

Generating a CAPF Report

After you configure Certificate Authority Proxy Function (CAPF) settings in the Phone Configuration window or the Bulk Administration Tool, you can generate a CAPF report to perform the following tasks:

- View the certificate operation status
- View the authentication strings
- View the authentication mode for listed devices.

After you generate the CAPF report, you can view the report in a CSV file.

For more information on generating a CAPF report, refer to *Cisco Unified CallManager Security Guide*.
