## Managing System Hardware

---

This chapter provides details on monitoring the health of the switch. It includes the following sections:

- [Displaying Switch Hardware Inventory, page 7-2](#)
- [Displaying Power Usage Information, page 7-4](#)
- [Configuring Power Supplies, page 7-5](#)
- [Displaying Module Temperature, page 7-8](#)
- [Monitoring Fan Modules, page 7-9](#)
- [Monitoring Clock Modules, page 7-9](#)
- [Displaying Environment Information, page 7-10](#)

# Displaying Switch Hardware Inventory

Use the **show hardware** command to display switch hardware inventory details. See [Example 7-1](#).

**Example 7-1 Displays the Hardware Information**

```
switch# show hardware

**Note**

To display and configure modules, see [Chapter 6, “Managing Modules.”](#)

# Displaying Power Usage Information

Use the **show environment power** command to display the actual power usage information for the entire switch. In response to this command power supply capacity and consumption information is displayed for each module. See [Example 7-2](#).

- Note** In a Cisco MDS 9500 Series switch, power usage is reserved for both supervisors regardless of whether or not only one supervisor is present.

## *Example 7-2 Displays Power Management Information*

```
switch# show environment power

-----
PS Model          Power      Power      Status
      (Watts)    (Amp @42V)

# Configuring Power Supplies

Switches in the MDS 9000 Family have two redundant power supply slots. The power supplies can be configured in either **redundant** or **combined** mode.

- **redundant**—Uses the capacity of one power supply only. This is the default mode. In case of power supply failure, the entire switch has sufficient power available in the system.
- **combined**—Uses the combined capacity of both power supplies. In case of power supply failure, the entire switch can be shut down (depends on the power used) causing traffic disruption. This mode is seldom used, except in cases where the switch has two low power supply capacities but a higher power usage.

**Note** The chassis in the Cisco MDS 9000 Family uses 1200Watts when powered at 110 volts, and 2500Watts when powered at 220 volts.

To configure the power supply mode, follow these steps:

	Command	Purpose
<b>Step 1</b>	<code>switch# config t</code>	Enters configuration mode.
<b>Step 2</b>	<code>switch(config)# power redundancy-mode combined</code> <code>switch(config)#</code>	Configures combined power supply mode.
	<code>switch(config)# power redundancy-mode redundant</code> <code>switch(config)#</code>	Reverts to the redundant (default) power supply mode.

## Power Supply Guidelines

**Note** Use the **show environment power** command to determine currently configured power supplies.

Be sure to follow these guidelines when configuring power supplies:

1. When power supplies with different capacities are installed in the switch, the total power available differs based on the configured mode:
  - In **redundant** mode, the total power is the lesser of the two power supply capacities. For example, if you have the following usage figures configured:

Power supply 1 = 2500Watts  
 Additional Power supply 2 = not used  
 Current usage = 2000Watts  
 Current capacity = 2500Watts

Then the following three scenarios differ as specified (see [Table 7-1](#)):

- a. **Scenario 1:** If 1800Watts is added to power supply 2, then power supply 2 is shut down.  
 Reason: 1800Watts is less than the usage of 2000Watts.
- b. **Scenario 2:** If 2200Watts is added to power supply 2, then the current capacity increases to 2200Watts.  
 Reason: 2200Watts is the lesser of the two power supplies.

- c. **Scenario 3:** If 3000Watts is added to power supply 2, then the current capacity value remains at 2500Watts.  
 Reason: 2500Watts is the lesser of the two power supplies.

**Table 7-1 Redundant Mode Power Supply Scenarios**

Scenario	Power Supply 1 (W) <sup>1</sup>	Current Usage (W)	Insertion of Power Supply 2 (W)	New Capacity (W)	Action Taken by Switch
1	2500	2000	1800	2500	Power supply 2 is shut down.
2	2500	2000	2200	2200	Capacity becomes 2200Watts.
3	2500	2000	3300	2500	Capacity remains the same.

1. W = Watts

- In **combined** mode, the total power is twice the lesser of the two power supply capacities.

For example, if you have the following usage figures configured:

Power supply 1 = 2500Watts  
 Additional Power supply 2 = not used  
 Current Usage = 2000Watts  
 Current capacity = 2500Watts

Then, the following three scenarios differ as specified (see [Table 7-2](#)):

- Scenario 1:** If 1800Watts is added to power supply 2, then the capacity increases to 3600Watts.  
 Reason: 3600Watts is twice the minimum (1800Watts).
- Scenario 2:** If 2200Watts is added to power supply 2, then the current capacity increases to 4400Watts.  
 Reason: 4400Watts is twice the minimum (2200Watts).
- Scenario 3:** If 3000Watts is added to power supply 2, then the current capacity increases to 5000Watts.  
 Reason: 5000Watts is twice the minimum (2500Watts).

**Table 7-2 Combined Mode Power Supply Scenarios**

Scenario	Power Supply 1 (W) <sup>1</sup>	Current Usage (W)	Insertion of Power Supply 2 (W)	New Capacity (W)	Action Taken by Switch
1	2500	2000	1800	3600	Power is never shut down. The new capacity is changed.
2	2500	2000	2200	4400	
3	2500	2000	3300	5000	

1. W = Watts

2. When you change the configuration from **combined** to **redundant** mode and the system detects a power supply that has a capacity lower than the current usage, the power supply is shut down. If both power supplies have a lower capacity than the current system usage, the configuration is not allowed. Various configuration scenarios are displayed and summarized in [Table 7-3](#).

- a. **Scenario 1:** You have the following usage figures configured:

Power supply 1 = 2500Watts  
 Additional Power supply 2 = 1800Watts  
 Current Usage = 2000Watts  
 Current mode = **combined** mode (so current capacity is 3600Watts)

You decide to change the switch to **redundant** mode. Then power supply 2 is shut down.

Reason: 1800Watts is the lesser of the two power supplies and it is less than the system usage.

- b. **Scenario 2:** You have the following usage figures configured:

Power supply 1 = 2500Watts  
 Additional Power supply 2 = 2200Watts  
 Current Usage = 2000Watts  
 Current mode = **combined** mode (so current capacity is 4400Watts).

You decide to change the switch to **redundant** mode. Then the current capacity decreases to 2200Watts.

Reason: 2200Watts is the lesser of the two power supplies.

- c. **Scenario 3:** You have the following usage figures configured:

Power supply 1 = 2500Watts  
 Additional Power supply 2 = 1800Watts  
 Current Usage = 3000Watts  
 Current mode = **combined** mode (so current capacity is 3600Watts).

You decide to change the switch to **redundant** mode. Then the current capacity decreases to 2500Watts and the configuration is rejected.

Reason: 2500Watts is less than the system usage (3000Watts).

**Table 7-3 Combined Mode Power Supply Scenarios**

Scenario	Power Supply 1 (W) <sup>1</sup>	Current Mode	Current Usage (W)	Power Supply 2 (W)	New Mode	New Capacity (W)	Action Taken by Switch
1	2500	<b>combined</b>	2000	1800	N/A	3600	Existing configuration.
	2500	N/A	2000	1800	<b>redundant</b>	2500	Power supply 2 is shut down
2	2500	<b>combined</b>	2000	2200	N/A	4400	Existing configuration.
	2500	N/A	2000	2200	<b>redundant</b>	2200	The new capacity is changed.
3	2500	<b>combined</b>	3000	1800	N/A	3600	Existing configuration.
	2500	N/A	3000	1800	<b>redundant</b>	N/A	Rejected, so the mode reverts to <b>combined</b> mode.

1. W = Watts

# Displaying Module Temperature

Use the **show environment temperature** command to display temperature sensors for each module.

**Example 7-3.**

Each module (switching and supervisor) has four sensors: 1 (outlet sensor), 2 (intake sensor), 3 (onboard sensor), and 4 (onboard sensor). Each sensor has two thresholds (in Celsius): minor and major.

**Note**

A threshold value of -127 indicates that no thresholds are configured or applicable.

- minor threshold—When a minor threshold is exceeded, a minor alarm occurs and the following action is taken for all four sensors:
  - Syslog messages are displayed
  - Call Home alerts are sent (if configured)
  - SNMP notifications are sent (if configured)
- major threshold—When a major threshold is exceeded, a major alarm occurs and the following action is taken as follows:
  - For sensors 1, 3, and 4 (outlet and onboard sensors):
    - Syslog messages are displayed
    - Call Home alerts are sent (if configured)
    - SNMP notifications are sent (if configured)
  - For sensor 2 (intake sensor):
    - If the threshold is exceeded in a switching module, the module is shut down
    - If the threshold is exceeded in a supervisor module with HA-standby or standby present, the supervisor module is shut down
    - If the standby supervisor is not present, the entire switch is shut down.

**Note**

Switch shut down only happens after a two -minute interval. During this interval the software monitors the temperature every five (5) seconds and continuously sends syslog messages as configured. If the required action is not taken (for example, a new fan module inserted to decrease temperature) and if the temperature does not come down, the system is shut down at the end of two minutes.

**Example 7-3 Displays Temperature Information**

```
switch# show environment temperature
-----
Module   Sensor   MajorThresh   MinorThres   CurTemp   Status
                  (Celsius)     (Celsius)    (Celsius)
-----
1         1        75           60            42         ok
1         2        65           50            28         ok
1         3       -127          -127          58         ok
1         4       -127          -127          46         ok

4         1        75           60            35         ok
4         2        65           50            27         ok
4         3       -127          -127          52         ok
4         4       -127          -127          35         ok
```

# Monitoring Fan Modules

Use the **show environment fan** command to display the fan status for each fan module. See [Example 7-4](#).

**Example 7-4 Displays Chassis Fan Information**

```
switch# show environment fan
-----
FAN          Model        Hw      Status
-----
Chassis      WS-9SLOT-FAN    0 . 0   ok
PS-1          --           --     ok
PS-2          --           --     ok
```

The fan status is continuously monitored. In case of a fan module failure, the following action is taken:

- Syslog messages are displayed.
- Call Home alerts are sent (if configured).
- SNMP notifications are sent (if configured).

**Caution** A fan failure could lead to temperature alarms if not corrected immediately.

# Monitoring Clock Modules

Use the **show environment clock** command to display the clock status for the chassis. See [Example 7-5](#).

**Example 7-5 Displays Chassis Clock Information**

```
switch# show environment clock
-----
Clock        Model        Hw      Status
-----
A            Clock Module  1 . 0   ok/active
B            Clock Module  1 . 0   ok/standby
```

Each switch has two clock modules: Clock A (default) and Clock B.

If Clock A fails, the entire switch is reset (shut down and restarted). When the switch is restarted, Clock B automatically takes over.

Clock modules cannot be configured. If Clock A is available during any reboot, the switch uses Clock A, otherwise it uses Clock B.

If both modules fail, the switch shuts down.

# Displaying Environment Information

Use the **show environment** command to display all environment-related switch information.

### *Example 7-6 Displays All Environment Information*

```
switch# show environment
Clock:
-----
Clock          Model           Hw      Status
-----
A              Clock Module    1.0     ok/active
B              Clock Module    1.0     ok/standby

Fan:
-----
FAN            Model           Hw      Status
-----
Chassis        DS-2SLOT-FAN   0.0     ok
PS-1           --              --     ok
PS-2           --              --     absent

Temperature:
-----
