the **match atm-vci** command in the egress direction.
- The **show policy-map interface** command does not display service policy information for ATM interfaces.
- Cisco IOS Release 12.2(33)SRE does not support cell-based ATM shaping per PVP.

### SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **interface atm *slot/port***
4. **atm pvp *vpi* l2transport**
5. **service-policy [input | output] *policy-map-name***
6. **xconnect *peer-router-id* *vcid* encapsulation mpls**
7. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                            |
| Step 3 | <b>interface atm <i>slot/port</i></b><br><br><b>Example:</b><br>Router(config)# interface atm 1/0                                                                          | Defines the interface and enters interface configuration mode.                                                                                                                                                                                                                                               |
| Step 4 | <b>atm pvp <i>vpi</i> l2transport</b><br><br><b>Example:</b><br>Router(config-if)# atm pvp 1 l2transport                                                                   | Specifies that the PVP is dedicated to transporting ATM cells and enters l2transport PVP configuration mode. <ul style="list-style-type: none"> <li>The <b>l2transport</b> keyword indicates that the PVP is for cell relay. This mode is for Layer 2 transport only; it is not for regular PVPs.</li> </ul> |
| Step 5 | <b>service-policy [input   output] <i>policy-map-name</i></b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvp)# service policy input poll                       | Enables a service policy on the specified PVP.                                                                                                                                                                                                                                                               |
| Step 6 | <b>xconnect <i>peer-router-id</i> <i>vcid</i> encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvp)# xconnect 10.0.0.1 123 encapsulation mpls | Binds the attachment circuit to a pseudowire VC. <ul style="list-style-type: none"> <li>The syntax for this command is the same as for all other Layer 2 transports.</li> </ul>                                                                                                                              |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config-if-atm-l2trans-pvp)# end                                                                                                | Exits l2transport PVP configuration mode and returns to privileged EXEC mode.                                                                                                                                                                                                                                |

## Enabling Traffic Shaping in ATM PVP Mode

Traffic shaping commands are supported in ATM PVP mode. For egress VP shaping, one configuration command is supported for each ATM service category. The supported service categories are constant bit rate (CBR), UBR, variable bit rate-nonreal time (VBR-NRT), and variable bit rate real-time (VBR-RT).

### Restrictions

- The Cisco 7600 series router does not support traffic shaping.
- Cisco IOS Release 12.2(33)SRE does not support cell-based ATM shaping per PVP.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface atm *slot/port***
4. **atm pvp *vpi* l2transport**
5. **ubr *pcr***  
or  
**cbr *pcr***  
or  
**vbr-nrt *pcr scr mbs***  
or  
**vbr-rt *pcr scr mbs***
6. **xconnect *peer-router-id vcid* encapsulation mpls**

### DETAILED STEPS

|        | Command or Action                                                                                        | Purpose                                                                                                                                                                                                                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                   | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                  |
| Step 3 | <b>interface atm <i>slot/port</i></b><br><br><b>Example:</b><br>Router(config)# interface atm 1/0        | Defines the interface and enters interface configuration mode.                                                                                                                                                                                                                                                     |
| Step 4 | <b>atm pvp <i>vpi</i> l2transport</b><br><br><b>Example:</b><br>Router(config-if)# atm pvp 1 l2transport | Specifies that the PVP is dedicated to transporting ATM cells, and enters l2transport PVP configuration mode.<br><ul style="list-style-type: none"> <li>• The <b>l2transport</b> keyword indicates that the PVP is for cell relay. This mode is for Layer 2 transport only; it is not for regular PVPs.</li> </ul> |

|        | Command or Action                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                              |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Step 6 | <pre>xconnect peer-router-id vcid encapsulation mpls</pre> <p><b>Example:</b><br/> Router(config-if-atm-l2trans-pvp)# xconnect 10.0.0.1 123 encapsulation mpls</p>                                                                       | <p>Binds the attachment circuit to a pseudowire VC.</p> <ul style="list-style-type: none"> <li>• The syntax for this command is the same as for all other Layer 2 transports.</li> </ul>                             |

## Enabling Matching of ATM VCIs

You can enable packet matching on an ATM VCI or range of VCIs using the **match atm-vci** command in class map configuration mode.

### Restrictions

- When you configure the **match atm-vci** command in class map configuration mode, you can add this class map to a policy map that can be attached only to an ATM VP.
- On the Cisco 7600 series router, the **match atm-vci** command is supported only in the ingress direction on an ATM VP.
- Cisco IOS Release 12.2(33)SRE does not support cell-based ATM shaping per PVP.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **class-map** *class-map-name* [**match-all** | **match-any**]
4. **match atm-vci** *vc-id* [*-vc-id*]
5. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                           |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                            | Enters global configuration mode.                                                                                                                                                                                                                 |
| Step 3 | <b>class-map</b> <i>class-map-name</i> [ <b>match-all</b>   <b>match-any</b> ]<br><br><b>Example:</b><br>Router(config)# class-map class1 | Creates a class map to be used for matching traffic to a specified class, and enters class map configuration mode.                                                                                                                                |
| Step 4 | <b>match atm-vci</b> <i>vc-id</i> [- <i>vc-id</i> ]<br><br><b>Example:</b><br>Router(config-cmap)# match atm-vci 50                       | Enables packet matching on an ATM VCI or range of VCIs. <ul style="list-style-type: none"> <li>The range is 32 to 65535.</li> </ul> <b>Note</b> You can use the <b>match not</b> command to match any VC except those you specify in the command. |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Router(config-cmap)# end                                                                             | (Optional) Returns to privileged EXEC mode.                                                                                                                                                                                                       |

## Configuration Examples for QoS Policy Support for L2VPN ATM PVPs

The following section shows an example of the QoS Policy Support for L2VPN ATM PVPs feature:

- [Enabling Traffic Shaping in ATM PVP Mode: Example, page 7](#)

### Enabling Traffic Shaping in ATM PVP Mode: Example

The following example enables traffic shaping in ATM PMP mode.

```
interface atm 1/0
 atm pvp 100 l2transport
 ubr 1000
 xconnect 10.11.11.11 777 encapsulation mpls
 atm pvp 101 l2transport
 ubr 1000
 xconnect 10.11.11.11 888 encapsulation mpls
 atm pvp 102 l2transport
 vbr-nrt 1200 800 128
 xconnect 10.11.11.11 999 encapsulation mpls
```

# Additional References

The following sections provide references related to the QoS Policy Support for L2VPN ATM PVPs feature.

# Feature Information for QoS Policy Support for L2VPN ATM PVPs

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for QoS Policy Support for L2VPN ATM PVPs

| Feature Name                          | Releases    | Feature Information                                                                                                                                                                                                                                                  |

# L2VPN: Pseudowire Preferential Forwarding

---

**First Published: February 27, 2009**

**Last Updated: November 20, 2009**

The L2VPN: Pseudowire Preferential Forwarding feature allows you to configure pseudowires so that you can use **ping**, **show**, and **traceroute** commands to find status information of the pseudowires before, during, and after a switchover.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for L2VPN: Pseudowire Preferential Forwarding](#)” section on [page 9](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for L2VPN: Pseudowire Preferential Forwarding

- Before configuring the L2VPN: Pseudowire Preferential Forwarding feature, you should understand the concepts in the following documents:
  - [Preferential Forwarding Status Bit Definition](#) (draft-ietf-pwe3-redundancy-bit-xx.txt)
  - [MPLS Pseudowire Status Signaling](#)
  - [L2VPN Pseudowire Redundancy](#)
  - [NSF/SSO—Any Transport over MPLS and AToM Graceful Restart](#)
  - [MPLS LSP Ping/Traceroute for LDP/TE, and LSP Ping for VCCV](#)
- The provider edge (PE) routers must be configured with the following features:
  - L2VPN Pseudowire Redundancy
  - NSF/SSO—AToM and AToM Graceful Restart
- The L2VPN: Pseudowire Preferential Forwarding feature requires that the following mechanisms be in place to enable you to detect a failure in the network:
  - LSP Ping/Traceroute and Any Transport over MPLS Virtual Circuit Connection Verification (AToM VCCV)
  - Local Management Interface (LMI)
  - Operation, Administration, and Maintenance (OAM)

## Restrictions for L2VPN: Pseudowire Preferential Forwarding

- Only ATM attachment circuits are supported.
- The following features are not supported:
  - Port mode cell relay
  - Any Transport over MPLS: AAL5 over MPLS
  - VC cell packing
  - OAM emulation
  - Integrated LMI/permanent virtual circuit (PVC)-D
  - PVC Range
  - L2TPv3 Pseudowire Redundancy
  - Local switching
  - Multiple backup pseudowires
  - Static pseudowires

## Information About L2VPN: Pseudowire Preferential Forwarding

The following section provides information about the L2VPN: Pseudowire Preferential Forwarding feature:

- [Overview of L2VPN: Pseudowire Preferential Forwarding, page 3](#)

## Overview of L2VPN: Pseudowire Preferential Forwarding

The L2VPN: Pseudowire Preferential Forwarding feature allows you to configure pseudowires so that you can use **ping**, **show**, and **traceroute** commands to find status information before, during, and after a switchover. The implementation of this feature is based on [Preferential Forwarding Status Bit Definition](#) (draft-ietf-pwe3-redundancy-bit-xx.txt). The L2VPN: Pseudowire Preferential Forwarding feature provides these enhancements for displaying information about the pseudowires:

- You can issue **ping mpls** commands on the backup pseudowires.
- You can display status of the pseudowires before, during, and after a switchover, using the **show xconnect** and **show mpls l2transport vc** commands.

**Note**

In a single-segment pseudowire, the PE routers at each end of the pseudowire serve as the termination points. In multisegment pseudowires, the terminating PE routers serve as the termination points.

## How to Configure L2VPN: Pseudowire Preferential Forwarding

The following section explains how to configure the L2VPN: Pseudowire Preferential Forwarding feature:

- [Configuring the Pseudowire, page 3](#) (required)

## Configuring the Pseudowire

You configure a connection, called a pseudowire, between the routers to transmit Layer 2 frames between PE routers.

As part of the pseudowire configuration, issue the **status redundancy master** command to make it the master. This enables the L2VPN: Pseudowire Preferential Forwarding feature to display the status of the active and backup pseudowires. By default, the PE router is in slave mode.

**Note**

One pseudowire must be the master and the other must be assigned the slave. You cannot configure both pseudowires as master or slave.

**Note**

You must specify the **encapsulation mpls** command as part of the pseudowire class for the Any Transport over MPLS (AToM) VCs to work properly. If you omit the **encapsulation mpls** command, you receive the following error:

```
% Incomplete command.
```

## Prerequisites

The PE routers must be configured for the L2VPN Pseudowire Redundancy and NSF/SSO—Any Transport over MPLS and AToM Graceful Restart features. See the following documents for configuration instructions:

- [L2VPN Pseudowire Redundancy](#)

- *NSF/SSO—Any Transport over MPLS and AToM Graceful Restart*

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **pseudowire-class** *name*
4. **encapsulation mpls**
5. **status redundancy** {**master** | **slave**}
6. **interworking** {**ethernet** | **ip**}

## DETAILED STEPS

|        | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|---------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                          | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>pseudowire-class</b> <i>name</i><br><br><b>Example:</b><br>Router(config)# pseudowire-class atom                             | Establishes a pseudowire class with a name that you specify, and enters pseudowire class configuration mode.                                                                                                                                                                                                                                                                                                                                 |
| Step 4 | <b>encapsulation mpls</b><br><br><b>Example:</b><br>Router(config-pw)# encapsulation mpls                                       | Specifies the tunneling encapsulation.<br><ul style="list-style-type: none"><li>• For AToM, the encapsulation type is <b>mpls</b>.</li></ul>                                                                                                                                                                                                                                                                                                 |
| Step 5 | <b>status redundancy</b> { <b>master</b>   <b>slave</b> }<br><br><b>Example:</b><br>Router(config-pw)# status redundancy master | Specifies the pseudowire as the master or slave.<br><ul style="list-style-type: none"><li>• This enables the L2VPN: Pseudowire Preferential Forwarding feature to display the status of the active and backup pseudowires.</li><li>• By default, the PE router is in slave mode.</li></ul> <b>Note</b> One pseudowire must be the master and the other must be assigned the slave. You cannot configure both pseudowires as master or slave. |
| Step 6 | <b>interworking</b> { <b>ethernet</b>   <b>ip</b> }<br><br><b>Example:</b><br>Router(config-pw)# interworking ip                | (Optional) Enables the translation between the different Layer 2 encapsulations.                                                                                                                                                                                                                                                                                                                                                             |

# Configuration Examples for L2VPN: Pseudowire Preferential Forwarding

This section contains the following examples:

- [L2VPN: Pseudowire Preferential Forwarding Configuration: Example, page 5](#)
- [Displaying the Status of the Pseudowires: Example, page 5](#)

## L2VPN: Pseudowire Preferential Forwarding Configuration: Example

The following commands configure a PE router with the L2VPN: Pseudowire Preferential Forwarding feature:

```
mpls ldp graceful-restart
mpls ip
mpls label protocol ldp
mpls ldp router-id Loopback0 force
mpls ldp advertise-labels
!
pseudowire-class mpls
  encapsulation mpls
  status redundancy master

interface ATM0/2/0.1 multipoint
  logging event subif-link-status
  atm pvp 50 l2transport
  xconnect 10.1.1.2 100 encap mpls
  backup peer 10.1.1.3 100 encap mpls
end
```

## Displaying the Status of the Pseudowires: Example

The following examples show the status of the active and backup pseudowires before, during, and after a switchover.

The **show mpls l2transport vc** command on the active PE router displays the status of the pseudowires:

Router# **show mpls l2transport vc**

| Local intf | Local circuit   | Dest address | VC ID | Status  |
|------------|-----------------|--------------|-------|---------|
| AT0/2/0.1  | ATM VPC CELL 50 | 10.1.1.2     | 100   | UP      |
| AT0/2/0.1  | ATM VPC CELL 50 | 10.1.1.3     | 100   | STANDBY |

The **show mpls l2transport vc** command on the backup PE router displays the status of the pseudowires. The active pseudowire on the backup PE router has the HOTSTANDBY status.

Router-standby# **show mpls l2transport vc**

| Local intf | Local circuit   | Dest address | VC ID | Status     |
|------------|-----------------|--------------|-------|------------|
| AT0/2/0.1  | ATM VPC CELL 50 | 10.1.1.2     | 100   | HOTSTANDBY |
| AT0/2/0.1  | ATM VPC CELL 50 | 10.1.1.3     | 100   | DOWN       |

During a switchover, the status of the active and backup pseudowires changes:

| Local intf | Local circuit   | Dest address | VC ID | Status     |
|------------|-----------------|--------------|-------|------------|
| AT0/2/0.1  | ATM VPC CELL 50 | 10.1.1.2     | 100   | RECOVERING |
| AT0/2/0.1  | ATM VPC CELL 50 | 10.1.1.3     | 100   | DOWN       |

| Local intf | Local circuit   | Dest address | VC ID | Status  |
|------------|-----------------|--------------|-------|---------|
| AT0/2/0.1  | ATM VPC CELL 50 | 10.1.1.2     | 100   | UP      |
| AT0/2/0.1  | ATM VPC CELL 50 | 10.1.1.3     | 100   | STANDBY |

```

# Feature Information for L2VPN: Pseudowire Preferential Forwarding

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for L2VPN: Pseudowire Preferential Forwarding

| Feature Name                              | Releases    | Feature Information                                                                                                                                                                                                                                                                                                                                                                 |

## **MPLS Layer 3 VPNs**

# Configuring MPLS Layer 3 VPNs

---

**First Published: May 2, 2005**

**Last Updated: August 26, 2008**

A Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) consists of a set of sites that are interconnected by means of an MPLS provider core network. At each customer site, one or more customer edge (CE) routers attach to one or more provider edge (PE) routers. This module explains how to create an MPLS VPN.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS Layer 3 VPNs” section on page 37](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Prerequisites for MPLS Layer 3 VPNs

Before configuring MPLS Layer 3 VPNs, you should have MPLS, Label Distribution Protocol (LDP), and Cisco Express Forwarding (CEF) installed in your network. All routers in the core, including the PE routers, must be able to support CEF and MPLS forwarding. See [“Assessing the Needs of MPLS VPN Customers” section on page 9](#) for more information.

## Restrictions for MPLS Layer 3 VPNs

When configuring static routes in an MPLS or MPLS VPN environment, some variations of the **ip route** and **ip route vrf** commands are not supported. These variations of the commands are not supported in Cisco IOS releases that support the Tag Forwarding Information Base (TFIB), specifically Cisco IOS Releases 12.xT, 12.xM, and 12.0S. The TFIB cannot resolve prefixes when the recursive route over which the prefixes travel disappears and then reappears. However, the command variations are supported in Cisco IOS releases that support the MPLS Forwarding Infrastructure (MFI), specifically Cisco IOS Release 12.2(25)S and later. Use the following guidelines when configuring static routes.

### Supported Static Routes in an MPLS Environment

The following **ip route** command is supported when you configure static routes in MPLS environment:

```
ip route destination-prefix mask interface next-hop-address
```

The following **ip route** commands are supported when you configure static routes in an MPLS environment and configure load sharing with static nonrecursive routes and a specific outbound interface:

```
ip route destination-prefix mask interface1 next-hop1  
ip route destination-prefix mask interface2 next-hop2
```

### Unsupported Static Routes in an MPLS Environment that Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS environment:

```
ip route destination-prefix mask next-hop-address
```

The following **ip route** command is not supported when you configure static routes in an MPLS environment and enable load sharing where the next hop can be reached through two paths:

```
ip route destination-prefix mask next-hop-address
```

The following **ip route** command is not supported when you configure static routes in an MPLS environment and enable load sharing where the destination can be reached through two next hops:

```
ip route destination-prefix mask next-hop1  
ip route destination-prefix mask next-hop2
```

Use the *interface* and *next-hop* arguments when specifying static routes.

### Supported Static Routes in an MPLS VPN Environment

The following **ip route vrf** commands are supported when you configure static routes in a MPLS VPN environment, and the next hop and interface are in the same VRF:

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask* **interface1 next-hop1**  
**ip route vrf** *vrf-name destination-prefix mask* **interface2 next-hop2**

The following **ip route vrf** commands are supported when you configure static routes in a MPLS VPN environment, and the next hop is in the global table in the MPLS cloud in the global routing table. For example, these commands are supported when the next hop is pointing to the Internet Gateway.

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address* **global**
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*  
(This command is supported when the next hop and interface are in the core.)

The following **ip route** commands are supported when you configure static routes in a MPLS VPN environment and enable load sharing with static nonrecursive routes and a specific outbound interfaces:

```
ip route destination-prefix mask interface1 next-hop1
ip route destination-prefix mask interface2 next-hop2
```

### Unsupported Static Routes in an MPLS VPN Environment that Uses the TFIB

The following **ip route** command is not supported when you configure static routes in a MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the next hop can be reached through two paths:

```
ip route vrf destination-prefix mask next-hop-address global
```

The following **ip route** commands are not supported when you configure static routes in a MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the destination can be reached through two next hops:

```
ip route vrf destination-prefix mask next-hop1 global
ip route vrf destination-prefix mask next-hop2 global
```

The following **ip route vrf** commands are not supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are in the same VRF:

```
ip route vrf vrf-name destination-prefix mask next-hop1
ip route vrf vrf-name destination-prefix mask next-hop2
```

### Supported Static Routes in an MPLS VPN Environment Where the Next Hop Resides in the Global Table on the CE Router

The following **ip route vrf** command is supported when you configure static routes in a MPLS VPN environment, and the next hop is in the global table on the CE side. For example, the following command is supported when the destination-prefix is the CE router's loopback address, as in EBGp multihop cases.

```
ip route vrf vrf-name destination-prefix mask interface next-hop-address
```

The following **ip route** commands are supported when you configure static routes in a MPLS VPN environment, the next hop is in the global table on the CE side, and you enable load sharing with static non-recursive routes and a specific outbound interfaces:

```
ip route destination-prefix mask interface1 nexthop1
ip route destination-prefix mask interface2 nexthop2
```

# Information about MPLS Layer 3 VPNs

Before configuring MPLS Layer 3 VPNs, you should understand the following concepts:

- [MPLS VPN Definition, page 4](#)
- [How an MPLS VPN Works, page 5](#)
- [Major Components of MPLS VPNs, page 7](#)
- [Benefits of an MPLS VPN, page 7](#)

## MPLS VPN Definition

Before defining an MPLS VPN, you need to define a VPN in general. A VPN is:

- An IP-based network delivering private network services over a public infrastructure
- A set of sites that are allowed to communicate with each other privately over the Internet or other public or private networks

Conventional VPNs are created by configuring a full mesh of tunnels or permanent virtual circuits (PVCs) to all sites in a VPN. This type of VPN is not easy to maintain or expand, because adding a new site requires changing each edge device in the VPN.

MPLS-based VPNs are created in Layer 3 and are based on the peer model. The peer model enables the service provider and the customer to exchange Layer 3 routing information. The service provider relays the data between the customer sites without the customer's involvement.

MPLS VPNs are easier to manage and expand than conventional VPNs. When a new site is added to an MPLS VPN, only the service provider's edge router that provides services to the customer site needs to be updated.

The different parts of the MPLS VPN are described as follows:

- **Provider (P) router**—Router in the core of the provider network. P routers run MPLS switching, and do not attach VPN labels (MPLS label in each route assigned by the PE router) to routed packets. VPN labels are used to direct data packets to the correct egress router.
- **PE router**—Router that attaches the VPN label to incoming packets based on the interface or subinterface on which they are received. A PE router attaches directly to a CE router.
- **Customer (C) router**—Router in the ISP or enterprise network.
- **Customer edge router**—Edge router on the network of the ISP that connects to the PE router on the network. A CE router must interface with a PE router.

[Figure 1](#) shows a basic MPLS VPN.

**Figure 1 Basic MPLS VPN Terminology**

103875

## How an MPLS VPN Works

MPLS VPN functionality is enabled at the edge of an MPLS network. The PE router performs the following:

- Exchanges routing updates with the CE router
- Translates the CE routing information into VPNv4 routes
- Exchanges VPNv4 routes with other PE routers through the Multiprotocol Border Gateway Protocol (MP-BGP)

## How Virtual Routing/Forwarding Tables Work in an MPLS VPN

Each VPN is associated with one or more virtual routing and forwarding (VRF) instances. A VRF defines the VPN membership of a customer site attached to a PE router. A VRF consists of the following components:

- An IP routing table
- A derived CEF table
- A set of interfaces that use the forwarding table
- A set of rules and routing protocol parameters that control the information that is included in the routing table

A one-to-one relationship does not necessarily exist between customer sites and VPNs. A site can be a member of multiple VPNs. However, a site can associate with only one VRF. A site's VRF contains all the routes available to the site from the VPNs of which it is a member.

Packet forwarding information is stored in the IP routing table and the CEF table for each VRF. A separate set of routing and CEF tables is maintained for each VRF. These tables prevent information from being forwarded outside a VPN, and also prevent packets that are outside a VPN from being forwarded to a router within the VPN.

## How VPN Routing Information Is Distributed in an MPLS VPN

The distribution of VPN routing information is controlled through the use of VPN route target communities, implemented by BGP extended communities. VPN routing information is distributed as follows:

- When a VPN route that is learned from a CE router is injected into BGP, a list of VPN route target extended community attributes is associated with it. Typically the list of route target community extended values is set from an export list of route targets associated with the VRF from which the route was learned.
- An import list of route target extended communities is associated with each VRF. The import list defines route target extended community attributes that a route must have in order for the route to be imported into the VRF. For example, if the import list for a particular VRF includes route target extended communities A, B, and C, then any VPN route that carries any of those route target extended communities—A, B, *or* C—is imported into the VRF.

## BGP Distribution of VPN Routing Information

A PE router can learn an IP prefix from the following sources:

- A CE router by static configuration
- A BGP session with the CE router
- A Routing Information Protocol (RIP) exchange with the CE router

The IP prefix is a member of the IPv4 address family. After the PE router learns the IP prefix, the PE converts it into a VPN-IPv4 prefix by combining it with an 8-byte route distinguisher (RD). The generated prefix is a member of the VPN-IPv4 address family. It uniquely identifies the customer address, even if the customer site is using globally nonunique (unregistered private) IP addresses. The route distinguisher used to generate the VPN-IPv4 prefix is specified by a configuration command associated with the VRF on the PE router.

BGP distributes reachability information for VPN-IPv4 prefixes for each VPN. BGP communication takes place at two levels:

- Within IP domains, known as an autonomous system (interior BGP [IBGP])
- Between autonomous systems (external BGP [EBGP]).

PE-PE or PE-RR (route reflector) sessions are IBGP sessions, and PE-CE sessions are EBGP sessions.

BGP propagates reachability information for VPN-IPv4 prefixes among PE routers by means of the BGP multiprotocol extensions (refer to RFC 2283, *Multiprotocol Extensions for BGP-4*), which define support for address families other than IPv4. Using the extensions ensures that the routes for a given VPN are learned only by other members of that VPN, enabling members of the VPN to communicate with each other.

## MPLS Forwarding

Based on routing information stored in the VRF IP routing table and VRF CEF table, packets are forwarded to their destination using MPLS.

A PE router binds a label to each customer prefix learned from a CE router and includes the label in the network reachability information for the prefix that it advertises to other PE routers. When a PE router forwards a packet received from a CE router across the provider network, it labels the packet with the label learned from the destination PE router. When the destination PE router receives the labeled packet,

it pops the label and uses it to direct the packet to the correct CE router. Label forwarding across the provider backbone is based on either dynamic label switching or traffic engineered paths. A customer data packet carries two levels of labels when traversing the backbone:

- The top label directs the packet to the correct PE router.
- The second label indicates how that PE router should forward the packet to the CE router.

## Major Components of MPLS VPNs

An MPLS-based VPN network has three major components:

- **VPN route target communities**—A VPN route target community is a list of all members of a VPN community. VPN route targets need to be configured for each VPN community member.
- **Multiprotocol BGP (MP-BGP) peering of VPN community PE routers**—MP-BGP propagates VRF reachability information to all members of a VPN community. MP-BGP peering needs to be configured in all PE routers within a VPN community.
- **MPLS forwarding**—MPLS transports all traffic between all VPN community members across a VPN service-provider network.

A one-to-one relationship does not necessarily exist between customer sites and VPNs. A given site can be a member of multiple VPNs. However, a site can associate with only one VRF. A customer-site VRF contains all the routes available to the site from the VPNs of which it is a member.

## Benefits of an MPLS VPN

MPLS VPNs allow service providers to deploy scalable VPNs and build the foundation to deliver value-added services, including:

**Connectionless Service**—A significant technical advantage of MPLS VPNs is that they are connectionless. The Internet owes its success to its basic technology, TCP/IP. TCP/IP is built on packet-based, connectionless network paradigm. This means that no prior action is necessary to establish communication between hosts, making it easy for two parties to communicate. To establish privacy in a connectionless IP environment, current VPN solutions impose a connection-oriented, point-to-point overlay on the network. Even if it runs over a connectionless network, a VPN cannot take advantage of the ease of connectivity and multiple services available in connectionless networks. When you create a connectionless VPN, you do not need tunnels and encryption for network privacy, thus eliminating significant complexity.

**Centralized Service**—Building VPNs in Layer 3 allows delivery of targeted services to a group of users represented by a VPN. A VPN must give service providers more than a mechanism for privately connecting users to intranet services. It must also provide a way to flexibly deliver value-added services to targeted customers. Scalability is critical, because customers want to use services privately in their intranets and extranets. Because MPLS VPNs are seen as private intranets, you may use new IP services such as:

- Multicast
- Quality of service (QoS)
- Telephony support within a VPN
- Centralized services including content and web hosting to a VPN

You can customize several combinations of specialized services for individual customers. For example, a service that combines IP multicast with a low-latency service class enables video conferencing within an intranet.

**Scalability**—If you create a VPN using connection-oriented, point-to-point overlays, Frame Relay, or ATM virtual connections (VCs), the VPN's key deficiency is scalability. Specifically, connection-oriented VPNs without fully meshed connections between customer sites are not optimal. MPLS-based VPNs instead use the peer model and Layer 3 connectionless architecture to leverage a highly scalable VPN solution. The peer model requires a customer site to peer with only one PE router as opposed to all other customer edge (CE) routers that are members of the VPN. The connectionless architecture allows the creation of VPNs in Layer 3, eliminating the need for tunnels or VCs.

Other scalability issues of MPLS VPNs are due to the partitioning of VPN routes between PE routers and the further partitioning of VPN and IGP routes between PE routers and provider (P) routers in a core network.

- PE routers must maintain VPN routes for those VPNs who are members.
- P routers do not maintain any VPN routes.

This increases the scalability of the provider's core and ensures that no one device is a scalability bottleneck.

**Security**—MPLS VPNs offer the same level of security as connection-oriented VPNs. Packets from one VPN do not inadvertently go to another VPN.

Security is provided in the following areas:

- At the edge of a provider network, ensuring packets received from a customer are placed on the correct VPN.
- At the backbone, VPN traffic is kept separate. Malicious spoofing (an attempt to gain access to a PE router) is nearly impossible because the packets received from customers are IP packets. These IP packets must be received on a particular interface or subinterface to be uniquely identified with a VPN label.

**Easy to Create**—To take full advantage of VPNs, customers must be able to easily create new VPNs and user communities. Because MPLS VPNs are connectionless, no specific point-to-point connection maps or topologies are required. You can add sites to intranets and extranets and form closed user groups. Managing VPNs in this manner enables membership of any given site in multiple VPNs, maximizing flexibility in building intranets and extranets.

**Flexible Addressing**—To make a VPN service more accessible, customers of a service provider can design their own addressing plan, independent of addressing plans for other service provider customers. Many customers use private address spaces, as defined in RFC 1918, and do not want to invest the time and expense of converting to public IP addresses to enable intranet connectivity. MPLS VPNs allow customers to continue to use their present address spaces without network address translation (NAT) by providing a public and private view of the address. A NAT is required only if two VPNs with overlapping address spaces want to communicate. This enables customers to use their own unregistered private addresses, and communicate freely across a public IP network.

**Integrated Quality of Service (QoS) Support**—QoS is an important requirement for many IP VPN customers. It provides the ability to address two fundamental VPN requirements:

- Predictable performance and policy implementation
- Support for multiple levels of service in an MPLS VPN

Network traffic is classified and labeled at the edge of the network before traffic is aggregated according to policies defined by subscribers and implemented by the provider and transported across the provider core. Traffic at the edge and core of the network can then be differentiated into different classes by drop probability or delay.

**Straightforward Migration**—For service providers to quickly deploy VPN services, use a straightforward migration path. MPLS VPNs are unique because you can build them over multiple network architectures, including IP, ATM, Frame Relay, and hybrid networks.

Migration for the end customer is simplified because there is no requirement to support MPLS on the CE router and no modifications are required to a customer's intranet.

## How to Configure MPLS Layer 3 VPNs

To configure and verify VPNs, perform the tasks described in the following sections:

- [Configuring the Core Network, page 9](#) (required)
- [Connecting the MPLS VPN Customers, page 13](#) (required)
- [Verifying Connectivity Between MPLS VPN Sites, page 27](#) (optional)

### Configuring the Core Network

Configuring the core network includes the following tasks:

- [Assessing the Needs of MPLS VPN Customers, page 9](#) (required)
- [Configuring Routing Protocols in the Core, page 10](#) (required)
- [Configuring MPLS in the Core, page 10](#) (required)
- [Determining if CEF Is Enabled in the Core, page 10](#) (required)
- [Configuring Multiprotocol BGP on the PE Routers and Route Reflectors, page 11](#) (required)

### Assessing the Needs of MPLS VPN Customers

Before you configure an MPLS VPN, you need to identify the core network topology so that it can best serve MPLS VPN customers. Perform this task to identify the core network topology.

#### SUMMARY STEPS

1. Identify the size of the network.
2. Identify the routing protocols.
3. Determine if you need MPLS High Availability support.
4. Determine if you need BGP load sharing and redundant paths.

## DETAILED STEPS

|               | Command or Action                                                                | Purpose                                                                                                                                                                                                                                                                                                       |
|---------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | Identify the size of the network.                                                | Identify the following to determine the number of routers and ports you need: <ul style="list-style-type: none"> <li>How many customers do you need to support?</li> <li>How many VPNs are needed per customer?</li> <li>How many virtual routing and forwarding instances are there for each VPN?</li> </ul> |
| <b>Step 2</b> | Identify the routing protocols in the core.                                      | Determine which routing protocols you need in the core network.                                                                                                                                                                                                                                               |
| <b>Step 3</b> | Determine if you need MPLS VPN High Availability support.                        | MPLS VPN Nonstop Forwarding and Graceful Restart are supported on select routers and Cisco IOS releases. Contact Cisco Support for the exact requirements and hardware support.                                                                                                                               |
| <b>Step 4</b> | Determine if you need BGP load sharing and redundant paths in the MPLS VPN core. | See <a href="#">Load Sharing MPLS VPN Traffic</a> for configuration steps.                                                                                                                                                                                                                                    |

## Configuring Routing Protocols in the Core

To configure a routing protocol—BGP, OSPF, IS-IS, EIGRP, static—see [Configuring IP Routing Protocols](#).

## Configuring MPLS in the Core

To enable MPLS on all routers in the core, you must configure a label distribution protocol. You can use either of the following as a label distribution protocol:

- MPLS Label Distribution Protocol (LDP). For configuration information, see the [Configuring MPLS Label Distribution Protocol \(LDP\)](#).
- MPLS Traffic Engineering Resource Reservation Protocol (RSVP). For configuration information, see [Configuring MPLS Traffic Engineering](#).

## Determining if CEF Is Enabled in the Core

Cisco Express Forwarding (CEF) must be enabled all routers in the core, including the PE routers. For information about how to determine if CEF is enabled, see [Configuring Basic Cisco Express Forwarding—Improving Performance, Scalability, and Resiliency in Dynamic Network](#).

## Configuring Multiprotocol BGP on the PE Routers and Route Reflectors

Perform this task to configure multiprotocol BGP (MP-BGP) connectivity on the PE routers and route reflectors.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default ipv4-unicast**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **address-family vpv4** [**unicast**]
8. **neighbor** {*ip-address* | *peer-group-name*} **send-community extended**
9. **neighbor** {*ip-address* | *peer-group-name*} **activate**
10. **end**

### DETAILED STEPS

|        | Command or Action                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>router bgp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 100                     | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul> |
| Step 4 | <b>no bgp default ipv4-unicast</b><br><br><b>Example:</b><br>Router(config-router)# no bgp default ipv4-unicast | (Optional) Disables the IPv4 unicast address family on all neighbors. <ul style="list-style-type: none"> <li>Use the <b>no</b> form of the <b>bgp default ipv4-unicast</b> command if you are using this neighbor for MPLS routes only.</li> </ul>                                                                                                                                                                                       |

|                | Command or Action                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b>  | <pre>neighbor {ip-address   peer-group-name} remote-as as-number</pre> <p><b>Example:</b><br/>Router(config-router)# neighbor pp.0.0.1<br/>remote-as 100</p>                  | <p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul> |
| <b>Step 6</b>  | <pre>neighbor {ip-address   peer-group-name} activate</pre> <p><b>Example:</b><br/>Router(config-router)# neighbor pp.0.0.1<br/>activate</p>                                  | <p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                  |
| <b>Step 7</b>  | <pre>address-family vpnv4 [unicast]</pre> <p><b>Example:</b><br/>Router(config-router)# address-family vpnv4</p>                                                              | <p>Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes.</p> <ul style="list-style-type: none"> <li>The optional <b>unicast</b> keyword specifies VPNv4 unicast address prefixes.</li> </ul>                                                                                                                   |
| <b>Step 8</b>  | <pre>neighbor {ip-address   peer-group-name} send-community extended</pre> <p><b>Example:</b><br/>Router(config-router-af)# neighbor pp.0.0.1<br/>send-community extended</p> | <p>Specifies that a communities attribute should be sent to a BGP neighbor.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                               |
| <b>Step 9</b>  | <pre>neighbor {ip-address   peer-group-name} activate</pre> <p><b>Example:</b><br/>Router(config-router-af)# neighbor pp.0.0.1<br/>activate</p>                               | <p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                  |
| <b>Step 10</b> | <pre>end</pre> <p><b>Example:</b><br/>Router(config-router-af)# end</p>                                                                                                       | <p>(Optional) Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                           |

## Troubleshooting Tips

You can enter a **show ip bgp neighbor** command to verify that the neighbors are up and running. If this command is not successful, enter a **debug ip bgp x.x.x.x events** command, where *x.x.x.x* is the IP address of the neighbor.

## Connecting the MPLS VPN Customers

To connect the MPLS VPN customers to the VPN, perform the following tasks:

- [Defining VRFs on the PE Routers to Enable Customer Connectivity, page 13](#) (required)
- [Configuring VRF Interfaces on PE Routers for Each VPN Customer, page 14](#) (required)
- [Configuring Routing Protocols Between the PE and CE Routers, page 15](#) (required)

### Defining VRFs on the PE Routers to Enable Customer Connectivity

To define VPN routing and forwarding (VRF) instances, perform this task.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf *vrf-name***
4. **rd *route-distinguisher***
5. **route-target {import | export | both} *route-target-ext-community***
6. **import map *route-map***
7. **exit**

#### DETAILED STEPS

|        | Command or Action                              | Purpose                                                                                                         |
|--------|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                  | Enables privileged EXEC mode.                                                                                   |
|        | <b>Example:</b><br>Router> enable              | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                            |
| Step 2 | <b>configure terminal</b>                      | Enters global configuration mode.                                                                               |
|        | <b>Example:</b><br>Router# configure terminal  |                                                                                                                 |
| Step 3 | <b>ip vrf <i>vrf-name</i></b>                  | Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode.                     |
|        | <b>Example:</b><br>Router(config)# ip vrf vpn1 | <ul style="list-style-type: none"> <li>• The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul> |

|        | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>rd</b> <i>route-distinguisher</i><br><br><b>Example:</b><br>Router(config-vrf)# <b>rd</b> 100:1                                                                                      | Creates routing and forwarding tables. <ul style="list-style-type: none"> <li>The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats: <ul style="list-style-type: none"> <li>16-bit AS number: your 32-bit number, for example, 101:3</li> <li>32-bit IP address: your 16-bit number, for example, 192.168.122.15:1</li> </ul> </li> </ul>                                                                                                                                                                                                                    |
| Step 5 | <b>route-target</b> { <b>import</b>   <b>export</b>   <b>both</b> }<br><i>route-target-ext-community</i><br><br><b>Example:</b><br>Router(config-vrf)# <b>route-target import</b> 100:1 | Creates a route-target extended community for a VRF. <ul style="list-style-type: none"> <li>The <b>import</b> keyword imports routing information from the target VPN extended community.</li> <li>The <b>export</b> keyword exports routing information to the target VPN extended community.</li> <li>The <b>both</b> keyword imports routing information from and exports routing information to the target VPN extended community.</li> <li>The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.</li> </ul> |
| Step 6 | <b>import map</b> <i>route-map</i><br><br><b>Example:</b><br>Router(config-vrf)# <b>import map</b> vpn1-route-map                                                                       | (Optional) Configures an import route map for a VRF. <ul style="list-style-type: none"> <li>The <i>route-map</i> argument specifies the route map to be used as an import route map for the VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-vrf)# <b>exit</b>                                                                                                                   | (Optional) Exits to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Configuring VRF Interfaces on PE Routers for Each VPN Customer

To associate a VRF with an interface or subinterface on the PE routers, perform this task.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **ip vrf forwarding** *vrf-name*
5. **end**

## DETAILED STEPS

|        | Command or Action                                                                                            | Purpose                                                                                                                                                                                                                                                                                                 |
|--------|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                               | Enters global configuration mode.                                                                                                                                                                                                                                                                       |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet 5/0         | Specifies the interface to configure and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>type</i> argument specifies the type of interface to be configured.</li> <li>The <i>number</i> argument specifies the port, connector, or interface card number.</li> </ul> |
| Step 4 | <b>ip vrf forwarding</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config-if)# ip vrf forwarding vpn1 | Associates a VRF with the specified interface or subinterface. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                            |
| Step 5 | <b>end</b><br><br>Router(config-if)# end                                                                     | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                               |

## Configuring Routing Protocols Between the PE and CE Routers

Configure the PE router with the same routing protocol that the CE router uses. You can configure the following routing protocols:

- [Configuring BGP as the Routing Protocol Between the PE and CE Routers, page 15](#)
- [Configuring RIPv2 as the Routing Protocol Between the PE and CE Routers, page 17](#)
- [Configuring Static Routes Between the PE and CE Routers, page 19](#)
- [Configuring OSPF as the Routing Protocol Between the PE and CE Routers, page 21](#)
- [Configuring EIGRP as the Routing Protocol Between the PE and CE Routers, page 23](#)
- [Configuring EIGRP Redistribution in the MPLS VPN, page 25](#)

### Configuring BGP as the Routing Protocol Between the PE and CE Routers

To configure PE-to-CE routing sessions using BGP, perform this task.

## SUMMARY STEPS

- enable**
- configure terminal**
- router bgp** *as-number*

4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **exit-address-family**
8. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 3 | <b>router bgp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                                 | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                           |
| Step 4 | <b>address-family ipv4</b> [ <b>multicast</b>   <b>unicast</b>   <b>vrf</b> <i>vrf-name</i> ]<br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 vrf vpn1 | Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf</b> <i>vrf-name</i> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |

|        | Command or Action                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                             |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router-af)# neighbor pp.0.0.1 remote-as 200 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul> |
| Step 6 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor pp.0.0.1 activate                        | Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                  |
| Step 7 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                                                   | Exits address family configuration mode.                                                                                                                                                                                                                                                                                                                                            |
| Step 8 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                                                                                                      | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                           |

## Configuring RIPv2 as the Routing Protocol Between the PE and CE Routers

To configure PE-to-CE routing sessions using RIPv2, perform this task.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router rip**
4. **version** {1 | 2}
5. **address-family** ipv4 [multicast | unicast | vrf *vrf-name*]
6. **network** *ip-address*
7. **redistribute** *protocol* [*process-id*] {**level-1** | **level-1-2** | **level-2**} [*as-number*] [**metric** *metric-value*] [**metric-type** *type-value*] [**match** {**internal** | **external 1** | **external 2**}] [**tag** *tag-value*] [**route-map** *map-tag*] [**subnets**]
8. **exit-address-family**
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>router rip</b><br><br><b>Example:</b><br>Router(config)# router rip                                                                                                                                                                                                                                   | Enables RIP.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 4 | <b>version {1   2}</b><br><br><b>Example:</b><br>Router(config-router)# version 2                                                                                                                                                                                                                        | Specifies a Routing Information Protocol (RIP) version used globally by the router.                                                                                                                                                                                                                                                                                                                                                                           |
| Step 5 | <b>address-family ipv4 [multicast   unicast   vrf vrf-name]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 vrf vpn1                                                                                                                                                            | Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf vrf-name</b> keyword and argument specifies the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |
| Step 6 | <b>network ip-address</b><br><br><b>Example:</b><br>Router(config-router-af)# network 192.168.7.0                                                                                                                                                                                                        | Enables RIP on the PE-to-CE link.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 7 | <b>redistribute protocol [process-id] {level-1   level-1-2   level-2} [as-number] [metric metric-value] [metric-type type-value] [match {internal   external 1   external 2}] [tag tag-value] [route-map map-tag] [subnets]</b><br><br><b>Example:</b><br>Router(config-router-af)# redistribute bgp 200 | Redistributes routes from one routing domain into another routing domain. <ul style="list-style-type: none"> <li>For the RIPv2 routing protocol, use the <b>redistribute bgp as-number</b> command.</li> </ul> See the <a href="#">redistribute</a> command for information about other arguments and keywords.                                                                                                                                               |

|        | Command or Action                                                                                  | Purpose                                   |
|--------|----------------------------------------------------------------------------------------------------|-------------------------------------------|
| Step 8 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family | Exits address family configuration mode.  |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                    | (Optional) Exits to privileged EXEC mode. |

## Configuring Static Routes Between the PE and CE Routers

To configure PE-to-CE routing sessions that use static routes, perform this task.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip route vrf** *vrf-name*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **redistribute** *protocol* [*process-id*] {**level-1** | **level-1-2** | **level-2**} [*as-number*] [**metric** *metric-value*] [**metric-type** *type-value*] [**match** {**internal** | **external 1** | **external 2**}] [**tag** *tag-value*] [**route-map** *map-tag*] [**subnets**]
6. **redistribute** *protocol* [*process-id*] {**level-1** | **level-1-2** | **level-2**} [*as-number*] [**metric** *metric-value*] [**metric-type** *type-value*] [**match** {**internal** | **external 1** | **external 2**}] [**tag** *tag-value*] [**route-map** *map-tag*] [**subnets**]
7. **exit-address-family**
8. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>ip route vrf vrf-name</b><br><br><b>Example:</b><br>Router(config)# ip route vrf 200                                                                                                                                                                                                                    | Defines static route parameters for every PE-to-CE session.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 4 | <b>address-family ipv4 [multicast   unicast   vrf vrf-name]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 vrf vpn1                                                                                                                                                              | Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf vrf-name</b> keyword and argument specifies the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |
| Step 5 | <b>redistribute protocol [process-id] {level-1   level-1-2   level-2} [as-number] [metric metric-value] [metric-type type-value] [match {internal   external 1   external 2}] [tag tag-value] [route-map map-tag] [subnets]</b><br><br><b>Example:</b><br>Router(config-router-af)# redistribute static    | Redistributes routes from one routing domain into another routing domain. <ul style="list-style-type: none"> <li>To redistribute VRF static routes into the VRF BGP table, use the <b>redistribute static</b> command.</li> </ul> See the command for information about other arguments and keywords.                                                                                                                                                         |
| Step 6 | <b>redistribute protocol [process-id] {level-1   level-1-2   level-2} [as-number] [metric metric-value] [metric-type type-value] [match {internal   external 1   external 2}] [tag tag-value] [route-map map-tag] [subnets]</b><br><br><b>Example:</b><br>Router(config-router-af)# redistribute connected | Redistributes routes from one routing domain into another routing domain. <ul style="list-style-type: none"> <li>To redistribute directly connected networks into the VRF BGP table, use the <b>redistribute connected</b> command.</li> </ul> See the <b>redistribute</b> command for information about other arguments and keywords.                                                                                                                        |

|        | Command or Action                                                                                                     | Purpose                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| Step 7 | <code>exit-address-family</code><br><br><b>Example:</b><br>Router(config-router-af)# <code>exit-address-family</code> | Exits address family configuration mode.  |
| Step 8 | <code>end</code><br><br><b>Example:</b><br>Router(config-router)# <code>end</code>                                    | (Optional) Exits to privileged EXEC mode. |

## Configuring OSPF as the Routing Protocol Between the PE and CE Routers

To configure PE-to-CE routing sessions that use OSPF, perform this task.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router ospf process-id [vrf vpn-name]`
4. `network ip-address wildcard-mask area area-id`
5. `address-family ipv4 [multicast | unicast | vrf vrf-name]`
6. `redistribute protocol [process-id] {level-1 | level-1-2 | level-2} [as-number] [metric metric-value] [metric-type type-value] [match {internal | external 1 | external 2}] [tag tag-value] [route-map map-tag] [subnets]`
7. `exit-address-family`
8. `end`

### DETAILED STEPS

|        | Command or Action                                                                                 | Purpose                                                                                                               |
|--------|---------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> <code>enable</code>                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# <code>configure terminal</code> | Enters global configuration mode.                                                                                     |

|        | Command or Action                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <pre>router ospf process-id [vrf vpn-name]</pre> <p><b>Example:</b><br/>Router(config)# router ospf 1 vrf grc</p>                                                                                                                                                                                                          | <p>Enables OSPF routing and enters router configuration mode.</p> <ul style="list-style-type: none"> <li>The <i>process-id</i> argument identifies the OSPF process.</li> <li>The <b>vrf</b> keyword and <i>vpn-name</i> argument identify a VPN. Create a separate OSPF process for each VRF that will receive VPN routes.</li> </ul>                                                                                                                                                                                                                                                                                    |
| Step 4 | <pre>network ip-address wildcard-mask area area-id</pre> <p><b>Example:</b><br/>Router(config-router)# network 192.168.129.16 0.0.0.3 area 20</p>                                                                                                                                                                          | <p>Defines the interfaces on which OSPF runs and to defines the area ID for those interfaces.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument identifies the IP address.</li> <li>The <i>wildcard-mask</i> argument identifies the IP-address-type mask that includes “don't care” bits.</li> <li>The <i>area-id</i> argument identifies the area that is to be associated with the OSPF address range. It can be specified as either a decimal value or as an IP address. To associate areas with IP subnets, specify a subnet address as the value of the <i>area-id</i> argument.</li> </ul> |
| Step 5 | <pre>address-family ipv4 [multicast   unicast   vrf vrf-name]</pre> <p><b>Example:</b><br/>Router(config-router)# address-family ipv4 vrf vpn1</p>                                                                                                                                                                         | <p>Specifies the IPv4 address family type and enters address family configuration mode.</p> <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf</b> <i>vrf-name</i> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul>                                                                                                                                                 |
| Step 6 | <pre>redistribute protocol [process-id] {level-1   level-1-2   level-2} [as-number] [metric metric-value] [metric-type type-value] [match {internal   external 1   external 2}] [tag tag-value] [route-map map-tag] [subnets]</pre> <p><b>Example:</b><br/>Router(config-router-af)# redistribute rip metric 1 subnets</p> | <p>Redistributes routes from one routing domain into another routing domain.</p> <p>You may need to include several protocols to ensure that all IBGP routes are distributed into the VRF.</p> <p>See the <b>redistribute</b> command for information about other arguments and keywords.</p>                                                                                                                                                                                                                                                                                                                             |

|        | Command or Action                                                                                                     | Purpose                                   |
|--------|-----------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| Step 7 | <code>exit-address-family</code><br><br><b>Example:</b><br>Router(config-router-af)# <code>exit-address-family</code> | Exits address family configuration mode.  |
| Step 8 | <code>end</code><br><br><b>Example:</b><br>Router(config-router)# <code>end</code>                                    | (Optional) Exits to privileged EXEC mode. |

### Configuring EIGRP as the Routing Protocol Between the PE and CE Routers

Using Enhanced Interior Gateway Routing Protocol (EIGRP) between the PE and CE routers allows you to transparently connect EIGRP customer networks through an MPLS-enabled BGP core network so that EIGRP routes are redistributed through the VPN across the BGP network as internal BGP (iBGP) routes.

To configure PE-to-CE routing sessions that use EIGRP, perform this task.

#### Prerequisites

BGP must be configured in the network core.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `no synchronization`
5. `neighbor ip-address remote-as as-number`
6. `neighbor ip-address update-source loopback interface-number`
7. `address-family vpv4`
8. `neighbor ip-address activate`
9. `neighbor ip-address send-community extended`
10. `exit-address-family`
11. `address-family ipv4 vrf vrf-name`
12. `redistribute eigrp as-number [metric metric-value][route-map map-name]`
13. `no synchronization`
14. `exit-address-family`
15. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                       |
| Step 3 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router(config)# router bgp 10                                                                            | Enters router configuration mode, and creates a BGP routing process.                                                                                                                                                                                                    |
| Step 4 | <b>no synchronization</b><br><br><b>Example:</b><br>Router(config-router)# no synchronization                                                                  | Configures BGP to send advertisements without waiting to synchronize with the IGP.                                                                                                                                                                                      |
| Step 5 | <b>neighbor ip-address remote-as as-number</b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.0.0.1 remote-as 10                                 | Establishes peering with the specified neighbor or peer-group. <ul style="list-style-type: none"> <li>In this step, you are establishing an iBGP session with the PE router that is connected to the CE router at the other CE site.</li> </ul>                         |
| Step 6 | <b>neighbor ip-address update-source loopback interface-number</b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.0.0.1 update-source loopback 0 | Configures BGP to use any operational interface for TCP connections. <ul style="list-style-type: none"> <li>This configuration step is not required. However, the BGP routing process will be less susceptible to the affects of interface or link flapping.</li> </ul> |
| Step 7 | <b>address-family vpnv4</b><br><br><b>Example:</b><br>Router(config-router)# address-family vpnv4                                                              | Enters address family configuration mode for configuring routing sessions that use standard IPv4 address prefixes, such as BGP, RIP, and static routing sessions.                                                                                                       |
| Step 8 | <b>neighbor ip-address activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1 activate                                             | Establishes peering with the specified neighbor or peer-group. <ul style="list-style-type: none"> <li>In this step, you are activating the exchange of VPNv4 routing information between the PE routers.</li> </ul>                                                     |
| Step 9 | <b>neighbor ip-address send-community extended</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1 send-community extended               | Configures the local router to send extended community attribute information to the specified neighbor. <ul style="list-style-type: none"> <li>This step is required for the exchange of EIGRP extended community attributes.</li> </ul>                                |

|         | Command or Action                                                                                                                                              | Purpose                                                                                                                                                                                                                                                      |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 10 | <code>exit-address-family</code><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                       | Exits address family configuration mode and enters router configuration mode.                                                                                                                                                                                |
| Step 11 | <code>address-family ipv4 vrf vrf-name</code><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 vrf RED                                     | Configures an IPv4 address-family for the EIGRP VRF and enters address family configuration mode. <ul style="list-style-type: none"> <li>An address-family VRF needs to be configured for each EIGRP VRF that runs between the PE and CE routers.</li> </ul> |
| Step 12 | <code>redistribute eigrp as-number [metric metric-value][route-map map-name]</code><br><br><b>Example:</b><br>Router(config-router-af)# redistribute eigrp 101 | Redistributes the EIGRP VRF into BGP. <ul style="list-style-type: none"> <li>The autonomous system number from the CE network is configured in this step.</li> </ul>                                                                                         |
| Step 13 | <code>no synchronization</code><br><br><b>Example:</b><br>Router(config-router-af)# no synchronization                                                         | Configures BGP to send advertisements without waiting to synchronize with the IGP.                                                                                                                                                                           |
| Step 14 | <code>exit-address-family</code><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                       | Exits address family configuration mode and enters router configuration mode.                                                                                                                                                                                |
| Step 15 | <code>end</code><br><br><b>Example:</b><br>Router(config-router)# end                                                                                          | Exits router configuration mode and enters privileged EXEC mode.                                                                                                                                                                                             |

## Configuring EIGRP Redistribution in the MPLS VPN

Perform this task to every PE router that provides VPN services to enable EIGRP redistribution in the MPLS VPN.

### Prerequisites

The metric must be configured for routes from external EIGRP autonomous systems and non-EIGRP networks before these routes can be redistributed into an EIGRP CE router. The metric can be configured in the redistribute statement using the **redistribute (IP)** command or configured with the **default-metric (EIGRP)** command. If an external route is received from another EIGRP autonomous system or a non-EIGRP network without a configured metric, the route will not be advertised to the CE router.

### Restrictions

Redistribution between native EIGRP VRFs is not supported. This is designed behavior.

## SUMMARY STEPS

1. `enable`

2. **configure terminal**
3. **router eigrp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **network** *ip-address wildcard-mask*
6. **redistribute bgp** {*as-number*} [**metric** *bandwidth delay reliability load mtu*] [**route-map** *map-name*]
7. **autonomous-system** *as-number*
8. **exit-address-family**
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                        |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                               |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                              |
| Step 3 | <b>router eigrp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router eigrp 1                                                                                                                                                       | Enters router configuration mode and creates an EIGRP routing process. <ul style="list-style-type: none"> <li>The EIGRP routing process for the PE router is created in this step.</li> </ul>                                                                                                                                                                                  |
| Step 4 | <b>address-family ipv4</b> [ <b>multicast</b>   <b>unicast</b>   <b>vrf</b> <i>vrf-name</i> ]<br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 vrf RED                                                                          | Enters address-family configuration mode and creates a VRF. <ul style="list-style-type: none"> <li>The VRF name must match the VRF name that was created in the previous section.</li> </ul>                                                                                                                                                                                   |
| Step 5 | <b>network</b> <i>ip-address wildcard-mask</i><br><br><b>Example:</b><br>Router(config-router-af)# network 172.16.0.0 0.0.255.255                                                                                                                   | Specifies the network for the VRF. <ul style="list-style-type: none"> <li>The network statement is used to identify which interfaces to include in EIGRP. The VRF must be configured with addresses that fall within the wildcard-mask range of the network statement.</li> </ul>                                                                                              |
| Step 6 | <b>redistribute bgp</b> { <i>as-number</i> } [ <b>metric</b> <i>bandwidth delay reliability load mtu</i> ] [ <b>route-map</b> <i>map-name</i> ]<br><br><b>Example:</b><br>Router(config-router-af)# redistribute bgp 10 metric 10000 100 255 1 1500 | Redistributes BGP into the EIGRP. <ul style="list-style-type: none"> <li>The autonomous system number and metric of the BGP network is configured in this step. BGP must be redistributed into EIGRP for the CE site to accept the BGP routes that carry the EIGRP information. A metric must also be specified for the BGP network and is configured in this step.</li> </ul> |

|        | Command or Action                                                                                                               | Purpose                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| Step 7 | <code>autonomous-system as-number</code><br><br><b>Example:</b><br><code>Router(config-router-af)# autonomous-system 101</code> | Specifies the autonomous system number of the EIGRP network for the customer site. |
| Step 8 | <code>exit-address-family</code><br><br><b>Example:</b><br><code>Router(config-router-af)# exit-address-family</code>           | Exits address family configuration mode and enters router configuration mode.      |
| Step 9 | <code>end</code><br><br><b>Example:</b><br><code>Router(config-router)# end</code>                                              | Exits router configuration mode and enters privileged EXEC mode.                   |

## Verifying the VPN Configuration

A route distinguisher must be configured for the VRF, and MPLS must be configured on the interfaces that carry the VRF. Use the **show ip vrf** command to verify the route distinguisher (RD) and interface that are configured for the VRF.

### SUMMARY STEPS

1. **show ip vrf**

### DETAILED STEPS

#### Step 1 **show ip vrf**

Use this command to display the set of defined VRF instances and associated interfaces. The output also maps the VRF instances to the configured route distinguisher.

## Verifying Connectivity Between MPLS VPN Sites

To verify that the local and remote CE routers can communicate across the MPLS core, perform the following tasks:

- [Verifying IP Connectivity from CE Router to CE Router Across the MPLS Core, page 27](#)
- [Verifying that the Local and Remote CE Routers are in the Routing Table, page 28](#)

## Verifying IP Connectivity from CE Router to CE Router Across the MPLS Core

Perform this task to verify IP connectivity from CE router to CE router across the MPLS VPN.

### SUMMARY STEPS

1. **enable**

2. **ping** [*protocol*] {*host-name* | *system-address*}
3. **trace** [*protocol*] [*destination*]
4. **show ip route** [*ip-address* [*mask*] [**longer-prefixes**]] | [*protocol* [*process-id*]] | [**list** *access-list-number* | *access-list-name*]
5. **disable**

## DETAILED STEPS

### Step 1 **enable**

Use this command to enable privileged EXEC mode.

### Step 2 **ping** [*protocol*] {*host-name* | *system-address*}

Use this command to diagnoses basic network connectivity on AppleTalk, CLNS, IP, Novell, Apollo, VINES, DECnet, or XNS networks. Use the **ping** command to verify the connectivity from one CE router to another.

### Step 3 **trace** [*protocol*] [*destination*]

Use this command to discover the routes that packets take when traveling to their destination. Use the **trace** command to verify the path that a packet goes through before reaching the final destination. The **trace** command can help isolate a trouble spot if two routers cannot communicate.

### Step 4 **show ip route** [*ip-address* [*mask*] [**longer-prefixes**]] | [*protocol* [*process-id*]] | [**list** *access-list-number* | *access-list-name*]

Use this command to display the current state of the routing table. Use the *ip-address* argument to verify that CE1 has a route to CE2. Verify the routes learned by CE1. Make sure that the route for CE2 is listed.

## Verifying that the Local and Remote CE Routers are in the Routing Table

Perform this task to check that the local and remote CE routers are in the routing table of the PE routers.

## SUMMARY STEPS

1. **enable**
2. **show ip route vrf** *vrf-name* [*prefix*]
3. **show ip cef vrf** *vrf-name* [*ip-prefix*]
4. **exit**

### Step 1 **enable**

Use this command to enable privileged EXEC mode.

### Step 2 **show ip route vrf** *vrf-name* [*prefix*]

Use this command to display the IP routing table associated with a VRF. Check that the loopback addresses of the local and remote CE routers are in the routing table of the PE routers.

### Step 3 **show ip cef vrf** *vrf-name* [*ip-prefix*]

Use this command to display the CEF forwarding table associated with a VRF. Check that the prefix of the remote CE router is in the CEF table.

**Step 4**    **exit**

---

## Configuration Examples for MPLS VPNs

- [Configuring an MPLS VPN Using BGP: Example, page 30](#)
- [Configuring an MPLS VPN Using RIP: Example, page 31](#)
- [Configuring an MPLS VPN Using Static Routes: Example, page 32](#)
- [Configuring an MPLS VPN Using OSPF: Example, page 33](#)
- [Configuring an MPLS VPN Using EIGRP: Example, page 34](#)

## Configuring an MPLS VPN Using BGP: Example

This example shows an MPLS VPN that is configured using BGP.

| PE Configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | CE Configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Configuring an MPLS VPN Using EIGRP: Example

This example shows an MPLS VPN that is configured using EIGRP.

| PE Configuration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | CE Configuration                                                                                                                                                                                                                                                         |

# Feature Information for MPLS Layer 3 VPNs

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Layer 3 VPNs

| Feature Name                                                       | Releases                                                                                | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# MPLS VPN Half-Duplex VRF

---

**First Published: May 2, 2005**

**Last Updated: May 9, 2008**

The MPLS VPN Half-Duplex VRF feature provides scalable hub-and-spoke connectivity for subscribers of an Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) service. This feature addresses the limitations previously imposed on hub-and-spoke topologies by removing the requirement of one Virtual Routing and Forwarding (VRF) per spoke. This feature also ensures that subscriber traffic always traverses the central link between the wholesale service provider and the Internet service provider (ISP), whether the subscriber traffic is being routed to a remote network by way of the upstream ISP or to another locally or remotely connected subscriber.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for MPLS VPN Half-Duplex VRF”](#) section on page 18.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

# Prerequisites for Configuring MPLS VPN Half-Duplex VRF

You must have a working MPLS core network.

## Restrictions for MPLS VPN Half-Duplex VRF

The following features are not supported on interfaces configured with the MPLS VPN Half-Duplex VRF feature:

- Multicast
- MPLS VPN Carrier Supporting Carrier
- MPLS VPN Interautonomous Systems

## Information About Configuring MPLS VPN Half-Duplex VRF

To configure this feature, you need to understand the following concepts:

- [MPLS VPN Half-Duplex VRF Overview, page 2](#)
- [Upstream and Downstream VRFs, page 3](#)
- [Reverse Path Forwarding Check, page 4](#)

For information about this feature on the Cisco 10000 series routers, see the “Half-Duplex VRF” section of the “Configuring Multiprotocol Label Switching” chapter in the *Cisco 10000 Series Router Broadband Aggregation, Leased-Line, and MPLS Configuration Guide*.

## MPLS VPN Half-Duplex VRF Overview

The MPLS VPN Half-Duplex VRF feature provides the following benefits:

- The MPLS VPN Half-Duplex VRF feature prevents local connectivity between subscribers at the spoke provider edge (PE) router and ensures that a hub site provides subscriber connectivity. Any sites that connect to the same PE router must forward intersite traffic using the hub site. This ensures that the routing done at the spoke site moves from the access-side interface to the network-side interface or from the network-side interface to the access-side interface, but never from the access-side interface to the access-side interface.
- The MPLS VPN Half-Duplex VRF feature prevents situations where the PE router locally switches the spokes without passing the traffic through the upstream ISP. This prevents subscribers from directly connecting to each other, which causes the wholesale service provider to lose revenue.
- The MPLS VPN Half-Duplex VRF feature improves scalability by removing the requirement of one VRF per spoke. When the feature is not configured, when spokes are connected to the same PE router each spoke is configured in a separate VRF to ensure that the traffic between the spokes traverses the central link between the wholesale service provider and the ISP. However, this configuration is not scalable. When many spokes connected to the same PE router, configuration of VRFs for each spoke becomes quite complex and greatly increases memory usage. This is especially true in large-scale wholesale service provider environments that support high-density remote access to Layer 3 VPNs.

[Figure 1](#) shows a sample hub-and-spoke topology.

**Figure 1**      **Hub-and-Spoke Topology**

## Upstream and Downstream VRFs

The MPLS VPN Half-Duplex VRF feature uses two unidirectional VRFs to forward IP traffic between the spokes and the hub PE router:

- The upstream VRF forwards IP traffic from the spokes toward the hub PE router. This VRF typically contains only a default route but might also contain summary routes and several default routes. The default route points to the interface on the hub PE router that connects to the upstream ISP. The router dynamically learns about the default route from the routing updates that the hub PE router or home gateway sends.

### Note

Although the upstream VRF is typically populated from the hub, it is possible also to have a separate local upstream interface on the spoke PE for a different local service that would not be required to go through the hub: for example, a local Domain Name System (DNS) or game server service.

- The downstream VRF forwards traffic from the hub PE router back to the spokes. This VRF can contain:
  - PPP peer routes for the spokes and per-user static routes received from the authentication, authorization, and accounting (AAA) server or from the Dynamic Host Control Protocol (DHCP) server
  - Routes imported from the hub PE router
  - Border Gateway Protocol (BGP), Open Shortest Path First (OSPF), Routing Information Protocol (RIP), or Enhanced Interior Gateway Routing Protocol (EIGRP) dynamic routes for the spokes

The spoke PE router redistributes routes from the downstream VRF into Multiprotocol Border Gateway Protocol (MP-BGP). That router typically advertises a summary route across the MPLS core for the connected spokes. The VRF configured on the hub PE router imports the advertised summary route.

## Reverse Path Forwarding Check

The Reverse Path Forwarding (RPF) check ensures that an IP packet that enters a router uses the correct inbound interface. The MPLS VPN Half-Duplex VRF feature supports unicast RPF check on the spoke-side interfaces. Because different VRFs are used for downstream and upstream forwarding, the RPF mechanism ensures that source address checks occur in the downstream VRF.

Unicast RPF is not on by default. You need to enable it, as described in [Configuring Unicast Reverse Path Forwarding](#).

## How to Configure MPLS VPN Half-Duplex VRF

This section contains the following procedures:

- [Configuring the Upstream and Downstream VRFs on the Spoke PE Router, page 4](#) (required)
- [Associating a VRF with an Interface, page 6](#) (required)
- [Configuring the Downstream VRF for an AAA Server, page 7](#) (optional)
- [Verifying MPLS VPN Half-Duplex VRF Configuration, page 7](#) (optional)

To configure this feature on the Cisco 10000 series routers, see the “Half-Duplex VRF” section of the “Configuring Multiprotocol Label Switching” chapter in the [Cisco 10000 Series Router Broadband Aggregation, Leased-Line, and MPLS Configuration Guide](#).

## Configuring the Upstream and Downstream VRFs on the Spoke PE Router

To configure the upstream and downstream VRFs on the PE router or on the spoke PE router, use the following procedure.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition** *vrf-name*
4. **rd** *route-distinguisher*
5. **address-family** {**ipv4** | **ipv6**}
6. **route-target** {**import** | **export** | **both**} *route-target-ext-community*
7. **exit-address-family**
8. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>vrf definition vrf-name</b><br><br><b>Example:</b><br>Router(config)# vrf definition vrf1                                                               | Configures a VRF routing table and enters VRF configuration mode. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name of the VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 4 | <b>rd route-distinguisher</b><br><br><b>Example:</b><br>Router(config-vrf)# rd 100:1                                                                       | Creates routing and forwarding tables for a VRF. <ul style="list-style-type: none"> <li>The <i>route-distinguisher</i> argument specifies to add an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter a route distinguisher in either of these formats: <ul style="list-style-type: none"> <li>16-bit autonomous system number (ASN): your 32-bit number<br/>For example, 101:3.</li> <li>32-bit IP address: your 16-bit number<br/>For example, 192.168.122.15:1.</li> </ul> </li> </ul>                                                                                                                                                                       |
| Step 5 | <b>address-family {ipv4   ipv6}</b><br><br><b>Example:</b><br>Router(config-vrf) address-family ipv4                                                       | Enters VRF address family configuration mode to specify an address family for a VRF. <ul style="list-style-type: none"> <li>The <b>ipv4</b> keyword specifies an IPv4 address family for a VRF.</li> <li>The <b>ipv6</b> keyword specifies an IPv6 address family for a VRF.</li> </ul> <p><b>Note</b> The MPLS VPN Half Duplex VRF feature supports only IPv4 address family.</p>                                                                                                                                                                                                                                                                                                      |
| Step 6 | <b>route-target {import   export   both}</b><br><b>route-target-ext-community</b><br><br><b>Example:</b><br>Router(config-vrf-af)# route-target both 100:2 | Creates a route-target extended community for a VRF. <ul style="list-style-type: none"> <li>The <b>import</b> keyword specifies to import routing information from the target VPN extended community.</li> <li>The <b>export</b> keyword specifies to export routing information to the target VPN extended community.</li> <li>The <b>both</b> keyword specifies to import both import and export routing information to the target VPN extended community.</li> <li>The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.</li> </ul> |

|        | Command or Action                                                                               | Purpose                                           |
|--------|-------------------------------------------------------------------------------------------------|---------------------------------------------------|
| Step 7 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-vrf-af)# exit-address-family | Exits from VRF address family configuration mode. |
| Step 8 | <b>end</b><br><br><b>Example:</b><br>Router(config-vrf-af)# end                                 | Exits to privileged EXEC mode.                    |

## Associating a VRF with an Interface

Perform the following task to associate a VRF with an interface, which activates the VRF.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **vrf forwarding** *vrf-name*
5. **ip address** *ip-address mask* [secondary]
6. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                               |
|--------|------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                           | Enters global configuration mode.                                                                                                                                                                                                                                                                     |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet 0/1                                     | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> <li>• The <b>type</b> argument identifies the type of interface to be configured.</li> <li>• The <b>number</b> argument identifies the port, connector, or interface card number.</li> </ul> |
| Step 4 | <b>vrf forwarding</b> <i>vrf-name</i> [ <b>downstream</b> <i>vrf2</i> ]<br><br><b>Example:</b><br>Router(config-if)# vrf forwarding vrf1 | Associates a VRF with an interface or subinterface. <ul style="list-style-type: none"> <li>• The <i>vrf-name</i> argument is the name of the VRF.</li> <li>• The <b>downstream</b> <i>vrf2</i> is the name of the downstream VRF into which peer and per-user routes are installed.</li> </ul>        |

|        | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]<br><br><b>Example:</b><br>Router(config-if)# ip address 10.24.24.24 255.255.255.255 | Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address.</li> <li>The <i>mask</i> argument is the mask of the associated IP subnet.</li> <li>The <b>secondary</b> keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul> |
| Step 6 | <b>end</b><br><br><b>Example:</b><br>Router(config-if) end                                                                                        | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                               |

## Configuring the Downstream VRF for an AAA Server

To configure the downstream VRF for an AAA (RADIUS) server in broadband or remote access situations, enter the following Cisco attribute value:

**lcp:interface-config=ip vrf forwarding U downstream D**

In standard VPN situations, enter instead the following Cisco attribute value:

**ip:vrf-id=U downstream D**

## Verifying MPLS VPN Half-Duplex VRF Configuration

To verify the Downstream VRF for an AAA Server configuration, perform the following steps.

### SUMMARY STEPS

1. **show vrf** [**brief** | **detail** | **id** | **interfaces** | **lock** | **select** ] [*vrf-name*]
2. **show ip route vrf** *vrf-name*
3. **show running-config** [**interface** *type number*]

### DETAILED STEPS

**Step 1** **show vrf** [**brief** | **detail** | **id** | **interfaces** | **lock** | **select** ] [*vrf-name*]

Use this command to display information about all of the VRFs configured on the router, including the downstream VRF for each associated interface or VAI:

Router# **show vrf**

```

Name      Default RD      Interfaces
Down      100:1           POS3/0/3 [D]
                        POS3/0/1 [D]
                        100:3          Loopback2
                        Virtual-Access3 [D]
```

```

Up      100:2      Virtual-Access4 [D]
          POS3/0/3
          POS3/0/1
          100:4      Virtual-Access3

```

### **show vrf detail vrf-name**

Use this command to display detailed information about the VRF you specify, including all interfaces, subinterfaces, and VAIs associated with the VRF.

If you do not specify a value for the *vrf-name* argument, detailed information about all of the VRFs configured on the router appears.

The following example shows how to display detailed information for the VRF called vrf1, in a broadband or remote access case:

```

Router# show vrf detail vrf1

VRF D; default RD 2:0; default VPNID <not set>
  Interfaces:
    Loopback2          Virtual-Access3 [D]  Virtual-Access4 [D]
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:2:0
  Import VPN route-target communities
    RT:2:1
  No import route-map
  No export route-map
VRF U; default RD 2:1; default VPNID <not set>
  Interfaces:
    Virtual-Access3      Virtual-Access4
  Connected addresses are not in global routing table
  No Export VPN route-target communities
  Import VPN route-target communities
    RT:2:1
  No import route-map
  No export route-map

```

The following example shows the VRF detail in a standard VPN situation:

```

Router# show vrf detail

VRF Down; default RD 100:1; default VPNID <not set> VRF Table ID = 1
  Description: import only from hub-pe
  Interfaces:
    Pos3/0/3 [D]          Pos3/0/1:0.1 [D]
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:100:0
  Import VPN route-target communities
    RT:100:1
  No import route-map
  No export route-map
  VRF label distribution protocol: not configured
  VRF Up; default RD 100:2; default VPNID <not set> VRF Table ID = 2
  Interfaces:
    Pos3/0/1          Pos3/0/3
  Connected addresses are not in global routing table
  No Export VPN route-target communities
  Import VPN route-target communities
    RT:100:1
  No import route-map
  No export route-map
  VRF label distribution protocol: not configured

```

**Step 2** **show ip route vrf vrf-name**

Use this command to display the IP routing table for the VRF you specify, and information about the per-user routes installed in the downstream VRF.

The following example shows how to display the routing table for the downstream VRF named D, in a broadband or remote access situation:

```
Router# show ip route vrf D
```

```
Routing Table: D
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS interarea
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route
```

Gateway of last resort is not set

```
10.0.0.0/8 is variably subnetted, 5 subnets, 2 masks
U    10.0.0.2/32 [1/0] via 10.0.0.1
S    10.0.0.0/8 is directly connected, Null0
U    10.0.0.5/32 [1/0] via 10.0.0.2
C    10.8.1.2/32 is directly connected, Virtual-Access4
C    10.8.1.1/32 is directly connected, Virtual-Access3
```

The following example shows how to display the routing table for the downstream VRF named Down, in a standard VPN situation:

```
Router# show ip route vrf Down
```

```
Routing Table: Down
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route
```

Gateway of last resort is 10.13.13.13 to network 0.0.0.0

```
C    10.2.0.0/8 is directly connected, Pos3/0/3
     10.3.0.0/32 is subnetted, 1 subnets
B    10.4.16.16 [200/0] via 10.13.13.13, 1w3d
B    10.6.0.0/8 [200/0] via 10.13.13.13, 1w3d
C    10.0.0.0/8 is directly connected, Pos3/0/1
     10.7.0.0/16 is subnetted, 1 subnets
B    10.7.0.0 [20/0] via 10.0.0.2, 1w3d
     10.0.6.0/32 is subnetted, 1 subnets
B    10.0.6.14 [20/0] via 10.0.0.2, 1w3d
     10.8.0.0/32 is subnetted, 1 subnets
B    10.8.15.15 [20/0] via 10.0.0.2, 1w3d
B*   0.0.0.0/0 [200/0] via 10.0.0.13, 1w3d
```

The following example shows how to display the routing table for the upstream VRF named U in a broadband or remote access situation:

```
Router# show ip route vrf U
```

```
Routing Table: U
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
```

```

D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS interarea
* - candidate default, U - per-user static route, o - ODR
P - periodic downloaded static route

```

Gateway of last resort is 192.168.0.20 to network 0.0.0.0

```

10.0.0.0/32 is subnetted, 1 subnets
C    10.0.0.8 is directly connected, Loopback2
B*   0.0.0.0/0 [200/0] via 192.168.0.20, 1w5d

```

The following example shows how to display the routing table for the upstream VRF named Up in a standard VPN situation:

Router# **show ip route vrf Up**

```

Routing Table: Up
Codes: C - connected, S - static, R - RIP, M - mobile, B - BGP
        D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2
        i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
        ia - IS-IS inter area, * - candidate default, U - per-user static route
        o - ODR, P - periodic downloaded static route

```

Gateway of last resort is 10.13.13.13 to network 0.0.0.0

```

10.2.0.0/32 is subnetted, 1 subnets
C    10.2.0.1 is directly connected, Pos3/0/3
10.3.0.0/32 is subnetted, 1 subnets
B    10.3.16.16 [200/0] via 10.13.13.13, 1w3d
B    10.6.0.0/8 [200/0] via 10.13.13.13, 1w3d
10.0.0.0/32 is subnetted, 1 subnets
C    10.0.0.1 is directly connected, Pos3/0/1
B*   0.0.0.0/0 [200/0] via 10.13.13.13, 1w3d

```

### Step 3 **show running-config [interface type number]**

Use this command to display information about the interface you specify, including information about the associated upstream and downstream VRFs.

The following example shows how to display information about the subinterface named POS3/0/1:

Router# **show running-config interface POS3/0/1**

Building configuration...

```

Current configuration : 4261 bytes
!
interface POS3/0/1
    ip vrf forwarding Up downstream Down
    ip address 10.0.0.1 255.0.0.0
end

```

## Configuration Examples for MPLS VPN Half-Duplex VRF

This section provides the following configuration examples:

- [Configuring the Upstream and Downstream VRFs on the Spoke PE Router: Example, page 11](#)
- [Associating a VRF with an Interface: Example, page 11](#)
- [Configuring MPLS VPN Half-Duplex VRF: Example Using Static CE-PE Routing, page 11](#)
- [Configuring MPLS VPN Half-Duplex VRF: Example Using RADIUS Server and Static CE-PE Routing, page 13](#)
- [Configuring MPLS VPN Half-Duplex VRF: Example Using Dynamic CE-PE Routing, page 14](#)

## Configuring the Upstream and Downstream VRFs on the Spoke PE Router: Example

The following example configures an upstream VRF named Up:

```
Router> enable
Router# configure terminal
Router(config)# vrf definition Up
Router(config-vrf)# rd 1:0
Router(config-vrf)# address-family ipv4
Router(config-vrf-af)# route-target import 1:0
Router(config-vrf-af)# exit-address-family
```

The following example configures a downstream VRF named Down:

```
Router> enable
Router# configure terminal
Router(config)# vrf definition Down
Router(config-vrf)# rd 1:8
Router(config-vrf)# address-family ipv4
Router(config-vrf-af)# route-target import 1:8
Router(config-vrf-af)# exit-address-family
```

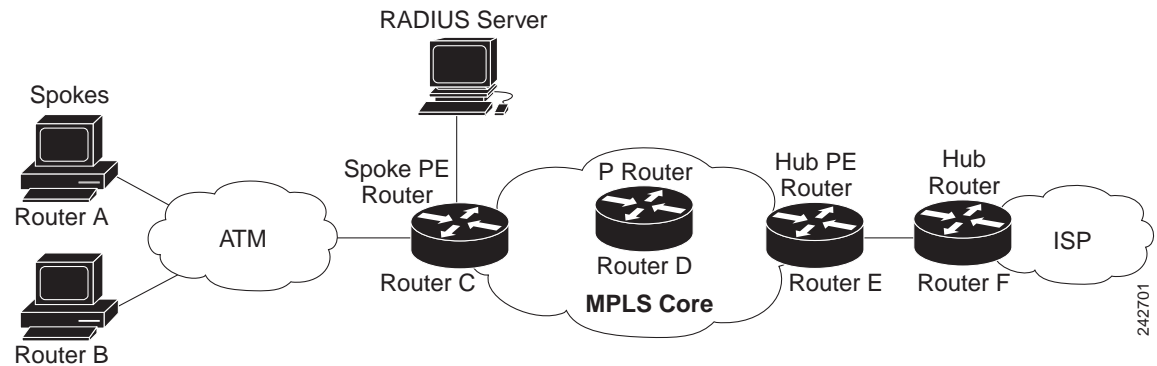

## Associating a VRF with an Interface: Example

The following example associates the VRF named Up with the POS3/0/1 subinterface and specifies the downstream VRF named Down:

```
Router> enable
Router# configure terminal
Router(config)# interface POS 3/0/1
Router(config-if)# vrf forwarding Up downstream Down
Router(config-if)# ip address 10.0.0.1 255.0.0.0
```

## Configuring MPLS VPN Half-Duplex VRF: Example Using Static CE-PE Routing

This example uses the hub-and-spoke topology shown in [Figure 2](#) with local authentication (that is, the RADIUS server is not used).

**Figure 2 Sample Topology**

```

```

## Configuring MPLS VPN Half-Duplex VRF: Example Using RADIUS Server and Static CE-PE Routing

The following example shows how to connect two Point-to-Point Protocol over Ethernet (PPPoE) clients to a single VRF pair on the spoke PE router named Router C. Although both PPPoE clients are configured in the same VRF, all communication occurs using the hub PE router. Half-duplex VRFs are configured on the spoke PE. The client configuration is downloaded to the spoke PE from the RADIUS server.

This example uses the hub-and-spoke topology shown in [Figure 2](#).

### Note

The wholesale provider can forward the user authentication request to the corresponding ISP. If the ISP authenticates the user, the wholesale provider appends the VRF information to the request that goes back to the PE router.

## Configuring MPLS VPN Half-Duplex VRF: Example Using Dynamic CE-PE Routing

The following example shows how to use OSPF to dynamically advertise the routes on the spoke sites.

This example uses the hub-and-spoke topology shown in [Figure 2](#).

### Creating the VRFs

```

vrf definition Down
  rd 100:1
  address-family ipv4
  route-target export 100:0
  exit-address-family
!
vrf definition Up
  rd 100:2
  address-family ipv4
  route-target import 100:1
  exit-address-family

```

### Enabling MPLS

```

mpls ldp graceful-restart
mpls ldp router-id Loopback0 force
mpls label protocol ldp

```

### Configuring BGP Toward Core

```

router bgp 100
  no bgp default ipv4-unicast

```

```

bgp log-neighbor-changes
bgp graceful-restart restart-time 120
bgp graceful-restart stalepath-time 360
bgp graceful-restart
neighbor 10.13.13.13 remote-as 100
neighbor 10.13.13.13 update-source Loopback0
!
address-family vpnv4
neighbor 10.13.13.13 activate
neighbor 10.13.13.13 send-community extended
bgp scan-time import 5
exit-address-family

```

### Configuring BGP Toward Edge

```

address-family ipv4 vrf Up
no auto-summary
no synchronization
exit-address-family
!
address-family ipv4 vrf Down
redistribute ospf 1000 vrf Down
no auto-summary
no synchronization
exit-address-family

```

### Spoke PE's Core-Facing Interfaces and Processes

```

interface Loopback0
    ip address 10.11.11.11 255.255.255.255
!
interface POS3/0/2
    ip address 10.0.1.1 255.0.0.0
    mpls label protocol ldp
    mpls ip

# Feature Information for MPLS VPN Half-Duplex VRF

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS VPN Half-Duplex VRF

# MPLS VPN—Show Running VRF

---

**First Published: March 16, 2006**

**Last Updated: July 11, 2008**

The MPLS VPN—Show Running VRF feature provides a Cisco IOS command-line interface (CLI) option to display a subset of the running configuration on a router that is linked to a Virtual Private Network (VPN) routing and forwarding (VRF) instance. You can display the configuration of a specific VRF or of all VRFs configured on a router.

On heavily loaded routers, the display of the configuration file might require several pages or screens. As the configuration increases in size and complexity, the possibility of misconfiguration also increases. You might find it difficult to trace a problem on a router where you have several VRFs configured. A command that displays all the elements of the configuration linked to a VRF allows for easier troubleshooting on a per-VRF basis and facilitates comparisons among configurations of different VRFs on the same router.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for MPLS VPN—Show Running VRF](#)” section on [page 6](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Configuration Examples for MPLS VPN—Show Running VRF, page 4](#)
- [Additional References, page 4](#)
- [Command Reference, page 5](#)
- [Feature Information for MPLS VPN—Show Running VRF, page 6](#)
- [Glossary, page 8](#)

## Prerequisites for MPLS VPN—Show Running VRF

- A Cisco IOS image that supports VRFs installed on the router
- At least one VRF configured on the router
- Cisco Express Forwarding for MPLS VPN routing and forwarding

## Restrictions for MPLS VPN—Show Running VRF

Any element of the running configuration of the router that is not linked directly to a VRF is not displayed. For example, a route map associated with a Border Gateway Protocol (BGP) neighbor in a VRF address-family configuration is not displayed. The VRF address-family configuration under BGP is displayed, but the route-map configuration is not. An exception to this general rule is the display of a controller configuration (for more information, see the [“Display of Configuration Not Directly Linked to a VRF”](#) section on page 4).

## Information About MPLS VPN—Show Running VRF

Before using the MPLS VPN—Show Running VRF feature, you should understand the following information:

- [Configuration Elements Displayed for the MPLS VPN—Show Running VRF Feature, page 2](#)
- [Display of VRF Routing Protocol Configuration, page 3](#)
- [Display of Configuration Not Directly Linked to a VRF, page 4](#)

## Configuration Elements Displayed for the MPLS VPN—Show Running VRF Feature

You can display the running configuration associated with a specific VRF or all VRFs on the router by entering the **show running-config vrf** command. To display the running configuration of a specific VRF, enter the name of the VRF as an argument to the **show running-config vrf** command. For example, for a VRF named vpn3, you enter:

```
Router# show running-config vrf vpn3
```

The **show running-config vrf** command displays the following elements of the running configuration on a router:

- The VRF configuration

This includes any configuration that is applied in the VRF submode.

- The configuration of each interface in the VRF

Entering a **show run vrf vpn-name** command is the same as executing a **show running-config interface type number** for each interface that you display by use of the **show ip vrf vpn-name** command. The interfaces display in the same sorted order that you would expect from the **show ip interface** command.

For a channelized interface, the configuration of the controller is displayed (as shown by the **show run controller controller-name** command).

For a subinterface, the configuration of the main interface is displayed.

- The configuration of routing-protocol address families or processes that are linked with the VRF, including static routing configuration (see the [“Display of VRF Routing Protocol Configuration” section on page 3](#))

## Display of VRF Routing Protocol Configuration

Open Shortest Path First (OSPF), Routing Information Protocol (RIP), Border Gateway Protocol (BGP), Enhanced Interior Gateway Routing Protocol (EIGRP), and static routing are routing protocols that support VRF configuration.

OSPF has one process per VRF. The **show running-config vrf** command display includes the complete configuration of any OSPF process associated with the VRF. For example, the following shows the sample display for OSPF process 101, which is associated with the VRF named vpn3:

```
router ospf 101 vrf vpn3
 log-adjacency-changes
 area 1 sham-link 10.43.43.43 10.23.23.23 cost 10
 network 172.17.0.0 0.255.255.255 area 1
```

RIP, BGP, and EIGRP support VRF address-family configuration. If a VRF address family for the VRF exists for any of these routing protocols, a configuration in the following format is displayed:

```
router protocol {AS | PID}
!
address-family ipv4 vrf vrf-name
.
.
.
```

Where the *protocol* argument is one of the following: **rip**, **bgp** or **eigrp**; the *AS* argument is an autonomous system number; the *PID* argument is a process identifier; and the *vrf-name* argument is the name of the associated VRF.

The following shows a sample display for a BGP with autonomous system number 100 associated with a VRF named vpn3:

```
!
router bgp 100
!
address-family ipv4 vrf vpn3
 redistribute connected
 redistribute ospf 101 match external 1 external 2
 no auto-summary
```

```
no synchronization
exit-address-family
!
```

The **show running-config vrf** command also includes the configuration of any static routes configured in the VRF. For example:

```
ip route vrf vpn1 10.1.1.0 255.255.255.0 10.30.1.1 global
ip route vrf vpn1 10.1.2.0 255.255.255.0 10.125.1.2
```

## Display of Configuration Not Directly Linked to a VRF

Any element of a configuration that is not linked directly to a VRF is not displayed. In some instances, the display of the configuration of an element that is not directly linked to a VRF is required.

For example, the **show running-config vrf** command displays the configuration of an E1 controller whose serial subinterfaces are in a VRF. The command displays the controller configuration and the subinterface configuration.

## How to Configure MPLS VPN—Show Running VRF

There are no tasks for the MPLS VPN—Show Running VRF feature.

## Configuration Examples for MPLS VPN—Show Running VRF

There are no configuration examples for the MPLS VPN—Show Running VRF feature.

## Additional References

The following sections provide references related to the MPLS VPN—Show Running VRF feature.

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **show policy-map interface brief**
- **show running-config vrf**

# Feature Information for MPLS VPN—Show Running VRF

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS VPN—Show Running VRF

| Feature Name              | Releases                                                            | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

# Glossary

**BGP**—Border Gateway Protocol. An interdomain routing protocol that replaces External Gateway Protocol (EGP). BGP systems exchange reachability information with other BGP systems. BGP is defined by RFC 1163.

**EGP**—External Gateway Protocol. An internet protocol for exchanging routing information between autonomous systems. EGP is documented in RFC 904. Not to be confused with the general term exterior gateway protocol. EGP is an obsolete protocol that was replaced by Border Gateway Protocol (BGP).

**EIGRP**—Enhanced Interior Gateway Routing Protocol. Advanced version of Interior Gateway Routing Protocol (IGRP) developed by Cisco. Provides superior convergence properties and operating efficiency, and combines the advantages of link state protocols with those of distance vector protocols.

**IGP**—Interior Gateway Protocol. An internet protocol used to exchange routing information within an autonomous system. Examples of common Internet IGPs include Interior Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), and Routing Information Protocol (RIP).

**IGRP**—Interior Gateway Routing Protocol. An Interior Gateway Protocol (IGP) developed by Cisco to address the issues associated with routing in large, heterogeneous networks.

**MPLS**—Multiprotocol Label Switching. A switching method that forwards IP traffic through the use of a label. This label instructs the routers and the switches in the network where to forward each packet based on preestablished IP routing information.

**OSPF**—Open Shortest Path First. A link-state, hierarchical, Interior Gateway Protocol (IGP) routing algorithm and routing protocol proposed as a successor to Routing Information Protocol (RIP) in the Internet community. OSPF features include least-cost routing, multipath routing, and load balancing. OSPF was derived from an early version of the Intermediate System-to-Intermediate System (IS-IS) protocol.

**RIP**—Routing Information Protocol. Internal Gateway Protocol (IGP) supplied with UNIX Berkeley Software Distribution (BSD) systems. RIP is the most common IGP in the Internet. It uses hop count as a routing metric.

**VPN**—Virtual Private Network. The result of a router configuration that enables IP traffic to use tunneling to travel securely over a public TCP/IP network.

**VRF**—A Virtual Private Network (VPN) routing and forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a provider edge (PE) router.

# MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs

---

**First Published: February 19, 2007**

**Last Updated: November 7, 2008**

This document describes how to configure a Virtual Private Network (VPN) routing and forwarding (VRF) instance for IPv4 and IPv6 VPNs and describes how to upgrade your existing single-protocol IPv4-only VRF to a multiprotocol VRF configuration.

The MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature introduces Cisco IOS command-line interface (CLI) commands that allow you to enable an IPv4 and IPv6 VPN in the same VRF instance and to simplify the migration from a single-protocol VRF configuration to a multiprotocol VRF configuration.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs](#)” section on [page 19](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Feature Information for MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs, page 19](#)
- [Glossary, page 21](#)

## Prerequisites for MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs

The MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature has the following prerequisites:

- For migration—An IPv4 Multiprotocol Label Switching (MPLS) VPN VRF must exist.
- For a new VRF configuration—Cisco Express Forwarding and an MPLS label distribution method, either Label Distribution Protocol (LDP) or MPLS traffic engineering (TE), must be enabled on all routers in the core, including the provider edge (PE) routers.

## Restrictions for MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs

The MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature has the following restrictions:

- Once you have converted to a multiprotocol VRF, you cannot convert the VRF back to an IPv4-only single-protocol VRF.
- You can associate an interface with only one VRF. You cannot configure a VRF for IPv4 and a different VRF for IPv6 on the same interface.
- You can configure only IPv4 and IPv6 address families in a multiprotocol VRF. Other protocols (IPX, AppleTalk, and the like) are not supported.

## Information About MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs

Before you use the MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature to migrate from a single-protocol VRF to a multiprotocol VRF, you should understand the following concepts:

- [VRF Concepts Similar for IPv4 and IPv6 MPLS VPNs, page 2](#)
- [Single-Protocol VRF to Multiprotocol VRF Migration, page 3](#)
- [Multiprotocol VRF Configurations Characteristics and Examples, page 4](#)

## VRF Concepts Similar for IPv4 and IPv6 MPLS VPNs

VPNs for IPv6 use the same VRF concepts that IPv4 MPLS VPNs use, such as address families, route distinguishers, route targets, and VRF identifiers. Customers that use both IPv4 and IPv6 VPNs might want to share VRF policies between address families. They might want a way to define applicable VRF policies for all address families, instead of defining VRF policies for an address family individually as they do for or a single-protocol IPv4-only VRF.

Prior to Cisco IOS Release 12.2(33)SRB, a VRF applied only to an IPv4 address family. A one-to-one relationship existed between the VRF name and a routing and forwarding table identifier, between a VRF name and a route distinguisher (RD), and between a VRF name and a VPN ID. This configuration is called a single-protocol VRF.

Cisco IOS Release 12.2(33)SRB introduces support for a multiple address-family (multi-AF) VRF structure. The multi-AF VRF allows you to define multiple address families under the same VRF. A given VRF, identified by its name and a set of policies, can apply to both an IPv4 VPN and an IPv6 VPN at the same time. This VRF can be activated on a given interface, even though the routing and forwarding tables are different for the IPv4 and IPv6 protocols. This configuration is called a multiprotocol VRF.

## Single-Protocol VRF to Multiprotocol VRF Migration

Prior to Cisco IOS Release 12.2(33)SRB, you could create a single-protocol IPv4-only VRF. You created a single-protocol VRF by entering the **ip vrf** command. To activate the single-protocol VRF on an interface, you entered the **ip vrf forwarding** (interface configuration) command.

After the introduction of the MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature in Cisco IOS Release 12.2(33)SRB, you create a multiprotocol VRF by entering the **vrf definition** command. To activate the multiprotocol VRF on an interface, you enter the **vrf forwarding** command.

The MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature introduces the **vrf upgrade-cli multi-af-mode {common-policies | non-common-policies} [vrf vrf-name]** command that forces VRF configuration migration from a single-protocol VRF model to a multiprotocol VRF model:

- If the route-target policies apply to all address families configured in the multi-AF VRF, select the **common-policies** keyword.
- If the route-target policies apply only to the IPv4 address family that you are migrating, select the **non-common-policies** keyword.

After you enter the **vrf upgrade-cli** command and save the configuration to NVRAM, the single-protocol VRF configuration is saved as a multiprotocol VRF configuration. In the upgrade process, the **ip vrf** command is converted to the **vrf definition** command (global configuration commands) and the **ip vrf forwarding** command is converted to the **vrf forwarding** command (interface configuration command). The **vrf upgrade-cli** command has a one-time immediate effect.

You might have both IPv4-only VRFs and multiprotocol VRFs on your router. Once you create a VRF, you can edit it using only the commands in the mode in which it was created. For example, you created a VRF named vrf2 with the following multiprotocol VRF commands:

```
Router# configure terminal
Enter configuration command, one per line. End with CNTL/Z
Router(config)# vrf definition vrf2
Router(config-vrf)# rd 2:2
Router(config-vrf)# route-target import 2:2
Router(config-vrf)# route-target export 2:2
Router(config-vrf)# end
```

If you try to edit VRF vrf2 with IPv4-only VRF commands, you receive the following message:

```
Router# configure terminal
Enter configuration command, one per line. End with CNTL/Z
Router(config)# ip vrf vrf2
```

% Use 'vrf definition vrf2' command

If you try to edit an IPv4-only VRF with the multiprotocol VRF commands, you would receive this message, where <vrf-name> is the name of the IPv4-only VRF:

% Use 'ip vrf <vrf-name>' command

The **ip vrf name** and **ip vrf forwarding** (interface configuration) *name* commands will be available for a period of time before they are removed. Use the **vrf upgrade** command to migrate your older IPv4-only VRFs to the new multiprotocol VRF configuration. When you need to create a new VRF—whether the VRF is for an IPv4 VPN, or IPv6 VPN, or both—use the multiprotocol VRF **vrf definition** and **vrf forwarding** commands that support a multi-AF configuration.

## Multiprotocol VRF Configurations Characteristics and Examples

In a multiprotocol VRF, you can configure both IPv4 VRFs and IPv6 VRFs under the same address family or configure separate VRFs for each IPv4 or IPv6 address family. The multiprotocol VRF configuration has the following characteristics:

- The VRF name identifies a VRF, which might have both IPv4 and IPv6 address families. On the same interface, you cannot have IPv4 and IPv6 address families using different VRF names.
- The RD, VPN ID, and Simple Network Management Protocol (SNMP) context are shared by both IPv4 and IPv6 address families for a given VRF.
- The policies (route target, for example) specified in multi-AF VRF mode, outside the address-family configuration, are defaults to be applied to each address family. Route targets are the only VRF characteristics that can be defined inside and outside an address family.

The following is also true when you associate a multiprotocol VRF with an interface:

- Binding an interface to a VRF (**vrf forwarding vrf-name** command) removes all IPv4 and IPv6 addresses configured on that interface.
- Once you associate a VRF with a given interface, all active address families belong to that VRF. The exception is when no address of the address-family type is configured, in which case the protocol is disabled.
- Configuring an address on an interface that is bound to a VRF requires that the address family corresponding to the address type is active for that VRF. Otherwise, an error message is issued stating that the address family must be activated first in the VRF.

Backward compatibility with the single-protocol VRF CLI is supported in Cisco IOS Release 12.2(33)SRB. This means that you might have single-protocol and multiprotocol CLI on the same router, but not in the same VRF configuration.

The single-protocol CLI continues to allow you to define an IPv4 address within a VRF and an IPv6 address in the global routing table on the same interface.

The following sections have multiprotocol VRF configuration examples:

- [Multiprotocol VRF Configuration: Single Protocol with Noncommon Policies Example, page 4](#)
- [Multiprotocol VRF Configuration: Multiprotocol with Noncommon Policies Example, page 5](#)
- [Multiprotocol VRF Configuration: Multiprotocol with Common Policies Example, page 5](#)
- [Multiprotocol VRF Configuration: Multiprotocol with Common and Noncommon Policies, page 5](#)

### Multiprotocol VRF Configuration: Single Protocol with Noncommon Policies Example

The following is an example of a multiprotocol VRF configuration for a single protocol (IPv4) with route-target policies in the address-family configuration:

```
vrf definition vrf2
rd 2:2
!
address-family ipv4
```

```
route-target export 2:2
route-target import 2:2
exit-address-family
```

The RD (2:2) applies to all address families defined for VRF vrf2.

## Multiprotocol VRF Configuration: Multiprotocol with Noncommon Policies Example

The following is an example of a multiprotocol VRF configuration for IPv4 and IPv6 VPNs in which the route-target policies are defined in the separate address-family configurations:

```
vrf definition vrf2
 rd 2:2
 !
 address-family ipv4
  route-target export 2:2
  route-target import 2:2
 exit-address-family
 !
 address-family ipv6
  route-target export 3:3
  route-target import 3:3
 exit-address-family
```

## Multiprotocol VRF Configuration: Multiprotocol with Common Policies Example

The following is an example of a multiprotocol VRF configuration for IPv4 and IPv6 VPNs with route-target policies defined in the global part of the VRF:

```
vrf definition vrf2
 rd 2:2
 route-target export 2:2
 route-target import 2:2
 !
 address-family ipv4
 exit-address-family
 !
 address-family ipv6
 exit-address-family
```

The route-target policies are defined outside the address-family configurations. Therefore, the policies apply to all address families defined in VRF vrf2.

## Multiprotocol VRF Configuration: Multiprotocol with Common and Noncommon Policies

The following is an example of a multiprotocol VRF with route-target policies defined in both global and address-family areas:

- For IPv6, the route-target definitions are defined under the address family. These definitions are used and the route-target definitions in the global area are ignored. Therefore, the IPv6 VPN ignores import 100:2.
- For IPv4, no route-target policies are defined under the address family, therefore, the global definitions are used.

```
vrf definition vrf1
 route-target export 100:1
 route-target import 100:1
 route-target import 100:2
 !
```

```

address-family ipv4
exit-address-family
!
address-family ipv6
route-target export 100:1
route-target import 100:1
route-target import 100:3
exit-address-family

```

## How to Configure MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs

This feature provides Cisco IOS CLI commands that allow you to configure a multiprotocol VRF (IPv4 and IPv6 VPNs in the same VRF) and to migrate a single-protocol VRF configuration (IPv4-only VRF) to a multiprotocol VRF configuration.

A multiprotocol VRF allows you to share route targets policies (import and export) between IPv4 and IPv6 or to configure separate route-target policies for IPv4 and IPv6 VPNs.

Perform the tasks in the following sections to configure or migrate to the MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature:

- [Configuring a VRF for IPv4 and IPv6 MPLS VPNs, page 6](#) (required)
- [Associating a Multiprotocol VRF with an Interface, page 9](#) (required)
- [Verifying the MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs Configuration, page 10](#) (optional)

Perform the following task to migrate from a single-protocol VRF to a multiprotocol VRF configuration:

- [Migrating from a Single-Protocol IPv4-Only VRF to a Multiprotocol VRF Configuration, page 13](#)

## Configuring a VRF for IPv4 and IPv6 MPLS VPNs

Perform the following task to configure a VRF for IPv4 and IPv6 MPLS VPNs. When you configure a VRF for both IPv4 and IPv6 VPNs (a multiprotocol VRF), you can choose to configure route-target policies that apply to all address families in the VRF or you can configure route-target policies that apply to individual address families in the VRF.

The following task shows how to configure a VRF that has that has route-target policies defined for IPv4 and IPv6 VPNs in separate VRF address families.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition** *vrf-name*
4. **rd** *route-distinguisher*
5. **address-family** {**ipv4** | **ipv6**}
6. **route-target** {**import** | **export** | **both**} *route-target-ext-community*
7. **exit-address-family**
8. **address-family** {**ipv4** | **ipv6**}

9. **route-target** {import | export | both} *route-target-ext-community*
10. **end**

## DETAILED STEPS

|        | Command or Action                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 3 | <b>vrf definition</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config)# vrf definition vrf1  | Configures a VRF routing table and enters VRF configuration mode. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name of the VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| Step 4 | <b>rd</b> <i>route-distinguisher</i><br><br><b>Example:</b><br>Router(config-vrf)# rd 100:1          | Creates routing and forwarding tables for a VRF. <ul style="list-style-type: none"> <li>The <i>route-distinguisher</i> argument specifies to add an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter a route distinguisher in either of these formats: <ul style="list-style-type: none"> <li>16-bit autonomous system number (ASN): your 32-bit number<br/>For example, 101:3.</li> <li>32-bit IP address: your 16-bit number<br/>For example, 192.168.122.15:1.</li> </ul> </li> </ul> |
| Step 5 | <b>address-family</b> {ipv4   ipv6}<br><br><b>Example:</b><br>Router(config-vrf) address-family ipv4 | Enters VRF address family configuration mode to specify an address family for a VRF. <ul style="list-style-type: none"> <li>The <b>ipv4</b> keyword specifies an IPv4 address family for a VRF.</li> <li>The <b>ipv6</b> keyword specifies an IPv6 address family for a VRF.</li> </ul>                                                                                                                                                                                                                           |

|         | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6  | <pre>route-target {import   export   both} route-target-ext-community</pre> <p><b>Example:</b><br/>Router(config-vrf-af)# route-target both 100:2</p> | <p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> <li>The <b>import</b> keyword specifies to import routing information from the target VPN extended community.</li> <li>The <b>export</b> keyword specifies to export routing information to the target VPN extended community.</li> <li>The <b>both</b> keyword specifies to import both import and export routing information to the target VPN extended community.</li> <li>The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.</li> </ul>                                                                                  |
| Step 7  | <pre>exit-address-family</pre> <p><b>Example:</b><br/>Router(config-vrf-af)# exit-address-family</p>                                                  | Exits from VRF address family configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 8  | <pre>address-family {ipv4   ipv6}</pre> <p><b>Example:</b><br/>Router(config-vrf) address-family ipv6</p>                                             | <p>Enters VRF address family configuration mode to specify an address family for a VRF.</p> <ul style="list-style-type: none"> <li>The <b>ipv4</b> keyword specifies an IPv4 address family for a VRF.</li> <li>The <b>ipv6</b> keyword specifies an IPv6 address family for a VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 9  | <pre>route-target {import   export   both} route-target-ext-community</pre> <p><b>Example:</b><br/>Router(config-vrf-af)# route-target both 100:3</p> | <p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> <li>The <b>import</b> keyword specifies to import routing information from the target VPN extended community.</li> <li>The <b>export</b> keyword specifies to export routing information to the target VPN extended community.</li> <li>The <b>both</b> keyword specifies to import both import and export routing information to the target VPN extended community.</li> <li>The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.</li> </ul> <p>Enter the <b>route-target</b> command one time for each target community.</p> |
| Step 10 | <pre>end</pre> <p><b>Example:</b><br/>Router(config-vrf-af)# end</p>                                                                                  | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Associating a Multiprotocol VRF with an Interface

Perform the following task to associate a multiprotocol VRF with an interface. Associating the VRF with an interface activates the VRF.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type number*
4. **vrf forwarding** *vrf-name*
5. **ip address** *ip-address mask* [**secondary**]
6. **ipv6 address** {*ipv6-address/prefix-length* | *prefix-name sub-bits/prefix-length*}
7. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                               | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                                                                                               |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 3 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet 0/1                                                 | Configures an interface type and enters interface configuration mode.<br><ul style="list-style-type: none"><li>• The <b>type</b> argument identifies the type of interface to be configured.</li><li>• The <b>number</b> argument identifies the port, connector, or interface card number.</li></ul>                                                                                                                             |
| Step 4 | <b>vrf forwarding</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config-if)# vrf forwarding vrf1                                               | Associates a VRF with an interface or subinterface.<br><ul style="list-style-type: none"><li>• The <i>vrf-name</i> argument is the name of the VRF.</li></ul>                                                                                                                                                                                                                                                                     |
| Step 5 | <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]<br><br><b>Example:</b><br>Router(config-if)# ip address 10.24.24.24<br>255.255.255.255 | Sets a primary or secondary IP address for an interface.<br><ul style="list-style-type: none"><li>• The <i>ip-address</i> argument is the IP address.</li><li>• The <i>mask</i> argument is the mask of the associated IP subnet.</li><li>• The <b>secondary</b> keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li></ul> |

|        | Command or Action                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>ipv6 address</b> { <i>ipv6-address/prefix-length</i>   <i>prefix-name sub-bits/prefix-length</i> }<br><br><b>Example:</b><br>Router(config-if)# ipv6 address<br>2001:0DB8:0300:0201::/64 | Configures an IPv6 address based on an IPv6 general prefix and enables IPv6 processing on an interface. <ul style="list-style-type: none"> <li>The <i>ipv6-address</i> argument is the IPv6 address to be used.</li> <li>The <i>prefix-length</i> argument is the length of the IPv6 prefix, which is a decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.</li> <li>The <i>prefix-name</i> argument is a general prefix that specifies the leading bits of the network to be configured on the interface.</li> <li>The <i>sub-bits</i> argument is the subprefix bits and host bits of the address to be concatenated with the prefixes provided by the general prefix specified with the <i>prefix-name</i> argument.</li> </ul> <p>The <i>sub-bits</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.</p> |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config-if) end                                                                                                                                  | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Verifying the MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs Configuration

Perform the following task to verify the MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature configuration, that is, to show that the VRF configuration is upgraded to a multi-AF multiprotocol VRF.

### SUMMARY STEPS

1. **enable**
2. **show running-config vrf** [*vrf-name*]
3. **show vrf**
4. **show vrf detail** [*vrf-name*]
5. **exit**

### DETAILED STEPS

#### Step 1 **enable**

Use this command to enable privileged EXEC mode. Enter your password, if prompted. For example:

```
Router> enable
Router#
```

**Step 2** **show running-config vrf** [*vrf-name*]

Use this command to verify that the upgrade to a multi-AF multiprotocol VRF configuration was successful. The following is sample command output before the upgrade to a multi-AF multiprotocol VRF:

```
Router# show running-config vrf vpn2

Building configuration...

Current configuration : 604 bytes
ip vrf vpn2
  rd 1:1
  route-target both 1:1
!
!
interface Loopback1
  ip vrf forwarding vpn2
  ip address 10.43.43.43 255.255.255.255
!
```

The following is sample command output after you upgrade to a multi-AF multiprotocol VRF with common policies for all address families:

```
Router# show running-config vrf vpn1

Building configuration...

Current configuration : 604 bytes
vrf definition vpn1
  rd 1:1
  route-target both 1:1
!
  address-family ipv4
  exit-address-family
!
!
interface Loopback1
  ip vrf forwarding vpn1
  ip address 10.43.43.43 255.255.255.255
!
```

This configuration contains the **vrf definition** command. The **vrf definition** command replaces the **ip vrf** command in the multi-AF multiprotocol VRF configuration.

**Step 3** **show vrf**

Use this command to verify that the upgrade to a multi-AF multiprotocol VRF configuration was successful. The **show vrf** command replaces the **show ip vrf** command when a VRF configuration is updated to a multi-AF multiprotocol VRF configuration. The **show vrf** command displays the protocols defined for a VRF. The following command shows sample output after you upgrade a single-protocol VRF configuration to a multi-AF multiprotocol VRF configuration:

```
Router# show vrf vpn1
```

| Name | Default RD | Protocols | Interfaces |
|------|------------|-----------|------------|
| vpn1 | 1:1        | ipv4      | Lo1/0      |

The following is sample output from the **show ip vrf vp1** command. Compare this to the output of the **show vrf vp1** command. The protocols under the VRF are not displayed.

```
Router# show ip vrf vrf1
```

| Name | Default RD | Interface |
|------|------------|-----------|
| vp1  | 1:1        | Loopback1 |

The following is sample output from the **show vrf** command for multiprotocol VRFs, one of which contains both IPv4 and IPv6 protocols:

```
Router# show vrf
```

| Name | Default RD | Protocols  | Interfaces     |
|------|------------|------------|----------------|
| vp1  | 1:1        | ipv4       | Lo1/0          |
| vp2  | 100:3      | ipv4       | Lo23 AT3/0/0.1 |
| vp4  | 100:2      | ipv4, ipv6 |                |

#### Step 4 **show vrf detail [vrf-name]**

Use this command to display all characteristics of the defined VRF to verify that the configuration is as you expected. For example, if your VRF configuration for VRF vp1 is as follows:

```
vrf definition vp1
 route-target both 100:1
 route-target import 100:2
 !
 address-family ipv4
 exit-address-family
 !
 address-family ipv6
 route-target both 100:1
 route-target import 100:3
 exit-address-family
```

This command would display the following:

```
Router# show vrf detail vp1
```

```
VRF vp1 (VRF Id = 3); default RD <not set>; default VPNID <not set>
  No interfaces
Address family ipv4 (Table ID = 3 (0x3)):
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:100:1

  Import VPN route-target communities
    RT:100:1          RT:100:2

  No import route-map
  No export route-map
  VRF label distribution protocol: not configured
  VRF label allocation mode: per-prefix
Address family ipv6 (Table ID = 503316483 (0x1E000003)):
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:100:1

  Import VPN route-target communities
    RT:100:1          RT:100:3

  No import route-map
  No export route-map
  VRF label distribution protocol: not configured
  VRF label allocation mode: per-prefix
```

**Step 5**    **exit**

Use this command to exit to user EXEC mode. For example:

```
Router# exit
Router>
```

## Migrating from a Single-Protocol IPv4-Only VRF to a Multiprotocol VRF Configuration

Perform the following task to force migration from a single-protocol IPv4-only VRF to a multiprotocol VRF configuration.

The multiprotocol VRF configuration allows you to define multiple address families under the same VRF. A given VRF, identified by its name and a set of policies, can apply to both an IPv4 VPN and an IPv6 VPN at the same time. This VRF can be activated on a given interface, even though the routing and forwarding tables are different for the IPv4 and IPv6 protocols.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf upgrade-cli multi-af-mode {common-policies | non-common-policies} [vrf vrf-name]**
4. **exit**
5. **show running-config vrf vrf-name**

### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                                                          |
|--------|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
|        | <b>Example:</b><br>Router> enable             |                                                                                                                  |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                                                |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                                                  |

|        | Command or Action                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <p><b>vrf upgrade-cli multi-af-mode</b> {<b>common-policies</b>   <b>non-common-policies</b>} [<b>vrf</b> <i>vrf-name</i>]</p> <p><b>Example:</b><br/> Router(config)# vrf upgrade-cli multi-af-mode common-policies vrf vpn4</p> | <p>Upgrades a VRF instance or all VRFs configured on the router to support multiple address families under the same VRF.</p> <ul style="list-style-type: none"> <li>The <b>multi-af-mode</b> keyword specifies an upgrade of a single-protocol VRF or all VRFs to a multiprotocol VRF that supports multi-AFs configuration.</li> <li>The <b>common-policies</b> keyword specifies to copy the route-target policies to the common part of the VRF configuration so that the policies apply to all address families configured in the multi-AF VRF.</li> <li>The <b>non-common-policies</b> keyword specifies to copy the route-target policies to the IPv4 address family part of the VRF configuration so that the policies apply only to IPv4.</li> <li>The <b>vrf</b> keyword specifies a VRF for the upgrade to a multi-AF VRF configuration.</li> <li>The <i>vrf-name</i> argument is the name of the single-protocol VRF to upgrade to a multi-AF VRF configuration.</li> </ul> |
| Step 4 | <p><b>exit</b></p> <p><b>Example:</b><br/> Router(config)# exit</p>                                                                                                                                                               | <p>Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 5 | <p><b>show running-config vrf</b> [<i>vrf-name</i>]</p> <p><b>Example:</b><br/> Router# show running-config vrf vpn4</p>                                                                                                          | <p>Displays the subset of the running configuration of a router that is linked to a specific VRF instance or to all VRFs configured on the router.</p> <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name of the VRF of which you want to display the configuration.</li> </ul> <p><b>Note</b> The Cisco IOS image that supports the multiprotocol VRF commands might not support the <b>show running-config vrf</b> command. You can use the <b>show running-config</b> command instead.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Configuration Examples for MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs

The following examples show how to use the VRF CLI provided by the MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs feature to migrate from a single-protocol VRF to a multiprotocol VRF configuration:

- [Configuring a VRF for IPv4 and IPv6 VPNs: Example, page 15](#)
- [Associating a Multiprotocol VRF with an Interface: Example, page 15](#)
- [Migrating from a Single-Protocol IPv4-Only VRF Configuration to a Multiprotocol VRF Configuration: Example, page 16](#)

## Configuring a VRF for IPv4 and IPv6 VPNs: Example

The following example shows how to configure a VRF for IPv4 and IPv6 VPNs:

```
configure terminal
!
vrf definition vrf1
  rd 100:1
!
  address-family ipv4
    route-target both 100:2
  exit-address-family
!
  address-family ipv6
    route-target both 100:3
  exit-address-family
```

In this example, noncommon policies are defined in the address-family configuration.

The following is an example of a VRF for IPv4 and IPv6 that has common policies defined in the global part of the VRF configuration:

```
configure terminal
!
vrf definition vrf2
  rd 200:1
  route-target both 200:2
!
  address-family ipv4
  exit-address-family
!
  address-family ipv6
  exit-address-family
end
```

## Associating a Multiprotocol VRF with an Interface: Example

The following example shows how to associate a multiprotocol VRF with an interface:

```
configure terminal
!
interface Ethernet 0/1
  vrf forwarding vrf1
  ip address 10.24.24.24 255.255.255.255
  ipv6 address 2001:0DB8:0300:0201::/64
end
```

## Migrating from a Single-Protocol IPv4-Only VRF Configuration to a Multiprotocol VRF Configuration: Example

This section contains examples that show how to migrate from a single-protocol IPv4-only VRF to a multiprotocol VRF configuration.

This example shows a single-protocol IPv4-only VRF before the Cisco IOS VRF CLI for IPv4 and IPv6 is entered on the router:

```
ip vrf vrf1
  rd 1:1
  route-target both 1:1

interface Loopback1
  ip vrf forwarding V1
  ip address 10.3.3.3 255.255.255.255
```

This example shows how to force the migration of the single-protocol VRF vrf1 to a multiprotocol VRF configuration:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
!
Router(config)# vrf upgrade-cli multi-af-mode common-policies vrf vrf1
```

```
You are about to upgrade to the multi-AF VRF syntax commands.
You will loose any IPv6 address configured on interfaces
belonging to upgraded VRFs.
Are you sure ? [yes]: yes
```

```
Number of VRFs upgraded: 1
```

```
Router(config)# exit
```

This example shows the multiprotocol VRF configuration after the forced migration:

```
vrf definition vrf1
  rd 1:1
  route-target both 1:1
  !
  address-family ipv4
  exit-address-family
  !

interface Loopback1
  vrf forwarding V1
  ip address 10.3.3.3 255.255.255.255
```

The following is another example of a multi-AF multiprotocol VRF configuration:

```
vrf definition vrf2
  rd 100:1
  address family ipv6
  route-target both 200:1
  exit-address-family
  !
ip vrf vrf1
  rd 200:1
  route-target both 200:1
  !
interface Ethernet0/0
  vrf forwarding vrf2
```

```
ip address 10.50.1.2 255.255.255.0
ipv6 address 2001:0DB8:0:1::/64
!
interface Ethernet0/1
 ip vrf forwarding vrf1
 ip address 10.60.1.2 255.255.255.0
 ipv6 address 2001:0DB8:1:1::/64
```

In this example, all addresses (IPv4 and IPv6) defined for interface Ethernet0/0 are in VRF vrf2. For the interface Ethernet0/1, the IPv4 address is defined in VRF vrf1 but the IPv6 address is in the global IPv6 routing table.

# Feature Information for MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs

| Feature Name                            | Releases                   | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

# Glossary

**6PE**—IPv6 provider edge router or a Multiprotocol Label Switching (MPLS) label switch router (LSR) edge router using IPv6.

**6VPE**—IPv6 Virtual Private Network (VPN) provider edge router.

**AF**—address family. Set of related communication protocols in which all members use a common addressing mechanism to identify endpoints. Also called protocol family.

**AFI**—Address Family Identifier. Carries the identity of the network-layer protocol that is associated with the network address.

**BGP**—Border Gateway Protocol. A routing protocol used between autonomous systems. It is the routing protocol that makes the internet work. BGP is a distance-vector routing protocol that carries connectivity information and an additional set of BGP attributes. These attributes allow for a set of policies for deciding the best route to use to reach a given destination. BGP is defined by RFC 1771.

**CE**—customer edge router. A service provider router that connects to Virtual Private Network (VPN) customer sites.

**FIB**—Forwarding Information Base. Database that stores information about switching of data packets. A FIB is based on information in the Routing Information Base (RIB). It is the optimal set of selected routes that are installed in the line cards for forwarding.

**HA**—high availability. High availability is defined as the continuous operation of systems. For a system to be available, all components—including application and database servers, storage devices, and the end-to-end network—need to provide continuous service.

**IP**—Internet Protocol. Network-layer protocol in the TCP/IP stack offering a connectionless internetwork service. IP provides features for addressing, type-of-service specification, fragmentation and reassembly, and security.

**IPv4**—IP Version 4. Network layer for the TCP/IP protocol suite. IPv4 is a connectionless, best-effort packet switching protocol.

**IPv6**—IP Version 6. Replacement for IPv4. IPv6 is a next-generation IP protocol. IPv6 is backward compatible with and designed to fix the shortcomings of IPv4, such as data security and maximum number of user addresses. IPv6 increases the address space from 32 to 128 bits, providing for an unlimited number of networks and systems. It also supports quality of service (QoS) parameters for real-time audio and video.

**MFI**—MPLS Forwarding Infrastructure. In the Cisco MPLS subsystem, the data structure for storing information about incoming and outgoing labels and associated equivalent packets suitable for labeling.

**MPLS**—Multiprotocol Label Switching. MPLS is a method for forwarding packets (frames) through a network. It enables routers at the edge of a network to apply labels to packets (frames). ATM switches or existing routers in the network core can switch packets according to the labels with minimal lookup overhead.

**PE**—provider edge router. A router that is part of a service provider's network and that is connected to a customer edge (CE) router. The PE router function is a combination of an MLS edge label switch router (LSR) function with some additional functions to support Virtual Private Networks (VPNs).

**RD (IPv4)**—route distinguisher. An 8-byte value that is concatenated with an IPv4 prefix to create a unique VPN IPv4 (VPNv4) prefix.

**RD (IPv6)**—route distinguisher. A 64-bit value that is prepended to an IPv6 prefix to create a globally unique VPN-IPv6 address.

**RIB**—Routing Information Base. The set of all available routes from which to choose the Forwarding Information Base (FIB). The RIB essentially contains all routes available for selection. It is the sum of all routes learned by dynamic routing protocols, all directly attached networks (that is—networks to which a given router has interfaces connected), and any additional configured routes, such as static routes.

**RT**—route target. Extended community attribute used to identify the Virtual Private Network (VPN) routing and forwarding (VRF) routing table into which a prefix is to be imported.

**VPN**—Virtual Private Network. Enables IP traffic to travel securely over a public TCP/IP network by encrypting all traffic from one network to another. A VPN uses “tunneling” to encrypt all information at the IP level.

**VRF**—Virtual Private Network (VPN) routing and forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a PE router.

**VRF table**—A routing and a forwarding table associated to a Virtual Private Network (VPN) routing and forwarding (VRF) instance. This is a customer-specific table, enabling the provider edge (PE) router to maintain independent routing states for each customer.

# MPLS VPN—BGP Local Convergence

---

**First Published: December 31, 2007**

**Last Updated: October 2, 2009**

The MPLS VPN—BGP Local Convergence feature reduces the downtime of a provider edge (PE) to customer edge (CE) link failure. It does so by rerouting PE-egress traffic onto a backup path to the CE before BGP has re-converged.

The MPLS VPN—BGP Local Convergence feature is also referred to as “local protection”.

Note that the MPLS VPN—BGP Local Convergence feature only affects traffic exiting the VPN. Therefore, it cannot fully protect traffic end-to-end by itself.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS VPN—BGP Local Convergence”](#) section on page 13.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Prerequisites for MPLS VPN—BGP Local Convergence

- Before this form of link protection can be enabled, the customer site must be connected to the provider site by more than one path.
- Both the main forwarding path and the redundant backup path must have been installed within BGP, and BGP must support lossless switchover between operational paths.

**Note**

Any routing protocol can be used between the PE and CE as long as the path is redistributed into BGP. That includes: eBGP, RIP, EIGRP, IS-IS, OSPF, and static routing. Any next-hop core tunneling technology that is supported by BGP is also supported for protection, including MPLS, IP/L2TPv3, and IP/GRE. Enabling a Carrier's Carrier (CsC) protocol between the PE and CE is also supported. Inter-AS option A (back-to-back VRF) is supported because it is essentially the same as performing the PE-CE link protection in both AS's. However, inter-AS options B and C protection are not supported at this time.

- All Provider Edge routers that are serving as backup to the link must have assigned a unique Route Distinguisher to each Virtual Routing and Forwarding table involved with the link to ensure that the route reflectors advertise all available paths.
- Although not required, it is recommended that the backup PE (shown as “PE2” in [Figure 2](#)) also be running the IOS version that is running on the PE (“PE1”) whose link with the CE will be protected; that is, Cisco IOS Release 12.2(33)SRC, Cisco IOS Release 12.2(33)SB, Cisco IOS Release 15.0(1)M or a more recent version of those products.

## Restrictions for MPLS VPN—BGP Local Convergence

- This feature only affects traffic exiting the VPN. Therefore, it cannot fully protect traffic end-to-end by itself.
- Configuration of this feature is not allowed in IPv6.
- Local protection is not applicable with VRF-lite. Although configuration of both features together is not blocked, protection does not occur.
- This link protection cannot be initiated *during* an HA stateful switchover (SSO). But links already configured with this protection *before* the switchover begins will remain protected after the switchover.
- When performing an ISSU downgrade from an image that does include this link protection to an image that does not support this feature, active protection will be halted when BGP routes are refreshed.

# Information About MPLS VPN—BGP Local Convergence

To configure the MPLS VPN—BGP Local Convergence feature, you should understand the following concepts:

- [How Link Failures Are Handled with BGP, page 3](#)
- [How Links Are Handled with the MPLS VPN—BGP Local Convergence Feature, page 3](#)
- [How Link Failures Are Detected, page 4](#)

## How Link Failures Are Handled with BGP

Within a Layer 3 VPN network, the failure of a PE-CE link can cause a loss of connectivity (LoC) to a customer site, which is detrimental to time-sensitive applications. Several factors contribute to the duration of such an outage:

- The time to detect the failure
- The programming of the forwarding
- The convergence of BGP (In large networks, the restored traffic arrival time at its destination varies according to the prefix.)

When BGP detects a PE-CE link failure, it removes all of the BGP paths through the failing link. BGP runs the bestpath algorithm on the affected prefixes and selects alternate paths for each prefix. These new paths (which typically include a remote PE) are installed into forwarding. The local labels are removed and BGP withdrawals are sent to all BGP neighbors. As each BGP neighbor receives the withdrawal messages (typically indirectly using route-reflectors), the bestpath algorithm is called and the prefixes are switched to an alternate path. Only then is connectivity restored.

## How Links Are Handled with the MPLS VPN—BGP Local Convergence Feature

The MPLS VPN—BGP Local Convergence feature requires that the prefixes to be protected on a PE-CE link have at least one backup path that does not include that link. (See Figure 1.) The customer site must have backup paths to the provider site.

**Figure 1** *Figure 1 Network Configured with Primary and Backup Paths*

The MPLS VPN—BGP Local Convergence feature reduces LoC time by sending the broken link's traffic over a backup path (as shown in Figure 2) instead of waiting for total network convergence. The local label is maintained for 5 minutes while prefixes switch from the failing local path to the backup path. Because the label is not freed as had been the usual practice, forwarding continues to take place.

The bestpath algorithm selects the backup path. Thus, the local label has been applied in place of the failed BGP bestpath label (which is sometimes called "label swapping"). Traffic is restored locally while the network propagation of the BGP withdrawal messages takes place. Eventually, the egress PE router converges and bypasses the local repair.

**Figure 2** *Figure 2 Network Using the Backup Path After a PE-CE Link Failure on the Primary Path*

#### Note

After the 5-minute label preservation, the local labels are freed. Any BGP prefix that is remote and is not part of a Carrier Supporting Carrier network does not have a local label and is removed. The delay in local label deletion does not modify normal BGP addition and deletion of BGP paths. Rather, BGP re-programs the new backup bestpath into forwarding as usual.

## How Link Failures Are Detected

Local protection relies on BGP being notified of the interface failure. Detection can occur using either the interface drivers or the routing tables. If an interface or route goes down, the corresponding path in the routing table is removed and BGP will be notified using the routing APIs.

However, when the routing table cannot detect the failure (as when a Layer 2 switch goes down), BGP determines that a neighbor is down through use of its hold-down timer. However, that determination can be extremely slow because of the 3-minute default for BGP session time-out.

You can reduce the detection delay by either reducing the BGP session time-out interval (as described in the [Configuring Internal BGP Features](#) document) or by enabling the Bidirectional Forwarding Detection protocol within eBGP between the PE and CE. For complete instructions to enable BFD, see the [Bidirectional Forwarding Detection](#) document.

# How to Enable MPLS VPN—BGP Local Convergence

This section contains the following information:

- [Configuring MPLS VPN—BGP Local Convergence with IPv4, page 5](#)
- [Configuring MPLS VPN—BGP Local Convergence with IPv6, page 6](#)
- [Troubleshooting Tips, page 8](#)

## Configuring MPLS VPN—BGP Local Convergence with IPv4

Perform the following steps to configure MPLS VPN—BGP Local Convergence for IPv4 MPLS VPNs.

### Prerequisite

Ensure that the CE is already connected to the PE by a minimum of two paths.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf *vrf-name***
4. **rd** (conditional)
5. **protection local-prefixes**
6. **show ip vrf detail**

### DETAILED STEPS

|        | Command or Action                                                                   | Purpose                                                                                                                                                                                                                                                                            |
|--------|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                              | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                     |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal      | Enters global configuration mode.                                                                                                                                                                                                                                                  |
| Step 3 | <b>ip vrf <i>vrf-name</i></b><br><br><b>Example:</b><br>Router(config)# ip vrf vpn1 | Enters VRF configuration mode. If no VRF routing table and Cisco Express Forwarding (CEF) table had been previously created for this named VRF, then this command also creates them, giving both tables the specified <i>vrf-name</i> (in this example, the name is <i>vpn1</i> ). |

|        | Command or Action                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <b>rd</b> <i>route-distinguisher</i><br><br><b>Example:</b><br>Router(config-vrf)# <b>rd</b> 100:3              | (Optional). If no route distinguisher had been previously established for the named VRF, then it is necessary to enter this command.<br><br>The <i>route-distinguisher</i> value can be either an: <ul style="list-style-type: none"> <li>autonomous system number followed by a colon and an arbitrary number (for example, 100:3)</li> <li>or</li> <li>IP address followed by a colon and an arbitrary number (for example, 192.168.122.15:1).</li> </ul> |
| Step 5 | <b>protection local-prefixes</b><br><br><b>Example:</b><br>Router(config-vrf)# <b>protection local-prefixes</b> | Allows a pre-configured backup path to carry traffic if the PE-CE link breaks by preserving the local prefixes while BGP reconverges.                                                                                                                                                                                                                                                                                                                       |
| Step 6 | <b>show ip vrf detail</b><br><br><b>Example:</b><br>Router(config-vrf)# <b>show ip vrf detail</b>               | (Optional) Verifies that MPLS VPN—BGP Local Convergence has been configured. (See Examples.)                                                                                                                                                                                                                                                                                                                                                                |

## Configuring MPLS VPN—BGP Local Convergence with IPv6

Perform the following steps to configure MPLS VPN—BGP Local Convergence for IPv6 MPLS VPNs.

### Prerequisite

Ensure that the CE is already connected to the PE by a minimum of two paths.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition** *vrf-name*
4. **rd** (optional)
5. **address-family** [ipv4 | ipv6]
6. **protection local-prefixes**
7. **show ip vrf detail**

## DETAILED STEPS

|        | Command or Action                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 3 | <b>vrf definition vrf-name</b><br><br><b>Example:</b><br>Router(config)# vrf definition vrf2                | Enters VRF definition configuration mode. If no VRF routing table and Cisco Express Forwarding (CEF) table had been previously created for this named VRF, then this command also creates them, giving both tables the specified <i>vrf-name</i> (in this example, the name is <i>vrf2</i> ).                                                                                                                                                         |
| Step 4 | <b>rd route-distinguisher</b><br><br><b>Example:</b><br>Router(config-vrf)# rd 100:3                        | (Optional) If no route distinguisher had been previously established for the named VRF, it is necessary to enter this command.<br><br>The <i>route-distinguisher</i> value can be either an: <ul style="list-style-type: none"> <li>autonomous system number followed by a colon and an arbitrary number (for example, 100:3)</li> <li>or</li> <li>IP address followed by a colon and an arbitrary number (for example, 192.168.122.15:1).</li> </ul> |
| Step 5 | <b>address-family [ ipv4   ipv6 ]</b><br><br><b>Example:</b><br>Router(config-vrf)# address-family ipv6     | Enters address family configuration mode and specifies the IPv4 or IPv6 protocol.                                                                                                                                                                                                                                                                                                                                                                     |
| Step 6 | <b>protection local-prefixes</b><br><br><b>Example:</b><br>Router(config-vrf-af)# protection local-prefixes | Allows a pre-configured backup path to carry traffic if the PE-CE link breaks by preserving the local prefixes while BGP reconverges.                                                                                                                                                                                                                                                                                                                 |
| Step 7 | <b>show ip vrf detail</b><br><br><b>Example:</b><br>Router(config-vrf)# show ip vrf detail                  | (Optional) Verifies that MPLS VPN—BGP Local Convergence has been configured. (See Examples.)                                                                                                                                                                                                                                                                                                                                                          |

## Examples

To verify that local link protection has been enabled, enter the VRF detail command **show ip vrf detail**. If the protection is enabled, the status message “Local prefix protection enabled” will be shown in the display:

```
Router# show ip vrf detail
VRF vpn1 (VRF Id = 1); default RD 100:1; default VPNID <not set>
  Interfaces:
    AT1/0/1.1
VRF Table ID = 1
  Export VPN route-target communities
    RT:100:1
  Import VPN route-target communities
    RT:100:1          RT:100:2
  No import route-map
  No export route-map
  VRF label distribution protocol: not configured
  VRF label allocation mode: per-prefix
    Local prefix protection enabled
```

## Troubleshooting Tips

- Ensure that a minimum of two paths are present for the protected prefix *w.x.y.z* in BGP in steady state condition on the PE. The path using the protected PE should be the BGP best-path before failover occurs. To view the configuration, enter the command **show ip bgp vpnv4 vrf vpn w.x.y.z**.
- Ensure that local protection has been enabled in the protected PE by entering the **show ip vrf detail** command as shown in the “Examples” section on page 8.
- When route reflectors exist in the topology, ensure that each VRF has a unique route distinguisher.

# Configuration Examples for MPLS VPN—BGP Local Convergence

The following examples show how MPLS VPN—BGP Local Convergence can prevent traffic loss after a link failure. You can display a detailed view of local link protection before, during, and after BGP convergence by using the **show bgp vpnv4** and **show mpls forwarding-table vrf** commands as shown in the following 3-stage example.

### Note

The **show bgp vpnv4 unicast** command is equivalent to the **show ip bgp vpnv4** command that existed in prior releases of Cisco IOS.

### Example 1: Before the Link Failure

Both a primary path and a backup path have been configured:

```
PE1# show bgp vpnv4 unicast all 172.16.0.1
BGP routing table entry for 100:1:172.16.0.1/32, version 2
Paths: (2 available, best #2, table v1)
Flag: 0x820
  Advertised to update-groups:
    1
    100, imported path from 100:2:172.16.0.1/32
```

```

172.16.0.6 (metric 21) from 172.16.0.7 (172.16.0.7)
  Origin incomplete, metric 0, localpref 100, valid, internal
  Extended Community: RT:100:0
  Originator: 172.16.0.6, Cluster list: 172.16.0.7
  mpls labels in/out 16/17
100
172.16.1.1 from 172.16.1.1 (172.16.0.1)
  Origin incomplete, metric 0, localpref 100, valid, external, best
  Extended Community: RT:100:0
  mpls labels in/out 16/nolabel
BGP routing table entry for 100:2:172.16.0.1/32, version 9
Paths: (1 available, best #1, no table)
Flag: 0x820
  Not advertised to any peer
100
172.16.0.6 (metric 21) from 172.16.0.7 (172.16.0.7)
  Origin incomplete, metric 0, localpref 100, valid, internal, best
  Extended Community: RT:100:0
  Originator: 172.16.0.6, Cluster list: 172.16.0.7
  mpls labels in/out nolabel/17

```

Label information for both paths can be displayed:

```

PE1# show bgp vpnv4 unicast all labels
Network          Next Hop          In label/Out label
Route Distinguisher: 100:1 (v1)
  172.16.0.1/32   172.16.0.6        16/17
                   172.16.1.1        16/nolabel
  172.16.0.5/32   172.16.0.4        nolabel/23
  172.16.0.22/32  0.0.0.0           17/nolabel(v1)
  172.16.0.44/32  172.16.0.4        nolabel/24
  172.16.0.66/32  172.16.0.6        nolabel/21
  172.16.1.0/24   172.16.1.1        18/nolabel
                   0.0.0.0           18/nolabel(v1)
  172.16.5.0/24   172.16.0.4        nolabel/25
  172.16.8.0/24   172.16.0.6        19/23
                   172.16.1.1        19/nolabel
Route Distinguisher: 100:2
  172.16.0.1/32   172.16.0.6        nolabel/17
  172.16.0.66/32  172.16.0.6        nolabel/21
  172.16.8.0/24   172.16.0.6        nolabel/23

```

The PE1 (see [Figure 1 on page 3](#)) forwarding table contains BGP bestpath information:

```

PE1# show mpls forwarding-table vrf v1 172.16.0.1 detail
Local   Outgoing Prefix      Bytes Label  Outgoing  Next Hop
Label   Label    or Tunnel Id  Switched     interface
16      No Label  172.16.0.1/32[v] 570          Et0/0     172.16.1.1
MAC/Encaps=14/14, MRU=1504, Label Stack{}
AABBCC000B00AABBCC000C000800
VPN route: v1
No output feature configured

PE1#

```

**Example 2: After the Link Failure and Before BGP Convergence**

After the link failure on only one path, the backup path remains available (see [Figure 2 on page 4](#)):

```

PE1# show bgp vpnv4 unicast all 172.16.0.1
BGP routing table entry for 100:1:172.16.0.1/32, version 19
Paths: (1 available, best #1, table v1)
  Not advertised to any peer
  100, imported path from 100:2:172.16.0.1/32
    172.16.0.6 (metric 21) from 172.16.0.7 (172.16.0.7)
      Origin incomplete, metric 0, localpref 100, valid, internal, best
      Extended Community: RT:100:0
      Originator: 172.16.0.6, Cluster list: 172.16.0.7
      mpls labels in/out 16/17
BGP routing table entry for 100:2:172.16.0.1/32, version 9
Paths: (1 available, best #1, no table)
  Not advertised to any peer
  100
    172.16.0.6 (metric 21) from 172.16.0.7 (172.16.0.7)
      Origin incomplete, metric 0, localpref 100, valid, internal, best
      Extended Community: RT:100:0
      Originator: 172.16.0.6, Cluster list: 172.16.0.7
      mpls labels in/out nolabel/17

```

The label information for the backup path label can be displayed:

```

PE1# show bgp vpnv4 unicast all labels
Network          Next Hop          In label/Out label
Route Distinguisher: 100:1 (v1)
  172.16.0.1/32   172.16.0.6         16/17
  172.16.0.5/32   172.16.0.4         nolabel/23
  172.16.0.22/32  0.0.0.0            17/nolabel(v1)
  172.16.0.44/32  172.16.0.4         nolabel/24
  172.16.0.66/32  172.16.0.6         nolabel/21
  172.16.1.0/24   172.16.0.6         nolabel/22
  172.16.5.0/24   172.16.0.4         nolabel/25
  172.16.8.0/24   172.16.0.6         19/23
Route Distinguisher: 100:2
  172.16.0.1/32   172.16.0.6         nolabel/17
  172.16.0.66/32  172.16.0.6         nolabel/21
  172.16.1.0/24   172.16.0.6         nolabel/22
  172.16.8.0/24   172.16.0.6         nolabel/23

```

The PE1 (see [Figure 1 on page 3](#)) forwarding table contains new label and next-hop information to direct traffic onto the backup path:

```

PE1# show mpls forwarding-table vrf v1 172.16.0.1 detail
Local      Outgoing  Prefix          Bytes Label  Outgoing  Next Hop
Label      Label    or Tunnel Id   Switched     interface
16         17       172.16.0.1/32[V] 0             Et1/0      172.16.3.2
          MAC/Encaps=14/22, MRU=1496, Label Stack{21 17}
          AABBC000D00AABBC000C018847 0001500000011000
          VPN route: v1
          No output feature configured
PE1#

```

**Example 3: After Local Label Expiration and BGP Re-convergence**

Because the local label preservation window has expired, the replacement local label is now gone from the PE1 forwarding table information:

```
PE1# show mpls forwarding-table vrf v1 172.16.0.1 detail
Local      Outgoing  Prefix          Bytes Label  Outgoing  Next Hop
Label      Label      or Tunnel Id    Switched     interface
None       17         172.16.0.1/32[V] 0           Et1/0       172.16.3.2
          MAC/Encaps=14/22, MRU=1496, Label Stack{21 17}
          AABBC000D00AABBC000C018847 0001500000011000
          VPN route: v1
          No output feature configured
```

The new BGP information reverts to the configuration shown in [Figure 1 on page 3](#):

```

## Feature Information for MPLS VPN—BGP Local Convergence

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS VPN—BGP Local Convergence

| Feature Name                   | Releases    | Feature Information                                                                                                                                                                                                                                                                                                               |

# MPLS VPN—Route Target Rewrite

---

**First Published: August 26, 2003**

**Last Updated: July 11, 2008**

The MPLS VPN—Route Target Rewrite feature allows the replacement of route targets on incoming and outgoing Border Gateway Protocol (BGP) updates. Typically, Autonomous System Border Routers (ASBRs) perform the replacement of route targets at autonomous system boundaries. Route Reflectors (RRs) and provider edge (PE) routers can also perform route target replacement.

The main advantage of the MPLS VPN—Route Target Rewrite feature is that it keeps the administration of routing policy local to the autonomous system.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for MPLS VPN—Route Target Rewrite”](#) section on [page 19](#).

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Command Reference, page 18](#)
- [Feature Information for MPLS VPN—Route Target Rewrite, page 19](#)
- [Glossary, page 20](#)

## Prerequisites for MPLS VPN—Route Target Rewrite

The MPLS VPN—Route Target Rewrite feature requires the following:

- You should know how to configure Multiprotocol Virtual Private Networks (MPLS VPNs).
- You need to configure your network to support interautonomous systems with different route target (RT) values in each autonomous system.
- You need to identify the RT replacement policy and target router for each autonomous system.

## Restrictions for MPLS VPN—Route Target Rewrite

You can apply multiple replacement rules using the route-map continue clause. The MPLS VPN—Route Target Rewrite feature does not support the continue clause on outbound route maps.

## Information About MPLS VPN—Route Target Rewrite

To configure the MPLS VPN—Route Target Rewrite feature, you need to understand the following concepts:

- [Route Target Replacement Policy, page 2](#)
- [Route Maps and Route Target Replacement, page 4](#)

## Route Target Replacement Policy

Routing policies for a peer include all configurations that may impact inbound or outbound routing table updates. The MPLS VPN—Route Target Rewrite feature can influence routing table updates by allowing the replacement of route targets on inbound and outbound BGP updates. Route targets are carried as extended community attributes in BGP Virtual Private Network IP Version 4 (VPNv4) updates. Route target extended community attributes are used to identify a set of sites and VPN routing and forwarding (VRF) instances that can receive routes with a configured route target.

In general, ASBRs perform route target replacement at autonomous system borders when the ASBRs exchange VPNv4 prefixes. You can also configure the MPLS VPN—Route Target Rewrite feature on PE routers and RR routers.

[Figure 1](#) shows an example of route target replacement on ASBRs in an MPLS VPN interautonomous system topology. This example includes the following configurations:

- PE1 is configured to import and export RT 100:1 for VRF VPN1.
- PE2 is configured to import and export RT 200:1 for VRF VPN2.
- ASBR1 is configured to rewrite all inbound VPNv4 prefixes with RT 200:1 to RT 100:1.
- ASBR2 is configured to rewrite all inbound VPNv4 prefixes with RT 100:1 to RT 200:1.

**Figure 1** *Route Target Replacement on ASBRs in an MPLS VPN Interautonomous System Topology*

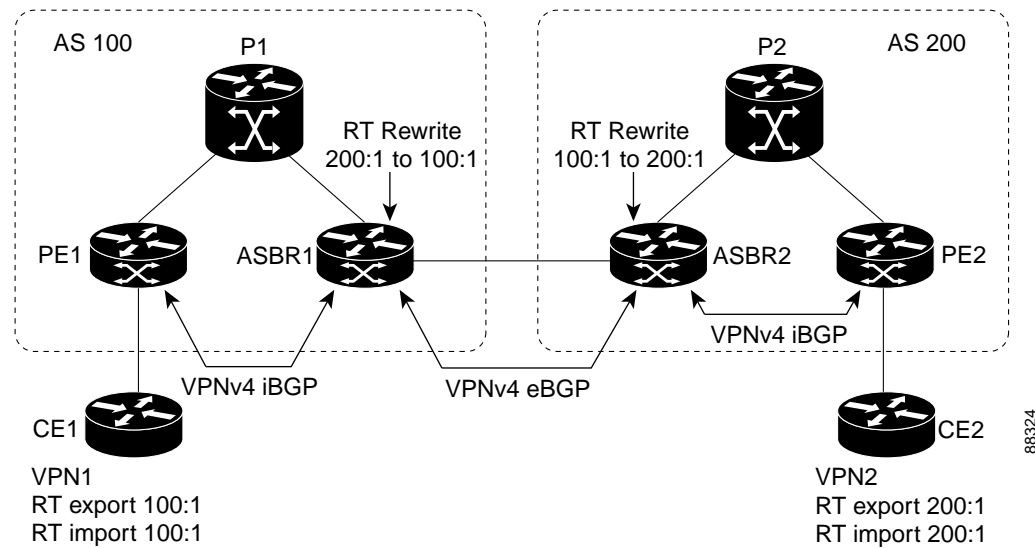

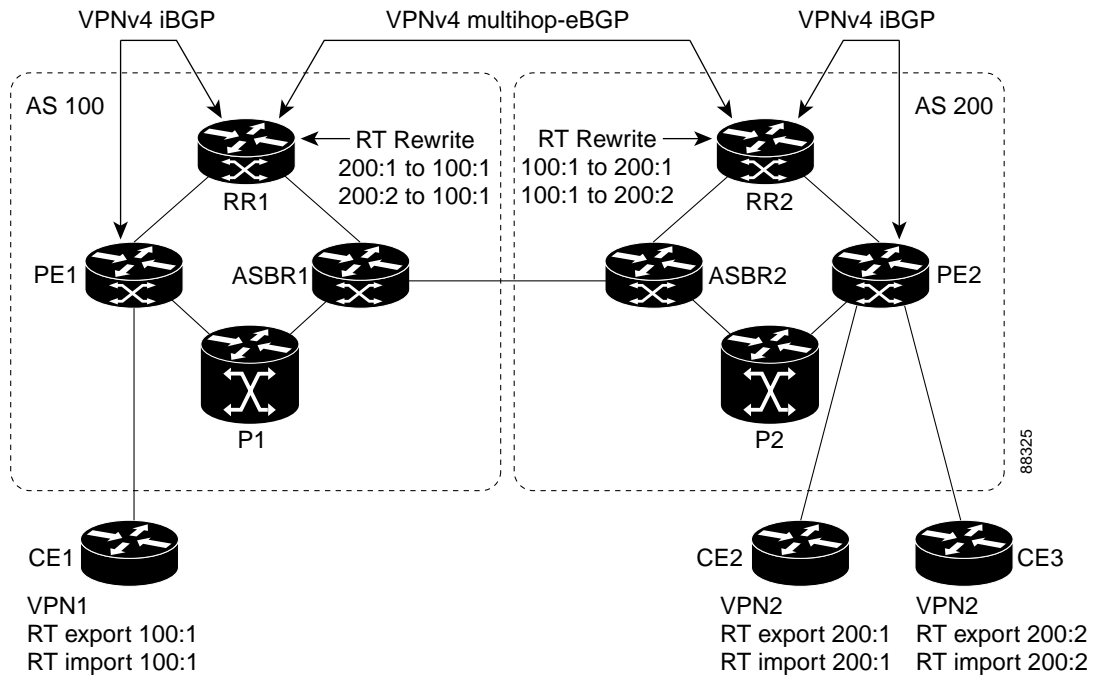

Figure 2 shows an example of route target replacement on route reflectors in an MPLS VPN interautonomous system topology. This example includes the following configurations:

- EBGP is configured on the route reflectors.
- EBGP and IBGP IPv4 label exchange is configured between all BGP routers.
- Peer groups are configured on the routers reflectors.
- PE2 is configured to import and export RT 200:1 for VRF VPN2.
- PE2 is configured to import and export RT 200:2 for VRF VPN3.
- PE1 is configured to import and export RT 100:1 for VRF VPN1.
- RR1 is configured to rewrite all inbound VPNv4 prefixes with RT 200:1 or RT 200:2 to RT 100:1.
- RR2 is configured to rewrite all inbound prefixes with RT 100:1 to RT 200:1 and RT 200:2.

**Figure 2** *Route Target Rewrite on Route Reflectors in an MPLS VPN Interautonomous System Topology*

## Route Maps and Route Target Replacement

The MPLS VPN—Route Target Rewrite feature extends the BGP inbound/outbound route map functionality to enable route target replacement. The **set extcomm-list delete** command entered in route-map configuration mode allows the deletion of a route target extended community attribute based on an extended community list.

## How to Configure MPLS VPN—Route Target Rewrite

This section contains the following procedures to configure MPLS VPN—Route Target Rewrite:

- [Configuring a Route Target Replacement Policy, page 4](#) (required)
- [Applying the Route Target Replacement Policy, page 8](#) (required)
- [Verifying the Route Target Replacement Policy, page 12](#) (optional)
- [Troubleshooting Your Route Target Replacement Policy, page 13](#) (optional)

## Configuring a Route Target Replacement Policy

Perform this task to configure an RT replacement policy for your internetwork.

If you configure a PE to rewrite RT *x* to RT *y* and the PE has a VRF that imports RT *x*, you need to configure the VRF to import RT *y* in addition to RT *x*.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip extcommunity-list** { *standard-list-number* | *expanded-list-number* } { **permit** | **deny** } [*regular-expression*] [**rt** | **soo** *extended-community-value*]
4. **route-map** *map-name* [**permit** | **deny**] [*sequence-number*]
5. **match extcommunity** { *standard-list-number* | *expanded-list-number* }
6. **set extcomm-list** *extended-community-list-number* **delete**
7. **set extcommunity** { **rt** *extended-community-value* [**additive**] | **soo** *extended-community-value* }
8. **end**
9. **show route-map** *map-name*

## DETAILED STEPS

|        | Command or Action                             | Purpose                                                                                                          |
|--------|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
|        | <b>Example:</b><br>Router> enable             |                                                                                                                  |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                                                |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                                                  |

| Command or Action                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 3</b></p> <pre>ip extcommunity-list {standard-list-number   expanded-list-number} {permit   deny} [regular-expression] [rt   soo extended-community-value]</pre> <p><b>Example:</b></p> <pre>Router(config)# ip extcommunity-list 1 permit rt 100:3</pre> | <p>Creates an extended community access list and controls access to it.</p> <ul style="list-style-type: none"> <li>• The <i>standard-list-number</i> argument is an integer from 1 to 99 that identifies one or more permit or deny groups of extended communities.</li> <li>• The <i>expanded-list-number</i> argument is an integer from 100 to 500 that identifies one or more permit or deny groups of extended communities. Regular expressions can be configured with expanded lists but not standard lists.</li> <li>• The <b>permit</b> keyword permits access for a matching condition.</li> <li>• The <b>deny</b> keyword denies access for a matching condition.</li> <li>• The <i>regular-expression</i> argument specifies an input string pattern to match against. When you use an expanded extended community list to match route targets, include the pattern RT: in the regular expression.</li> <li>• The <b>rt</b> keyword specifies the route target extended community attribute. The <b>rt</b> keyword can be configured only with standard extended community lists and not expanded community lists.</li> <li>• The <b>soo</b> keyword specifies the site of origin (SOO) extended community attribute. The <b>soo</b> keyword can be configured only with standard extended community lists and not expanded community lists.</li> <li>• The <i>extended-community-value</i> argument specifies the route target or site of origin. The value can be one of the following combinations: <ul style="list-style-type: none"> <li>– autonomous-system-number:network-number</li> <li>– ip-address:network-number</li> </ul> <p>The colon is used to separate the autonomous system number and network number or IP address and network number.</p> </li> </ul> |

|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <p><b>Command:</b></p> <pre>route-map map-name [permit   deny] [sequence-number]</pre> <p><b>Example:</b></p> <pre>Router(config)# route-map extmap permit 10</pre>                                                                                                   | <p>Defines the conditions for redistributing routes from one routing protocol into another or enables policy routing and enables route-map configuration mode.</p> <ul style="list-style-type: none"> <li>The <i>map-name</i> argument defines a meaningful name for the route map. The <b>redistribute</b> router configuration command uses this name to reference this route map. Multiple route maps may share the same map name.</li> <li>If the match criteria are met for this route map, and the <b>permit</b> keyword is specified, the route is redistributed as controlled by the set actions. In the case of policy routing, the packet is policy routed.</li> </ul> <p>If the match criteria are not met, and the <b>permit</b> keyword is specified, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set.</p> <p>The <b>permit</b> keyword is the default.</p> <ul style="list-style-type: none"> <li>If the match criteria are met for the route map and the <b>deny</b> keyword is specified, the route is not redistributed. In the case of policy routing, the packet is not policy routed, and no further route maps sharing the same map tag name will be examined. If the packet is not policy routed, the normal forwarding algorithm is used.</li> <li>The <i>sequence-number</i> argument is a number that indicates the position a new route map will have in the list of route maps already configured with the same name. If given with the <b>no</b> form of this command, the position of the route map should be deleted.</li> </ul> |
| Step 5 | <p><b>Command:</b></p> <pre>match extcommunity {standard-list-number  expanded-list-number}</pre> <p><b>Example:</b></p> <pre>Router(config-route-map)# match extcommunity 1</pre> <p><b>Example:</b></p> <pre>Router(config-route-map)# match extcommunity 101</pre> | <p>Matches BGP extended community list attributes.</p> <ul style="list-style-type: none"> <li>The <i>standard-list-number</i> argument is a number from 1 to 99 that identifies one or more permit or deny groups of extended community attributes.</li> <li>The <i>expanded-list-number</i> argument is a number from 100 to 500 that identifies one or more permit or deny groups of extended community attributes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 6 | <p><b>Command:</b></p> <pre>set extcomm-list extended-community-list-number delete</pre> <p><b>Example:</b></p> <pre>Router(config-route-map)# set extcomm-list 1 delete</pre>                                                                                        | <p>Removes a route target from an extended community attribute of an inbound or outbound BGP VPNv4 update.</p> <ul style="list-style-type: none"> <li>The <i>extended-community-list-number</i> argument specifies the extended community list number.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|        | Command or Action                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7 | <pre>set extcommunity {rt extended-community-value [additive]   soo extended-community-value}</pre> <p><b>Example:</b><br/>Router(config-route-map)# set extcommunity rt 100:4 additive</p> | <p>Sets BGP extended community attributes.</p> <ul style="list-style-type: none"> <li>The <b>rt</b> keyword specifies the route target extended community attribute.</li> <li>The <b>soo</b> keyword specifies the site of origin extended community attribute.</li> <li>The <i>extended-community-value</i> argument specifies the value to be set. The value can be one of the following combinations: <ul style="list-style-type: none"> <li>autonomous-system-number : network-number</li> <li>ip-address : network-number</li> </ul> <p>The colon is used to separate the autonomous system number and network number or IP address and network number.</p> </li> <li>The <b>additive</b> keyword adds a route target to the existing route target list without replacing any existing route targets.</li> </ul> |
| Step 8 | <pre>end</pre> <p><b>Example:</b><br/>Router(config-route-map)# end</p>                                                                                                                     | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 9 | <pre>show route-map map-name</pre> <p><b>Example:</b><br/>Router# show route-map extmap</p>                                                                                                 | <p>(Optional) Use this command to verify that the match and set entries are correct.</p> <ul style="list-style-type: none"> <li>The <i>map-name</i> argument is the name of a specific route map.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Applying the Route Target Replacement Policy

Perform the following tasks to apply the route target replacement policy to your internetwork:

- [Associating Route Maps with Specific BGP Neighbors, page 8](#)
- [Refreshing BGP Session to Apply Route Target Replacement Policy, page 10](#)

## Associating Route Maps with Specific BGP Neighbors

Perform this task to associate route maps with specific BGP neighbors.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
5. **address-family** **vpn**v4 [**unicast**]

6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **neighbor** {*ip-address* | *peer-group-name*} **send-community** [**both** | **extended** | **standard**]
8. **neighbor** {*ip-address* | *peer-group-name*} **route-map** *map-name* {**in** | **out**}
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>router bgp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                                               | Configures a BGP routing process and places the router in router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.</li> </ul> <p>Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</p> |
| Step 4 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router)# neighbor 172.10.0.2<br>remote-as 200 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                                           |
| Step 5 | <b>address-family vpnv4</b> [ <b>unicast</b> ]<br><br><b>Example:</b><br>Router(config-router)# address-family vpnv4                                                                      | Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> <li>The optional <b>unicast</b> keyword specifies VPNv4 unicast address prefixes.</li> </ul>                                                                                                                                                                                             |
| Step 6 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 172.16.0.2<br>activate                     | Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                                                                                            |

|        | Command or Action                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7 | <pre>neighbor {ip-address   peer-group-name} send-community [both   extended   standard]</pre> <p><b>Example:</b><br/>Router(config-router-af)# neighbor 172.16.0.2<br/>send-community extended</p> | <p>Specifies that a communities attribute should be sent to a BGP neighbor.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <b>both</b> keyword sends standard and extended community attributes.</li> <li>The <b>extended</b> keyword sends an extended community attribute.</li> <li>The <b>standard</b> keyword sends a standard community attribute.</li> </ul> |
| Step 8 | <pre>neighbor {ip-address   peer-group-name} route-map map-name {in   out}</pre> <p><b>Example:</b><br/>Router(config-router-af)# neighbor 172.16.0.2<br/>route-map extmap in</p>                   | <p>Apply a route map to incoming or outgoing routes</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP or multiprotocol peer group.</li> <li>The <i>map-name</i> argument specifies the name of a route map.</li> <li>The <b>in</b> keyword applies route map to incoming routes.</li> <li>The <b>out</b> keyword applies route map to outgoing routes.</li> </ul>                                           |
| Step 9 | <pre>end</pre> <p><b>Example:</b><br/>Router(config-router-af)# end</p>                                                                                                                             | <p>(Optional) Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Refreshing BGP Session to Apply Route Target Replacement Policy

Perform this task to refresh the BGP session to apply the RT replacement policy.

After you have defined two routers to be BGP neighbors, the routers form a BGP connection and exchange routing information. If you subsequently change a routing policy, you must reset BGP connections for the configuration change to take effect. After configuring the RT replacement policy and applying it to the target routers in your system, you must refresh the BGP session to put the policy into operation.

### SUMMARY STEPS

1. **enable**
2. **clear ip bgp** { \* | *neighbor-address* | *peer-group-name* [soft [in | out]] } [ipv4 { multicast | unicast } | vpnv4 unicast { soft | in | out }]
3. **disable**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>clear ip bgp</b> { *   <i>neighbor-address</i>   <i>peer-group-name</i> [ <b>soft</b> [ <b>in</b>   <b>out</b> ]] [ <b>ipv4</b> { <b>multicast</b>   <b>unicast</b> }   <b>vpn4</b> <b>unicast</b> [ <b>soft</b>   <b>in</b>   <b>out</b> ]]<br><br><b>Example:</b><br>Router# clear ip bgp vpn4 unicast 172.16.0.2 in | Resets a BGP connection using BGP soft reconfiguration. <ul style="list-style-type: none"> <li>The <b>*</b> keyword resets all current BGP sessions.</li> <li>The <i>neighbor-address</i> argument resets only the identified BGP neighbor.</li> <li>The <i>peer-group-name</i> argument resets the specified BGP peer group.</li> <li>The <b>ipv4</b> keyword resets the specified IPv4 address family neighbor or peer group. The <b>multicast</b> or <b>unicast</b> keyword must be specified.</li> <li>The <b>vpn4</b> keyword resets the specified VPNv4 address family neighbor or peer group. The <b>unicast</b> keyword must be specified.</li> <li>The <b>soft</b> keyword indicates a soft reset. Does not reset the session. The <b>in</b> or <b>out</b> keywords do not follow the <b>soft</b> keyword when a connection is cleared under the VPNv4 or IPv4 address family because the <b>soft</b> keyword specifies both.</li> <li>The <b>in</b> and <b>out</b> keywords trigger inbound or outbound soft reconfiguration, respectively. If the <b>in</b> or <b>out</b> keyword is not specified, both inbound and outbound soft reset are triggered.</li> </ul> |
| Step 3 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                                                                                                                                                                                                                  | (Optional) Exits to user EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Troubleshooting Tips

To determine whether a BGP router supports the route refresh capability, use the **show ip bgp neighbors** command. If a router supports the route refresh capability, the following message is displayed:

```
Received route refresh capability from peer.
```

You can issue the **debug ip bgp updates** command on the router where you entered the **clear ip bgp** command to verify that the updates are occurring.

**Note**

Issuing the **debug ip bgp updates** command could impair performance if the router sends or receives a large number of BGP updates.

## Verifying the Route Target Replacement Policy

Perform this task to verify the operation of your RT replacement policy.

### SUMMARY STEPS

1. **enable**
2. **show ip bgp vpnv4 all *network-address***
3. **exit**

### DETAILED STEPS

#### Step 1 **enable**

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```
Router> enable
Router#
```

#### Step 2 **show ip bgp vpnv4 all *network-address***

Use this command to verify that all VPNv4 prefixes with a specified RT extended community attribute are replaced with the proper RT extended community attribute at the ASBRs or route reflectors and to verify that the PE routers receive the rewritten RT extended community attributes from the ASBRs or route reflectors. The following examples verify route target replacement on ABSR1 and ABSR2.

Verify route target replacement on ABSR1:

```
Router# show ip bgp vpnv4 all 172.16.17.17

BGP routing table entry for 100:1:172.16.17.17/32, version 6
Paths: (1 available, best #1, no table)
  Advertised to update-groups:
    1
  300
    172.16.11.11 (metric 589) from 172.16.11.11 (172.16.11.11)
      Origin incomplete, metric 0, localpref 100, valid, internal, best
      Extended Community: RT:200:1
```

Verify route target replacement on ABSR2:

```
Router# show ip bgp vpnv4 all 172.16.17.17

BGP routing table entry for 100:1:172.16.17.17/32, version 6
Paths: (1 available, best #1, no table)
  Advertised to update-groups:
    1
  100 300
    192.168.1.1 from 192.168.1.1 (172.16.13.13)
      Origin incomplete, localpref 100, valid, external, best
      Extended Community: RT:100:1
```

The following examples verify route target replacement on PE1 and PE2.

Verify route target on PE1:

```
Router# show ip bgp vpnv4 all 172.16.17.17

BGP routing table entry for 100:1:172.16.17.17/32, version 13
Paths: (1 available, best #1, table vpn1)
  Advertised to update-groups:
```

```

1
300
192.168.2.1 (via vpn1) from 192.168.2.1 (172.16.19.19)
  Origin incomplete, metric 0, localpref 100, valid, external, best
  Extended Community: RT:200:1

```

Verify route target on PE2:

```
Router# show ip bgp vpnv4 all 172.16.17.17
```

```

BGP routing table entry for 100:1:172.16.17.17/32, version 13
Paths: (1 available, best #1, table vpn1)
  Advertised to update-groups:
    3
100 300
  192.168.1.1 (metric 20) from 172.16.16.16 (172.16.16.16)
    Origin incomplete, localpref 100, valid, internal, best
    Extended Community: RT:100:1

```

### Step 3 exit

Use this command to exit to user EXEC mode:

```

Router# exit
Router>

```

## Troubleshooting Your Route Target Replacement Policy

Perform this task to troubleshoot your RT replacement policy.

### SUMMARY STEPS

1. **enable**
2. **debug ip bgp updates**
3. **show ip bgp vpnv4 all *network-address***
4. **exit**

### DETAILED STEPS

#### Step 1 enable

Use this command to enable privileged EXEC mode. Enter your password if prompted. For example:

```

Router> enable
Router#

```

#### Step 2 debug ip bgp updates

Use the following command to verify that BGP updates are occurring on the ASBR. The ASBR in this example has the IP address 172.16.16.16.

```

Router# debug ip bgp updates

BGP(2): no valid path for 100:1:172.16.20.20/32
BGP(2): no valid path for 100:1:10.0.0.0/8
%BGP-5-ADJCHANGE: neighbor 172.16.16.16 Down User reset

```

```

starting at 0.0.0.0
BGP(2): 172.16.11.11 NEXT_HOP part 1 net 100:1:172.16.20.20/32,
next 172.16.15.15
BGP(2): 172.16.11.11 send UPDATE (format) 100:1:172.16.20.20/32,
next 172.16.15.15, metric 0, path 200 400, extended community
RT:1:1 RT:10000:111 RT:33333:888888888
RT:65535:999999999
BGP(2): 172.16.11.11 NEXT_HOP part 1 net 100:1:10.0.0.0/8,
next 172.16.15.15
BGP(2): 172.16.11.11 send UPDATE (format) 100:1:192.168.3.0/8,
next 172.16.15.15, metric 0, path 200, extended community
RT:1:1 RT:10000:111 RT:33333:888888888 RT:65535:999999999
BGP(2): 2 updates (average = 118, maximum = 121)
BGP(2): 172.16.11.11 updates replicated for neighbors: 172.16.11.11
BGP(2): 172.16.11.11 update run completed, afi 2, ran for 0ms,
neighbor version 17, start version 17, throttled to 17

```

You can also reset the BGP connection using the **clear ip bgp \*** command and enter the **debug ip bgp updates** command again to verify that BGP updates are occurring as shown in the output after the **clear ip bgp** command is entered.

**Step 3** `show ip bgp vpnv4 all network-address`

Use this command to verify that RT extended community attributes are replaced correctly. For example:

```
Router# show ip bgp vpnv4 all 172.16.17.17

BGP routing table entry for 100:1:172.16.17.17/32, version 6
Paths: (1 available, best #1, no table)
  Advertised to update-groups:
    1
  100 300
    192.168.1.1 from 192.168.1.1 (172.16.13.13)
      Origin incomplete, localpref 100, valid, external, best
      Extended Community: RT:100:1
```

This example shows VPN address information from the BGP table and verifies that RT extended community attributes are replaced correctly.

**Step 4** `exit`

Use this command to exit to user EXEC mode:

```
Router# exit
Router>
```

## Configuration Examples for MPLS VPN—Route Target Rewrite

This section contains the following configuration examples for the MPLS VPN—Route Target Rewrite feature:

- [Configuring Route Target Replacement Policies: Examples, page 15](#)
- [Applying Route Target Replacement Policies: Examples, page 16](#)

### Configuring Route Target Replacement Policies: Examples

This example shows the RT replacement configuration of an ASBR (ASBR1) that exchanges VPNv4 prefixes with another ASBR (ASBR2). The route map extmap is configured to replace RTs on inbound updates. Any incoming update with RT 100:3 is replaced with RT 200:3. Any other prefixes with an RT whose autonomous system number is 100 is rewritten to RT 200:4.

```
!
ip extcommunity-list 1 permit rt 100:3
ip extcommunity-list 101 permit RT:100:*
!
route-map extmap permit 10
match extcommunity 1
set extcomm-list 1 delete
set extcommunity rt 200:3 additive
!
route-map regexp permit 10
match extcommunity 101
set extcomm-list 101 delete
set extcommunity rt 200:4 additive
!
route-map regexp permit 20
```

This example shows the use of the route-map configuration **continue** command when you need to apply more than one replacement rule on an update. In this example, an incoming update with RT 100:3 is replaced with RT 200:3. Without the **continue 20** command, route-map evaluation would stop when a match on sequence 10 is made. With the **continue 20** command, route-map evaluation continues into sequence 20 even if a match occurs in sequence 10. If the incoming update has an RT 100:4, the router replaces it with RT 200:4.

```
!
ip extcommunity-list 1 permit rt 100:3
ip extcommunity-list 2 permit rt 100:4
!
route-map extmap permit 10
match extcommunity 1
set extcomm-list 1 delete
set extcommunity rt 200:3 additive
continue 20
!
route-map extmap permit 20
match extcommunity 2
set extcomm-list 2 delete
set extcommunity rt 200:4 additive
!
route-map extmap permit 30
```

**Note**

The route-map configuration **continue** command is not supported on outbound route maps.

## Applying Route Target Replacement Policies: Examples

This section contains the following examples:

- [Associating Route Maps with Specific BGP Neighbor: Example, page 16](#)
- [Refreshing the BGP Session to Apply the Route Target Replacement Policy: Example, page 17](#)

### Associating Route Maps with Specific BGP Neighbor: Example

This example shows the association of route map extmap with a BGP neighbor. The BGP inbound route map is configured to replace RTs on incoming updates.

```
router bgp 100
.
.
.
neighbor 172.16.0.2 remote-as 100
.
.
.
!
address family vpnv4
neighbor 172.16.0.2 activate
neighbor 172.16.0.2 send-community extended
neighbor 172.16.0.2 route-map extmap in
```

This example shows the association of the same route map with the outbound BGP neighbor. The route map is configured to replace RTs on outgoing updates.

```
router bgp 100
```

```

.
.
.
neighbor 172.16.0.2 remote-as 100
.
.
.
!
address family vpnv4
neighbor 172.16.0.2 activate
neighbor 172.16.0.2 send-community extended
neighbor 172.16.0.2 route-map extmap out

```

## Refreshing the BGP Session to Apply the Route Target Replacement Policy: Example

The following example shows the **clear ip bgp** command used to initiate a dynamic reconfiguration in the BGP peer 172.16.0.2. This command requires that the peer supports the route refresh capability.

```
Router# clear ip bgp 172.16.0.2 vpnv4 unicast in
```

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mps/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mps/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **set extcomm-list delete**

# Feature Information for MPLS VPN—Route Target Rewrite

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS VPN—Route Target Rewrite

| Feature Name                  | Releases                                                          | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MPLS VPN—Route Target Rewrite | 12.0(26)S<br>12.2(25)S<br>12.2(33)SRA<br>12.2(33)SXH<br>12.4(20)T | <p>The MPLS VPN—Route Target Rewrite feature allows the replacement of route targets on incoming and outgoing Border Gateway Protocol (BGP) updates. Typically, Autonomous System Border Routers (ASBRs) perform the replacement of route targets at autonomous system boundaries. Route Reflectors (RRs) and provider edge (PE) routers can also perform route target replacement.</p> <p>The main advantage of the MPLS VPN—Route Target Rewrite feature is that it keeps the administration of routing policy local to the autonomous system.</p> <p>In 12.0(26)S, this feature was introduced for the Cisco 7200, 7500, and 12000 series routers.</p> <p>In 12.2(25)S, this feature was integrated into a Cisco IOS 12.2S release to support the Cisco 7500 series router.</p> <p>In 12.2(33)SRA, this feature was integrated into a Cisco IOS 12.2SRA release.</p> <p>In 12.2(33)SXH, this feature was integrated into a Cisco IOS 12.2SXH release.</p> <p>In 12.4(20)T, this feature was integrated into a Cisco IOS 12.4T release.</p> <p>The following sections provide information about this feature:</p> <ul style="list-style-type: none"> <li>• <a href="#">Route Target Replacement Policy, page 2</a></li> <li>• <a href="#">Route Maps and Route Target Replacement, page 4</a></li> <li>• <a href="#">Configuring a Route Target Replacement Policy, page 4</a></li> <li>• <a href="#">Verifying the Route Target Replacement Policy, page 12</a></li> <li>• <a href="#">Troubleshooting Your Route Target Replacement Policy, page 13</a></li> </ul> <p>The following command was modified: <b>set extcomm-list delete</b>.</p> |

# Glossary

**autonomous system**—A collection of networks that share the same routing protocol and that are under the same system administration.

**ASBR**—autonomous system border router. A router that connects and exchanges information between two or more autonomous systems.

**BGP**—Border Gateway Protocol. The exterior border gateway protocol used to exchange routing information between routers in separate autonomous systems. BGP uses Transmission Control Protocol (TCP). Because TCP is a reliable protocol, BGP does not experience problems with dropped or fragmented data packets.

**CE router**—customer edge router. The customer router that connects to the provider edge (PE) router.

**EBGP**—External Border Gateway Protocol. A BGP session between routers in different autonomous systems. When a pair of routers in different autonomous systems are more than one IP hop away from each other, an EBGP session between those two routers is called multihop EBGP.

**IBGP**—Internal Border Gateway Protocol. A BGP session between routers within the same autonomous system.

**IGP**—Interior Gateway Protocol. Internet protocol used to exchange routing information within an autonomous system. Examples of common Internet IGPs include Internal Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), and Routing Information Protocol (RIP).

**LDP**—Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets. The Cisco proprietary version of this protocol is the Tag Distribution Protocol (TDP).

**LER**—label edge router. The edge router that performs label imposition and disposition.

**LSR**—label switch router. The role of an LSR is to forward packets in an MPLS network by looking only at the fixed-length label.

**MPLS**—Multiprotocol Label Switching. A switching method that forwards IP traffic using a label. This label instructs the routers and the switches in the network where to forward the packets based on preestablished IP routing information.

**NLRI**—Network Layer Reachability Information. BGP sends routing update messages containing NLRI, which describes the route. In this context, an NLRI is a prefix. A BGP update message carries one or more NLRI prefixes and the attributes of a route for the NLRI prefixes. The route attributes include a BGP next-hop gateway address, community values, and other information.

**P router**—provider router. The core router in the service provider network that connects to provider edge (PE) routers. In a packet-switched star topology, a router that is part of the backbone and that serves as the single pipe through which all traffic from peripheral networks must pass on its way to other peripheral networks.

**PE router**—provider edge router. The label edge router (LER) in the service provider network that connects to the customer edge (CE) router.

**RD**—route distinguisher. An 8-byte value that is concatenated with an IPv4 prefix to create a unique VPN IPv4 (VPNv4) prefix.

**RR**—route reflector. A router that advertises, or reflects, IBGP learned routes to other IBGP peers without requiring a full network mesh.

**RT**—route target. Extended community attribute used to identify the VRF routing table into which a prefix is to be imported.

**VPN**—Virtual Private Network. A group of sites that, as a result of a set of administrative policies, can communicate with each other over a shared backbone.

**VPNv4 prefix**—IPv4 prefix preceded by an 8-byte route distinguisher. The VPN addresses are made unique by adding a route distinguisher to the front of the address.

**VRF**—VPN routing and forwarding instance. A VRF consists of an IP routing table, a derived forwarding table, a set of interfaces that use the forwarding table, and a set of rules and routing protocols that determine what goes into the forwarding table. In general, a VRF includes the routing information that defines a customer VPN site that is attached to a provider edge (PE) router.

# MPLS VPN—Per VRF Label

---

**First Published: June 29, 2007**

**Last Updated: December 5, 2008**

The MPLS VPN—Per VRF Label feature (hereafter, in this document, referred to as the Per VRF Label feature or the Per VRF feature) allows you to configure a single Virtual Private Network (VPN) label for all local routes in the entire VPN routing and forwarding (VRF) domain on Cisco 6500 routers. This MPLS VPN—Per VRF Label feature incorporates a single (per VRF) VPN label that for *all* local routes in the VRF table.

You can enable (or disable) the MPLS VPN—Per VRF Label feature in global configuration mode. This feature is available for the Cisco 6500 router only.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for MPLS VPN—Per VRF Label](#)” section on page 12.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Contents

This document includes the following topics:

- [Prerequisites for the Per VRF Label Feature, page 2](#)
- [Restrictions for the Per VRF Label Feature, page 2](#)
- [Information About the Per VRF Label Feature, page 2](#)
- [How to Configure the Per VRF Label Feature, page 3](#)
- [Configuration Examples for the Per VRF Label feature, page 5](#)

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Additional References, page 10](#)
- [Command Reference, page 11](#)
- [Feature Information for MPLS VPN—Per VRF Label, page 12](#)

## Prerequisites for the Per VRF Label Feature

- If your VRF domain has the external/internal Border Gateway Protocol (EIBGP) multipath feature or the Carrier Supporting Carrier (CSC) feature enabled, disable those features before you configure the Per VRF Label feature.
- Before configuring Multiprotocol Label Switching (MPLS) Layer 3 VPNs, you must have MPLS, Label Distribution Protocol (LDP), and Cisco Express Forwarding (CEF) installed in your network. All routers in the core, including the Provider Edge (PE) routers, must be able to support CEF and MPLS forwarding.

## Restrictions for the Per VRF Label Feature

- Enabling the Per VRF Label feature causes BGP reconvergence, which can result in data loss for traffic coming from the MPLS VPN core.

**Note**

You can minimize network disruption by enabling this feature during a scheduled MPLS maintenance window. Also, if possible, avoid enabling this feature on a live router.

- There is no performance degradation when you configure up to 511 VRFs; however, when you add more than 511 VRFs, your network might experience some minor performance degradation (similar to the normal degradation experienced by any of the directly connected VRF prefixes present in the router).
- Per-prefix MPLS counters for VPN prefixes are lost when you enable the Per VRF Label feature.
- You cannot use this feature with CSC and EIBGP multipath features.

## Information About the Per VRF Label Feature

To configure the MPLS VPN—Per VRF Label feature, you should understand the following concept:

- [MPLS VPN—Per VRF Label Functionality, page 2](#)

## MPLS VPN—Per VRF Label Functionality

The PE stores both local and remote routes and includes a label entry for each route. For distributed platforms, the per-prefix labels consume memory. When there are many VRFs and routes, the amount of memory that the per-prefix labels consume can become an issue.

This new Per VRF Label feature allows the advertisement of a single VPN label for local routes throughout the entire VRF. The router uses a new VPN label for the VRF decoding and IP-based lookup to learn where to forward packets for the PE or customer edge (CE) interfaces.

The following conditions apply when you configure the Per VRF Label feature:

- The VRF uses one label for all local routes.
- When you *enable* the Per VRF Label feature, any existing Per VRF Aggregate label is used. If no Per VRF Aggregate label is present, the software creates a new Per VRF label.
- When you *enable* the Per VRF Label feature, the CE router's learned local routes will experience some data loss.  
  
The CE does not lose data when you disable the Per VRF Label feature because when you disable the feature, the configuration reverts to the default labeling configuration of the Cisco 6500 platform, which uses the Per VRF Aggregate label from the local nonCE-sourced routes.
- When you *disable* the Per VRF Label feature, the configuration reverts to the default configuration of the Cisco 6500 routers.
- A Per VRF label forwarding entry is deleted only if the VRF or the BGP configuration is removed.

#### Summarization of Label Allocation Modes

Table 1 defines the label allocations used with various route types.

**Table 1**      **Label Allocation Modes**

| Route Types                                                                              | Label Mode:<br>Cisco 6500 Default | Label Mode:<br>Per VRF Label Feature |
|------------------------------------------------------------------------------------------|-----------------------------------|--------------------------------------|
| Local to the PE (connected, static route to NULL0, BGP aggregates), redistributed to BGP | Per VRF Aggregate label           | Per VRF label                        |
| Locally learned from CE (through EBGp or other PE or CE protocols)                       | Per Prefix label                  | Per VRF label                        |

## How to Configure the Per VRF Label Feature

This section describes the following required task:

- [Configuring the Per VRF Label Feature, page 3](#)

### Configuring the Per VRF Label Feature

To configure the Per VRF Label feature, perform the following task.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls label mode { vrf *vrf-name* | all-vrfs } protocol bgp-vpnv4 { per-prefix | per-vrf }**
4. **end**
5. **show ip vrf detail**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                        | Purpose                                                                                                          |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                           | Enters global configuration mode.                                                                                |
| Step 3 | <b>mpls label mode {vrf vrf-name   all-vrfs} protocol bgp-vpnv4 {per-prefix   per-vrf}</b><br><br><b>Example:</b><br>Router(config)# mpls label mode all-vrfs protocol bgp-vpnv4 per-vrf | Configures the Per VRF Label feature.                                                                            |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                 | Returns to privileged EXEC mode.                                                                                 |
| Step 5 | <b>show ip vrf detail</b><br><br><b>Example:</b><br>Router# show ip vrf detail                                                                                                           | Displays the VRF label mode.                                                                                     |

## Examples

The following command example shows how to verify the Per VRF Label configuration:

In this example output, the **bold** text indicates the label modes:

```
Router# show ip vrf detail

VRF vpn1; default RD 1:1; default VPNID <not set>
VRF Table ID = 1
  Interfaces:
    Ethernet0/0          Serial5/0          Loopback1
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:1:1
  Import VPN route-target communities
    RT:1:1
  No import route-map
  No export route-map
CSC is not configured.

## Configuration Examples for the Per VRF Label feature

This section shows examples for three different configurations:

- [No Label Mode \(Cisco 6500 Router Default\): Example, page 6](#)

- [Mixed Mode \(with Global Per-Prefix\): Example, page 7](#)
- [Mixed Mode \(with Global Per-VRF\): Example, page 9](#)

## No Label Mode (Cisco 6500 Router Default): Example

The following example shows the default label mode configuration (no label mode) for the Cisco 6500 router.

In this example output, the **bold** text indicates the label modes:

```
Router# show ip vrf detail

VRF vpn1; default RD 1:1; default VPNID <not set>
VRF Table ID = 1
  Interfaces:
    Ethernet0/0          Serial5/0          Loopback1
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:1:1
  Import VPN route-target communities
    RT:1:1
  No import route-map
  No export route-map
  CSC is not configured.
  VRF label allocation mode: per-prefix
  per-vrf-aggr for connected and BGP aggregates (Label 19)
VRF vpn2; default RD 2:1; default VPNID <not set>
VRF Table ID = 2
  Interfaces:
    Ethernet2/0          Loopback2
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:2:1
  Import VPN route-target communities
    RT:2:1
  No import route-map
  No export route-map
  CSC is not configured.
  VRF label allocation mode: per-prefix
  per-vrf-aggr for connected and BGP aggregates (Label 20)
VRF vpn3; default RD 3:1; default VPNID <not set>
VRF Table ID = 3
  Interfaces:
    Ethernet3/0          Loopback3
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:3:1
  Import VPN route-target communities
    RT:3:1
  No import route-map
  No export route-map
  CSC is not configured.
  VRF label allocation mode: per-prefix
  per-vrf-aggr for connected and BGP aggregates (Label 23)
Router# show ip bgp vpnv4 all labels

      Network          Next Hop          In label/Out label
Route Distinguisher: 1:1 (vpn1)
  127.0.0.1/32         192.168.1.1         27/nolabel
  127.0.0.5/32         127.0.0.4           nolabel/19
  192.168.1.0/24       192.168.1.1         IPv4 VRF Aggr:19/nolabel
```

```

192.168.4.0/24 0.0.0.0 IPv4 VRF Aggr:19/aggregate(vpn1)
127.0.0.4 nolabel/20
172.16.0.0/16 0.0.0.0 IPv4 VRF Aggr:19/aggregate(vpn1)
172.16.128.0/32 192.168.1.1 28/nolabel
Route Distinguisher: 2:1 (vpn2)
127.0.2.2/32 0.0.0.0 IPv4 VRF Aggr:20/aggregate(vpn2)
127.0.0.6/32 192.168.5.1 21/nolabel
192.168.5.0/24 0.0.0.0 IPv4 VRF Aggr:20/aggregate(vpn2)
172.17.128.0/32 192.168.5.1 22/nolabel
Route Distinguisher: 3:1 (vpn3)
127.0.3.2/32 0.0.0.0 IPv4 VRF Aggr:23/aggregate(vpn3)
127.0.0.8/32 192.168.7.1 24/nolabel
192.168.7.0/24 0.0.0.0 IPv4 VRF Aggr:23/aggregate(vpn3)
172.16.128.0/32 192.168.7.1 25/nolabel

```

Router# **show mpls forwarding-table**

| 28        | Untagged           | 172.16.128.0/32[V]0 | 0                  | Et0/0                 | 192.168.1.1 |

## Mixed Mode (with Global Per-Prefix): Example

For this example, the following commands set VPN 1 for per-vrf label mode, VPN 2 for per-prefix label mode, and all remaining VPNs for per-prefix (globally).

In this example output, the **bold** text indicates the label modes:

```

Router# mpls label mode vrf vpn1 protocol bgp-vpnv4 per-vrf
Router# mpls label mode vrf vpn2 protocol bgp-vpnv4 per-prefix

```

Use the following show commands to display the label mode settings:

Router# **show ip vrf detail**

```

VRF vpn1; default RD 1:1; default VPNID <not set>
VRF Table ID = 1
  Interfaces:
    Ethernet0/0          Serial5/0          Loopback1
  Connected addresses are not in global routing table
  Export VPN route-target communities
    RT:1:1
  Import VPN route-target communities
    RT:1:1
  No import route-map
  No export route-map
CSC is not configured.
VRF label allocation mode: per-vrf (Label 26)
VRF vpn2; default RD 2:1; default VPNID <not set>
VRF Table ID = 2
  Interfaces:

```

```

Ethernet2/0          Loopback2
Connected addresses are not in global routing table
Export VPN route-target communities
RT:2:1
Import VPN route-target communities
RT:2:1
No import route-map
No export route-map
CSC is not configured.
VRF label allocation mode: per-prefix
per-vrf-aggr for connected and BGP aggregates (Label 27)
VRF vpn3; default RD 3:1; default VPNID <not set>
VRF Table ID = 3
Interfaces:
Ethernet3/0          Loopback3
Connected addresses are not in global routing table
Export VPN route-target communities
RT:3:1
Import VPN route-target communities
RT:3:1
No import route-map
No export route-map
CSC is not configured.
VRF label allocation mode: per-prefix
per-vrf-aggr for connected and BGP aggregates (Label 28)

```

Router# **show ip bgp vpnv4 all label**

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **debug ip bgp vpnv4 unicast**
- **mpls label mode**

# Feature Information for MPLS VPN—Per VRF Label

Table 2 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2** Feature Information for MPLS VPN—Per VRF Label

| Feature Name           | Releases    | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# MPLS VPN 6VPE per VRF Label

---

**First Published: February 16, 2007**

**Last Updated: December 2, 2008**

The MPLS VPN 6VPE per VRF Label feature allows you to configure a single Virtual Private Network (VPN) label for all local routes in the entire IPv6 VPN routing and forwarding (VRF) domain on Cisco 7600 routers. This MPLS VPN 6VPE per VRF Label feature incorporates a single (per VRF) VPN label for *all* local IPv6 routes in the VRF table.

You can enable (or disable) the MPLS VPN 6VPE per VRF Label feature in global configuration mode. This feature is available for the Cisco 7600 router only.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS VPN 6VPE per VRF Label” section on page 9](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

- [Command Reference, page 8](#)
- [Feature Information for MPLS VPN 6VPE per VRF Label, page 9](#)

## Prerequisites for the MPLS VPN 6VPE per VRF Label feature

- If your VRF domain has the external/internal Border Gateway Protocol (EIBGP) multipath feature or the Carrier Supporting Carrier (CSC) feature enabled, disable those features before you configure the MPLS VPN 6VPE per VRF Label feature.
- Before configuring Multiprotocol Label Switching (MPLS) Layer 3 VPNs, you must have MPLS, Label Distribution Protocol (LDP), and Cisco Express Forwarding installed in your network. All routers in the core, including the provider edge (PE) routers, must be able to support Cisco Express Forwarding and MPLS forwarding.
- Before configuring a 6VPE per VRF label, be sure that the IPv6 address family is configured on that VRF.

## Restrictions for the MPLS VPN 6VPE per VRF Label feature

- Enabling the MPLS VPN 6VPE per VRF Label feature causes BGP reconvergence, which can result in data loss for traffic coming from the MPLS VPN core.

**Note**

You can minimize network disruption by enabling this feature during a scheduled MPLS maintenance window. Also, if possible, avoid enabling this feature on a live router.

- Per-prefix MPLS counters for VPN prefixes are lost when you enable the MPLS VPN 6VPE per VRF Label feature.
- You cannot use this feature with CSC and EIBGP multipath features.

## Information About the MPLS VPN 6VPE per VRF Label feature

To configure the MPLS VPN 6VPE per VRF Label feature, you should understand the following concept:

- [MPLS VPN 6VPE per VRF Label Functionality, page 2](#)

## MPLS VPN 6VPE per VRF Label Functionality

The PE router stores both local and remote routes and includes a label entry for each route. For distributed platforms, the multiplicity of per-prefix labels consume memory. When there are many VRFs and routes, the amount of memory that the per-prefix labels consume can cause performance degradation on some platform devices. To avoid this issue, the MPLS VPN 6VPE per VRF Label feature allows the advertisement of a single VPN label for local routes throughout the entire VRF. The router uses a new VPN label for the VRF decoding and IP-based lookup to learn where to forward packets for the PE or customer edge (CE) interfaces.

The following conditions apply when you configure the MPLS VPN 6VPE per VRF Label feature:

- The VRF uses one label for all local routes.
- When you *enable* the MPLS VPN 6VPE per VRF Label feature, any existing per VRF aggregate label is used. If no per VRF aggregate label is present, the software creates a new 6VPE per VRF label.
- When you *enable* the MPLS VPN 6VPE per VRF Label feature, the CE router's learned local routes will experience some data loss.

The CE does not lose data when you disable the MPLS VPN 6VPE per VRF Label feature because the configuration reverts to the default labeling configuration of the Cisco 7600 platform, which uses the Per VRF Aggregate label from the local nonCE-sourced routes.
- When you *disable* the MPLS VPN 6VPE per VRF Label feature, the configuration reverts to the default configuration of the Cisco 7600 routers.
- A 6VPE Per VRF Label forwarding entry is deleted only if the VRF, the IPv6 VRF address family, or the BGP configuration is removed.

See the [Implementing IPv6 VPN over MPLS \(6VPE\)](#) configuration guide for detailed information about IPv6 VPN services and 6VPE.

#### Summarization of Label Allocation Modes

[Table 1](#) defines the label allocations used with various route types.

**Table 1**      **Label Allocation Modes**

| Route Types                                                                              | Label Mode:<br>Cisco 7600 Default | Label Mode:<br>MPLS VPN 6VPE per VRF Label feature |
|------------------------------------------------------------------------------------------|-----------------------------------|----------------------------------------------------|
| Local to the PE (connected, static route to NULL0, BGP aggregates), redistributed to BGP | Per VRF Aggregate label           | 6VPE Per VRF Label                                 |
| Locally learned from CE (through external BGP or other PE or CE protocols)               | Per Prefix label                  | 6VPE Per VRF Label                                 |

## How to Configure the MPLS VPN 6VPE per VRF Label Feature

This section describes the following required task:

- [Configuring the MPLS VPN 6VPE per VRF Label Feature, page 3](#)

### Configuring the MPLS VPN 6VPE per VRF Label Feature

To configure a single (per VRF) VPN label for *all* local IPv6 routes in the VRF table, perform the following task.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**

3. **mpls label mode** {vrf *vrf-name* | **all-vrfs**} **protocol** {**bgp-vpnv6** | **all-afs**}  
    {per-prefix | per-vrf}
4. **end**
5. **show vrf detail** *vrf-name*

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                          | Purpose                                                                                                             |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                     | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                             | Enters global configuration mode.                                                                                   |
| Step 3 | <b>mpls label mode</b> {vrf <i>vrf-name</i>   <b>all-vrfs</b> } <b>protocol</b> { <b>bgp-vpnv6</b>   <b>all-afs</b> } {per-prefix   per-vrf}<br><br><b>Example:</b><br>Router(config)# mpls label mode all-vrfs protocol bgp-vpnv6 per-vrf | Configures a single (per VRF) VPN label for <i>all</i> local IPv6 routes in the VRF table.                          |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                                                                   | Returns to privileged EXEC mode.                                                                                    |
| Step 5 | <b>show vrf detail</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router# show vrf detail vpn1                                                                                                                                              | Displays the VRF label mode for the specified VRF.                                                                  |

## Examples

The following example shows how to verify the 6VPE per VRF label configuration.

In this example output, the **bold** text indicates the 6VPE per VRF label mode for VPN1.

```
Router# show vrf detail vpn1
```

```
VRF vpn1 (VRF Id = 1); default RD 1:1; default VPNID <not set>
  Interfaces:

## Troubleshooting Tips

The `debug ip bgp vpnv6 unicast` command can help troubleshoot the 6VPE per VRF label configuration.

## Configuration Examples for MPLS VPN 6VPE per VRF Label

This section shows the default label mode configuration example (no label mode) for the Cisco 7600 router:

- [6VPE No Label Mode \(Cisco 7600 Router Default\): Example, page 5](#)

## 6VPE No Label Mode (Cisco 7600 Router Default): Example

The following example shows the 6VPE default label mode configuration (no label mode) for the Cisco 7600 router.

In this example output, the **bold** text indicates the default label mode for VPN1.

```
Router# show vrf detail vpn1
```

```
VRF vpn1 (VRF Id = 1); default RD 1:1; default VPNID <not set>
  Interfaces:
    GE4/1          Lo1
  Address family ipv4 (Table ID = 1 (0x1)):
    Connected addresses are not in global routing table
    Export VPN route-target communities
      RT:1:1
    Import VPN route-target communities
      RT:1:1          RT:2:2
    No import route-map
    No export route-map
    VRF label distribution protocol: not configured
    VRF label allocation mode: per-prefix
      vrf-conn-aggr for connected and BGP aggregates (Label 17)
  Address family ipv6 (Table ID = 503316481 (0x1E000001)):
    Connected addresses are not in global routing table
    Export VPN route-target communities
      RT:1:1
    Import VPN route-target communities
      RT:1:1
    No import route-map
    No export route-map

## Command Reference

The following commands are introduced or modified in the feature or features documented in this module. For information about these commands, see the *Cisco IOS Multiprotocol Label Switching Command Reference* at [http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp\\_book.html](http://www.cisco.com/en/US/docs/ios/mpls/command/reference/mp_book.html). For information about all Cisco IOS commands, use the Command Lookup Tool at <http://tools.cisco.com/Support/CLILookup> or the *Cisco IOS Master Command List, All Releases*, at [http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all\\_book.html](http://www.cisco.com/en/US/docs/ios/mcl/allreleasemcl/all_book.html).

- **debug ip bgp vpnv6 unicast**
- **mpls label mode (6VPE)**

# Feature Information for MPLS VPN 6VPE per VRF Label

Table 2 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2** Feature Information for MPLS VPN 6VPE per VRF Label

| Feature Name                | Releases    | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

# MPLS Multi-VRF (VRF-Lite)

---

**First Published: January 1, 2000**

**Last Updated: July 30, 2008**

The MPLS Multi-VRF feature allows you to configure and maintain more than one instance of a routing and forwarding table within the same customer edge (CE) router.

## Finding Feature Information in This Module

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the “[Feature Information for MPLS Multi-VRF](#)” section on page 18.

## Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for MPLS Multi-VRF

The network’s core and provider edge routers must be configured for MPLS Virtual Private Network (VPN) operation.

## Restrictions with MPLS Multi-VRF

You can configure the MPLS Multi-VRF feature only on Layer 3 interfaces.

The MPLS Multi-VRF feature is not supported by Interior Gateway Routing Protocol (IGRP) nor IS-IS.

Label distribution for a given VPN routing and forwarding (VRF) instance on a given router can be handled by either Border Gateway Protocol (BGP) or Label Distribution Protocol (LDP), but not by both protocols at the same time.

Multicast cannot operate on a Layer 3 interface that is configured with the MPLS Multi-VRF feature.

## Information About MPLS Multi-VRF

To configure subscription-based Cisco IOS content filtering, you should understand the following concepts:

- [How the MPLS Multi-VRF Feature Works, page 2](#)
- [How Packets Are Forwarded in a Network Using the MPLS Multi-VRF Feature, page 3](#)

## How the MPLS Multi-VRF Feature Works

The MPLS Multi-VRF feature enables a service provider to support two or more VPNs, where the IP addresses can overlap several VPNs. The MPLS Multi-VRF feature uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN Switched Virtual Interfaces (SVIs), but a Layer 3 interface cannot belong to more than one VRF at any one time. The Multi-VRF feature allows an operator to support two or more routing domains on a CE router, with each routing domain having its own set of interfaces and its own set of routing and forwarding tables. The MPLS Multi-VRF feature makes it possible to extend the Label Switched Paths (LSPs) to the CE and into each routing domain that the CE supports.

The MPLS Multi-VRF feature works as follows:

- Each CE router advertises its site's local routes to a provider edge (PE) router and learns the remote VPN routes from that PE router.
- PE routers exchange routing information with CE routers by using static routing or a routing protocol such as BGP, RIPv1, or RIPv2.
- PE routers exchange MPLS label information with CE routers through LDP or BGP.
- The PE router needs to maintain VPN routes only for those VPNs to which it is directly attached, eliminating the requirement that the PE maintain all of the service provider's VPN routes. Each PE router maintains a VRF for each of its directly connected sites. Two or more interfaces on a PE router can be associated with a single VRF if all the sites participate in the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CE routers, the PE router exchanges VPN routing information with other PE routers through internal BGP (iBGP).

With the MPLS Multi-VRF feature, two or more customers can share one CE router, and only one physical link is used between the CE and the PE routers. The shared CE router maintains separate VRF tables for each customer and routes packets for each customer based on that customer's own routing table. The MPLS Multi-VRF feature extends limited PE router functionality to a CE router, giving it the ability, through the maintenance of separate VRF tables, to extend the privacy and security of a VPN to the branch office.

Figure 1 shows a configuration where each CE router acts as if it were two CE routers. Because the MPLS Multi-VRF feature is a Layer 3 feature, each interface associated with a VRF must be a Layer 3 interface.

**Figure 1** Each CE Router Acting as Several Virtual CE Routers

## How Packets Are Forwarded in a Network Using the MPLS Multi-VRF Feature

Following is the packet-forwarding process in an MPLS Multi-VRF CE-enabled network, as illustrated in Figure 1:

- When the CE receives a packet from a VPN, it looks up the routing table based on the input interface. When a route is found, the CE imposes the MPLS label it received from the PE for that route and forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it swaps the incoming label with the corresponding label stack and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it swaps the VPN label with the label it earlier had received for the route from the CE, and forwards it to the CE.
- When a CE receives a packet from an egress PE, it uses the incoming label on the packet to forward the packet to the correct VPN.

To configure Multi-VRF, you create a VRF table and then specify the Layer 3 interface associated with that VRF. Next, you configure the routing protocols within the VPN, and between the CE and the PE. BGP is the preferred routing protocol for distributing VPN routing information across the provider's backbone, for reasons that will be detailed in the section, [How to Configure MPLS Multi-VRF, page 4](#).

The Multi-VRF network has three major components:

- **VPN route target communities:** These are lists of all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- **Multiprotocol BGP peering of VPN community PE routers:** This propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
- **VPN forwarding:** This transports all traffic between VPN community members across a VPN service-provider network.

# How to Configure MPLS Multi-VRF

This section contains the following procedures:

- [Configuring VRFs, page 4](#) (Required)
- [Configuring BGP as the Routing Protocol \(Recommended\), page 6](#) (Required)
- [Configuring PE-to-CE MPLS Forwarding and Signalling with BGP \(Recommended\), page 8](#) (Required)
- [Configuring a Routing Protocol Other Than BGP, page 10](#) (Required)
- [Configuring PE-to-CE MPLS Forwarding and Signalling with LDP, page 11](#) (Required)

When BGP is used as the routing protocol, it can also be used for MPLS label exchange between the PE and CE routers. By contrast, if OSPF, EIGRP, RIP, or static routing is used, LDP must be used to signal labels.

To configure the MPLS Multi-VRF feature, you create a VRF table and then specify the Layer 3 interface associated with that VRF. Then you configure the routing protocols within the VPN and between the CE and the PE routers.

The Multi-VRF network has three major components:

- **VPN route target communities:** These are lists of all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- **Multiprotocol BGP peering of VPN community PE routers:** This propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
- **VPN forwarding:** This transports all traffic between VPN community members across a VPN service provider network.

Consider these points when configuring the MPLS Multi-VRF feature in your network:

- A router with the MPLS Multi-VRF feature is shared by several customers, and each customer has its own routing table.
- Because each customer uses a different VRF table, the same IP addresses can be reused. Overlapping IP addresses are allowed in different VPNs.
- The MPLS Multi-VRF feature lets several customers share the same physical link between the PE and the CE routers. Trunk ports with several VLANs separate packets among the customers. Each customer has its own VLAN.
- For the PE router, there is no difference between using the MPLS Multi-VRF feature or using several CE routers. In [Figure 2](#), for example, four virtual Layer 3 interfaces are connected to the MPLS Multi-VRF CE router.
- The MPLS Multi-VRF feature does not affect the packet switching rate.

## Configuring VRFs

Configure VRFs on both the PE and the CE routers.

## Restrictions

Multicast cannot be configured at the same time on the same Layer 3 interface as the MPLS Multi-VRF feature.

## Default VRF Configuration

If a VRF has not been configured, the router has the following default configuration:

- No VRFs have been defined.
- No import maps, export maps, or route maps have been defined.
- No VRF maximum routes exist.
- Only the global routing table exists on the interface.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip routing**
4. **ip vrf vrf-name**
5. **rd route-distinguisher**
6. **route-target { export | import | both } route-target-ext-community**
7. **import map route-map**
8. **exit**
9. **interface interface-id**
10. **ip vrf forwarding vrf-name**
11. **show ip vrf**

## DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                                                                               |
|--------|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|

| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                     |
| Step 3 | <b>ip routing</b><br><br><b>Example:</b><br>Router(config)# ip routing         | Enables IP routing.                                                                                                   |

|         | Command or Action                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                 |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4  | <code>ip vrf vrf-name</code><br><br><b>Example:</b><br>Router(config)# ip vrf v1                                                                                      | Names the VRF, and enters VRF configuration mode.                                                                                                                                                                                                                                                       |
| Step 5  | <code>rd route-distinguisher</code><br><br><b>Example:</b><br>Router(config-vrf)# rd 100:1                                                                            | Creates a VRF table by specifying a route distinguisher.<br>Enter either an autonomous system number and an arbitrary number (xxx:y), or an IP address and an arbitrary number (A.B.C.D:y).                                                                                                             |
| Step 6  | <code>route-target {export   import   both}</code><br><code>route-target-ext-community</code><br><br><b>Example:</b><br>Router(config-vrf)# route-target export 100:1 | Creates a list of import, export, or import and export route target communities for the specified VRF.<br>Enter either an autonomous system number and an arbitrary number (xxx:y), or an IP address and an arbitrary number (A.B.C.D:y).<br><br><b>Note</b> This command works only if BGP is running. |
| Step 7  | <code>import map route-map</code><br><br><b>Example:</b><br>Router(config-vrf)# import map importmap1                                                                 | (Optional) Associates a route map with the VRF.                                                                                                                                                                                                                                                         |
| Step 8  | <code>exit</code><br><br><b>Example:</b><br>Router(config-vrf)# exit                                                                                                  | Returns to global configuration mode.                                                                                                                                                                                                                                                                   |
| Step 9  | <code>interface interface-id</code><br><br><b>Example:</b><br>Router(config)# interface fastethernet3/0.10                                                            | Specifies the Layer 3 interface to be associated with the VRF and enters interface configuration mode.<br>The interface can be a routed port or an SVI.                                                                                                                                                 |
| Step 10 | <code>ip vrf forwarding vrf-name</code><br><br><b>Example:</b><br>Router(config-if)# ip vrf forwarding v1                                                             | Associates the VRF with the Layer 3 interface.                                                                                                                                                                                                                                                          |
| Step 11 | <code>show ip vrf</code><br><br><b>Example:</b><br>Router# show ip vrf                                                                                                | Displays the settings of the VRFs.                                                                                                                                                                                                                                                                      |

## Configuring BGP as the Routing Protocol (Recommended)

Most routing protocols can be used between the CE and the PE routers. However, external BGP (eBGP) is recommended, because:

- BGP does not require more than one algorithm to communicate with many CE routers.
- BGP is designed to pass routing information between systems run by different administrations.
- BGP makes it easy to pass attributes of the routes to the CE router.

When BGP is used as the routing protocol, it can also be used to handle the MPLS label exchange between the PE and CE routers. By contrast, if OSPF, EIGRP, RIP, or static routing is used, LDP must be used to signal labels.

To configure a BGP PE-to-CE routing session, perform the following steps on the CE and on the PE routers.

## PSUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *autonomous-system-number*
4. **network** *ip-address* **mask** *network-mask*
5. **redistribute ospf** *process-id* **match internal**
6. **network** *ip-address* **area** *area-id*
7. **address-family ipv4 vrf** *vrf-name*
8. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
9. **neighbor** *address* **activate**

## DETAILED STEPS

|        | Command                                                                                                                                                           | Purpose                                                                                                                                 |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                            | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                     |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                    | Enters global configuration mode.                                                                                                       |
| Step 3 | <b>router bgp</b> <i>autonomous-system-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                        | Configures the BGP routing process with the autonomous system number passed to other BGP routers, and enters router configuration mode. |
| Step 4 | <b>network</b> <i>ip-address</i> <b>mask</b> <i>network-mask</i><br><br><b>Example:</b><br>Router(config-router)# network<br>10.0.0.0 mask 255.255.255.0          | Specifies a network and mask to announce using BGP.                                                                                     |
| Step 5 | <b>redistribute ospf</b> <i>process-id</i> <b>match</b><br><b>internal</b><br><br><b>Example:</b><br>Router(config-router)# redistribute<br>ospf 2 match internal | Sets the router to redistribute OSPF internal routes.                                                                                   |

|        | Command                                                                                                                                                                                    | Purpose                                                                                                                              |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>network</b> <i>ip-address</i> <b>area</b> <i>area-id</i><br><br><b>Example:</b><br>Router(config-router)# network<br>10.0.0.0 255.255.255.0 area 0                                      | Identifies the network address and mask on which OSPF is running, and the area ID of that network address.                           |
| Step 7 | <b>address-family</b> <b>ipv4</b> <b>vrf</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config-router)# address-family<br>ipv4 vrf v12                                               | Identifies the name of the VRF instance that will be associated with the next two commands, and enters VRF address-family mode.      |
| Step 8 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router-af)# neighbor<br>10.0.0.3 remote-as 100 | Informs this router's BGP neighbor table of the neighbor's address (or peer group name) and the neighbor's autonomous system number. |
| Step 9 | <b>neighbor</b> <i>address</i> <b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor<br>10.0.0.3 activate                                                           | Activates the advertisement of the IPv4 address-family neighbors.                                                                    |

## Configuring PE-to-CE MPLS Forwarding and Signalling with BGP (Recommended)

If BGP is used for routing between the PE and the CE routers, configure BGP to signal the labels on the VRF interfaces of both the CE and the PE routers. You must enable signalling globally at the router configuration level and for each interface:

- At the router-configuration level, to enable MPLS label signalling via BGP, use the **neighbor send-label** command).
- At the interface level, to enable MPLS forwarding on the interface used for the PE-to-CE eBGP session, use the **mpls bgp forwarding** command.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *autonomous-system-number*
4. **address-family** **ipv4** **vrf** *vrf-name*
5. **neighbor** *address* **send-label**
6. **neighbor** *address* **activate**
7. **end**
8. **configure terminal**
9. **interface** *interface-id*

## 10. mpls bgp forwarding

## DETAILED STEPS

|        | Command                                                                                                                        | Purpose                                                                                                                                                                                                                                        |
|--------|--------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                         | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>Enter your password if prompted.</li></ul>                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                 | Enters global configuration mode.                                                                                                                                                                                                              |
| Step 3 | <b>router bgp</b> <i>autonomous-system-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 100                     | Configures the BGP routing process with the autonomous system number passed to other BGP routers and enters router configuration mode.                                                                                                         |
| Step 4 | <b>address-family ipv4 vrf</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config-router)#<br>address-family ipv4 vrf v12 | Identifies the name of the VRF instance that will be associated with the next two commands and enters address family configuration mode.                                                                                                       |
| Step 5 | <b>neighbor address send-label</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor<br>10.0.0.3 remote-as 100      | Enables the router to use BGP to distribute MPLS labels along with the IPv4 routes to the peer router(s).<br><br>If a BGP session is running when you issue this command, the command does not take effect until the BGP session is restarted. |
| Step 6 | <b>neighbor address activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor<br>10.0.0.3 activate             | Activates the advertisement of the IPv4 address-family neighbors.                                                                                                                                                                              |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                             | Returns to privileged EXEC mode.                                                                                                                                                                                                               |
| Step 8 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                 | Enters global configuration mode.                                                                                                                                                                                                              |

|         | Command                                                                                                        | Purpose                                                                                                                                    |
|---------|----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Step 9  | <b>interface</b> <i>interface-id</i><br><br><b>Example:</b><br>Router(config)# interface<br>fastethernet3/0.10 | Enters interface configuration mode for the interface to be used for the BGP session.<br><br>The interface can be a routed port or an SVI. |
| Step 10 | <b>mpls bgp forwarding</b><br><br><b>Example:</b><br>Router(config-if)# mpls bgp<br>forwarding                 | Enables MPLS forwarding on the interface.                                                                                                  |

## Configuring a Routing Protocol Other Than BGP

You can use RIP, EIGRP, OSPF or with static routing. This configuration uses OSPF, but the process is the same for other protocols. If OSPF, EIGRP, RIP, or static routing is used, LDP must be used to signal labels.

If you use OSPF as the routing protocol between the PE and the CE routers, issue the **capability vrf-lite** command in router configuration mode. See [OSPF Support for Multi-VRF in CE Routers](#) for more information.

## Restrictions

If OSPF, EIGRP, RIP, or static routing is used, LDP must be used to signal labels.

The MPLS Multi-VRF feature is not supported by IGRP nor IS-IS.

Multicast cannot be configured on the same Layer 3 interface as the MPLS Multi-VRF feature is configured.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router ospf** *process-id* [**vrf** *vrf-name*]
4. **log-adjacency-changes**
5. **redistribute bgp** *autonomous-system-number* **subnets**
6. **network** *ip-address subnet-mask* **area** *area-id*
7. **show ip ospf**

## DETAILED STEPS

|        | Command or Action                                                                                                                         | Purpose                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                            | Enters global configuration mode.                                                                                |
| Step 3 | <b>router ospf process-id [vrf vpn-name]</b><br><br><b>Example:</b><br>Router(config)# router ospf 100 vrf v1                             | Enables OSPF routing, specifies a VRF table, and enters router configuration mode.                               |
| Step 4 | <b>log-adjacency-changes</b><br><br><b>Example:</b><br>Router(config-router)# log-adjacency-changes                                       | (Optional) Logs changes in the adjacency state.<br><br>This is the default state.                                |
| Step 5 | <b>redistribute bgp autonomous-system-number subnets</b><br><br><b>Example:</b><br>Router(config-router)# redistribute bgp 800 subnets    | Sets the router to redistribute information from the BGP network to the OSPF network.                            |
| Step 6 | <b>network ip-address subnet-mask area area-id</b><br><br><b>Example:</b><br>Router(config-router)# network 10.0.0.0 255.255.255.0 area 0 | Indicates the network address and mask on which OSPF runs, and the area ID of that network address.              |
| Step 7 | <b>show ip ospf</b><br><br><b>Example:</b><br>Router# show ip ospf                                                                        | Displays information about the OSPF routing processes.                                                           |

## Configuring PE-to-CE MPLS Forwarding and Signalling with LDP

If OSPF, EIGRP, RIP, or static routing is used, LDP must be used to signal labels.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface interface-id**
4. **mpls ip**

## DETAILED STEPS

|        | Command or Action                                                            | Purpose                                                                                                                      |
|--------|------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code>                                                          | Enables privileged EXEC mode.                                                                                                |
|        | <b>Example:</b><br><code>Router&gt; enable</code>                            | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                           |
| Step 2 | <code>configure terminal</code>                                              | Enters global configuration mode.                                                                                            |
|        | <b>Example:</b><br><code>Router# configure terminal</code>                   |                                                                                                                              |
| Step 3 | <code>interface interface-id</code>                                          | Enters interface configuration mode for the interface associated with the VRF. The interface can be a routed port or an SVI. |
|        | <b>Example:</b><br><code>Router(config)# interface fastethernet3/0.10</code> |                                                                                                                              |
| Step 4 | <code>mpls ip</code>                                                         | Enables MPLS forwarding of IPv4 packets along normally routed paths for this interface.                                      |
|        | <b>Example:</b><br><code>Router(config-if)# mpls ip</code>                   |                                                                                                                              |

# Configuration Examples for MPLS Multi-VRF

This section contains the following examples:

- [Configuring MPLS Multi-VRF on the PE Router: Example, page 13](#)
- [Configuring MPLS Multi-VRF on the CE Router, page 14](#)

**Figure 2** MPLS Multi-VRF Configuration Example

## Configuring MPLS Multi-VRF on the PE Router: Example

### Configuring VRFs

```
configure terminal
ip vrf v1
 rd 100:1
 route-target export 100:1
 route-target import 100:1
 exit
ip vrf v2
 rd 100:2
 route-target export 100:2
 route-target import 100:2
 exit
```

### Configuring PE-to-CE connections Using BGP for Both Routing and Label Exchange

```
router bgp 100
 address-family ipv4 vrf v2
  neighbor 10.0.0.8 remote-as 800
  neighbor 10.0.0.8 activate
  neighbor 10.0.0.8 send-label
 exit
 address-family ipv4 vrf v1
  neighbor 10.0.0.8 remote-as 800
  neighbor 10.0.0.8 activate
  neighbor 10.0.0.8 send-label
 end
```

```

configure terminal
interface fastethernet3/0.10
 ip vrf forwarding v1
 ip address 10.0.0.3 255.255.255.0
 mpls bgp forwarding
 exit
interface fastethernet3/0.20
 ip vrf forwarding v2
 ip address 10.0.0.3 255.255.255.0
 mpls bgp forwarding
 exit

```

### Configuring PE-to-CE Connections Using OSPF for Routing and LDP for Label Exchange

```

router ospf 100 vrf v1
 network 10.0.0.0 255.255.255.0 area 0
 exit
router ospf 101 vrf v2
 network 10.0.0.0 255.255.255.0 area 0
 exit
interface fastethernet3/0.10
 ip vrf forwarding v1
 ip address 10.0.0.3 255.255.255.0
 mpls ip
 exit
interface fastethernet3/0.20
 ip vrf forwarding v2
 ip address 10.0.0.3 255.255.255.0
 mpls ip
 exit

```

## Configuring MPLS Multi-VRF on the CE Router

### Configuring VRFs

```

configure terminal
 ip routing
 ip vrf v11
 rd 800:1
 route-target export 800:1
 route-target import 800:1
 exit
 ip vrf v12
 rd 800:2
 route-target export 800:2
 route-target import 800:2
 exit

```

### Configuring CE Router VPN Connections

```

interface fastethernet3/8
 ip vrf forwarding v11
 ip address 10.0.0.8 255.255.255.0
 exit
interface fastethernet3/11
 ip vrf forwarding v12
 ip address 10.0.0.8 255.255.255.0
 exit
router ospf 1 vrf v11
 network 10.0.0.0 255.255.255.0 area 0
 network 10.0.0.0 255.255.255.0 area 0
 exit

```

```
router ospf 2 vrf v12
 network 10.0.0.0 255.255.255.0 area 0
 network 10.0.0.0 255.255.255.0 area 0
 exit
```

**Note**

If BGP is used for routing between the PE and CE routers, the BGP-learned routes from the PE router can be redistributed into OSPF using the commands in the following example.

```
router ospf 1 vrf v11
 redistribute bgp 800 subnets
 exit
router ospf 2 vrf v12
 redistribute bgp 800 subnets
 exit
```

**Configuring PE-to-CE Connections Using BGP for Both Routing and Label Exchange**

```
router bgp 800
 address-family ipv4 vrf v12
  neighbor 10.0.0.3 remote-as 100
  neighbor 10.0.0.3 activate
  neighbor 10.0.0.3 send-label
  redistribute ospf 2 match internal
 exit
 address-family ipv4 vrf v11
  neighbor 10.0.0.3 remote-as 100
  neighbor 10.0.0.3 activate
  neighbor 10.0.0.3 send-label
  redistribute ospf 1 match internal
 end

interface fastethernet3/0.10
 ip vrf forwarding v11
 ip address 10.0.0.8 255.255.255.0
 mpls bgp forwarding
 exit
interface fastethernet3/0.20
 ip vrf forwarding v12
 ip address 10.0.0.8 255.255.255.0
 mpls bgp forwarding
 exit
```

**Configuring PE-to-CE Connections Using OSPF for Routing and LDP for Label Exchange**

```
router ospf 1 vrf v11
 network 10.0.0.0 255.255.255.0 area 0
 exit
router ospf 2 vrf v12
 network 10.0.0.0 255.255.255.0 area 0
 exit

interface fastethernet3/0.10
 ip vrf forwarding v11
 ip address 10.0.0.3 255.255.255.0
 mpls ip
 exit
interface fastethernet3/0.20
 ip vrf forwarding v12
 ip address 10.0.0.3 255.255.255.0
 mpls ip
 exit
```

# Command Reference

This feature uses no new or modified commands.

# Feature Information for MPLS Multi-VRF

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS Multi-VRF

| Feature Name   | Releases                                                                                       | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

# BGP Best External

---

**First Published: November 25, 2009**

**Last Updated: November 25, 2009**

The BGP Best External feature provides the network with a backup external route to avoid loss of connectivity of the primary external route. The BGP Best External feature advertises as a backup route the most preferred route among those received from external neighbors. This feature is beneficial in active-backup topologies, where service providers use routing policies that cause a border router to choose a path received over an internal BGP (iBGP) session (that of another border router) as the best path for a prefix even if it has an external BGP (eBGP) learned path. This active-backup topology defines one exit or egress point for the prefix in the autonomous system and uses the other points as backups if the primary link or eBGP peering is unavailable. The policy causes the border router to hide from the autonomous system the paths that it learned over its eBGP sessions, because it does not advertise any path for such prefixes. To cope with this situation, some routers advertise one externally learned path called the best-external path.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for BGP Best External” section on page 12](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Configuration Examples for BGP Best External, page 9](#)
- [Additional References, page 10](#)
- [Feature Information for BGP Best External, page 12](#)

## Prerequisites for BGP Best External

- The Bidirectional Forwarding Detection (BFD) protocol must be enabled to quickly detect link failures.
- Ensure that the BGP and the Multiprotocol Label Switching (MPLS) network is up and running with the customer site connected to the provider site by more than one path (multihomed).
- The backup path must have a unique next hop that is not the same as the next hop of the best path.
- BGP must support lossless switchover between operational paths.

## Restrictions for BGP Best External

- The BGP Best External feature will not install a backup path if BGP Multipath is installed and a multipath exists in the BGP table. One of the multipaths automatically acts as a backup for the other paths.
- The BGP Best External feature is not supported with the following features:
  - MPLS VPN Carrier Supporting Carrier
  - MPLS VPN Inter-Autonomous Systems, option B
  - MPLS VPN Per VRF Label
- The BGP Best External feature cannot be configured with Multicast, L2VPNs, or IPv6 VPNs.
- The BGP Best External feature cannot be configured on route reflectors.
- The BGP Best External feature does not support NSF/SSO. However, ISSU is supported if both route processors have the BGP Best External feature configured.
- The BGP Best External feature can only be configured on VPNv4 and IPv4 VRF address families.
- When you configure the BGP Best External feature using the **bgp advertise-best-external** command, you do not need to also enable the BGP PIC feature with the **bgp additional-paths install** command. The BGP PIC feature is automatically enabled by the BGP Best External feature.
- When you configure the BGP Best External feature, it will override the functionality of the [MPLS VPN—BGP Local Convergence](#) feature. However, you do not have to remove the **protection local-prefixes** command from the configuration.

## Information About BGP Best External

Before configuring the BGP Best External feature, you should understand the following concepts:

- [BGP Best External Overview, page 3](#)
- [What the Best External Route Means, page 3](#)
- [How the BGP Best External Feature Works, page 3](#)

- [Configuration Modes for Enabling BGP Best External, page 4](#)

## BGP Best External Overview

Service providers use routing policies that cause a border router to choose a path received over an internal BGP (iBGP) session (that of another border router) as the best path for a prefix even if it has an external BGP (eBGP) learned path. This practice is known popularly as active-backup topology and is done to define one exit or egress point for the prefix in the autonomous system and to use the other points as backups if the primary link or eBGP peering is unavailable.

The policy, though beneficial, causes the border router to hide from the autonomous system the paths that it learned over its eBGP sessions, because it does not advertise any path for such prefixes. To cope with this situation, some routers advertise one externally learned path called the best-external path. The best-external behavior causes the BGP selection process to select two paths to every destination:

- The best path is selected from the complete set of routes known to that destination.
- The best external path is selected from the set of routes received from its external peers.

BGP advertises to external peers the best path. Instead of withdrawing the best path from its internal peers when it selects an iBGP path as the best path, BGP advertises the best external path to the internal peers.

The BGP Best External feature is an essential component of the prefix independent (PIC) edge for both Internet access and MPLS VPN scenarios makes alternate paths available in the network in the active-backup topology.

## What the Best External Route Means

The BGP Best External feature uses a “best external route” as a backup path, which, according to *draft-marques-idr-best-external*, is the most preferred route among those received from external neighbors. The most preferred route from external neighbors can be the following:

- Two routers in different clusters that have an iBGP session between them.
- Two routers in different autonomous systems of a confederation that have an eBGP session between them.

The best external route might be different from the best route installed in the RIB. The best route could be an internal route. By allowing the best external route to be advertised and stored in addition to the best route, networks gain faster restoration of connectivity by providing additional paths that may be used if the primary path fails.

## How the BGP Best External Feature Works

The BGP Best External feature is based on Internet Engineering Task Force (IETF) *draft-marques-idr-best-external.txt*. The BGP Best External feature advertises a best external route to its internal peers as a backup route. The backup route is stored in the routing information base (RIB) and Cisco Express Forwarding. If the primary path fails, the BGP PIC functionality enables the best external path to take over, enabling faster restoration of connectivity.

**Figure 1** *MPLS VPN: Best External at the Edge of MPLS VPN*

Figure 1 shows an MPLS VPN using the BGP Best External feature. The network includes the following components:

- eBGP sessions exist between the provider edge (PE) and customer edge (CE) routers.
- PE1 is the primary router and has a higher local preference setting.
- Traffic from CE2 uses PE1 to reach router CE1.
- PE1 has two paths to reach CE1.
- CE1 is dual-homed with PE1 and PE2.
- PE1 is the primary path and PE2 is the backup path.

In Figure 1, traffic in the MPLS cloud flows through PE1 to reach CE1. Therefore, PE2 uses PE1 as the best path and PE2 as the backup path.

PE1 and PE2 are configured with the BGP Best External feature. BGP computes both the best path (the PE1–CE1 link) and an backup path (PE2) and installs both paths into the RIB and Cisco Express Forwarding. The best external path (PE2) is advertised to the peer routers in addition to the best path.

When Cisco Express Forwarding detects a link failure on PE1–CE1 link, Cisco Express Forwarding immediately switches to the backup path PE2. Traffic is quickly re-routed very due to local Fast Convergence in Cisco Express Forwarding using the backup path. Thus traffic loss is minimized and fast convergence achieved.

## Configuration Modes for Enabling BGP Best External

You can enable the BGP Best External feature in different modes, each of which protects VRFs in its own way:

- If you issue the **bgp advertise-best-external** command in VPNv4 address family configuration mode, it applies to all IPv4 VRFs. If you issue the command in this mode, you need not also issue it for specific VRFs.
- If you issue the **bgp advertise-best-external** command in IPv4 address-family configuration mode, it applies only that VRF.

# How to Configure BGP Best External

Perform the following tasks to enable the BGP Best External feature.

- [Enabling the BGP Best External Feature, page 5](#)
- [Verifying the BGP Best External Feature, page 7](#)

## Enabling the BGP Best External Feature

Perform the following task to enable the BGP Best External feature. In this task the configuration shown allows the BGP Best External feature to be configured in either IPv4 or VPNv4 address family. In VPNv4 address family configuration mode, the BGP Best External feature applies to all IPv4 VRFs and you do not have to configure it for specific VRFs as well. If you issue the **bgp advertise-best-external** command in IPv4 VRF address family configuration mode, the BGP Best External feature applies only that VRF.

### Prerequisites

- Configure the MPLS VPN and verify that it is working properly before configuring the BGP Best External feature. See [Configuring MPLS Layer 3 VPNs](#) for more information.
- Configure multiprotocol VRFs, which allows you to share route targets policies (import and export) between IPv4 and IPv6 or to configure separate route-target policies for IPv4 and IPv6 VPNs. For information on configuring multiprotocol VRFs, see [MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs](#).
- Ensure that the CE router is connected to the network by at least two paths.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *autonomous-system-number*
4. **address-family ipv4** [**unicast** | **vrf** *vrf-name*]  
or  
**address-family vpnv4** [**unicast**]
5. **bgp advertise-best-external**
6. **neighbor** *ip-address* **remote-as** *autonomous-system-number*
7. **neighbor** *ip-address* **activate**
8. **neighbor** *ip-address* **fall-over** [**bfd** | **route-map** *map-name*]
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>router bgp</b> <i>autonomous-system-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 40000                                                                                                                                                         | Enters router configuration mode for the specified routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 4 | <b>address-family ipv4</b> [ <b>unicast</b>   <b>vrf</b> <i>vrf-name</i> ]<br>or<br><b>address-family vpnv4</b> [ <b>unicast</b> ]<br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 unicast<br>or<br>Router(config-router)# address-family vpnv4 | Specifies the IPv4 or VPNv4 address family and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>unicast</b> keyword specifies the IPv4 or VPNv4 unicast address family.</li> <li>The <b>vrf</b> keyword and <i>vrf-name</i> argument specify the name of the virtual routing and forwarding (VRF) instance to associate with subsequent IPv4 address family configuration mode commands.</li> </ul>                                                                                                   |
| Step 5 | <b>bgp advertise-best-external</b><br><br><b>Example:</b><br>Router(config-router-af)# bgp advertise-best-external                                                                                                                                                   | Calculates and uses an external backup path and installs it into the RIB and Cisco Express Forwarding.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 6 | <b>neighbor ip-address remote-as</b> <i>autonomous-system-number</i><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 192.168.1.1 remote-as 45000                                                                                                        | Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local router. <ul style="list-style-type: none"> <li>By default, neighbors that are defined using the <b>neighbor remote-as</b> command in router configuration mode exchange only IPv4 unicast address prefixes. To exchange other address prefix types, neighbors must also be activated using the <b>neighbor activate</b> command in address family configuration mode for the other prefix types.</li> </ul> |
| Step 7 | <b>neighbor ip-address activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 192.168.1.1 activate                                                                                                                                                | Enables the neighbor to exchange prefixes for the IPv4 unicast address family with the local router.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|        | Command or Action                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                          |

| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                                                                                          | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                        |

## Verifying the BGP Best External Feature

Perform the following task to verify that the BGP Best External feature is configured correctly.

### SUMMARY STEPS

- enable**
- show vrf detail**
- show ip bgp ipv4 {mdt {all | rd | vrf} | multicast | tunnel | unicast}**  
or  
**show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [rib-failure] [ip-prefix/length [longer-prefixes]] [network-address [mask] [longer-prefixes]] [cidr-only] [community [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors [paths [line]] [peer-group] [quote-regexp] [regexp] [summary] [labels]**
- show bgp vpnv4 unicast vrf vrf-name ip-address**
- show ip route vrf vrf-name repair-paths ip-address**
- show ip cef vrf vrf-name ip-address detail**

### DETAILED STEPS

#### Step 1 enable

Use this command to enable privileged EXEC mode. Enter your password, if prompted. For example:

```
Router> enable
Router#
```

#### Step 2 show vrf detail

Use this command to verify that the BGP Best External feature is enabled. The following **show vrf detail** command output shows that the BGP Best External feature is enabled. (Relevant output is shown in bold).

```
Router# show vrf detail

VRF test1 (VRF Id = 1); default RD 400:1; default VPNID <not set>
  Interfaces:
    Se4/0
  Address family ipv4 (Table ID = 1 (0x1)):
    BGP Best External: enabled
```

```

Export VPN route-target communities
  RT:100:1          RT:200:1          RT:300:1
  RT:400:1
Import VPN route-target communities
  RT:100:1          RT:200:1          RT:300:1
  RT:400:1
No import route-map
No export route-map
VRF label distribution protocol: not configured
VRF label allocation mode: per-prefix
Prefix protection with additional path enabled
Address family ipv6 not active.

```

### Step 3 **show ip bgp ipv4 { mdt { all | rd | vrf } | multicast | tunnel | unicast }**

or

**show ip bgp vpnv4 { all | rd route-distinguisher | vrf vrf-name } [rib-failure] [ip-prefix/length [longer-prefixes]] [network-address [mask] [longer-prefixes]] [cidr-only] [community] [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors] [paths [line]] [peer-group] [quote-regexp] [regexp] [summary] [labels]**

Use this command to verify that the best external route is advertised. In the command output, the code b indicates a backup path and the code x designates the best external path. In the following example, the relevant output is shown in bold.

```
Router# show ip bgp vpnv4 all
```

```

BGP table version is 1104964, local router ID is 10.2.2.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
               r RIB-failure, S Stale, multipath, b backup-path, x best-external
Origin codes: i - IGP, e - EGP, ? - incomplete

```

| Network                                           | Next Hop        | Metric   | LocPrf | Weight       | Path |
|---------------------------------------------------|-----------------|----------|--------|--------------|------|
| Route Distinguisher: 11:12 (default for vrf blue) |                 |          |        |              |      |
| *>i1.0.0.1/32                                     | 10.10.3.3       | 0        | 200    | 0 1 ?        |      |
| * i                                               | 10.10.3.3       | 0        | 200    | 0 1 ?        |      |
| *                                                 | 10.0.0.1        |          |        | 0 1 ?        |      |
| <b>*bx</b>                                        | <b>10.0.0.1</b> | <b>0</b> |        | <b>0 1 ?</b> |      |
| *                                                 | 10.0.0.1        |          |        | 0 1 ?        |      |

### Step 4 **show bgp vpnv4 unicast vrf vrf-name ip-address**

Use this command to verify that the best external route is advertised. In the following example, the relevant output is shown in bold.

```
Router# show bgp vpnv4 unicast vrf vpn1 10.10.10.10
```

```

BGP routing table entry for 10:10:10.10.10.10/32, version 10
Paths: (2 available, best #1, table vpn1)
  Advertise-best-external
    Advertised to update-groups:
      1          2
    200
      10.6.6.6 (metric 21) from 10.6.6.6 (10.6.6.6)
      Origin incomplete, metric 0, localpref 200, valid, internal, best
      Extended Community: RT:1:1
      mpls labels in/out 23/23
    200
      10.1.2.1 from 10.1.2.1 (10.1.1.1)
      Origin incomplete, metric 0, localpref 100, valid, external, backup/repair,
      advertise-best-external
      Extended Community: RT:1:1 , recursive-via-connected
      mpls labels in/out 23/nolabel

```

**Step 5** `show ip route vrf vrf-name repair-paths ip-address`

Use this command to display the repair route, which is shown in bold.

```
Router# show ip route vrf vpn1 repair-paths
```

```
Routing Table: vpn1
```

```
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
        D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2
        i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
        ia - IS-IS inter area, * - candidate default, U - per-user static route
        o - ODR, P - periodic downloaded static route, H - NHRP
        + - replicated route, % - next hop override
```

```
Gateway of last resort is not set
```

```

      10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
B       10.1.1.0/24 [200/0] via 10.6.6.6, 00:38:33
          [RPR][200/0] via 10.1.2.1, 00:38:33
B       10.1.1.1/32 [200/0] via 10.6.6.6, 00:38:33
          [RPR][200/0] via 10.1.2.1, 00:38:33
      10.0.0.0/8 is variably subnetted, 3 subnets, 2 masks
C       10.1.2.0/24 is directly connected, Ethernet0/0
L       10.1.2.2/32 is directly connected, Ethernet0/0
B       10.1.6.0/24 [200/0] via 10.6.6.6, 00:38:33
          [RPR][200/0] via 10.1.2.1, 00:38:33
```

**Step 6** `show ip cef vrf vrf-name ip-address detail`

Use this command to display the best external route. In the following example, the relevant output is shown in bold.

```
Router# show ip cef vrf test 10.71.8.164 detail
```

```
10.71.8.164/30, epoch 0, flags rib defined all labels
recursive via 10.249.0.102 label 35
  nexthop 10.249.246.101 Ethernet0/0 label 25
recursive via 10.249.0.104 label 28, repair
  nexthop 10.249.246.101 Ethernet0/0 label 24
```

## Configuration Examples for BGP Best External

The following examples configure and then verify the BGP Best External feature:

- [Configuring the BGP Best External Feature: Example, page 9](#)

### Configuring the BGP Best External Feature: Example

The following example configures the BGP Best External feature in VPNv4 mode:

```
vrf definition test1
rd 400:1
route-target export 100:1
route-target export 200:1
route-target export 300:1
route-target export 400:1
route-target import 100:1
route-target import 200:1
```

```

route-target import 300:1
route-target import 400:1
address-family ipv4
exit-address-family
exit
!
interface Ethernet1/0
vrf forwarding test1
ip address 10.0.0.1 255.0.0.0
exit
!

# Feature Information for BGP Best External

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for BGP Best External

| Feature Name      | Releases                   | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# BGP PIC Edge for IP and MPLS-VPN

---

**First Published: November 20, 2009**

**Last Updated: November 25, 2009**

The BGP PIC Edge for IP and MPLS-VPN feature improves convergence after a network failure. This convergence is applicable to both core and edge failures and can be used in both IP and MPLS networks. BGP PIC Edge for IP and MPLS-VPN feature creates and stores a backup/alternate path in the routing information base (RIB), forwarding information base (FIB) and in Cisco Express Forwarding, so that when a failure is detected, the backup/alternate path can immediately take over, thus enabling fast failover.

Benefits of this feature include the following:

- An additional path for failover allows faster restoration of connectivity if a primary path is invalid or is withdrawn.
- Reduction of traffic loss.
- Constant convergence time so that the switching time is the same for all prefixes.

**Note**

---

In this document, the BGP PIC Edge for IP and MPLS-VPN feature is called “BGP PIC.”

---

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for BGP PIC” section on page 18](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

# Contents

- [Prerequisites for BGP PIC, page 2](#)
- [Restrictions for BGP PIC, page 2](#)
- [Information About BGP PIC, page 3](#)
- [How to Configure BGP PIC, page 11](#)
- [Configuration Examples for BGP PIC, page 13](#)
- [Additional References, page 17](#)
- [Feature Information for BGP PIC, page 18](#)

## Prerequisites for BGP PIC

- Ensure that the BGP and the IP or Multiprotocol Label Switching (MPLS) network is up and running with the customer site connected to the provider site by more than one path (multihomed).
- Ensure that the backup/alternate path has a unique next hop that is not the same as the nexthop of the best path.
- Enable Bidirectional Forwarding Detection (BFD) protocol to quickly detect link failures of directly connected neighbors.

## Restrictions for BGP PIC

The following restrictions apply to the BGP PIC feature:

- With BGP Multipath, the BGP PIC feature is already supported.
- In MPLS VPNs, the BGP PIC feature is not supported with MPLS VPN Inter-Autonomous Systems Option B.
- The BGP PIC feature supports prefixes only the IPv4 and VPNv4 address families.
- The BGP PIC feature cannot be configured with Multicast, L2VPNs, or IPv6 VPNs.
- If the route reflector is only in the control plane, then you do not need BGP PIC, because BGP PIC addresses data plane convergence.
- When two PE routers become each other's backup/alternate path to a CE router, traffic might loop if the CE router fails. Neither router will reach the CE router, and traffic will continue to be forwarded between the PE router until the time-to-live (TTL) timer expires.
- The BGP PIC feature does not support NSF/SSO. However, ISSU is supported if both route processors have the BGP PIC feature configured.
- The BGP PIC feature solves the traffic forwarding only for a single network failure at both edge and core.
- The BGP PIC feature does not work with the he BGP Best External feature. If you try to configure the BGP PIC feature after configuring the BGP Best External feature, you receive an error.

# Information About BGP PIC

Before configuring the BGP PIC feature, you should understand the following concepts:

- [How BGP Converges Under Normal Circumstances, page 3](#)
- [How BGP PIC Improves Convergence, page 3](#)
- [How a Failure Is Detected, page 5](#)
- [How BGP PIC Can Achieve Subsecond Convergence, page 5](#)
- [How BGP PIC Improves Upon the Functionality of MPLS VPN—BGP Local Convergence, page 6](#)
- [Configuration Modes for Enabling BGP PIC, page 6](#)
- [BGP PIC Scenarios, page 6](#)

## How BGP Converges Under Normal Circumstances

Under normal circumstances, BGP can take several seconds to a few minutes to converge after a network change. At a high level, BGP goes through the following process:

1. BGP learns of failures through either IGP or BFD events or interface events.
2. BGP withdraws the routes from the routing information base (RIB), and the RIB withdraws the routes from the forwarding information base (FIB) and distributed FIB (dFIB). This process clears the data path for the affected prefixes.
3. BGP sends withdraw messages to its neighbors.
4. BGP calculates the next best path to the affected prefixes.
5. BGP inserts the next best path for affected prefixes into the RIB, and the RIB installs them in the FIB and dFIB.

This process takes from a few seconds to a few minutes to complete depending on the latency of the network, the convergence time across the network, and the local load on the devices. The data plane converges only after the control plane converges.

## How BGP PIC Improves Convergence

BGP PIC functionality is achieved by additional functionality in the BGP, RIB, Cisco Express Forwarding, and MPLS.

- BGP Functionality

BGP PIC affects prefixes under the IPv4 and VPNv4 address families. For those prefixes, BGP calculates an additional second best path in addition to the primary best path. (The second best path is called the backup/alternate path.) BGP installs the best and backup/alternate paths for the affected prefixes into the BGP RIB. The backup/alternate path provides a fast reroute mechanism to counter a singular network failure. BGP also includes the alternate/backup path in its application programming interface (API) to the IP RIB.

- RIB Functionality

For BGP PIC, RIB installs an alternate path per route if one is available. With BGP PIC functionality, if the RIB selects a BGP route containing a backup/alternate path, it installs the backup/alternate path with the best path. The RIB also includes the alternate path in its API with the FIB.

- Cisco Express Forwarding (FIB) Functionality

With BGP PIC, Cisco Express Forwarding stores an alternate path per prefix. When the primary path goes down, Cisco Express Forwarding searches for the backup/alternate path when in a prefix independent manner. Cisco Express Forwarding also listens to BFD events to rapidly detect local failures.

- MPLS Functionality

MPLS Forwarding is similar to Cisco Express Forwarding in that it stores alternate paths and switches to an the alternate path if the primary path goes away.

When the BGP PIC feature is enabled, BGP calculates a backup/alternate path per prefix and installs them into BGP RIB, IP RIB, and FIB. This improves convergence after a network failure. There are two types of network failures that the BGP PIC feature detects:

- Core node/link failure (iBGP node failure): If a PE node/link fails, then the failure is detected through IGP convergence. IGP conveys the failure through the RIB to the FIB.
- Local link/immediate neighbor node failure (eBGP node/link failure): To detect a local link failure or eBGP single-hop peer node failure in less than a second, you must enable BFD. Cisco Express Forwarding looks for BFD events to detect a failure of an eBGP single-hop peer.

#### Convergence in the Data Plane

Upon detection of a failure, Cisco Express Forwarding detects the alternate nexthop for all prefixes affected by the failure. The data plane convergence is achieved in subseconds depending on whether the BGP PIC implementation exists software or hardware.

#### Convergence in the Control Plane Convergence

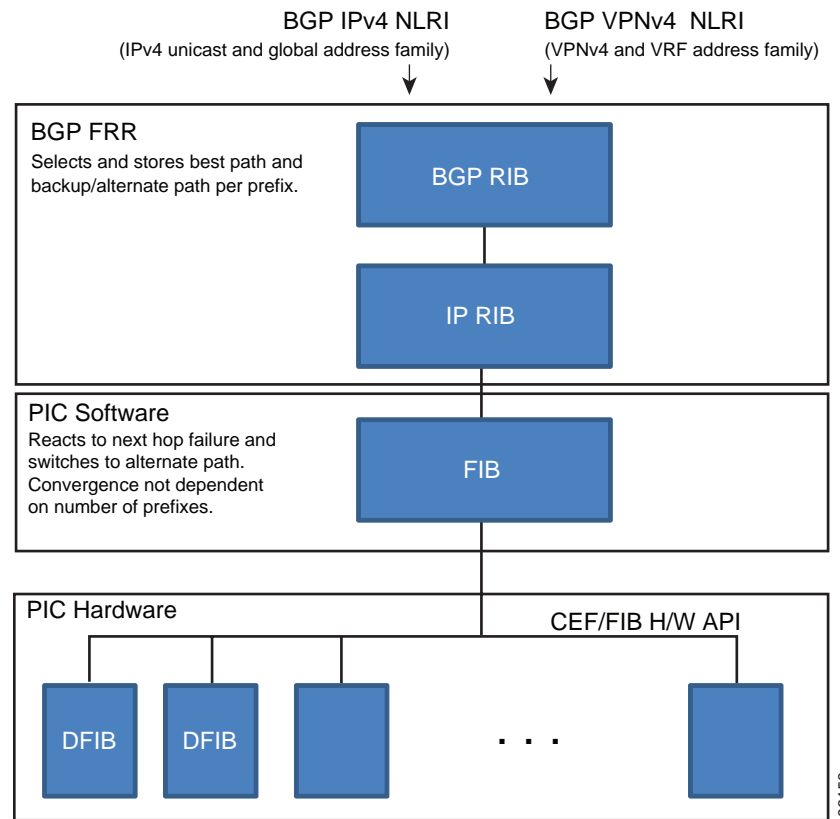

Upon detection of failure, BGP learns about the failure through IGP convergence or BFD events and sends withdraw messages for the prefixes, recalculating the best and backup/alternate paths, and advertising the next best path across the network.

## BGP Fast Reroute's Role in the BGP PIC Feature

BGP Fast Reroute (FRR) provides a best path and a backup/alternate path in BGP, RIB, and Cisco Express Forwarding. BGP FRR provides a very fast reroute mechanism into the RIB and Cisco Express Forwarding on the backup BGP next hop to reach a destination when the current best path is not available.

BGP FRR precomputes a second best path in BGP and gives it to the RIB and Cisco Express Forwarding as a backup/alternate path, and Cisco Express Forwarding programs it into line cards.

Therefore BGP FRR is responsible for the setup of the best path and backup/alternate path. The BGP PIC feature provides the ability for Cisco Express Forwarding to quickly switch the traffic to the other egress ports if the current next hop or the link to this next hop goes down. This is illustrated in [Figure 1](#).

**Figure 1** *BGP PIC Edge and BGP FRR*

196159

## How a Failure Is Detected

If the failure is detected in the IBGP (remote) peer, it is detected by IGP and can take a few seconds for the detection to occur. Convergence can occur in subseconds or seconds, depending on whether PIC is enabled on the line cards.

If the failure is with directly connected neighbors (EBGP), if you use BFD to detect when a neighbor has gone away, the detection is within a subsecond and the convergence can occur in subseconds or seconds, depending on whether PIC is enabled on the line cards.

## How BGP PIC Can Achieve Subsecond Convergence

The BGP PIC feature works at the Cisco Express Forwarding level, and Cisco Express Forwarding can be processed in hardware line cards and in software.

- For platforms that support Cisco Express Forwarding processing in the line cards, the BGP PIC feature can converge in subseconds. The 7600 router supports Cisco Express Forwarding processing in the line cards and thus can attain subsecond convergence.

- For platforms that do not use Cisco Express Forwarding in hardware line cards, Cisco Express Forwarding is achieved in the software. The BGP PIC feature will work with the Cisco Express Forwarding through the software and achieve convergence within seconds. The Cisco 10000 router and the Cisco ASR 1000 series router supports Cisco Express Forwarding in the software and thus can achieve convergence in seconds rather than milliseconds.

## How BGP PIC Improves Upon the Functionality of MPLS VPN—BGP Local Convergence

The BGP PIC feature is an enhancement to the [MPLS VPN—BGP Local Convergence](#) feature, which provides a failover mechanism that recalculates the best path and installs the new path in forwarding after a link failure. The feature maintains the local label for 5 minutes to ensure that the traffic uses the backup/alternate path, thus minimizing traffic loss.

The BGP PIC feature improves the LoC time to under a second by calculating a backup/alternate path in advance. When a link failure occurs, the traffic is sent to the backup/alternate path.

When you configure the BGP PIC feature, it will override the functionality of the [MPLS VPN—BGP Local Convergence](#) feature. You do not have to remove the **protection local-prefixes** command from the configuration.

## Configuration Modes for Enabling BGP PIC

Because many service provider networks contain many VRFs, the BGP PIC feature allows you to configure BGP PIC feature for all VRFs at once.

- VPNv4 address family configuration mode protects all the VRFs.
- VRF-IPv4 address family configuration mode protects only IPv4 VRFs.
- Global router configuration mode protects prefixes in the global routing table.

## BGP PIC Scenarios

The following scenarios explain how you can configure BGP PIC functionality to achieve fast convergence:

- [IP PE–CE Link and Node Protection on the CE Side \(Dual PEs\)](#), page 6
- [IP PE–CE Link and Node Protection on the CE Side \(Dual CEs and Dual PE Primary and Backup Nodes\)](#), page 7
- [IP MPLS PE–CE Link Protection for the Primary or Backup/Alternate Path](#), page 8
- [IP MPLS PE–CE Node Protection for Primary or Backup/Alternate Path](#), page 9

### IP PE–CE Link and Node Protection on the CE Side (Dual PEs)

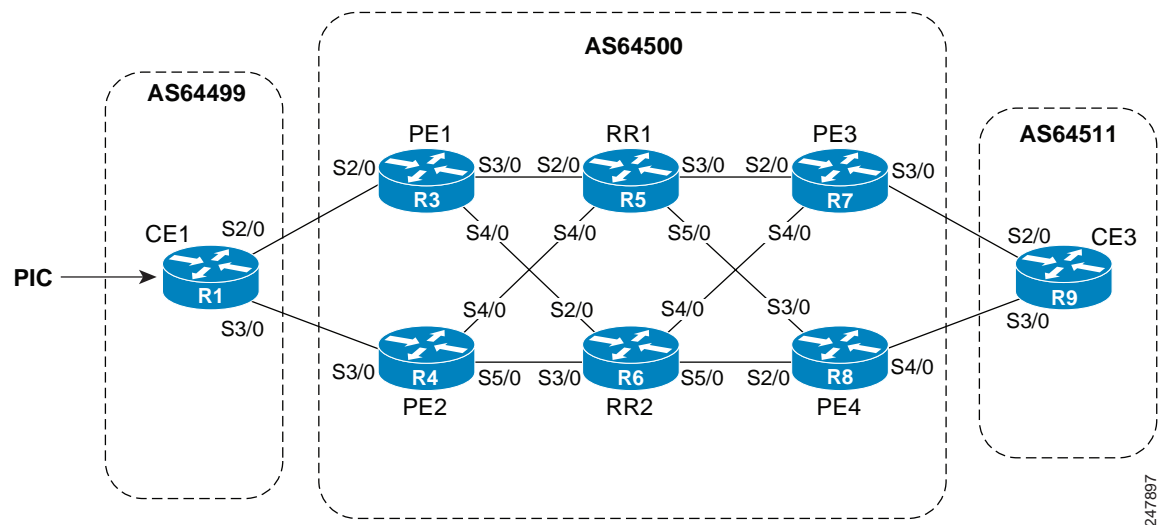

[Figure 2](#) shows a network that uses the BGP PIC feature. The network includes the following components:

- eBGP sessions exist between the PE and CE routers.
- Traffic from CE1 uses PE1 to reach network 192.168.9.0/24 through router CE3.

- CE1 has two paths:
  - PE1 as the primary path.
  - PE2 as the backup/alternate path.

CE1 is configured with the BGP PIC feature. BGP computes PE1 as the best path and PE2 as the backup/alternate path and installs both the routes into the RIB and Cisco Express Forwarding forwarding plane. When the CE1–PE1 link goes down, Cisco Express Forwarding detects the link failure and points the forwarding object to the backup/alternate path. Traffic is quickly rerouted due to local fast convergence in Cisco Express Forwarding.

**Figure 2** Using BGP PIC To Protect PE-CE Link

## IP PE–CE Link and Node Protection on the CE Side (Dual CEs and Dual PE Primary and Backup Nodes)

Figure 3 shows a network that uses the BGP PIC feature on CE1. The network includes the following components:

- eBGP sessions exist between the PE and CE routers.
- Traffic from CE1 uses PE1 to reach network 192.168.9.0/24 through router CE3.
- CE1 has two paths:
  - PE1 as the primary path.
  - PE2 as the backup/alternate path.
- An iBGP session exists between the CE1 and CE2 routers.

In this example, CE1 and CE2 are configured with the BGP PIC feature. BGP computes PE1 as the best path and PE2 as the backup/alternate path and installs both the routes into the RIB and Cisco Express Forwarding plane.

There should not be any policies set on CE1 and CE2 for the eBGP peers PE1 and PE2. Both CE routers must point to the external eBGP route as next hop. On CE1, the next hop to reach CE3 is through PE1, so PE1 is the best path to reach CE3. On CE2, the best path to reach CE3 is PE2. CE2 advertises to CE1 with itself as the next hop and CE1 does the same to CE2. As a result, CE1 has two paths for the specific

prefix and it usually selects the directly connected eBGP path over the iBGP path through the best path selection rules. Similarly, CE2 has two paths—an eBGP path through PE2 and an iBGP path through CE1–PE1.

When the CE1–PE1 link goes down, Cisco Express Forwarding detects the link failure and points the forwarding object to the backup/alternate node CE2. Traffic is quickly rerouted due to local fast convergence in Cisco Express Forwarding.

If the CE1–PE1 link or PE1 goes down and BGP PIC is enabled on CE1, BGP recomputes the best path, removing the next hop PE1 from RIB and reinstalling CE2 as the nexthop into the RIB and Cisco Express Forwarding. CE1 automatically gets a backup/alternate repair path into Cisco Express Forwarding and the traffic loss during forwarding is now in subseconds, thereby achieving fast convergence.

**Figure 3** Using BGP PIC in a Dual CE, Dual PE Network

## IP MPLS PE–CE Link Protection for the Primary or Backup/Alternate Path

Figure 3 shows a network that uses that uses the BGP PIC feature on CE1 and CE2. The network includes the following components:

- eBGP sessions exist between the PE and CE routers.
- The PE routers are VPNv4 iBGP peers with reflect routers in the MPLS network.
- Traffic from CE1 uses PE1 to reach network 192.168.9.0/24 through router CE3.
- CE3 is dual-homed with PE3 and PE4.
- PE1 has two paths to reach CE3 from the reflect routers:
  - PE3 is the primary path with the next hop as a PE3 address.
  - PE4 is the backup/alternate path with the next hop as a PE4 address.

In this example, all the PE routers can be configured with the BGP PIC feature under IPv4 or VPNv4 address families.

For BGP PIC to work in BGP for PE–CE link protection, set the policies on PE3 and PE4 for the prefixes received from CE3 so that one of the PE routers acts as primary and the other as backup/alternate. Usually this is done using local preference and giving better local preference to PE3. In the MPLS cloud, traffic internally flows through PE3 to reach CE3. PE1 thus has PE3 as the best path and PE4 as the second path.

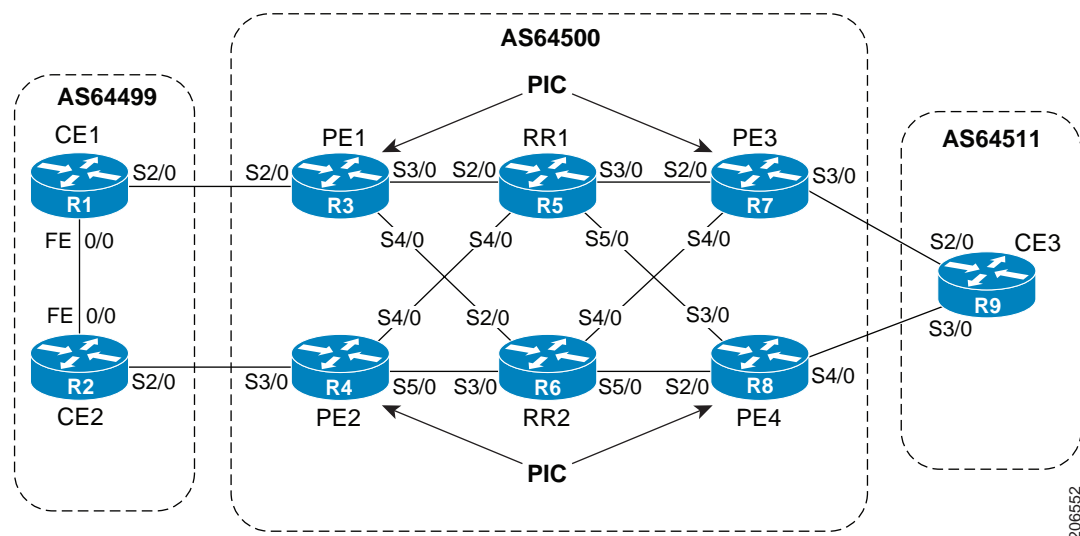

When the PE3–CE3 link goes down, Cisco Express Forwarding detects the link failure, PE3 recomputes the best path and selects PE4 as the best path and sends a withdraw for the PE3 prefix to the reflect routers. Some of the traffic goes through PE3–PE4 until BGP installs PE4 as the best path route into the RIB and Cisco Express Forwarding. PE1 receives the withdraw and recomputes the best path and selects PE4 as the best path and installs the routes into the RIB and Cisco Express Forwarding plane.

Thus, with BGP PIC enabled on PE3 and PE4, Cisco Express Forwarding detects the link failure and does in-place modification of the forwarding object to the backup/alternate node PE4 that already exists in Cisco Express Forwarding. PE4 knows that the backup/alternate path is locally generated and routes the traffic to the egress port connected to CE3. This way, traffic loss is minimized and fast convergence is achieved.

## IP MPLS PE–CE Node Protection for Primary or Backup/Alternate Path

Figure 4 shows a network that uses the BGP PIC feature on all the PE routers in an MPLS network.

**Figure 4** Enabling BGP PIC on All PEs Routers in the MPLS Network

The network includes the following components:

- eBGP sessions exist between the PE and CE routers.
- The PE routers are VPNv4 iBGP peers with reflect routers in the MPLS network.
- Traffic from CE1 uses PE1 to reach network 192.168.9.0/24 through router CE3.
- CE3 is dual-homed with PE3 and PE4.
- PE1 has two paths to reach CE3 from the reflect routers:
  - PE3 is the primary path with the next hop as a PE3 address.
  - PE4 is the backup/alternate path with the next hop as a PE4 address.

In this example, all the PE routers are configured with the BGP PIC feature under IPv4 and VPNv4 address families.

For BGP PIC to work in BGP for the PE–CE node protection, set the policies on PE3 and PE4 for the prefixes received from CE3 such that one of the PE routers acts as primary and the other as backup/alternate. Usually this is done using local preference and giving better local preference to PE3. In the MPLS cloud, traffic internally flows through PE3 to reach CE3. So PE1 has PE3 as the best path and PE4 as the second path.

When PE3 goes down, PE1 knows about the removal of the host prefix by IGP in subseconds and recomputes the best path and selects PE4 as the best path and installs the routes into the RIB and Cisco Express Forwarding forwarding plane. Normal BGP convergence will happen, while BGP PIC is redirecting the traffic through PE4. Thus, packets are not lost.

Thus, with BGP PIC enabled on PE3 Cisco Express Forwarding detects the node failure on PE3 and points the forwarding object to the backup/alternate node PE4. PE4 knows that the backup/alternate path is locally generated and routes the traffic to the egress port using the backup/alternate path. This way, traffic loss is minimized.

#### **No local policies set on the PE routers**

PE1 and PE2 point to the eBGP CE paths as the next hop with no local policy. Each of the PE routers receives the other's path and BGP calculates the backup/alternate path and installs it into Cisco Express Forwarding along with its own eBGP path towards CE as the best path. The limitation of the MPLS PE–CE link and node protection solutions is that you cannot change BGP policies. They should work without the need of a best-external path.

#### **Local policies set on the PE routers**

Whenever there is a local policy on the PE routers to select one of the PE routers as the primary path to reach the egress CE, the `bgp advertise-best-external` command is needed on the backup/alternate node PE3 to propagate the external CE routes with a backup/alternate label into the route reflectors and the far-end PE routers.

## **Cisco Express Forwarding Recursion**

Recursion is the ability to find the next longest matching path when the primary path goes away.

When the BGP PIC feature is not installed, if the next hop to a prefix fails, Cisco Express forwarding finds the next path to reach the prefix by recursing through the FIB to find the next longest matching path to the prefix. This is useful if the next hop is multiple hops away and there is more than one way of reaching the next hop.

However with the of BGP PIC feature, you want to disable Cisco Express Forwarding recursion, for the following reasons:

- Recursion slows down convergence when Cisco Express Forwarding searches all the FIB entries.
- BGP PIC Edge already precomputes an alternate path, thus eliminating the need for CEF recursion.

When BGP PIC functionality is enabled, Cisco Express Forwarding recursion is disabled by default for two conditions :

- For next hops learned with a /32 network mask (host routes)
- For next hops that are directly connected

For all other cases, Cisco Express Forwarding recursion is enabled.

As part of BGP PIC functionality, you can issue the **bgp recursion host** command to disable or enable Cisco Express Forwarding recursion for BGP host routes.

To disable or enable Cisco Express Forwarding recursion for BGP directly connected next hops, you can issue the **disable-connected-check** command.

## How to Configure BGP PIC

Configuring the BGP PIC feature consists of the following task:

- [Enabling BGP PIC, page 11](#)

### Enabling BGP PIC

Because many service provider networks contain many VRFs, the BGP PIC feature allows you to configure BGP PIC feature for all VRFs at once.

- VPNv4 address family configuration mode protects all the VRFs.
- VRF-IPv4 address family configuration mode protects only IPv4 VRFs.
- Global router configuration mode protects prefixes in the global routing table.

For a full configuration example that includes configuring multiprotocol VRFs and show output to verify that the feature is enabled, see the “[Configuring BGP PIC: Example](#)” section on page 13.

### Prerequisites

- If you are implementing the BGP PIC feature in an MPLS VPN, ensure the network is working properly before configuring the BGP PIC feature. See [Configuring MPLS Layer 3 VPNs](#) for more information.
- If you are implementing the BGP PIC feature in an MPLS VPN, configure multiprotocol VRFs, which allows you to share route-targets policies (import and export) between IPv4 and IPv6 or to configure separate route-target policies for IPv4 and IPv6 VPNs. For information on configuring multiprotocol VRFs, see [MPLS VPN—VRF CLI for IPv4 and IPv6 VPNs](#).
- Ensure that the CE router is connected to the network by at least two paths.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *autonomous-system-number*
4. **address-family ipv4** [**unicast** | **vrf** *vrf-name*]  
or  
**address-family vpnv4** [**unicast**]
5. **bgp additional-paths install**
6. **neighbor** *ip-address* **remote-as** *autonomous-system-number*
7. **neighbor** *ip-address* **activate**
8. **bgp recursion host**

9. **neighbor ip-address fall-over** [bfd | **route-map** *map-name*]
10. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>router bgp</b> <i>autonomous-system-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 40000                                                                                                                                                         | Enters router configuration mode for the specified routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 4 | <b>address-family ipv4</b> [ <b>unicast</b>   <b>vrf</b> <i>vrf-name</i> ]<br>or<br><b>address-family vpnv4</b> [ <b>unicast</b> ]<br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 unicast<br>or<br>Router(config-router)# address-family vpnv4 | Specifies the IPv4 or VPNv4 address family and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>unicast</b> keyword specifies the IPv4 or VPNv4 unicast address family.</li> <li>The <b>vrf</b> keyword and <i>vrf-name</i> argument specify the name of the virtual routing and forwarding (VRF) instance to associate with subsequent IPv4 address family configuration mode commands.</li> </ul>                                                                                                   |
| Step 5 | <b>bgp additional-paths install</b><br><br><b>Example:</b><br>Router(config-router-af)# bgp additional-paths install                                                                                                                                                 | Calculates a backup/alternate path and installs it into the RIB and Cisco Express Forwarding.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 6 | <b>neighbor ip-address remote-as</b> <i>autonomous-system-number</i><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 192.168.1.1 remote-as 45000                                                                                                        | Adds the IP address of the neighbor in the specified autonomous system to the IPv4 multiprotocol BGP neighbor table of the local router. <ul style="list-style-type: none"> <li>By default, neighbors that are defined using the <b>neighbor remote-as</b> command in router configuration mode exchange only IPv4 unicast address prefixes. To exchange other address prefix types, neighbors must also be activated using the <b>neighbor activate</b> command in address family configuration mode for the other prefix types.</li> </ul> |
| Step 7 | <b>neighbor ip-address activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 192.168.1.1 activate                                                                                                                                                | Enables the neighbor to exchange prefixes for the IPv4 unicast address family with the local router.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|         | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                 |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 8  | <b>bgp recursion host</b><br><br><b>Example:</b><br>Router(config-router-af)# bgp recursion host                                                      | (Optional) Enables the recursive-via-host flag for IPv4, VPNv4, and VRF address families. <ul style="list-style-type: none"> <li>When the BGP PIC feature is enabled, Cisco Express Forwarding recursion is disabled. Under most circumstances, you do not want to enable recursion when BGP PIC is enabled.</li> </ul> |
| Step 9  | <b>neighbor ip-address fall-over [bfd  route-map map-name]</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 192.168.1.1 fall-over bfd | Enables BFD protocol support to detect when a neighbor has gone away, which can occur within a subsecond.                                                                                                                                                                                                               |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                                                    | Exits address family configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                |

## Configuration Examples for BGP PIC

The following examples configure and then verify the BGP PIC feature:

- [Configuring BGP PIC: Example, page 13](#)
- [Displaying Backup/Alternate Paths for BGP PIC: Example, page 14](#)

### Configuring BGP PIC: Example

The following example configures the BGP PIC feature in VPNv4 address-family configuration mode, which enables the feature on all VRFs. (The **bgp additional-paths install** command is shown in bold.) In the following example there are two VRFs defined: blue and green. All the VRFs, including those in VRFs blue and green are protected by backup/alternate paths.

```
vrf definition test1

```

The following **show vrf detail** command output shows that the BGP PIC feature is enabled. (Relevant output is shown in bold)

```

Router# show vrf detail

VRF test1 (VRF Id = 1); default RD 400:1; default VPNID <not set>
  Interfaces:
    Se4/0
  Address family ipv4 (Table ID = 1 (0x1)):
    Export VPN route-target communities
      RT:100:1          RT:200:1          RT:300:1
      RT:400:1
    Import VPN route-target communities
      RT:100:1          RT:200:1          RT:300:1
      RT:400:1
    No import route-map
    No export route-map
    VRF label distribution protocol: not configured
    VRF label allocation mode: per-prefix
    Prefix protection with additional path enabled
  Address family ipv6 not active.

```

## Displaying Backup/Alternate Paths for BGP PIC: Example

The command output in the following example shows that the VRFs in VRF blue have backup/alternate paths. The relevant command output is shown in bold.

```

Router# show ip bgp vpnv4 vrf blue 10.0.0.0

```

```

BGP routing table entry for 10:12:12.0.0/24, version 88
Paths: (4 available, best #1, table blue)
  Additional-path
    Advertised to update-groups:
      6
    1, imported path from 12:23:12.0.0/24
      10.3.3.3 (metric 21) from 10.6.6.6 (10.6.6.6)
        Origin incomplete, metric 0, localpref 200, valid, internal, best
        Extended Community: RT:12:23
        Originator: 10.3.3.3, Cluster list: 10.0.0.1 , recursive-via-host
        mpls labels in/out nolabel/37
    1, imported path from 12:23:12.0.0/24
      10.13.13.13 (via green) from 10.13.13.13 (10.0.0.2)
        Origin incomplete, metric 0, localpref 100, valid, external
        Extended Community: RT:12:23 , recursive-via-connected
    1, imported path from 12:23:12.0.0/24
      10.3.3.3 (metric 21) from 10.7.7.7 (10.7.7.7)
        Origin incomplete, metric 0, localpref 200, valid, internal
        Extended Community: RT:12:23
        Originator: 10.3.3.3, Cluster list: 10.0.0.1 , recursive-via-host
        mpls labels in/out nolabel/37
    1
      10.11.11.11 from 10.11.11.11 (1.0.0.1)
        Origin incomplete, metric 0, localpref 100, valid, external, backup/repair
        Extended Community: RT:11:12 , recursive-via-connected

```

The command output in the following example shows that the VRFs in VRF green have backup/alternate paths. The relevant command output is shown in bold.

```
Router# show ip bgp vpnv4 vrf green 12.0.0.0
```

```

BGP routing table entry for 12:23:12.0.0/24, version 87
Paths: (4 available, best #4, table green)
  Additional-path

## Feature Information for BGP PIC

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS, Catalyst OS, and Cisco IOS XE software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1**      **Feature Information for BGP PIC**

| Feature Name                     | Releases                   | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# MPLS VPN—L3VPN over GRE

---

**First Published: September 29, 2008**

**Last Updated: November 20, 2009**

The MPLS VPN—L3VPN over GRE feature provides a mechanism for tunneling Multiprotocol Label Switching (MPLS) packets over a non-MPLS network.

The MPLS VPN—L3VPN over GRE feature utilizes MPLS over generic routing encapsulation (MPLSoGRE) to encapsulate MPLS packets inside IP tunnels. This action creates a virtual point-to-point link across non-MPLS networks.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS VPN—L3VPN over GRE”](#) section on page 11.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Feature Information for MPLS VPN—L3VPN over GRE, page 11](#)

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Prerequisites for MPLS VPN—L3VPN over GRE

Before you configure the MPLS VPN—L3VPN over GRE feature, ensure that your MPLS Virtual Private Network (VPN) is configured and working properly. See the [Configuring MPLS Layer 3 VPNs](#) module for information about setting up MPLS VPNs.

Ensure that the following routing protocols are configured and working properly:

- Label Distribution Protocol (LDP)—for MPLS label distribution. See [MPLS Label Distribution Protocol Overview](#).
- Multiprotocol Border Gateway Protocol (MP-BGP)—for VPN route and label distribution. See [Configuring MPLS Layer 3 VPNs](#).

## Restrictions for MPLS VPN—L3VPN over GRE

The MPLS VPN—L3VPN over GRE feature does not support the following:

- Quality of service (QoS) service policies configured on the tunnel interface; they are supported on the physical or subinterface
- GRE options: sequencing, checksum, and source route
- IPv6 GRE
- Advanced features such as Carrier Supporting Carrier (CSC) and Interautonomous System (Inter-AS)

## Information About MPLS VPN—L3VPN over GRE

The MPLS VPN—L3VPN over GRE feature provides a mechanism for tunneling MPLS packets over non-MPLS networks.

MPLS VPN—L3VPN over GRE allows you to create a GRE tunnel across a non-MPLS network. The MPLS packets are encapsulated within the GRE tunnel packets, and the encapsulated packets traverse the non-MPLS network through the GRE tunnel. When GRE tunnel packets are received at the other side of the non-MPLS network, the GRE tunnel packet header is removed and the inner MPLS packet is forwarded to its final destination.

The MPLS VPN—L3VPN over GRE feature supports three GRE tunnel configurations:

- [PE-to-PE Tunneling, page 2](#)
- [P-to-PE Tunneling, page 3](#)
- [P-to-P Tunneling, page 4](#)

## PE-to-PE Tunneling

The provider edge-to-provider edge (PE-to-PE) tunneling configuration provides a scalable way to connect multiple customer networks across a non-MPLS network. With this configuration, traffic that is destined to multiple customer networks is multiplexed through a single GRE tunnel.

**Note**

A similar nonscalable alternative is to connect each customer network through separate GRE tunnels (for example, connecting one customer network for each GRE tunnel).

As shown in [Figure 1](#), the PE routers assign VPN routing and forwarding (VRF) numbers to the customer edge (CE) routers on each side of the non-MPLS network.

The PE routers use routing protocols such as BGP, OSPF, or Routing Information Protocol (RIP) to learn about the IP networks behind the CE routers. The routes to the IP networks behind the CE routers are stored in the associated CE router's VRF routing table.

The PE router on one side of the non-MPLS network uses the routing protocols (that are operating within the non-MPLS network) to learn about the PE router on the other side of the non-MPLS network. The learned routes that are established between the PE routers are then stored in the main or default routing table.

The opposing PE router uses BGP to learn about the routes that are associated with the customer networks behind the PE routers. These learned routes are not known to the non-MPLS network.

For this example, BGP defines a static route to the BGP neighbor (the opposing PE router) through the GRE tunnel that spans the non-MPLS network. Because the routes that are learned by the BGP neighbor include the GRE tunnel next hop, all customer network traffic is sent using the GRE tunnel.

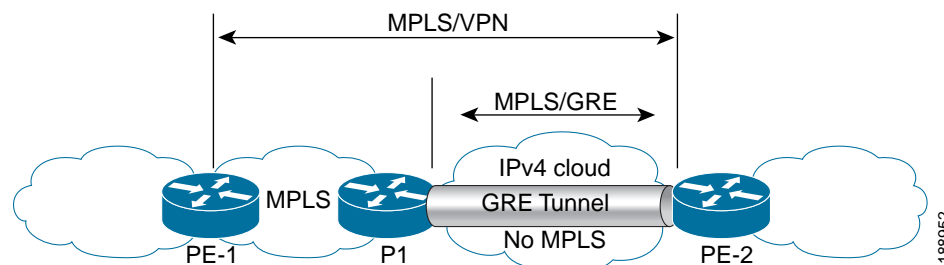

**Figure 1** PE-to-PE Tunneling

## P-to-PE Tunneling

As shown in [Figure 2](#), the provider-to-provider edge (P-to-PE) tunneling configuration provides a way to connect a PE router (P1) to an MPLS segment (PE-2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single GRE tunnel.

**Figure 2** P-to-PE Tunneling

## P-to-P Tunneling

As shown in [Figure 3](#), the provider-to-provider (P-to-P) configuration provides a method of connecting two MPLS segments (P1 to P2) across a non-MPLS network. In this configuration, MPLS traffic that is destined to the other side of the non-MPLS network is sent through a single GRE tunnel.

**Figure 3** P-to-P Tunneling

## How to Configure MPLS VPN—L3VPN over GRE

This section contains the following procedure:

- [Configuring the MPLS VPN—L3VPN over GRE Tunnel Interface, page 4](#) (required)

### Configuring the MPLS VPN—L3VPN over GRE Tunnel Interface

To configure the MPLS VPN—L3VPN over GRE feature, you must create a GRE tunnel to span the non-MPLS networks. You must perform this procedure on the devices located at both ends of the GRE tunnel.

### Prerequisites

Before configuring the MPLS VPN—L3VPN over GRE feature, ensure that your MPLS VPN and the appropriate routing protocols are configured and working properly. See the [“Prerequisites for MPLS VPN—L3VPN over GRE”](#) section on page 2.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface tunnel** *tunnel-number*
4. **ip route** *prefix mask* { *ip-address* | *interface-type interface-number* [*ip-address*] } [**dhcp**] [*distance*] [*name next-hop-name*] [**permanent** | **track** *number*] [**tag** *tag*]
5. **tunnel source** *source-address*
6. **tunnel destination** *destination-address*

7. **mpls ip**
8. **exit**
9. **show ip route**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                          |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                                                                                                                      | Enters global configuration mode.                                                                                |
| Step 3 | <b>interface tunnel</b> <i>tunnel-number</i><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                                                                                                                                                                                                                                           | Creates a tunnel on the specified interface and enters interface configuration mode.                             |
| Step 4 | <b>ip route</b> <i>prefix mask {ip-address   interface-type interface-number [ip-address]}</i><br>[ <b>dhcp</b> ] [ <b>distance</b> ] [ <b>name</b> <i>next-hop-name</i> ]<br>[ <b>permanent</b>   <b>track</b> <i>number</i> ] [ <b>tag</b> <i>tag</i> ]<br><br><b>Example:</b><br>Router(config-if)# ip route 209.165.200.253<br>255.255.255.224 FastEthernet 0/0 | Configures a static route to the BGP neighbor on the SIP 2 interface or tunnel interface.                        |
| Step 5 | <b>tunnel source</b> <i>source-address</i><br><br><b>Example:</b><br>Router(config-if)# tunnel source<br>209.165.200.254                                                                                                                                                                                                                                            | Specifies the tunnel's source IP address.                                                                        |
| Step 6 | <b>tunnel destination</b> <i>destination-address</i><br><br><b>Example:</b><br>Router(config-if)# tunnel destination<br>209.165.200.255                                                                                                                                                                                                                             | Specifies the tunnel's destination IP address.                                                                   |
| Step 7 | <b>mpls ip</b><br><br><b>Example:</b><br>Router(config-if)# mpls ip                                                                                                                                                                                                                                                                                                 | Enables MPLS on the tunnel's physical interface.                                                                 |

|        | Command or Action                                                            | Purpose                                                                              |
|--------|------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| Step 8 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                | Exits the interface configuration mode.                                              |
| Step 9 | <b>show ip route</b><br><br><b>Example:</b><br>Router(config)# show ip route | Displays the unicast routes and configures a static route globally or on the tunnel. |

## Examples

The following example shows a GRE tunnel configuration that spans a non-MPLS network. This example shows the tunnel configuration on the PE devices (PE1 and PE2) located at both ends of the tunnel:

### PE1 Configuration

```
Router# configure terminal
Router(config)# interface Tunnel 1
Router(config-if)# ip address 209.165.200.253 255.255.255.224
Router(config-if)# tunnel source 209.165.200.254
Router(config-if)# tunnel destination 209.165.200.255
Router(config-if)# mpls ip
```

### PE2 Configuration

```
Router# configure terminal
Router(config)# interface Tunnel 1
Router(config-if)# ip address 209.165.200.235 255.255.255.224
Router(config-if)# tunnel source 209.165.200.240
Router(config-if)# tunnel destination 209.165.200.245
Router(config-if)# mpls ip
```

## Configuration Examples for MPLS VPN—L3VPN over GRE

This section provides the following configuration example for the MPLS VPN—L3VPN over GRE feature:

- [MPLS Configuration with MPLS VPN—L3VPN over GRE: Example, page 6](#)
- [Display of Unicast Routes: Example, page 8](#)

## MPLS Configuration with MPLS VPN—L3VPN over GRE: Example

The following basic MPLS configuration example uses a GRE tunnel to span a non-MPLS network. This example is similar to the configuration shown in [Figure 1 on page 3](#).

### PE1 Configuration

```
!
mpls ip
!
ip vrf vpn1
```

```

rd 100:1
route-target import 100:1
route-target export 100:1
!
interface loopback 0
ip address 209.165.200.225 255.255.255.224
!
interface GigabitEthernet 0/1/2
ip address 209.165.200.226 255.255.255.224
!
interface Tunnel 1
ip address 209.165.200.227 255.255.255.224
tunnel source 209.165.200.228
tunnel destination 209.165.200.229
mpls ip
!
interface GigabitEthernet 0/1/3
ip vrf forwarding vpn1
ip address 209.165.200.230 255.255.255.224
!
router bgp 100
neighbor 209.165.200.231 remote-as 100
neighbor 209.165.200.231 update-source loopback0
!
address-family vpnv4
neighbor 209.165.200.232 activate
neighbor 209.165.200.232 send community-extended
!
address-family ipv4 vrf vpn1
neighbor 209.165.200.240 remote-as 20
neighbor 209.165.200.240 activate
!

```

### PE2 Configuration

```

!
mpls ip
!
ip vrf vpn1
rd 100:1
route-target import 100:1
route-target export 100:1
!
interface loopback 0
ip address 209.165.200.240 255.255.255.224
!
interface GigabitEthernet 0/1/1
ip address 209.165.200.241 255.255.255.224
!
interface Tunnel 1
ip address 209.165.200.244 255.255.255.224
tunnel source 209.165.200.245
tunnel destination 209.165.200.247
mpls ip
!
interface GigabitEthernet 0/0/5
ip vrf forwarding vpn1
ip address 209.165.200.249 255.255.255.224
!
router bgp 100
neighbor 209.165.200.250 remote-as 100
neighbor 209.165.200.252 update-source loopback0
!
address-family vpnv4

```

```

neighbor 209.165.200.253 activate
neighbor 209.165.200.254 send community-extended
!
address-family ipv4 vrf vpn1
neighbor 209.165.200.254 remote-as 30
neighbor 209.165.200.255 activate

```

## Display of Unicast Routes: Example

The following example shows the display of unicast routes. This display shows the next hop for the BGP neighbor depending on the selected interface.

```

Router# show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route

Gateway of last resort is not set

    209.165.200.225/32 is subnetted, 1 subnets
O      209.165.200.226 [110/3] via 209.165.200.250, 00:09:55, POS2/0/0
    209.165.200.227/32 is subnetted, 1 subnets
C      209.165.200.229 is directly connected, Loopback0
    209.165.200.230/32 is subnetted, 1 subnets
O      209.165.200.231 [110/2] via 209.165.200.232, 00:09:55, POS2/0/0
S      209.165.200.240/8 [1/0] via 209.165.200.252
    209.165.200.245/32 is subnetted, 2 subnets
S      209.165.200.247 is directly connected, POS2/0/0
O      209.165.200.248 [110/3] via 209.165.200.249, 00:09:55, POS2/0/0
C      209.165.200.254/8 is directly connected, POS2/0/0

```

# Feature Information for MPLS VPN—L3VPN over GRE

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for MPLS VPN—L3VPN over GRE

| Feature Name                    | Releases                                           | Feature Information                                                                                                                                                                                |

# Dynamic Layer 3 VPNs with Multipoint GRE Tunnels

---

**First Published: January 23, 2003**

**Last Updated: November 20, 2009**

The Dynamic Layer 3 VPNs with Multipoint GRE Tunnels feature provides a Layer-3 (L3) transport mechanism based on an enhanced multipoint generic routing encapsulation (mGRE) tunneling technology for use in IP networks. The dynamic Layer-3 tunneling transport can also be used within IP networks to transport Virtual Private Network (VPN) traffic across service provider and enterprise networks, and to provide interoperability for packet transport between IP and Multiprotocol Label Switching (MPLS) VPNs. This feature provides support for RFC 2547, which defines the outsourcing of IP backbone services for enterprise networks.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for Dynamic L3 VPNs with mGRE Tunnels”](#) section on page 24.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Dynamic L3 VPNs with mGRE Tunnels

Before you configure the Dynamic Layer 3 VPNs with Multipoint GRE Tunnels feature, ensure that your MPLS VPN is configured and working properly. See the “[Configuring MPLS Layer 3 VPNs](#)” module for information about setting up MPLS VPNs.

## Restrictions for Dynamic L3 VPNs with mGRE Tunnels

- MPLS VPN over mGRE is supported on the Cisco 7600 series routers using the ES-40 line card and the SIP 400 line card as core facing cards.
- Tunnelled tag traffic must enter the router through a line card, which supports MPLS VPN over mGRE. The supported line cards are the ES-40 and the SIP-400.
- The deployment of MPLS VPN using both IP/GRE and MPLS encapsulation within a single network is not supported.
- Each provider edge (PE) router supports one tunnel configuration only.
- MPLS VPN of mGRE does not support the transportation of multicase traffic between VPNs.
- MPLS VPN over mGRE supports a maximum of 4,000 tunnel endpoints per tunnel instance. However, hardware limitations may reduce the number of tunnel endpoints.

## Information About Dynamic L3 VPNs with mGRE Tunnels

You can configure mGRE tunnels to create a multipoint tunnel network that overlays an IP backbone. This overlay connects PE routers to transport VPN traffic.

In addition, when MPLS VPNs are configured over mGRE you can deploy L3 PE-based VPN services using a standards based IP core. This allows you to provision the VPN services without using the overlay method. When MPLS VPN over mGRE is configured, the system uses IPv4-based mGRE tunnels to encapsulate VPN-labeled IPv4 and IPv6 packets between PEs.

This section contains information on the following:

- [Layer 3 mGRE Tunnels, page 2](#)
- [MPLS VPN over mGRE, page 4](#)

## Layer 3 mGRE Tunnels

By configuring mGRE tunnels, you create a multipoint tunnel network as an overlay to the IP backbone. This overlay interconnects the PE routers to transport VPN traffic through the backbone. This multipoint tunnel network uses Border Gateway Protocol (BGP) to distribute VPNv4 routing information between PE routers maintaining the peer relationship between the service provider or enterprise network and customer sites. The advertised next hop in BGP VPNv4 triggers tunnel endpoint discovery. This feature

provides the ability for multiple service providers to cooperate and offer a joint VPN service with traffic tunneled directly from the ingress PE router at one service provider directly to the egress PE router at a different service provider site.

In addition to providing the VPN transport capability, the mGRE tunnels create a full-mesh topology and reduce the administrative and operational overhead previously associated with a full mesh of point-to-point tunnels used to interconnect multiple customer sites. The configuration requirements are greatly reduced and enables the network to grow with minimal additional configuration.

Dynamic L3 tunnels provide for better scaling when creating partial-mesh or full-mesh VPNs. Adding new remote VPN peers is simplified because only the new router needs to be configured. The new address is learned dynamically and propagated to the nodes in the network. The dynamic routing capability dramatically reduces the size of configuration needed on all routers in the VPN, such that with the use of multipoint tunnels, only one tunnel interfaced needs to be configured on a PE that services many VPNs. The L3 mGRE tunnels need to be configured only on the PE router. Features available with GRE are still available with mGRE, including dynamic IP routing and IP multicast and Cisco Express Forwarding (CEF) switching of mGRE/Next Hop Routing Protocol (NHRP) tunnel traffic.

The following sections describe how the mGRE tunnels are used:

- [Interconnecting Provider Edge Routers Within an IP Network, page 3](#)
- [Packet Transport Between IP and MPLS Networks, page 4](#)
- [BGP Next Hop Verification, page 4](#)

## Interconnecting Provider Edge Routers Within an IP Network

The Dynamic Layer 3 VPNs with Multipoint GRE Tunnels feature allows you to create a multi access tunnel network to interconnect the PE routers servicing your IP network. This tunnel network transports IP VPN traffic to all of the PE routers. [Figure 1](#) illustrates the tunnel overlay network used in an IP network to transport VPN traffic between the PE routers.

**Figure 1** mGRE Tunnel Overlay Connecting PE Routers within an IP Network

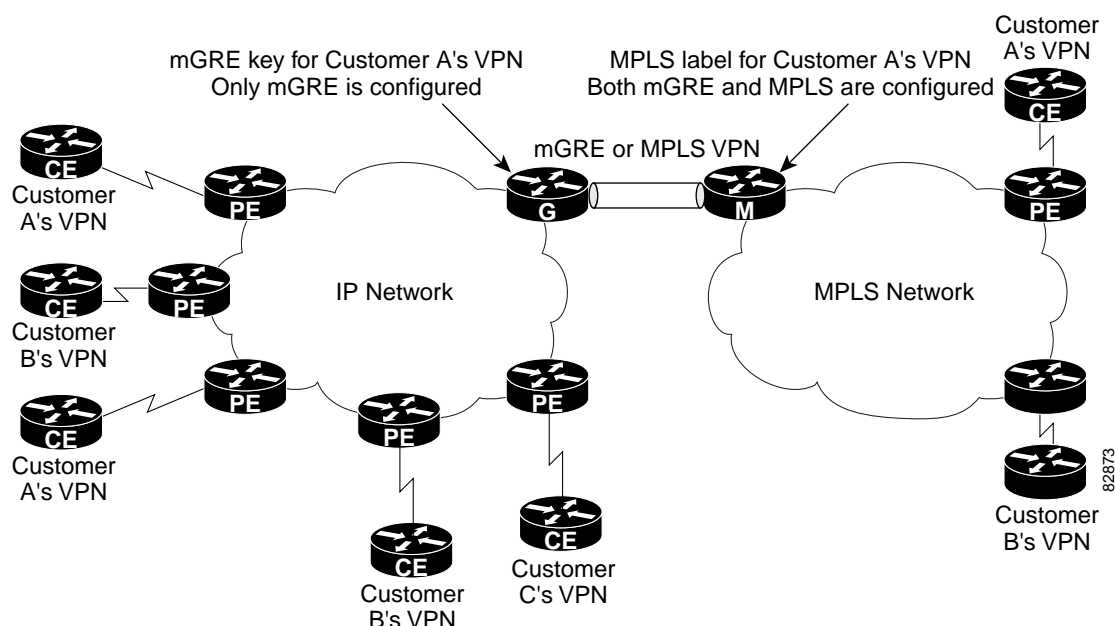

The multi access tunnel overlay network provides full connectivity between PE routers. The PE routers exchange VPN routes using BGP as defined in RFC 2547. IP traffic is redirected through the multipoint tunnel overlay network using distinct IP address spaces for the overlay and transport networks and by changing the address space instead of changing the numerical value of the address.

## Packet Transport Between IP and MPLS Networks

Layer 3 mGRE tunnels can be used as a packet transport mechanism between IP and MPLS networks. To enable the packet transport between the two different protocols, one PE router on one side of the connection between the two networks must run MPLS. [Figure 2](#) shows how mGRE tunnels can be used to transport VPN traffic between PE routers.

**Figure 2** mGRE Used to Transport VPN Traffic Between IP and MPLS Network

For the packet transport to occur between the IP and MPLS network, the MPLS VPN label is mapped to the GRE key. The mapping takes place on the router where both mGRE and MPLS are configured. In [Figure 2](#) the mapping of the label to the key occurs on Router M, which sits on the MPLS network.

## BGP Next Hop Verification

BGP performs the BGP path selection, or next hop verification, at the PE. For a BGP path to a network to be considered in the path selection process, the next hop for the path must be reachable in the Interior Gateway Protocol (IGP). When an IP prefix is received and advertised as the next hop IP address, the IP traffic is tunneled from the source to the destination by switching the address space of the next hop.

## MPLS VPN over mGRE

GRE is a point-to-point tunneling protocol where two peers form the endpoints of the tunnel. It is designed to encapsulate network-layer packets inside IP tunneling packets. mGRE is a similar protocol with a single endpoint at one side of the tunnel connected to multiple endpoints at the other side of the

tunnel. The mGRE tunnel provides a common link between branch offices that connect to the same VPN. As GRE requires a full mesh topology, mGRE uses a point-to-multipoint topology and therefore requires fewer tunnels.

MPLS is a widely deployed VPN internet architecture. MPLS requires that all core routers in the network support MPLS. This feature is useful in networks where the service provider uses a backbone carrier to provide connectivity.

MPLS VPN over mGRE is a feature that overcomes the requirement of the carrier supporting MPLS, by allowing you to provide MPLS connectivity between networks that are connected by IP-only networks. This allows MPLS label switch paths (LSPs) to use GRE tunnels to cross routing areas, autonomous systems and Internet service providers (ISPs).

When MPLS VPNs are configured over mGRE you can deploy L3 Provider Edge (PE) based VPN services using a standards-based IP core. This allows you to provision the VPN services without using LSP or a Label Distribution Protocol (LDP). The system uses IPv4-based mGRE tunnels to encapsulate VPN-labeled IPv4 and IPv6 packets between PEs.

The MPLS VPN over mGRE feature also allows you to deploy existing MPLS VPN LSP-encapsulated technology concurrently with MPLS VPN over mGRE and enables the system to determine which encapsulation method is used to route specific traffic. The ingress PE router determines which encapsulation technology to use when transmitting a packet to the remote PE router.

This section includes information on the following topics:

- [Route Maps, page 6](#)
- [Tunnel Endpoint Discovery and Forwarding, page 6](#)
- [Tunnel Decapsulation, page 6](#)
- [Tunnel Source, page 6](#)
- [IPv6 VPN, page 7](#)

## Route Maps

By default, VPN traffic is sent using an LSP. The MPLS VPN over mGRE feature uses user-defined route-maps to determine which VPN prefixes are reachable over an mGRE tunnel and which VPN prefixes are reachable using an LSP. The route map is applied to advertisements for VPNv4 and VPNv6 address families. The route map uses a NextHOP Tunnel Table to determine the encapsulation method for the VPN traffic.

To route traffic over the mGRE tunnel, the system creates an alternative address space that shows that all next hops are reached by encapsulating the traffic in an mGRE tunnel. To configure a specific route to use an mGRE tunnel, the user adds an entry for that route to the route map. The new entry remaps the Network Layer Reachability Information (NLRI) of the route to the alternative address space. If there is no remap entry in the route map for a route, then traffic on that route is forwarded over an LSP.

When the user configures MPLS VPN over mGRE, the system automatically provisions the alternative address space, normally held in the tunnel-encapsulated virtual routing and forwarding (VRF) instance. To ensure that all traffic reachable through the address space is encapsulated in an mGRE tunnel, the system installs a single default route out of a tunnel. The system also creates a default tunnel on the route map. The user can attach this default route map to the appropriate BGP updates.

## Tunnel Endpoint Discovery and Forwarding

In order for MPLS VPN over mGRE to function correctly, the system must be able to discover the remote PEs in the system and construct tunnel forwarding information for these remote PEs. In addition the system must be able to detect when a remote PE is no longer valid and remove the tunnel forwarding information for that PE.

If an ingress PE receives a VPN advertisement over BGP, it uses the route target attributes (which it inserts into the VRF) and the MPLS VPN label from the advertisement, to associate the prefixes with the appropriate customer. The next hop of the inserted route is set to the NLRI of the advertisement.

The advertised prefixes contain information about remote PEs in the system (in the form of NLRIs), and the PE uses this information to notify the system when an NLRI becomes active or inactive. The system uses this notification to update the PE forwarding information.

When the system receives notification of a new remote PE, it adds the information to the Tunnel Endpoint Database, which causes the system to create an adjacency associated with the tunnel interface. The adjacency description includes information on the encapsulation and other processing that the system must perform to send encapsulated packets to the new remote PE.

The adjacency information is placed into the tunnel encapsulated VRF. When a user remaps a VPN NLRI to a route in the VRF (using the route map) the system links the NLRI to the adjacency, therefore the VPN is linked to a tunnel.

## Tunnel Decapsulation

When the egress PE receives a packet from a tunnel interface that uses MPLS VPN over mGRE, the PE decapsulates the packet to create a VPN label tagged packet, and sends the packet to the MPLS forwarding (MFI) code.

## Tunnel Source

MPLS VPN over mGRE uses a single tunnel configured as a multi point GRE tunnel to configure a system with a large number of endpoints (remote PEs). To identify the origin of tunnel-encapsulated packets, the system uses the tunnel source information.

At the transmitting (ingress) PE, when a VPN packet is sent to a tunnel, the tunnel destination is the NLRI. At a receiving (egress) PE, the tunnel source is the address that the packets encapsulated in the mGRE tunnel are received on. Therefore, at the egress PE the packet destination must match the NLRI from the local PE.

## IPv6 VPN

If the advertising PE router has an IPv6 address then the NLRI must also be an IPv6 address (regardless of the network between the PEs). If the network between the PEs is IPv4 based, the system creates the IPv6 address of the advertising PE using an IPv4 mapped address in the following form: ::FFFF:IPv4-PE-address. The receiving PE sets the next hop for the VPN tag IPv6 prefixes to the IPv4 address embedded in the IPv6 NLRI. This enables the PE to link VPNv6 traffic to an LSP or an mGRE tunnel in the same way it maps VPNv4 traffic.

When a PE receives VPNv6 updates it applies the IPv6 route map. MPLS VPN over mGRE uses the IPv6 route map to set the next hop information in the Tunnel\_Encap VRF.

## How to Configure L3 VPN mGRE Tunnels

To deploy L3 VPN mGRE tunnels you create a VRF instance, create the mGRE tunnel, redirect the VPN IP traffic to the tunnel, and set up the BGP VPNv4 exchange so that updates are filtered through a route map and interesting prefixes are resolved in the VRF table.

To deploy MPLS VPN over mGRE tunnels, you create a VRF instance, enable and configure L3 VPN encapsulation, link the route map to the application template, and set up the BGP VPNv4 and VPNv6 exchange so that updates are filtered through the route map.

The configuration steps to deploy MPLS VPN over mGRE are described in the following sections:

- [Creating the VRF and mGRE Tunnel, page 7](#) (Required)
- [Setting Up BGP VPN Exchange, page 9](#) (Required)
- [Enabling the MPLS VPN over mGRE Tunnels and Configuring L3VPN Encapsulation Profile, page 11](#) (Required)
- [Defining the Address Space and Specifying Address Resolution for MPLS VPNs over mGRE, page 14](#) (Required)

## Creating the VRF and mGRE Tunnel

The tunnel that transports the VPN traffic across the service provider network resides in its own address space. A special VRF instance must be created called Resolve in VRF (RiV). This section describes how to create the VRF and GRE tunnel.

### Prerequisites

The IP address on the interface should be the same as that of the source interface specified in the configuration. The source interface specified should match that used by BGP as a source for the VPNv4 update.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf *vrf-name***
4. **rd 1:1**
5. **interface tunnel *tunnel name***
6. **ip address *ip-address subnet-id***
7. **tunnel source loopback *n***
8. **tunnel mode gre multipoint l3vpn**
9. **tunnel key *gre-key***
10. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                    | Purpose                                                                                                                             |
|--------|--------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                       | Enters global configuration mode.                                                                                                   |
| Step 3 | <b>ip vrf <i>vrf-name</i></b><br><br><b>Example:</b><br>Router(config)# ip vrf customer a riv                                        | Creates the special Resolve in VRF (RiV) VRF instance and table that will be used for the tunnel and redirection of the IP address. |
| Step 4 | <b>rd 1:1</b><br><br><b>Example:</b><br>Router(config-vrf)# rd 1:1                                                                   | Enters the VRF configuration mode and specifies a route distinguisher (RD) for a VPN VRF instance.                                  |
| Step 5 | <b>interface tunnel <i>tunnel name</i></b><br><br><b>Example:</b><br>Router(config-vrf)# interface tunnel 1                          | Enters interface configuration mode to create the tunnel.                                                                           |
| Step 6 | <b>ip address <i>ip-address subnet-id</i></b><br><br><b>Example:</b><br>Router(config-if)# ipaddress 209.165.200.225 255.255.255.224 | Specifies the IP address for the tunnel.                                                                                            |

|         | Command or Action                                                                                                           | Purpose                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Step 7  | <code>tunnel source loopback <i>n</i></code><br><br><b>Example:</b><br>Router(config-if)# tunnel source loopback test1      | Creates the loopback interface.                                           |
| Step 8  | <code>tunnel mode gre multipoint l3vpn</code><br><br><b>Example:</b><br>Router(config-if)# tunnel mode gre multipoint l3vpn | Sets the mode for the tunnel as “gre multipoint l3vpn”.                   |
| Step 9  | <code>tunnel key gre-key</code><br><br><b>Example:</b><br>Router(config-if)# tunnel key 18                                  | Specifies the GRE key for the tunnel.                                     |
| Step 10 | <code>end</code><br><br><b>Example:</b><br>Router(config-if)# end                                                           | Exits the current configuration mode and returns to privileged EXEC mode. |

## Setting Up BGP VPN Exchange

The configuration task described in this section sets up the BGP VPNv4 exchange so that the updates are filtered through a route map and interesting prefixes are resolved in the VRF table.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface tunnel tunnel name`
4. `ip route vrf rv-vrf-name IP address subnet mask tunnel n`
5. `router bgp as-number`
6. `network network id`
7. `neighbor {ip-address | peer-group-name} remote-as as-number`
8. `neighbor {ip-address | peer-group-name} update-source interface-type`
9. `address-family vpnv4 [unicast]`
10. `neighbor {ip-address | peer-group-name} activate`
11. `neighbor {ip-address | peer-group-name} route-map map-name {in | out}`
12. `set ip next-hop resolve-in-vrf vrf name`
13. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                            | Purpose                                                                                                                                     |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                            |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                               | Enters global configuration mode.                                                                                                           |
| Step 3 | <b>interface tunnel tunnel name</b><br><br><b>Example:</b><br>Router(config)# interface tunnel 1                                                                             | Enters interface configuration mode for the tunnel.                                                                                         |
| Step 4 | <b>ip route vrf riv-vrf-name ip address subnet mask tunnel n</b><br><br><b>Example:</b><br>Router(config-if)# ip route vrf 209.165.200.226 255.255.255.224 tunnel 1          | Sets the packet forwarding to the special RiV VRF.                                                                                          |
| Step 5 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                                         | Specifies the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. |
| Step 6 | <b>network network id</b><br><br><b>Example:</b><br>Router(config)# network 209.165.200.255                                                                                  | Specifies the network ID for the networks to be advertised by the BGP and multiprotocol BGP routing processes.                              |
| Step 7 | <b>neighbor {ip-address   peer-group-name} remote-as as-number</b><br><br><b>Example:</b><br>Router(config)# neighbor 209.165.200.227 remote-as 100                          | Adds an entry to the BGP or multiprotocol BGP neighbor table.                                                                               |
| Step 8 | <b>neighbor {ip-address   peer-group-name} update-source interface-type</b><br><br><b>Example:</b><br>Router(config)# neighbor 209.165.200.228 update-source FastEthernet0/1 | Specifies a specific operational interface that BGP sessions use for TCP connections.                                                       |
| Step 9 | <b>address-family vpnv4 [unicast]</b><br><br><b>Example:</b><br>Router(config)# address-family vpnv4                                                                         | Specifies address family configuration mode for configuring routing sessions, such as BGP, that use standard VPN4 address prefixes.         |

|         | Command or Action                                                                                                                                                                                                    | Purpose                                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Step 10 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config)# neighbor 209.165.200.229<br>activate                                                     | Enables the exchange of information with a neighboring router.                                                                         |
| Step 11 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>route-map</b> <i>map-name</i> { <b>in</b>   <b>out</b> }<br><br><b>Example:</b><br>Router(config)# neighbor 209.165.200.230<br>route-map mpt in | Applies a route map to incoming or outgoing routes. <ul style="list-style-type: none"> <li>Use once for each inbound route.</li> </ul> |
| Step 12 | <b>set ip next-hop resolve-in-vrf</b> <i>vrf name</i><br><br><b>Example:</b><br>Router(config)# set ip next-hop resolve-in-vrf<br>vrft                                                                               | Specifies that the next hop is to be resolved in the VRF table for the specified VRF.                                                  |
| Step 13 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                                             | Exits the current configuration mode and returns to privileged EXEC mode.                                                              |

## Enabling the MPLS VPN over mGRE Tunnels and Configuring L3VPN Encapsulation Profile

This section describes how to define the VRF, enable MPLS VPN over mGRE, and configure an L3VPN encapsulation profile.

### Note

Transport protocols such as IPv6, MPLS, IP, and Layer 2 Tunneling Protocol version 3 (L2TPv3) can also be used in this configuration.

## Prerequisites

To enable and configure MPLS VPN over mGRE you must first define the VRF for tunnel encapsulation and enable L3VPN encapsulation in the system.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **vrf definition** *vrf-name*
4. **rd 1:1**

5. **exit**
6. **ip cef**
7. **ipv6 unicast-routing**
8. **ipv6 cef**
9. **l3vpn encapsulation ip** *profile name*
10. **transport ipv4** [*source interface n*]
11. **protocol gre** [*key gre-key*]
12. **exit**
13. **interface** *type number*
14. **ip address** *ip-address mask*
15. **ip router isis**
16. **end**

## DETAILED STEPS

|        | Command or Action                                                                                           | Purpose                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                              | Enters global configuration mode.                                                                                |
| Step 3 | <b>vrf definition</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config)# vrf definition tunnel encap | Configures a VPN VRF routing table instance and enters VRF configuration mode.                                   |
| Step 4 | <b>rd</b> 1:1<br><br><b>Example:</b><br>Router(config-vrf)# rd 1:1                                          | Specifies an RD for a VPN VRF instance.                                                                          |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-vrf)# exit                                              | Exits VRF configuration mode.                                                                                    |
| Step 6 | <b>ip cef</b><br><br><b>Example:</b><br>Router(config)# ip cef                                              | Enables Cisco Express Forwarding on the router.                                                                  |

|         | Command or Action                                                                                                                        | Purpose                                                                                                                                                              |
|---------|------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <code>ipv6 unicast-routing</code><br><br><b>Example:</b><br>Router(config)# ipv6 unicast-routing                                         | Enables the forwarding of IPv6 unicast datagrams.                                                                                                                    |
| Step 8  | <code>ipv6 cef</code><br><br><b>Example:</b><br>Router(config)# ipv6 cef                                                                 | Enables Cisco Express Forwarding for IPv6 on the router.                                                                                                             |
| Step 9  | <code>l3vpn encapsulation ip profile name</code><br><br><b>Example:</b><br>Router(config)# l3vpn encapsulation ip tunnel encap           | Enters L3 VPN encapsulation configuration mode to create the tunnel.                                                                                                 |
| Step 10 | <code>transport ipv4 source interface n</code><br><br><b>Example:</b><br>Router(config-l3vpn-encap-ip)# transport ipv4 source loopback 0 | Specifies IPv4 transport source mode and defines the transport source interface.                                                                                     |
| Step 11 | <code>protocol gre [key gre-key]</code><br><br><b>Example:</b><br>Router(config-l3vpn-encap-ip)# protocol gre key 1234                   | Specifies GRE as the tunnel mode and sets the GRE key.                                                                                                               |
| Step 12 | <code>exit</code><br><br><b>Example:</b><br>Router(config-l3vpn-encap-ip)# exit                                                          | Exits L3 VPN encapsulation configuration mode.                                                                                                                       |
| Step 13 | <code>interface type number</code><br><br><b>Example:</b><br>Router(config)# interface loopback 0                                        | Enters interface configuration mode to configure the interface type.                                                                                                 |
| Step 14 | <code>ip address ip-address mask</code><br><br><b>Example:</b><br>Router(config-if)# ip address 10.10.10.4 255.255.255.255               | Specifies the primary IP address and mask for the interface.                                                                                                         |
| Step 15 | <code>ip router isis</code><br><br><b>Example:</b><br>Router(config-if)# ip router isis                                                  | Configures an Intermediate System-to-Intermediate System (IS-IS) routing process for IP on the interface and attaches a null area designator to the routing process. |
| Step 16 | <code>end</code><br><br><b>Example:</b><br>Router(config-if)#end                                                                         | Exits the current configuration mode and returns to privileged EXEC mode.                                                                                            |

## Defining the Address Space and Specifying Address Resolution for MPLS VPNs over mGRE

This section describes how to define the address space and specify the address resolution for MPLS VPNs over mGRE. The following steps also enables you to link the route map to the application template and sets up the BGP VPNv4 and VPNv6 exchange so that updates are filtered through the route map.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **bgp log-neighbor-changes**
5. **neighbor** *ip-address* **remote-as** *as-number*
6. **neighbor** *ip-address* **update-source** *interface name*
7. **address-family ipv4**
8. **no synchronization**
9. **redistribute connected**
10. **neighbor** *ip-address* **activate**
11. **no auto-summary**
12. **exit**
13. **address-family vpnv4**
14. **neighbor** *ip-address* **activate**
15. **neighbor** *ip-address* **send-community both**
16. **neighbor** *ip-address* **route-map** *map-name* **in**
17. **exit**
18. **address-family vpnv6**
19. **neighbor** *ip-address* **activate**
20. **neighbor** *ip-address* **send-community both**
21. **neighbor** *ip-address* **route-map** *map-name* **in**
22. **exit**
23. **route-map** *map-tag* **permit** *position*
24. **set ip next-hop encapsulate l3vpn** *profile name*
25. **set ipv6 next-hop encapsulate l3vpn** *profile name*
26. **exit**
27. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                             |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                         | Enters global configuration mode.                                                                                                                                                                                                                   |
| Step 3 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router (config)# router bgp 100                                                                  | Specifies the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along and enters router configuration mode.                                                                    |
| Step 4 | <b>bgp log-neighbor-changes</b><br><br><b>Example:</b><br>Router (config-router)# bgp log-neighbor-changes                                             | Enables logging of BGP neighbor resets.                                                                                                                                                                                                             |
| Step 5 | <b>neighbor ip-address remote-as as-number</b><br><br><b>Example:</b><br>Router (config-router)# neighbor 10.10.10.6 remote-as 100                     | Adds an entry to the BGP or multiprotocol BGP neighbor table.                                                                                                                                                                                       |
| Step 6 | <b>neighbor ip-address update-source interface name</b><br><br><b>Example:</b><br>Router (config-router)# neighbor 10.10.10.6 update-source loopback 0 | Allows BGP sessions to use any operational interface for TCP connections.                                                                                                                                                                           |
| Step 7 | <b>address-family ipv4</b><br><br><b>Example:</b><br>Router (config-router)# address-family vpv4                                                       | Enters address family configuration mode to configure routing sessions, that use IPv4 address prefixes.                                                                                                                                             |
| Step 8 | <b>no synchronization</b><br><br><b>Example:</b><br>Router (config-router-af)# no synchronization                                                      | Enables the Cisco IOS software to advertise a network route without waiting for an IGP.                                                                                                                                                             |
| Step 9 | <b>redistribute connected</b><br><br><b>Example:</b><br>Router (config-router-af)# redistribute connected                                              | Redistributes routes from one routing domain into another routing domain and allows the target protocol to redistribute routes learned by the source protocol and connected prefixes on those interfaces over which the source protocol is running. |

|         | Command or Action                                                                                                                                              | Purpose                                                                                                                        |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Step 10 | <b>neighbor ip-address activate</b><br><br><b>Example:</b><br>Router (config-router-af)# neighbor 10.10.10.6 activate                                          | Enables the exchange of information with a BGP neighbor.                                                                       |
| Step 11 | <b>no auto-summary</b><br><br><b>Example:</b><br>Router (config-router-af)# no auto-summary                                                                    | Disables automatic summarization and sends subprefix routing information across classful network boundaries                    |
| Step 12 | <b>exit</b><br><br><b>Example:</b><br>Router (config-router-af)# exit                                                                                          | Exits address family configuration mode.                                                                                       |
| Step 13 | <b>address-family vpnv4</b><br><br><b>Example:</b><br>Router (config-router)# address-family vpnv4                                                             | Enters address family configuration mode to configure routing sessions, such as BGP, that use standard VPNv4 address prefixes. |
| Step 14 | <b>neighbor ip-address activate</b><br><br><b>Example:</b><br>Router (config-router-af)# neighbor 10.10.10.6 activate                                          | Enables the exchange of information with a BGP neighbor.                                                                       |
| Step 15 | <b>neighbor ip-address send-community both</b><br><br><b>Example:</b><br>Router (config-router-af)# neighbor 10.10.10.6 send-community both                    | Specifies that a communities attribute, for both standard and extended communities, should be sent to a BGP neighbor.          |
| Step 16 | <b>neighbor ip-address route-map map-name in</b><br><br><b>Example:</b><br>Router (config-router-af)# neighbor 10.10.10.6 route-map SELECT UPDATE FOR L3VPN in | Applies the named route map to the incoming route.                                                                             |
| Step 17 | <b>exit</b><br><br><b>Example:</b><br>Router (config-router-af)# exit                                                                                          | Exits address family configuration mode.                                                                                       |
| Step 18 | <b>address-family vpnv6</b><br><br><b>Example:</b><br>Router (config-router)# address-family vpnv4                                                             | Enters address family configuration mode to configure routing sessions, such as BGP, that use VPNv6 address prefixes.          |
| Step 19 | <b>neighbor ip-address activate</b><br><br><b>Example:</b><br>Router (config-router-af)# neighbor 209.165.200.252 activate                                     | Enables the exchange of information with a BGP neighbor.                                                                       |

|         | Command or Action                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 20 | <pre>neighbor ip-address send-community both</pre> <p><b>Example:</b><br/> Router (config-router-af)# neighbor<br/> 209.165.200.252 send-community both </p>                           | Specifies that a communities attribute, for both standard and extended communities, should be sent to a BGP neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 21 | <pre>neighbor ip-address route-map ip-address in</pre> <p><b>Example:</b><br/> Router (config-router-af)# neighbor<br/> 209.165.200.252 route-map SELECT UPDATE FOR<br/> L3VPN in </p> | Applies the named route map to the incoming route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 22 | <pre>exit</pre> <p><b>Example:</b><br/> Router (config-router-af)# exit </p>                                                                                                           | Exits address family configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 23 | <pre>route-map map-tag permit position</pre> <p><b>Example:</b><br/> Router (config-router)# route-map SELECT UPDATE<br/> FOR L3VPN permit 10 </p>                                     | <p>Enters route-map configuration mode and defines the conditions for redistributing routes from one routing protocol into another.</p> <ul style="list-style-type: none"> <li>• The <b>redistribute</b> router configuration command uses the specified map tag to reference this route map. Multiple route maps may share the same map tag name.</li> <li>• If the match criteria are met for this route map, the route is redistributed as controlled by the set actions.</li> <li>• If the match criteria are not met, the next route map with the same map tag is tested. If a route passes none of the match criteria for the set of route maps sharing the same name, it is not redistributed by that set.</li> <li>• The <i>position</i> argument indicates the position a new route map will have in the list of route maps already configured with the same name.</li> </ul> |
| Step 24 | <pre>set ip next-hop encapsulate l3vpn tunnel encap</pre> <p><b>Example:</b><br/> Router (config-route-map)# set ip next-hop<br/> encapsulate l3vpn my profile </p>                    | Indicates that output IPv4 packets that pass a match clause of the route map are sent to the VRF for tunnel encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 25 | <pre>set ipv6 next-hop encapsulate l3vpn profile<br/>name</pre> <p><b>Example:</b><br/> Router (config-route-map)# set ip next-hop<br/> encapsulate l3vpn tunnel encap </p>            | Indicates that output IPv6 packets that pass a match clause of the route map are sent to the VRF for tunnel encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|         | Command or Action                                               | Purpose                                                                  |
|---------|-----------------------------------------------------------------|--------------------------------------------------------------------------|
| Step 26 | <code>exit</code>                                               | Exits route-map configuration mode and enters global configuration mode. |
|         | <b>Example:</b><br>Router (config-route-map)# <code>exit</code> |                                                                          |
| Step 27 | <code>exit</code>                                               | Exits global configuration mode.                                         |
|         | <b>Example:</b><br>Router (config)# <code>exit</code>           |                                                                          |

## What to Do Next

You can perform the following to make sure that the configuration is working properly.

### Check the VRF Prefix

Verify that the specified VRF prefix has been received by BGP. The BGP table entry should show that the route map has worked and that the next hop is showing in the RiV. Use the **show ip bgp vpnv4** command as shown in this example:

```
Router# show ip bgp vpnv4 vrf customer 209.165.200.250
BGP routing table entry for 100:1:209.165.200.250/24, version 12
Paths: (1 available, best #1)
  Not advertised to any peer
  Local
209.165.200.251 in "my riv" from 209.165.200.251 (209.165.200.251)
  Origin incomplete, metric 0, localpref 100, valid, internal, best
  Extended Community: RT:100:1
```

Confirm that the same information has been propagated to the routing table:

```
Router# show ip route vrf customer 209.165.200.250
Routing entry for 209.165.200.250/24
  Known via "bgp 100", distance 200, metric 0, type internal
  Last update from 209.165.200.251 00:23:07 ago
  Routing Descriptor Blocks:
  * 209.165.200.251 (my riv), from 209.165.200.251, 00:23:07 ago
    Route metric is 0, traffic share count is 1
    AS Hops 0
```

### CEF Switching

You can also verify that CEF switching is working as expected:

```
Router# show ip cef vrf customer 209.165.200.250
209.165.200.250/24, version 6, epoch 0
0 packets, 0 bytes
  tag information set
    local tag: VPN-route-head
    fast tag rewrite with Tu1, 123.1.1.2, tags imposed: {17}
  via 209.165.200.251, 0 dependencies, recursive
    next hop 209.165.200.251, Tunnel1 via 209.165.200.251/32 (my riv)
    valid adjacency
    tag rewrite with Tu1, 209.165.200.251, tags imposed: {17}
```

## Endpoint Creation

Note that in this example display the tunnel endpoint has been created correctly:

```
Router# show tunnel endpoint tunnel 1
Tunnell running in multi-GRE/IP mode
RFC2547/L3VPN Tunnel endpoint discovery is active on Tu1
Transporting l3vpn traffic to all routes recursing through "my riv"

Endpoint 209.165.200.251 via destination 209.165.200.251
Endpoint 209.165.200.254 via destination 209.165.200.254
```

## Adjacency

Confirm that the corresponding adjacency has been created.

```
Router# show adjacency Tunnel 1 interface
Protocol Interface      Address
TAG       Tunnell          209.165.200.251(4)
                                15 packets, 1980 bytes
                                4500000000000000FF2FC3C77B010103
                                7B01010200008847
                                Epoch: 0
                                Fast adjacency disabled
                                IP redirect disabled
                                IP mtu 1472 (0x0)
                                Fixup enabled (0x2)
                                GRE tunnel
                                Adjacency pointer 0x624A1580, refCount 4
                                Connection Id 0x0
                                Bucket 121
```

Note that because MPLS is being transported over mGRE, the LINK\_TAG adjacency is the relevant adjacency. The MTU reported in the adjacency is the payload length (including the MPLS label) that the packet will accept. The mac string shown in the adjacency display can be interpreted as follows:

```
45000000 -> Beginning of IP Header (Partially populated, t1 & chksum
00000000   are fixed up per packet)
FF2FC3C7
7B010103 -> Source IP Address in transport network 209.165.200.253
7B010102 -> Destination IP address in transport network 209.165.200.252
00008847 -> GRE Header
```

Refer to the [Cisco IOS Multiprotocol Label Switching Configuration Guide](#) for information about configuring MPLS Layer 3 VPNs.

You can use **show l3vpn encapsulation profile name** command to get information on the basic state of the application. The output of this command provides you details on the references to the tunnel and VRF.

# Configuration Examples for Dynamic L3 VPNs Support Using mGRE Tunnels

This section provides an example to configure the layer 3 VPN over mGRE.

- [Configuring Layer 3 VPN mGRE Tunnels: Example, page 20](#)

## Configuring Layer 3 VPN mGRE Tunnels: Example

This example shows the configuration sequence for creating mGRE tunnels. It includes the definition of the special VRF instance.

```
ip vrf my riv
  rd 1:1
interface Tunnell
  ip vrf forwarding my_riv
  ip address 209.165.200.250 255.255.255.224
  tunnel source Loopback0
  tunnel mode gre multipoint l3vpn
  tunnel key 123
end
ip route vrf my riv ip address subnet mask Tunnell

router bgp 100
  network 209.165.200.251
  neighbor 209.165.200.250 remote-as 100
  neighbor 209.165.200.250 update-source Loopback0
  !
  address-family vpnv4
  neighbor 209.165.200.250 activate
  neighbor 209.165.200.250 route-map SELECT_UPDATES_FOR_L3VPN_OVER_MGRE in
  !
  route-map SELECT_UPDATES_FOR_L3VPN_OVER_MGRE permit 10
  set ip next-hop in-vrf my riv
```

This example shows the configuration to link a route map to the application:

```
vrf definition Customer A
  rd 100:110
  route-target export 100:1000
  route-target import 100:1000
  !
  address-family ipv4
  exit-address-family
  !
  address-family ipv6
  exit-address-family
  !
vrf definition tunnel encap
  rd 1:1
  !
  address-family ipv4
  exit-address-family
  !
  address-family ipv6
  exit-address-family
  !
  !
ip cef
```

```
!
ipv6 unicast-routing
ipv6 cef
!
!
l3vpn encapsulation ip profile name
  transport source loopback 0
  protocol gre key 1234
!
!
interface Loopback0
  ip address 209.165.200.252 255.255.255.224
  ip router isis
!
interface Serial2/0
  vrf forwarding Customer A
  ip address 209.165.200.253 255.255.255.224
  ipv6 address 3FFE:1001::/64 eui-64
  no fair-queue
  serial restart-delay 0
!
router bgp 100
  bgp log-neighbor-changes
  neighbor 209.165.200.254 remote-as 100
  neighbor 209.165.200.254 update-source Loopback0
  !
  address-family ipv4
    no synchronization
    redistribute connected
    neighbor 209.165.200.254 activate
    no auto-summary
  exit-address-family
  !
  address-family vpnv4
    neighbor 209.165.200.254 activate
    neighbor 209.165.200.254 send-community both
    neighbor 209.165.200.254 route-map SELECT UPDATE FOR L3VPN in
  exit-address-family
  !
  address-family vpnv6
    neighbor 209.165.200.254 activate
    neighbor 209.165.200.254 send-community both
    neighbor 209.165.200.254 route-map SELECT UPDATE FOR L3VPN in
  exit-address-family
  !
  address-family ipv4 vrf Customer A
    no synchronization
    redistribute connected
  exit-address-family
  !
  address-family ipv6 vrf Customer A
    redistribute connected
    no synchronization
  exit-address-family
  !
  !
  route-map SELECT UPDATE FOR L3VPN permit 10
  set ip next-hop encapsulate <profile_name>
  set ipv6 next-hop encapsulate <profile_name>
```

# Feature Information for Dynamic L3 VPNs with mGRE Tunnels

Table 1 lists the features in this module and provides links to specific configuration information. Only features that were introduced or modified in Cisco IOS Release 12.0(23)S or a later release appear in the table.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for Dynamic L3 VPNs with mGRE Tunnels

| Feature Name                                                                       | Releases    | Feature Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic Layer-3 VPNs (L3 VPNs) (RFC 2547 based) with Multipoint GRE (mGRE) Tunnels | 12.0(23)S   | This feature provides an L3 transport mechanism based on an enhanced mGRE tunneling technology for use in IP networks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| MPLS VPN over mGRE                                                                 | 12.2(33)SRE | <p>This feature provides support to carry MPLS Layer 3 VPN traffic over mGRE. # MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

---

**First Published: May 2, 2005**

**Last Updated: February 27, 2009**

The MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses feature allows a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) to span service providers and autonomous systems. This module explains how to enable Autonomous System Boundary Routers (ASBRs) to use Exterior Border Gateway Protocol (EBGP) to exchange IPv4 Network Layer Reachability Information (NLRI) in the form of VPN-IPv4 addresses.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses”](#) section on page 33.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

- Before you configure EBGp routing between autonomous systems or subautonomous systems in an MPLS VPN, ensure that you have properly configured all MPLS VPN routing instances and sessions. The configuration tasks outlined in this section build from those configuration tasks. Perform the following tasks as described in the [Configuring MPLS Layer 3 VPNs](#) module:
  - Define VPN routing instances
  - Configure BGP routing sessions in the MPLS core
  - Configure PE-to-PE routing sessions in the MPLS core
  - Configure BGP PE-to-CE routing sessions
  - Configure a VPN-IPv4 EBGp session between directly connected ASBRs
- This feature is supported on the Cisco 12000 series router line cards listed in [Table 1](#).

**Table 1** Cisco 12000 Series Line Card Support Added for Cisco IOS Releases

| Type                    | Line Cards           | Cisco IOS Release Added |
|-------------------------|----------------------|-------------------------|

## Restrictions for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Multihop VPN-IPv4 EBGp is not supported.

## Information About MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Before configuring this feature, you should understand the following concepts:

- [MPLS VPN Inter-AS Introduction, page 3](#)
- [Benefits of MPLS VPN Inter-AS, page 3](#)
- [Use of Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 4](#)
- [Information Exchange in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 4](#)

## MPLS VPN Inter-AS Introduction

An autonomous system is a single network or group of networks that is controlled by a common system administration group and that uses a single, clearly defined routing protocol.

As VPNs grow, their requirements expand. In some cases, VPNs need to reside on different autonomous systems in different geographic areas. Also, some VPNs need to extend across multiple service providers (overlapping VPNs). Regardless of the complexity and location of the VPNs, the connection between autonomous systems must be seamless to the customer.

## Benefits of MPLS VPN Inter-AS

An MPLS VPN Inter-AS provides the following benefits:

- Allows a VPN to cross more than one service provider backbone

Service providers running separate autonomous systems can jointly offer MPLS VPN services to the same customer. A VPN can begin at one customer site and traverse different VPN service provider backbones before arriving at another site of the same customer. Previously, MPLS VPN could

traverses only a single BGP autonomous system service provider backbone. This feature allows multiple autonomous systems to form a continuous (and seamless) network between customer sites of a service provider.

- Allows a VPN to exist in different areas

A service provider can create a VPN in different geographic areas. Having all VPN traffic flow through one point (between the areas) allows for better rate control of network traffic between the areas.

- Allows confederations to optimize IBGP meshing

Internal Border Gateway Protocol (IBGP) meshing in an autonomous system is more organized and manageable. An autonomous system can be divided into multiple, separate subautonomous systems and then classify them into a single confederation (even though the entire VPN backbone appears as a single autonomous system). This capability allows a service provider to offer MPLS VPNs across the confederation because it supports the exchange of labeled VPN-IPv4 NLRI between the subautonomous systems that form the confederation.

## Use of Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Separate autonomous systems from different service providers can communicate by exchanging IPv4 NLRI in the form of VPN-IPv4 addresses. The ASBRs use EBGp to exchange that information. Then an Interior Gateway Protocol (IGP) distributes the network layer information for VPN-IPv4 prefixes throughout each VPN and each autonomous system. Routing information uses the following protocols:

- Within an autonomous system, routing information is shared using an IGP.
- Between autonomous systems, routing information is shared using an EBGp. An EBGp allows a service provider to set up an interdomain routing system that guarantees the loop-free exchange of routing information between separate autonomous systems.

The primary function of an EBGp is to exchange network reachability information between autonomous systems, including information about the list of autonomous system routes. The autonomous systems use EBGp border edge routers to distribute the routes, which include label switching information. Each border edge router rewrites the next hop and labels. See the [“Information Exchange in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses”](#) section for more information.

Interautonomous system configurations supported in an MPLS VPN are as follows:

- Interprovider VPN—MPLS VPNs that include two or more autonomous systems, connected by separate border edge routers. The autonomous systems exchange routes using EBGp. No IGP or routing information is exchanged between the autonomous systems.
- BGP confederations—MPLS VPNs that divide a single autonomous system into multiple subautonomous systems, and classify them as a single, designated confederation. The network recognizes the confederation as a single autonomous system. The peers in the different autonomous systems communicate over EBGp sessions; however, they can exchange route information as if they were IBGP peers.

## Information Exchange in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

This section contains the following topics:

- [Transmission of Information in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 5](#)
- [Exchange of VPN Routing Information in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 6](#)
- [Packet Forwarding Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses, page 8](#)
- [Use of a Confederation for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 9](#)

## Transmission of Information in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Figure 1 illustrates one MPLS VPN consisting of two separate autonomous systems. Each autonomous system operates under different administrative control and runs a different IGP. Service providers exchange routing information through EBGP border edge routers (ASBR1, ASBR2).

**Figure 1** *EBGP Connection Between Two MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses*

This configuration uses the following process to transmit information:

- 
- Step 1** The provider edge router (PE-1) assigns a label for a route before distributing that route. The PE router uses the multiprotocol extensions of BGP to transmit label mapping information. The PE router distributes the route as a VPN-IPv4 address. The address label and the VPN identifier are encoded as part of the NLRI.
- Step 2** The two route reflectors (RR-1 and RR-2) reflect VPN-IPv4 internal routes within the autonomous system. The autonomous systems' border edge routers (ASBR1 and ASBR2) advertise the VPN-IPv4 external routes.

- Step 3** The EBGp border edge router (ASBR1) redistributes the route to the next autonomous system (ASBR2). ASBR1 specifies its own address as the value of the EBGp next-hop attribute and assigns a new label. The address ensures the following:
- That the next-hop router is always reachable in the service provider (P) backbone network.
  - That the label assigned by the distributing router is properly interpreted. (The label associated with a route must be assigned by the corresponding next-hop router.)
- Step 4** The EBGp border edge router (ASBR2) redistributes the route in one of the following ways, depending on its configuration:
- If the IBGP neighbors are configured with the **neighbor next-hop-self** command, ASBR2 changes the next-hop address of updates received from the EBGp peer, then forwards it.
  - If the IBGP neighbors are not configured with the **neighbor next-hop-self** command, the next-hop address does not get changed. ASBR2 must propagate a host route for the EBGp peer through the IGP. To propagate the EBGp VPN-IPv4 neighbor host route, use the **redistribute connected subnets** command. The EBGp VPN-IPv4 neighbor host route is automatically installed in the routing table when the neighbor comes up. This is essential to establish the label switched path between PE routers in different autonomous systems.
- 

## Exchange of VPN Routing Information in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Autonomous systems exchange VPN routing information (routes and labels) to establish connections. To control connections between autonomous systems, the PE routers and EBGp border edge routers maintain a Label Forwarding Information Base (LFIB). The LFIB manages the labels and routes that the PE routers and EBGp border edge routers receive during the exchange of VPN information.

Figure 2 illustrates the exchange of VPN route and label information between autonomous systems. The autonomous systems use the following conditions to exchange VPN routing information:

- Routing information includes:
  - The destination network (N)
  - The next-hop field associated with the distributing router
  - A local MPLS label (L)
- An RD1: route distinguisher is part of a destination network address. It makes the VPN-IPv4 route globally unique in the VPN service provider environment.
- The ASBRs are configured to change the next-hop (next hop-self) when sending VPN-IPv4 NLRI to the IBGP neighbors. Therefore, the ASBRs must allocate a new label when they forward the NLRI to the IBGP neighbors.

**Figure 2** *Exchanging Routes and Labels Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses*

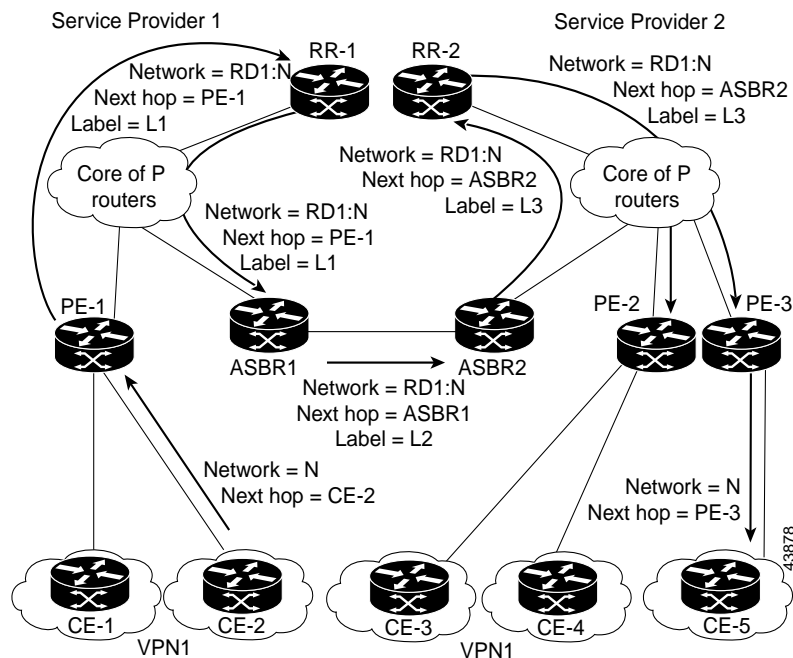

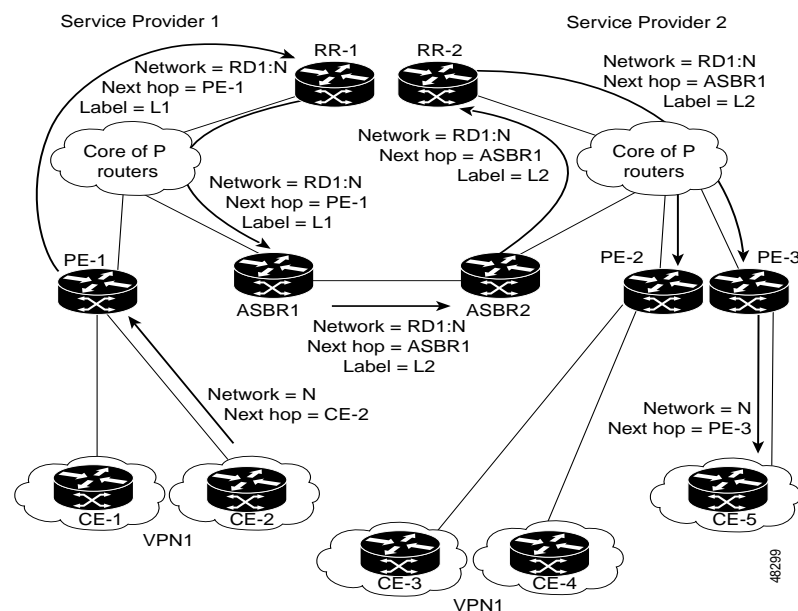

Figure 3 illustrates the exchange of VPN route and label information between autonomous systems. The only difference is that ASBR2 is configured with the **redistribute connected** command, which propagates the host routes to all PEs. The **redistribute connected** command is necessary because ASBR2 is not configured to change the next-hop address.

**Figure 3** *Exchanging Routes and Labels with the redistribute connected Command in an MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses*

## Packet Forwarding Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses

Figure 4 illustrates how packets are forwarded between autonomous systems in an interprovider network using the following packet forwarding method.

Packets are forwarded to their destination by means of MPLS. Packets use the routing information stored in the LFIB of each PE router and EBGP border edge router.

The service provider VPN backbone uses dynamic label switching to forward labels.

Each autonomous system uses standard multilevel labeling to forward packets between the edges of the autonomous system routers (for example, from CE-5 to PE-3). Between autonomous systems, only a single level of labeling is used, corresponding to the advertised route.

A data packet carries two levels of labels when traversing the VPN backbone:

- The first label (IGP route label) directs the packet to the correct PE router or EBGP border edge router. (For example, the IGP label of ASBR2 points to the ASBR2 border edge router.)
- The second label (VPN route label) directs the packet to the appropriate PE router or EBGP border edge router.

**Figure 4** Forwarding Packets Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses

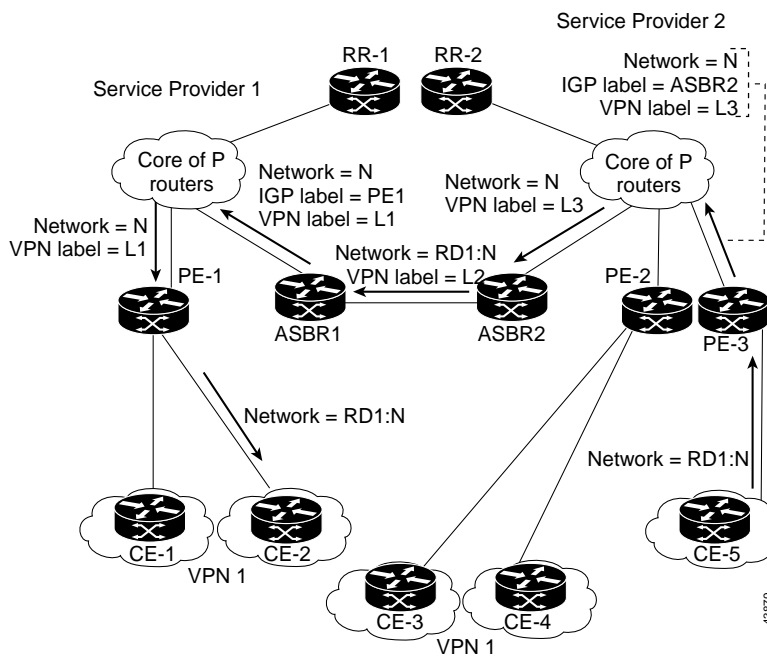

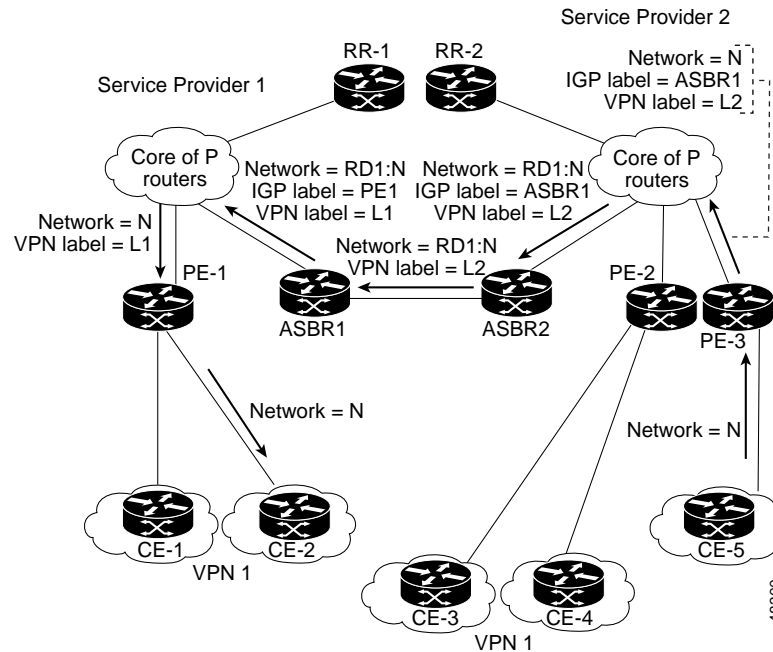

Figure 5 shows the same packet forwarding method as described in Figure 4, except the EBGp router (ASBR1) forwards the packet without reassigning it a new label.

**Figure 5 Forwarding Packets Without a New Label Assignment Between MPLS VPN Inter-AS Systems with ASBRs Exchanging VPN-IPv4 Addresses**

## Use of a Confederation for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

A confederation is multiple subautonomous systems grouped together. A confederation reduces the total number of peer devices in an autonomous system. A confederation divides an autonomous system into subautonomous systems and assigns a confederation identifier to the autonomous systems. A VPN can span service providers running in separate autonomous systems or in multiple subautonomous systems that form a confederation.

In a confederation, each subautonomous system is fully meshed with other subautonomous systems. The subautonomous systems communicate using an IGP, such as Open Shortest Path First (OSPF) or Intermediate System-to-Intermediate System (IS-IS). Each subautonomous system also has an EBGp connection to the other subautonomous systems. The confederation EBGp (CEBGp) border edge routers forward next-hop-self addresses between the specified subautonomous systems. The next-hop-self address forces the BGP to use a specified address as the next hop rather than letting the protocol choose the next hop.

You can configure a confederation with separate subautonomous systems in either of two ways:

- You can configure a router to forward next-hop-self addresses between only the CEBGP border edge routers (both directions). The subautonomous systems (IBGP peers) at the subautonomous system border do not forward the next-hop-self address. Each subautonomous system runs as a single IGP domain. However, the CEBGP border edge router addresses are known in the IGP domains.
- You can configure a router to forward next-hop-self addresses between the CEBGP border edge routers (both directions) and within the IBGP peers at the subautonomous system border. Each subautonomous system runs as a single IGP domain but also forwards next-hop-self addresses between the PE routers in the domain. The CEBGP border edge router addresses are known in the IGP domains.

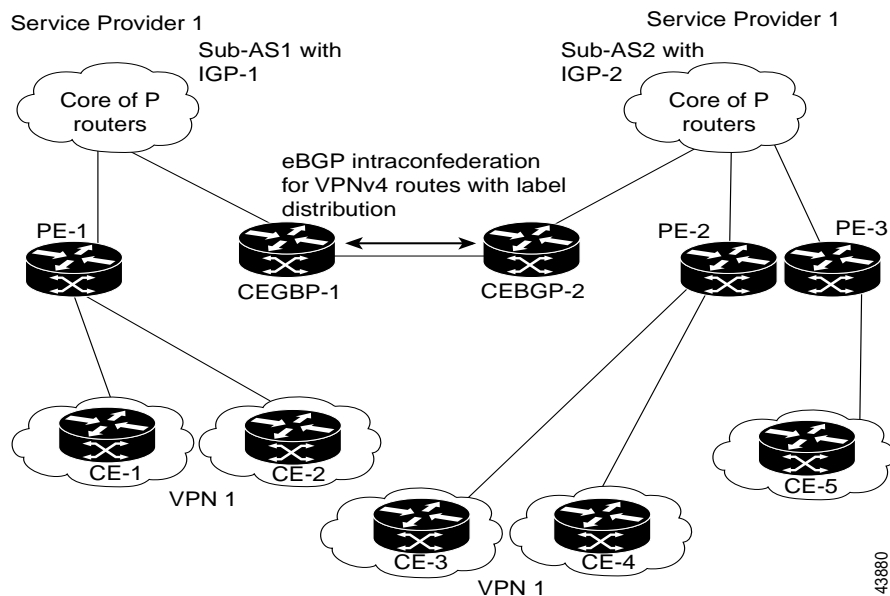

**Note**

Figure 2 and Figure 3 illustrate how two autonomous systems exchange routes and forward packets. Subautonomous systems in a confederation use a similar method of exchanging routes and forwarding packets.

Figure 6 illustrates a typical MPLS VPN confederation configuration. In this confederation configuration:

- The two CEBGP border edge routers exchange VPN-IPv4 addresses with labels between the two subautonomous systems.
- The distributing router changes the next-hop addresses and labels and uses a next-hop-self address.
- IGP-1 and IGP-2 know the addresses of CEBGP-1 and CEBGP-2.

**Figure 6** *EBGP Connection Between Two Subautonomous Systems in a Confederation*

In this confederation configuration:

- CEBGP border edge routers function as neighboring peers between the subautonomous systems. The subautonomous systems use EBGP to exchange route information.
- Each CEBGP border edge router (CEBGP-1, CEBGP-2) assigns a label for the route before distributing the route to the next subautonomous system. The CEBGP border edge router distributes the route as a VPN-IPv4 address by using the multiprotocol extensions of BGP. The label and the VPN identifier are encoded as part of the NLRI.
- Each PE and CEBGP border edge router assigns its own label to each VPN-IPv4 address prefix before redistributing the routes. The CEBGP border edge routers exchange VPN-IPv4 addresses with the labels. The next-hop-self address is included in the label (as the value of the EBGP next-hop attribute). Within the subautonomous systems, the CEBGP border edge router address is distributed throughout the IGP neighbors, and the two CEBGP border edge routers are known to both confederations.

# How to Configure MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

To configure MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, perform the tasks in the following sections:

- [Configuring the ASBRs to Exchange VPN-IPv4 Addresses, page 11](#) (required)
- [Configuring EBGp Routing to Exchange VPN Routes Between Subautonomous Systems in a Confederation, page 12](#) (required)
- [Verifying Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses, page 15](#) (optional)

## Configuring the ASBRs to Exchange VPN-IPv4 Addresses

To configure an EBGp ASBR to exchange VPN-IPv4 routes with another autonomous system, perform this task.

### Note

Issue the **redistribute connected subnets** command in the IGP configuration portion of the router to propagate host routes for VPN-IPv4 EBGp neighbors to other routers and provider edge routers. Alternatively, you can specify the next-hop-self address when you configure IBGP neighbors.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default route-target filter**
5. **address-family vpnv4** [unicast]
6. **neighbor** *peer-group-name* **remote-as** *as-number*
7. **neighbor** *peer-group-name* **activate**
8. **exit-address-family**
9. **end**

### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                              |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br>Router> enable             | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                    |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                      |

|               | Command or Action                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>router bgp <i>as-number</i></b><br><br><b>Example:</b><br>Router(config)# router bgp 1                                                    | Creates an EBGp routing process and assigns it an autonomous system number. <ul style="list-style-type: none"> <li>The autonomous system number is passed along and identifies the router to EBGp routers in another autonomous system.</li> </ul>                                                                                                     |
| <b>Step 4</b> | <b>no bgp default route-target filter</b><br><br><b>Example:</b><br>Router(config)# no bgp default route-target filter                       | Disables BGP route-target filtering and places the router in configuration mode. <ul style="list-style-type: none"> <li>All received BGP VPN-IPv4 routes are accepted by the router.</li> </ul>                                                                                                                                                        |
| <b>Step 5</b> | <b>address-family vpnv4 [<i>unicast</i>]</b><br><br><b>Example:</b><br>Router(config-router)# address-family vpnv4                           | Configures a routing session to carry VPNv4 addresses across the VPN backbone and places the router in address family configuration mode. <ul style="list-style-type: none"> <li>Each address has been made globally unique by the addition of an 8-byte route distinguisher (RD).</li> <li>The unicast keyword specifies a unicast prefix.</li> </ul> |
| <b>Step 6</b> | <b>neighbor <i>peer-group-name</i> remote-as <i>as-number</i></b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 1 remote-as 2 | Enters the address family configuration mode and specifies a neighboring EBGp peer group. <ul style="list-style-type: none"> <li>This EBGp peer group is identified to the specified autonomous system.</li> </ul>                                                                                                                                     |
| <b>Step 7</b> | <b>neighbor <i>peer-group-name</i> activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 1 activate                      | Activates the advertisement of the VPNv4 address family to a neighboring EBGp router.                                                                                                                                                                                                                                                                  |
| <b>Step 8</b> | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                           | Exits from the address family submode of the router configuration mode.                                                                                                                                                                                                                                                                                |
| <b>Step 9</b> | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                     | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                         |

## Configuring EBGp Routing to Exchange VPN Routes Between Subautonomous Systems in a Confederation

Perform this task to configure EBGp routing to exchange VPN routes between subautonomous systems in a confederation.

**Note**

To ensure that the host routes for VPN-IPv4 EBGP neighbors are propagated (by means of the IGP) to the other routers and provider edge routers, specify the **redistribute connected** command in the IGP configuration portion of the CEBGP router. If you are using OSPF, make sure that the OSPF process is not enabled on the CEBGP interface where the “redistribute connected” subnet exists.

**Note**

In this confederation, subautonomous system IGP domains must know the addresses of CEBGP-1 and CEBGP-2. If you do not specify a next-hop-self address as part of the router configuration, ensure that the addresses of all PE routers in the subautonomous system are distributed throughout the network, not just the addresses of CEBGP-1 and CEBGP-2.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **router bgp** *sub-autonomous-system*
4. **bgp confederation identifier** *as-number*
5. **bgp confederation peers** *sub-autonomous-system*
6. **no bgp default route-target filter**
7. **address-family vpnv4 [unicast]**
8. **neighbor** *peer-group-name* **remote-as** *as-number*
9. **neighbor** *peer-group-name* **next-hop-self**
10. **neighbor** *peer-group-name* **activate**
11. **exit-address-family**
12. **end**

**DETAILED STEPS**

|        | Command or Action                               | Purpose                                                                                                                                                                  |
|--------|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                   | Enables privileged EXEC mode.                                                                                                                                            |
|        | <b>Example:</b><br>Router> enable               | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                       |
| Step 2 | <b>configure terminal</b>                       | Enters global configuration mode.                                                                                                                                        |
|        | <b>Example:</b><br>Router# configure terminal   |                                                                                                                                                                          |
| Step 3 | <b>router bgp</b> <i>sub-autonomous-system</i>  | Creates an EBGP routing process and assigns it an autonomous system number and enters the router in configuration mode.                                                  |
|        | <b>Example:</b><br>Router(config)# router bgp 2 | <ul style="list-style-type: none"> <li>The subautonomous system number is passed along to identify the router to EBGP routers in other subautonomous systems.</li> </ul> |

|         | Command or Action                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                 |
|---------|----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4  | <b>bgp confederation identifier</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router)# bgp confederation identifier 100 | Defines an EBGp confederation by specifying a confederation identifier associated with each subautonomous system. <ul style="list-style-type: none"> <li>The subautonomous systems appear as a single autonomous system.</li> </ul>                                                                     |
| Step 5  | <b>bgp confederation peers</b> <i>sub-autonomous-system</i><br><br><b>Example:</b><br>Router(config-router)# bgp confederation peers 1 | Specifies the subautonomous systems that belong to the confederation (identifies neighbors of other subautonomous systems within the confederation as special EBGp peers).                                                                                                                              |
| Step 6  | <b>no bgp default route-target filter</b><br><br><b>Example:</b><br>Router(config-router)# no bgp default route-target filter          | Disables BGP route-target community filtering. All received BGP VPN-IPv4 routes are accepted by the router.                                                                                                                                                                                             |
| Step 7  | <b>address-family vpnv4</b> [ <b>unicast</b> ]<br><br><b>Example:</b><br>Router(config-router)# address-family vpnv4                   | Configures a routing session to carry VPNv4 addresses across the VPN backbone. Each address is made globally unique by the addition of an 8-byte RD. Enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>unicast</b> keyword specifies a unicast prefix.</li> </ul> |
| Step 8  | <b>neighbor peer-group-name remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 1 remote-as 1  | Enters the address family configuration mode and specifies a neighboring EBGp peer group. <ul style="list-style-type: none"> <li>This EBGp peer group is identified to the specified subautonomous system.</li> </ul>                                                                                   |
| Step 9  | <b>neighbor peer-group-name next-hop-self</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 1 next-hop-self             | Advertises the router as the next hop for the specified neighbor. <ul style="list-style-type: none"> <li>If a next-hop-self address is specified as part of the router configuration, the <b>redistribute connected</b> command need not be used.</li> </ul>                                            |
| Step 10 | <b>neighbor peer-group-name activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor R activate                       | Activates the advertisement of the VPNv4 address family to a neighboring PE router in the specified subautonomous system.                                                                                                                                                                               |
| Step 11 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                     | Exits from the address family submode of the router configuration mode.                                                                                                                                                                                                                                 |
| Step 12 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                               | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                          |

## Verifying Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

Perform this task to display the VPN-IPv4 LFIB entries.

### SUMMARY STEPS

1. **enable**
2. **show ip bgp vpnv4** {all | rd route-distinguisher | vrf vrf-name} [summary] [labels]
3. **show mpls forwarding-table** [network {mask | length} | labels label [-label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail]
4. **disable**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                               |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                    |
| Step 2 | <b>show ip bgp vpnv4</b> {all   rd route-distinguisher   vrf vrf-name} [summary] [labels]<br><br><b>Example:</b><br>Router# show ip bgp vpnv4 all labels                                                                                   | Displays VPN address information from the BGP table. <ul style="list-style-type: none"> <li>• Use the <b>all</b> and <b>labels</b> keywords to display information about all VPNv4 labels.</li> </ul> |
| Step 3 | <b>show mpls forwarding-table</b> [network {mask   length}   labels label [-label]   interface interface   next-hop address   lsp-tunnel [tunnel-id]] [vrf vrf-name] [detail]<br><br><b>Example:</b><br>Router# show mpls forwarding-table | Displays the contents of the MPLS LFIB (such as VPNv4 prefix/length and BGP next-hop destination for the route).                                                                                      |
| Step 4 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                                                                                                                                   | Exits to user EXEC mode.                                                                                                                                                                              |

### Examples

The sample output from the **show mpls forwarding-table** command shows how the VPN-IPv4 LFIB entries appear:

```
Router# show mpls forwarding-table
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id    | Bytes tag switched | Outgoing interface | Next Hop    |
|-----------|--------------------|------------------------|--------------------|--------------------|-------------|
| 33        | 33                 | 10.120.4.0/24          | 0                  | Hs0/0              | point2point |
| 35        | 27                 | 100:12:10.200.0.1/32 \ | 0                  | Hs0/0              | point2point |

In this example, the Prefix field appears as a VPN-IPv4 RD, plus the prefix. If the value is longer than the width of the Prefix column (as illustrated in the last line of the example), the output automatically wraps onto the next line in the forwarding table, preserving column alignment.

## Configuration Examples for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

This section provides the following configuration examples for MPLS VPN Inter-AS:

- [Configuring MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses: Example, page 16](#)
- [Configuring MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses in a Confederation: Example, page 23](#)

### Configuring MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses: Example

The network topology in [Figure 7](#) shows two autonomous systems, which are configured as follows:

- Autonomous system 1 (AS1) includes PE1, P1, and EBG1. The IGP is OSPF.
- Autonomous system 2 (AS2) includes PE2, P2, and EBG2. The IGP is IS-IS.
- CE1 and CE2 belong to the same VPN, which is called VPN1.
- The P routers are route reflectors.
- EBG1 is configured with the **redistribute connected subnets** command.
- EBG2 is configured with the **neighbor next-hop-self** command.

**Figure 7** Configuring Two Autonomous Systems

### Configuration for Autonomous System 1, CE1: Example

The following example shows how to configure CE1 in VPN1 in a topology with two autonomous systems (see [Figure 7](#)):

```
CE1: Burlington
!
interface Loopback1
```

```

ip address aa.0.0.6 255.255.255.255
!
interface Serial1/3
description wychmere
no ip address
encapsulation frame-relay
frame-relay intf-type dce
!
interface Serial1/3.1 point-to-point
description wychmere
ip address aa.6.2.1 255.255.255.252
frame-relay interface-dlci 22
!
router ospf 1
network aa.0.0.0 0.255.255.255 area 0

```

## Configuration for Autonomous System 1, PE1: Example

The following example shows how to configure PE1 in AS1 in a topology with two autonomous systems (see [Figure 7](#)):

```

PE1: wychmere
!
ip cef
!
ip vrf V1

```

## Configuring MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses in a Confederation: Example

The network topology in [Figure 8](#) shows a single internet service provider, which is partitioning the backbone with confederations. The autonomous system number of the provider is 100. The two autonomous systems run their own IGP and are configured as follows:

- Autonomous system 1 (AS1) includes PE1, P1, CEBGP1. The IGP is OSPF.
- Autonomous system 2 (AS2) includes PE2, P2, CEBGP2. The IGP is IS-IS.

- CE1 and CE2 belong to the same VPN, which is called VPN1.
- The P routers are route reflectors.
- CEBGP1 is configured with the **redistribute connected subnets** command.
- CEBGP2 is configured with the **neighbor next-hop-self** command.

**Figure 8** *Configuring Two Autonomous Systems in a Confederation*

## Configuration for Autonomous System 1, CE1: Example

The following example shows how to configure CE1 in VPN1 in a confederation topology (see [Figure 8](#)):

```
CE1: Burlington
!
interface Loopback1
 ip address aa.0.0.6 255.255.255.255
!
interface Serial1/3
 description wychmere

## Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

[Table 2](#) lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For details on when support for specific commands was introduced, see the command reference documents.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

[Table 2](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2** Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses

# MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

---

**First Published: May 2, 2005**

**Last Updated: February 27, 2009**

The MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels feature allows a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) to span service providers and autonomous systems. This module explains how to configure an MPLS VPN Inter-AS network so that the Autonomous System Boundary Routers (ASBRs) exchange IPv4 routes with MPLS labels of the provider edge (PE) routers. Route reflectors (RRs) exchange VPN-IPv4 routes by using multihop, multiprotocol, external Border Gateway Protocol (eBGP).

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels” section on page 37](#).

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

The network must be properly configured for MPLS VPN operation before you configure MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels.

[Table 1](#) lists the Cisco 12000 series line card support in Cisco IOS S releases.

**Table 1** *Cisco 12000 Series Line Card Support in Cisco IOS S Releases*

| Type                  | Line Cards                                                                                                                       | Cisco IOS Release Supported        |

## Restrictions for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

This feature includes the following restrictions:

- For networks configured with eBGP multihop, you must configure a label switched path (LSP) between nonadjacent routers.
- The physical interfaces that connect the BGP speakers must support Cisco Express Forwarding or distributed Cisco Express Forwarding and MPLS.

## Information About MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

Before configuring MPLS VPN Inter-AS, you should understand the following concepts:

- [MPLS VPN Inter-AS Introduction, page 3](#)
- [Benefits of MPLS VPN Inter-AS, page 4](#)
- [Information About Using MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels, page 4](#)

## MPLS VPN Inter-AS Introduction

An autonomous system is a single network or group of networks that is controlled by a common system administration group and that uses a single, clearly defined routing protocol.

As VPNs grow, their requirements expand. In some cases, VPNs need to reside on different autonomous systems in different geographic areas. Also, some VPNs need to extend across multiple service providers (overlapping VPNs). Regardless of the complexity and location of the VPNs, the connection between autonomous systems must be seamless to the customer.

## Benefits of MPLS VPN Inter-AS

MPLS VPN Inter-AS provides the following benefits:

- Allows a VPN to cross more than one service provider backbone

Service providers running separate autonomous systems, can jointly offer MPLS VPN services to the same customer. A VPN can begin at one site and traverse different VPN service provider backbones before arriving at another site of the same customer. Previously, MPLS VPNs could traverse only a single BGP autonomous system service provider backbone. This feature allows multiple autonomous systems to form a continuous (and seamless) network between customer sites of a service provider.

- Allows a VPN to exist in different areas

A service provider can create a VPN in different geographic areas. Having all VPN traffic flow through one point (between the areas) allows for better rate control of network traffic between the areas.

- Allows confederations to optimize iBGP meshing

Internal Border Gateway Protocol (iBGP) meshing in an autonomous system is more organized and manageable. This feature can divide an autonomous system into multiple, separate subautonomous systems and then classify them into a single confederation (even though the entire VPN backbone appears as a single autonomous system). This capability allows a service provider to offer MPLS VPNs across the confederation because it supports the exchange of labeled VPN-IPv4 Network Layer Reachability Information (NLRI) between the subautonomous systems that form the confederation.

## Information About Using MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

This feature can configure a MPLS VPN Inter-AS network so that the ASBRs exchange IPv4 routes with MPLS labels of the PE routers. RRs exchange VPN-IPv4 routes by using multihop, multiprotocol, External Border Gateway Protocol (eBGP). This method of configuring the Inter-AS system is often called MPLS VPN Inter-AS—IPv4 BGP Label Distribution.

## Benefits of MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

An Inter-AS system can be configured so that the ASBRs exchange the IPv4 routes and MPLS labels has the following benefits:

- Saves the ASBRs from having to store all the VPN-IPv4 routes. Using the route reflectors to store the VPN-IPv4 routes and forward them to the PE routers results in improved scalability compared with configurations where the ASBR holds all of the VPN-IPv4 routes and forwards the routes based on VPN-IPv4 labels.
- Simplifies the configuration at the border of the network by having the route reflectors hold the VPN-IPv4 routes.
- Enables a non-VPN core network to act as a transit network for VPN traffic. You can transport IPv4 routes with MPLS labels over a non-MPLS VPN service provider.

- Eliminates the need for any other label distribution protocol between adjacent LSRs. If two adjacent label switch routers (LSRs) are also BGP peers, BGP can handle the distribution of the MPLS labels. No other label distribution protocol is needed between the two LSRs.

## How the Inter-AS Works When ASBRs Exchange IPv4 Routes with MPLS Labels

A VPN service provider network to exchange IPv4 routes with MPLS labels can be configured. The VPN service provider network can be configured as follows:

- Route reflectors exchange VPN-IPv4 routes by using multihop, multiprotocol eBGP. This configuration also preserves the next-hop information and the VPN labels across the autonomous systems.
- A local PE router (for example, PE1 in [Figure 1](#)) needs to know the routes and label information for the remote PE router (PE2). This information can be exchanged between the PE routers and ASBRs in one of two ways:
  - Internal Gateway Protocol (IGP) and Label Distribution Protocol (LDP): The ASBR can redistribute the IPv4 routes and MPLS labels it learned from eBGP into IGP and LDP and vice versa.
  - Internal Border Gateway Protocol (iBGP) IPv4 label distribution: The ASBR and PE router can use direct iBGP sessions to exchange VPN-IPv4 and IPv4 routes and MPLS labels.

Alternatively, the route reflector can reflect the IPv4 routes and MPLS labels learned from the ASBR to the PE routers in the VPN. This is accomplished by the ASBR exchanging IPv4 routes and MPLS labels with the route reflector. The route reflector also reflects the VPN-IPv4 routes to the PE routers in the VPN. For example, in VPN1 of [Figure 1](#), RR1 reflects to PE1 the VPN-IPv4 routes it learned and IPv4 routes and MPLS labels learned from ASBR1. Using the route reflectors to store the VPN-IPv4 routes and forward them through the PE routers and ASBRs allows for a scalable configuration.

**Figure 1** *VPNs Using eBGP and iBGP to Distribute Routes and MPLS Labels*

## BGP Routing Information

BGP routing information includes the following items:

- A network number (prefix), which is the IP address of the destination.
- Autonomous system path, which is a list of the other autonomous systems through which a route passes on its way to the local router. The first autonomous system in the list is closest to the local router; the last autonomous system in the list is farthest from the local router and usually the autonomous system where the route began.
- Path attributes, which provide other information about the autonomous system path, for example, the next hop.

## Types of BGP Messages and MPLS Labels

MPLS labels are included in the update messages that a router sends. Routers exchange the following types of BGP messages:

- Keepalive messages—Routers exchange keepalive messages to determine if a neighboring router is still available to exchange routing information. The router sends these messages at regular intervals. (Sixty seconds is the default for Cisco routers.) The keepalive message does not contain routing data; it contains only a message header.
- Notification messages—When a router detects an error, it sends a notification message.
- Open messages—After a router establishes a TCP connection with a neighboring router, the routers exchange open messages. This message contains the number of the autonomous system to which the router belongs and the IP address of the router that sent the message.
- Update messages—When a router has a new, changed, or broken route, it sends an update message to the neighboring router. This message contains the NLRI, which lists the IP addresses of the usable routes. The update message includes any routes that are no longer usable. The update message also includes path attributes and the lengths of both the usable and unusable paths. Labels for VPN-IPv4 routes are encoded in the update message as specified in RFC 2858. The labels for the IPv4 routes are encoded in the update message as specified in RFC 3107.

## How BGP Sends MPLS Labels with Routes

When BGP (eBGP and iBGP) distributes a route, it can also distribute an MPLS label that is mapped to that route. The MPLS label mapping information for the route is carried in the BGP update message that contains the information about the route. If the next hop is not changed, the label is preserved.

When you issue the **neighbor send-label** command on both BGP routers, the routers advertise to each other that they can then send MPLS labels with the routes. If the routers successfully negotiate their ability to send MPLS labels, the routers add MPLS labels to all outgoing BGP updates.

# How to Configure MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

To configure MPLS VPN Inter-AS with ASBRs exchanging IPv4 routes and MPLS labels, perform the tasks in the following sections:

- [Configuring the ASBRs to Exchange IPv4 Routes and MPLS Labels, page 7](#)
- [Configuring the Route Reflectors to Exchange VPN-IPv4 Routes, page 9](#)
- [Configuring the Route Reflector to Reflect Remote Routes in Its Autonomous System, page 11](#)

- [Verifying the MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels Configuration, page 13](#)

Figure 2 shows the following sample configuration:

- The configuration consists of two VPNs.
- The ASBRs exchange the IPv4 routes with MPLS labels.
- The route reflectors exchange the VPN-IPv4 routes using multihop MPLS eBGP.
- The route reflectors reflect the IPv4 and VPN-IPv4 routes to the other routers in their autonomous system.

**Figure 2** *Configuring Two VPN Service Providers to Exchange IPv4 Routes and MPLS Labels*

## Configuring the ASBRs to Exchange IPv4 Routes and MPLS Labels

Perform this task to configure the ASBRs to exchange IPv4 routes and MPLS labels. This configuration procedure uses ASBR1 as an example.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
5. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **neighbor** *ip-address* **send-label**
8. **exit-address-family**
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                              | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                | Configures a BGP routing process and places the router in router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                                                                                                                                                                                                  |
| Step 4 | <b>neighbor {ip-address   peer-group-name} remote-as as-number</b><br><br><b>Example:</b><br>Router(config-router)# neighbor hh.0.0.1 remote-as 200 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                                                                                                                                                                                                                                     |
| Step 5 | <b>address-family ipv4 [multicast   unicast   mdt   vrf vrf-name]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4          | Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>mdt</b> keyword specifies an IPv4 multicast distribution tree (MDT) address family session.</li> <li>The <b>vrf vrf-name</b> keyword and argument specify the name of the VPN routing and forwarding (VRF) instance to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |

|        | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor hh.0.0.1<br>activate | Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul> |
| Step 7 | <b>neighbor</b> <i>ip-address</i> <b>send-label</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor hh.0.0.1<br>send-label                             | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighboring router.</li> </ul>                                                     |
| Step 8 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                                  | Exits address family configuration mode.                                                                                                                                                                                                                                       |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                                                                  | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                      |

## Configuring the Route Reflectors to Exchange VPN-IPv4 Routes

Perform this task to enable the route reflectors to exchange VPN-IPv4 routes by using multihop, multiprotocol eBGP.

This procedure also specifies that the next hop information and the VPN label are to be preserved across the autonomous systems. This procedure uses RR1 as an example of the route reflector.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
5. **address-family vpnv4** [unicast]
6. **neighbor** {*ip-address* | *peer-group-name*} **ebgp-multihop** [*tth*]
7. **neighbor** {*ip-address* | *peer-group-name*} **activate**
8. **neighbor** {*ip-address* | *peer-group-name*} **next-hop unchanged**
9. **exit-address-family**
10. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                     | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 3 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                       | Configures a BGP routing process and places the router in router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul> The autonomous system number identifies RR1 to routers in other autonomous systems. |
| Step 4 | <b>neighbor {ip-address   peer-group-name} remote-as as-number</b><br><br><b>Example:</b><br>Router(config-router)# neighbor bb.bb.bb.bb remote-as 200     | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                                                                                                                        |
| Step 5 | <b>neighbor {ip-address   peer-group-name} ebgp-multihop [ttl]</b><br><br><b>Example:</b><br>Router(config-router)# neighbor bb.bb.bb.bb ebgp-multihop 255 | Accepts and attempts BGP connections to external peers residing on networks that are not directly connected. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>ttl</i> argument specifies the time-to-live in the range from 1 to 255 hops.</li> </ul>                                                                                                     |
| Step 6 | <b>address-family vpnv4 [unicast]</b><br><br><b>Example:</b><br>Router(config-router)# address-family vpnv4                                                | Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> <li>The optional <b>unicast</b> keyword specifies VPNv4 unicast address prefixes.</li> </ul>                                                                                                                                                                                                                                                                 |

|         | Command or Action                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                 |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor bb.bb.bb.bb activate                    | Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                          |
| Step 8  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>next-hop unchanged</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor ip-address next-hop unchanged | Enables an eBGP multihop peer to propagate the next hop unchanged. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the next hop.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group that is the next hop.</li> </ul> |
| Step 9  | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                                                     | Exits address family configuration mode.                                                                                                                                                                                                                                                                |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                                                                                                        | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                               |

## Configuring the Route Reflector to Reflect Remote Routes in Its Autonomous System

Perform this task to enable the RR to reflect the IPv4 routes and labels learned by the ASBR to the PE routers in the autonomous system.

This is accomplished by making the ASBR and PE router route reflector clients of the RR. This procedure also explains how to enable the RR to reflect the VPN-IPv4 routes.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **neighbor** {*ip-address* | *peer-group-name*} **activate**
6. **neighbor** *ip-address* **route-reflector-client**
7. **neighbor** *ip-address* **send-label**
8. **exit-address-family**
9. **address-family vpnv4** [**unicast**]
10. **neighbor** {*ip-address* | *peer-group-name*} **activate**

11. **neighbor *ip-address* route-reflector-client**
12. **exit-address-family**
13. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 3 | <b>router bgp <i>as-number</i></b><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                       | Configures a BGP routing process and places the router in router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                                                                           |
| Step 4 | <b>address-family ipv4 [<i>multicast</i>   <i>unicast</i>   <i>vrf vrf-name</i>]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4         | Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard IPv4 address prefixes. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf <i>vrf-name</i></b> keyword and argument specify the name of the VRF instance to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |
| Step 5 | <b>neighbor {<i>ip-address</i>   <i>peer-group-name</i>}</b><br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor ee.ee.ee.ee activate | Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                                                                                                                                                                   |
| Step 6 | <b>neighbor <i>ip-address</i> route-reflector-client</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor ee.ee.ee.ees route-reflector-client         | Configures the router as a BGP route reflector and configures the specified neighbor as its client. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP neighbor being configured as a client.</li> </ul>                                                                                                                                                                                                                                                                  |

|         | Command or Action                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                        |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <b>neighbor</b> <i>ip-address</i> <b>send-label</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor ee.ee.ee.ee send-label                          | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighboring router.</li> </ul>                                                     |
| Step 8  | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                               | Exits address family configuration mode.                                                                                                                                                                                                                                       |
| Step 9  | <b>address-family</b> <b>vpnvp4</b> [ <b>unicast</b> ]<br><br><b>Example:</b><br>Router(config-router)# address-family vpnvp4                                    | Enters address family configuration mode for configuring routing sessions, such as BGP sessions, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> <li>The optional <b>unicast</b> keyword specifies VPNv4 unicast address prefixes.</li> </ul>     |
| Step 10 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor ee.ee.ee.ee activate | Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul> |
| Step 11 | <b>neighbor</b> <i>ip-address</i> <b>route-reflector-client</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor ee.ee.ee.ee route-reflector-client  | Enables the RR to pass iBGP routes to the neighboring router.                                                                                                                                                                                                                  |
| Step 12 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                               | Exits address family configuration mode.                                                                                                                                                                                                                                       |
| Step 13 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                                                               | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                      |

## Verifying the MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels Configuration

If you use ASBRs to distribute the IPv4 labels and route reflectors to distribute the VPN-IPv4 routes, use the following procedures to help verify the configuration:

- Verifying the Route Reflector Configuration, page 14
- Verifying that CE1 Can Communicate with CE2, page 15
- Verifying that PE1 Can Communicate with CE2, page 16
- Verifying that PE2 Can Communicate with CE2, page 18

- [Verifying the ASBR Configuration, page 19](#)

Figure 3 shows the configuration that is referred to in the next several sections.

**Figure 3** *Configuring Two VPN Service Providers to Exchange IPv4 Routes and MPLS Labels*

## Verifying the Route Reflector Configuration

Perform this task to verify the route reflector configuration.

### SUMMARY STEPS

1. **enable**
2. **show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [summary] [labels]**
3. **disable**

DETAILED STEPS

|        | Command or Action                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                    |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                           |
| Step 2 | <b>show ip route vrf vrf-name</b> [ <b>connected</b> ]<br>[ <b>protocol</b> [ <b>as-number</b> ] [ <b>tag</b> ] [ <b>output-modifiers</b> ]]<br>[ <b>list number</b> [ <b>output-modifiers</b> ]] [ <b>profile</b> ]<br>[ <b>static</b> [ <b>output-modifiers</b> ]] [ <b>summary</b><br>[ <b>output-modifiers</b> ]] [ <b>supernets-only</b><br>[ <b>output-modifiers</b> ]] [ <b>traffic-engineering</b><br>[ <b>output-modifiers</b> ]]<br><br><b>Example:</b><br>Router# show ip route vrf vpn1 nn.nn.nn.nn                                                                                                                                                                                                                                                                          | (Optional) Displays the IP routing table associated with a VRF. <ul style="list-style-type: none"> <li>Use this command to verify that router PE1 learns routes from router CE2 (nn.nn.nn.nn).</li> </ul>                                  |
| Step 3 | <b>show ip bgp vpnv4</b> { <b>all</b>   <b>rd route-distinguisher</b><br>  <b>vrf vrf-name</b> } [ <b>ip-prefix length</b><br>[ <b>longer-prefixes</b> ] [ <b>output-modifiers</b> ]]<br>[ <b>network-address</b> [ <b>mask</b> ] [ <b>longer-prefixes</b> ]<br>[ <b>output-modifiers</b> ]] [ <b>cidr-only</b> ] [ <b>community</b> ]<br>[ <b>community-list</b> ] [ <b>dampened-paths</b> ] [ <b>filter-list</b> ]<br>[ <b>flap-statistics</b> ] [ <b>inconsistent-as</b> ] [ <b>neighbors</b> ]<br>[ <b>paths</b> [ <b>line</b> ]] [ <b>peer-group</b> ] [ <b>quote-regexp</b> ]<br>[ <b>regexp</b> ] [ <b>summary</b> ] [ <b>tags</b> ]<br><br><b>Example:</b><br>Router# show ip bgp vpnv4 vrf vpn1 nn.nn.nn.nn<br><br><b>Example:</b><br>Router# show ip bgp vpnv4 all nn.nn.nn.nn | (Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> <li>Use the <b>vrf</b> or <b>all</b> keyword to verify that router PE2 is the BGP next-hop to router CE2.</li> </ul>                    |
| Step 4 | <b>show ip cef</b> [ <b>vrf vrf-name</b> ] [ <b>network</b> [ <b>mask</b> ]]<br>[ <b>longer-prefixes</b> ] [ <b>detail</b> ]<br><br><b>Example:</b><br>Router# show ip cef vrf vpn1 nn.nn.nn.nn                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | (Optional) Displays entries in the Forwarding Information Base (FIB) or displays a summary of the FIB. <ul style="list-style-type: none"> <li>Use this command to verify that the Cisco Express Forwarding entries are correct.</li> </ul> |
| Step 5 | <b>show mpls forwarding-table</b> [{ <b>network</b> { <b>mask</b>  <br><b>length</b> }   <b>labels label</b> [ <b>-label</b> ]   <b>interface</b><br><b>interface</b>   <b>next-hop address</b>   <b>lsp-tunnel</b><br>[ <b>tunnel-id</b> ]}] [ <b>detail</b> ]<br><br><b>Example:</b><br>Router# show mpls forwarding-table                                                                                                                                                                                                                                                                                                                                                                                                                                                             | (Optional) Displays the contents of the MPLS LFIB. <ul style="list-style-type: none"> <li>Use this command to verify the IGP label for the BGP next hop router (autonomous system boundary).</li> </ul>                                    |
| Step 6 | <b>show ip bgp</b> [ <b>network</b> ] [ <b>network-mask</b> ]<br>[ <b>longer-prefixes</b> ]<br><br><b>Example:</b><br>Router# show ip bgp ff.ff.ff.ff                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | (Optional) Displays entries in the BGP routing table. <ul style="list-style-type: none"> <li>Use the <b>show ip bgp</b> command to verify the label for the remote egress PE router (PE2).</li> </ul>                                      |

|        | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7 | <pre>show ip bgp vpnv4 {all   rd route-distinguisher   vrf vrf-name} [summary] [labels]</pre> <p><b>Example:</b><br/>Router# show ip bgp vpnv4 all labels</p> | (Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> <li>Use the <b>all</b> and <b>summary</b> keywords to verify the VPN label of CE2, as advertised by PE2.</li> </ul> |
| Step 8 | <pre>disable</pre> <p><b>Example:</b><br/>Router# disable</p>                                                                                                 | (Optional) Exits to user EXEC mode.                                                                                                                                                                                    |

## Verifying that PE2 Can Communicate with CE2

Perform this task to ensure that PE2 can access CE2.

### SUMMARY STEPS

1. **enable**
2. **show ip route vrf vrf-name [connected] [protocol [as-number] [tag] [output-modifiers]] [list number [output-modifiers]] [profile] [static [output-modifiers]] [summary [output-modifiers]] [supernets-only [output-modifiers]] [traffic-engineering [output-modifiers]]**
3. **show mpls forwarding-table [vrf vrf-name] [{network {mask | length} | labels label [-label] | interface interface | next-hop address | lsp-tunnel [tunnel-id]]] [detail]**
4. **show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [summary] [labels]**
5. **show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]**
6. **disable**

### DETAILED STEPS

The command output shows the local label for CE2 and the outgoing interface.</li> </ul> |
| Step 6 | <pre>disable</pre> <p><b>Example:</b><br/>Router# disable</p>                                                                                                                                                                                                          | <p>(Optional) Exits to user EXEC mode.</p>                                                                                                                                                                                                                                           |

## Verifying the ASBR Configuration

Perform this task to verify that the ASBRs exchange IPv4 routes with MPLS labels or IPv4 routes without labels as prescribed by a route map.

### SUMMARY STEPS

1. **enable**
2. **show ip bgp** [network] [network-mask] [longer-prefixes]
3. **show ip cef** [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]
4. **disable**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Step 4 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                                                                                                                                 | (Optional) Exits to user EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                        |

## Configuration Examples for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

Configuration examples for MPLS VPN Inter-AS are as follows:

- Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over an MPLS VPN Service Provider: Examples, page 20
- Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over a Non-MPLS VPN Service Provider: Examples, page 26

## Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over an MPLS VPN Service Provider: Examples

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over an MPLS VPN service provider included in this section are as follows:

- [Route Reflector 1 Configuration Example \(MPLS VPN Service Provider\)](#), page 22
- [ASBR1 Configuration Example \(MPLS VPN Service Provider\)](#), page 23
- [Route Reflector 2 Configuration Example \(MPLS VPN Service Provider\)](#), page 24
- [ASBR2 Configuration Example \(MPLS VPN Service Provider\)](#), page 25

Figure 4 shows two MPLS VPN service providers. The service provider distributes the VPN-IPv4 routes between the route reflectors. The MPLS VPN service providers distribute the IPv4 routes with MPLS labels between the ASBRs.

The configuration example shows the following two techniques you can use to distribute the VPN-IPv4 routes and the IPv4 routes with MPLS labels of the remote RRs and PEs to the local RRs and PEs:

- Autonomous system 100 uses the RRs to distribute the VPN-IPv4 routes learned from the remote RRs. The RRs also distribute the remote PE address and label learned from ASBR1 using IPv4 labels.
- In Autonomous system 200, the IPv4 routes that ASBR2 learned are redistributed into IGP.

**Figure 4** *Distributing IPv4 Routes and MPLS Labels Between MPLS VPN Service Providers*

## Route Reflector 1 Configuration Example (MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPN-IPv4 routes with RR2 using multiprotocol, multihop eBGP.
- The VPN-IPv4 next-hop information and the VPN label are preserved across the autonomous systems.
- RR1 reflects to PE1:
  - The VPN-IPv4 routes learned from RR2
  - The IPv4 routes and MPLS labels learned from ASBR1

```

## ASBR1 Configuration Example (MPLS VPN Service Provider)

ASBR1 exchanges IPv4 routes and MPLS labels with ASBR2.

In this example, ASBR1 uses route maps to filter routes:

- A route map called OUT specifies that ASBR1 should distribute the PE1 route (ee.ee) with labels and the RR1 route (aa.aa) without labels.
- A route map called IN specifies that ASBR1 should accept the PE2 route (ff.ff) with labels and the RR2 route (bb.bb) without labels.

```

## Route Reflector 2 Configuration Example (MPLS VPN Service Provider)

RR2 exchanges VPN-IPv4 routes with RR1 through multihop, multiprotocol eBGP. This configuration also specifies that the next-hop information and the VPN label are preserved across the autonomous systems:

```

ip subnet-zero
ip cef
!
interface Loopback0
 ip address bb.0.0.0 255.255.255.255
!
interface Serial1/1
 ip address ii.0.0.0 255.0.0.0
!
router ospf 20

neighbor ff.ff.ff.ff send-community extended
exit-address-family
!
ip default-gateway 3.3.0.1
no ip classless
!
end

```

## ASBR2 Configuration Example (MPLS VPN Service Provider)

ASBR2 exchanges IPv4 routes and MPLS labels with ASBR1. However, in contrast to ASBR1, ASBR2 does not use the RR to reflect IPv4 routes and MPLS labels to PE2. ASBR2 redistributes the IPv4 routes and MPLS labels learned from ASBR1 into IGP. PE2 can now reach these prefixes.

```

ip subnet-zero
ip cef
!
mpls label protocol ldp
!
interface Loopback0
 ip address xx.xx.xx.xx 255.255.255.255
!
interface Ethernet1/0

## Configuring MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels over a Non-MPLS VPN Service Provider: Examples

Configuration examples for Inter-AS using BGP to distribute routes and MPLS labels over a non MPLS VPN service provider included in this section are as follows:

- [Route Reflector 1 Configuration Example \(Non-MPLS VPN Service Provider\), page 27](#)
- [ASBR1 Configuration Example \(Non-MPLS VPN Service Provider\), page 28](#)
- [Route Reflector 2 Configuration Example \(Non-MPLS VPN Service Provider\), page 30](#)
- [ASBR2 Configuration Example \(Non-MPLS VPN Service Provider\), page 30](#)
- [ASBR3 Configuration Example \(Non-MPLS VPN Service Provider\), page 32](#)
- [Route Reflector 3 Configuration Example \(Non-MPLS VPN Service Provider\), page 33](#)
- [ASBR4 Configuration Example \(Non-MPLS VPN Service Provider\), page 34](#)

Figure 5 shows two MPLS VPN service providers that are connected through a non MPLS VPN service provider. The autonomous system in the middle of the network is configured as a backbone autonomous system that uses LDP or Tag Distribution Protocol (TDP) to distribute MPLS labels. Traffic engineering tunnels can also be used instead of TDP or LDP to build the LSP across the non MPLS VPN service provider.

**Figure 5** *Distributing Routes and MPLS Labels over a Non-MPLS VPN Service Provider*

## Route Reflector 1 Configuration Example (Non-MPLS VPN Service Provider)

The configuration example for RR1 specifies the following:

- RR1 exchanges VPN-IPv4 routes with RR2 using multiprotocol, multihop eBGP.
- The VPN-IPv4 next-hop information and the VPN label are preserved across the autonomous systems.
- RR1 reflects to PE1:
  - The VPN-IPv4 routes learned from RR2
  - The IPv4 routes and MPLS labels learned from ASBR1

```
ip subnet-zero
ip cef
!
interface Loopback0
 ip address aa.aa.aa.aa 255.255.255.255
!

snmp-server packetsize 2048
!
end

```

## ASBR1 Configuration Example (Non-MPLS VPN Service Provider)

ASBR1 exchanges IPv4 routes and MPLS labels with ASBR2.

In this example, ASBR1 uses route maps to filter routes:

- A route map called OUT specifies that ASBR1 should distribute the PE1 route (ee.aa) with labels and the RR1 route (aa.aa) without labels.
- A route map called IN specifies that ASBR1 should accept the PE2 route (ff.aa) with labels and the RR2 route (bb.bb) without labels.

```

!
route-map OUT permit 13
match ip address 1
set mpls-label
!
end

```

## Route Reflector 2 Configuration Example (Non-MPLS VPN Service Provider)

RR2 exchanges VPN-IPv4 routes with RR1 using multihop, multiprotocol eBGP. This configuration also specifies that the next-hop information and the VPN label are preserved across the autonomous systems:

```
ip subnet-zero
ip cef
!
interface Loopback0
 ip address bb.bb.bb.bb 255.255.255.255
!
interface Serial1/1
 ip address ii.0.0.2 255.0.0.0
!
router ospf 20

 neighbor aa.aa.aa.aa next-hop-unchanged           !MH vpnv4 session with RR1
 neighbor aa.aa.aa.aa send-community extended      !with next-hop-unchanged
 neighbor ff.ff.ff.ff activate
 neighbor ff.ff.ff.ff route-reflector-client        !vpnv4 session with PE2
 neighbor ff.ff.ff.ff send-community extended
 exit-address-family
!
ip default-gateway 3.3.0.1
no ip classless
!
end
```

## ASBR2 Configuration Example (Non-MPLS VPN Service Provider)

ASBR2 exchanges IPv4 routes and MPLS labels with ASBR1. However, in contrast to ASBR1, ASBR2 does not use the RR to reflect IPv4 routes and MPLS labels to PE2. ASBR2 redistributes the IPv4 routes and MPLS labels learned from ASBR1 into IGP. PE2 can now reach these prefixes.

```
ip subnet-zero
ip cef
!
mpls label protocol ldp
!
interface Loopback0
 ip address xx.xx.xx.xx 255.255.255.255
!
interface Ethernet0/1
 ip address qq.0.0.2 255.0.0.0
!
interface Ethernet1/2
```

```

ip address jj.0.0.1 255.0.0.0
mpls label protocol ldp
mpls ip
!
router ospf 20

match ip address 3
!
end

```

## ASBR3 Configuration Example (Non-MPLS VPN Service Provider)

ASBR3 belongs to a non MPLS VPN service provider. ASBR3 exchanges IPv4 routes and MPLS labels with ASBR1. ASBR3 also passes the routes learned from ASBR1 to ASBR3 through RR3.

### Note

Do not redistribute eBGP routes learned into iBGP if you are using iBGP to distribute the routes and labels. This is not a supported configuration.

```
ip subnet-zero
ip cef
!
interface Loopback0
 ip address yy.yy.yy.yy 255.255.255.255
interface Hssi4/0
 ip address mm.0.0.0.1 255.0.0.0

## Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

[Table 2](#) lists the features in this module and provides links to specific configuration information.

Not all commands may be available in your Cisco IOS software release. For details on when support for specific commands was introduced, see the command reference documents.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### Note

[Table 2](#) lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2** Feature Information for MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels

# MPLS VPN Carrier Supporting Carrier Using LDP and an IGP

---

**First Published:** May 2, 2005  
**Last Updated:** February 5, 2009

Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Carrier Supporting Carrier (CSC) enables one MPLS VPN-based service provider to allow other service providers to use a segment of its backbone network. This module explains how to configure the MPLS VPN CSC network using MPLS Label Distribution Protocol (LDP) to distribute MPLS labels and an Interior Gateway Protocol (IGP) to distribute routes.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the “[Feature Information for MPLS VPN CSC with LDP and IGP](#)” section on page 66.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

**Americas Headquarters:**  
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

- [Command Reference, page 65](#)
- [Feature Information for MPLS VPN CSC with LDP and IGP, page 66](#)
- [Glossary, page 66](#)

## Prerequisites for MPLS VPN CSC with LDP and IGP

This feature includes the following requirements:

- The provider edge (PE) routers of the backbone carrier require 128 MB of memory.
- The backbone carrier must enable the PE router to check that the packets it receives from the customer edge (CE) router contain only the labels that the PE router advertised to the CE router. This prevents data spoofing, which occurs when a packet from an unrecognized IP address is sent to a router.

## Restrictions for MPLS VPN CSC with LDP and IGP

The following features are not supported with this feature:

- ATM MPLS
- Carrier supporting carrier traffic engineering
- Carrier supporting carrier quality of service (QoS)
- RSVP aggregation
- VPN Multicast between the customer carrier and the backbone carrier network

The following router platforms are supported on the edge of the MPLS VPN:

- Cisco 7200 series
- Cisco 7500 series
- Cisco 12000 series

See [Table 1](#) for Cisco 12000 series line card support added for Cisco IOS releases.

**Table 1** *Cisco12000 Series Line Card Support Added for Cisco IOS Releases*

| Type                    | Line Cards           | Cisco IOS Release Added |
|-------------------------|----------------------|-------------------------|
| Packet over SONET (POS) | 4-Port OC-3 POS      | 12.0(16)ST              |
|                         | 1-Port OC-12 POS     |                         |
|                         | 8-Port OC-3 POS      | 12.0(21)ST              |
|                         | 16-Port OC-3 POS     |                         |
|                         | 4-Port OC-12 POS     |                         |
|                         | 1-Port OC-48 POS     |                         |
|                         | 4-Port OC-3 POS ISE  | 12.0(22)S               |

## Information About MPLS VPN CSC with LDP and IGP

Before configuring MPLS VPN CSC, you should understand the following concepts:

- [MPLS VPN CSC Introduction, page 3](#)
- [Benefits of Implementing MPLS VPN CSC, page 3](#)
- [Configuration Options for MPLS VPN CSC with LDP and IGP, page 4](#)

## MPLS VPN CSC Introduction

Carrier supporting carrier is where one service provider allows another service provider to use a segment of its backbone network. The service provider that provides the segment of the backbone network to the other provider is called the backbone carrier. The service provider that uses the segment of the backbone network is called the customer carrier.

A backbone carrier offers Border Gateway Protocol and Multiprotocol Label Switching (BGP/MPLS) VPN services. The customer carrier can be either:

- An Internet service provider (ISP)
- A BGP/MPLS VPN service provider

## Benefits of Implementing MPLS VPN CSC

The MPLS VPN CSC provides the following benefits to service providers who are backbone carriers and to customer carriers.

### Benefits to the Backbone Carrier

- The backbone carrier can accommodate many customer carriers and give them access to its backbone. The backbone carrier does not need to create and maintain separate backbones for its customer carriers. Using one backbone network to support multiple customer carriers simplifies the

backbone carrier's VPN operations. The backbone carrier uses a consistent method for managing and maintaining the backbone network. This is also cheaper and more efficient than maintaining separate backbones.

- The MPLS VPN carrier supporting carrier feature is scalable. Carrier supporting carrier can change the VPN to meet changing bandwidth and connectivity needs. The feature can accommodate unplanned growth and changes. The carrier supporting carrier feature enables tens of thousands of VPNs to be configured over the same network, and it allows a service provider to offer both VPN and Internet services.
- The MPLS VPN carrier supporting carrier feature is a flexible solution. The backbone carrier can accommodate many types of customer carriers. The backbone carrier can accept customer carriers who are ISPs or VPN service providers or both. The backbone carrier can accommodate customer carriers that require security and various bandwidths.

#### **Benefits to the Customer Carriers**

- The MPLS VPN carrier supporting carrier feature removes from the customer carrier the burden of configuring, operating, and maintaining its own backbone. The customer carrier uses the backbone network of a backbone carrier, but the backbone carrier is responsible for network maintenance and operation.
- Customer carriers who use the VPN services provided by the backbone carrier receive the same level of security that Frame Relay or ATM-based VPNs provide. Customer carriers can also use IPSec in their VPNs for a higher level of security; it is completely transparent to the backbone carrier.
- Customer carriers can use any link layer technology (SONET, Digital Subscriber Line, Frame Relay, and so on) to connect the CE routers to the PE routers and the PE routers to the P routers. The MPLS VPN carrier supporting carrier feature is link layer independent. The CE routers and PE routers use IP to communicate, and the backbone carrier uses MPLS.
- The customer carrier can use any addressing scheme and still be supported by a backbone carrier. The customer address space and routing information are independent of the address space and routing information of other customer carriers or the backbone provider.

## **Configuration Options for MPLS VPN CSC with LDP and IGP**

The backbone carrier offers BGP and MPLS VPN services. The customer carrier can be one of the two types of service providers described in the following sections, which explain how the backbone and customer carriers distribute IPv4 routes and MPLS labels.

- [Customer Carrier Is an ISP, page 4](#)
- [Customer Carrier Is a BGP/MPLS VPN Service Provider, page 7](#)

### **Customer Carrier Is an ISP**

This section explains how a BGP/MPLS VPN service provider (backbone carrier) can provide a segment of its backbone network to a customer who is an ISP.

Consider the following example:

An ISP has two sites: one in California, the other in Maine. Each site is a point of presence (POP). The ISP wants to connect these sites using a VPN service provided by a backbone carrier. [Figure 1](#) illustrates this situation.

**Figure 1**      **Sample BGP/MPLS Backbone Carrier Supporting an ISP****Note**

The CE routers in the figures are CE routers to the backbone carrier. However, they are PE routers to the customer carrier.

In this example, only the backbone carrier uses MPLS. The customer carrier (ISP) uses only IP. As a result, the backbone carrier must carry all the Internet routes of the customer carrier, which could be as many as 100,000 routes. This poses a scalability problem for the backbone carrier. To solve the scalability problem, the backbone carrier is configured as follows:

- The backbone carrier allows only internal routes of the customer carrier (IGP routes) to be exchanged between the CE routers of the customer carrier and the PE routers of the backbone carrier.
- MPLS is enabled on the interface between the CE router of the customer carrier and the PE router of the backbone carrier.

Internal and external routes are differentiated this way:

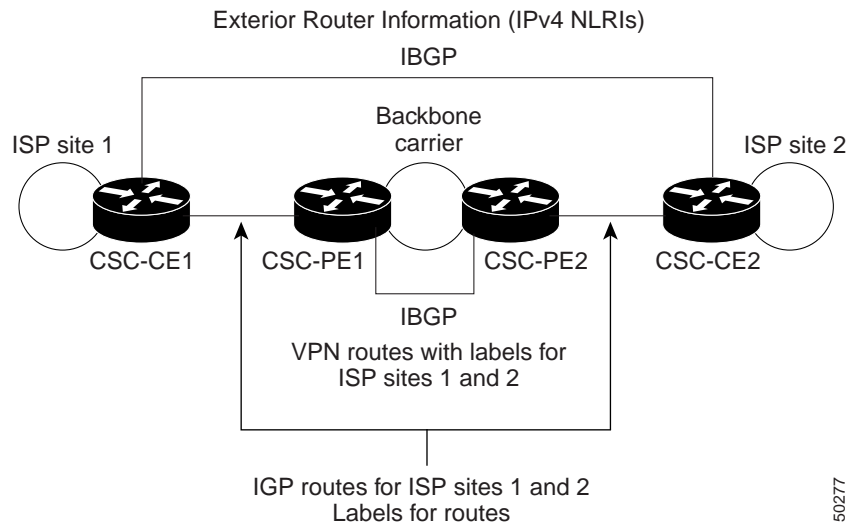

- Internal routes go to any of the routers within the ISP.
- External routes go to the Internet.

The number of internal routes is much lower than the number of external routes. Restricting the routes between the CE routers of the customer carrier and the PE routers of the backbone carrier significantly reduces the number of routes that the PE router needs to maintain.

Because the PE routers do not have to carry external routes in the VRF routing table, they can use the incoming label in the packet to forward the customer carrier Internet traffic. Adding MPLS to the routers provides a consistent method of transporting packets from the customer carrier to the backbone carrier. MPLS allows the exchange of an MPLS label between the PE and the CE routers for every internal customer carrier route. The routers in the customer carrier have all the external routes either through internal Border Gateway Protocol (iBGP) or route redistribution to provide Internet connectivity.

[Figure 2](#) shows how information is exchanged when the network is configured in this manner.

**Figure 2** *Backbone Carrier Exchanging Routing Information with a Customer Carrier Who Is an ISP*

In [Figure 3](#), routes are created between the backbone carrier and the customer carrier sites. ASBR2 receives an Internet route that originated outside the network. All routers in the ISP sites have all the external routes through IBGP connections among them.

**Figure 3** *Establishing a Route Between a Backbone Carrier and a Customer Carrier Who Is an ISP*

[Table 2](#) describes the process of establishing the route, which can be divided into two distinct steps:

- The backbone carrier propagates the IGP information of the customer carrier, which enables the customer carrier routers to reach all the customer carrier routers in the remote sites.
- Once the routers of the customer carriers in different sites are reachable, external routes can be propagated in the customer carrier sites, using IBGP without using the backbone carrier routers.

**Table 2**      ***Establishing a Route Between the Backbone Carrier and the Customer Carrier ISP***

| Step | Description                                                                                                                                                                                                                                                                           |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | CSC-CE2 sends the internal routes within site 2 to CSC-PE2. The routes include the route to ASBR2.                                                                                                                                                                                    |
| 2    | CSC-PE2 sends the routing information for site 2 to CSC-PE1, using MPLS VPN processes. CSC-PE1 gets one label (called L3), which is associated with the route to the VPN-IP address for ASBR2. CSC-PE1 gets another label (called L2), which is associated with the route to CSC-PE2. |
| 3    | CSC-PE1 sends the routing information associated with internal routes from site 2 to CSC-CE1. CSC-PE1 also sends the label binding information. As a result, CSC-CE1 gets the route to ASBR2 with CSC-PE1 as the next hop. The label associated with that route is called L1.         |
| 4    | CSC-CE1 distributes the routing information through site 1. Every router in site 1 gets a route for every internal destination in site 2. Therefore, every router in site 1 can reach routers in site 2 and learn external routes through IBGP.                                       |
| 5    | ASBR2 receives an Internet route.                                                                                                                                                                                                                                                     |
| 6    | The IBGP sessions exchange the external routing information of the ISP, including a route to the Internet. Every router in site 1 knows a route to the Internet, with ASBR2 as the next hop of that route.                                                                            |

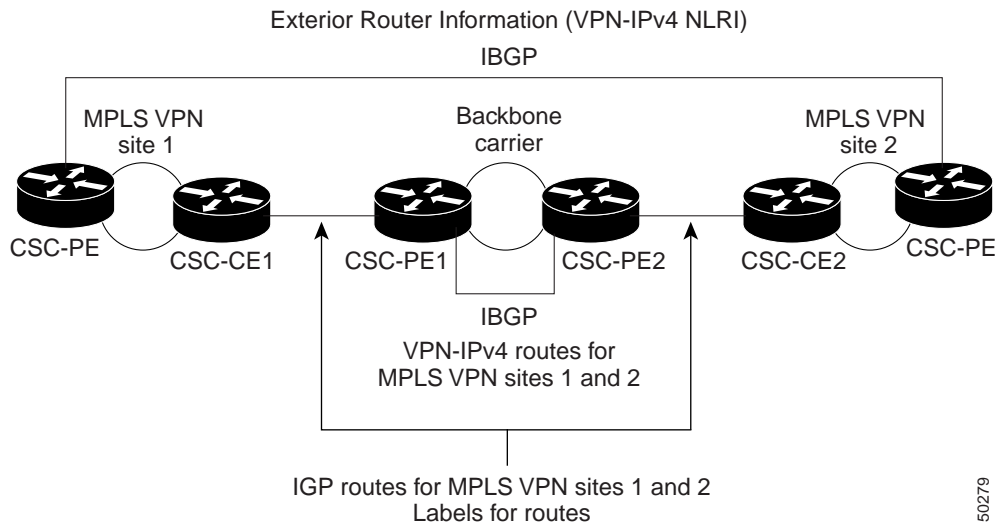

## Customer Carrier Is a BGP/MPLS VPN Service Provider

When a backbone carrier and the customer carrier both provide BGP/MPLS VPN services, the method of transporting data is different from when a customer carrier provides only ISP services. The following list highlights those differences:

- When a customer carrier provides BGP/MPLS VPN services, its external routes are VPN-IPv4 routes. When a customer carrier is an ISP, its external routes are IP routes.
- When a customer carrier provides BGP/MPLS VPN services, every site within the customer carrier must use MPLS. When a customer carrier is an ISP, the sites do not need to use MPLS.

Figure 4 shows how information is exchanged when MPLS VPN services reside on all customer carrier sites and on the backbone carrier.

**Figure 4** Backbone Carrier Exchanging Information with a Customer Carrier Who Is an MPLS VPN Service Provider

In the example shown in [Figure 5](#), routes are created between the backbone carrier and the customer carrier sites.

**Figure 5** Establishing a Route Between a Backbone Carrier and a Customer Carrier Who Is an MPLS VPN Service Provider

[Table 3](#) describes the process of establishing the route.

**Table 3** Establishing a Route Between the Backbone Carrier and Customer Carrier Site

| Step | Description                                                                                                                                                                                                                                                                         |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | CE2 sends all the internal routes within site 2 to CSC-PE2.                                                                                                                                                                                                                         |
| 2    | CSC-PE2 sends the routing information for site 2 to CSC-PE1, using MPLS VPN processes. CSC-PE1 gets one label (called L3), which is associated with the route to the VPN-IP address for PE2. CSC-PE1 gets another label (called L2), which is associated with the route to CSC-PE2. |

**Table 3**      **Establishing a Route Between the Backbone Carrier and Customer Carrier Site**

| Step | Description                                                                                                                                                                                                                                                                 |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3    | CSC-PE1 sends the routing information associated with internal routes from site 2 to CSC-CE1. CSC-PE1 also sends the label binding information. As a result, CSC-CE1 gets the route to PE2 with CSC-PE1 as the next hop. The label associated with that route is called L1. |
| 4    | CE1 distributes the routing and labeling information through site 1. Every router in site 1 gets a route for every internal destination in site 2. Therefore, PE1 can establish an MP-IBGP session with PE2.                                                                |
| 5    | CE2 advertises the internal routes of MPLS VPN site 2 to PE2.                                                                                                                                                                                                               |
| 6    | PE2 allocates labels for all the VPN routes (regular MPLS VPN functionality) and advertises the labels to PE1, using MP-IBGP.                                                                                                                                               |
| 7    | PE1 can forward traffic from VPN site 1 that is destined for VPN site 2.                                                                                                                                                                                                    |

## How to Configure MPLS VPN CSC with LDP and IGP

This section contains the following procedures:

- [Configuring the Backbone Carrier Core, page 9](#) (required)
- [Configuring the CSC-PE and CSC-CE Routers, page 15](#) (required)
- [Verifying the Carrier Supporting Carrier Configuration, page 17](#) (optional)

### Configuring the Backbone Carrier Core

Configuring the backbone carrier core requires configuring connectivity and routing functions for the CSC core and the CSC-PE routers.

Configuring and verifying the CSC core (backbone carrier) involves the following tasks:

- [Verifying IP Connectivity and LDP Configuration in the CSC Core, page 9](#) (optional)
- [Configuring VRFs for CSC-PE Routers, page 11](#) (required)
- [Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier, page 13](#) (required)

### Prerequisites

Before you configure a backbone carrier core, configure the following on the CSC core routers:

- An IGP routing protocol—BGP, OSPF, IS-IS, EIGRP, static, and so on. For information, see [Configuring a Basic BGP Network](#), [Configuring OSPF](#), [Configuring a Basic IS-IS Network](#), and [Configuring EIGRP](#).
- Label Distribution Protocol (LDP). For information, see [MPLS Label Distribution Protocol](#).

### Verifying IP Connectivity and LDP Configuration in the CSC Core

Perform this task to verify IP connectivity and LDP configuration in the CSC core. For a configuration example for this task, see the [“Verifying IP Connectivity and LDP Configuration in the CSC Core” section on page 9](#).

## SUMMARY STEPS

1. **enable**
2. **ping** [*protocol*] [*host-name* | *system-address*]
3. **trace** [*protocol*] [*destination*]
4. **show mpls forwarding-table** [*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]] [**vrf** *vrf-name*] [**detail**]
5. **show mpls ldp discovery** [**vrf** *vrf-name* | **all**]
6. **show mpls ldp neighbor** [[**vrf** *vrf-name*] [*address* | *interface*] [**detail**] | **all**]
7. **show ip cef** [**vrf** *vrf-name*] [*network* [*mask*]] [**longer-prefixes**] [**detail**]
8. **show mpls interfaces** [[**vrf** *vrf-name*] [*interface*] [**detail**] | **all**]
9. **show ip route**
10. **disable**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                              |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                     |
| Step 2 | <b>ping</b> [ <i>protocol</i> ] [ <i>host-name</i>   <i>system-address</i> ]<br><br><b>Example:</b><br>Router# ping ip 10.0.0.1                                                                                                                                                                                                                                | (Optional) Diagnoses basic network connectivity on AppleTalk, Connectionless Network Service (CLNS), IP, Novell, Apollo, VINES, DECnet, or Xerox Network System (XNS) networks. <ul style="list-style-type: none"> <li>Use the <b>ping ip</b> command to verify the connectivity from one CSC core router to another.</li> </ul>                                     |
| Step 3 | <b>trace</b> [ <i>protocol</i> ] [ <i>destination</i> ]<br><br><b>Example:</b><br>Router# trace ip 10.0.0.1                                                                                                                                                                                                                                                    | (Optional) Discovers the routes that packets will actually take when traveling to their destination. <ul style="list-style-type: none"> <li>Use the <b>trace</b> command to verify the path that a packet goes through before reaching the final destination. The <b>trace</b> command can help isolate a trouble spot if two routers cannot communicate.</li> </ul> |
| Step 4 | <b>show mpls forwarding-table</b> [ <i>network</i> { <i>mask</i>   <i>length</i> }   <b>labels</b> <i>label</i> [- <i>label</i> ]   <b>interface</b> <i>interface</i>   <b>next-hop</b> <i>address</i>   <b>lsp-tunnel</b> [ <i>tunnel-id</i> ]] [ <b>vrf</b> <i>vrf-name</i> ] [ <b>detail</b> ]<br><br><b>Example:</b><br>Router# show mpls forwarding-table | (Optional) Displays the contents of the MPLS label forwarding information base (LFIB). <ul style="list-style-type: none"> <li>Use the <b>show mpls forwarding-table</b> command to verify that MPLS packets are being forwarded.</li> </ul>                                                                                                                          |
| Step 5 | <b>show mpls ldp discovery</b> [ <b>vrf</b> <i>vrf-name</i>   <b>all</b> ]<br><br><b>Example:</b><br>Router# show mpls ldp discovery                                                                                                                                                                                                                           | (Optional) Displays the status of the LDP discovery process. <ul style="list-style-type: none"> <li>Use the <b>show mpls ldp discovery</b> command to verify that LDP is operational in the CSC core.</li> </ul>                                                                                                                                                     |

|         | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                             |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6  | <pre>show mpls ldp neighbor [[vrf vrf-name] [address   interface] [detail]   all]</pre> <p><b>Example:</b><br/>Router# show mpls ldp neighbor</p> | (Optional) Displays the status of LDP sessions. <ul style="list-style-type: none"> <li>Use the <b>show mpls ldp neighbor</b> command to verify LDP configuration in the CSC core.</li> </ul>                                                                        |
| Step 7  | <pre>show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]</pre> <p><b>Example:</b><br/>Router# show ip cef</p>                  | (Optional) Displays entries in the forwarding Information Base (FIB). <ul style="list-style-type: none"> <li>Use the <b>show ip cef</b> command to check the forwarding table (prefixes, next hops, and interfaces).</li> </ul>                                     |
| Step 8  | <pre>show mpls interfaces [[vrf vrf-name] [interface] [detail]   all]</pre> <p><b>Example:</b><br/>Router# show mpls interfaces</p>               | (Optional) Displays information about one or more or all interfaces that are configured for label switching. <ul style="list-style-type: none"> <li>Use the <b>show mpls interfaces</b> command to verify that the interfaces are configured to use LDP.</li> </ul> |
| Step 9  | <pre>show ip route</pre> <p><b>Example:</b><br/>Router# show ip route</p>                                                                         | (Optional) Displays IP routing table entries. <ul style="list-style-type: none"> <li>Use the <b>show ip route</b> command to display the entire routing table, including host IP address, next hop, and interface.</li> </ul>                                       |
| Step 10 | <pre>disable</pre> <p><b>Example:</b><br/>Router# disable</p>                                                                                     | (Optional) Returns to privileged EXEC mode.                                                                                                                                                                                                                         |

## Troubleshooting Tips

You can use the **ping** and **trace** commands to verify complete MPLS connectivity in the core. You also get useful troubleshooting information from the additional **show** commands.

## Configuring VRFs for CSC-PE Routers

Perform this task to configure VPN routing and forwarding (VRF) instances for the backbone carrier edge (CSC-PE) routers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf vrf-name**
4. **rd route-distinguisher**
5. **route-target {import | export | both} route-target-ext-community**
6. **import map route-map**
7. **exit**
8. **interface type number**
9. **ip vrf forwarding vrf-name**

## 10. end

## DETAILED STEPS

|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 3 | <b>ip vrf vrf-name</b><br><br><b>Example:</b><br>Router(config)# ip vrf vpn1                                                                              | Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 4 | <b>rd route-distinguisher</b><br><br><b>Example:</b><br>Router(config-vrf)# rd 100:1                                                                      | Creates routing and forwarding tables. <ul style="list-style-type: none"> <li>The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN-IPv4 prefix. You can enter an RD in either of these formats: <ul style="list-style-type: none"> <li>16-bit AS number: your 32-bit number, for example, 101:3</li> <li>32-bit IP address: your 16-bit number, for example, 192.168.122.15:1</li> </ul> </li> </ul>                                                                                                                                                                                                                    |
| Step 5 | <b>route-target {import   export   both}</b><br><i>route-target-ext-community</i><br><br><b>Example:</b><br>Router(config-vrf)# route-target import 100:1 | Creates a route-target extended community for a VRF. <ul style="list-style-type: none"> <li>The <b>import</b> keyword imports routing information from the target VPN extended community.</li> <li>The <b>export</b> keyword exports routing information to the target VPN extended community.</li> <li>The <b>both</b> keyword imports routing information from and exports routing information to the target VPN extended community.</li> <li>The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.</li> </ul> |
| Step 6 | <b>import map route-map</b><br><br><b>Example:</b><br>Router(config-vrf)# import map vpn1-route-map                                                       | (Optional) Configures an import route map for a VRF. <ul style="list-style-type: none"> <li>The <i>route-map</i> argument specifies the route map to be used as an import route map for the VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|         | Command or Action                                                                                            | Purpose                                                                                                                                                                                                                                                                                                 |
|---------|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <b>exit</b><br><br><b>Example:</b><br>Router(config-vrf)# exit                                               | (Optional) Exits to global configuration mode.                                                                                                                                                                                                                                                          |
| Step 8  | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet5/0          | Specifies the interface to configure and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>type</i> argument specifies the type of interface to be configured.</li> <li>The <i>number</i> argument specifies the port, connector, or interface card number.</li> </ul> |
| Step 9  | <b>ip vrf forwarding</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config-if)# ip vrf forwarding vpn1 | Associates a VRF with the specified interface or subinterface. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                            |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                  | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                               |

### Troubleshooting Tips

Enter a **show ip vrf detail** command and make sure the MPLS VPN is up and associated with the right interfaces.

## Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier

Perform this task to configure multiprotocol BGP (MP-BGP) for VPN connectivity in the backbone carrier.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default ipv4-unicast**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **update-source** *interface-type*
7. **address-family** **vpn4** [**unicast**]
8. **neighbor** {*ip-address* | *peer-group-name*} **send-community** **extended**
9. **neighbor** {*ip-address* | *peer-group-name*} **activate**
10. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                                   | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul> |
| Step 4 | <b>no bgp default ipv4-unicast</b><br><br><b>Example:</b><br>Router(config-router)# no bgp default ipv4-unicast                                                        | (Optional) Disables the IPv4 unicast address family on all neighbors. <ul style="list-style-type: none"> <li>Use the <b>no</b> form of the <b>bgp default-unicast</b> command if you are using this neighbor for MPLS routes only.</li> </ul>                                                                                                                                                                                            |
| Step 5 | <b>neighbor {ip-address   peer-group-name} remote-as as-number</b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.0.0.1 remote-as 100                    | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                      |
| Step 6 | <b>neighbor {ip-address   peer-group-name} update-source interface-type</b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.0.0.1 update-source loopback0 | Allows BGP sessions to use a specific operational interface for TCP connections. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>interface-type</i> argument specifies the interface to be used as the source.</li> </ul>                              |
| Step 7 | <b>address-family vpnv4 [unicast]</b><br><br><b>Example:</b><br>Router(config-router)# address-family vpnv4                                                            | Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> <li>The optional <b>unicast</b> keyword specifies VPNv4 unicast address prefixes.</li> </ul>                                                                                                                                                                        |

|         | Command or Action                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                               |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 8  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>send-community</b> extended<br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>send-community extended | Specifies that a communities attribute should be sent to a BGP neighbor. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul> |
| Step 9  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.12.12.12<br>activate                            | Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                    |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                                                                                                | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                             |

### Troubleshooting Tips

You can enter a **show ip bgp neighbor** command to verify that the neighbors are up and running. If this command generates an error message, enter a **debug ip bgp x.x.x.x events** command, where *x.x.x.x* is the IP address of the neighbor.

## Configuring the CSC-PE and CSC-CE Routers

To enable the CSC-PE and CSC-CE routers to distribute routes and MPLS labels, perform the following tasks:

- [Configuring LDP on the CSC-PE and CSC-CE Routers, page 15](#) (required)
- [Enabling MPLS Encapsulation on the CSC-PE and CSC-CE Routers, page 16](#) (required)

### Prerequisites

Before you configure the CSC-PE and CSC-CE routers, you must configure an IGP on the CSC-PE and CSC-CE routers. A routing protocol is required between the PE and CE routers that connect the backbone carrier to the customer carrier. The routing protocol enables the customer carrier to exchange IGP routing information with the backbone carrier. Use the same routing protocol that the customer carrier uses. You can choose RIP, OSPF, or static routing as the routing protocol. BGP is not supported. For the configuration steps, see [Configuring MPLS Layer 3 VPNs](#).

### Configuring LDP on the CSC-PE and CSC-CE Routers

MPLS LDP is required between the PE and CE routers that connect the backbone carrier to the customer carrier. You can configure LDP as the default label distribution protocol for the entire router or just for the PE-to-CE interface for VRF.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls label protocol ldp**
4. **interface** *type number*
5. **mpls label protocol ldp**
6. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                              | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                      |
| Step 3 | <b>mpls label protocol ldp</b><br><br><b>Example:</b><br>Router(config)# mpls label protocol ldp    | Specifies MPLS LDP as the default label distribution protocol for the router.                                                                                                                                                                                                                                          |
| Step 4 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet5/0 | (Optional) Specifies the interface to configure and enters interface configuration mode.<br><ul style="list-style-type: none"><li>• The <i>type</i> argument specifies the type of interface to be configured.</li><li>• The <i>number</i> argument specifies the port, connector, or interface card number.</li></ul> |
| Step 5 | <b>mpls label protocol ldp</b><br><br><b>Example:</b><br>Router(config-if)# mpls label protocol ldp | (Optional) Specifies MPLS LDP as the default label distribution protocol for the interface.                                                                                                                                                                                                                            |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                       | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                              |

## Enabling MPLS Encapsulation on the CSC-PE and CSC-CE Routers

Every packet that crosses the backbone carrier must be encapsulated, so that the packet includes MPLS labels. You can enable MPLS encapsulation for the entire router or just on the interface of the PE or CE router. To enable the encapsulation of packets, perform the following task.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mpls ip**
4. **interface** *type number*
5. **mpls ip**
6. **exit**

## DETAILED STEPS

|        | Command or Action                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                |
|--------|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                              | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                    |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                      |
| Step 3 | <b>mpls ip</b><br><br><b>Example:</b><br>Router(config)# mpls ip                                    | Enables MPLS encapsulation for the router.                                                                                                                                                                                                                                                                             |
| Step 4 | <b>interface</b> <i>type number</i><br><br><b>Example:</b><br>Router(config)# interface Ethernet5/0 | (Optional) Specifies the interface to configure and enters interface configuration mode.<br><ul style="list-style-type: none"><li>• The <i>type</i> argument specifies the type of interface to be configured.</li><li>• The <i>number</i> argument specifies the port, connector, or interface card number.</li></ul> |
| Step 5 | <b>mpls ip</b><br><br><b>Example:</b><br>Router(config-if)# mpls ip                                 | (Optional) Enables MPLS encapsulation for the specified interface.                                                                                                                                                                                                                                                     |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                       | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                              |

## Verifying the Carrier Supporting Carrier Configuration

The following commands verify the status of LDP sessions that were configured between the backbone carrier and customer carrier. Now the customer carrier ISP sites appear as a VPN customer to the backbone carrier.

## SUMMARY STEPS

1. `show mpls ldp discovery vrf vrf-name`
2. `show mpls ldp discovery all`

## DETAILED STEPS

### Step 1 `show mpls ldp discovery vrf vrf-name`

Use this command to show that the LDP sessions are in VRF VPN1 of the PE router of the backbone carrier, for example:

```
Router# show mpls ldp discovery vrf vpn1

Local LDP Identifier:
  10.0.0.0:0
Discovery Sources:
  Interfaces:
    Ethernet1/0 (ldp): xmit/recv
      LDP Id: 10.0.0.1:0
    POS6/0 (ldp): xmit
```

### Step 2 `show mpls ldp discovery all`

Use this command to list all LDP sessions in a router, for example:

```
Router# show mpls ldp discovery all

Local LDP Identifier:
  10.10.10.10:0
Discovery Sources:
  Interfaces:
    Ethernet1/5 (ldp): xmit/recv
      LDP Id: 10.5.5.5:0
VRF vpn1: Local LDP Identifier:
  10.0.0.1:0
Discovery Sources:
  Interfaces:
    Ethernet1/0 (ldp): xmit/recv
      LDP Id: 10.0.0.1:0
    POS6/0 (ldp): xmit
```

The Local LDP Identifier field shows the LDP identifier for the local label switching router for this session. The Interfaces field displays the interfaces engaging in LDP discovery activity:

- xmit indicates that the interface is transmitting LDP discovery hello packets.
- rcv indicates that the interface is receiving LDP discovery hello packets.

# Configuration Examples for MPLS VPN CSC with LDP and IGP

This section provides the following configuration examples:

- [MPLS VPN CSC Network with a Customer Who Is an ISP: Example](#)
- [MPLS VPN CSC Network with a Customer Who Is an MPLS VPN Provider: Example](#)
- [MPLS VPN CSC Network That Contains Route Reflectors: Example](#)

- [MPLS VPN CSC Network with a Customer Who Has VPNs at the Network Edge: Example](#)

## MPLS VPN CSC Network with a Customer Who Is an ISP: Example

Figure 6 shows a carrier supporting carrier network configuration where the customer carrier is an ISP. The customer carrier has two sites, each of which is a POP. The customer carrier connects these sites using a VPN service provided by the backbone carrier. The backbone carrier uses MPLS. The ISP sites use IP. To enable packet transfer between the ISP sites and the backbone carrier, the CE routers that connect the ISPs to the backbone carrier run MPLS.

**Figure 6** *Carrier Supporting Carrier Network with a Customer Carrier Who Is an ISP*

The following examples show the configuration of each router in the carrier supporting carrier network. OSPF is used to connect the customer carrier to the backbone carrier.

### CSC-CE1 Configuration

## MPLS VPN CSC Network with a Customer Who Is an MPLS VPN Provider: Example

Figure 7 shows a carrier supporting carrier network configuration where the customer carrier is an MPLS VPN provider. The customer carrier has two sites. The backbone carrier and the customer carrier use MPLS. The IBGP sessions exchange the external routing information of the ISP.

**Figure 7** *Carrier Supporting Carrier Network with a Customer Carrier Who Is an MPLS VPN Provider*

The following configuration examples show the configuration of each router in the carrier supporting carrier network. OSPF is the protocol used to connect the customer carrier to the backbone carrier.

### CE1 Configuration

## MPLS VPN CSC Network That Contains Route Reflectors: Example

Figure 8 shows a carrier supporting carrier network configuration that contains route reflectors. The customer carrier has two sites.

**Figure 8** Carrier Supporting Carrier Network that Contains Route Reflectors**Note**

A connection between route reflectors (RRs) is not necessary.

The following configuration examples show the configuration of each router in the carrier supporting carrier network. Note the following:

- The router IP addresses are abbreviated for ease of reading. For example, the loopback address for PE 1 is 25, which is equivalent to 10.25.25.25.
- The following list shows the loopback addresses for the CSC-PE routers:
  - CSC-PE1 (75K-37-3): loopback 0 = 10.15.15.15, loopback 1 = 10.18.18.18
  - CSC-PE2 (75K-38-3): loopback 0 = 10.16.16.16, loopback 1 = 10.20.20.20

## Command Reference

This feature uses no new or modified commands.

# Feature Information for MPLS VPN CSC with LDP and IGP

Table 4 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 4 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 4** Feature Information for MPLS VPN CSC with LDP and IGP

| Feature Name                        | Releases                                                                     | Feature Configuration Information                                                                                                                                                                                                                                                                                                                                                                                                      |

## Glossary

**ASBR**—autonomous system boundary router. A router that connects one autonomous system to another.

**BGP**—Border Gateway Protocol. An interdomain routing protocol designed to provide loop-free routing between separate routing domains that contain independent routing policies (autonomous systems).

**carrier supporting carrier**—A situation where one service provider allows another service provider to use a segment of its backbone network.

**CE router**—customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router. In this document, the CE router sits on the edge of the customer carrier network.

**edge router**—A router that is at the edge of the network. It defines the boundary of the MPLS network. It receives and transmits packets. Also referred to as edge label switch router and label edge router.

**IGP**—Interior Gateway Protocol. Internet protocol used to exchange routing information within an autonomous system.

**LDP**—Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets.

**MPLS**—Multiprotocol Label Switching. Switching method that forwards IP traffic using a label. This label instructs the routers and the switches in the network where to forward the packets based on preestablished IP routing information.

**PE router**—provider edge router. A router, at the edge of a service provider's network, that interfaces to CE routers.

**VPN**—Virtual Private Network. A network that enables IP traffic to use tunneling to travel securely over a public TCP/IP network.

# MPLS VPN Carrier Supporting Carrier with BGP

---

**First Published: May 2, 2005**

**Last Updated: February 5, 2009**

Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) Carrier Supporting Carrier (CSC) enables one MPLS VPN-based service provider to allow other service providers to use a segment of its backbone network. This module explains how to configure an MPLS VPN CSC network that uses Border Gateway Protocol (BGP) to distribute routes and MPLS labels.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for MPLS VPN CSC with BGP”](#) section on page 50.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

## Prerequisites for MPLS VPN CSC with BGP

- You should be able to configure MPLS VPNs with end-to-end (CE-to-CE router) pings working. To accomplish this, you need to know how to configure Interior Gateway Protocols (IGPs), MPLS Label Distribution Protocol (LDP), and Multiprotocol Border Gateway Protocol (MP-BGP).
- Make sure that the CSC-PE routers and the CSC-CE routers run images that support BGP label distribution. Otherwise, you cannot run external BGP (EBGP) between them. Ensure that connectivity between the customer carrier and the backbone carrier. EBGP-based label distribution is configured on these links to enable MPLS between the customer and backbone carriers.

## Restrictions for MPLS VPN CSC with BGP

On a provider edge (PE) router, you can configure an interface for either BGP with labels or LDP. You cannot enable both types of label distribution on the same interface. If you switch from one protocol to the other, then you must disable the existing protocol on all interfaces before enabling the other protocol.

This feature does not support the following:

- EBGP multihop between CSC-PE and CSC-CE routers
- EIBGP multipath load sharing

The physical interfaces that connect the BGP speakers must support Cisco Express Forwarding or distributed Cisco Express Forwarding and MPLS.

## Information About MPLS VPN CSC with BGP

Before configuring MPLS VPN CSC, you should understand the following concepts:

- [MPLS VPN CSC Introduction, page 2](#)
- [Benefits of Implementing MPLS VPN CSC, page 3](#)
- [Benefits of Implementing MPLS VPN CSC with BGP, page 3](#)
- [Configuration Options for MPLS VPN CSC with BGP, page 4](#)

## MPLS VPN CSC Introduction

Carrier supporting carrier is where one service provider allows another service provider to use a segment of its backbone network. The service provider that provides the segment of the backbone network to the other provider is called the backbone carrier. The service provider that uses the segment of the backbone network is called the customer carrier.

A backbone carrier offers Border Gateway Protocol and Multiprotocol Label Switching (BGP/MPLS) VPN services. The customer carrier can be either:

- An Internet service provider (ISP)
- A BGP/MPLS VPN service provider

## Benefits of Implementing MPLS VPN CSC

The MPLS VPN CSC network provides the following benefits to service providers who are backbone carriers and to customer carriers.

### Benefits to the Backbone Carrier

- The backbone carrier can accommodate many customer carriers and give them access to its backbone. The backbone carrier does not need to create and maintain separate backbones for its customer carriers. Using one backbone network to support multiple customer carriers simplifies the backbone carrier's VPN operations. The backbone carrier uses a consistent method for managing and maintaining the backbone network. This is also cheaper and more efficient than maintaining separate backbones.
- The MPLS VPN carrier supporting carrier feature is scalable. Carrier supporting carrier can change the VPN to meet changing bandwidth and connectivity needs. The feature can accommodate unplanned growth and changes. The carrier supporting carrier feature enables tens of thousands of VPNs to be set up over the same network, and it allows a service provider to offer both VPN and Internet services.
- The MPLS VPN carrier supporting carrier feature is a flexible solution. The backbone carrier can accommodate many types of customer carriers. The backbone carrier can accept customer carriers who are ISPs or VPN service providers or both. The backbone carrier can accommodate customer carriers that require security and various bandwidths.

### Benefits to the Customer Carriers

- The MPLS VPN carrier supporting carrier feature removes from the customer carrier the burden of configuring, operating, and maintaining its own backbone. The customer carrier uses the backbone network of a backbone carrier, but the backbone carrier is responsible for network maintenance and operation.
- Customer carriers who use the VPN services provided by the backbone carrier receive the same level of security that Frame Relay or ATM-based VPNs provide. Customer carriers can also use IPSec in their VPNs for a higher level of security; it is completely transparent to the backbone carrier.
- Customer carriers can use any link layer technology (SONET, DSL, Frame Relay, and so on) to connect the CE routers to the PE routers and the PE routers to the P routers. The MPLS VPN carrier supporting carrier feature is link layer independent. The CE routers and PE routers use IP to communicate, and the backbone carrier uses MPLS.
- The customer carrier can use any addressing scheme and still be supported by a backbone carrier. The customer address space and routing information are independent of the address space and routing information of other customer carriers or the backbone provider.

## Benefits of Implementing MPLS VPN CSC with BGP

You can configure your CSC network to enable BGP to transport routes and MPLS labels between the backbone carrier PE routers and the customer carrier CE routers using multiple paths. The benefits of using BGP to distribute IPv4 routes and MPLS label routes are:

- BGP takes the place of an IGP and LDP in a VPN forwarding/routing instance (VRF) table. You can use BGP to distribute routes and MPLS labels. Using a single protocol instead of two simplifies the configuration and troubleshooting.

- BGP is the preferred routing protocol for connecting two ISPs, mainly because of its routing policies and ability to scale. ISPs commonly use BGP between two providers. This feature enables those ISPs to use BGP.

## Configuration Options for MPLS VPN CSC with BGP

The backbone carrier offers BGP and MPLS VPN services. The customer carrier can be either of the following:

- [Customer Carrier Is an ISP with an IP Core, page 4](#)
- [Customer Carrier Is an MPLS Service Provider With or Without VPN Services, page 4](#)

The following sections explain how the backbone and customer carriers distribute IPv4 routes and MPLS labels.

### Customer Carrier Is an ISP with an IP Core

[Figure 1](#) shows a network configuration where the customer carrier is an ISP. The customer carrier has two sites, each of which is a point of presence (POP). The customer carrier connects these sites using a VPN service provided by the backbone carrier. The backbone carrier uses MPLS. The ISP sites use IP.

**Figure 1** Network Where the Customer Carrier Is an ISP

The links between the CE and PE routers use EBGp to distribute IPv4 routes and MPLS labels. Between the links, the PE routers use multiprotocol IBGP to distribute VPNv4 routes.

#### Note

If a router other than a Cisco router is used as a CSC-PE or CSC-CE, that router must support IPv4 BGP label distribution (RFC 3107). Otherwise, you cannot run EBGp with labels between the routers.

### Customer Carrier Is an MPLS Service Provider With or Without VPN Services

[Figure 2](#) shows a network configuration where the backbone carrier and the customer carrier are BGP/MPLS VPN service providers. This is known as hierarchical VPNs. The customer carrier has two sites. Both the backbone carrier and the customer carrier use MPLS in their networks.

**Figure 2** Network Where the Customer Carrier Is an MPLS VPN Service Provider

In this configuration, the customer carrier can configure its network in one of the following ways:

- The customer carrier can run IGP and LDP in its core network. In this case, the CSC-CE1 router in the customer carrier redistributes the EBGP routes it learns from the CSC-PE1 router of the backbone carrier to IGP.
- The CSC-CE1 router of the customer carrier system can run an IPv4 and labels IBGP session with the PE1 router.

## How to Configure MPLS VPN CSC with BGP

This section contains the following tasks:

- [Identifying the Carrier Supporting Carrier Topology, page 5](#) (required)
- [Configuring the Backbone Carrier Core, page 6](#) (required)
- [Configuring the CSC-PE and CSC-CE Routers, page 12](#) (required)
- [Configuring the Customer Carrier Network, page 21](#) (required)
- [Configuring the Customer Site for Hierarchical VPNs, page 24](#) (required)

## Identifying the Carrier Supporting Carrier Topology

Before you configure the MPLS VPN CSC with BGP, you need to identify both the backbone and customer carrier topology.

For hierarchical VPNs, the customer carrier of the MPLS VPN network provides MPLS VPN services to its own customers. In this instance, you need to identify the type of customer carrier as well as the topology of the customer carriers. Hierarchical VPNs require extra configuration steps, which are noted in the configuration sections.

### Note

You can connect multiple CSC-CE routers to the same PE, or you can connect a single CSC-CE router to CSC-PEs using more than one interface to provide redundancy and multiple path support in CSC topology.

Perform this task to identify the carrier supporting carrier topology.

## SUMMARY STEPS

1. Identify the type of customer carrier, ISP or MPLS VPN service provider.
2. (For hierarchical VPNs only) Identify the CE routers.
3. (For hierarchical VPNs only) Identify the customer carrier core router configuration.
4. Identify the customer carrier edge (CSC-CE) routers.
5. Identify backbone carrier router configuration.

## DETAILED STEPS

|        | Command or Action                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                |
|--------|---------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Identify the type of customer carrier, ISP or MPLS VPN service provider.              | Sets up requirements for configuration of carrier supporting carrier network. <ul style="list-style-type: none"> <li>• For an ISP, customer site configuration is not required.</li> <li>• For an MPLS VPN service provider, the customer site needs to be configured, as well as any task or step designated “for hierarchical VPNs only.”</li> </ul> |
| Step 2 | (For hierarchical VPNs only) Identify the CE routers.                                 | Sets up requirements for configuration of CE to PE connections.                                                                                                                                                                                                                                                                                        |
| Step 3 | (For hierarchical VPNs only) Identify the customer carrier core router configuration. | Sets up requirements for connection configuration between core (P) routers and between P routers and edge routers (PE and CSC-CE routers).                                                                                                                                                                                                             |
| Step 4 | Identify the customer carrier edge (CSC-CE) routers.                                  | Sets up requirements for configuration of CSC-CE to CSC-PE connections.                                                                                                                                                                                                                                                                                |
| Step 5 | Identify the backbone carrier router configuration.                                   | Sets up requirements for connection configuration between CSC core routers and between CSC core routers and edge routers (CSC-CE and CSC-PE routers).                                                                                                                                                                                                  |

## What to Do Next

Set up your carrier supporting carrier networks with the [“Configuring the Backbone Carrier Core” section on page 6](#).

## Configuring the Backbone Carrier Core

Configuring the backbone carrier core requires setting up connectivity and routing functions for the CSC core and the CSC-PE routers.

Configuring and verifying the CSC core (backbone carrier) involves the following tasks:

- [Verifying IP Connectivity and LDP Configuration in the CSC Core, page 7](#) (optional)
- [Configuring VRFs for CSC-PE Routers, page 8](#) (required)
- [Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier, page 10](#) (required)

## Prerequisites

Before you configure a backbone carrier core, configure the following on the CSC core routers:

- An IGP routing protocol—BGP, OSPF, IS-IS, EIGRP, static, and so on.
- Label Distribution Protocol (LDP). For information, see [How to Configure MPLS LDP](#).

## Verifying IP Connectivity and LDP Configuration in the CSC Core

Perform this task to verify IP connectivity and LDP configuration in the CSC core.

### SUMMARY STEPS

1. **enable**
2. **ping** [*protocol*] {*host-name* | *system-address*}
3. **trace** [*protocol*] [*destination*]
4. **show mpls forwarding-table** [**vrf** *vrf-name*] [{*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]
5. **show mpls ldp discovery** [**vrf** *vrf-name* | **all**]
6. **show mpls ldp neighbor** [[**vrf** *vrf-name*] [*address* | *interface*] [**detail**] | **all**]
7. **show ip cef** [**vrf** *vrf-name*] [*network* [*mask*]] [**longer-prefixes**] [**detail**]
8. **show mpls interfaces** [[**vrf** *vrf-name*] [*interface*] [**detail**] | **all**]
9. **show ip route**
10. **disable**

### DETAILED STEPS

|        | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                 |
|--------|---------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                          | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul>                                                                                                                                                                                                                                                     |
| Step 2 | <b>ping</b> [ <i>protocol</i> ] { <i>host-name</i>   <i>system-address</i> }<br><br><b>Example:</b><br>Router# ping ip 10.1.0.0 | (Optional) Diagnoses basic network connectivity on AppleTalk, CLNS, IP, Novell, Apollo, VINES, DECnet, or XNS networks.<br><ul style="list-style-type: none"><li>• Use the <b>ping ip</b> command to verify the connectivity from one CSC core router to another.</li></ul>                                                                                             |
| Step 3 | <b>trace</b> [ <i>protocol</i> ] [ <i>destination</i> ]<br><br><b>Example:</b><br>Router# trace ip 10.2.0.0                     | (Optional) Discovers the routes that packets will actually take when traveling to their destination.<br><ul style="list-style-type: none"><li>• Use the <b>trace</b> command to verify the path that a packet goes through before reaching the final destination. The <b>trace</b> command can help isolate a trouble spot if two routers cannot communicate.</li></ul> |

|         | Command or Action                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                    |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4  | <pre>show mpls forwarding-table [vrf vrf-name] [{network {mask   length}   labels label [- label]   interface interface   next-hop address   lsp-tunnel [tunnel-id]]} [detail]</pre> <p><b>Example:</b><br/>Router# show mpls forwarding-table</p> | <p>(Optional) Displays the contents of the MPLS label forwarding information base (LFIB).</p> <ul style="list-style-type: none"> <li>Use the <b>show mpls forwarding-table</b> command to verify that MPLS packets are being forwarded.</li> </ul>                         |
| Step 5  | <pre>show mpls ldp discovery [vrf vrf-name   all]</pre> <p><b>Example:</b><br/>Router# show mpls ldp discovery</p>                                                                                                                                 | <p>(Optional) Displays the status of the LDP discovery process.</p> <ul style="list-style-type: none"> <li>Use the <b>show mpls ldp discovery</b> command to verify that LDP is operational in the CSC core.</li> </ul>                                                    |
| Step 6  | <pre>show mpls ldp neighbor [[vrf vrf-name] [address   interface] [detail]   all]</pre> <p><b>Example:</b><br/>Router# show mpls ldp neighbor</p>                                                                                                  | <p>(Optional) Displays the status of LDP sessions.</p> <ul style="list-style-type: none"> <li>Use the <b>show mpls ldp neighbor</b> command to verify LDP configuration in the CSC core.</li> </ul>                                                                        |
| Step 7  | <pre>show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]</pre> <p><b>Example:</b><br/>Router# show ip cef</p>                                                                                                                   | <p>(Optional) Displays entries in the forwarding information base (FIB).</p> <ul style="list-style-type: none"> <li>Use the <b>show ip cef</b> command to check the forwarding table (prefixes, next hops, and interfaces).</li> </ul>                                     |
| Step 8  | <pre>show mpls interfaces [[vrf vrf-name] [interface] [detail]   all]</pre> <p><b>Example:</b><br/>Router# show mpls interfaces</p>                                                                                                                | <p>(Optional) Displays information about one or more or all interfaces that are configured for label switching.</p> <ul style="list-style-type: none"> <li>Use the <b>show mpls interfaces</b> command to verify that the interfaces are configured to use LDP.</li> </ul> |
| Step 9  | <pre>show ip route</pre> <p><b>Example:</b><br/>Router# show ip route</p>                                                                                                                                                                          | <p>(Optional) Displays IP routing table entries.</p> <ul style="list-style-type: none"> <li>Use the <b>show ip route</b> command to display the entire routing table, including host IP address, next hop, interface, and so forth.</li> </ul>                             |
| Step 10 | <pre>disable</pre> <p><b>Example:</b><br/>Router# disable</p>                                                                                                                                                                                      | <p>(Optional) Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                         |

## Troubleshooting Tips

You can use the **ping** and **trace** commands to verify complete MPLS connectivity in the core. You also get useful troubleshooting information from the additional **show** commands.

## Configuring VRFs for CSC-PE Routers

Perform this task to configure VPN forwarding/routing instances (VRFs) for the backbone carrier edge (CSC-PE) routers.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*
5. **route-target** {**import** | **export** | **both**} *route-target-ext-community*
6. **import map** *route-map*
7. **exit**
8. **interface** *type number*
9. **ip vrf forwarding** *vrf-name*
10. **end**

## DETAILED STEPS

|        | Command or Action                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                               |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal              | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 3 | <b>ip vrf</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config)# ip vrf vpn1         | Defines the VPN routing instance by assigning a VRF name and enters VRF configuration mode. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                                                                                                                                      |
| Step 4 | <b>rd</b> <i>route-distinguisher</i><br><br><b>Example:</b><br>Router(config-vrf)# rd 100:1 | Creates routing and forwarding tables. <ul style="list-style-type: none"> <li>The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix. You can enter an RD in either of these formats: <ul style="list-style-type: none"> <li>16-bit AS number: your 32-bit number, for example, 101:3</li> <li>32-bit IP address: your 16-bit number, for example, 192.168.122.15:1</li> </ul> </li> </ul> |

|                | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b>  | <pre>route-target {import   export   both} route-target-ext-community</pre> <p><b>Example:</b><br/>Router(config-vrf)# route-target import 100:1</p> | <p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> <li>The <b>import</b> keyword imports routing information from the target VPN extended community.</li> <li>The <b>export</b> keyword exports routing information to the target VPN extended community.</li> <li>The <b>both</b> keyword imports routing information from and exports routing information to the target VPN extended community.</li> <li>The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.</li> </ul> |
| <b>Step 6</b>  | <pre>import map route-map</pre> <p><b>Example:</b><br/>Router(config-vrf)# import map vpn1-route-map</p>                                             | <p>(Optional) Configures an import route map for a VRF.</p> <ul style="list-style-type: none"> <li>The <i>route-map</i> argument specifies the route map to be used as an import route map for the VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 7</b>  | <pre>exit</pre> <p><b>Example:</b><br/>Router(config-vrf)# exit</p>                                                                                  | <p>(Optional) Exits to global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 8</b>  | <pre>interface type number</pre> <p><b>Example:</b><br/>Router(config)# interface Ethernet5/0</p>                                                    | <p>Specifies the interface to configure.</p> <ul style="list-style-type: none"> <li>The <i>type</i> argument specifies the type of interface to be configured.</li> <li>The <i>number</i> argument specifies the port, connector, or interface card number.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 9</b>  | <pre>ip vrf forwarding vrf-name</pre> <p><b>Example:</b><br/>Router(config-if)# ip vrf forwarding vpn1</p>                                           | <p>Associates a VRF with the specified interface or subinterface.</p> <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 10</b> | <pre>end</pre> <p>Router(config-if)# end</p>                                                                                                         | <p>(Optional) Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Troubleshooting Tips

Enter a **show ip vrf detail** command and make sure the MPLS VPN is up and associated with the right interfaces.

## Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier

Perform this task to configure Multiprotocol BGP (MP-BGP) connectivity in the backbone carrier.

### SUMMARY STEPS

1. **enable**

2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default ipv4-unicast**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **update-source** *interface-type*
7. **address-family vpnv4 [unicast]**
8. **neighbor** {*ip-address* | *peer-group-name*} **send-community extended**
9. **neighbor** {*ip-address* | *peer-group-name*} **activate**
10. **end**

|        | Command or Action                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>router bgp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                                       | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul> |
| Step 4 | <b>no bgp default ipv4-unicast</b><br><br><b>Example:</b><br>Router(config-router)# no bgp default ipv4-unicast                                                                   | (Optional) Disables the IPv4 unicast address family on all neighbors. <ul style="list-style-type: none"> <li>Use the <b>no</b> form of the <b>bgp default-unicast</b> command if you are using this neighbor for MPLS routes only.</li> </ul>                                                                                                                                                                                            |
| Step 5 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.5.5.5 remote-as 100 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                      |

|         | Command or Action                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>update-source</b> <i>interface-type</i><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.2.0.0<br>update-source loopback0 | Allows BGP sessions to use a specific operational interface for TCP connections. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>interface-type</i> argument specifies the interface to be used as the source.</li> </ul> |
| Step 7  | <b>address-family</b> <b>vpnv4</b> [ <b>unicast</b> ]<br><br><b>Example:</b><br>Router(config-router)# address-family vpnv4                                                                                | Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> <li>The optional <b>unicast</b> keyword specifies VPNv4 unicast address prefixes.</li> </ul>                                                                                                                                           |
| Step 8  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>send-community</b> <b>extended</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>send-community extended   | Specifies that a communities attribute should be sent to a BGP neighbor. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP-speaking neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                       |
| Step 9  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.4.0.0<br>activate                                        | Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                                          |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                                                                                                         | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                   |

## Troubleshooting Tips

You can enter a **show ip bgp neighbor** command to verify that the neighbors are up and running. If this command is not successful, enter a **debug ip bgp x.x.x.x events** command, where *x.x.x.x* is the IP address of the neighbor.

## Configuring the CSC-PE and CSC-CE Routers

Perform the following tasks to configure and verify links between a CSC-PE router and the carrier CSC-CE router for an MPLS VPN CSC network that uses BGP to distribute routes and MPLS labels.

- [Configuring CSC-PE Routers, page 13](#) (required)
- [Configuring CSC-CE Routers, page 15](#) (required)
- [Verifying Labels in the CSC-PE Routers, page 17](#) (optional)

- [Verifying Labels in the CSC-CE Routers, page 19](#) (optional)

Figure 3 shows the configuration for the peering with directly connected interfaces between CSC-PE and CSC-CE routers. This configuration is used as the example in the tasks that follow.

**Figure 3** Configuration for Peering with Directly Connected Interfaces Between CSC-PE and CSC-CE Routers

## Configuring CSC-PE Routers

Perform this task to configure the CSC-PE routers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **neighbor** *ip-address* **as-override**
8. **neighbor** *ip-address* **send-label**
9. **exit-address-family**
10. **end**

### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                              |
|--------|-----------------------------------------------|--------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode.                                                        |
|        | <b>Example:</b><br>Router> enable             | <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                    |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                      |

|        | Command or Action                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>router</b> <b>bgp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                                         | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                           |
| Step 4 | <b>address-family</b> <b>ipv4</b> [ <b>multicast</b>   <b>unicast</b>   <b>vrf</b> <i>vrf-name</i> ]<br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 vrf vpn1         | Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf</b> <i>vrf-name</i> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |
| Step 5 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>remote-as 200 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                                                |
| Step 6 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.2<br>activate                        | Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                                                                                                 |
| Step 7 | <b>neighbor</b> <i>ip-address</i> <b>as-override</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.2<br>as-override                                                  | Configures a PE router to override the autonomous system number (ASN) of a site with the ASN of a provider. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the router that is to be overridden with the ASN provided.</li> </ul>                                                                                                                                                                                |
| Step 8 | <b>neighbor</b> <i>ip-address</i> <b>send-label</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.2<br>send-label                                                    | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighboring router.</li> </ul>                                                                                                                                                                                                                                         |

|         | Command or Action                                                                                  | Purpose                                   |
|---------|----------------------------------------------------------------------------------------------------|-------------------------------------------|
| Step 9  | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family | Exits address family configuration mode.  |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                    | (Optional) Exits to privileged EXEC mode. |

### Troubleshooting Tips

Enter a **show ip bgp neighbor** command to verify that the neighbors are up and running. Make sure you see the following line in the command output under Neighbor capabilities:

```
IPv4 MPLS Label capability:advertised and received
```

## Configuring CSC-CE Routers

Perform this task to configure the CSC-CE routers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **redistribute** *protocol*
6. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
7. **neighbor** {*ip-address* | *peer-group-name*} **activate**
8. **neighbor** *ip-address* **send-label**
9. **exit-address-family**
10. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|--------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                               | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 3 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router(config)# router bgp 200                                                 | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 4 | <b>address-family ipv4 [multicast   unicast   vrf vrf-name]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 | Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf vrf-name</b> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 5 | <b>redistribute protocol</b><br><br><b>Example:</b><br>Router(config-router-af)# redistribute static                                 | Redistributes routes from one routing domain into another routing domain. <ul style="list-style-type: none"> <li>The <i>protocol</i> argument specifies the source protocol from which routes are being redistributed. It can be one of the following keywords: <b>bgp</b>, <b>egp</b>, <b>igrp</b>, <b>isis</b>, <b>ospf</b>, <b>mobile</b>, <b>static [ip]</b>, <b>connected</b>, and <b>rip</b>. <ul style="list-style-type: none"> <li>The <b>static [ip]</b> keyword redistributes IP static routes. The optional <b>ip</b> keyword is used when you redistribute static routes into IS-IS.</li> <li>The <b>connected</b> keyword refers to routes which are established automatically when IP is enabled on an interface. For routing protocols such as OSPF and IS-IS, these routes are redistributed as external to the autonomous system.</li> </ul> </li> </ul> |

|         | Command or Action                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                             |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.5.0.2<br>remote-as 100 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul> |
| Step 7  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.3.0.2<br>activate                        | Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                  |
| Step 8  | <b>neighbor</b> <i>ip-address</i> <b>send-label</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.2<br>send-label                                                    | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighboring router.</li> </ul>                                                                                                                                                          |
| Step 9  | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                                                         | Exits from the address family configuration mode.                                                                                                                                                                                                                                                                                                                                   |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                                                                                                            | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                           |

## Verifying Labels in the CSC-PE Routers

Perform this task to verify the labels in the CSC-PE routers.

### SUMMARY STEPS

1. **enable**
2. **show ip bgp vpnv4** {**all** | **rd** *route-distinguisher* | **vrf** *vrf-name*} [**summary**] [**labels**]
3. **show mpls interfaces** [**all**]
4. **show ip route vrf** *vrf-name* [*prefix*]
5. **show ip bgp vpnv4** {**all** | **rd** *route-distinguisher* | **vrf** *vrf-name*} [**summary**] [**labels**]
6. **show ip cef** [**vrf** *vrf-name*] [*network* [*mask*]] [**longer-prefixes**] [**detail**]
7. **show mpls forwarding-table** [**vrf** *vrf-name*] [{*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]
8. **traceroute vrf** [*vrf-name*] *ip-address*

## 9. disable

## DETAILED STEPS

|        | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 2 | <b>show ip bgp vpnv4 {all   rd route-distinguisher   vrf vrf-name} [summary] [labels]</b><br><br><b>Example:</b><br>Router# show ip bgp vpnv4 all summary     | (Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> <li>Use the <b>show ip bgp vpnv4 all summary</b> command to check that the BGP session is up and running between the CSC-PE routers and the CSC-CE routers. Check the data in the State/PfxRcd column to verify that prefixes are learned during each session.</li> </ul>                                                                                                                                                              |
| Step 3 | <b>show mpls interfaces [all]</b><br><br><b>Example:</b><br>Router# show mpls interfaces all                                                                  | (Optional) Displays information about one or more interfaces that have been configured for label switching. <ul style="list-style-type: none"> <li>Use the <b>show mpls interfaces all</b> command to check that MPLS interfaces are up and running, and that LDP-enabled interfaces show that LDP is up and running. Check that LDP is turned off on the VRF because EBGp distributes the labels.</li> </ul>                                                                                                                             |
| Step 4 | <b>show ip route vrf vrf-name [prefix]</b><br><br><b>Example:</b><br>Router# show ip route vrf vpn1 10.5.5.5                                                  | (Optional) Displays the IP routing table associated with a VRF. <ul style="list-style-type: none"> <li>Use the <b>show ip route vrf</b> command to check that the prefixes for the PE routers are in the routing table of the CSC-PE routers.</li> </ul> <p><b>Note</b> If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes for the same destination learned from the CSC-CE are installed in the corresponding VRF routing table.</p>                                                       |
| Step 5 | <b>show ip bgp vpnv4 {all   rd route-distinguisher   vrf vrf-name} [summary] [labels]</b><br><br><b>Example:</b><br>Router# show ip bgp vpnv4 vrf vpn1 labels | (Optional) Displays VPN address information from the BGP table. <ul style="list-style-type: none"> <li>Use the <b>show ip bgp vpnv4 vrf vrf-name labels</b> command to check that the prefixes for the customer carrier MPLS service provider networks are in the BGP table and have the appropriate labels.</li> </ul> <p><b>Note</b> If you have multiple paths configured between CSC-PE and CSC-CE, verify that the labels for the same destination learned from the CSC-CE are installed in the corresponding VRF routing table.</p> |

|        | Command or Action                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <pre>show ip cef [vrf vrf-name] [network [mask]] [longer-prefixes] [detail]</pre> <p><b>Example:</b><br/>Router# show ip cef vrf vpn1 10.1.0.0 detail</p>                                                                                                                   | <p>(Optional) Displays entries in the forwarding information base (FIB) or displays a summary of the FIB.</p> <ul style="list-style-type: none"> <li>Use the <b>show ip cef vrf</b> and the <b>show ip cef vrf detail</b> commands to check that the prefixes of the PE routers are in the CEF table.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 7 | <pre>show mpls forwarding-table [vrf vrf-name] [{network {mask   length}   labels label [- label]   interface interface   next-hop address   lsp-tunnel [tunnel-id]]] [detail]</pre> <p><b>Example:</b><br/>Router# show mpls forwarding-table vrf vpn1 10.1.0.0 detail</p> | <p>(Optional) Displays the contents of the MPLS forwarding information base (LFIB).</p> <ul style="list-style-type: none"> <li>Use the <b>show mpls forwarding-table</b> command with the <b>vrf</b> keyword and both the <b>vrf</b> and <b>detail</b> keywords to check that the prefixes for the PE routers in the local customer MPLS VPN service provider are in the LFIB.</li> </ul> <p><b>Note</b> If you have multiple paths configured between CSC-PE and CSC-CE, verify that the labels for the same destination learned from the CSC-CE are installed in the corresponding VRF table.</p>                                                                                                                                                           |
| Step 8 | <pre>traceroute vrf [vrf-name] ip-address</pre> <p><b>Example:</b><br/>Router# traceroute vrf vpn2 10.2.0.0</p>                                                                                                                                                             | <p>Shows the routes that packets follow traveling through a network to their destination.</p> <ul style="list-style-type: none"> <li>Use the <b>traceroute vrf</b> command to check the data path and transport labels from a PE to a destination CE router.</li> </ul> <p><b>Note</b> This command works with MPLS-aware traceroute only if the backbone routers are configured to propagate and generate IP Time to Live (TTL) information. For more information, see the documentation on the <b>mpls ip propagate-ttl</b> command.</p> <p><b>Note</b> If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes for the same destination learned from the CSC-CE are installed in the corresponding VRF table.</p> |
| Step 9 | <pre>disable</pre> <p><b>Example:</b><br/>Router# disable</p>                                                                                                                                                                                                               | <p>(Optional) Exits to user EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Verifying Labels in the CSC-CE Routers

Perform this task to verify the labels in the CSC-CE routers.

### SUMMARY STEPS

1. **enable**
2. **show ip bgp summary**
3. **show ip route [address]**

4. **show mpls ldp bindings** [*network* {*mask* | *length*}]
5. **show ip cef** [*network* [*mask*]] [**longer-prefixes**] [**detail**]
6. **show mpls forwarding-table** [**vrf** *vrf-name*] [{*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]
7. **show ip bgp labels**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 2 | <b>show ip bgp summary</b><br><br><b>Example:</b><br>Router# show ip bgp summary                                                                                  | (Optional) Displays the status of all BGP connections. <ul style="list-style-type: none"> <li>Use the <b>show ip bgp summary</b> command to check that the BGP session is up and running on the CSC-CE routers.</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>show ip route</b> [ <i>address</i> ]<br><br><b>Example:</b><br>Router# show ip route 10.1.0.0                                                                  | (Optional) Displays IP routing table entries. <ul style="list-style-type: none"> <li>Use the <b>show ip route</b> command to check that the loopback address of the local and remote PE routers are in the routing table.</li> </ul> <p><b>Note</b> If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes for the same destination learned from the CSC-CE are installed in the corresponding VRF table.</p>                                                                                                          |
| Step 4 | <b>show mpls ldp bindings</b> [ <i>network</i> { <i>mask</i>   <i>length</i> }]<br><br><b>Example:</b><br>Router# show mpls ldp bindings 10.2.0.0 255.255.255.255 | (Optional) Displays the contents of the label information base (LIB). <ul style="list-style-type: none"> <li>Use the <b>show mpls ldp bindings</b> command to check that the prefix of the local PE router is in the MPLS LDP bindings.</li> </ul>                                                                                                                                                                                                                                                                                                               |
| Step 5 | <b>show ip cef</b> [ <i>network</i> [ <i>mask</i> ]] [ <b>longer-prefixes</b> ] [ <b>detail</b> ]<br><br><b>Example:</b><br>Router# show ip cef 10.5.0.0 detail   | (Optional) Displays entries in the forwarding information base (FIB) or a summary of the FIB. <ul style="list-style-type: none"> <li>Use the <b>show ip cef</b> and the <b>show ip cef detail</b> commands to check that the prefixes of the local and remote PE routers are in the Cisco Express Forwarding table.</li> </ul> <p><b>Note</b> If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes and the labels for the same destination learned from the CSC-CE are installed in the corresponding VRF table.</p> |

| Command or Action                                                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Step 6</b></p> <pre>show mpls forwarding-table [vrf vrf-name] [{network {mask   length}   labels label [- label]   interface interface   next-hop address   lsp-tunnel {tunnel-id}}] [detail]</pre> <p><b>Example:</b><br/>Router# show mpls forwarding-table 10.2.0.0 detail</p> | <p>(Optional) Displays the contents of the MPLS LFIB.</p> <ul style="list-style-type: none"> <li>Use the <b>show mpls forwarding-table</b> and <b>show mpls forwarding-table detail</b> commands to check that the prefixes of the local and remote PE routers are in the MPLS forwarding table.</li> </ul> <p><b>Note</b> If you have multiple paths configured between CSC-PE and CSC-CE, verify that the multiple routes and labels for the same destination learned from the CSC-CE are installed in the corresponding VRF routing table.</p> |

## Configuring the Customer Carrier Network

Perform the following tasks to configure and verify the customer carrier network. This requires setting up connectivity and routing functions for the customer carrier core (P) routers and the customer carrier edge (PE) routers.

- [Verifying IP Connectivity in the Customer Carrier, page 21](#) (optional)
- [Configuring a Customer Carrier Core Router as a Route Reflector, page 22](#) (optional)

## Prerequisites

Before you configure an MPLS VPN CSC network that uses BGP to distribute routes and MPLS labels, you must configure the following on your customer carrier routers:

- An IGP routing protocol—BGP, OSPF, IS-IS, EIGRP, static, and so on. For information, see [Configuring a Basic BGP Network](#), [Configuring OSPF](#), [Configuring a Basic IS-IS Network](#), and [Configuring EIGRP](#).
- MPLS VPN functionality on the PE routers (for hierarchical VPNs only).
- Label Distribution Protocol (LDP) on P and PE routers (for hierarchical VPNs only). For information, see [How to Configure MPLS LDP](#).

### Note

You must configure the items in the preceding list before performing the tasks in this section.

## Verifying IP Connectivity in the Customer Carrier

Perform this task to verify IP connectivity in the customer carrier.

## SUMMARY STEPS

1. **enable**
2. **ping** [*protocol*] {*host-name* | *system-address*}
3. **trace** [*protocol*] [*destination*]
4. **show ip route**
5. **disable**

## DETAILED STEPS

|        | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                   |
|--------|---------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                          | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                          |
| Step 2 | <b>ping</b> [ <i>protocol</i> ] { <i>host-name</i>   <i>system-address</i> }<br><br><b>Example:</b><br>Router# ping ip 10.2.0.0 | Diagnoses basic network connectivity on AppleTalk, CLNS, IP, Novell, Apollo, VINES, DECnet, or XNS networks. <ul style="list-style-type: none"> <li>Use the <b>ping</b> command to verify the connectivity from one customer carrier core router to another.</li> </ul>                                                                                   |
| Step 3 | <b>trace</b> [ <i>protocol</i> ] [ <i>destination</i> ]<br><br><b>Example:</b><br>Router# trace ip 10.1.0.0                     | Discovers the routes that packets will actually take when traveling to their destination. <ul style="list-style-type: none"> <li>Use the <b>trace</b> command to verify the path that a packet goes through before reaching the final destination. The <b>trace</b> command can help isolate a trouble spot if two routers cannot communicate.</li> </ul> |
| Step 4 | <b>show ip route</b><br><br><b>Example:</b><br>Router# show ip route                                                            | Displays IP routing table entries. <ul style="list-style-type: none"> <li>Use the <b>show ip route</b> command to display the entire routing table, including host IP address, next hop, interface, and so forth.</li> </ul>                                                                                                                              |
| Step 5 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                        | Returns to user mode.                                                                                                                                                                                                                                                                                                                                     |

## Configuring a Customer Carrier Core Router as a Route Reflector

Perform this task to configure a customer carrier core (P) router as a route reflector of multiprotocol BGP prefixes.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*

4. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
5. **address-family vpnv4** [**unicast**]
6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **neighbor** *ip-address* **route-reflector-client**
8. **exit-address-family**
9. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 3 | <b>router bgp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 200                                                                                             | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and labels the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul> |
| Step 4 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.1.1.1<br>remote-as 100 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                        |
| Step 5 | <b>address-family vpnv4</b> [ <b>unicast</b> ]<br><br><b>Example:</b><br>Router(config-router)# address-family vpnv4                                                                    | Enters address family configuration mode for configuring routing sessions, such as BGP, that use standard VPNv4 address prefixes. <ul style="list-style-type: none"> <li>The optional <b>unicast</b> keyword specifies VPNv4 unicast address prefixes.</li> </ul>                                                                                                                                                                          |

|        | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.1.1.1<br>activate | Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul> |
| Step 7 | <b>neighbor</b> <i>ip-address</i> <b>route-reflector-client</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.1.1.1<br>route-reflector-client     | Configures the router as a BGP route reflector and configures the specified neighbor as its client. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the BGP neighbor being identified as a client.</li> </ul>                    |
| Step 8 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                                  | Exits address family configuration mode.                                                                                                                                                                                                                                           |
| Step 9 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                                                                                     | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                          |

## Troubleshooting Tips

By default, neighbors that are defined using the **neighbor remote-as** command in router configuration mode exchange only unicast address prefixes. For neighbors to exchange other address prefix types, such as multicast and VPNv4, you must also activate neighbors using the **neighbor activate** command in address family configuration mode, as shown.

Route reflectors and clients (neighbors or internal BGP peer groups) that are defined in router configuration mode using the **neighbor route-reflector-client** command reflect unicast address prefixes to and from those clients by default. To cause them to reflect prefixes for other address families, such as multicast, define the reflectors and clients in address family configuration mode, using the **neighbor route-reflector-client** command, as shown.

## Configuring the Customer Site for Hierarchical VPNs

### Note

This section applies only to customer carrier networks that use BGP to distribute routes and MPLS labels.

Perform the following tasks to configure and verify the customer site for hierarchical VPNs:

- [Defining VPNs on PE Routers for Hierarchical VPNs, page 25](#) (required)
- [Configuring BGP Routing Sessions on the PE Routers for Hierarchical VPNs, page 26](#) (required)
- [Verifying Labels in Each PE Router for Hierarchical VPNs, page 28](#) (optional)
- [Configuring CE Routers for Hierarchical VPNs, page 29](#) (required)
- [Verifying IP Connectivity in the Customer Site, page 31](#) (optional)

**Note**

This section applies to hierarchical VPNs only.

## Defining VPNs on PE Routers for Hierarchical VPNs

Perform this task to define VPNs on PE routers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip vrf** *vrf-name*
4. **rd** *route-distinguisher*
5. **route-target** {**import** | **export** | **both**} *route-target-ext-community*
6. **import map** *route-map*
7. **ip vrf forwarding** *vrf-name*
8. **exit**

### DETAILED STEPS

|        | Command or Action                                                                           | Purpose                                                                                                                                                                                                                |
|--------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                      | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                  |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal              | Enters global configuration mode.                                                                                                                                                                                      |
| Step 3 | <b>ip vrf</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config)# ip vrf vpn2         | Creates a VRF routing table and a Cisco Express Forwarding table and enters VRF configuration mode.<br><ul style="list-style-type: none"> <li>• The <i>vrf-name</i> argument is a name you assign to a VRF.</li> </ul> |
| Step 4 | <b>rd</b> <i>route-distinguisher</i><br><br><b>Example:</b><br>Router(config-vrf)# rd 200:1 | Creates routing and forwarding tables for a VRF.<br><ul style="list-style-type: none"> <li>• The <i>route-distinguisher</i> argument adds an 8-byte value to an IPv4 prefix to create a VPN IPv4 prefix.</li> </ul>    |

|        | Command or Action                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <pre>route-target {import   export   both} route-target-ext-community</pre> <p><b>Example:</b><br/>Router(config-vrf)# route-target export 200:1</p> | <p>Creates a route-target extended community for a VRF.</p> <ul style="list-style-type: none"> <li>The <b>import</b> keyword imports routing information from the target VPN extended community.</li> <li>The <b>export</b> keyword exports routing information to the target VPN extended community.</li> <li>The <b>both</b> keyword imports routing information from and export routing information to the target VPN extended community.</li> <li>The <i>route-target-ext-community</i> argument adds the route-target extended community attributes to the VRF's list of import, export, or both (import and export) route-target extended communities.</li> </ul> |
| Step 6 | <pre>import map route-map</pre> <p><b>Example:</b><br/>Router(config-vrf)# import map map23</p>                                                      | <p>Configures an import route map for a VRF.</p> <ul style="list-style-type: none"> <li>The <i>route-map</i> argument specifies the route map to be used as an import route map for the VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 7 | <pre>ip vrf forwarding vrf-name</pre> <p><b>Example:</b><br/>Router(config-vrf)# ip vrf forwarding vpn2</p>                                          | <p>Associates a VPN VRF instance with an interface or subinterface.</p> <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 8 | <pre>exit</pre> <p><b>Example:</b><br/>Router(config-vrf)# exit</p>                                                                                  | <p>Exits to global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring BGP Routing Sessions on the PE Routers for Hierarchical VPNs

Perform this task to configure BGP routing sessions on the PE routers for PE-to-CE router communication.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **neighbor** {*ip address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **activate**
7. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 3 | <b>router bgp <i>as-number</i></b><br><br><b>Example:</b><br>Router(config)# router bgp 200                                                                                           | Configures the router to run a BGP process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                 |
| Step 4 | <b>address-family ipv4 [<i>multicast</i>   <i>unicast</i>   <i>vrf vrf-name</i>]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 multicast                   | Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf <i>vrf-name</i></b> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |
| Step 5 | <b>neighbor {<i>ip-address</i>   <i>peer-group-name</i>}</b><br><b>remote-as <i>as-number</i></b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.5.5.5 remote-as 300 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                                                |

|        | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.1.0.0<br>activate | Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul> |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                                                                  | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                      |

## Verifying Labels in Each PE Router for Hierarchical VPNs

Perform this task to verify labels in each PE router for hierarchical VPNs.

### SUMMARY STEPS

1. **enable**
2. **show ip route vrf vrf-name** [*prefix*]
3. **show mpls forwarding-table** [*vrf vrf-name*] [*prefix*] [*detail*]
4. **show ip cef** [*network* [*mask* [*longer-prefix*]]] [*detail*]
5. **show ip cef vrf vrf-name** [*ip-prefix*]
6. **exit**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                       |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                       | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                              |

## Configuring CE Routers for Hierarchical VPNs

Perform this task to configure CE routers for hierarchical VPNs. This configuration is the same as that for an MPLS VPN that is not in a hierarchical topology.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip cef** [*distributed*]
4. **interface** *type number*
5. **ip address** *ip-address mask* [*secondary*]
6. **exit**
7. **router bgp** *as-number*
8. **redistribute** *protocol*
9. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
10. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 3 | <b>ip cef [distributed]</b><br><br><b>Example:</b><br>Router(config)# ip cef distributed                                       | Enables Cisco Express Forwarding on the route processor card. <ul style="list-style-type: none"> <li>The <b>distributed</b> keyword enables distributed Cisco Express Forwarding operation. Cisco Express Forwarding information is distributed to the line cards. Line cards perform express forwarding.</li> </ul> <b>Note</b> For the Cisco ASR 1000 Series Aggregation Services Router, the <b>distributed</b> keyword is required.                                                                                                                                                                     |
| Step 4 | <b>interface type number</b><br><br><b>Example:</b><br>Router(config)# interface loopback 0                                    | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>type</i> argument specifies the type of interface to be configured. <ul style="list-style-type: none"> <li>A loopback interface indicates a software-only interface that emulates an interface that is always up. It is a virtual interface supported on all platforms.</li> </ul> </li> <li>The <i>number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces you can create.</li> </ul> |
| Step 5 | <b>ip address ip-address mask [secondary]</b><br><br><b>Example:</b><br>Router(config-if)# ip address 10.8.0.0 255.255.255.255 | Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address.</li> <li>The <i>mask</i> argument is the mask for the associated IP subnet.</li> <li>The <b>secondary</b> keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul>                                                                                                                                                                               |
| Step 6 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                  | Exits interface configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|         | Command or Action                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <code>router bgp as-number</code><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                                   | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                                                                                                                                                                                                                                                |
| Step 8  | <code>redistribute protocol</code><br><br><b>Example:</b><br>Router(config-router)# redistribute connected                                                                   | Redistributes routes from one routing domain into another routing domain. <ul style="list-style-type: none"> <li>The <i>protocol</i> argument specifies the source protocol from which routes are being redistributed. It can be one of the following keywords: <b>bgp</b>, <b>connected</b>, <b>egp</b>, <b>igrp</b>, <b>isis</b>, <b>mobile</b>, <b>ospf</b>, <b>static</b> [ip], or <b>rip</b>.</li> </ul> <p>The <b>connected</b> keyword refers to routes that are established automatically when IP is enabled on an interface. For routing protocols such as Open Shortest Path First (OSPF) and IS-IS, these routes are redistributed as external to the autonomous system.</p> |
| Step 9  | <code>neighbor {ip-address   peer-group-name}</code><br><code>remote-as as-number</code><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.8.0.0<br>remote-as 100 | Adds the IP address of the neighbor in the remote autonomous system to the multiprotocol BGP neighbor table of the local router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                                                                                                                                                                                                  |
| Step 10 | <code>end</code><br><br><b>Example:</b><br>Router(config-router)# end                                                                                                        | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Verifying IP Connectivity in the Customer Site

Perform this task to verify IP connectivity in the customer site.

### SUMMARY STEPS

- enable**
- show ip route** [*ip-address* [*mask*] [**longer-prefixes**] | *protocol* [*process-id*] | **list** [*access-list-number* | *access-list-name*] | **static download**]
- ping** [*protocol*] {*host-name* | *system-address*}
- trace** [*protocol*] [*destination*]
- disable**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                                         | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                       |
| Step 2 | <b>show ip route</b> [ <i>ip-address</i> [ <i>mask</i> ]<br>[ <b>longer-prefixes</b> ]   <i>protocol</i> [ <i>process-id</i> ]  <br><b>list</b> [ <i>access-list-number</i>   <i>access-list-name</i> ]  <br><b>static download</b> ]<br><br><b>Example:</b><br>Router# show ip route 10.5.5.5 | (Optional) Displays the current state of the routing table. <ul style="list-style-type: none"> <li>Use the <b>show ip route</b> <i>ip-address</i> command to check that the loopback addresses of the remote CE routers learned through the PE router are in the routing table of the local CE routers.</li> </ul>                                                                                                                                     |
| Step 3 | <b>ping</b> [ <i>protocol</i> ] { <i>host-name</i>   <i>system-address</i> }<br><br><b>Example:</b><br>Router# ping 10.5.5.5                                                                                                                                                                   | Diagnoses basic network connectivity on Apollo, AppleTalk, Connectionless Network Service (CLNS), DECnet, IP, Novell IPX, VINES, or XNS networks. <ul style="list-style-type: none"> <li>Use the <b>ping</b> command to check connectivity between customer site routers.</li> </ul>                                                                                                                                                                   |
| Step 4 | <b>trace</b> [ <i>protocol</i> ] [ <i>destination</i> ]<br><br><b>Example:</b><br>Router# trace ip 10.5.5.5                                                                                                                                                                                    | Discovers the routes that packets will actually take when traveling to their destination. <ul style="list-style-type: none"> <li>Use the <b>trace</b> command to follow the path of the packets in the customer site.</li> <li>To use nondefault parameters and invoke an extended <b>trace</b> test, enter the <b>trace</b> command without a destination argument. You will be stepped through a dialog to select the desired parameters.</li> </ul> |
| Step 5 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                                                                                                                                                                                       | (Optional) Exits to user EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Configuration Examples for MPLS VPN CSC with BGP

Configuration examples for the MPLS VPN CSC with BGP include the following:

- [Configuring the Backbone Carrier Core: Examples, page 33](#)
- [Configuring the Links Between CSC-PE and CSC-CE Routers: Examples, page 36](#)
- [Configuring the Customer Carrier Network: Examples, page 43](#)
- [Configuring the Customer Site for Hierarchical VPNs: Examples, page 44](#)

Figure 4 shows a sample CSC topology for exchanging IPv4 routes and MPLS labels. Use this figure as a reference for configuring and verifying carrier supporting carrier routers to exchange IPv4 routes and MPLS labels.

**Figure 4**      **Sample CSC Topology for Exchanging IPv4 Routes and MPLS Labels**

Table 1 describes the sample configuration shown in Figure 4.

**Table 1**      **Description of Sample Configuration Shown in Figure 4**

| Routers             | Description                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CE1 and CE2         | <p>Belong to an end customer. CE1 and CE2 routers exchange routes learned from PE routers.</p> <p>The end customer is purchasing VPN services from a customer carrier.</p>                                                                                                                                                                                            |
| PE1 and PE2         | <p>Part of a customer carrier network that is configured to provide MPLS VPN services. PE1 and PE2 are peering with a VPNv4 IBGP session to form an MPLS VPN network.</p>                                                                                                                                                                                             |
| CSC-CE1 and CSC-CE2 | <p>Part of a customer carrier network. CSC-CE1 and CSC-CE2 routers exchange IPv4 BGP updates with MPLS labels and redistribute PE loopback addressees to and from the IGP (OSPF in this example).</p> <p>The customer carrier is purchasing carrier supporting carrier VPN services from a backbone carrier.</p>                                                      |
| CSC-PE1 and CSC-PE2 | <p>Part of the backbone carrier's network configured to provide carrier supporting carrier VPN services. CSC-PE1 and CSC-PE2 are peering with a VPNv4 IP BGP session to form the MPLS VPN network. In the VRF, CSC-PE1 and CSC-PE2 are peering with the CSC-CE routers, which are configured for carrying MPLS labels with the routes, with an IPv4 EBGP session.</p> |

## Configuring the Backbone Carrier Core: Examples

Configuration and verification examples for the backbone carrier core included in this section are as follows:

- [Verifying IP Connectivity and LDP Configuration in the CSC Core: Example, page 34](#)
- [Configuring VRFs for CSC-PE Routers: Example, page 35](#)
- [Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier: Example, page 35](#)

## Verifying IP Connectivity and LDP Configuration in the CSC Core: Example

Check that CSC-PE2 is reachable from CSC-PE1 by entering the following command on CSC-CE1:

```
Router# ping 10.5.5.5
```

Type escape sequence to abort.

Sending 5, 100-byte ICMP Echos to 10.5.5.5, timeout is 2 seconds:

!!!!

Success rate is 100 percent (5/5), round-trip min/avg/max = 4/4/4 ms

Verify the path from CSC-PE1 to CSC-PE2 by entering the following command on CSC-CE1:

```
Router# trace 10.5.5.5
```

Type escape sequence to abort.

Tracing the route to 10.5.5.5

```
  1 10.5.5.5 0 msec 0 msec *
```

Check that CSC-PE router prefixes are in the MPLS forwarding table:

```
Router# show mpls forwarding-table
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop    |
|-----------|--------------------|---------------------|--------------------|--------------------|-------------|
| 16        | 2/nn               | dd.dd.dd.dd/32      | 0                  | AT2/1/0.1          | point2point |
| 17        | 16                 | bb.bb.bb.bb/32[V]   | 30204              | Et1/0              | pp.0.0.1    |
| 21        | Pop tag            | cc.cc.cc.cc/32[V]   | 0                  | Et1/0              | pp.0.0.1    |
| 22        | Pop tag            | nn.0.0.0/8[V]       | 570                | Et1/0              | pp.0.0.1    |
| 23        | Aggregate          | pp.0.0.0/8[V]       | 0                  |                    |             |
| 2         | 2/nn               | gg.gg.gg.gg/32[V]   | 0                  | AT3/0.1            | point2point |
| 8         | 2/nn               | hh.hh.hh.hh/32[V]   | 15452              | AT3/0.1            | point2point |
| 29        | 2/nn               | qq.0.0.0/8[V]       | 0                  | AT3/0.1            | point2point |
| 30        | 2/nn               | ss.0.0.0/8[V]       | 0                  | AT3/0.1            | point2point |

Check the status of LDP discovery processes in the core:

```
Router# show mpls ldp discovery
```

Local LDP Identifier:

ee.00.00.00:0

Discovery Sources:

Interfaces:

ATM2/1/0.1 (ldp): xmit/rcv

TDP Id: dd.dd.dd.dd:1

Check the status of LDP sessions in the core:

```
Router# show mpls ldp neighbor
```

Peer LDP Ident: dd.dd.dd.dd:1; Local LDP Ident ee.00.00.00:1

TCP connection: dd.dd.dd.dd.646 - ee.00.00.00.11007

State: Oper; Msgs sent/rcvd: 20/21; Downstream on demand

Up time: 00:14:56

LDP discovery sources:

ATM2/1/0.1, Src IP addr: dd.dd.dd.dd

Check the forwarding table (prefixes, next-hops, and interfaces):

```
Router# show ip cef
```

| Prefix    | Next Hop | Interface                           |
|-----------|----------|-------------------------------------|
| 0.0.0.0/0 | drop     | Null0 (default route handler entry) |

```

0.0.0.0/32          receive
dd.dd.dd.dd/32      dd.dd.dd.dd      ATM2/1/0.1
ee.aa.aa.aa/32      receive
224.0.0.0/4         drop
224.0.0.0/24        receive
255.255.255.255/32 receive

```

**Note**

Also see the [“Verifying Labels in the CSC-CE Routers: Examples”](#) section on page 41.

Verify that interfaces are configured to use LDP:

```
Router# show mpls interfaces
```

| Interface   | IP        | Tunnel | Operational |
|-------------|-----------|--------|-------------|
| Ethernet0/1 | Yes (ldp) | No     | Yes         |

Display the entire routing table, including host IP address, next hop, interface, and so forth:

```
Router# show ip route
```

```

Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR

```

Gateway of last resort is not set

```

          dd.0.0.0/32 is subnetted, 1 subnets
O          dd.dd.dd.dd [110/7] via dd.dd.dd.dd, 00:16:42, ATM2/1/0.1
          ee.0.0.0/32 is subnetted, 1 subnets
C          ee.aa.aa.aa is directly connected, Loopback0

```

## Configuring VRFs for CSC-PE Routers: Example

The following example shows how to configure a VPN routing and forwarding (VRF) instance for a CSC-PE router:

```

ip cef distributed

ip vrf vpn1
rd 100:1
route target both 100:1
!

```

## Configuring Multiprotocol BGP for VPN Connectivity in the Backbone Carrier: Example

The following example shows how to configure Multiprotocol BGP (MP-BGP) for VPN connectivity in the backbone carrier:

```

ip cef distributed

ip vrf vpn1
rd 100:1
route target both 100:1

hostname csc-pe1

```

```

!
router bgp 100
  no bgp default ipv4-unicast
  bgp log-neighbor-changes
  timers bgp 10 30
  neighbor ee.aa.aa.aa remote-as 100
  neighbor ee.aa.aa.aa update-source Loopback0
  no auto-summary
!
address-family vpnv4
  neighbor ee.aa.aa.aa activate
  neighbor ee.aa.aa.aa send-community extended
  bgp dampening 30
  exit-address-family
!
router bgp 100
. . .
! (BGP IPv4 to CSC-CE router from CSC-PE router)
!
address-family ipv4 vrf vpn1
  neighbor ss.0.0.2 remote-as 200
  neighbor ss.0.0.2 activate
  neighbor ss.0.0.2 as-override
  neighbor ss.0.0.2 advertisement-interval 5
  neighbor ss.0.0.2 send-label
  no auto-summary
  no synchronization
  bgp dampening 30
  exit-address-family
!

```

## Configuring the Links Between CSC-PE and CSC-CE Routers: Examples

This section contains the following examples:

- [Configuring the CSC-PE Routers: Examples, page 36](#)
- [Configuring the CSC-CE Routers: Examples, page 37](#)
- [Verifying Labels in the CSC-PE Routers: Examples, page 38](#)
- [Verifying Labels in the CSC-CE Routers: Examples, page 41](#)

## Configuring the CSC-PE Routers: Examples

The following example shows how to configure a CSC-PE router:

```

ip cef
!
ip vrf vpn1
  rd 100:1
  route-target export 100:1
  route-target import 100:1
mpls label protocol ldp
!

  neighbor pp.0.0.1 as-override
  neighbor pp.0.0.1 advertisement-interval 5
  neighbor pp.0.0.1 send-label
  no auto-summary
  no synchronization
  bgp dampening 30
  exit-address-family

```

## Configuring the CSC-CE Routers: Examples

The following example shows how to configure a CSC-CE router:

```

ip cef
!
mpls label protocol ldp
!
interface Loopback0
  ip address cc.cc.cc.cc 255.255.255.255
!
interface Ethernet3/0
  ip address pp.0.0.1 255.0.0.0
!
interface Ethernet4/0
  ip address nn.0.0.2 255.0.0.0

```

```

no ip directed-broadcast
no ip mroute-cache
mpls label protocol ldp
mpls ip
!
router ospf 200
log-adjacency-changes
auto-cost reference-bandwidth 1000
redistribute connected subnets           !Exchange routes
redistribute bgp 200 metric 3 subnets     !learned from PE1
passive-interface ATM1/0
passive-interface Ethernet3/0
network cc.cc.cc.cc 0.0.0.0 area 200
network nn.0.0.0 0.255.255.255 area 200
!
router bgp 200
no bgp default ipv4-unicast
bgp log-neighbor-changes
timers bgp 10 30
neighbor pp.0.0.2 remote-as 100
neighbor pp.0.0.2 update-source Ethernet3/0
no auto-summary
!
address-family ipv4
redistribute connected
redistribute ospf 200 metric 4 match internal
neighbor pp.0.0.2 activate
neighbor pp.0.0.2 send-label
no auto-summary
no synchronization
bgp dampening 30
exit-address-family

```

## Verifying Labels in the CSC-PE Routers: Examples

The following examples show how to verify the configurations of the CSC-PE routers.

Verify that the BGP session is up and running between the CSC-PE router and the CSC-CE router. Check the data in the State/PfxRcd column to verify that prefixes are learned during each session.

Router# **show ip bgp vpnv4 all summary**

```

BBGP router identifier 10.5.5.5, local AS number 100
BGP table version is 52, main routing table version 52
12 network entries and 13 paths using 2232 bytes of memory
6 BGP path attribute entries using 336 bytes of memory
1 BGP AS-PATH entries using 24 bytes of memory
1 BGP extended community entries using 24 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
Dampening enabled. 0 history paths, 0 dampened paths
BGP activity 16/4 prefixes, 27/14 paths, scan interval 5 secs

```

| Neighbor | V | AS  | MsgRcvd | MsgSent | TblVer | InQ | OutQ | Up/Down  | State/PfxRcd |
|----------|---|-----|---------|---------|--------|-----|------|----------|--------------|
| 10.5.5.5 | 4 | 100 | 7685    | 7686    | 52     | 0   | 0    | 21:17:04 | 6            |
| 10.0.0.2 | 4 | 200 | 7676    | 7678    | 52     | 0   | 0    | 21:16:43 | 7            |

Verify that the MPLS interfaces are up and running, and that LDP-enabled interfaces show that LDP is up and running. LDP is turned off on the VRF because EBGp distributes the labels.

Router# **show mpls interfaces all**

| Interface          | IP        | Tunnel | Operational |
|--------------------|-----------|--------|-------------|
| GigabitEthernet6/0 | Yes (ldp) | No     | Yes         |

| VRF         | Operational |
|-------------|-------------|
| vpn1:       |             |
| Ethernet3/1 | Yes         |

Verify that the prefix for the local PE router is in the routing table of the CSC-PE router:

```
Router# show ip route vrf vpn2 10.5.5.5
```

```
Routing entry for 10.5.5.5/32
  Known via "bgp 100", distance 20, metric 4
  Tag 200, type external
  Last update from pp.0.0.2 21:28:39 ago
  Routing Descriptor Blocks:
    * pp.0.0.2, from pp.0.0.2, 21:28:39 ago
      Route metric is 4, traffic share count is 1
      AS Hops 1, BGP network version 0
```

Verify that the prefix for the remote PE router is in the routing table of the CSC-PE router:

```
Router# show ip route vrf vpn2 10.5.5.5
```

```
Routing entry for 10.5.5.5/32
  Known via "bgp 100", distance 200, metric 4
  Tag 200, type internal
  Last update from 10.1.0.0 21:27:39 ago
  Routing Descriptor Blocks:
    * 10.1.0.0 (Default-IP-Routing-Table), from 10.1.0.0, 21:27:39 ago
      Route metric is 4, traffic share count is 1
      AS Hops 1, BGP network version 0
```

Verify that the prefixes for the customer carrier MPLS VPN service provider networks are in the BGP table, and have appropriate labels:

```
Router# show ip bgp vpnv4 vrf vpn2 labels
```

| Network                           | Next Hop | In label/Out label |
|-----------------------------------|----------|--------------------|
| Route Distinguisher: 100:1 (vpn1) |          |                    |
| cc.cc.cc.cc/32                    | pp.0.0.2 | 22/imp-null        |
| bb.bb.bb.bb/32                    | pp.0.0.2 | 27/20              |
| hh.hh.hh.hh/32                    | ee.0.0.0 | 34/35              |
| gg.gg.gg.gg/32                    | ee.0.0.0 | 30/30              |
| nn.0.0.0                          | pp.0.0.2 | 23/imp-null        |
| ss.0.0.0                          | ee.0.0.0 | 33/34              |
| pp.0.0.0                          | pp.0.0.2 | 25/aggregate(vpn1) |

Verify that the prefix of the PE router in the local customer carrier MPLS VPN service provider is in the Cisco Express Forwarding table:

```
Router# show ip cef vrf vpn2 10.1.0.0
```

```
10.1.0.0/32, version 19, cached adjacency pp.0.0.2
0 packets, 0 bytes
  tag information set
    local tag: 27
    fast tag rewrite with Et3/1, pp.0.0.2, tags imposed {20}
  via pp.0.0.2, 0 dependencies, recursive
  next hop pp.0.0.2, Ethernet3/1 via pp.0.0.2/32
  valid cached adjacency
  tag rewrite with Et3/1, pp.0.0.2, tags imposed {20}
```

```
Router# show ip cef vrf vpn2 10.1.0.0 detail
```

```

10.1.0.0/32, version 19, cached adjacency pp.0.0.2
0 packets, 0 bytes
tag information set
  local tag: 27
  fast tag rewrite with Et3/1, pp.0.0.2, tags imposed {20}
via pp.0.0.2, 0 dependencies, recursive
next hop pp.0.0.2, Ethernet3/1 via pp.0.0.2/32
valid cached adjacency
tag rewrite with Et3/1, pp.0.0.2, tags imposed {20}

```

Verify that the prefix of the PE router in the local customer carrier MPLS VPN service provider is in the MPLS forwarding table:

```
Router# show mpls forwarding-table vrf vpn2 10.1.0.0
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop |
|-----------|--------------------|---------------------|--------------------|--------------------|----------|
| 27        | 20                 | 10.1.0.0/32[V]      | 958048             | Et3/1              | pp.0.0.2 |

```
Router# show mpls forwarding-table vrf vpn2 10.1.0.0 detail
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop |
|-----------|--------------------|---------------------|--------------------|--------------------|----------|
| 27        | 20                 | 10.1.0.0/32[V]      | 958125             | Et3/1              | pp.0.0.2 |

MAC/Encaps=14/18, MTU=1500, Tag Stack{20}

```

## Verifying Labels in the CSC-CE Routers: Examples

The following examples show how to verify the configurations of the CSC-CE routers.

Verify that the BGP session is up and running:

```
Router# show ip bgp summary
```

```

BGP router identifier cc.cc.cc.cc, local AS number 200
BGP table version is 35, main routing table version 35
14 network entries and 14 paths using 2030 bytes of memory
3 BGP path attribute entries using 168 bytes of memory
1 BGP AS-PATH entries using 24 bytes of memory
0 BGP route-map cache entries using 0 bytes of memory
0 BGP filter-list cache entries using 0 bytes of memory
Dampening enabled. 1 history paths, 0 dampened paths
BGP activity 17/67 prefixes, 29/15 paths, scan interval 60 secs

```

```

Neighbor      V      AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down State/PfxRcd
pp.0.0.1      4      100    7615    7613     35    0    0 21:06:19      5

```

Verify that the loopback address of the local PE router is in the routing table:

```
Router# show ip route 10.1.0.0
```

```

Routing entry for 10.1.0.0/32
  Known via "ospf 200", distance 110, metric 101, type intra area
  Redistributing via bgp 200
  Advertised by bgp 200 metric 4 match internal
  Last update from nn.0.0.1 on Ethernet4/0, 00:34:08 ago
  Routing Descriptor Blocks:
    * nn.0.0.1, from bb.bb.bb.bb, 00:34:08 ago, via Ethernet4/0
      Route metric is 101, traffic share count is 1

```

Verify that the loopback address of the remote PE router is in the routing table:

```
Router# show ip route 10.5.5.5
```

```

Routing entry for 10.5.5.5/32
  Known via "bgp 200", distance 20, metric 0
  Tag 100, type external
  Redistributing via ospf 200
  Advertised by ospf 200 metric 3 subnets
  Last update from pp.0.0.1 00:45:16 ago
  Routing Descriptor Blocks:
    * pp.0.0.1, from pp.0.0.1, 00:45:16 ago
      Route metric is 0, traffic share count is 1
      AS Hops 2, BGP network version 0

```

Verify that the prefix of the local PE router is in the MPLS LDP bindings:

```
Router# show mpls ldp bindings 10.1.0.0 255.255.255.255
```

```
tib entry: 10.1.0.0/32, rev 20
  local binding: tag: 20
  remote binding: tsr: 10.1.0.0:0, tag: imp-null
```

Verify that the prefix of the local PE router is in the Cisco Express Forwarding table:

```
Router# show ip cef 10.1.0.0
```

```
10.1.0.0/32, version 46, cached adjacency nn.0.0.1
0 packets, 0 bytes
  tag information set
    local tag: 20
  via nn.0.0.1, Ethernet4/0, 0 dependencies
    next hop nn.0.0.1, Ethernet4/0
    unresolved
    valid cached adjacency
    tag rewrite with Et4/0, nn.0.0.1, tags imposed {}
```

Verify that the prefix of the local PE router is in the MPLS forwarding table:

```
Router# show mpls forwarding-table 10.1.0.0
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop |
|-----------|--------------------|---------------------|--------------------|--------------------|----------|
| 20        | Pop tag            | bb.bb.bb.bb/32      | 893397             | Et4/0              | nn.0.0.1 |

```
Router# show mpls forwarding-table 10.1.0.0 detail
```

| Local tag                                                             | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop |
|-----------------------------------------------------------------------|--------------------|---------------------|--------------------|--------------------|----------|
| 20                                                                    | Pop tag            | bb.bb.bb.bb/32      | 893524             | Et4/0              | nn.0.0.1 |
| MAC/Encaps=14/14, MTU=1504, Tag Stack{}                               |                    |                     |                    |                    |          |
| 00074F83685400B04A74A0708847                                          |                    |                     |                    |                    |          |
| No output feature configured                                          |                    |                     |                    |                    |          |
| Per-packet load-sharing, slots: 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 |                    |                     |                    |                    |          |

Verify that the BGP routing table contains labels for prefixes in the customer carrier MPLS VPN service provider networks:

```
Router# show ip bgp labels
```

| Network        | Next Hop | In Label/Out Label |
|----------------|----------|--------------------|
| cc.cc.cc.cc/32 | 0.0.0.0  | imp-null/exp-null  |
| bb.bb.bb.bb/32 | nn.0.0.1 | 20/exp-null        |
| hh.hh.hh.hh/32 | pp.0.0.1 | 26/34              |
| gg.gg.gg.gg/32 | pp.0.0.1 | 23/30              |
| nn.0.0.0       | 0.0.0.0  | imp-null/exp-null  |
| ss.0.0.0       | pp.0.0.1 | 25/33              |
| pp.0.0.0       | 0.0.0.0  | imp-null/exp-null  |
| pp.0.0.1/32    | 0.0.0.0  | 16/exp-null        |

Verify that the prefix of the remote PE router is in the Cisco Express Forwarding table:

```
Router# show ip cef 10.5.5.5
```

```
10.5.5.5/32, version 54, cached adjacency pp.0.0.1
0 packets, 0 bytes
  tag information set
    local tag: 26
    fast tag rewrite with Et3/0, pp.0.0.1, tags imposed {34}
  via pp.0.0.1, 0 dependencies, recursive
```

```

next hop pp.0.0.1, Ethernet3/0 via pp.0.0.1/32
valid cached adjacency
tag rewrite with Et3/0, pp.0.0.1, tags imposed {34}

```

Verify that the prefix of the remote PE router is in the MPLS forwarding table:

```
Router# show mpls forwarding-table 10.5.5.5
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop |
|-----------|--------------------|---------------------|--------------------|--------------------|----------|
| 26        | 34                 | hh.hh.hh.hh/32      | 81786              | Et3/0              | pp.0.0.1 |

```
Router# show mpls forwarding-table 10.5.5.5 detail
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop |
|-----------|--------------------|---------------------|--------------------|--------------------|----------|
| 26        | 34                 | hh.hh.hh.hh/32      | 81863              | Et3/0              | pp.0.0.1 |

MAC/Encaps=14/18, MTU=1500, Tag Stack{34}  
00B0C26E105500B04A74A0548847 00022000  
No output feature configured  
Per-packet load-sharing, slots: 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15

## Configuring the Customer Carrier Network: Examples

Customer carrier configuration and verification examples in this section include:

- [Verifying IP Connectivity in the Customer Carrier: Example, page 43](#)
- [Configuring a Customer Carrier Core Router as a Route Reflector: Example, page 44](#)

### Verifying IP Connectivity in the Customer Carrier: Example

Verify the connectivity from one customer carrier core router to another (from CE1 to CE2) by entering the following command:

```
Router# ping 10.2.0.0
```

```

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.2.0.0, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 8/9/12 ms

```

Verify the path that a packet goes through on its way to its final destination from CE1 to CE2:

```
Router# trace 10.2.0.0
```

```

Type escape sequence to abort.
Tracing the route to 10.2.0.0

 0 10.0.0.2 0 msec 0 msec 4 msec
 1 10.0.0.2 [MPLS: Labels 20/21 Exp 0] 8 msec 8 msec 12 msec
 2 10.0.0.2 [MPLS: Labels 28/21 Exp 0] 8 msec 8 msec 12 msec
 3 10.0.0.1 [MPLS: Labels 17/21 Exp 0] 8 msec 8 msec 12 msec
 4 10.0.0.2 [MPLS: Labels 16/21 Exp 0] 8 msec 8 msec 12 msec
 5 10.0.0.1 [AS 200] [MPLS: Label 21 Exp 0] 8 msec 8 msec 8 msec
 6 10.0.0.2 [AS 200] 8 msec 4 msec *

```

Verify the path that a packet goes through on its way to its final destination from CE2 to CE1:

```
Router# trace 10.1.0.0
```

Type escape sequence to abort.  
Tracing the route to 10.1.0.0

```

 1 tt.0.0.1 0 msec 0 msec 0 msec
 2 qq.0.0.2 [MPLS: Labels 18/21 Exp 0] 8 msec 12 msec 12 msec
 3 ss.0.0.1 [MPLS: Labels 28/21 Exp 0] 8 msec 8 msec 8 msec
 4 pp.0.0.2 [MPLS: Labels 17/21 Exp 0] 12 msec 8 msec 8 msec
 5 pp.0.0.1 [MPLS: Labels 16/21 Exp 0] 12 msec 12 msec 8 msec
 6 mm.0.0.2 [AS 200] [MPLS: Label 21 Exp 0] 12 msec 8 msec 12 msec
 7 mm.0.0.1 [AS 200] 4 msec 4 msec *
```

## Configuring a Customer Carrier Core Router as a Route Reflector: Example

The following example shows how to use an address family to configure internal BGP peer 10.1.1.1 as a route-reflector client for both unicast and multicast prefixes:

```

router bgp 200
 address-family vpnv4
  neighbor 10.1.1.1 activate
  neighbor 10.1.1.1 route-reflector-client

router bgp 100
 address-family vpnv4
  neighbor xx.xx.xx.xx activate
  neighbor xx.xx.xx.xx route-reflector-client
  ! xx.xx.xx.xx is a PE router
  neighbor xx.xx.xx.xx send-community extended
 exit address-family
! You need to configure your peer BGP neighbor.
```

## Configuring the Customer Site for Hierarchical VPNs: Examples

This section contains the following configuration and verification examples for the customer site:

- [Configuring PE Routers for Hierarchical VPNs: Examples, page 44](#)
- [Verifying Labels in Each PE Router for Hierarchical VPNs: Examples, page 45](#)
- [Configuring CE Routers for Hierarchical VPNs: Examples, page 47](#)
- [Verifying IP Connectivity in the Customer Site: Examples, page 47](#)

## Configuring PE Routers for Hierarchical VPNs: Examples

This example shows how to configure a PE router:

```

ip cef
!
ip vrf vpn2
 rd 200:1
  route-target export 200:1
  route-target import 200:1
mpls label protocol ldp
!
interface Loopback0
 ip address bb.bb.bb.bb 255.255.255.255
!
interface Ethernet3/0
 ip address nn.0.0.1 255.0.0.0
```

```

no ip directed-broadcast
no ip mroute-cache
mpls label protocol ldp
mpls ip
!
interface Ethernet3/3
 ip vrf forwarding vpn2
 ip address mm.0.0.2 255.0.0.0
 no ip directed-broadcast
 no ip mroute-cache
!
router ospf 200
 log-adjacency-changes
 auto-cost reference-bandwidth 1000
 redistribute connected subnets
 passive-interface Ethernet3/3
 network bb.bb.bb.bb 0.0.0.0 area 200
 network nn.0.0.0 0.255.255.255 area 200
!
router bgp 200
 no bgp default ipv4-unicast
 bgp log-neighbor-changes
 timers bgp 10 30
 neighbor hh.hh.hh.hh remote-as 200
 neighbor hh.hh.hh.hh update-source Loopback0
!
address-family vpnv4                                !VPNv4 session with PE2
 neighbor hh.hh.hh.hh activate
 neighbor hh.hh.hh.hh send-community extended
 bgp dampening 30
 exit-address-family
!
 address-family ipv4 vrf vpn2
 neighbor mm.0.0.1 remote-as 300
 neighbor mm.0.0.1 activate
 neighbor mm.0.0.1 as-override
 neighbor mm.0.0.1 advertisement-interval 5
no auto-summary
no synchronization
bgp dampening 30
exit-address-family

```

## Verifying Labels in Each PE Router for Hierarchical VPNs: Examples

The following examples show how to verify the configuration of PE router in hierarchical VPNs.

Verify that the loopback address of the local CE router is in the routing table of the PE1 router:

```
Router# show ip route vrf vpn2 10.2.2.2
```

```

Routing entry for 10.2.2.2/32
  Known via "bgp 200", distance 20, metric 0
  Tag 300, type external
  Last update from mm.0.0.2 20:36:59 ago
  Routing Descriptor Blocks:
  * mm.0.0.2, from mm.0.0.2, 20:36:59 ago
    Route metric is 0, traffic share count is 1
    AS Hops 1, BGP network version 0

```

Verify that the prefix for the local CE router is in the MPLS forwarding table, and that the prefix is untagged:

```
Router# show mpls forwarding-table vrf vpn2 10.2.2.2
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop |
|-----------|--------------------|---------------------|--------------------|--------------------|----------|
| 23        | Untagged           | aa.aa.aa.aa/32[V]   | 0                  | Et3/3              | nn.0.0.2 |

Verify that the prefix of the remote PE router is in the Cisco Express Forwarding table:

```
Router# show ip cef 10.5.5.5
```

```
10.5.5.5/32, version 31, cached adjacency nn.0.0.2
0 packets, 0 bytes
tag information set
  local tag: 31
  fast tag rewrite with Et3/0, nn.0.0.2, tags imposed {26}
via nn.0.0.2, Ethernet3/0, 2 dependencies
  next hop nn.0.0.2, Ethernet3/0
  unresolved
  valid cached adjacency
  tag rewrite with Et3/0, nn.0.0.2, tags imposed {26}
```

Verify that the loopback address of the remote CE router is in the routing table:

```
Router# show ip route vrf vpn2 10.2.0.0
```

```
Routing entry for 10.2.0.0/32
  Known via "bgp 200", distance 200, metric 0
  Tag 300, type internal
  Last update from hh.hh.hh.hh 20:38:49 ago
  Routing Descriptor Blocks:
    * hh.hh.hh.hh (Default-IP-Routing-Table), from hh.hh.hh.hh, 20:38:49 ago
      Route metric is 0, traffic share count is 1
      AS Hops 1, BGP network version 0
```

Verify that the prefix of the remote CE router is in the MPLS forwarding table, and that an outgoing interface exists:

```
Router# show mpls forwarding-table vrf vpn2 10.2.0.0
```

| Local tag | Outgoing tag or VC | Prefix or Tunnel Id | Bytes tag switched | Outgoing interface | Next Hop |
|-----------|--------------------|---------------------|--------------------|--------------------|----------|
| None      | 26                 | jj.jj.jj.jj/32      | 0                  | Et3/0              | nn.0.0.2 |

Verify that the prefix of the remote CE router is in the Cisco Express Forwarding table:

```
Router# show ip cef vrf vpn2 10.2.0.0
```

```
10.2.0.0/32, version 12, cached adjacency nn.0.0.2
0 packets, 0 bytes
tag information set
  local tag: VPN route head
  fast tag rewrite with Et3/0, nn.0.0.2, tags imposed {26 32}
via hh.hh.hh.hh, 0 dependencies, recursive
  next hop nn.0.0.2, Ethernet3/0 via hh.hh.hh.hh/32
  valid cached adjacency
  tag rewrite with Et3/0, nn.0.0.2, tags imposed {26 32}
```

Verify that the prefix of the local PE router is in the Cisco Express Forwarding table:

```
Router# show ip cef 10.1.0.0
```

```
10.1.0.0/32, version 9, connected, receive
tag information set
  local tag: implicit-null
```

## Configuring CE Routers for Hierarchical VPNs: Examples

The following example shows how to configure a CE router:

```
ip cef distributed
interface Loopback0

## Verifying IP Connectivity in the Customer Site: Examples

The following examples show how to verify IP connectivity at the customer site.

Verify that the loopback address of the remote CE router, learned from the PE router, is in the routing table of the local router:

```
Router# show ip route 10.2.0.0

Routing entry for 10.2.0.0/32
  Known via "bgp 300", distance 20, metric 0
  Tag 200, type external
  Redistributing via ospf 300
  Advertised by ospf 300 subnets
  Last update from mm.0.0.1 20:29:35 ago
  Routing Descriptor Blocks:
  * mm.0.0.1, from mm.0.0.1, 20:29:35 ago
    Route metric is 0, traffic share count is 1
    AS Hops 2
```

# Command Reference

This feature uses no new or modified commands.

# Feature Information for MPLS VPN CSC with BGP

Table 2 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 2 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 2** Feature Information for MPLS VPN CSC with BGP

# Glossary

**ASBR**—Autonomous System Boundary router. A router that connects one autonomous system to another.

**BGP**—Border Gateway Protocol. An interdomain routing protocol designed to provide loop-free routing between separate routing domains that contain independent routing policies (autonomous systems).

**CE router**—customer edge router. A router that is part of a customer network and that interfaces to a provider edge (PE) router. In this document, the CE router sits on the edge of the customer carrier network.

**edge router**—A router that is at the edge of the network. It defines the boundary of the MPLS network. It receives and transmits packets. Also referred to as edge label switch router and label edge router.

**LDP**—Label Distribution Protocol. A standard protocol between MPLS-enabled routers to negotiate the labels (addresses) used to forward packets.

**MPLS**—Multiprotocol Label Switching. Switching method that forwards IP traffic using a label. This label instructs the routers and the switches in the network where to forward the packets based on preestablished IP routing information.

**PE router**—provider edge router. A router, at the edge of a service provider's network, that interfaces to CE routers.

**VPN**—Virtual Private Network. A network that enables IP traffic to use tunneling to travel securely over a public TCP/IP network.

# Load Sharing MPLS VPN Traffic

---

**First Published: May 2, 2005**

**Last Updated: February 18, 2009**

Load sharing distributes traffic so that no individual router is overburdened. In a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) network, you can achieve load sharing through the following methods:

- BGP multipath options
- Directly connected loopback peering

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the [“Feature Information for Load Sharing MPLS VPN Traffic”](#) section on page 50.

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

- [Command Reference, page 49](#)
- [Feature Information for Load Sharing MPLS VPN Traffic, page 50](#)

## Prerequisites for Load Sharing MPLS VPN Traffic

Before configuring load sharing, ensure that your MPLS VPN network (including MPLS VPN carrier supporting carrier or interautonomous system) is configured and working properly. See the “[Related Documents](#)” section on [page 48](#) for references related to MPLS VPNs.

## Restrictions for Load Sharing MPLS VPN Traffic

When you configure static routes in an MPLS or MPLS VPN environment, some variations of the **ip route** and **ip route vrf** commands are not supported. These variations of the commands are not supported in Cisco IOS releases that support the Tag Forwarding Information Base (TFIB), specifically Cisco IOS Releases 12.*n*T, 12.*n*M, and 12.0S. The TFIB cannot resolve prefixes when the recursive route over which the prefixes travel disappears and then reappears. However, the command variations are supported in Cisco IOS releases that support the MPLS Forwarding Infrastructure (MFI), specifically Cisco IOS Release 12.2(25)S and later releases. Use the following guidelines when configuring static routes.

### Supported Static Routes in an MPLS Environment

The following **ip route** command is supported when you configure static routes in an MPLS environment:

**ip route** *destination-prefix mask interface next-hop-address*

The following **ip route** commands are supported when you configure static routes in an MPLS environment and configure load sharing with static nonrecursive routes and a specific outbound interface:

**ip route** *destination-prefix mask interface1 next-hop1*  
**ip route** *destination-prefix mask interface2 next-hop2*

### Unsupported Static Routes in an MPLS Environment That Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS environment:

**ip route** *destination-prefix mask next-hop-address*

The following **ip route** command is not supported when you configure static routes in an MPLS VPN environment and enable load sharing where the next hop can be reached through two paths:

**ip route** *destination-prefix mask next-hop-address*

The following **ip route** command is not supported when you configure static routes in an MPLS VPN environment and enable load sharing where the destination can be reached through two next hops:

**ip route** *destination-prefix mask next-hop1*  
**ip route** *destination-prefix mask next-hop2*

Use the *interface* and *next-hop* arguments when specifying static routes.

### Supported Static Routes in an MPLS VPN Environment

The following **ip route vrf** commands are supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are associated with the same virtual routing and forwarding (VRF) instance:

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*
- **ip route vrf** *vrf-name destination-prefix mask interface1 next-hop1*  
**ip route vrf** *vrf-name destination-prefix mask interface2 next-hop2*

The following **ip route vrf** commands are supported when you configure static routes in an MPLS VPN environment, and the next hop is in the global table in the MPLS cloud in the global routing table. For example, these commands are supported when the next hop is pointing to the internet gateway.

- **ip route vrf** *vrf-name destination-prefix mask next-hop-address global*
- **ip route vrf** *vrf-name destination-prefix mask interface next-hop-address*  
(This command is supported when the next hop and the interface are in the core.)

The following **ip route** commands are supported when you configure static routes in an MPLS VPN environment and enable load sharing with static nonrecursive routes and a specific outbound interfaces:

```
ip route destination-prefix mask interface1 next-hop1
ip route destination-prefix mask interface2 next-hop2
```

### Unsupported Static Routes in an MPLS VPN Environment That Uses the TFIB

The following **ip route** command is not supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the next hop can be reached through two paths:

```
ip route vrf destination-prefix mask next-hop-address global
```

The following **ip route** commands are not supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table in the MPLS cloud within the core, and you enable load sharing where the destination can be reached through two next hops:

```
ip route vrf destination-prefix mask next-hop1 global
ip route vrf destination-prefix mask next-hop2 global
```

The following **ip route vrf** commands are not supported when you configure static routes in an MPLS VPN environment, and the next hop and interface are in the same VRF:

```
ip route vrf vrf-name destination-prefix mask next-hop1
ip route vrf vrf-name destination-prefix mask next-hop2
```

### Supported Static Routes in an MPLS VPN Environment Where the Next Hop Resides in the Global Table on the CE Router

The following **ip route vrf** command is supported when you configure static routes in an MPLS VPN environment, and the next hop is in the global table on the customer edge (CE) side. For example, the following command is supported when the destination-prefix is the CE router's loopback address, as in EBGp multihop cases.

```
ip route vrf vrf-name destination-prefix mask interface next-hop-address
```

The following **ip route** commands are supported when you configure static routes in an MPLS VPN environment, the next hop is in the global table on the CE side, and you enable load sharing with static nonrecursive routes and a specific outbound interfaces:

```
ip route destination-prefix mask interface1 nexthop1
ip route destination-prefix mask interface2 nexthop2
```

# Information About Load Sharing MPLS VPN Traffic

Before configuring load sharing features, you should understand the following concepts:

- [Load Sharing Using BGP Multipath Options, page 4](#)
- [Load Sharing Using Directly Connected Loopback Peering, page 6](#)

## Load Sharing Using BGP Multipath Options

A variety of Border Gateway Protocol (BGP) multipath options exist that enable you to configure load sharing on your MPLS VPN that uses BGP. The following sections describe some BGP multipath options:

- [Internal BGP Multipath Load Sharing, page 4](#)
- [BGP Multipath for eBGP and iBGP, page 4](#)
- [eBGP Multipath Load Sharing, page 6](#)

### Internal BGP Multipath Load Sharing

When a BGP-speaking router with no local policy configured receives multiple network layer reachability information (NLRI) from the internal BGP (iBGP) for the same destination, the router chooses one iBGP path as the best path. The best path is then installed in the IP routing table of the router. The iBGP multipath feature enables the BGP-speaking router to select multiple iBGP paths as the best paths to a destination. The best paths are then installed in the IP routing table of the router. To enable iBGP multipath load sharing, you issue the **maximum-paths ibgp** command in router configuration mode. For more information about iBGP multipath load sharing, see [Configuring BGP](#).

### BGP Multipath for eBGP and iBGP

The BGP multipath load sharing for both eBGP and iBGP in an MPLS VPN feature allows multihomed autonomous systems and provider edge (PE) routers to be configured to distribute traffic across both external BGP (eBGP) and iBGP paths.

BGP installs up to the maximum number of paths allowed (configured using the **maximum-paths** command). BGP uses the best path algorithm to select one multipath as the best path, inserts the best path into the routing information base (RIB), and advertises the best path to BGP peers. Other multipaths can be inserted into the RIB, but only one path is selected as the best path.

Cisco Express Forwarding uses multipaths to perform load balancing on a per-packet or per-source or destination pair basis. To enable the load sharing feature, configure the router with MPLS VPNs that contain VPN routing and forwarding instances (VRFs) that import both eBGP and iBGP paths. You can configure the number of multipaths separately for each VRF.

**Note**

---

This feature operates within the configuration parameters of the existing outbound routing policy.

---

## eBGP and iBGP Multipath Load Sharing in an MPLS Network Using BGP

Figure 1 shows an MPLS service provider network using BGP that connects two remote networks to PE1 and PE2, which are both configured for VPNv4 unicast iBGP peering. Network 2 is a multihomed network that is connected to PE1 and PE2. Network 2 also has extranet VPN services configured with Network 1. Both Network 1 and Network 2 are configured for eBGP peering with the PE routers.

**Figure 1** A Service Provider MPLS Network Using BGP

You can configure PE1 so that both iBGP and eBGP paths can be selected as multipaths and imported into the VRF of Network 1. Cisco Express Forwarding uses the mutlipaths to perform load balancing. Traffic is distributed as follows:

- IP traffic that is sent from Network 2 to PE1 and PE2 is sent across the eBGP paths as IP traffic.
- IP traffic that is sent from PE1 to PE2 is sent across the iBGP path as MPLS traffic.
- MPLS traffic that is sent across an eBGP path is sent as IP traffic.

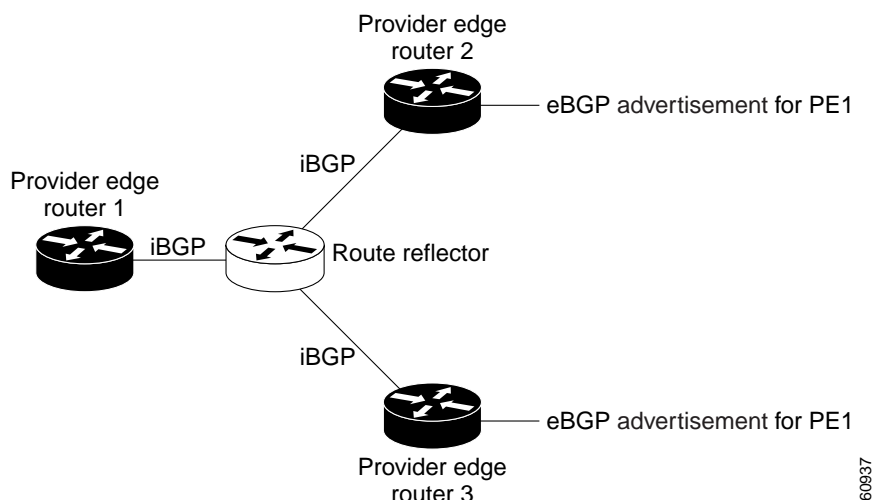

Any prefix that is advertised from Network 2 will be received by PE1 through route distinguisher (RD) 21 and RD22.

- The advertisement through RD21 is carried in IP packets.
- The advertisement through RD22 is carried in MPLS packets.

Both paths can be selected as multipaths for VRF1 and inserted into the VRF1 RIB.

## eBGP and iBGP Multipath Load Sharing with Route Reflectors

Figure 2 shows a topology that contains three PE routers and a route reflector, all configured for iBGP peering. PE2 and PE3 each advertise an equal preference eBGP path to PE1. By default, the route reflector chooses only one path and advertises PE1.

**Figure 2** *Topology with a Route Reflector*

For all equal preference paths to PE1 to be advertised through the route reflector, you must configure each VRF with a different RD. The prefixes received by the route reflector are recognized differently and advertised to PE1.

## eBGP Multipath Load Sharing

When a router learns two identical eBGP paths for a prefix from a neighboring autonomous system, it chooses the path with the lower route ID as the best path. This best path is installed in the IP routing table. You can enable eBGP multipath, which installs multiple paths in the IP routing table when the eBGP paths are learned from a neighboring autonomous system, instead of picking one best path.

During packet switching, depending on the switching mode, either per-packet or per-destination load sharing is performed among the multiple paths. The **maximum-paths** router configuration command controls the number of paths allowed. By default, BGP installs only one path to the IP routing table.

## Load Sharing Using Directly Connected Loopback Peering

You use this feature with MPLS VPN Inter-AS and MPLS VPN carrier supporting carrier (CSC) networks to load share traffic between adjacent label switched routers (LSRs) that are connected by multiple links. The LSRs could be a pair of autonomous system boundary routers (ASBRs) or a CSC-PE and a CSC-CE.

Using directly connected loopback peering allows load sharing at the IGP level, so more than one BGP session is not needed between the LSRs. No other label distribution mechanism is needed between the adjacent LSRs than BGP.

Directly connected loopback peering enables load sharing of traffic as follows:

- A BGP session is established, using the loopback addresses of the LSRs.
- MPLS is enabled on the connecting links.
- Multiple static routes to the loopback address of the adjacent LSR allow IGP load sharing.
- The outgoing label to the loopback address of the adjacent LSR is an implicit null label and is inferred by the LSR.

- Because IGP load sharing is enabled on the loopback address of the adjacent LSR, any traffic destined to a prefix that is learned over the BGP session (and recurses over the loopback) is load shared.

## How to Configure Load Sharing

This section contains the following procedures:

- [Configuring BGP Multipath Load Sharing for eBGP and iBGP, page 7](#) (required)
- [Verifying BGP Multipath Load Sharing for eBGP and iBGP, page 8](#) (optional)
- [Configuring eBGP Multipath Load Sharing with MPLS VPN Inter-AS, page 9](#) (required)
- [Configuring eBGP Multipath Load Sharing with MPLS VPN Carrier Supporting Carrier, page 11](#) (required)
- [Configuring Directly Connected Loopback Peering for MPLS VPN Inter-AS using ASBRs to Exchange VPN-IPv4 Addresses, page 16](#) (required)
- [Configuring Directly Connected Loopback Peering for MPLS VPN Inter-AS Using ASBRs to Exchange IPv4 Routes and Labels, page 23](#) (required)
- [Configuring Directly Connected Loopback Peering on MPLS VPN Carrier Supporting Carrier, page 31](#) (required)

## Configuring BGP Multipath Load Sharing for eBGP and iBGP

This section lists restrictions for load sharing.

### Restrictions

- Configuring BGP multipath for eBGP and iBGP is only for basic MPLS Layer 3 VPNs. MPLS VPN Inter-AS and MPLS VPN carrier supporting carrier do not support this multipath configuration.
- With multiple iBGP paths installed in a routing table, a route reflector advertises only one of the paths (one next hop). If a router is behind a route reflector, all routers that are connected to multihomed sites are not advertised unless separate VRFs with different RDs are configured for each VRF.
- Each IP routing table entry for a BGP prefix that has multiple iBGP paths uses additional memory. We recommend not using this feature on a router with a low amount of available memory and especially when the router is carrying a full Internet routing table.

To configure iBGP and eBGP routes for multipath load sharing, perform the following task.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
5. **maximum-paths eibgp** *number-of-paths*

## DETAILED STEPS

|        | Command or Action                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 3 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router(config)# router bgp 1                                                            | Enters router configuration mode and configures the router to run a BGP routing process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 4 | <b>address-family ipv4 [multicast   unicast   vrf vrf-name]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 vrf vrf1 | Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes.<br><br><b>Note</b> For this task you must create the VRF and specify the <b>vrf</b> keyword. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf vrf-name</b> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |
| Step 5 | <b>maximum-paths eibgp number-of-paths</b><br><br><b>Example:</b><br>Router(config-router-af)# maximum-paths eibgp 6                          | Configures the number of parallel iBGP and eBGP routes that can be installed into a routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Verifying BGP Multipath Load Sharing for eBGP and iBGP

To verify the configuration of iBGP and eBGP routes for multipath load sharing, perform this task.

## SUMMARY STEPS

- enable**
- show ip bgp vpnv4 {all | rd route-distinguisher | vrf vrf-name} [rib-failure] [ip-prefix/length [longer-prefixes]] [network-address [mask] [longer-prefixes]] [cidr-only] [community] [community-list] [dampened-paths] [filter-list] [flap-statistics] [inconsistent-as] [neighbors] [paths [line]] [peer-group] [quote-regexp] [regexp] [summary] [labels]**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                           | Purpose                                                                                                                                                              |

## Configuring eBGP Multipath Load Sharing with MPLS VPN Inter-AS

Perform this task on the ASBRs to configure eBGP Multipath for MPLS VPN interautonomous systems with ASBRs exchanging IPv4 routes and MPLS labels.

## Restrictions

eBGP Multipath is not supported on MPLS VPN Inter-AS with ASBRs that exchange VPNv4 routes.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
5. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
6. **maximum paths** *number-paths*
7. **neighbor** {*ip-address* | *peer-group-name*} **activate**
8. **neighbor** *ip-address* **send-label**
9. **exit-address-family**
10. **end**

## DETAILED STEPS

|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>router bgp <i>as-number</i></b><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                                           | Configures a BGP routing process and places the router in router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                                                       |
| Step 4 | <b>neighbor {<i>ip-address</i>   <i>peer-group-name</i>}</b><br><b>remote-as <i>as-number</i></b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.0.0.1<br>remote-as 200 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                                                                                          |
| Step 5 | <b>address-family ipv4 [<b>multicast</b>   <b>unicast</b>   <b>vrf</b> <i>vrf-name</i>]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4                      | Enters address family configuration mode for configuring routing sessions such as BGP that use standard IPv4 address prefixes. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf <i>vrf-name</i></b> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |
| Step 6 | <b>maximum-paths <i>number-paths</i></b><br><br><b>Example:</b><br>Router(config-router-af)# maximum-paths 2                                                                          | (Optional) Controls the maximum number of parallel routes an IP routing protocol can support. <ul style="list-style-type: none"> <li>The <i>number-paths</i> argument specifies the maximum number of parallel routes an IP routing protocol installs in a routing table.</li> </ul>                                                                                                                                                                                                                         |

|         | Command or Action                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                        |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>activate | Enables the exchange of information with a neighboring router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul> |
| Step 8  | <b>neighbor</b> <i>ip-address</i> <b>send-label</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>send-label                             | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighboring router.</li> </ul>                                                     |
| Step 9  | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                                  | Exits address family configuration mode.                                                                                                                                                                                                                                       |
| Step 10 | <b>end</b><br><br><b>Example:</b><br>Router(config-router-af)# end                                                                                                  | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                      |

## Configuring eBGP Multipath Load Sharing with MPLS VPN Carrier Supporting Carrier

This section contains the following procedures:

- [Configuring eBGP Multipath Load Sharing on the CSC-PE Routers, page 11](#)
- [Configuring eBGP Multipath Load Sharing on the CSC-CE Routers, page 13](#)

### Configuring eBGP Multipath Load Sharing on the CSC-PE Routers

Perform this task to configure eBGP Multipath load sharing on the CSC-PE routers that distribute BGP routes with MPLS labels.

#### SUMMARY STEPS

- enable**
- configure terminal**
- router bgp** *as-number*
- address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]
- maximum paths** *number-paths*
- neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
- neighbor** {*ip-address* | *peer-group-name*} **activate**
- neighbor** *ip-address* **as-override**

9. **neighbor *ip-address* send-label**
10. **exit-address-family**
11. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                 |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 3 | <b>router bgp <i>as-number</i></b><br><br><b>Example:</b><br>Router(config)# router bgp 100                                                                        | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <b><i>as-number</i></b> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                                  |
| Step 4 | <b>address-family ipv4 [<i>multicast</i>   <i>unicast</i>   <i>vrf vrf-name</i>]</b><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 vrf vpn1 | Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b><i>multicast</i></b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b><i>unicast</i></b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b><i>vrf vrf-name</i></b> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |
| Step 5 | <b>maximum-paths <i>number-paths</i></b><br><br><b>Example:</b><br>Router(config-router-af)# maximum-paths 2                                                       | (Optional) Controls the maximum number of parallel routes an IP routing protocol can support. <ul style="list-style-type: none"> <li>On the CSC-PE router, this command is enabled in address family configuration mode.</li> <li>The <b><i>number-paths</i></b> argument specifies the maximum number of parallel routes an IP routing protocol installs in a routing table.</li> </ul>                                                                                         |

|         | Command or Action                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                             |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>remote-as 200 | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul> |
| Step 7  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>activate                        | Enables the exchange of information with a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                  |
| Step 8  | <b>neighbor</b> <i>ip-address</i> <b>as-override</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>as-override                                                  | Configures a PE router to override the autonomous system number (ASN) of a site with the ASN of a provider. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the router that is to be overridden with the ASN provided.</li> </ul>                                                                                                 |
| Step 9  | <b>neighbor</b> <i>ip-address</i> <b>send-label</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.0.0.1<br>send-label                                                    | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighboring router.</li> </ul>                                                                                                                                                          |
| Step 10 | <b>exit-address-family</b><br><br><b>Example:</b><br>Router(config-router-af)# exit-address-family                                                                                         | Exits address family configuration mode.                                                                                                                                                                                                                                                                                                                                            |
| Step 11 | <b>end</b><br><br><b>Example:</b><br>Router(config-router)# end                                                                                                                            | (Optional) Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                           |

## Configuring eBGP Multipath Load Sharing on the CSC-CE Routers

Perform this task to configure eBGP Multipath load sharing on the CSC-CE routers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **maximum paths** *number-paths*
5. **address-family ipv4** [**multicast** | **unicast** | **vrf** *vrf-name*]

6. **redistribute** *protocol*
7. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
8. **neighbor** {*ip-address* | *peer-group-name*} **activate**
9. **neighbor** *ip-address* **send-label**
10. **exit-address-family**
11. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                             | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                   |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 3 | <b>router bgp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 200                                                                        | Configures a BGP routing process and enters router configuration mode. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along. Valid numbers are from 0 to 65535. Private autonomous system numbers that can be used in internal networks range from 64512 to 65535.</li> </ul>                           |
| Step 4 | <b>maximum-paths</b> <i>number-paths</i><br><br><b>Example:</b><br>Router(config-router)# maximum-paths 2                                                          | (Optional) Controls the maximum number of parallel routes an IP routing protocol can support. <ul style="list-style-type: none"> <li>On the CSC-CE routers, this command is issued in router configuration mode.</li> <li>The <i>number-paths</i> argument specifies the maximum number of parallel routes an IP routing protocol installs in a routing table.</li> </ul>                                                                                          |
| Step 5 | <b>address-family ipv4</b> [ <b>multicast</b>   <b>unicast</b>   <b>vrf</b> <i>vrf-name</i> ]<br><br><b>Example:</b><br>Router(config-router)# address-family ipv4 | Specifies the IPv4 address family type and enters address family configuration mode. <ul style="list-style-type: none"> <li>The <b>multicast</b> keyword specifies IPv4 multicast address prefixes.</li> <li>The <b>unicast</b> keyword specifies IPv4 unicast address prefixes.</li> <li>The <b>vrf</b> <i>vrf-name</i> keyword and argument specify the name of the VRF to associate with subsequent IPv4 address family configuration mode commands.</li> </ul> |

|         | Command or Action                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 6  | <p><b>redistribute</b> <i>protocol</i></p> <p><b>Example:</b><br/>Router(config-router-af)# redistribute static</p>                                                                                | <p>Redistributes routes from one routing domain into another routing domain.</p> <ul style="list-style-type: none"> <li>The <i>protocol</i> argument specifies the source protocol from which routes are being redistributed. It can be one of the following keywords: <b>bgp</b>, <b>connected</b>, <b>egp</b>, <b>igrp</b>, <b>isis</b>, <b>mobile</b>, <b>ospf</b>, <b>rip</b>, and <b>static [ip]</b>. <ul style="list-style-type: none"> <li>The <b>static [ip]</b> keyword redistributes IP static routes.</li> </ul> </li> </ul> <p><b>Note</b> The optional <b>ip</b> keyword is used when you redistribute static routes into Intermediate System-to-Intermediate System (IS-IS).</p> <ul style="list-style-type: none"> <li>The <b>connected</b> keyword refers to routes that are established automatically when IP is enabled on an interface.</li> <li>For routing protocols such as Open Shortest Path First (OSPF) and IS-IS, these routes are redistributed as external to the autonomous system.</li> </ul> |
| Step 7  | <p><b>neighbor</b> {<i>ip-address</i>   <i>peer-group-name</i>}<br/><b>remote-as</b> <i>as-number</i></p> <p><b>Example:</b><br/>Router(config-router-af)# neighbor 10.0.0.2<br/>remote-as 100</p> | <p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> <li>The <i>as-number</i> argument specifies the autonomous system to which the neighbor belongs.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 8  | <p><b>neighbor</b> {<i>ip-address</i>   <i>peer-group-name</i>}<br/><b>activate</b></p> <p><b>Example:</b><br/>Router(config-router-af)# neighbor 10.0.0.2<br/>activate</p>                        | <p>Enables the exchange of information with a neighboring BGP router.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument specifies the name of a BGP peer group.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 9  | <p><b>neighbor</b> <i>ip-address</i> <b>send-label</b></p> <p><b>Example:</b><br/>Router(config-router-af)# neighbor 10.0.0.2<br/>send-label</p>                                                   | <p>Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument specifies the IP address of the neighboring router.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 10 | <p><b>exit-address-family</b></p> <p><b>Example:</b><br/>Router(config-router-af)# exit-address-family</p>                                                                                         | <p>Exits address family configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 11 | <p><b>end</b></p> <p><b>Example:</b><br/>Router(config-router)# end</p>                                                                                                                            | <p>(Optional) Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Configuring Directly Connected Loopback Peering for MPLS VPN Inter-AS using ASBRs to Exchange VPN-IPv4 Addresses

This section describes the following tasks you need to do to configure peering of loopback interfaces of directly connected ASBRs:

- [Configuring Loopback Interface Addresses for Directly Connected ASBRs, page 16](#) (required)
- [Configuring /32 Static Routes to the eBGP Neighbor Loopback, page 17](#) (required)
- [Configuring Forwarding on Connecting Loopback Interfaces, page 18](#) (required)
- [Configuring an eBGP Session Between the Loopbacks, page 19](#) (required)
- [Verifying That Load Sharing Occurs Between Loopbacks, page 22](#) (optional)

Figure 3 shows the loopback configuration for directly connected ASBR1 and ASBR2. This configuration is used as the example in the tasks that follow.

**Figure 3** Loopback Interface Configuration for Directly Connected ASBR1 and ASBR2

### Configuring Loopback Interface Addresses for Directly Connected ASBRs

Perform this task to configure loopback interface addresses for directly connected ASBRs.

#### Note

Loopback addresses need to be configured for each directly connected ASBR. That is, configure a loopback address for ASBR1 and for ASBR2 in the example shown in [Figure 3](#).

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface loopback** *interface-number*
4. **ip address** *ip-address mask* [**secondary**]
5. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>interface loopback</b> <i>interface-number</i><br><br><b>Example:</b><br>Router(config)# interface loopback 0                                  | Configures a software-only virtual interface that emulates an interface that is always up and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>interface-number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces that you can create.</li> </ul>                                           |
| Step 4 | <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]<br><br><b>Example:</b><br>Router(config-if)# ip address 10.10.10.10 255.255.255.255 | Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address.</li> <li>The <i>mask</i> argument is the mask for the associated IP subnet.</li> <li>The <b>secondary</b> keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul> |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                                                       | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring /32 Static Routes to the eBGP Neighbor Loopback

Perform this task to configure /32 static routes to the eBGP neighbor loopback.

**Note**

You need to configure /32 static routes on each of the directly connected ASBRs.

## SUMMARY STEPS

- enable**
- configure terminal**
- ip route** *prefix mask* {*ip-address* | *interface-type interface-number* [*ip-address*]} [*distance*] [*name*] [**permanent**] [**tag tag**]
- end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 3 | <b>ip route prefix mask {ip-address   interface-type interface-number [ip-address]} [distance] [name] [permanent] [tag tag]</b><br><br><b>Example:</b><br>Router(config)# ip route 10.20.20.20 255.255.255.255 Ethernet 1/0 172.16.0.1 | Establishes static routes. <ul style="list-style-type: none"> <li>The <i>prefix</i> argument is the IP route prefix for the destination.</li> <li>The <i>mask</i> argument is the prefix mask for the destination.</li> <li>The <i>ip-address</i> argument is the IP address of the next hop that you can use to reach the specified network.</li> <li>The <i>interface-type</i> and <i>interface-number</i> arguments are the network interface type and interface number.</li> <li>The <i>distance</i> argument is an administrative distance.</li> <li>The <i>name</i> argument applies a name to the specified route.</li> <li>The <b>permanent</b> keyword specifies that the route is not to be removed, even if the interface shuts down.</li> <li>The <b>tag tag</b> keyword and argument name a tag value that can be used as a “match” value for controlling redistribution through the use of route maps.</li> </ul> |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                                                               | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Configuring Forwarding on Connecting Loopback Interfaces

Perform this task to configure forwarding on the connecting loopback interfaces.

This task is required for sessions between loopbacks. In the [“Configuring /32 Static Routes to the eBGP Neighbor Loopback”](#) task, Ethernet 1/0 and Ethernet 0/0 are the connecting interfaces.

## SUMMARY STEPS

- enable**
- configure terminal**
- interface type slot/port**

4. **mpls bgp forwarding**
5. **exit**
6. Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).
7. **end**

## DETAILED STEPS

|        | Command or Action                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|--------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                           | Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 3 | <b>interface type slot/port</b><br><br><b>Example:</b><br>Router(config)# interface ethernet 1/0 | Configures an interface type and enters interface configuration mode.<br><ul style="list-style-type: none"> <li>The <i>type</i> argument is the type of interface to be configured.</li> <li>The <i>slot</i> argument is the slot number. Refer to the appropriate hardware manual for slot and port information.</li> <li>The <i>/port</i> argument is the port number. Refer to the appropriate hardware manual for slot and port information.</li> </ul> |
| Step 4 | <b>mpls bgp forwarding</b><br><br><b>Example:</b><br>Router(config-if)# mpls bgp forwarding      | Configures BGP to enable MPLS forwarding on connecting interfaces.                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                    | Exits to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 6 | Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).                            | —                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                         | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring an eBGP Session Between the Loopbacks

Perform this task to configure an eBGP session between the loopbacks.

**Note**

You need to configure an eBGP session between loopbacks on each directly connected ASBR.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **no bgp default route-target filter**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **disable-connected-check**
7. **neighbor** {*ip-address* | *ipv6-address* | *peer-group-name*} **update-source** *interface-type interface-number*
8. **address-family vpnv4** [**unicast**]
9. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address*} **activate**
10. **neighbor** {*ip-address* | *peer-group-name*} **send-community** [**both** | **standard** | **extended**]
11. **end**

**DETAILED STEPS**

|        | Command or Action                                                     | Purpose                                                                                                                                                                                                            |
|--------|-----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                                         | Enables privileged EXEC mode.                                                                                                                                                                                      |
|        | <b>Example:</b><br>Router> enable                                     | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                 |
| Step 2 | <b>configure terminal</b>                                             | Enters global configuration mode.                                                                                                                                                                                  |
|        | <b>Example:</b><br>Router# configure terminal                         |                                                                                                                                                                                                                    |
| Step 3 | <b>router bgp</b> <i>as-number</i>                                    | Configures the BGP routing process.                                                                                                                                                                                |
|        | <b>Example:</b><br>Router(config)# router bgp 200                     | <ul style="list-style-type: none"> <li>The <i>as-number</i> indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.</li> </ul> |
| Step 4 | <b>no bgp default route-target filter</b>                             | Disables BGP route-target filtering, and enters router configuration mode.                                                                                                                                         |
|        | <b>Example:</b><br>Router(config)# no bgp default route-target filter | <ul style="list-style-type: none"> <li>All received BGP VPN-IPv4 routes are accepted by the router.</li> </ul>                                                                                                     |

|        | Command or Action                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5 | <p><b>neighbor</b> {<i>ip-address</i>   <i>peer-group-name</i>}<br/><b>remote-as</b> <i>as-number</i></p> <p><b>Example:</b><br/>Router(config-router)# neighbor 10.20.20.20<br/>remote-as 100</p>                                                               | <p>Adds an entry to the BGP or multiprotocol BGP neighbor table.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <i>as-number</i> argument is the autonomous system to which the neighbor belongs.</li> </ul>                                                                                                                                                                                                                                                                                                                                                               |
| Step 6 | <p><b>neighbor</b> {<i>ip-address</i>   <i>peer-group-name</i>}<br/><b>disable-connected-check</b></p> <p><b>Example:</b><br/>Router(config-router)# neighbor 10.20.20.20<br/>disable-connected-check</p>                                                        | <p>Allows peering between loopbacks.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 7 | <p><b>neighbor</b> {<i>ip-address</i>   <i>ipv6-address</i>   <i>peer-group-name</i>} <b>update-source</b> <i>interface-type</i> <i>interface-number</i></p> <p><b>Example:</b><br/>Router(config-router)# neighbor 10.20.20.20<br/>update-source Loopback 0</p> | <p>Allows BGP sessions to use any operational interface for TCP connections.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IPv4 address of the BGP-speaking neighbor.</li> <li>The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor.</li> </ul> <p>This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p> <ul style="list-style-type: none"> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <i>interface-type</i> argument is the interface type.</li> <li>The <i>interface-number</i> argument is the interface number.</li> </ul> |
| Step 8 | <p><b>address-family</b> <b>vpn</b>v4 [<b>unicast</b>]</p> <p><b>Example:</b><br/>Router(config-router)# address-family vpnv4</p>                                                                                                                                | <p>Enters address family configuration mode for configuring routing protocols such as BGP, Routing Information Protocol (RIP), and static routing.</p> <ul style="list-style-type: none"> <li>The <b>unicast</b> keyword specifies unicast prefixes.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 9 | <p><b>neighbor</b> {<i>ip-address</i>   <i>peer-group-name</i>   <i>ipv6-address</i>} <b>activate</b></p> <p><b>Example:</b><br/>Router(config-router-af)# neighbor 10.20.20.20<br/>activate</p>                                                                 | <p>Enables the exchange of information with a BGP neighbor.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighboring router.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor.</li> </ul> <p><b>Note</b> This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>                                                                                                                                                                                              |

|         | Command or Action                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 10 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>send-community</b> [ <b>both</b>   <b>standard</b>   <b>extended</b> ]<br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.20.20.20<br>send-community extended | Specifies that a communities attribute should be sent to a BGP neighbor. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighboring router.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <b>both</b> keyword specifies that both standard and extended communities will be sent.</li> <li>The <b>standard</b> keyword specifies that only standard communities will be sent.</li> <li>The <b>extended</b> keyword specifies that only extended communities will be sent.</li> </ul> |
| Step 11 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                                                                        | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Verifying That Load Sharing Occurs Between Loopbacks

Perform this task to verify that load sharing occurs between loopbacks. You need to ensure that the MPLS Label Forwarding Information Base (LFIB) entry for the neighbor route lists the available paths and interfaces.

### SUMMARY STEPS

1. **enable**
2. **show mpls forwarding-table** [*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]] [**vrf** *vrf-name*] [**detail**]
3. **disable**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                         | Purpose                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                    | (Optional) Enables privileged EXEC mode.<br><ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                 |
| Step 2 | <b>show mpls forwarding-table</b> [ <i>network {mask   length}</i> ]   <b>labels</b> <i>label [-label]</i>   <b>interface</b> <i>interface</i>   <b>next-hop</b> <i>address</i>   <b>lsp-tunnel</b> [ <i>tunnel-id</i> ] [ <b>vrf</b> <i>vrf-name</i> ] [ <b>detail</b> ] | Displays the contents of the MPLS LFIB.<br><ul style="list-style-type: none"> <li>Enter an optional keyword or argument if desired.</li> </ul> |
| Step 3 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                                                                                                                                                                  | Exits to user EXEC mode.                                                                                                                       |

## Configuring Directly Connected Loopback Peering for MPLS VPN Inter-AS Using ASBRs to Exchange IPv4 Routes and Labels

The following sections describe how to configure peering of loopback interfaces of directly connected ASBRs to achieve load sharing in an interautonomous system network:

- [Configuring Loopback Interface Addresses for Directly Connected ASBRs, page 24](#) (required)
- [Configuring /32 Static Routes to the eBGP Neighbor Loopback, page 25](#) (required)
- [Configuring Forwarding on Connecting Loopback Interfaces, page 26](#) (required)
- [Configuring an eBGP Session Between the Loopbacks, page 27](#) (required)
- [Verifying That Load Sharing Occurs Between Loopbacks, page 30](#) (optional)

Figure 4 shows the loopback configuration for directly connected ASBR1 and ASBR2. This configuration is used as the example in the tasks that follow.

**Figure 4** Loopback Interface Configuration for Directly Connected ASBR1 and ASBR2

## Configuring Loopback Interface Addresses for Directly Connected ASBRs

Perform this task to configure loopback interface addresses.

### Note

Loopback addresses need to be configured for each directly connected ASBR. That is, configure a loopback address for ASBR1 and for ASBR2 in the example shown in [Figure 4](#).

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface loopback** *interface-number*
4. **ip address** *ip-address mask* [secondary]
5. **end**

### DETAILED STEPS

|        | Command or Action                                       | Purpose                                                                                                                                                                                                                                          |
|--------|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                 |
|        | <b>Example:</b><br>Router> enable                       |                                                                                                                                                                                                                                                  |
| Step 2 | <b>configure terminal</b>                               | Enters global configuration mode.                                                                                                                                                                                                                |
|        | <b>Example:</b><br>Router# configure terminal           |                                                                                                                                                                                                                                                  |
| Step 3 | <b>interface loopback</b> <i>interface-number</i>       | Configures a software-only virtual interface that emulates an interface that is always up and enters interface configuration mode.                                                                                                               |
|        | <b>Example:</b><br>Router(config)# interface loopback 0 | <ul style="list-style-type: none"> <li>The <i>interface-number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces that you can create.</li> </ul> |

|        | Command or Action                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 4 | <code>ip address ip-address mask [secondary]</code><br><br><b>Example:</b><br><pre>Router(config-if)# ip address 10.10.10.10 255.255.255.255</pre> | Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address.</li> <li>The <i>mask</i> argument is the mask for the associated IP subnet.</li> <li>The <b>secondary</b> keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul> |
| Step 5 | <code>end</code><br><br><b>Example:</b><br><pre>Router(config-if)# end</pre>                                                                       | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring /32 Static Routes to the eBGP Neighbor Loopback

Perform this task to configure /32 static routes to the eBGP neighbor loopback.

### Note

You need to configure /32 static routes on each of the directly connected ASBRs.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip route** *prefix mask {ip-address | interface-type interface-number [ip-address]}* [*distance*] [*name*] [**permanent**] [**tag tag**]
4. **end**

## DETAILED STEPS

|        | Command or Action                                                                               | Purpose                                                                                                          |
|--------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br><pre>Router&gt; enable</pre>                      | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br><pre>Router# configure terminal</pre> | Enters global configuration mode.                                                                                |

|        | Command or Action                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <pre>ip route prefix mask {ip-address   interface-type interface-number [ip-address]} [distance] [name] [permanent] [tag tag]</pre> <p><b>Example:</b></p> <pre>Router(config)# ip route 10.20.20.20 255.255.255.255 Ethernet 1/0 172.16.0.1</pre> | <p>Establishes static routes.</p> <ul style="list-style-type: none"> <li>The <i>prefix</i> argument is the IP route prefix for the destination.</li> <li>The <i>mask</i> argument is the prefix mask for the destination.</li> <li>The <i>ip-address</i> argument is the IP address of the next hop that you can use to reach the specified network.</li> <li>The <i>interface-type</i> and <i>interface-number</i> arguments are the network interface type and interface number.</li> <li>The <i>distance</i> argument is an administrative distance.</li> <li>The <i>name</i> argument applies a name to the specified route.</li> <li>The <b>permanent</b> keyword specifies that the route is not to be removed, even if the interface shuts down.</li> <li>The <b>tag tag</b> keyword and argument name a tag value that can be used as a “match” value for controlling redistribution through the use of route maps.</li> </ul> |
| Step 4 | <pre>end</pre> <p><b>Example:</b></p> <pre>Router(config)# end</pre>                                                                                                                                                                               | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring Forwarding on Connecting Loopback Interfaces

Perform this task to configure forwarding on the connecting loopback interfaces.

This task is required for sessions between loopbacks. In the [“Configuring /32 Static Routes to the eBGP Neighbor Loopback”](#) task, Ethernet1/0 and Ethernet0/0 are the connecting interfaces.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *type slot/port*
4. **mpls bgp forwarding**
5. **exit**
6. Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0)
7. **end**

## DETAILED STEPS

|--------|---------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                  | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 3 | <b>interface</b> <i>type slot/port</i><br><br><b>Example:</b><br>Router(config)# interface ethernet 1/0 | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>type</i> argument is the type of interface to be configured.</li> <li>The <i>slot</i> argument is the slot number. Refer to the appropriate hardware manual for slot and port information.</li> <li>The <i>/port</i> argument is the port number. Refer to the appropriate hardware manual for slot and port information.</li> </ul> |
| Step 4 | <b>mpls bgp forwarding</b><br><br><b>Example:</b><br>Router(config-if)# mpls bgp forwarding             | Configures BGP to enable MPLS forwarding on connecting interfaces.                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 5 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                           | Exits to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 6 | Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).                                   | —                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Step 7 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Configuring an eBGP Session Between the Loopbacks

Perform the following tasks to configure an eBGP session between the loopbacks.

**Note**

You need to configure an eBGP session between loopbacks on each directly connected ASBR.

## SUMMARY STEPS

1. enable

2. **configure terminal**
3. **router bgp** *as-number*
4. **bgp log-neighbor-changes**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **disable-connected-check**
7. **neighbor** {*ip-address* | *ipv6-address* | *peer-group-name*} **update-source** *interface-type interface-number*
8. **address-family ipv4** [**unicast**] **vrf** *vrf-name*
9. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address*} **activate**
10. **neighbor** {*ip-address* | *peer-group-name*} **send-community** [**both** | **standard** | **extended**]
11. **end**

## DETAILED STEPS

| Step 6 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>disable-connected-check</b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.20.20.20<br>disable-connected-check                                                         | Allows peering between loopbacks. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 7 | <b>neighbor</b> { <i>ip-address</i>   <i>ipv6-address</i>   <i>peer-group-name</i> } <b>update-source</b> <i>interface-type</i> <i>interface-number</i><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.20.20.20<br>update-source Loopback 0 | Allows BGP sessions to use any operational interface for TCP connections. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IPv4 address of the BGP-speaking neighbor.</li> <li>The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor.</li> </ul> <p><b>Note</b> This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p> <ul style="list-style-type: none"> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <i>interface-type</i> argument is the interface type.</li> <li>The <i>interface-number</i> argument is the interface number.</li> </ul> |
| Step 8 | <b>address-family</b> <b>ipv4</b> [ <b>unicast</b> ] <b>vrf</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config-router)# address-family ipv4                                                                                                      | Enters address family configuration mode for configuring routing protocols such as BGP, Routing Information Protocol (RIP), and static routing. <ul style="list-style-type: none"> <li>The <b>unicast</b> keyword specifies unicast prefixes.</li> <li>The <b>vrf</b> <i>vrf-name</i> keyword and argument specify the name of a VPN routing/forwarding instance (VRF) to associate with submodule commands.</li> </ul>                                                                                                                                                                                                                                                                                                                  |
| Step 9 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i>   <i>ipv6-address</i> } <b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.20.20.20<br>activate                                                                 | Enables the exchange of information with a BGP neighbor. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighboring router.</li> <li>The <i>peer-group-name</i> argument is the name of the BGP peer group.</li> <li>The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor.</li> </ul> <p><b>Note</b> This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>                                                                                                                                                                                                        |

|         | Command or Action                                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 10 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>send-community</b> [ <b>both</b>   <b>standard</b>   <b>extended</b> ]<br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.20.20.20<br>send-community extended | Specifies that a communities attribute should be sent to a BGP neighbor. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighboring router.</li> <li>The <i>peer-group-name</i> argument is the name of the BGP peer group.</li> <li>The <b>both</b> keyword specifies that both standard and extended communities will be sent.</li> <li>The <b>standard</b> keyword specifies that only standard communities will be sent.</li> <li>The <b>extended</b> keyword specifies that only extended communities will be sent.</li> </ul> |
| Step 11 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                                                                        | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Verifying That Load Sharing Occurs Between Loopbacks

To verify that load sharing can occur between loopbacks, ensure that the MPLS LFIB entry for the neighbor route lists the available paths and interfaces.

### SUMMARY STEPS

1. **enable**
2. **show mpls forwarding-table** [*network* {*mask* | *length*} | **labels** *label* [-*label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]] [**vrf** *vrf-name*] [**detail**]
3. **disable**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                         | Purpose                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                    | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                   |
| Step 2 | <b>show mpls forwarding-table</b> [ <i>network {mask   length}</i> ]   <b>labels</b> <i>label [-label]</i>   <b>interface</b> <i>interface</i>   <b>next-hop</b> <i>address</i>   <b>lsp-tunnel</b> [ <i>tunnel-id</i> ] [ <b>vrf</b> <i>vrf-name</i> ] [ <b>detail</b> ] | Displays the contents of the MPLS LFIB. <ul style="list-style-type: none"> <li>Enter a keyword or argument, if desired.</li> </ul> |
| Step 3 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                                                                                                                                                                  | Exits to user EXEC mode.                                                                                                           |

## Configuring Directly Connected Loopback Peering on MPLS VPN Carrier Supporting Carrier

The following sections explain how to load balance CSC traffic by peering loopback interfaces of directly connected CSC-PE and CSC-CE routers:

- [Configuring Loopback Interface Addresses on CSC-PE Routers, page 32](#) (required)
- [Configuring Loopback Interface Addresses for CSC-CE Routers, page 33](#) (required)
- [Configuring /32 Static Routes to the eBGP Neighbor Loopback on the CSC-PE Router, page 34](#) (required)
- [Configuring /32 Static Routes to the eBGP Neighbor Loopback on the CSC-CE Router, page 36](#) (required)
- [Configuring Forwarding on CSC-PE Interfaces That Connect to the CSC-CE Loopback, page 37](#) (required)
- [Configuring Forwarding on CSC-CE Interfaces That Connect to the CSC-PE Loopback, page 39](#) (required)
- [Configuring an eBGP Session Between the CSC-PE Router and the CSC-CE Loopback, page 40](#) (required)
- [Configuring an eBGP Session Between the CSC-CE Router and the CSC-PE Loopback, page 43](#) (required)
- [Verifying That Load Sharing Occurs Between Loopbacks, page 45](#) (optional)

Figure 5 shows the loopback configuration for directly connected CSC-PE and CSC-CE routers. This configuration is used as the example in the tasks that follow.

Figure 5 Loopback Interface Configuration for Directly Connected CSC-PE and CSC-CE Routers

Restrictions

Load sharing using directly connected loopback peering does not apply to CSC networks that use LDP and an IGP to distribute routes and MPLS labels.

Configuring Loopback Interface Addresses on CSC-PE Routers

Perform this task to configure loopback interface addresses on the CSC-PE router.

Note

Configuration of a loopback interface address on the CSC-PE router requires the enabling of a VRF. The CSC-CE router loopback interface does not require the enabling a of VRF.

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. interface loopback *interface-number*
- 4. ip vrf forwarding *vrf-name*
- 5. ip address *ip-address mask* [secondary]
- 6. end

DETAILED STEPS

|        | Command or Action                                                                    | Purpose                                                                                                          |
|--------|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br>Router> enable                         | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br>Router# configure terminal | Enters global configuration mode.                                                                                |

|        | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>interface loopback</b> <i>interface-number</i><br><br><b>Example:</b><br>Router(config)# interface loopback 0                                  | Configures a software-only virtual interface that emulates an interface that is always up, and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>interface-number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces that you can create.</li> </ul>                                          |
| Step 4 | <b>ip vrf forwarding</b> <i>vrf-name</i><br><br><b>Example:</b><br>Router(config-if)# ip vrf forwarding vpn1                                      | Associates a VRF with the specified interface or subinterface. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                                                                                                                                                  |
| Step 5 | <b>ip address</b> <i>ip-address mask</i> [ <b>secondary</b> ]<br><br><b>Example:</b><br>Router(config-if)# ip address 10.20.20.20 255.255.255.255 | Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address.</li> <li>The <i>mask</i> argument is the mask for the associated IP subnet.</li> <li>The <b>secondary</b> keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul> |
| Step 6 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                          | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring Loopback Interface Addresses for CSC-CE Routers

Perform this task to configure loopback interface addresses for CSC-CE routers.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface loopback** *interface-number*
4. **ip address** *ip-address mask* [**secondary**]
5. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                              |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 3 | <b>interface loopback interface-number</b><br><br><b>Example:</b><br>Router(config)# interface loopback 0                         | Configures a software-only virtual interface that emulates an interface that is always up. <ul style="list-style-type: none"> <li>The <i>interface-number</i> argument is the number of the loopback interface that you want to create or configure. There is no limit on the number of loopback interfaces that you can create.</li> </ul>                                                                                   |
| Step 4 | <b>ip address ip-address mask [secondary]</b><br><br><b>Example:</b><br>Router(config-if)# ip address 10.10.10.10 255.255.255.255 | Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address.</li> <li>The <i>mask</i> argument is the mask for the associated IP subnet.</li> <li>The <b>secondary</b> keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul> |
| Step 5 | <b>end</b><br><br><b>Example:</b><br>Router(config-if)# end                                                                       | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                |

## Configuring /32 Static Routes to the eBGP Neighbor Loopback on the CSC-PE Router

Perform the following task to configure /32 static routes to the eBGP neighbor loopback on the CSC-PE router.

## SUMMARY STEPS

- enable**
- configure terminal**
- ip route vrf vrf-name prefix mask {ip-address | interface-type interface-number [ip-address]} [global] [distance] [name] [permanent] [tag tag]**
- end**

## DETAILED STEPS

| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                                                                                                                | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 3 | <b>ip route vrf vrf-name prefix mask {ip-address   interface-type interface-number [ip-address]} [global] [distance] [name] [permanent] [tag tag]</b><br><br><b>Example:</b><br>Router(config)# ip route vrf vpn1 10.10.10.10 255.255.255.255 Ethernet 1/0 172.16.0.2 | Establishes static routes for a VRF. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name of the VRF for the static route.</li> <li>The <i>prefix</i> argument is the IP route prefix for the destination.</li> <li>The <i>mask</i> argument is the prefix mask for the destination.</li> <li>The <i>ip-address</i> argument is the IP address of the next hop that you can use to reach the destination network.</li> <li>The <i>interface-type</i> and <i>interface-number</i> arguments are the network interface type and interface number.</li> <li>The <b>global</b> keyword specifies that the given next hop address is in the nonVRF routing table.</li> <li>The <i>distance</i> argument is an administrative distance.</li> <li>The <i>name</i> argument applies a name to the specified route.</li> <li>The <b>permanent</b> keyword specifies that the route is not to be removed, even if the interface shuts down.</li> <li>The <b>tag tag</b> keyword and argument name a tag value that can be used as a “match” value for controlling redistribution via route maps.</li> </ul> |
| Step 4 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                                                                                                              | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Configuring /32 Static Routes to the eBGP Neighbor Loopback on the CSC-CE Router

Perform the following task to configure /32 static routes to the eBGP neighbor loopback for the CSC-CE router.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip route** *prefix mask {ip-address | interface-type interface-number [ip-address]}* [*distance*] [*name*] [**permanent**] [**tag tag**]
4. **end**

### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                                                          |
|--------|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode. <ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
|        | <b>Example:</b><br>Router> enable             |                                                                                                                  |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                                                |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                                                  |

|        | Command or Action                                                                                                                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <pre>ip route prefix mask {ip-address   interface-type interface-number [ip-address]} [distance] [name] [permanent] [tag tag]</pre> <p><b>Example:</b></p> <pre>Router(config)# ip route 10.20.20.20 255.255.255.255 Ethernet 1/0 172.16.0.1</pre> | <p>Establishes static routes.</p> <ul style="list-style-type: none"> <li>The <i>prefix</i> argument is the IP route prefix for the destination.</li> <li>The <i>mask</i> argument is the prefix mask for the destination.</li> <li>The <i>ip-address</i> argument is the IP address of the next hop that you can use to reach the destination network.</li> <li>The <i>interface-type</i> and <i>interface-number</i> arguments are the network interface type and interface number.</li> <li>The <i>distance</i> argument is an administrative distance.</li> <li>The <i>name</i> argument applies a name to the specified route.</li> <li>The <b>permanent</b> keyword specifies that the route is not to be removed, even if the interface shuts down.</li> <li>The <b>tag tag</b> keyword and argument name a tag value that can be used as a “match” value for controlling redistribution via route maps.</li> </ul> |
| Step 4 | <pre>end</pre> <p><b>Example:</b></p> <pre>Router(config)# end</pre>                                                                                                                                                                               | <p>Exits to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Configuring Forwarding on CSC-PE Interfaces That Connect to the CSC-CE Loopback

Perform this task to configure forwarding on CSC-PE interfaces that connect to the CSC-CE loopback.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type slot/port**
4. **ip vrf forwarding vrf-name**
5. **ip address ip-address mask [secondary]**
6. **mpls bgp forwarding**
7. **exit**
8. Repeat Steps 3 through 6 for another connecting interface (Ethernet 0/0).
9. **end**

## DETAILED STEPS—CSC-PE

|        | Command or Action                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 3 | <b>interface type slot/port</b><br><br><b>Example:</b><br>Router(config)# interface ethernet 1/0                                 | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> <li>The <i>type</i> argument is the type of interface to be configured.</li> <li>The <i>slot</i> argument is the slot number. Refer to the appropriate hardware manual for slot and port information.</li> <li>The <i>port</i> argument is the port number. Refer to the appropriate hardware manual for slot and port information.</li> </ul> |
| Step 4 | <b>ip vrf forwarding vrf-name</b><br><br><b>Example:</b><br>Router(config-if)# ip vrf forwarding vpn1                            | Associates a VRF with an interface or subinterface. <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                                                                                                                                                                                       |
| Step 5 | <b>ip address ip-address mask [secondary]</b><br><br><b>Example:</b><br>Router(config-if)# ip address 172.16.0.1 255.255.255.255 | Sets a primary or secondary IP address for an interface. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address.</li> <li>The <i>mask</i> argument is the mask for the associated IP subnet.</li> <li>The <b>secondary</b> keyword specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</li> </ul>                           |
| Step 6 | <b>mpls bgp forwarding</b><br><br><b>Example:</b><br>Router(config-if)# mpls bgp forwarding                                      | Configures BGP to enable MPLS forwarding on connecting interfaces.                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 7 | <b>exit</b><br><br><b>Example:</b><br>Router(config-if)# exit                                                                    | Exits to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                     |

|        | Command or Action                                                           | Purpose                        |
|--------|-----------------------------------------------------------------------------|--------------------------------|
| Step 8 | Repeat Steps 3 through 6 for another connecting interface (Ethernet 0/0).   | —                              |
| Step 9 | <code>end</code><br><br><b>Example:</b><br><code>Router(config)# end</code> | Exits to privileged EXEC mode. |

## Configuring Forwarding on CSC-CE Interfaces That Connect to the CSC-PE Loopback

Perform this task to configure forwarding on CSC-CE interfaces that connect to the CSC-PE loopback.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type slot/port`
4. `mpls bgp forwarding`
5. `exit`
6. Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).
7. `end`

### DETAILED STEPS

|        | Command or Action                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <code>enable</code><br><br><b>Example:</b><br><code>Router&gt; enable</code>                                        | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                                                                                                                             |
| Step 2 | <code>configure terminal</code><br><br><b>Example:</b><br><code>Router# configure terminal</code>                   | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 3 | <code>interface type slot/port</code><br><br><b>Example:</b><br><code>Router(config)# interface ethernet 1/0</code> | Configures an interface type and enters interface configuration mode. <ul style="list-style-type: none"> <li>• The <i>type</i> argument is the type of interface to be configured.</li> <li>• The <i>slot</i> argument is the slot number. Refer to the appropriate hardware manual for slot and port information.</li> <li>• The <i>/port</i> argument is the port number. Refer to the appropriate hardware manual for slot and port information.</li> </ul> |

|        | Command or Action                                                                                              | Purpose                                                            |
|--------|----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|
| Step 4 | <code>mpls bgp forwarding</code><br><br><b>Example:</b><br><code>Router(config-if)# mpls bgp forwarding</code> | Configures BGP to enable MPLS forwarding on connecting interfaces. |
| Step 5 | <code>exit</code><br><br><b>Example:</b><br><code>Router(config-if)# exit</code>                               | Exits to global configuration mode.                                |
| Step 6 | Repeat Steps 3 and 4 for another connecting interface (Ethernet 0/0).                                          | —                                                                  |
| Step 7 | <code>end</code><br><br><b>Example:</b><br><code>Router(config)# end</code>                                    | Exits to privileged EXEC mode.                                     |

## Configuring an eBGP Session Between the CSC-PE Router and the CSC-CE Loopback

Perform this task to configure an eBGP session between the CSC-PE router and the CSC-CE loopback.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-number`
4. `bgp log-neighbor-changes`
5. `neighbor {ip-address | peer-group-name} remote-as as-number`
6. `neighbor {ip-address | peer-group-name} disable-connected-check`
7. `neighbor {ip-address | ipv6-address | peer-group-name} update-source interface-type interface-number`
8. `address-family ipv4 [unicast] vrf vrf-name`
9. `ip vrf forwarding vrf-name`
10. `neighbor {ip-address | peer-group-name | ipv6-address} activate`
11. `neighbor ip-address send-label`
12. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                        |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                            | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul>                                                                                                                                                                                                                                               |
| Step 2 | <b>configure terminal</b><br><br><b>Example:</b><br>Router# configure terminal                                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                              |
| Step 3 | <b>router bgp as-number</b><br><br><b>Example:</b><br>Router(config)# router bgp 200                                                                                              | Configures the BGP routing process. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.</li> </ul>                                                                                                |
| Step 4 | <b>bgp log-neighbor-changes</b><br><br><b>Example:</b><br>Router(config-router)# bgp log-neighbor-changes                                                                         | Enables logging of BGP neighbor resets.                                                                                                                                                                                                                                                                                                                        |
| Step 5 | <b>neighbor {ip-address   peer-group-name}</b><br><b>remote-as as-number</b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.10.10.10<br>remote-as 100               | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <i>as-number</i> argument is the autonomous system to which the neighbor belongs.</li> </ul> |
| Step 6 | <b>neighbor {ip-address   peer-group-name}</b><br><b>disable-connected-check</b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.10.10.10<br>disable-connected-check | Allows peering between loopbacks. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> </ul>                                                                                                                            |

|         | Command or Action                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <p><b>neighbor</b> {<i>ip-address</i>   <i>ipv6-address</i>   <i>peer-group-name</i>} <b>update-source</b> <i>interface-type</i> <i>interface-number</i></p> <p><b>Example:</b><br/>Router(config-router)# neighbor 10.10.10.10<br/>update-source Loopback 0</p> | <p>Allows BGP sessions to use any operational interface for TCP connections.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IPv4 address of the BGP-speaking neighbor.</li> <li>The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor.</li> </ul> <p>This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p> <ul style="list-style-type: none"> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <i>interface-type</i> argument is the interface type.</li> <li>The <i>interface-number</i> argument is the interface number.</li> </ul> |
| Step 8  | <p><b>address-family</b> <b>ipv4</b> [<b>unicast</b>] <b>vrf</b> <i>vrf-name</i></p> <p><b>Example:</b><br/>Router(config-router)# address-family ipv4 vrf<br/>vpn1</p>                                                                                          | <p>Enters address family configuration mode for configuring routing protocols such as BGP, Routing Information Protocol (RIP), and static routing.</p> <ul style="list-style-type: none"> <li>The <b>ipv4</b> keyword configures sessions that carry standard IPv4 address prefixes.</li> <li>The <b>unicast</b> keyword specifies unicast prefixes.</li> <li>The <b>vrf</b> <i>vrf-name</i> keyword and argument specify the name of a VRF to associate with submode commands.</li> </ul>                                                                                                                                                                                                                                          |
| Step 9  | <p><b>ip vrf forwarding</b> <i>vrf-name</i></p> <p><b>Example:</b><br/>Router(config-router-af)# ip vrf forwarding<br/>vpn1</p>                                                                                                                                  | <p>Associates a VRF with an interface or subinterface.</p> <ul style="list-style-type: none"> <li>The <i>vrf-name</i> argument is the name assigned to a VRF.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Step 10 | <p><b>neighbor</b> {<i>ip-address</i>   <i>peer-group-name</i>   <i>ipv6-address</i>} <b>activate</b></p> <p><b>Example:</b><br/>Router(config-router-af)# neighbor 10.10.10.10<br/>activate</p>                                                                 | <p>Enables the exchange of information with a BGP neighbor.</p> <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighboring router.</li> <li>The <i>peer-group-name</i> argument is the name of the BGP peer group.</li> <li>The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor.</li> </ul> <p><b>Note</b> This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</p>                                                                                                                                                                                            |

|         | Command or Action                                                            | Purpose                                                                                                                       |
|---------|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Step 11 | <b>neighbor</b> <i>ip-address</i> <b>send-label</b>                          | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router.                                         |
|         | <b>Example:</b><br>Router(config-router-af)# neighbor 10.10.10.10 send-label | <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighboring router.</li> </ul> |
| Step 12 | <b>end</b>                                                                   | Exits to privileged EXEC mode.                                                                                                |
|         | <b>Example:</b><br>Router(config)# end                                       |                                                                                                                               |

## Configuring an eBGP Session Between the CSC-CE Router and the CSC-PE Loopback

Perform this task to configure an eBGP session between the CSC-CE router and the CSC-PE loopback.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **router bgp** *as-number*
4. **bgp log-neighbor-changes**
5. **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*
6. **neighbor** {*ip-address* | *peer-group-name*} **disable-connected-check**
7. **neighbor** {*ip-address* | *ipv6-address* | *peer-group-name*} **update-source** *interface-type interface-number*
8. **address-family ipv4** [**unicast**] [**vrf** *vrf-name*]
9. **neighbor** {*ip-address* | *peer-group-name* | *ipv6-address*} **activate**
10. **neighbor** *ip-address* **send-label**
11. **end**

### DETAILED STEPS

|        | Command or Action                             | Purpose                                                                            |
|--------|-----------------------------------------------|------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b>                                 | Enables privileged EXEC mode.                                                      |
|        | <b>Example:</b><br>Router> enable             | <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>configure terminal</b>                     | Enters global configuration mode.                                                  |
|        | <b>Example:</b><br>Router# configure terminal |                                                                                    |

|        | Command or Action                                                                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>router</b> <b>bgp</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config)# router bgp 200                                                                                                                                                        | Configures the BGP routing process. <ul style="list-style-type: none"> <li>The <i>as-number</i> argument indicates the number of an autonomous system that identifies the router to other BGP routers and tags the routing information passed along.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 4 | <b>bgp</b> <b>log-neighbor-changes</b><br><br><b>Example:</b><br>Router(config-router)# bgp log-neighbor-changes                                                                                                                                          | Enables logging of BGP neighbor resets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Step 5 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>remote-as</b> <i>as-number</i><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.20.20.20<br>remote-as 100                                                                | Adds an entry to the BGP or multiprotocol BGP neighbor table. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <i>as-number</i> argument is the autonomous system to which the neighbor belongs.</li> </ul>                                                                                                                                                                                                                                                                                                                        |
| Step 6 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> }<br><b>disable-connected-check</b><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.20.20.20<br>disable-connected-check                                                         | Allows peering between loopbacks. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighbor.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Step 7 | <b>neighbor</b> { <i>ip-address</i>   <i>ipv6-address</i>   <i>peer-group-name</i> } <b>update-source</b> <i>interface-type</i> <i>interface-number</i><br><br><b>Example:</b><br>Router(config-router)# neighbor 10.20.20.20<br>update-source Loopback 0 | Allows BGP sessions to use any operational interface for TCP connections. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IPv4 address of the BGP-speaking neighbor.</li> <li>The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor.<br/><br/>This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons.</li> <li>The <i>peer-group-name</i> argument is the name of a BGP peer group.</li> <li>The <i>interface-type</i> argument is the interface type.</li> <li>The <i>interface-number</i> argument is the interface number.</li> </ul> |

| Step 9  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> / <i>ipv6-address</i> } <b>activate</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.20.20.20 activate | Enables the exchange of information with a BGP neighbor. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighboring router.</li> <li>The <i>peer-group-name</i> argument is the name of the BGP peer group.</li> <li>The <i>ipv6-address</i> argument is the IPv6 address of the BGP-speaking neighbor.</li> </ul> <b>Note</b> This argument must be in the form documented in RFC 2373, where the address is specified in hexadecimal using 16-bit values between colons. |
| Step 10 | <b>neighbor ip-address send-label</b><br><br><b>Example:</b><br>Router(config-router-af)# neighbor 10.20.20.20 send-label                                                              | Enables a BGP router to send MPLS labels with BGP routes to a neighboring BGP router. <ul style="list-style-type: none"> <li>The <i>ip-address</i> argument is the IP address of the neighboring router.</li> </ul>                                                                                                                                                                                                                                                                                                        |
| Step 11 | <b>end</b><br><br><b>Example:</b><br>Router(config)# end                                                                                                                               | Exits to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Verifying That Load Sharing Occurs Between Loopbacks

To verify that load sharing occurs between loopbacks, ensure that the MPLS LFIB entry for the neighbor route lists the available paths and interfaces.

### SUMMARY STEPS

1. **enable**
2. **show mpls forwarding-table** [**vrf vrf-name**] [{*network* {*mask* | *length*} | **labels** *label* [- *label*] | **interface** *interface* | **next-hop** *address* | **lsp-tunnel** [*tunnel-id*]}] [**detail**]
3. **disable**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                | Purpose                                                                                                          |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><br><b>Example:</b><br>Router> enable                                                                                                                           | Enables privileged EXEC mode. <ul style="list-style-type: none"> <li>Enter your password if prompted.</li> </ul> |
| Step 2 | <b>show mpls forwarding-table</b> [vrf vrf-name] [{network {mask   length}   labels label [- label]   interface interface   next-hop address   lsp-tunnel {tunnel-id}}] [detail] | Displays the contents of the MPLS LFIB.                                                                          |
| Step 3 | <b>disable</b><br><br><b>Example:</b><br>Router# disable                                                                                                                         | Exits to user EXEC mode.                                                                                         |

## Configuration Examples for Load Sharing MPLS VPN Traffic

This section contains the following configuration examples for Load Sharing MPLS VPN Traffic:

- [Configuring a Router to Select eBGP or iBGP Paths as Multipaths: Example, page 46](#)
- [Configuring a /32 Static Route from an ASBR to the Loopback Address of Another ASBR: Examples, page 46](#)
- [Configuring BGP/MPLS Forwarding on the Interfaces Connecting ASBRs: Example, page 47](#)
- [Configuring VPNv4 Sessions on an ASBR: Example, page 47](#)
- [Verifying VPN NLRI for a Specified Network: Example, page 47](#)

### Configuring a Router to Select eBGP or iBGP Paths as Multipaths: Example

The following example configures a router in address family configuration mode to select six eBGP or iBGP paths as multipaths:

```
Router(config)# router bgp 100
Router(config-router)# address-family ipv4 vrf try
Router(config-router-af)# maximum-paths eibgp 6
Router(config-router-af)# end
```

### Configuring a /32 Static Route from an ASBR to the Loopback Address of Another ASBR: Examples

The following example configures a /32 static route from ASBR1 to the loopback address of ASBR2:

```
Router# configure terminal
Router(config)# ip route 10.20.20.20 255.255.255 e1/0 168.192.0.1
```

```
Router(config)# ip route 10.20.20.20 255.255.255 e0/0 168.192.2.1
```

The following example configures a /32 static route from ASBR2 to the loopback address of ASBR1:

```
Router# configure terminal
Router(config)# ip route vrf vpn1 10.10.10.10 255.255.255 e1/0 168.192.0.2
Router(config)# ip route vrf vpn1 10.10.10.10 255.255.255 e0/0 168.192.2.2
```

## Configuring BGP/MPLS Forwarding on the Interfaces Connecting ASBRs: Example

The following example configures BGP/MPLS forwarding on the interfaces connecting ASBR2 with ASBR1:

```
Router# configure terminal
Router(config)# interface ethernet 1/0
Router(config-if)# ip vrf forwarding vpn1
Router(config-if)# ip address 168.192.0.1 255.255.255.255
Router(config-if)# mpls bgp forwarding
Router(config-if)# exit
Router(config)# interface ethernet 0/0
Router(config-if)# ip vrf forwarding vpn1
Router(config-if)# ip address 168.192.2.1 255.255.255.255
Router(config-if)# mpls bgp forwarding
Router(config-if)# exit
```

## Configuring VPNv4 Sessions on an ASBR: Example

The following example configures VPNv4 sessions on ASBR2:

```
Router# configure terminal
Router(config)# router bgp 200
Router(config-router)# bgp log-neighbor-changes
Router(config-router)# neighbor 10.10.10.10 remote-as 100
Router(config-router)# neighbor 10.10.10.10 disable-connected-check
Router(config-router)# neighbor 10.10.10.10 update-source Loopback0
!
Router(config-router)# address-family vpnv4
Router(config-router-af)# neighbor 10.10.10.10 activate
Router(config-router-af)# neighbor 10.10.10.10 send-community extended
Router(config-router-af)# end
```

## Verifying VPN NLRI for a Specified Network: Example

If you enter the **all** keyword with the **show ip bgp vpnv4** command, the output displays information about all VPN network layer reachability information (NLRI) for a specified network:

```
Router# show ip bgp vpnv4 all 10.22.22.0

BGP routing table entry for 10:1:22.22.22.0/24, version 19

## Command Reference

This feature uses no new or modified commands.

# Feature Information for Load Sharing MPLS VPN Traffic

Table 1 lists the release history for this feature.

Not all commands may be available in your Cisco IOS software release. For release information about a specific command, see the command reference documentation.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which Cisco IOS and Catalyst OS software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Note

Table 1 lists only the Cisco IOS software release that introduced support for a given feature in a given Cisco IOS software release train. Unless noted otherwise, subsequent releases of that Cisco IOS software release train also support that feature.

**Table 1** Feature Information for Load Sharing MPLS VPN Traffic

# MPLS VPN—Inter-AS Option AB

---

**First Published: December 17, 2007**

**Last Updated: October 2, 2009**

The MPLS VPN—Inter-AS Option AB feature combines the best functionality of an Inter-AS Option (10) A and Inter-AS Option (10) B network to allow a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) service provider to interconnect different autonomous systems to provide VPN services. These networks are defined in RFC 4364 section 10 “Multi-AS Backbones,” option “a” and option “b” respectively.

When different autonomous systems are interconnected in an MPLS VPN—Inter-AS Option AB configuration, the entire network configuration is scaled and simplified, and maintains IP Quality of Service (QoS) functions between Autonomous System Boundary Router (ASBR) peers.

In an Inter-AS Option A network, ASBR peers are connected by multiple sub-interfaces with at least one interface VPN that spans the two autonomous systems. These ASBRs associate each sub-interface with a VRF and a BGP session to signal unlabeled IP prefixes. As a result, traffic between the back-to-back VRFs is IP. In this scenario, the VPNs are isolated from each other and because the traffic is IP, QoS mechanisms that operate on IP traffic can be applied to achieve customer Service Level Agreements (SLAs). The downside of this configuration is that there needs to be one BGP session for each sub-interface (and at least one subinterface for each VPN), which causes scalability concerns as this network grows.

In an Inter-AS Option B network, ASBR peers are connected by one or more sub-interfaces that are enabled to receive MPLS traffic. A Multi-protocol Border Gateway Protocol (MP-BGP) session is used to distribute labeled VPN prefixes between the ASBR. As a result, the traffic that flows between them is labeled. The downside of this configuration is that because the traffic is MPLS, QoS mechanisms that can only be applied to IP traffic cannot be applied and the VRFs cannot be isolated.

## **Finding Feature Information in This Module**

Your Cisco IOS software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your Cisco IOS software release. To reach links to specific feature documentation in this module and to see a list of the releases in which each feature is supported, use the [“Feature Information for MPLS VPN—Inter-AS Option AB” section on page 45](#).

---

**Americas Headquarters:**

**Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA**

**Finding Support Information for Platforms and Cisco IOS and Catalyst OS Software Images**

Use Cisco Feature Navigator to find information about platform support and Cisco IOS and Catalyst OS software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Contents

- [Prerequisites for MPLS VPN—Inter-AS Option AB, page 2](#)
- [Restrictions for MPLS VPN—Inter-AS Option AB, page 2](#)
- [Information About MPLS VPN—Inter-AS Option AB, page 3](#)
- [How to Configure Inter-AS Option AB, page 9](#)
- [Configuration Examples for MPLS VPN—Inter-AS Option AB, page 18](#)
- [Additional References, page 42](#)
- [Feature Information for MPLS VPN—Inter-AS Option AB, page 45](#)
- [Glossary, page 46](#)

## Prerequisites for MPLS VPN—Inter-AS Option AB

Follow the appropriate configuration tasks outlined in the following documents:

- [Configuring MPLS Layer 3 VPNs](#)
- [MPLS VPN Inter-AS with ASBRs Exchanging VPN-IPv4 Addresses](#)
- [MPLS VPN Inter-AS with ASBRs Exchanging IPv4 Routes and MPLS Labels](#)

Perform the following requirements before configuring the MPLS VPN—Inter-AS Option AB feature.

- Enable Cisco Express Forwarding, which is required for MPLS VPN routing and forwarding operation.
- Identify the VPNs for the MPLS VPN—Inter-AS Option AB network and configure the VRFs to which these VPNs belong. These VRFs are used for Inter-AS Option AB connections on the ASBR interface.

## Restrictions for MPLS VPN—Inter-AS Option AB

This feature has the following restrictions:

- The In Service Software Upgrade (ISSU) feature can only be configured on the active Route Processor (RP) if the standby RP supports this feature. The ISSU feature can be configured if both the active and standby RP support this feature.
- Carrier Supporting Carrier (CSC) MPLS load-balancing on ASBR Option AB VRF interfaces is not supported.
- VPNv6 is not supported.

# Information About MPLS VPN—Inter-AS Option AB

This section provides an introduction to the MPLS VPN—Inter-AS Option AB feature and describes its benefits:

- [MPLS VPN—Inter-AS Option AB Introduction, page 2](#)
- [Benefits of MPLS VPN—Inter-AS Option AB, page 2](#)
- [MPLS VPN—Inter-AS Option AB Route Distribution and Packet Forwarding in Non-CSC Networks, page 4](#)
- [MPLS VPN—Inter-AS Option AB Route Distribution and Packet Forwarding for CSC, page 7](#)

## MPLS VPN—Inter-AS Option AB Introduction

MPLS VPN service providers need to interconnect different autonomous systems to provide service for multiple VPN customers. The MPLS VPN—Inter-AS Option AB feature allows the different autonomous systems to interconnect by using a single MP-BGP session in the global routing table to carry control plane traffic. This MP-BGP session signals VPN prefixes between two ASBRs for each virtual routing and forwarding (VRF) instance. The data plane traffic is on a VRF interface. This traffic can either be IP or MPLS.

**Note**

Inter-AS connections can be configured between ASBRs that either have or do not have connections between different providers.

## Benefits of MPLS VPN—Inter-AS Option AB

The MPLS VPN—Inter-AS Option AB feature provides the following benefits for service providers:

- Network configuration can be simplified because only one BGP session is configured for each VRF on the ASBR.
- One BGP session reduces CPU utilization.
- Networks can be scaled because a single MP-BGP session, which is enabled globally on the router, reduces the number of sessions required by multiple VPNs, while continuing to keep VPNs isolated and secured from each other.
- IP QoS functions between ASBR peers are maintained for customer SLAs.
- Dataplane traffic is isolated on a per-VRF basis for security purposes.

## MPLS VPN—Inter-AS Option AB Route Distribution and Packet Forwarding in Non-CSC Networks

The following sections describe MPLS VPN—Inter-AS Option AB operation:

- [Route Distribution for VPN 1, page 5](#)
- [Packet Forwarding for VPN 1, page 5](#)
- [Route Distribution for VPN 2, page 6](#)

### Note

All imported routes are accomplished by configuring the appropriate route targets (RTs).

The following attributes describe the topology of the sample MPLS VPN—Inter-AS Option AB network shown in [Figure 1 on page 4](#):

- Customer edge 1 (CE1) and CE3 belong to VPN 1.
- CE2 and CE 4 belong to VPN 2.
- Provider edge 1 (PE1) uses route distinguisher 1 (RD 1) for VPN 1 (VRF 1) and RD 2 for VPN 2 (VRF 2).
- PE2 uses RD 3 for VPN 1 (VRF 1) and RD 4 for VPN 2 (VRF 2).
- ASBR1 has VRF 1 provisioned with RD 5 and VRF 2 provisioned with RD 6.
- ASBR2 has VRF 1 provisioned with RD 7 and VRF 2 provisioned and RD 8.
