

Installation and Release Notes for Cisco Performance Monitor 3.3

Revised: June 26, 2009
Text Part Number: OL-20053-01

When you purchase Cisco Security Manager 3.3 (Security Manager), your license grants you the right to download, install, and use Cisco Performance Monitor 3.3 (Performance Monitor).

Performance Monitor is a browser-based tool that monitors and troubleshoots the health and performance of services that contribute to network security. It helps you to isolate, analyze, and troubleshoot events in your network as they occur, so that you can increase service availability. Supported service types are remote-access VPN, site-to-site VPN, firewall, web server load-balancing, and proxied SSL.

This guide supplements the [Installation Guide for Cisco Security Manager 3.3](#) that you received with your copy of Security Manager. Although that guide does not describe any installation procedure for Performance Monitor specifically, it does describe a broad framework of prerequisites, best practices, checklists, troubleshooting tips, and other material to ensure that all of your Security Manager software—including Performance Monitor—can be installed successfully.

This guide contains:

- High-level descriptions of the hardware and software requirements for installation.
- High-level instructions for installing, upgrading to, and uninstalling Performance Monitor.
- Bug ID numbers, headlines, and descriptions for known problems that might affect you as a Performance Monitor user. If you access this document in HTML or PDF form, you can click any ID number to see the release note enclosure in the Bug Toolkit on Cisco.com. A release note enclosure contains symptoms, conditions, and workaround information.

Note

Before you install Performance Monitor, we recommend that you read and follow all of the relevant guidance in the Security Manager installation guide.

Americas Headquarters:

New and Changed Features in this Release

This section describes new and changed features in the Performance Monitor 3.3 release.

- Performance Monitor 3.3 supports the VPN Services Port Adaptor (VSPA) in backward compatibility mode with the VPN Shared Port Adaptor (VPN SPA). New features of the VSPA are not supported.

Installation Requirements

You can use Performance Monitor as a standalone product or install it on the same server with Security Manager, Cisco Auto Update Server (AUS), RME, or all three. In any of these installations, you must also install Common Services 3.2, or Performance Monitor cannot work.

Required Services and Ports

You must ensure that the following ports (as shown in [Table 1](#)) are opened and available for use by Performance Monitor.

Table 1 Ports and Services Used for Performance Monitor

Service	Protocol	Port
HTTP	TCP	1741
HTTPS	TCP	443
SNMP	UDP	161/162
SYSLOG	UDP	514
SYBASE	SYBASE	43453

**Note**

CiscoWorks Common Services 3.2 is required for Performance Monitor to work. You can install Performance Monitor only after you install Common Services from the Security Manager 3.3 installation DVD. Performance Monitor cannot coexist on a server with any patched or unpatched Common Services version earlier than 3.2. If you are upgrading to Performance Monitor 3.3 from an earlier version that does not use Common Services 3.2, you must upgrade Common Services to 3.2 before you upgrade Performance Monitor.

Requirements for installation and operation vary in relation to the presence of other software on your server and according to the way you use Performance Monitor.

You can install Performance Monitor on a Windows-based server that uses one CPU or multiple CPUs.

Table 2 describes server requirements and restrictions.

Table 2 **Installation Requirements and Restrictions**

Component	Requirement
System hardware	<ul style="list-style-type: none"> • IBM PC-compatible with a 2 GHz or faster processor. • Color monitor with at least 1024 x 768 resolution and a video card capable of 16-bit colors. • DVD-ROM drive. • 100BaseT (100 Mbps) or faster network connection; single interface only. • Keyboard. • Mouse.
System software	<p>Microsoft Windows 2003:^{1,2}</p> <ul style="list-style-type: none"> • Enterprise Edition with SP1 and SP2. • Standard Edition with SP1 and SP2. • R2 Enterprise Edition with SP1 and SP2. • R2 Standard Edition with SP1 and SP2. <p>Security Manager supports only the US-English and Japanese versions of Windows. From the Start Menu, open the Control Panel for Windows³, open the panel where you configure region and language settings⁴, then set the default locale. (We do not support English as the language in any Japanese version of Windows.)</p> <p>Microsoft ODBC Driver Manager 3.510 or later is also required, so your server can work with Sybase database files. To confirm the installed ODBC version, find and right-click ODBC32.DLL, then select Properties from the shortcut menu. The file version is listed under the Version tab.⁵</p>
Memory (RAM)	2 GB.
File system	NTFS.
Browser	<p>One of the following:</p> <ul style="list-style-type: none"> • Microsoft Internet Explorer 6.0 Service Pack 2. • Internet Explorer 7.0 • Firefox 2.0.
Compression software	WinZip 9.0 or compatible.

Table 2 *Installation Requirements and Restrictions (continued)*

Component	Requirement
Hard Drive Space	20 GB.
IP Address	One static IP address. The Performance Monitor installer displays a warning if it detects any dynamic IP addresses on the target server. Dynamic addresses are not supported. If the server has more than one IP address, you do not need to disable any of the multiple network interface cards before installation.

- To confirm the installed Windows version from the Start menu, select **Run**, then enter either **ver** or **winver**.
- Security Manager and its included applications is not supported on 64-bit Windows operating systems or on virtual machines such as VMware.
- To open the Control Panel for Windows from the Start Menu, you follow a path that varies according to your Windows version and configuration.
- The panel where you specify region and language settings for Windows has a name that varies according to your Windows version and configuration.
- Alternatively after you install Security Manager, select **Server > Admin** from the Common Services desktop, click **Selftest**, then click **Create**. When the table is refreshed, click the newest entry in the *SelfTest Server Information* column. When the “Server Info” window opens, scroll to the *odbc.pl* section to see the installed ODBC version.

Caution

Do not install this product on a primary or backup domain controller. We do not support any use of Common Services 3.2 on a Windows domain controller.

Do not install this product in an encrypted directory. Common Services 3.2 does not support directory encryption.

Do not install this product if Terminal Services is enabled in Application mode. In such a case, you must disable Terminal Services, then restart the server before you install. Common Services 3.2 supports only the Remote Administration mode for Terminal Services.

Scalability

The following table describes Performance Monitor scalability.

Table 3 *Cisco Performance Monitor Scalability*

Number of devices	Supports up to 500 devices, including security contexts.
Number of users	Supports up to 5 simultaneous users.
VPN restrictions	<ul style="list-style-type: none"> We recommend that you monitor only the hubs, not the spokes, in any hub-and-spoke VPNs that you monitor. We recommend that you monitor no more than 5,000 tunnels.

Installing Performance Monitor

Note

United States law requires Cisco Systems to limit access to any software that uses advanced encryption technologies. Therefore, you must have and use a Cisco.com user account to download the Performance Monitor installation utility.

You can install Performance Monitor on:

- A standalone server, after you install a supported version of Common Services.
- The same server on which you installed Security Manager, AUS, RME, or all three.

For related information, see [Installation Requirements, page 2](#).

The Performance Monitor installation utility does not include Common Services, which you must install before you install Performance Monitor. You must use the Security Manager installer included in your Security Manager 3.3 installation DVD to install Common Services. The Security Manager installer supports the installation of only Common Services if you do not want to run any other application on the server besides Performance Monitor, such as Security Manager or Auto Update Server. If you are installing Performance Monitor 3.3 on a server that has a version of Common Services other than 3.2 installed, you must upgrade Common Services to 3.2 before you install Performance Monitor.

The Performance Monitor license is a separate file from the Security Manager license file and includes the license for RME 4.2 too. The Security Manager media kit contains the Software License Claim Certificate for the Performance Monitor and RME. You can install the license either before or after you install Performance Monitor. For instructions on how to obtain and install the license file, see the *User Guide for CiscoWorks Common Services 3.2* at the following URL:

http://www.cisco.com/en/US/products/sw/cscowork/ps3996/products_user_guide_list.html.

You can install Performance Monitor from either the Security Manager DVD or Cisco.com. The following sections describe how to install and enter license details for Performance Monitor:

- [Installing from the DVD, page 5](#)
- [Installing from Cisco.com, page 6](#)
- [Updating License from the Common Services GUI, page 6](#)

Installing from the DVD

This procedure describes how to install Performance Monitor from the Security Manager installation DVD.

Procedure

-
- Step 1** Insert the DVD into the DVD-ROM drive.
- Step 2** From the mcp3_3 folder, double-click **Setup.exe** to start the installation utility.
- Step 3** Click **Yes** to confirm that you are installing Performance Monitor.
- Step 4** Follow the prompts in the installation wizard.
- Step 5** When you are prompted to select the licensing information, select one of the following:
- **License File Location**—Enter the full pathname of the license file or click **Browse** to find it. You can specify the permanent license file if you have previously staged it on the server.
 - **Evaluation Only**—Enables the free 90-day evaluation period.
-

Installing from Cisco.com

This procedure describes how to install Performance Monitor from Cisco.com

Procedure

-
- Step 1** Log in to your Cisco.com account at <http://www.cisco.com/cgi-bin/login>.
- Step 2** Go to <http://www.cisco.com/go/csmanager>, then click **Download Software**.
- Step 3** Download the installation utility for Performance Monitor, **fcs-mcp-33-win-k9.exe**.
- Step 4** To start the installation, double-click your downloaded copy of the utility, then follow the prompts.
- Step 5** When you are prompted to select the licensing information, select one of the following:
- **License File Location**—Enter the full pathname of the license file or click **Browse** to find it. You can specify the permanent license file if you have previously staged it on the server.
 - **Evaluation Only**—Enables the free 90-day evaluation period.
-

Updating License from the Common Services GUI

After you complete the installation, you can also use the License Information page of the Common Services GUI to enter the Performance Monitor license details. You can view details of your current software license, or update to a new license from the License page.

This procedure describes how to update to a new Performance Monitor license from the Licensing page.

Before You Begin

You should place your license file on the target server prior to installation. You will be prompted to select this file during installation.

Procedure

-
- Step 1** Log in to the Cisco Security Management Server desktop.
- Step 2** Click the Server Administration panel. The CiscoWorks home page is displayed.
- Step 3** From the CiscoWorks UI, select **Common Services > Server > Admin > Licensing**.
- The License Information page displays the license name, license version, status of the license, and the expiration date of the license.
- Step 4** Click **Update**.
- Enter the path to the new license file in the License field, or click **Browse** to locate the new file.
- Step 5** Click **OK**.
- The system verifies whether the license file is valid, and updates the license. The updated licensing information appears in the License Information page. Otherwise, an error message is displayed.
-

Uninstalling and Reinstalling Performance Monitor

Note

To learn which data files are essential to Common Services operation and understand how to archive that data, see the Common Services online help or read the documentation on Cisco.com. We recommend that you make back up copies of all essential data files from your server before you uninstall or reinstall Performance Monitor.

To uninstall or reinstall applications on your server, see:

- [Uninstalling Performance Monitor, page 7](#)
- [Reinstalling Performance Monitor, page 8](#)

Uninstalling Performance Monitor

Caution

A server that is infected with a virus might be unstable after you uninstall software from it and reboot. If your server is not stable after an uninstallation and reboot, we recommend that you scan it for viruses and other kinds of malware.

Before You Begin

If any version of Windows Defender (which was known in its public beta test versions as both Microsoft AntiSpyware and Giant AntiSpyware) is installed, disable it before you uninstall Performance Monitor. Otherwise, the uninstallation application cannot run.

- Step 1** Select **Start > Programs > Cisco Security Manager > Uninstall Cisco Security Manager** or **Start > Programs > Performance Monitor > Uninstall Performance Monitor** (if installed individually).
- Step 2** From the list of applications, select **Cisco Performance Monitor**.
- Step 3** (Optional) Select any other components to uninstall.
- Step 4** Click **Next** twice.

The uninstaller removes Performance Monitor and every other component that you selected.

Note

If a Windows command line prompt window is open in `\CSCOPx\bin` when you uninstall Performance Monitor, the uninstaller cannot delete `\CSCOPx\bin`. In this case, you can choose whether and how to delete the directory.

- Step 5** *Only after you uninstall* Performance Monitor, Common Services, and *all* related applications, assuming that you uninstall all server applications:
- If a folder exists at `C:\Program Files\CSCOPx`, delete, move, or rename the folder.
 - If the `C:\CMFLOCK.TXT` file exists, delete it.

- c. Use a Registry editor to delete these Registry entries before you reinstall Performance Monitor or any related applications:

- My Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Cisco\Resource Manager
- My Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Cisco\MDC

**Tip**

Although no reboot is required, we recommend that you reboot the server after an uninstallation so that Registry entries and running processes on the server are in a suitable state for a future reinstallation.

**Note**

If the uninstallation causes an error, see the “Troubleshooting and FAQs” chapter in *Installing and Getting Started With CiscoWorks LAN Management Solution 3.0*: http://www.cisco.com/en/US/products/sw/cscowork/ps3996/prod_installation_guides_list.html.

Step 6 If you disabled Windows Defender before uninstalling Performance Monitor, reenable it now.

Reinstalling Performance Monitor

**Caution**

Although the Security Manager installation utility performs a full, mandatory backup automatically if you use it to reinstall Security Manager, AUS, or Common Services, *no* such backup occurs when you use the Performance Monitor installation utility to reinstall Performance Monitor. We recommend that you follow the backup instructions in the Common Services online help before you reinstall Performance Monitor.

**Note**

- If you install Common Services and Performance Monitor on a server, then reinstall Common Services later, you must also reinstall Performance Monitor.
- During reinstallation, you might see a warning message that says:

The application that you are installing requires new tasks to be registered with ACS. If you have already registered this application with ACS from another server, you do not need to register it again. However if you re-register the application, you will lose any custom roles that you had created earlier for this application in ACS.

In this case, log in to your Cisco.com account and see “Impact of Installing CiscoWorks Applications in ACS Mode” in *Installing and Getting Started With CiscoWorks LAN Management Solution 3.0*, at http://www.cisco.com/en/US/products/sw/cscowork/ps3996/prod_installation_guides_list.html.

To reinstall Performance Monitor or related applications, see [Installing Performance Monitor, page 4](#).

Upgrading Performance Monitor

You can upgrade to Performance Monitor 3.3 from any of the following previous versions: 3.1, 3.2, 3.2.1, or 3.2.2. Performance Monitor supports two types of upgrades, namely, inline and backing up and restoring of data. Inline upgrade refers to running the installation for the version to which you want to upgrade without uninstalling the previous version of Performance Monitor from a server. Upgrade using backup and restore refers to backing up the database from the server running a previous version of Performance Monitor and restoring the backed up data on the server you want to upgrade after installing the later version of Performance Monitor. If you are performing an upgrade using the backup and restore method on the same server, you must uninstall the previous version after backing up the data and then perform restoration of the database after installing the new version.

When you upgrade from an earlier version of Performance Monitor to 3.3, both the evaluation and permanent licenses are preserved and hold good. If you want to update your existing license file, you must use the License Information page of the Common Services GUI. See [Updating License from the Common Services GUI, page 6](#) for more information.

Note

Performance Monitor 3.3 requires that you use Common Services 3.2. Therefore, if you upgrade from an earlier Performance Monitor version that does not use Common Services 3.2, the installed Common Services version must be upgraded to 3.2 before you upgrade Performance Monitor. You can use the Security Manager installer included in your Security Manager 3.3 installation DVD to upgrade Common Services.

The following sections describe the procedure to upgrade to Performance Monitor 3.3 using inline and backup and restore methods:

- [Upgrading to Performance Monitor 3.3 Using Inline Method, page 9](#)
- [Upgrading to Performance Monitor 3.3 by Backing Up and Restoring the Database, page 9](#)

Upgrading to Performance Monitor 3.3 Using Inline Method

To use the inline method to upgrade to Performance Monitor 3.3 on a server where Performance Monitor 3.1, 3.2, 3.2.1, or 3.2.2 is installed, first upgrade Common Services to 3.2 and then simply run the installer for Performance Manager 3.3. For step-by-step instructions, see [Installing Performance Monitor, page 4](#). You can use the Security Manager installer included in your Security Manager 3.3 installation DVD to upgrade Common Services.

Upgrading to Performance Monitor 3.3 by Backing Up and Restoring the Database

The following procedure describes how to back up the database on a server where Performance Monitor 3.1, 3.2, 3.2.1, or 3.2.2 is installed and restore it after installing Performance Monitor 3.3 on the server.

- Step 1** Create a backup of the database for Performance Monitor 3.1, 3.2, 3.2.1, or 3.2.2:
- Log in to the Cisco Security Management Server desktop.
 - Click the **Server Administration** panel. The CiscoWorks Common Services page is displayed.

- c. From the Server tab, select **Admin > Backup**.
- d. Complete the fields and click **Apply** to backup your data.

Note You cannot perform a backup of the database on Performance Monitor servers placed across sites or locations by using a mapped network drive.

- Step 2** Uninstall Performance Monitor 3.1, 3.2, 3.2.1, or 3.2.2. See [Uninstalling Performance Monitor, page 7](#).
- Step 3** Upgrade Common Services to 3.2. You can use the Security Manager installer included in your Security Manager 3.3 installation DVD to upgrade Common Services.
- Step 4** Install Performance Monitor 3.3. See [Installing Performance Monitor, page 4](#).
If you want to restore the backed up database on a different server than the one running Performance Monitor 3.1, 3.2, 3.2.1, or 3.2.2, skip [Step 4](#) and proceed to [Step 5](#).
- Step 5** Restore the database from the backup corresponding to the version to which you want to upgrade. See [Restoring the Performance Monitor Database, page 10](#).

Restoring the Performance Monitor Database

You can restore your database by running a script from the command line. You have to shut down and restart CiscoWorks while restoring data. This procedure describes how you can restore the backed up Performance Monitor database on your server. A single backup and restore facility exists to back up and restore all applications installed on a CiscoWorks server.; you cannot back up or restore individual applications on a CiscoWorks server. Make sure you have the correct permissions, and do the following.

Note

When you back up the Performance Monitor 3.3 database (with a permanent license) from one server to restore to a different server that has been inline-upgraded from Performance Monitor 3.1 to 3.3 with an evaluation license, the license that existed before the restore operation is retained. For more information (CSCso92580), log in to the Cisco Software Bug Toolkit at <http://www.cisco.com/cgi-bin/Support/Bugtool/home.pl>.

- Step 1** Stop all processes by entering the following at the command line:

```
net stop crmdmgt
```

- Step 2** Restore the database by entering:

```
NMSROOT\bin\perl NMSROOT\bin\restorebackup.pl [-t temporary_directory] [-gen generationNumber] [-d backup_directory] [-h]
```

where:

- *NMSROOT*—(Required) Environment variable containing full pathname of the Common Services installation directory (by default, C:\Program Files\CSCOpX, where C: is the System Drive).
- *[-gen generationNumber]*—Optional. By default, it is the latest generation. If generations 1 through 5 exist, then 5 will be the latest.
- *-t temporary_directory*—(Optional) This is the directory or folder used by the restore program to store its temporary files. By default this directory is *NMSROOT/tempBackupData*. You can customize this by specifying your own temporary directory to avoid overloading *NMSROOT*.

- **-d backup_directory**—(Required) The backup directory to use.
- **-h**—(Optional) Provides help. When used with **-d BackupDirectory**, shows correct syntax along with available suites and generations.

To restore the most recent version, enter the following command:

```
NMSROOT\bin\perl NMSROOT\bin\restorebackup.pl -d backup directory
```

For example, **-d drive:\var\backup**

Step 3 Examine the log file in the following location to verify that the database was restored by entering:

```
NMSROOT\log\restorebackup.log
```

Step 4 Restart the system by entering:

```
net start crmdmgt
```

Known Problems

This section describes problems known to exist in this release of Performance Monitor.

Note

- The problems and other issues in the following tables are known to affect Performance Monitor 3.3. However, some of the problems were found in releases of Monitoring Center for Performance 2.x, so their descriptions or headlines might contain obsolete terms and references. Any such terms and references apply to Performance Monitor as well.
- To obtain more information about known problems, click the ID number or use the Cisco Software Bug Toolkit at <http://www.cisco.com/cgi-bin/Support/Bugtool/home.pl>. (You will be prompted to log into Cisco.com.)

Table 4 Performance Monitor 3.3 Known Problems

CSCeb57907—Cannot import an SSL service module from a CSV file

Description: If you try to import a CSV file that contains the IP address of an SSL service module, the SSL service module is not validated.

CSCec17725—SNMP version 2 traps are required for interface-down events

Description: If you use SNMP version 1 traps for linkUp and linkDown, Performance Monitor cannot generate events in response to changes to the state of an interface.

CSCec28656—32 KB-rows in a User Session report take 5 minutes or more to load

Description: If the search result is more than 10,000 entries, the User Session report takes 5 minutes or more to load.

CSCec28918—User logged in once but two sessions are displayed in the report

Description: The User Session report displays two sessions for the same user even though the user logged in only once within the time selected for the report.

CSCec49471—User session state marked Active instead of Completed

Description: If a completed user session remains in an active state, the User Session report shows two or more sessions with the same username, IP address, and VPN device name.

CSCed36700—STS: no CPU/mem usage for 831/803 with 12.3(2)T and 12.3(5b)f

Description: CPU usage values are not available for a Cisco 800 Series router. A known problem in Cisco IOS prevents Performance Monitor from displaying these statistics.

CSCed57697—Page Not Found error appears when you start Performance Monitor

Description: You see a Page Not Found error when you try to start Performance Monitor from a supported browser.

CSCed68244—Performance Monitor cannot clear Interface State event in PIX failover

Description: If a PIX device is configured as part of a failover pair, Performance Monitor misinterprets some of the syslog information it receives.

CSCee59388—Cannot see load-balancing Interface Down event

Description: The load-balancing Interface Down event is not displayed in the event browser.

CSCeh54686—A multi-homed Performance Monitor server cannot monitor imported devices

Description: If your Performance Monitor server has more than one NIC, you cannot monitor devices that you import.

CSCsa48691—Import operation does not seem to finish

Description: After you import a device, the GUI describes the status as Running and the import does not seem to finish.

Table 4 Performance Monitor 3.3 Known Problems (continued)**CSCsc43213—Performance Monitor doesn't discover all security contexts**

Description: Some security contexts (virtual firewalls) do not appear if you select **Monitor > Firewall**.

CSCsc95489—Unable to monitor Easy VPN tunnels on PIX 6.3

Description: If you select **Monitor > Remote Access VPN**, the displayed information does not include Easy VPN tunnels that are configured on PIX 6.3 devices.

CSCsd28035—Tunnel table is empty for Easy VPN server

Description: If you select **Monitor > Site-to-Site VPN**, then click **Tunnels** in the TOC, the displayed information does not include Easy VPN tunnels that are configured on IOS routers.

CSCse11165—No memory usage data available for VPN 3000 concentrators

Description: VPN 3000 Series concentrators do not provide any way to poll memory usage statistics. Therefore, if you select **Monitor > Site-to-Site VPN**, the displayed *Memory Usage %* value for these concentrators is always zero.

CSCse17747—SNMP access outage on VPN SPA doesn't generate event

Description: Performance Monitor does not display any Critical Problems or events to show that it has stopped polling a VPN Shared Port Adapter (VPN SPA) on which SNMP community string values have changed.

CSCso92580—License not updated after restoring Perf. Monitor 3.2 on inline upgrade

Description: When you back up the Performance Monitor 3.2 database (with a permanent license) from one server to restore to a different server that has been inline-upgraded from Performance Monitor 3.1 to 3.2 with an evaluation license, the license that existed before the restore operation is retained.

CSCta17924—Tunnel packet counters not updated for P2P S2S VPN on VSPA

Description: The tunnel packet counters for a Cisco VPN Service Port Adapter that is part of a point-to-point VPN topology are not updated correctly on the Monitor -> Site to Site VPN -> Interfaces page.

CSCsz35980—Alarms related to contexts are not deleted when device deleted

Description: If you delete a multi-context FWSM and then add it again within four hours, some stale alarms that were not deleted with the device may be shown as events when the device is added again. However, these entries are removed from the database by the device table purger, which runs every four hours.

CSCsz74628—Performance Monitor: Packet counters not updated in RA-VPN device page

Description: When RA-VPN is configured on an 800-series router, Packets In and Packets Out counters are not accurate in Performance Monitor for any interface other than the first one defined.

CSCsz74737—Performance Monitor: Site-to-site VPN charts updated with RA-VPN data.

Description: Site-to-Site VPN charts on Summary > VPN page of Performance Monitor are updated with RA-VPN data.
