

CHAPTER 16

Configuring Custom Devices

When you define a custom device, you must define a custom device and log parser. The type of log parser is not defined by the custom device type or the log parser templates, but when you define an instance of the custom device type itself. When you are defining an instance of the custom device, you are required to specify the reporting method, which is either SNMP TRAP or SYSLOG. You are prompted to select either SYSLOG or SNMP as the device type. It is this designation that determines what kind of traffic MARS is expecting to receive from the reporting device.

Adding User Defined Log Parser Templates

MARS allows the user to enter any SYSLOG or SNMP device into the network topology, configure it to report data to the MARS and query the data using free-form query.

User needs to specify the incoming data format so that MARS can parse and retrieve session information from arbitrary logs.

Note

While the raw message for an event does include the header information, MARS removes the header prior to sending the payload to the custom parser. When writing a parser log template, do not include the header fields.

To add a user-defined log parser template, you must perform the following tasks:

1. Add a custom Device or Application type. See [Define a Custom Device/Application Type](#), page 16-2.
2. Add a log parser template. See [Add Parser Log Templates for the Custom Device/Application](#), page 16-3.
3. Add device with the above custom Device or Application type. See [Add Custom Device or Application as Reporting Device](#), page 16-13.

Until each of these tasks is completed, MARS is unable to parse the logs from the reporting device, even if it is receiving those events.

Define a Custom Device/Application Type

The device or application type provides a logical grouping for the custom log templates that you define. MARS uses this logical container to select which custom log templates to apply to traffic received from a reporting device of that device type. You must perform this task before you can begin to define a custom log parser.

-
- Step 1** Go to **Admin >Custom Setup** tab
- Step 2** Click the **User Defined Log Parser Templates**

Figure 16-1 User Defined Log Parser Template

The screenshot shows the 'User Defined Log Parser Templates' configuration page. At the top, there are navigation tabs: SUMMARY, INCIDENTS, and QUERY. Below these are system management tabs: System Setup, System Maintenance, User Management, System Parameters, and Custom Setup. The user is logged in as ADMIN on a PN-MARS Standalone device (pnmars34 v3.3). The main heading is 'User Defined Log Parser Templates'. Below this, there is a 'Device/Application Type:' field with a dropdown menu currently set to 'None available', and three buttons: 'Add', 'Edit', and 'Delete'. Underneath is a section titled 'Log Templates' which contains a table with the following headers: 'Log ID', 'Log Description', and 'Mapped to Event Type'. The table body is currently empty. A vertical ID number '143233' is visible on the right side of the table area.

- Step 3** On the next screen, click **Add** button which is located next to the Device/Application type list

Figure 16-2 Device Type Definition

- Step 4** Choose the Type - Appliance or Software.
 - Appliance - A hardware device that can send logs to the MARS Appliance
 - Software - An application running on a host and the host can be configured to send logs to the MARS Appliance
- Step 5** Enter the Vendor, Model and Version for the Device or Application. (For Example, Cisco PIX 7.0)
- Step 6** Click **Submit**.

Figure 16-3 User Defined Device/Application Type

Add Parser Log Templates for the Custom Device/Application

While the raw message for an event does include the header information, MARS removes the header prior to sending the payload to the custom parser. When writing a parser log template, do not include the header fields.

**Note**

If a log template attempts to parse the header information, the custom parser will fail and indicate that the message is an Unknown Device Event Type. The parser only receives the payload information.

Step 1 Go to the **Admin > Custom Setup** tab.

Step 2 Click the **User Defined Log Parser Templates**.

Step 3 Select the newly created/existing Device or Application from the Device/Application Type list.

Step 4 To add a log template, click **Add** located in the Log Templates for area.

A log template ties directly to the particular message that you want to parse. A log template is composed of one or more Event Types that describe the contents of the message. Using the Event Types, MARS parses the message when it is received.

Step 5 Enter a value in the **Log ID** field. This value is a unique string value that identifies the log message.

The Log ID field provides an opportunity to map this message number or another moniker used by the device to the custom event type that you are developing. You can use this value to clarify the device messages for which you have developed custom event types.

Step 6 Enter **Description** - a description of the log message.

Step 7 Map the log to an Event Type.

**Note**

The MARS Appliance comes with a number of predefined Event Types. To display them, select **System** (for example) from the list above the Event Type select window and click **Get**

Step 8 New **Event Types** can be added by clicking **Add** below the Event Type list.

Figure 16-4 Mapping Log to Event Type

Log Template for : Vendor1 Model1 1.2

The screenshot shows a web-based configuration interface for a log parser template. At the top, there are two tabs: 'Definition' (selected) and 'Patterns'. Below the tabs, the 'Definition' section contains the following fields:

- *Log ID:
- Description:

Below these fields is a section titled 'Map to Event Type'. It includes a search area with a dropdown for 'User', a dropdown for 'All Severity', and buttons for 'Get' and 'Search'. The search results are displayed in a list view on the right, showing one entry: 'Teardown Connection'. At the bottom of the interface are buttons for 'Add', 'Edit', and 'Delete'.

143246

Figure 16-5 Define Event Type

Event Type Definition

The screenshot shows a form for defining an event type. The fields are as follows:

- *Event Type:
- Description:
- Severity:
- CVE Name:

At the bottom of the form are two buttons: 'Cancel' and 'Submit'.

143247

- Step 9** Add new Event type and its information and click **Submit (optional)**
- Step 10** Click **Apply** - the **Patterns** link will become enabled.
- Step 11** Click the **Patterns** link.

Figure 16-6 Define Event Patterns

Patterns for Log Template : Log1

Definition		Patterns			
<input type="button" value="Add"/> <input type="button" value="Edit"/> <input type="button" value="Delete"/> <input type="button" value="Test"/>					
Position	Key Pattern	Parsed Field	Value Type	Value Format	Value Pattern
0 to 0 of 0 <input type="text" value="25 per page"/>					
<input type="button" value="Add"/> <input type="button" value="Edit"/> <input type="button" value="Delete"/> <input type="button" value="Test"/>					
<input type="button" value="Back"/>		<input type="button" value="Submit"/>			

Step 12 Click **Add** to input patterns.

The parsing patterns for the example above are specified to match the following example raw message reported in an event.

```
Teardown TCP connection 1000 faddr 67.126.151.132/80 gaddr 198.133.219.28/43246 laddr
10.1.1.30/890 (sudha) duration 01:00:02 bytes 1000000 (TCP FINs)
```

Step 13 The first step is to identify the values in the log that need to be parsed and stored in MARS events.

Step 14 Currently MARS supports the following parsed value fields in its events:

- Source address
- Destination address
- Source port
- Destination Port
- Protocol
- NAT Source address
- NAT Destination address
- NAT Source port
- NAT Destination Port
- NAT Protocol
- Device Time stamp
- Session Duration
- Received Time stamp
- Exchanged Bytes
- Reported User

Step 15 The parsing format can now be thought of as being made up of several KEY pattern followed by VALUE patterns. Both KEY and VALUE patterns are regular expressions based on the library PCRE which is perl-compatible regular expressions (see, [Appendix B, “Regular Expression Reference,”](#) for details on syntax). Note that a KEY can be an empty string. A log format consists of several KEY-VALUE sub-pattern pairs.

Figure 16-7 Define Pattern for a Log

Pattern definition for Log ID : Log1

→ Position:	<input type="text" value="1"/>
→ Key Pattern:	<input type="text" value="Teardown"/>
→ Parsed Field:	<input type="text" value="Protocol"/>
→ Value Type:	<input type="text" value="Protocol (String)"/>
→ Pattern Name:	<input type="text" value="PROTOCOL_STRING"/>
Or enter new:	<input type="text"/>
→ Description:	<input type="text" value="Protocol, as a protocol string as defined in /etc/protocols"/>
→ Value Pattern:	<input type="text" value="[\w-/+]+"/>

143249

- Step 16** In the above example, the **Position** refers to the position of each KEY-VALUE sub-pattern pair. These KEY-VALUE sub-pattern pairs are concatenated in the order of their positions and used for matching against the raw message in an event. It does allow arbitrary whitespace between KEY and VALUE patterns, as well as between KEY-VALUE sub-patterns.
- Step 17** In the above example, the **Key-Pattern** is “**Teardown**” is a simple regular expression that does not have any wildcards or repetitions.
- Step 18** The **Parsed Field** is one of fields of a MARS event that has been fully parsed. In the above case, it is the protocol field.
- Step 19** The **Value Type** gives indication to the parser on what kind of value to expect so that suitable parsing action can be applied on the matching sub-pattern string. By “**Choosing Protocol (String)**” as the value type above, we indicate that the protocol field is coming in the form of a string as defined in the file /etc/protocols in a UNIX system. For example, “**TCP**” is the string that will be captured by the value pattern. The **Value Type** will indicate that TCP is to be converted into its protocol number, 6.
- Step 20** **Pattern Name** is a mnemonic given to standard regular expression patterns available for the user who is specifying the log format. There are several common pre defined patterns with appropriate names. In the edit box right below the **Pattern Name** list, a user can add new value names to identify value patterns that may be commonly used in their logs. In the above figure, the value pattern captures all word-character strings that may also include the characters ‘-’, ‘/’ and ‘+’.

Figure 16-8 Sub Pattern Definition

Pattern definition for Log ID : Log1

→ Position:

→ Parsed Field:

→ Value Type:

→ Pattern Name:
Or enter new:

→ Description:

→ Value Pattern:

- Step 21** The above KEY-VALUE sub-pattern in the 2nd position of the log format. Notice that the key pattern isn't just a simple string, it is a regexp `\d+` which matches against all unsigned decimal numbers. The parsed field where the above value is stored is the Source Address which is specified as a dotted quad. Notice the somewhat complicated regexp that only capture IP addresses in the correct range (0.0.0.0 through 255.255.255.255).

Figure 16-9 Third Position of Pattern Definition

Once the log template is defined and submitted, you must define a reporting device based on the custom device.

Add Custom Device or Application as Reporting Device

Adding the new custom device or application is similar as adding predefined device or application. The type of device that you create depends on whether it was defined as a custom appliance or software device. If it is software-based, you must first define a host and then add a reporting application. Otherwise, you can select the appliance type directly from the Device Type list.

The following example adds an instance of the newly defined Apache Webserver1.1 software application.

- Step 1** Go to the **Admin** tab.
- Step 2** Click the **Security and Monitor Devices**.
- Step 3** Click **Add** to add a new device.
- Step 4** From the **Device Type** list, select **Add SW security apps on a new host**.
- Step 5** Fill in name and other host details and click **Apply**.
- Step 6** Click on **Reporting Applications**.
- Step 7** Select **Application** (e.g., Apache Webserver.1.1) from the list and click **Add**.

Figure 16-19 Adding the Customer Application to MARS

Device Type: Edit host with security applications
