

mls acl tcam default-result

To set the default action during the ACL TCAM update, use the **mls acl tcam default-result** command in global configuration mode. To return to the default settings, use the **no** form of this command.

mls acl tcam default-result {permit | deny | bridge}

no mls acl tcam default-result

Syntax Description	Command	Description
	permit	Permits all traffic.
	deny	Denies all traffic.
	bridge	Bridges all Layer 3 traffic up to the rendezvous point.

Defaults deny

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 2.

In the transition time between when an existing ACL is removed and a new ACL is applied, a default **deny** is programmed in the hardware. Once the new ACL has been applied completely in the hardware, the default **deny** is removed.

Use the **mls acl tcam default-result permit** command to permit all traffic in the hardware or bridge all traffic to the software during the transition time.

Examples This example shows how to permit all traffic to pass during the ACL TCAM update:

```
Router(config)# mls acl tcam default-result permit
```

This example shows how to deny all traffic during the ACL TCAM update:

```
Router(config)# mls acl tcam default-result deny
```

This example shows how to bridge all Layer 3 traffic up to the rendezvous point during the ACL TCAM update:

```
Router(config)# mls acl tcam default-result bridge
```

mls acl tcam override dynamic dhcp-snooping

To allow web-based authentication (webauth) and IP Source Guard (IPSG) to function together on the same interface, use the **mls acl tcam override dynamic dhcp-snooping** command in global configuration mode. To disable this compatibility function, use the **no** form of this command.

mls acl tcam override dynamic dhcp-snooping

no mls acl tcam override dynamic dhcp-snooping

Syntax Description This command has no arguments or keywords.

Command Default This function is disabled by default.

Command Modes Global configuration (config)

Command History	Release	Modification
	12.2(33)SXI2	This command was introduced.

Usage Guidelines On the Catalyst 6500 series switch, when both webauth and IPSG are configured on the same access port and DHCP snooping is enabled on the access VLAN, the webauth downloadable ACLs (DACLS) can interfere with the DHCP snooping functionality. To prevent this interference, enter the **mls acl tcam override dynamic dhcp-snooping** command in global configuration mode. This command causes DHCP snooping entries to be replicated in the DACLS.

Examples This example shows how to configure compatibility between webauth and IPSG:

```
Router(config)# mls acl tcam override dynamic dhcp-snooping
```

Related Commands	Command	Description
	ip admission	Configures web-based authentication on the interface.
	ip dhcp snooping	Enables DHCP snooping.
	ip verify source	Enables IP Source Guard on the port.

mls acl tcam share-global

To enable sharing of the global default ACLs, use the **mls acl tcam share-global** command in global configuration mode. To turn off sharing of the global defaults, use the **no** form of this command.

mls acl tcam share-global

no mls acl tcam share-global

Syntax Description This command has no arguments or keywords.

Defaults Enabled

Command Modes Global configuration

Command History	Release	Modification
	12.2(18)SXE	Support for this command was introduced on the Supervisor Engine 720.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage Guidelines If you power cycle one of the DFCs, we recommend that you reset all the DFCs across the ACLs of the different DFCs.

Examples This example shows how to enable sharing of the global default ACLs:

```
Router(config)# mls acl tcam share-global
```

mls acl vacl apply-self

To enable VACL lookups on software-switched and router-generated packets on the Catalyst 6500 Supervisor Engine 2, use the **mls acl vacl apply-self** command in global configuration mode. To disable VACL lookups for software packets, use the **no** form of this command.

mls acl vacl apply-self

no mls acl vacl apply-self

Syntax Description

This command has no keywords or arguments.

Defaults

VACL lookup on the egress VLAN for software packets are not enabled on switches with Supervisor Engine 2.

Command Modes

Global configuration

Command History

Release	Modification
12.2SXF15	Support for this command was introduced on the Supervisor Engine 2.

Usage Guidelines

On the Supervisor Engine 2 based switches running Cisco IOS Release 12.2(18)SXF15 or a later release, you can enable VACL lookups on software-switched and router generated packets for the VLAN filter configured on the egress VLAN by entering the **mls acl vacl apply-self** command.

On both the Supervisor Engine 720 and Supervisor Engine 32, software-switched packets and router-generated packets are always subjected to VACL lookups on the egress VLAN.

Examples

This example shows how to enable VACL lookups on software-switched and router-generated packets:

```
Router(config)# mls acl vacl apply-self
Router(config)#
```

mls aclmerge algorithm

To select the type of ACL merge method to use, use the **mls aclmerge algorithm** command in global configuration mode.

```
mls aclmerge algorithm {bdd | odm}
```

Syntax Description	Parameter	Description
	bdd	Specifies the binary decision diagram (BDD)-based algorithm.
	odm	Specifies the order dependent merge (ODM)-based algorithm.

Defaults **bdd**

Command Modes Global configuration

Command History	Release	Modification
	12.2(17d)SXB	Support for this command on the Supervisor Engine 2 was extended to Cisco IOS Release 12.2(17d)SXB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 720.

The BDD-based ACL merge uses Boolean functions to condense entries into a single merged list of Ternary Content Addressable Memory (TCAM) entries that can be programmed into the TCAM.

You cannot disable the ODM-based ACL merge on Cisco 7600 series routers that are configured with a Supervisor Engine 720.

The ODM-based ACL merge uses an order-dependent merge algorithm to process entries that can be programmed into the TCAM.

Note

The ODM-based ACL merge supports both security ACLs and ACLs that are used for QoS filtering.

If you change the algorithm method, the change is not retroactive. For example, ACLs that have had the merge applied are not affected. The merge change applies to future merges only.

Use the **show fm summary** command to see the status of the current merge method.

Examples

This example shows how to select the BDD-based ACL to process ACLs:

```
Router(config)# mls aclmerge algorithm bdd
The algorithm chosen will take effect for new ACLs which are being applied, not
for already applied ACLs.
Router(config)
```

This example shows how to select the ODM-based ACL merge to process ACLs:

```
Router(config)# mls aclmerge algorithm odm
```

The algorithm chosen will take effect for new ACLs which are being applied, not for already applied ACLs.

Related Commands

Command	Description
show fm summary	Displays a summary of feature manager information.

mls ip acl port expand

To enable ACL-specific features for Layer 4, use the **mls ip acl port expand** command in global configuration mode. To disable the ACL-specific Layer 4 features, use the **no** form of this command.

mls ip acl port expand

no mls ip acl port expand

Syntax Description This command has no arguments or keywords.

Defaults This command has no default settings.

Command Modes Global configuration

Command History	Release	Modification
	12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
	12.2(17d)SXB	Support for this command on the Supervisor Engine 2 was extended to Cisco IOS Release 12.2(17d)SXB.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage Guidelines This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 2.

Examples This example shows how to enable the expansion of ACL logical operations on Layer 4 ports:

```
Router(config)# mls ip acl port expand
```

mls ip inspect

To permit traffic through any ACLs that would deny the traffic through other interfaces from the global configuration command mode, use the **mls ip inspect** command. Use the **no** form of this command to return to the default settings.

mls ip inspect *acl-name*

no mls ip inspect *acl-name*

Syntax Description	<i>acl-name</i>	ACL name.
--------------------	-----------------	-----------

Defaults	Disabled
----------	----------

Command Modes	Global configuration
---------------	----------------------

Command History	Release	Modification
	12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
	12.2(17d)SXB	Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB.
	12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.

Usage Guidelines	On a Cisco 7600 series router, when interfaces are configured to deny traffic, the CBAC permits traffic to flow bidirectionally only through the interface that is configured with the ip inspect command.
------------------	---

Examples	This example shows how to permit the traffic through a specific ACL (named den-ftp-c):
----------	--

```
Router(config)# mls ip inspect deny-ftp-c
Router(config)#
```

Related Commands	Command	Description
	ip inspect	Applies a set of inspection rules to an interface.

mls rate-limit all

To enable and set the rate limiters common to unicast and multicast packets in the global configuration command mode, use the **mls rate-limit all** command. Use the **no** form of this command to disable the rate limiters.

```
mls rate-limit all { mtu-failure | ttl-failure } pps [packets-in-burst]
```

```
no mls rate-limit all { mtu-failure | ttl-failure }
```

Syntax Description

all	Specifies rate limiting for unicast and multicast packets.
mtu-failure	Enables and sets the rate limiters for MTU-failed packets.
ttl-failure	Enables and sets the rate limiters for TTL-failed packets.
<i>pps</i>	Packets per second; valid values are from 10 to 1000000 packets per second.
<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.

Defaults

The Layer 2 rate limiters are off by default. If you enable and set the rate limiters, the default *packets-in-burst* is **10**.

Command Modes

Global configuration

Command History

Release	Modification
12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.

Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 2.

Rate limiters can rate-limit packets that are punted from the data path in the hardware up to the data path in the software. Rate limiters protect the control path in the software from congestion by dropping the traffic that exceeds the configured rate.

Note

For Cisco 7600 series routers configured with a PFC3A, enabling the Layer 2 rate limiters has a negative impact on the multicast traffic. This negative impact does not apply to Cisco 7600 series routers configured with a PFC3BXL.

Examples

This example shows how to set the TTL-failure limiter for unicast and multicast packets:

```
Router(config)# mls rate-limit all ttl-failure 15
Router(config)#
```

Related Commands

Command	Description
<code>show mls rate-limit</code>	Displays information about the MLS rate limiter.

mls rate-limit layer2

To enable and rate limit the control packets in Layer 2, use the **mls rate-limit layer2** command in global configuration mode. To disable the rate limiter in the hardware, use the **no** form of this command.

```
mls rate-limit layer2 { ip-admission | l2pt | pdu | port-security | unknown } pps [packets-in-burst]
```

```
no mls rate-limit layer2 [l2pt | pdu | port-security | unknown]
```

Syntax Description

ip-admission <i>pps</i>	Specifies the rate limit for IP admission on Layer 2 ports; valid values are from 10 to 1000000 packets per second.
l2pt <i>pps</i>	Specifies the rate limit for control packets in Layer 2 with a protocol-tunneling multicast-MAC address in Layer 2; valid values are from 10 to 1000000 packets per second.
pdu <i>pps</i>	Specifies the rate limit for Bridge Protocol Data Unit (BPDU), Cisco Discovery Protocol (CDP), Protocol Data Unit (PDU), and VLAN Trunk Protocol (VTP) PDU Layer 2 control packets; valid values are from 10 to 1000000 packets per second.
port-security <i>pps</i>	Specifies the rate limit for port security traffic; valid values are from 10 to 1000000 packets per second.
unknown	Specifies the rate limit for unknown unicast flooding on Layer 2 ports; valid values are from 10 to 1000000 packets per second.
<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.

Defaults

The Layer 2 rate limiters are off by default. If you enable and set the rate limiters, the default *packets-in-burst* value is 10 and *pps* value has no default setting.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.2(17a)SX	This command was introduced on the Supervisor Engine 720.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.(33)SRA.
12.2(18)SXF5	This port-security keyword was added.
12.2(33)SXH	The ip-admission keyword was added.

Usage Guidelines

MLS provides high-performance hardware-based Layer 3 switching at Layer 2.

This command is not supported on Catalyst 6500 series switches and Cisco 7600 series routers that are configured with a Supervisor Engine 2.

The **unknown** keyword is only available on PFC3C line cards. When PFC3C and PFC3B linecards are powered on in the same chassis the chassis will downgrade to the PFC3B linecard and the **unknown** keyword will be unavailable.

You cannot configure the Layer 2 rate limiters if the global switching mode is set to truncated mode. The following restrictions are pertinent to the use of the **port-security** *pps* keywords and argument:

- The PFC2 does not support the port-security rate limiter.
- The truncated switching mode does not support the port-security rate limiter.
- The lower the value, the more the CPU is protected.

Rate limiters control packets as follows:

- The frames are classified as Layer 2 control frames by the destination MAC address. The destination MAC address used are as follows:
 - 0180.C200.0000 for IEEE BPDU
 - 0100.0CCC.CCCC for CDP
 - 0100.0CCC.CCCD for Per VLAN Spanning Tree (PVST)/Shared Spanning Tree Protocol (SSTP) BPDU
- The software allocates an Local Target Logic (LTL) index for the frames.
- The LTL index is submitted to the forwarding engine for aggregate rate limiting of all the associated frames.

The Layer 2 control packets are as follows:

- General Attribute Registration Protocol (GARP) VLAN Registration Protocol (GVRP)
- BPDUs
- CDP/Dynamic Trunking Protocol (DTP)/Port Aggregation Protocol (PAgP)/UniDirectional Link Detection Protocol (UDLD)/Link Aggregation Control Protocol (LACP) /VTP PDUs
- PVST/SSTP PDUs

If the rate of the traffic exceeds the configured rate limit, the excess packets are dropped at the hardware.

The **pdu** and **l2pt** rate limiters use specific hardware rate-limiter numbers only, such as 9 through 12. Enter the **show mls rate-limit usage** command to display the available rate-limiter numbers. The available numbers are displayed as “Free” in the output field. If all four of those rate limiters are in use by other features, a system message is displayed telling you to turn off a feature to rate limit the control packets in Layer 2.

When a MAC move occurs and a packet is seen on two ports, the packet is redirected to the software. If one of those ports has the violation mode set to restrict or protect, the packet is dropped in software. You can use the port-security rate limiter to throttle the number of such packets redirected to software. This helps in protecting the software from high traffic rates.

Examples

This example shows how to enable and set the rate limiters for the protocol-tunneling packets in Layer 2:

```
Router(config)# mls rate-limit layer2 l2pt 3000
```

This example shows how to configure the **port-security** rate limiter:

```
Router(config)# mls rate-limit layer2 port-security 500
```

This example shows how to configure the **ip-admission** rate limiter:

```
Router(config)# mls rate-limit layer2 ip-admission 560
```

Related Commands

Command	Description
show mls rate-limit	Displays information about the MLS rate limiter.

mls rate-limit unicast l3-features

To enable and set the Layer 3 security rate limiters for the unicast packets in the global configuration command mode, use the **mls rate-limit unicast l3-features** command. Use the **no** form of this command to disable the rate limiters.

```
mls rate-limit unicast l3-features pps [packets-in-burst]
```

```
no mls rate-limit unicast l3-features pps [packets-in-burst]
```

Syntax Description

<i>pps</i>	Packets per second; see the “Usage Guidelines” section for valid values.
<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.

Defaults

The defaults are as follows:

- Enabled at **2000 pps** and *packets-in-burst* is set to **1**.
- If the *packets-in-burst* is not set, **10** is programmed for unicast cases.

Command Modes

Global configuration

Command History

Release	Modification
12.2(17d)SXB	Support for this command was introduced on the Supervisor Engine 2.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.

Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 720.

Examples

This example shows how to set the Layer 3 security rate limiters for the unicast packets:

```
Router(config)# mls rate-limit unicast l3-features 5000
Router(config)#
```

Related Commands

Command	Description
show mls rate-limit	Displays information about the MLS rate limiter.

mls rate-limit multicast ipv4

To enable and set the rate limiters for the IPv4 multicast packets in the global configuration command mode, use the **mls rate-limit multicast ipv4** command. Use the **no** form of this command to disable the rate limiters.

mls rate-limit multicast ipv4 { **connected** | **fib-miss** | **igmp** | **ip-option** | **partial** | **non-rpf** } *pps* [*packets-in-burst*]

no mls rate-limit multicast ipv4 { **connected** | **fib-miss** | **igmp** | **ip-option** | **partial** | **non-rpf** }

Syntax Description

connected	Enables and sets the rate limiters for multicast packets from directly connected sources.
fib-miss	Enables and sets the rate limiters for the FIB-missed multicast packets.
igmp	Enables and sets the rate limiters for the IGMP packets.
ip-option	Enables and sets the rate limiters for the multicast packets with IP options.
partial	Enables and sets the rate limiters for the multicast packets during a partial SC state.
non-rpf	Enables and sets the rate limiters for the multicast packets failing the RPF check.
<i>pps</i>	Packets per second; valid values are from 10 to 1000000 packets per second.
<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.

Defaults

The defaults are as follows:

- If the *packets-in-burst* is not set, a default of **100** is programmed for multicast cases.
- **fib-miss**—Enabled at **100000 pps** and *packet-in-burst* is set to **100**.
- **ip-option**—Disabled.
- **partial**—Enabled at **100000 pps** and *packet-in-burst* is set to **100**.

Command Modes

Global configuration

Command History

Release	Modification
12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
12.2(17b)SXA	This command was changed to support the igmp and ip-option keywords.
12.2(18)SXD	This command was changed to include the ipv4 keyword.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.

Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 2.

You cannot configure the IPv4 rate limiters if the global switching mode is set to truncated mode.

The rate limiters can rate limit the packets that are punted from the data path in the hardware up to the data path in the software. The rate limiters protect the control path in the software from congestion and drop the traffic that exceeds the configured rate.

The **ip-option** keyword is supported in PFC3BXL or PFC3B mode only.

Examples

This example shows how to set the rate limiters for the multicast packets failing the RPF check:

```
Router(config)# mls rate-limit multicast ipv4 non-rpf 100
Router(config)#
```

This example shows how to set the rate limiters for the multicast packets during a partial SC state:

```
Router(config)# mls rate-limit multicast ipv4 partial 250
Router(config)#
```

This example shows how to set the rate limiters for the FIB-missed multicast packets:

```
Router(config)# mls rate-limit multicast ipv4 fib-miss 15
Router(config)#
```

Related Commands

Command	Description
show mls rate-limit	Displays information about the MLS rate limiter.

mls rate-limit multicast ipv6

To configure the IPv6 multicast rate limiters, use the **mls rate-limit multicast ipv6** command in global configuration mode. To disable the rate limiters, use the **no** form of this command.

```
mls rate-limit multicast ipv6 {connected pps [packets-in-burst] | rate-limiter-name {share {auto | target-rate-limiter}}}
```

```
no mls rate-limit multicast ipv6 {connected | rate-limiter-name}
```

Syntax Description

connected <i>pps</i>	Enables and sets the rate limiters for the IPv6 multicast packets from a directly connected source; valid values are from 10 to 1000000 packets per second.
<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.
<i>rate-limiter-name</i>	Rate-limiter name; valid values are default-drop , route-ctrl , secondary-drop , sg , starg-bridge , and starg-m-bridge . See the “Usage Guidelines” section for additional information.
share	Specifies the sharing policy for IPv6 rate limiters; see the “Usage Guidelines” section for additional information.
auto	Decides the sharing policy automatically.
<i>target-rate-limiter</i>	Rate-limiter name that was the first rate-limiter name programmed in the hardware for the group; valid values are default-drop , route-ctrl , secondary-drop , sg , starg-bridge , and starg-m-bridge . See the “Usage Guidelines” section for additional information.

Command Default

If the *burst* is not set, a default of **100** is programmed for multicast cases.

Command Modes

Global configuration

Command History

Release	Modification
12.2(18)SXD	This command was introduced on the Supervisor Engine 720.
12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.

Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 2.

The *rate-limiter-name* argument must be a rate limiter that is not currently programmed.

The *target-rate-limiter* argument must be a rate limiter that is programmed in the hardware and must be the first rate limiter programmed for its group.

[Table 43](#) lists the IPv6 rate limiters and the class of traffic that each rate limiter serves.

Table 43 IPv6 Rate Limiters

Rate-Limiter ID	Traffic Classes to be Rate Limited
Connected	Directly connected source traffic
Default-drop	* (*, G/m)SSM * (*, G/m)SSM non-rpf
Route-control	* (*, FF02::X/128)
Secondary-drop	* (*, G/128) SPT threshold is infinity
SG	* (S, G) RP-RPF post-switchover * (*, FFx2/16)
Starg-bridge	* (*, G/128) SM * SM non-rpf traffic when (*, G) exists
Starg-M-bridge	* (*, G/m) SM * (*, FF/8) * SM non-rpf traffic when (*, G) does not exist

You can configure rate limiters for IPv6 multicast traffic using one of the following methods:

- Direct association of the rate limiters for a traffic class—Select a rate and associate the rate with a rate limiter. This example shows how to pick a rate of 1000 pps and 20 packets per burst and associate the rate with the **default-drop** rate limiter:

```
Router(config)# mls rate-limit multicast ipv6 default-drop 1000 20
```

- Static sharing of a rate limiter with another preconfigured rate limiter—When there are not enough adjacency-based rate limiters available, you can share a rate limiter with an already configured rate limiter (target rate limiter). This example shows how to share the **route-cntl** rate limiter with the **default-drop** target rate limiter:

```
Router(config)# mls rate-limit multicast ipv6 route-cntl share default-drop
```

If the target rate limiter is not configured, a message displays that the target rate limiter must be configured for it to be shared with other rate limiters.

- Dynamic sharing of rate limiters—If you are not sure about which rate limiter to share with, use the **share auto** keywords to enable dynamic sharing. When you enable dynamic sharing, the system picks a preconfigured rate limiter and shares the given rate limiter with the preconfigured rate limiter. This example shows how to choose dynamic sharing for the **route-cntl** rate limiter:

```
Router(config)# mls rate-limit multicast ipv6 route-cntl share auto
```

Examples

This example shows how to set the rate limiters for the IPv6 multicast packets from a directly connected source:

```
Router(config)# mls rate-limit multicast ipv6 connected 1500 20
Router(config)#
```

This example shows how to configure a direct association of the rate limiters for a traffic class:

```
Router(config)# mls rate-limit multicast ipv6 default-drop 1000 20
Router(config)#
```

This example shows how to configure the static sharing of a rate limiter with another preconfigured rate limiter:

```
Router(config)# mls rate-limit multicast ipv6 route-ctrl share default-drop
Router(config)#
```

This example shows how to enable dynamic sharing for the **route-ctrl** rate limiter:

```
Router(config)# mls rate-limit multicast ipv6 route-ctrl share auto
Router(config)#
```

Related Commands

Command	Description
show mls rate-limit	Displays information about the MLS rate limiter.

mls rate-limit unicast acl

To enable and set the ACL-bridged rate limiters in global configuration command mode, use the **mls rate-limit unicast acl** command. Use the **no** form of this command to disable the rate limiters.

```
mls rate-limit unicast acl {input | output | vacl-log} pps [packets-in-burst]
```

Syntax Description	Parameter	Description
	input	Specifies the rate limiters for the input ACL-bridged unicast packets.
	output	Specifies the rate limiters for the output ACL-bridged unicast packets.
	vacl-log	Specifies the rate limiters for the VACL log cases.
	<i>pps</i>	Packets per second; see the “Usage Guidelines” section for valid values.
	<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.

Defaults

The defaults are as follows:

- **input**—Disabled.
- **output**—Disabled.
- **vacl-log**—Enabled at **2000** *pps* and *packets-in-burst* is set to **1**.
- If the *packets-in-burst* is not set, **10** is programmed for unicast cases.

Command Modes

Global configuration

Command History

Release	Modification
12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
12.2(17a)SX	The mls rate-limit unicast command was reformatted.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.

Usage Guidelines

The **input** and **output** keywords are not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 2.

The rate limiters can rate limit the packets that are punted from the data path in the hardware up to the data path in the software. The rate limiters protect the control path in the software from congestion and drop the traffic that exceeds the configured rate.

When setting the *pps*, valid values are as follows:

- ACL input and output cases—10 to 1000000 *pps*
- VACL log cases—10 to 5000 *pps*

You cannot change the **vacl-log** *packets-in-burst* keyword and argument; it is set to **1** by default.

Some cases (or scenarios) share the same hardware register. These cases are divided into the following two groups:

- Group 1:
 - Egress ACL-bridged packets
 - Ingress ACL-bridged packets
- Group 2:
 - RPF failure
 - ICMP unreachable for ACL drop
 - ICMP unreachable for no-route
 - IP errors

All the components of each group use or share the same hardware register. For example, ACL-bridged ingress and egress packets use register A. ICMP-unreachable, no-route, and RPF failure use register B.

In most cases, when you change a component of a group, all the components in the group are overwritten to use the same hardware register as the first component changed. A warning message is printed out each time that an overwriting operation occurs, but only if you enable the service internal mode. The overwriting operation does not occur in these situations:

- The *pps* value is set to **0** (zero) for a particular case.
- When the ingress or egress ACL-bridged packet cases are disabled, overwriting does not occur until the cases are enabled again. If either case is disabled, the other is not affected as long as the remaining case is enabled. For example, if you program the ingress ACL-bridged packets with a 100-pps rate, and then you configure the egress ACL-bridged packets with a 200-pps rate, the ingress ACL-bridged packet value is overwritten to 200 pps and both the ingress and the egress ACL-bridged packets have a 200-pps rate.

Examples

This example shows how to set the input ACL-bridged packet limiter for unicast packets:

```
Router(config)# mls rate-limit unicast acl input 100
Router(config)#
```

Related Commands

Command	Description
show mls rate-limit	Displays information about the MLS rate limiter.

mls rate-limit unicast cef

To enable and set the Cisco Express Forwarding rate limiters in global configuration command mode, use the **mls rate-limit unicast cef** command. Use the **no** form of this command to disable the rate limiters.

```
mls rate-limit unicast cef {receive | glean} pps [packets-in-burst]
```

Syntax Description

receive	Enables and sets the rate limiters for receive packets.
glean	Enables and sets the rate limiters for ARP-resolution packets.
<i>pps</i>	Packets per second; valid values are from 10 to 1000000 packets per second.
<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.

Defaults

The defaults are as follows:

- **receive**—Disabled.
- **glean**—Disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.2(17a)SX	Support for this command was introduced on the Supervisor Engine 720.
12.2(17d)SXB	Support for this command on the Supervisor Engine 2 was extended to Release 12.2(17d)SXB. The default for glean was changed to disabled.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.

Usage Guidelines

If you enable the CEF rate limiters, the following behaviors occur (if the behavior that is listed is unacceptable, disable the CEF rate limiters):

- If a packet hits a glean/receive adjacency, the packet may be dropped instead of being sent to the software if there is an output ACL on the input VLAN and the matched entry result is deny.
- If the matched ACL entry result is bridge, the packet is subject to egress ACL bridge rate limiting (if turned ON) instead of glean/receive rate limiting.
- The glean/receive adjacency rate limiting is applied only if the output ACL lookup result is permit or there is no output ACLs on the input VLAN.

Examples

This example shows how to set the CEF-glean limiter for the unicast packets:

```
Router(config)# mls rate-limit unicast cef glean 5000
Router(config)#
```

Related Commands

Command	Description
show mls rate-limit	Displays information about the MLS rate limiter.

mls rate-limit unicast ip

To enable and set the rate limiters for the unicast packets in global configuration command mode, use the **mls rate-limit unicast ip** command. Use the **no** form of this command to disable the rate limiters.

```
mls rate-limit unicast ip {errors | features | options | rpf-failure} pps [packets-in-burst]
```

```
mls rate-limit unicast ip icmp {redirect | unreachable acl-drop pps | no-route pps} [packets-in-burst]
```

```
no mls rate-limit unicast ip {errors | features | icmp {redirect | unreachable {acl-drop | no-route}} | options | rpf-failure} pps [packets-in-burst]
```

Syntax Description

errors	Specifies rate limiting for unicast packets with IP checksum and length errors.
features	Specifies rate limiting for unicast packets with software-security features in Layer 3 (for example, authorization proxy, IPsec, and inspection).
options	Specifies rate limiting for unicast IPv4 packets with options.
rpf-failure	Specifies rate limiting for unicast packets with RPF failures.
<i>pps</i>	Packets per second; see the “Usage Guidelines” section for valid values.
<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.
icmp redirect	Specifies rate limiting for unicast packets requiring ICMP redirect.
icmp unreachable acl-drop <i>pps</i>	Enables and sets the rate limiters for the ICMP unreachables for the ACL-dropped packets.
icmp unreachable no-route <i>pps</i>	Enables and sets the rate limiters for the ICMP unreachables for the FIB-miss packets.

Defaults

The defaults are as follows:

- If the *packets-in-burst* is not set, a default of **10** is programmed as the burst for unicast cases.
- **errors**—Enabled at **500 pps** and *packets-in-burst* set to **10**.
- **rpf-failure**—Enabled at **500 pps** and *packets-in-burst* set to **10**.
- **icmp unreachable acl-drop**—Enabled at **500 pps** and *packets-in-burst* set to **10**.
- **icmp unreachable no-route**—Enabled at **500 pps** and *packets-in-burst* set to **10**.
- **icmp redirect**—Disabled.

Command Modes

Global configuration

Command History

Release	Modification
12.2(14)SX	Support for this command was introduced on the Supervisor Engine 720.
12.2(17a)SX	The mls rate-limit unicast command added the ip keyword to the following: <ul style="list-style-type: none"> • options • icmp • rpf-failure • errors • features <p>These keywords were changed as follows:</p> <ul style="list-style-type: none"> • The features keyword replaced the l3-features keyword. • The mls rate-limit unicast icmp redirect command replaced the mls rate-limit unicast icmp-redirect command. • The mls rate-limit unicast icmp unreachable command replaced the mls rate-limit unicast icmp-unreachable command.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.

Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 2.

To provide OAL support for denied packets, enter the **mls rate-limit unicast ip icmp unreachable acl-drop 0** command.

OAL and VACL capture are incompatible. Do not configure both features on the switch. With OAL configured, use SPAN to capture traffic.

The rate limiters can rate limit the packets that are punted from the data path in the hardware up to the data path in the software. The rate limiters protect the control path in the software from congestion and drop the traffic that exceeds the configured rate.

**Note**

When you configure an ICMP rate limiter, and an ICMP redirect occurs, exiting data traffic is dropped while the remaining traffic on the same interface is forwarded.

When setting the *pps*, the valid values are **0** and from 10 to 1000000. Setting the *pps* to **0** globally disables the redirection of the packets to the route processor. The **0** value is supported for these rate limiters:

- ICMP unreachable ACL-drop
- ICMP unreachable no-route
- ICMP redirect
- IP rpf failure

Some cases (or scenarios) share the same hardware register. These cases are divided into the following two groups:

- Group 1:
 - Egress ACL-bridged packets
 - Ingress ACL-bridged packets
- Group 2:
 - RPF failure
 - ICMP unreachable for ACL drop
 - ICMP unreachable for no-route
 - IP errors

All the components of each group use or share the same hardware register. For example, ACL-bridged ingress and egress packets use register A. ICMP-unreachable, no-route, and RPF failure use register B.

In most cases, when you change a component of a group, all the components in the group are overwritten to use the same hardware register as the first component changed. A warning message is printed out each time that an overwriting operation occurs, but only if you enable the service internal mode. The overwriting operation does not occur in these situations:

- The *pps* value is set to **0** (zero) for a particular case.
- When the ingress or egress ACL-bridged packet cases are disabled, overwriting does not occur until the cases are enabled again. If either case is disabled, the other is not affected as long as the remaining case is enabled. For example, if you program the ingress ACL-bridged packets with a 100-pps rate, and then you configure the egress ACL-bridged packets with a 200-pps rate, the ingress ACL-bridged packet value is overwritten to 200 pps and both the ingress and the egress ACL-bridged packets have a 200-pps rate.

Examples

This example shows how to set the ICMP-redirect limiter for unicast packets:

```
Router(config)# mls rate-limit unicast ip icmp redirect 250
Router(config)#
```

Related Commands

Command	Description
show mls rate-limit	Displays information about the MLS rate limiter.

mls rate-limit unicast vACL-log

To enable and set the VACL-log case rate limiters in the global configuration command mode, use the **mls rate-limit unicast vACL-log** command. Use the **no** form of this command to disable the rate limiters.

```
mls rate-limit unicast vACL-log pps [packets-in-burst]
```

Syntax Description

<i>pps</i>	Packets per second; see the “Usage Guidelines” section for valid values.
<i>packets-in-burst</i>	(Optional) Packets in burst; valid values are from 1 to 255.

Defaults

The defaults are as follows:

- Enabled at **2000 pps** and *packets-in-burst* is set to **1**.
- If the *packets-in-burst* is not set, **10** is programmed for unicast cases.

Command Modes

Global configuration

Command History

Release	Modification
12.2(17d)SXB	Support for this command was introduced on the Supervisor Engine 2.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.

Usage Guidelines

This command is not supported on Cisco 7600 series routers that are configured with a Supervisor Engine 720.

The rate limiters can rate limit the packets that are punted from the data path in the hardware up to the data path in the software. The rate limiters protect the control path in the software from congestion and drop the traffic that exceeds the configured rate.

When setting the *pps*, valid values are as follows:

- ACL input and output cases—10 to 1000000 *pps*
- VACL log cases—10 to 5000 *pps*

Setting the *pps* to **0** globally disables the redirection of the packets to the route processor.

You cannot change the **vACL-log** *packets-in-burst* keyword and argument; it is set to **1** by default.

Some cases (or scenarios) share the same hardware register. These cases are divided into the following two groups:

- Group1:
 - Egress ACL-bridged packets
 - Ingress ACL-bridged packets

- Group 2:
 - RPF failure
 - ICMP unreachable for ACL drop
 - ICMP unreachable for no-route
 - IP errors

All the components of each group use or share the same hardware register. For example, ACL-bridged ingress and egress packets use register A. ICMP-unreachable, no-route, and RPF failure use register B.

In most cases, when you change a component of a group, all the components in the group are overwritten to use the same hardware register as the first component changed. A warning message is printed out each time that an overwriting operation occurs, but only if you enable the service internal mode. The overwriting operation does not occur in these situations:

- The *pps* value is set to **0** (zero) for a particular case.
- When the ingress or egress ACL-bridged packet cases are disabled, overwriting does not occur until the cases are enabled again. If either case is disabled, the other is not affected as long as the remaining case is enabled. For example, if you program the ingress ACL-bridged packets with a 100-pps rate, and then you configure the egress ACL-bridged packets with a 200-pps rate, the ingress ACL-bridged packet value is overwritten to 200 pps and both the ingress and the egress ACL-bridged packets have a 200-pps rate.

Examples

This example shows how to set the VACL-log case packet limiter for unicast packets:

```
Router(config)# mls rate-limit unicast vacl-log 100
Router(config)#
```

Related Commands

Command	Description
show mls rate-limit	Displays information about the MLS rate limiter.

mode (IPSec)

To change the mode for a transform set, use the **mode** command in crypto transform configuration mode. To reset the mode to the default value of tunnel mode, use the **no** form of this command.

mode [tunnel | transport]

no mode

Syntax Description	tunnel 	(Optional) Specifies the mode for a transform set: either tunnel or transport mode.
	transport	If neither tunnel nor transport is specified, the default (tunnel mode) is assigned.

Defaults Tunnel mode

Command Modes Crypto transform configuration

Command History	Release	Modification
	11.3 T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines Use this command to change the mode specified for the transform. This setting is only used when the traffic to be protected has the same IP addresses as the IPSec peers (this traffic can be encapsulated either in tunnel or transport mode). This setting is ignored for all other traffic (all other traffic is encapsulated in tunnel mode).

If the traffic to be protected has the same IP address as the IP Security peers and transport mode is specified, during negotiation the router will request transport mode but will accept either transport or tunnel mode. If tunnel mode is specified, the router will request tunnel mode and will accept only tunnel mode.

After you define a transform set, you are put into the crypto transform configuration mode. While in this mode you can change the mode to either tunnel or transport. This change applies only to the transform set just defined.

If you do not change the mode when you first define the transform set, but later decide you want to change the mode for the transform set, you must re-enter the transform set (specifying the transform name and all its transforms) and then change the mode.

If you use this command to change the mode, the change will only affect the negotiation of subsequent IPSec security associations via crypto map entries which specify this transform set. (If you want the new settings to take effect sooner, you can clear all or part of the security association database. See the **clear crypto sa** command for more details.)

Tunnel Mode

With tunnel mode, the entire original IP packet is protected (encrypted, authenticated, or both) and is encapsulated by the IPSec headers and trailers (an Encapsulation Security Protocol header and trailer, an Authentication Header, or both). Then a new IP header is prefixed to the packet, specifying the IPSec endpoints as the source and destination.

Tunnel mode can be used with any IP traffic. Tunnel mode must be used if IPSec is protecting traffic from hosts behind the IPSec peers. For example, tunnel mode is used with Virtual Private Networks (VPNs) where hosts on one protected network send packets to hosts on a different protected network via a pair of IPSec peers. With VPNs, the IPSec peers “tunnel” the protected traffic between the peers while the hosts on their protected networks are the session endpoints.

Transport Mode

With transport mode, only the payload (data) of the original IP packet is protected (encrypted, authenticated, or both). The payload is encapsulated by the IPSec headers and trailers (an ESP header and trailer, an AH header, or both). The original IP headers remain intact and are not protected by IPSec.

Use transport mode only when the IP traffic to be protected has IPSec peers as both the source and destination. For example, you could use transport mode to protect router management traffic. Specifying transport mode allows the router to negotiate with the remote peer whether to use transport or tunnel mode.

Examples

The following example defines a transform set and changes the mode to transport mode. The mode value only applies to IP traffic with the source and destination addresses at the local and remote IPSec peers.

```
crypto ipsec transform-set newer esp-des esp-sha-hmac
mode transport
exit
```

Related Commands

Command	Description
crypto ipsec transform-set	Defines a transform set—an acceptable combination of security protocols and algorithms.

mode ra

To place the public key infrastructure (PKI) server into Registration Authority (RA) certificate server mode, use the **mode ra** command in certificate server configuration mode. To remove the PKI server from RA certificate mode, use the **no** form of this command.

mode ra [transparent]

no mode ra [transparent]

Syntax Description

transparent	The transparent keyword allows the CA server in RA mode to interoperate with more than one type of CA server.
--------------------	--

Defaults

The PKI server is not placed into RA certificate server mode.

Command Modes

Certificate server configuration

Command History

Release	Modification
12.3(7)T	This command was introduced.
15.1(2)T	This command was modified. In Cisco IOS Release 15.1(2)T, the transparent keyword was introduced that allows the IOS CA server in RA mode to interoperate with more than one type of CA server.

Usage Guidelines

When this command is configured, ensure that the **crypto pki trustpoint** command has also been configured and that the enrollment URL is pointed to a Cisco IOS issuing certification authority (CA). If the **mode ra** command is not configured and the certificate server is enabled for the first time, a self-signed CA certificate will be generated and the certificate server will operate as a root CA.

The Cisco IOS certificate server can act as an RA for a Cisco IOS CA or another third party CA. The **transparent** keyword is used if a third-party CA is used.

When the **transparent** keyword is used, the original PKCS#10 enrollment message is not re-signed and is forwarded unchanged. This enrollment message makes the IOS RA certificate server work with CA servers like the Microsoft CA server.

Examples

The following configuration example shows that a RA mode certificate server named "myra" has been configured:

```
Router (config)# crypto pki trustpoint myra
Router (ca-trustpoint)# enrollment url http://10.3.0.6
Router (ca-trustpoint)# subject-name cn=myra, ou=ioscs RA, o=cisco, c=us
Router (ca-trustpoint)# exit
```

```
Router (config)# crypto pki server myra
Router (cs-server)# mode ra
Router (cs-server)# no shutdown
```

Related Commands:

Command	Description
crypto pki server	Enables a Cisco IOS certificate server.
crypto pki trustpoint	Declares the trustpoint that your router should use.
enrollment	Specifies the enrollment parameters of a CA.
show crypto pki server	Displays the current state and configuration of the certificate server.

mode secure

To enable the secure mode in the Lightweight Directory Access Protocol (LDAP) server, use the **mode secure** command in LDAP server configuration mode. To disable the secure mode in LDAP server, use the **no** form of this command.

mode secure [no-negotiation]

no mode secure [no-negotiation]

Syntax Description	no-negotiation (Optional) Specifies the Transport Layer Security (TLS) specific parameter.				
Command Default	The secure mode is disabled.				
Command Modes	LDAP server configuration (config-ldap-server)				
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>15.1(1)T</td> <td>This command was introduced.</td> </tr> </tbody> </table>	Release	Modification	15.1(1)T	This command was introduced.
Release	Modification				
15.1(1)T	This command was introduced.				
Usage Guidelines	Use the mode secure command to establish a TLS connection with the LDAP server. This command will help to secure all the transactions.				
Examples	<p>The following example shows how to configure the secure mode on the LDAP server:</p> <pre>Router(config)# ldap server server1 Router(config-ldap-server)# mode secure no-negotiation</pre>				
Related Commands	<table border="1"> <thead> <tr> <th>Command</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ldap server</td> <td>Defines an LDAP server and enters LDAP server configuration mode.</td> </tr> </tbody> </table>	Command	Description	ldap server	Defines an LDAP server and enters LDAP server configuration mode.
Command	Description				
ldap server	Defines an LDAP server and enters LDAP server configuration mode.				

mode sub-cs

To place the public key infrastructure (PKI) server into sub-certificate server mode, use the **mode sub-cs** command in certificate server mode. To remove the PKI server from sub-certificate mode, use the **no** form of this command.

mode sub-cs

no mode sub-cs

Syntax Description

This command has no arguments or keywords.

Defaults

The PKI server is not placed into sub-certificate server mode.

Command Modes

Certificate server

Command History

Release	Modification
12.3(14)T	This command was introduced.

Usage Guidelines

When this command is configured, ensure that the **crypto pki trustpoint** command has also been configured and that the enrollment URL is pointed to a Cisco IOS root certification authority (CA). If the **mode sub-cs** command is not configured and the certificate server is enabled for the first time, a self-signed CA certification will be generated and the certificate server will operate as a root CA.

Note

The **no mode sub-cs** command will have no effect if the server has been configured already. For example, if you want to make the subordinate CA a root CA, you must delete the server and re-create it.

Examples

The following configuration example shows that a subordinate certificate server named “sub” has been configured:

```
Router (config)# crypto pki trustpoint sub
Router (ca-trustpoint)# enrollment url http://10.3.0.6
Router (ca-trustpoint)# exit

Router (config)# crypto pki server sub
Router (cs-server)# issuer-name CN=sub CA, O=Cisco, C=us
Router (cs-server)# mode sub-cs
Router (cs-server)# no shutdown
```

Related Commands

Command	Description
crypto pki server	Enables a Cisco IOS certificate server.
crypto pki trustpoint	Declares the trustpoint that your router should use.

Command	Description
enrollment	Specifies the enrollment parameters of a CA.
issuer-name	Specifies the DN as the CA issuer name for the certificate server.
show crypto pki server	Displays the current state and configuration of the certificate server.

monitor event-trace dmvpn

To monitor and control Dynamic Multipoint VPN (DMVPN) traces, use the **monitor event-trace dmvpn** command in privileged EXEC or global configuration mode.

Privileged EXEC

```
monitor event-trace dmvpn {dump [merged] pretty | {nhrrp {error | event | exception} | tunnel}
                             {clear | continuous [cancel] | disable | enable | one-shot} | tunnel}}
```

Global Configuration

```
monitor event-trace dmvpn {dump-file url | {nhrrp {error | event | exception} | tunnel} {disable
                             | dump-file url | enable | size | stacktrace value}}
```

```
no monitor event-trace dmvpn {dump-file url | {nhrrp {error | event | exception} | tunnel}
                               {disable | dump-file url | enable | size | stacktrace value}}
```

Syntax Description

dump	Displays all event traces.
merged	(Optional) Displays entries in all the event traces sorted by time.
pretty	Displays the event traces in ASCII format.
nhrrp	Monitors Next Hop Resolution Protocol (NHRP) traces.
error	Monitors NHRP error traces.
event	Monitors NHRP event traces.
exception	Monitors NHRP exception errors.
tunnel	Monitors all tunnel events.
clear	Clears the trace.
continuous	Displays the latest event trace entries continuously.
cancel	(Optional) Cancels continuous display of the latest trace entries.
disable	Disables NHRP or tunnel tracing.
enable	Enables NHRP or tunnel tracing.
one-shot	Clears the trace, sets the running configuration, and then disables the configuration at the wrap point.
tunnel	Monitors all tunnel events.
dump-file url	Sets the name of the dump file.
stacktrace value	Specifies the trace buffer stack to be cleared first. The stack range is from 1 to 16.

Command Default

DMVPN event tracing is disabled.

Command Modes

Privileged EXEC (#)
Global configuration (config)

Command History

Release	Modification
15.1(4)M	This command was introduced.

Usage Guidelines

You can use the **monitor event-trace dmvpn** command to configure the DMVPN Event Tracing feature. The DMVPN Event Tracing feature provides a trace facility for troubleshooting Cisco IOS DMVPN. This feature enables you to monitor DMVPN events, errors, and exceptions. During runtime, the event trace mechanism logs trace information in a buffer space. A display mechanism extracts and decodes the debug data.

Note

You can configure the DMVPN Event Tracing feature in privileged EXEC mode or global configuration mode based on the desired parameters.

Examples

The following example shows how to configure a router to monitor and control NHRP event traces in privileged EXEC mode:

```
Router# monitor event-trace dmvpn nhrp event enable
```

The following example shows how to configure a router to monitor and control NHRP exception traces in privileged EXEC mode:

```
Router# monitor event-trace dmvpn nhrp exception enable
```

The following example shows how to configure a router to monitor and control NHRP error traces in privileged EXEC mode:

```
Router# monitor event-trace dmvpn nhrp error enable
```

The following example shows how to configure a router to monitor and control NHRP event traces in global configuration mode:

```
Router# enable
Router(config)# monitor event-trace dmvpn nhrp event enable
```

The following example shows how to configure a router to monitor and control NHRP exception traces in global configuration mode:

```
Router# enable
Router(config)# monitor event-trace dmvpn nhrp exception enable
```

The following example shows how to configure a router to monitor and control NHRP error traces in global configuration mode:

```
Router# enable
Router(config)# monitor event-trace dmvpn nhrp error enable
```

Related Commands

Command	Description
show monitor event-trace dmvpn	Displays DMVPN trace information.

name

To configure the redundancy group with a name, use the **name** command in redundancy application group configuration mode. To remove the name of a redundancy group, use the **no** form of this command.

name *group-name*

no name *group-name*

Syntax	Description
<i>group-name</i>	Name of the redundancy group.

Command Default The redundancy group is not configured with a name.

Command Modes Redundancy application group configuration (config-red-app-grp)

Command History	Release	Modification
	Cisco IOS XE Release 3.1S	This command was introduced.

Examples The following example shows how to configure the redundancy group name as group1:

```
Router# configure terminal
Router(config)# redundancy
Router(config-red)# application redundancy
Router(config-red-app)# group 1
Router(config-red-app-grp)# name group1
```

Related Commands	Command	Description
	application redundancy	Enters redundancy application configuration mode.
	group	Enters redundancy application group configuration mode.
	shutdown	Shuts down a group manually.

name (view)

To change the name of a lawful intercept view, use the **name** command in view configuration mode. To return to the default lawful intercept view name, which is “li-view,” use the **no** form of this command.

name *new-name*

no name *new-name*

Syntax Description

<i>new-name</i>	Lawful intercept view name.
-----------------	-----------------------------

Defaults

A lawful intercept view is called “li-view.”

Command Modes

View configuration (config-view)

Command History

Release	Modification
12.3(7)T	This command was introduced.
12.2(33)SRB	This command was integrated into Cisco IOS Release 12.2(33)SRB.
Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.
12.2(33)SXI	This command was integrated into Cisco IOS Release 12.2(33)SXI.

Usage Guidelines

Only a system administrator or a level 15 privilege user can change the name of a lawful intercept view.

Examples

The following example shows how to configure a lawful intercept view and change the view name to “myliview”:

```
!Initialize the LI-View.
Router(config-view)# li-view lipass user li_admin password li_adminpass
00:19:25:%PARSER-6-LI_VIEW_INIT:LI-View initialized.
Router(config-view)# name myliview
Router(config-view)# end
```

Related Commands

Command	Description
li-view	Initializes a lawful intercept view.
parser view	Creates or changes a CLI view and enters view configuration mode.

named-key

To specify which peer's RSA public key you will manually configure and enter public key configuration mode, use the **named-key** command in public key chain configuration mode. This command should be used only when the router has a single interface that processes IP Security (IPSec).

named-key *key-name* [**encryption** | **signature**]

Syntax Description		
<i>key-name</i>	Specifies the name of the remote peer's RSA keys. This is always the fully qualified domain name of the remote peer; for example, router.example.com.	
encryption	(Optional) Indicates that the RSA public key to be specified will be an encryption special-usage key.	
signature	(Optional) Indicates that the RSA public key to be specified will be a signature special-usage key.	

Defaults If neither the **encryption** nor the **signature** keyword is used, general-purpose keys will be specified.

Command Modes Public key chain configuration.

Command History	Release	Modification
	11.3 T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines Use this command or the **addressed-key** command to specify which IPSec peer's RSA public key you will manually configure next.

Follow this command with the **key-string** command to specify the key.

If you use the **named-key** command, you also need to use the **address** public key configuration command to specify the IP address of the peer.

If the IPSec remote peer generated general purpose RSA keys, do not use the **encryption** or **signature** keyword.

If the IPSec remote peer generated special usage keys, you must manually specify both keys: perform this command and the **key-string** command twice and use the **encryption** and **signature** keywords in turn.

Examples The following example manually specifies the RSA public keys of two IPSec peers. The peer at 10.5.5.1 uses general-purpose keys, and the other peer uses special-purpose keys.

```
crypto key pubkey-chain rsa
```

Related Commands

Command	Description
address	Specifies the IP address of the remote RSA public key of the remote peer you will manually configure.
addressed-key	Specifies the RSA public key of the peer you will manually configure.
crypto key pubkey-chain rsa	Enters public key configuration mode (to allow you to manually specify the RSA public keys of other devices).
key-string (IKE)	Specifies the RSA public key of a remote peer.
show crypto key pubkey-chain rsa	Displays peer RSA public keys stored on your router.

nas

To add an access point or router to the list of devices that use the local authentication server, use the **nas** command in local RADIUS server configuration mode. To remove the identity of the network access server (NAS) that is configured on the local RADIUS server, use the **no** form of this command.

nas *ip-address* **key** *shared-key*

no nas *ip-address* **key** *shared-key*

Syntax Description

<i>ip-address</i>	IP address of the access point or router.
key	Specifies a key.
<i>shared-key</i>	Shared key that is used to authenticate communication between the local authentication server and the access points and routers that use this authenticator.

Defaults

No default behavior or values

Command Modes

Local RADIUS server configuration

Command History

Release	Modification
12.2(11)JA	This command was introduced on the Cisco Aironet Access Point 1100 and the Cisco Aironet Access Point 1200.
12.3(11)T	This command was integrated into Cisco IOS Release 12.3(11)T and implemented on the following platforms: Cisco 2600XM, Cisco 2691, Cisco 2811, Cisco 2821, Cisco 2851, Cisco 3700, and Cisco 3800 series routers.

Examples

The following command adds the access point having the IP address 192.168.12.17 to the list of devices that use the local authentication server, using the shared key named shared256.

```
Router(config-radsrv)# nas 192.168.12.17 key shared256
```

Related Commands

Command	Description
block count	Configures the parameters for locking out members of a group to help protect against unauthorized attacks.
clear radius local-server	Clears the statistics display or unblocks a user.
debug radius local-server	Displays the debug information for the local server.
group	Enters user group configuration mode and configures shared setting for a user group.
radius-server host	Specifies the remote RADIUS server host.

Command	Description
radius-server local	Enables the access point or router to be a local authentication server and enters into configuration mode for the authenticator.
reauthentication time	Specifies the time (in seconds) after which access points or wireless-aware routers must reauthenticate the members of a group.
show radius local-server statistics	Displays statistics for a local network access server.
ssid	Specifies up to 20 SSIDs to be used by a user group.
user	Authorizes a user to authenticate using the local authentication server.
vlan	Specifies a VLAN to be used by members of a user group.

nasi authentication

To enable authentication, authorization, and accounting (AAA) authentication for NetWare Asynchronous Services Interface (NASI) clients connecting to a router, use the **nasi authentication** command in line configuration mode. To return to the default, as specified by the **aaa authentication nasi** command, use the **no** form of the command.

nasi authentication { **default** | *list-name* }

no nasi authentication { **default** | *list-name* }

Syntax Description	default	Uses the default list created with the aaa authentication nasi command.
	<i>list-name</i>	Uses the list created with the aaa authentication nasi command.

Defaults Uses the default set with the **aaa authentication nasi** command.

Command Modes Line configuration

Command History	Release	Modification
	11.1	This command was introduced.
	12.2(15)T	This command is no longer supported in Cisco IOS Mainline or Technology-based (T) releases. It may continue to appear in 12.2S-family releases.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines This command is a per-line command used with AAA authentication that specifies the name of a list of authentication methods to try at login. If no list is specified, the default list is used, even if it is not specified in the command line. (You create defaults and lists with the **aaa authentication nasi** command.) Entering the **no** form of this command has the same effect as entering the command with the **default** argument.

Caution

If you use a *list-name* value that was not configured with the **aaa authentication nasi** command, you will disable login on this line.

Before issuing this command, create a list of authentication processes by using the **aaa authentication nasi** global configuration command.

Examples The following example specifies that the default AAA authentication be used on line 4:

```
line 4
  nasi authentication default
```

The following example specifies that the AAA authentication list called *list1* be used on line 7:

```
line 7
  nasi authentication list1
```

Related Commands

Command	Description
aaa authentication nasi	Specifies AAA authentication for NASI clients connecting through the access server.
ipx nasi-server enable	Enables NASI clients to connect to asynchronous devices attached to a router.
show ipx nasi connections	Displays the status of NASI connections.
show ipx spx-protocol	Displays the status of the SPX protocol stack and related counters.

nat (IKEv2 profile)

To configure Network Address Translation (NAT) keepalive for Internet Key Exchange Version 2 (IKEv2), use the **nat** command in IKEv2 profile configuration mode. To delete NAT keepalive configuration, use the **no** form of this command.

nat keepalive *interval*

no nat keepalive

Syntax Description	keepalive <i>interval</i>	Specifies the NAT keepalive interval in seconds.
--------------------	---------------------------	--

Command Default	NAT keepalive is disabled.
-----------------	----------------------------

Command Modes	IKEv2 profile configuration (config-ikev2-profile)
---------------	--

Command History	Release	Modification
	15.1(1)T	This command was introduced.
	Cisco IOS XE Release 3.3S.	This command was integrated into Cisco IOS XE Release 3.3S.

Usage Guidelines	Use this command to configure NAT keepalive. NAT keepalive configuration specified in an IKEv2 profile overrides the global configuration. NAT keepalive prevents the NAT translation entries from deletion in the absence of any traffic when there is NAT between IKE peers.
------------------	--

Examples	The following example shows how to specify the NAT keepalive interval:
----------	--

```
Router(config)# crypto ikev2 profile prf1
Router(config-ikev2-profile)# nat keepalive 500
```

Related Commands	Command	Description
	crypto ikev2 nat	Defines NAT keepalive globally for all peers.
	crypto ikev2 profile	Defines an IKEv2 profile.

nbns-list

To enter the webvpn NBNS list configuration mode to configure a NetBIOS Name Service (NBNS) server list for Common Internet File System (CIFS) name resolution, use the **nbns-list** command in webvpn context configuration mode. To remove the NBNS server list from the SSL VPN context configuration, use the **no** form of this command.

nbns-list *name*

no nbns-list *name*

Syntax Description	<i>name</i>	Name of the NBNS list. The name can be up to 64 characters in length. This argument is case sensitive.
---------------------------	-------------	--

Command Default Webvpn NBNS list configuration mode is not entered, and a NBNS server list cannot be configured.

Command Modes Webvpn context configuration

Command History	Release	Modification
	12.4(6)T	This command was introduced.

Usage Guidelines The NBNS server list is used to configure a list of Windows Internet Name Service (WINS) to resolve Microsoft file-directory shares. Entering the **nbns-list** command places the router in webvpn NBNS list configuration mode. You can specify up to three NetBIOS name servers. A single server is configured as the master browser if multiple servers are specified in the server list.

Note

NBNS and CIFS resolution is supported only on Microsoft Windows 2000 or Linux Samba servers.

Examples The following example configures an NBNS server list:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# nbns-list SERVER_LIST
Router(config-webvpn-nbnslist)# nbns-server 172.16.1.1 master
Router(config-webvpn-nbnslist)# nbns-server 172.16.2.2 timeout 10 retries 5
Router(config-webvpn-nbnslist)# nbns-server 172.16.3.3 timeout 10 retries 5
Router(config-webvpn-nbnslist)#
```

Related Commands

Command	Description
nbns-server	Adds a server to an NBNS server list.
webvpn context	Enters webvpn context configuration mode to configure the SSL VPN context.

nbns-list (policy group)

To attach a NetBIOS name service (NBNS) server list to a policy group configuration, use the **nbns-list** command in webvpn group policy configuration mode. To remove the NBNS server list from the policy group configuration, use the **no** form of this command.

nbns-list *name*

no nbns-list

Syntax Description	<i>name</i>	Name of the NBNS server list that was configured in webvpn context configuration mode.
---------------------------	-------------	--

Command Default An NBNS server list is not attached to a policy group configuration.

Command Modes Webvpn group policy configuration

Command History	Release	Modification
	12.4(6)T	This command was introduced.

Usage Guidelines The configuration of this command applies to only clientless mode configuration.

Examples The following example applies the NBNS server list to the policy group configuration:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# nbns-list SERVER_LIST
Router(config-webvpn-nbnslist)# nbns-server 172.16.1.1 master
Router(config-webvpn-nbnslist)# nbns-server 172.16.2.2 timeout 10 retries 5
Router(config-webvpn-nbnslist)# nbns-server 172.16.3.3 timeout 10 retries 5
Router(config-webvpn-nbnslist)# exit
Router(config-webvpn-context)# policy group ONE
Router(config-webvpn-group)# nbns-list SERVER_LIST
Router(config-webvpn-group)#
```

Related Commands	Command	Description
	nbns-list	Enters webvpn NBNS list configuration mode to configure a NBNS server list for CIFS name resolution.
	nbns-server	Adds a server to an NBNS server list.
	policy group	Enters webvpn group policy configuration mode to configure a group policy.
	webvpn context	Enters webvpn context configuration mode to configure the SSL VPN context.

nbns-server

To add a server to a NetBIOS name service (NBNS) server list, use the **nbns-server** command in webvpn NBNS list configuration mode. To remove the server entry from the NBNS server list, use the **no** form of this command.

```
nbns-server ip-address [master] [timeout seconds] [retries number]
```

```
no nbns-server ip-address [master] [timeout seconds] [retries number]
```

Syntax Description

<i>ip-address</i>	The IPv4 address of the NetBIOS server.
master	(Optional) Configures a single NetBIOS server as the master browser.
timeout <i>seconds</i>	(Optional) Configures the length of time, in seconds, that the networking device will wait for a query reply before sending a query to another NetBIOS server. A number from 1 through 30 can be configured for this argument.
retries <i>number</i>	(Optional) Number of times that the specified NetBIOS server will be queried. A number from 0 through 10 can be configured for this argument. Entering the number 0 configures the networking device not to resend a query.

Command Default

The following default values are used if this command is not configured or if the **no** form is entered:

```
timeout 2
```

```
retries 2
```

Command Modes

Webvpn NBNS list configuration

Command History

Release	Modification
12.4(6)T	This command was introduced.

Usage Guidelines

The server specified with the *ip-address* argument can be a primary domain controller (PDC) in a Microsoft network. A Windows Internet Naming Service (WINS) server cannot and should not be specified. When multiple NBNS servers are specified, a single server is configured as master browser.

Examples

The following example adds three servers to an NBNS server list:

```
Router(config)# webvpn context context1
Router(config-webvpn-context)# nbns-list SERVER_LIST
Router(config-webvpn-nbnslist)# nbns-server 172.16.1.1 master
Router(config-webvpn-nbnslist)# nbns-server 172.16.2.2 timeout 10 retries 5
Router(config-webvpn-nbnslist)# nbns-server 172.16.3.3 timeout 10 retries 5
```

Related Commands

Command	Description
nbns-list	Enters webypn NBNS list configuration mode to configure a NBNS server list for CIFS name resolution.
webypn context	Enters webypn context configuration mode to configure the SSL VPN context.

netmask

To specify the subnet mask to be used by the client for local connectivity, use the **netmask** command in ISAKMP group configuration mode or IKEv2 authorization policy configuration mode. To disable the mask, use the **no** form of this command.

netmask *mask*

no netmask *mask*

Syntax Description

<i>mask</i>	Subnet mask address.
-------------	----------------------

Command Default

Default mask is used.

Command Modes

ISAKMP group configuration (config-isakmp-group)
IKEv2 authorization policy configuration (config-ikev2-author-policy)

Command History

Release	Modification
12.2(8)T	This command was introduced on the Easy VPN remote.
Cisco IOS XE Release 3.3S	This command was integrated into Cisco IOS XE Release 3.3S.

Usage Guidelines

Use this command to specify the subnet mask for the IP address assigned to the client.

Examples

The following example shows that the subnet mask 255.255.255.255 is to be downloaded to the client:

```
crypto isakmp client configuration group group1
 netmask 255.255.255.255
```

Related Commands

Command	Description
crypto ikev2 authorization policy	Specifies an IKEv2 authorization policy group.
crypto isakmp client configuration group	Specifies the DNS domain to which a group belongs.

no crypto engine software ipsec

To disable hardware crypto engine failover to the software crypto engine, use the **no crypto engine software ipsec** command in global configuration mode. To reenable failover, use the **crypto engine software ipsec** form of this command.

no crypto engine software ipsec

crypto engine software ipsec

Syntax Description This command has no arguments or keywords.

Defaults Failover is enabled.

Command Modes Global configuration

Command History

Release	Modification
12.1E	This command was introduced.
12.3(14)T	This command was integrated into Cisco IOS Release 12.3(14)T.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines

Use this command for those situations in which the amount of IP Security (IPSec) traffic is more than can be handled (because of bandwidth) by the software routines on the CPU.

Examples

The following example shows that hardware crypto engine failover to the software crypto engine has been disabled:

```
no crypto engine software ipsec
```

The following example shows that hardware crypto engine failover has been reenabled:

```
crypto engine software ipsec
```

Related Commands

Command	Description
crypto engine accelerator	Enables the onboard hardware accelerator of the router for IPSec encryption.

no crypto xauth

To ignore extended authentication (Xauth) during an Internet Key Exchange (IKE) Phase 1 negotiation, use the **no crypto xauth** command in global configuration mode. To consider Xauth proposals, use the **crypto xauth** command.

no crypto xauth *interface*

crypto xauth *interface*

Syntax Description	<i>interface</i>	Interface whose IP address is the local endpoint to which the remote peer will send IKE requests.
---------------------------	------------------	---

Defaults	No default behaviors or values
-----------------	--------------------------------

Command Modes	Global configuration (config)
----------------------	-------------------------------

Command History	Release	Modification
	12.2(15)T	This command was introduced.
Cisco IOS XE Release 2.6	This command was integrated into Cisco IOS XE Release 2.6.	

Usage Guidelines	The no version of this command was introduced to support Unity clients that do not require Xauth when using Internet Security Association and Key Management Protocol (ISAKMP) profiles.
-------------------------	---

Note

This command does not support loopback interfaces.

Examples	The following example shows that Xauth proposals on Ethernet 1/1 are to be ignored: no crypto xauth Ethernet1/1
-----------------	--

no ip inspect

To turn off Context-based Access Control (CBAC) completely at a firewall, use the **no ip inspect** command in global configuration mode.

no ip inspect

Syntax Description This command has no arguments or keywords.

Defaults No default behavior or values.

Command Modes Global configuration

Command History

Release	Modification
11.2 P	This command was introduced.
12.2(33)SRA	This command was integrated into Cisco IOS release 12.(33)SRA.
12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines Turn off CBAC with the **no ip inspect** global configuration command.

Note

The **no ip inspect** command removes all CBAC configuration entries and resets all CBAC global timeouts and thresholds to the defaults. All existing sessions are deleted and their associated access lists are removed.

Examples The following example turns off CBAC at a firewall:

```
no ip inspect
```

no ip ips sdf builtin

To instruct the router not to load the built-in signatures if it cannot find the specified signature definition files (SDFs), use the **no ip ips sdf builtin** command in global configuration mode.

no ip ips sdf builtin

Syntax Description

This command has no arguments or keywords.

Defaults

If the router fails to load the SDF, the router will load the default, built-in signatures.

Command Modes

Global configuration

Command History

Release	Modification
12.3(8)T	This command was introduced.

Usage Guidelines

Caution

If the **no ip ips sdf builtin** command is issued and the router running Intrusion Prevention System (IPS) fails to load the SDF, you will receive an error message stating that IPS is completely disabled.

Examples

The following example shows how to instruct the router not to refer to the default, built-in signature if the attack-drop.sdf file fails to load:

```
Router(config) no ip ips sdf builtin
```

Related Commands

Command	Description
copy ips-sdf	Loads or saves the SDF in the router.
ip ips sdf location	Specifies the location in which the router will load the SDF.

object-group (Catalyst 6500 series switches)

To define object groups that you can use to optimize your configuration, use the **object-group** global configuration mode command. To remove object groups from the configuration use the **no** form of this command .

object-group ip {{address *obj-grp-id*} | {port *obj-grp-id*}}

no object-group ip {{address *obj-grp-id*} | {port *obj-grp-id*}}

Syntax Description

ip	Specifies the IP object group.
address <i>obj-grp-id</i>	Specifies the IP address of the object group and allows you to define the object group name and enter IP-address object-group configuration mode. See the “Usage Guidelines” section for more information.
port <i>obj-grp-id</i>	Specifies the IP port of the object group and allows you to create or modify a PBACL protocol port object group. See the “Usage Guidelines” section for more information.

Command Default

This command has no default settings.

Command Modes

The following table shows the modes in which you can enter the command:

Command Mode	Firewall Mode		Security Context		
	Routed	Transparent	Single	Multiple	
				Context	System
Global configuration	Yes	Yes	Yes	Yes	No

Command History

Release	Modification
12.2(33)SXH	This command was introduced on the Catalyst 6500 series switches.

Usage Guidelines

This command supports IPv4 and IPv6 addresses.

Objects such as hosts, protocols, or services can be grouped, and then you can issue a single command using the group name to apply to every item in the group.

When you define a group with the **object-group** command and then use any security appliance command, the command applies to every item in that group. This feature can significantly reduce your configuration size.

Once you define an object group, you must use the **object-group** keyword before the group name in all applicable security appliance commands as follows:

```
Router# show running-config object-group group-name
```

where group-name is the name of the group.

This example shows the use of an object group once it is defined:

```
Router(config)# access-list access_list_name permit tcp any object-group group-name
```

In addition, you can group access list command arguments:

Individual Argument	Object Group Replacement
<i>protocol</i>	object-group <i>protocol</i>
<i>host and subnet</i>	object-group <i>network</i>
<i>service</i>	object-group <i>service</i>
<i>icmp-type</i>	object-group <i>icmp-type</i>

You can group commands hierarchically; an object group can be a member of another object group.

To use object groups, you must do the following:

- Use the **object-group** keyword before the object group name in all commands as follows:

```
Router(config)# access-list acl permit tcp object-group remotes object-group locals  
object-group eng-svc
```

where **remotes** and **locals** are sample object group names.

- The object group must be nonempty.
- You cannot remove or empty an object group if it is being used in a command.

Use the **exit**, **quit**, or any valid config-mode commands such as **access-list** to close an object-group mode and exit the object-group main command.

The **show running-config object-group** command displays all defined object groups by their grp-id when the **show running-config object-group group-id** command is entered, and by their group type when you enter the **show running-config object-group group-type** command. When you enter the **show running-config object-group** command without an argument, all defined object groups are shown.

Use the **clear configure object-group** command to remove a group of previously defined **object-group** commands. Without an argument, the **clear configure object-group** command lets you to remove all defined object groups that are not being used in a command. Use of the *group-type* argument removes all defined object groups that are not being used in a command for that group type only.

You can use all other security appliance commands in an object-group mode, including the **show running-config** and **clear configure** commands

Commands within the object-group mode appear indented when displayed or saved by the **show running-config object-group**, **write**, or **config** commands.

Commands within the object-group mode have the same command privilege level as the main command.

When you use more than one object group in an **access-list** command, the elements of all object groups that are used in the command are linked, starting with the elements of the first group with the elements of the second group, then the elements of the first and second groups together with the elements of the third group, and so on.

The starting position of the description text is the character right immediately following the white space (a blank or a tab) following the **description** keyword.

When you enter the **object-group ip address** command, the prompt changes to

```
Router(config-ipaddr-ogroup)#
```

and allows you to create or modify a PBACL protocol port object group.

The following IP address object-group configuration commands are available:

- **A.B.C.D**—Specifies the network address of the object-group members.
- **end**—Exits from configuration mode.
- **exit**—Exits from IP object-group configuration mode.
- **host address** or **host name**—Specifies the host address or name of the object-group member.
- **no**—Negates or sets the default values of a command.

Use the **no** form of the command to delete the object group with the specified name.

When you enter the **object-group ip port** command, the prompt changes to Router(config-port-ogroup)# and allows you to define the object group name and enter port object-group configuration mode. The following port object-group configuration commands are available:

- **end**—Exits from configuration mode.
- **eq number**—Matches only packets on a given port number; valid values are from 0 to 65535.
- **exit**—Exits from the IP object-group configuration mode.
- **gt number**—Matches only packets on a given port number; valid values are from 0 to 65535.
- **lt number**—Matches only packets with a lower port number; valid values are from 0 to 65535.
- **neq number**—Matches only packets with a lower port number; valid values are from 0 to 65535.
- **no**—Negates or sets default values of a command.
- **range number number**—Matches only packets in the range of port numbers; valid values are from 0 to 65535.

Use the **no** form of the command to delete the object group with the specified name.

Examples

This example shows how to create an object group with three hosts and a network address:

```
Router(config)# object-group ip address myAG
Router(config-ipaddr-pgroup)# host 10.20.20.1
Router(config-ipaddr-pgroup)# host 10.20.20.5
Router(config-ipaddr-pgroup)# 10.30.0.0 255.255.0.0
```

This example shows how to create a port object group that matches protocol port 100 and any port greater than 200, except 300:

```
Router(config)# object-group ip port myPG
Router(config-port-pgroup)# eq 100
Router(config-port-pgroup)# gt 200
Router(config-port-pgroup)# neq 300
```

Related Commands

Command	Description
clear configure object-group	Removes all the object group commands from the configuration.
group-object	Adds network object groups.
network-object	Adds a network object to a network object group.
port-object	Adds a port object to a service object group.
show running-config object-group	Displays the current object groups.

object-group network

To define network object groups for use in object group-based ACLs (OGACLs) and enter network object-group configuration mode (config-network-group), use the **object-group network** command in global configuration mode. To remove network object groups from the configuration, use the **no** form of this command.

object-group network *object-group-name*

no object-group network *object-group-name*

Syntax Description	<i>object-group-name</i>	Specifies a name for a network type of object group. <i>object-group-name</i> is a sequence of 1 to 64 characters consisting of letters, digits, underscores (_), dashes (-), or periods (.). <i>object-group-name</i> must start with a letter.
---------------------------	--------------------------	---

Command Default	No network object groups are created.
------------------------	---------------------------------------

Command Modes	Global configuration (config)
----------------------	-------------------------------

Command History	Release	Modification
	12.4(20)T	This command was introduced.
	15.0(1)M	This command was modified. The any command was added as a command in network object-group configuration mode.

Usage Guidelines	<p>A network object group is a group of any of the following objects: hostnames, host IP addresses, subnets, ranges of IP addresses, or existing network object groups. A network object group is an ordered list and can be used in an ACL or in other commands. You can use a single command using the group name to apply to every object in the group.</p>
-------------------------	--

This command supports only IPv4 addresses.

Commands within the network object-group mode appear indented when displayed or saved by the **write memory** or **show running-config** commands.

Commands within the network object-group mode have the same command privilege level as the main command.

When you enter the **object-group network** command, the command mode enters network object-group configuration mode (config-network-group) and allows you to populate or modify a network OGACL. The following commands are available in this mode:

- **any**—Specifies any IP address for an object group. The effect is to allow any IP address in the range of 0.0.0.0 to 255.255.255.255 to be used in an object group.
This command supports only IPv4 addresses.
- **description** *description-text*—Description of the object or object group (you can use up to 200 characters).
- **group-object** *nested-object-group-name*—Existing network object group (child) to be included in the current object group (parent).

The type of child object group must match that of the parent (for example, if you are creating a network object group, you must specify another network object group as the child).

You can use duplicated objects in an object group if it is because of the inclusion of group objects. For example, if object 1 is in both group A and group B, you can define a group C that includes both A and B. However, you cannot include a group object that causes the group hierarchy to become circular (for example, you cannot include group A in group B and then also include group B in group A).

You can use an unlimited number of nested object groups (however, a maximum of two levels is recommended).

- **host** {*host-address* | *host-name*}—Host object. If you specify a host address, you must use an IPv4 address.
- **network-address** {*/nn* | *network-mask*}—Specifies a subnet object for the object group.

When the command is used in the network-address /nn format to create a subnet object, for example 209.165.201.0 /27, the 27 most significant bits are allocated for the network prefix number, and the remaining 5 bits are reserved for host addressing. If the same subnet object is created using the network-address network-mask format of the command, the command appears as 209.165.201.31 255.255.255.224. In this case, the subnet mask is 255.255.255.224. The default subnet mask is 255.255.255.255.

Using a subnet mask of 0.0.0.0 includes any address in the range 0.0.0.0 to 255.255.255.255 in the subnet object—this gives the subnet object the same range as the range specified by the **any** command.

The network-address command supports only IPv4 addresses.

- **range** *host-address1* *host-address2*—Species the range of host IP addresses for an object group.
If the range specified is 0.0.0.0 to 255.255.255.255 this specifies that any IP address can be used as a host IP address—this has the same effect as the **any** command, which specifies that any IP address can be used.
If the same IP address is used for host-address1 and host-address2, the effect is the same as using the **host** command—the identical IP address specified becomes the single host IP address for the object group.

This command supports only IPv4 addresses.

Use the **no** form of the command to delete the object group with the specified name. (You cannot delete an object group that is being used within an ACL or a CPL policy.)

Examples

The following example shows how to configure a network object group named `my_network_object_group` that contains two hosts and a subnet as objects.

```
Router> enable
Router# configure terminal
Router(config)# object-group network my_network_object_group
Router(config-network-group)# host 10.20.20.1
Router(config-network-group)# host 10.20.20.5
Router(config-network-group)# 10.30.0.0 255.255.0.0
```

The following example shows how to configure a network object group named `sjc_ftp_servers` that contains two hosts, a subnet, and an existing object group (child) named `sjc_eng_ftp_servers` as objects.

```
Router> enable
Router# configure terminal
Router(config)# object-group network sjc_ftp_servers
Router(config-network-group)# host sjc.eng.ftp
Router(config-network-group)# host 172.23.56.195
Router(config-network-group)# 209.165.200.225 255.255.255.224
Router(config-network-group)# group-object sjc_eng_ftp_servers
```

The following example creates an object group called `printer_users` and specifies any IP address for the object group:

```
Router> enable
Router# configure terminal
Router(config)# object-group network printer_users
Router(config-network-group)# description sw_engineers
Router(config-network-group)# any
```

The following example creates an object group called `printer_users` and specifies a range of host IP addresses from 209.165.202.129 to 255.255.255.255 for the object group:

```
Router> enable
Router# configure terminal
Router(config)# object-group network printer_users
Router(config-network-group)# description sw_engineers
Router(config-network-group)# range 209.165.202.129 255.255.255.255
```

Related Commands

Command	Description
deny	Sets conditions in a named IP access list or OGACL that will deny packets.
ip access-group	Applies an ACL or OGACL to an interface or a service policy map.
ip access-list	Defines an IP access list or OGACL by name or number.
object-group service	Defines service object groups for use in OGACLs.
permit	Sets conditions in a named IP access list or OGACL that will permit packets.
show ip access-list	Displays the contents of IP access lists or OGACLs.
show object-group	Displays information about object groups that are configured.

object-group service

To define service object groups for use in object group-based ACLs (OGACLs), use the **object-group service** command in global configuration mode. To remove service object groups from the configuration, use the **no** form of this command.

object-group service *object-group-name*

no object-group service *object-group-name*

Syntax Description

object-group-name Specifies a service type of object group.

Command Default

No service object groups are created.

Command Modes

Global configuration (config)

Command History

Release	Modification
12.4(20)T	This command was introduced.

Usage Guidelines

A service object group is a group of any of the following objects:

- Source and destination protocol ports (such as Telnet or SNMP)
- ICMP types (such as echo, echo-reply, or host-unreachable)
- Top-level protocols (such as TCP, UDP, or ESP)
- Existing service object groups

A service object group is an ordered list and can be used in an ACL or other commands. You can use a single command using the group name to apply to every object in the group.

This command supports only IPv4 addresses.

Commands within the service object-group mode appear indented when displayed or saved by the **write** or **config** commands.

Commands within the service object-group mode have the same command privilege level as the main command.

When you use more than one object group in an **access-list** command, the elements of all object groups that are used in the command are linked, starting with the elements of the first group with the elements of the second group, then the elements of the first and second groups together with the elements of the third group, and so on.

When you enter the **object-group service** command, the prompt changes to `Router(config-service-group)#` and allows you to populate or modify a service OGACL. The following commands are available in this mode:

- **description** *description-text*—Description of the object or object group (you can use up to 200 characters).

- *protocol*—(Required) Specifies an IP protocol number or name. You can use any one of the following values:
 - *number*—IP protocol number. The range is 0 to 255.
 - **ahp**—Authentication Header Protocol.
 - **eigrp**—Cisco EIGRP routing protocol.
 - **esp**—Encapsulation Security Payload.
 - **gre**—Cisco GRE tunneling.
 - **igmp**—Internet Gateway Message Protocol.
 - **ip**—Any Internet Protocol.
 - **ipinip**—IP in IP tunneling.
 - **nos**—KA9Q NOS compatible IP over IP tunneling.
 - **ospf**—OSPF routing protocol.
 - **pcp**—Payload Compression Protocol.
 - **pim**—Protocol Independent Multicast.
- **tcp | udp | tcp-udp** [**source** { {[**eq**] | [**lt**] | [**gt**] } *port1* | **range** *port1 port2*}] {[**eq**] | [**lt**] | [**gt**] } *port1* | **range** *port1 port2*]
—Transmission Control Protocol, User Datagram Protocol, or both.
 - **source**—Specifies a source port or ports. Specifying a source port or ports is optional, but when specifying them, the **source** keyword is required. Specifying a destination port or ports is optional. To specify destination ports, you specify an optional or required operator and a port value or values.
 - *operator port1* [*port2*]
—Use the following operator keywords to specify a port value or a range of ports:
 - eq**—Single port value *port1*. When no *operator* is specified, the default is **eq**. However, this keyword is always present in the configuration file.
 - The following keywords are required when specifying a range of ports.
 - range**—Range of ports between *port1* and *port2*, inclusive.
 - lt**—All port values that are less than *port1*.
 - gt**—All port values that are greater than *port1*.
 - *port1* [*port2*]
—Decimal number or name of a TCP and/or UDP service. The value of the number ranges from 0 to 65535. If a name is specified, the name must be one of the supported TCP or UDP port name (or both). If a number is specified, translation to its corresponding name (if one exists) based on the protocol type will be made when showing the object configuration.

Following are the supported services for TCP:

- 0-65535**—Port number.
- bgp**—Border Gateway Protocol (179).
- chargen**—Character generator (19).
- cmd**—Remote commands (rcmd, 514).
- daytime**—Daytime (13).
- discard**—Discard (9).
- domain**—Domain Name Service (53).

drip—Dynamic Routing Information Protocol (3949).

echo—Echo (7).

exec—Exec (rsh, 512).

finger—Finger (79).

ftp—File Transfer Protocol (21).

ftp-data—FTP data connections (20).

gopher—Gopher (70).

hostname—NIC hostname server (101).

ident—Ident Protocol (113).

irc—Internet Relay Chat (194).

klogin—Kerberos login (543).

kshell—Kerberos shell (544).

login—Login (rlogin, 513).

lpd—Printer service (515).

nntp—Network News Transport Protocol (119).

pim-auto-rp PIM Auto-RP (496).

pop2—Post Office Protocol v2 (109).

pop3—Post Office Protocol v3 (110).

smtplib—Simple Mail Transport Protocol (25).

sunrpc—Sun Remote Procedure Call (111).

tacacs—TAC Access Control System (49).

talk—Talk (517).

telnet—Telnet (23).

time—Time (37).

uucp—Unix-to-Unix Copy Program (540).

whois—Nicname (43).

www—World Wide Web (HTTP, 80).

Following are the supported services for UDP:

0-65535—Port number.

biff—Biff (mail notification, comsat, 512).

bootpc—Bootstrap Protocol (BOOTP) client (68).

bootps—Bootstrap Protocol (BOOTP) server (67).

discard—Discard (9).

dnsix—DNSIX security protocol auditing (195).

domain—Domain Name Service (DNS, 53).

echo—Echo (7).

isakmp—Internet Security Association and Key Management Protocol (500).

mobile-ip—Mobile IP registration (434).

nameserver—IEN116 name service (obsolete, 42).
netbios-dgm—NetBios datagram service (138).
netbios-ns—NetBios name service (137).
netbios-ss—NetBios session service (139).
non500-isakmp Internet Security Association and Key Management Protocol (4500).
ntp—Network Time Protocol (123).
pim-auto-rp—PIM Auto-RP (496).
rip—Routing Information Protocol (router, in.routed, 520).
snmp—Simple Network Management Protocol (161).
snmptrap—SNMP Traps (162).
sunrpc—Sun Remote Procedure Call (111).
syslog—System Logger (514).
tacacs—TAC Access Control System (49).
talk—Talk (517).
tftp—Trivial File Transfer Protocol (69).
time—Time (37).
who—Who service (rwho, 513).

xdmcp—X Display Manager Control Protocol (177).

Following are the supported services for TCP and UDP:

0-65535—Port number.

discard—Discard (9).

domain—Domain Name Service (53).

echo—Echo (7).

pim-auto-rp—PIM Auto-RP (496).

sunrpc—Sun Remote Procedure Call (111).

syslog—Syslog (514).

tacacs—TAC Access Control System (49).

talk—Talk (517).

- **icmp** *icmp-type*—Decimal number or name of an Internet Control Message Protocol (ICMP) type:

Following are the supported ICMP types:

- **0-65535**—Port number.
- **alternate-address**—Alternate address.
- **conversion-error**—Datagram conversion.
- **echo**—Echo (ping).
- **echo-reply**—Echo reply.
- **information-reply**—Information replies.
- **information-request**—Information requests.
- **mask-reply**—Mask replies.

- **mask-request**—Mask requests.
- **mobile-redirect**—Mobile host redirect.
- **parameter-problem**—All parameter problems.
- **redirect**—All redirects.
- **router-advertisement**—Router discovery advertise.
- **router-solicitation**—Router discovery solicitations.
- **source-quench**—Source quenches.
- **time-exceeded**—All time exceeded.
- **timestamp-reply**—Timestamp replies.
- **timestamp-request**—Timestamp requests.
- **traceroute**—Traceroute.
- **unreachable**—All unreachables.
- **group-object** *nested-object-group-name*—Existing network object group (child) to be included in the current object group (parent).

The type of child object group must match that of the parent (for example, if you are creating a network object group, you must specify another network object group as the child).

You can use duplicated objects in an object group if it is because of the inclusion of group objects. For example, if object 1 is in both group A and group B, you can define a group C that includes both A and B. However, you cannot include a group object that causes the group hierarchy to become circular (for example, you cannot include group A in group B and then also include group B in group A).

You can use an unlimited number of nested object groups (however, a maximum of two levels is recommended).

Use the **no** form of the command to delete the object group with the specified name. (You cannot delete an object group that is being used within an ACL or a CPL policy.)

Examples

This example shows how to create a service object group that matches protocol port 100 and any port greater than 200, except 300:

```
Router> enable
Router# configure terminal
Router(config)# object-group service my_service_object_group
Router(config-service-group)# eq 100
Router(config-service-group)# gt 200
Router(config-service-group)# neq 300
```

Related Commands

Command	Description
deny	Sets conditions in a named IP access list or OGACL that will deny packets.
ip access-group	Applies an ACL or OGACL to an interface or a service policy map.
ip access-list	Defines an IP access list or OGACL by name or number.
object-group network	Defines network object groups for use in OGACLs.
permit	Sets conditions in a named IP access list or OGACL that will permit packets.

Command	Description
show ip access-list	Displays the contents of IP access lists or OGACLs.
show object-group	Displays information about object groups that are configured

occur-at (ips-auto-update)

To define a preset time for which the Cisco IOS Intrusion Prevention System (IPS) automatically obtains updated signature information, use the **occur-at** command in IPS-auto-update configuration mode.

occur-at {[monthly | weekly] day minutes hours}

Syntax Description

monthly	Monthly update option in days of the month from 1 to 31, minutes from the top of the hour from 0 to 59 and hours of the day from 0 to 23, in which automatic signature updates occur.
weekly	Weekly update option in days of the week from 0 to 6, minutes from the top of the hour from 0 to 59 and hours of the day from 0 to 23, in which automatic signature updates occur.

Command Default

The default value is defined in the signature definition XML.

Command Modes

IPS-auto-update configuration (config-ips-auto-update)

Command History

Release	Modification
12.4(11)T	This command was introduced.
12.4(22)T	The command was modified with the monthly and weekly keywords in Cisco IOS Release 12.4(22)T.

Usage Guidelines

Automatic signature updates allow users to override the existing IPS configuration and automatically keep signatures up to date on the basis of a preset time, which can be configured to a preferred setting.

Use the **ip ips auto-update** command to enable Cisco IOS IPS to automatically update the signature file on the system. Thereafter, issue the **occur-at** command to define how often the Cisco IOS IPS signature files should be automatically updated.

Examples

The following example shows how to configure automatic signature updates and set the frequency in which updates are made. In this example, the signature package file is pulled from the TFTP server at the third hour of the 5 day of the month, at the 56th minute of this hour.

Note

Adjustments are made for months without 31 days and daylight savings time.

```
Router# clock set ?

Related Commands

Command	Description
ip ips auto-update	Enables automatic signature updates for Cisco IOS IPS.
cisco	Enables automatic signature updates from Cisco.com.

ocsp url

To specify the URL of an online certificate status protocol (OCSP) server to override the OCSP server URL (if one exists) in Authority Info Access (AIA) extension of the certificate, use the **ocsp url** command in ca-trustpoint configuration mode. To disable the OCSP server, use the **no** form of this command.

ocsp url *url*

no ocsp url *url*

Syntax Description

<i>url</i>	All certificates associated with a configured trustpoint will be checked by the OCSP server at the specified HTTP URL.
------------	--

Defaults

Uses the OCSP server URL in AIA extension of the certificate. If a URL does not exist, revocation check will fail.

Command Modes

Ca-trustpoint configuration

Command History

Release	Modification
12.3(2)T	This command was introduced.

Usage Guidelines

A central OCSP server can be configured to collect and update certificate revocation lists (CRLs) from different certification authority (CA) servers. Thus, the devices within the network can rely on the OCSP server to check the certificate status without retrieving and caching each CRL for every device.

Examples

The following example shows how to configure your router to use the OCSP server at the HTTP URL "http://myocspserver:81." If the server is down, revocation check will be ignored.

```
Router(config)# crypto pki trustpoint mytp
Router(ca-trustpoint)# ocsp url http://myocspserver:81
Router(ca-trustpoint)# revocation-check ocsp none
```

Related Commands

Command	Description
crypto pki trustpoint	Declares the CA that your router should use.
revocation-check	Checks the revocation status of a certificate.

on

To specify the location where Rivest, Shamir, and Adelman (RSA) keys will be generated upon initial auto enrollment, use the **on** command in ca-trustpoint configuration mode.

on *devicename*:

Syntax Description

<i>devicename</i> :	Specifies the RSA key storage device.
---------------------	---------------------------------------

Command Default

Keys are generated and stored in NVRAM.

Command Modes

Ca-trustpoint

Command History

Release	Modification
12.4(11)T	This command was introduced.

Usage Guidelines

Locations that may be specified include a USB token, local disk, or NVRAM.

A USB token may be used as a cryptographic device in addition to a storage device. Using a USB token as a cryptographic devices allows RSA operations such as key generation, signing, and authentication to be performed on the token. Private keys are not distributed and remain on the token by default, however you may configure the private key storage location.

Keys that reside on a USB token, or on-token keys, are saved to persistent token storage when they are generated. Key deletion will remove the on-token keys from persistent storage immediately. (Keys that do not reside on a token are saved to or deleted from non-token storage locations only when the **write memory** or similar command is issued.)

Examples

The following example shows the configuration for the “mytp-A” certificate server and its associated trustpoint, where RSA keys generated by the initial auto enrollment for the trustpoint will be stored on a USB token, “usbtoken0”:

```
crypto pki server mytp-A
  database level complete
  issuer-name CN=company, L=city, C=country
  grant auto
! Specifies that certificate requests will be granted automatically.
!

crypto pki trustpoint mytp-A
  revocation-check none
  rsakeypair myTP-A
  storage usbtoken0:
! Specifies that keys will be stored on usbtoken0:.
  on usbtoken0:
! Specifies that keys generated on initial auto enroll will be generated on and stored on
! usbtoken0:
```

Related Commands

Command	Description
crypto key generate rsa	Generates RSA key pairs.
crypto key import rsa	Imports RSA key pairs.
crypto pki trustpoint	Declares the trustpoint that the router will use.

one-minute

To define the number of new unestablished sessions that will cause the system to start deleting half-open sessions and stop deleting half-open sessions, use the **one-minute** command in parameter-map type inspect configuration mode. To disable the value, use the **no** form of this command.

one-minute {*low number-of-connections* | **high** *number-of-connections*}

no one-minute {*low number-of-connections* | **high** *number-of-connections*}

Syntax Description	low <i>number-of-connections</i>	high <i>number-of-connections</i>
	Number of new unestablished sessions that will cause the system to stop deleting half-open sessions.	Number of new unestablished sessions that will cause the system to start deleting half-open sessions.

Command Default None

Command Modes Parameter-map type inspect configuration

Command History	Release	Modification
	12.4(6)T	This command was introduced.

Usage Guidelines When you are configuring an inspect type parameter map, you can enter the **one-minute** subcommand after you enter the **parameter-map type inspect** command.

Enter the **one-minute** command twice; once to specify a high number at which the system will start deleting half-open sessions, and once to specify a low number at which the system will stop deleting half-open sessions.

For more detailed information about creating a parameter map, see the **parameter-map type inspect** command.

Examples The following example causes the system to start deleting half-open sessions when there are 300 unestablished sessions, and to stop deleting half-open sessions when there are 400 unestablished systems:

```
parameter-map type inspect internet-policy
  one minute high 400
  one minute low 300
```

Related Commands

Command	Description
ip inspect one-minute high	Defines the rate of new unestablished sessions that will cause the software to start deleting half-open sessions.
ip inspect one-minute low	Defines the rate of new unestablished TCP sessions that will cause the software to stop deleting half-open sessions.
parameter-map type inspect	Configures an inspect parameter map for connecting thresholds, timeouts, and other parameters pertaining to the inspect action.

outgoing

To configure filtering for outgoing export traffic, use the **outgoing** command in router IP traffic export (RITE) configuration mode. To disable filtering for outgoing traffic, use the **no** form of this command.

outgoing {**access-list** {*standard* | *extended* | *named*} | **sample one-in-every** *packet-number*}

no outgoing {**access-list** {*standard* | *extended* | *named*} | **sample one-in-every** *packet-number*}

Syntax Description

access-list {*standard* | *extended* | *named*} An existing numbered (standard or extended) or named access control list (ACL).

Note The filter is applied only to exported traffic.

sample one-in-every *packet-number* Export only one packet out of every specified number of packets. Valid range for the *packet-number* argument is 2 to 2147483647 packets.

Defaults

If this command is not enabled, outgoing IP traffic is not exported.

Command Modes

RITE configuration

Command History

Release	Modification
12.3(4)T	This command was introduced.
12.2(25)S	This command was integrated into Cisco IOS Release 12.2(25)S.

Usage Guidelines

When configuring a network device for IP traffic export, you can issue the **outgoing** command to filter unwanted outgoing traffic via the following methods:

- ACLs, which accept or deny an IP packet for export
- Sampling, which allows you to export one in every few packets in which you are interested. Use this option when it is not necessary to export all incoming traffic. Also, sampling is useful when a monitored ingress interface can send traffic faster than the egress interface can transmit it.

Note

If you issue this command, you must also issue the **bidirectional** command, which enables outgoing traffic to be exported. However, only routed traffic (such as passthrough traffic) is exported; that is, traffic that originates from the network device is not exported.

Examples

The following example shows how to configure the profile “corp1,” which will send captured IP traffic to host “00a.8aab.90a0” at the interface “FastEthernet 0/1.” This profile is also configured to export one in every 50 packets and to allow incoming traffic only from the ACL “ham_ACL.”

```
Router(config)# ip traffic-export profile corp1
Router(config-rite)# interface FastEthernet 0/1
Router(config-rite)# bidirectional
```

```

Router(config-rite)# mac-address 00a.8aab.90a0
Router(config-rite)# outgoing sample one-in-every 50
Router(config-rite)# incoming access-list ham_acl
Router(config-rite)# exit
Router(config)# interface FastEthernet 0/0
Router(config-if)# ip traffic-export apply corp1
    
```

Related Commands

Command	Description
bidirectional	Enables incoming and outgoing IP traffic to be exported across a monitored interface.
ip traffic-export profile	Creates or edits an IP traffic export profile and enables the profile on an ingress interface.
incoming	Configures filtering for incoming IP traffic.
