

Forced Authorization Codes (FAC)

The Forced Authorization Codes (FAC) feature, which allows you to regulate the types of calls that certain users can place, forces the user to enter a valid authorization code on the phone before the call completes.

The FAC feature requires that you make changes to route patterns and update your dial plan documents to reflect that you enabled or disabled FAC for each route pattern.

For more information on how to use and configure this feature, refer to the [“Client Matter Codes and Forced Authorization Codes”](#) chapter in the *Cisco CallManager Features and Services Guide*.
