

## Preface

---

### Audience

This guide is for the networking professional who installs and manages Cisco Aironet 1300 Series Outdoor Access Point/Bridge. To use this guide, you should have experience working with the Cisco IOS and be familiar with the concepts and terminology of wireless local area networks.

### Purpose

This guide provides the information you need to install and configure your access point/bridge. This guide provides procedures for using the IOS commands that have been created or changed for use with the access point/bridge. It does not provide detailed information about these commands. For detailed information about these commands, refer to the *Cisco IOS Command Reference for Cisco Aironet Access Points and Bridges* for this release. For information about the standard IOS Release 12.3 commands, refer to the IOS documentation set available from the Cisco.com home page. Click **Technical Documentation** in the Quick Links section.

This guide also includes an overview of the access point/bridge web-based interface, which contains all the functionality of the command-line interface (CLI). This guide does not provide field-level descriptions of the web-based windows nor does it provide the procedures for configuring the access point/bridge from the web-based interface. For all window descriptions and procedures, refer to the access point/bridge online help, which is available from the Help buttons on the web-based interface pages.

### Organization

This guide is organized into these chapters:

[Chapter 1, “Overview,”](#) lists the software and hardware features of the access point/bridge and describes the access point/bridge’s role in your network.

[Chapter 2, “Configuring the Access Point/Bridge for the First Time,”](#) describes how to configure basic settings on a new access point/bridge.

[Chapter 3, “Using the Web-Browser Interface,”](#) describes how to use the web-browser interface to configure the access point/bridge.

[Chapter 4, “Using the Command-Line Interface,”](#) describes how to use the command-line interface (CLI) to configure the access point/bridge.

[Chapter 5, “Administering the Access Point/Bridge,”](#) describes how to perform one-time operations to administer your access point/bridge, such as preventing unauthorized access to the access point/bridge, setting the system date and time, and setting the system name and prompt.

[Chapter 6, “Configuring Radio Settings,”](#) describes how to configure settings for the access point/bridge radio such as the role in the radio network, data rates, transmit power, channel settings, and others.

[Chapter 7, “Configuring Multiple SSIDs,”](#) describes how to configure and manage multiple service set identifiers (SSIDs) on your access point/bridge. You can configure up to 16 SSIDs on your access point/bridge and assign different configuration settings to each SSID.

[Chapter 8, “Configuring Spanning Tree Protocol,”](#) describes how to configure Spanning Tree Protocol (STP) on your access point/bridge. STP prevents bridge loops in your network.

[Chapter 9, “Configuring Cipher Suites and WEP,”](#) describes how to configure the cipher suites required to use authenticated key management, Wired Equivalent Privacy (WEP), and WEP features including MIC, CMIC, TKIP, CKIP, and broadcast key rotation.

[Chapter 10, “Configuring Authentication Types,”](#) describes how to configure authentication types on the access point/bridge. Client devices use these authentication methods to join your network.

[Chapter 11, “Configuring WDS, Fast Secure Roaming, Radio Management, and Wireless Intrusion Detection Services,”](#) describes Wireless Domain Services (WDS), fast secure roaming, and radio management features. The chapter also provides instructions for configuring the access point/bridge to register with a WDS access point.

[Chapter 12, “Configuring RADIUS and TACACS+ Servers,”](#) describes how to enable and configure the Remote Authentication Dial-In User Service (RADIUS) and Terminal Access Controller Access Control System Plus (TACACS+), which provide detailed accounting information and flexible administrative control over authentication and authorization processes.

[Chapter 13, “Configuring VLANs,”](#) describes how to configure your access point/bridge to interoperate with the VLANs set up on your wired LAN.

[Chapter 14, “Configuring QoS,”](#) describes how to configure quality of service (QoS) on your access point/bridge. With this feature, you can provide preferential treatment to certain traffic at the expense of others.

[Chapter 15, “Configuring Filters,”](#) describes how to configure and manage MAC address, IP, and Ethertype filters on the access point/bridge using the web-browser interface.

[Chapter 16, “Configuring CDP,”](#) describes how to configure Cisco Discovery Protocol (CDP) on your access point/bridge. CDP is a device-discovery protocol that runs on all Cisco network equipment.

[Chapter 17, “Configuring SNMP,”](#) describes how to configure the Simple Network Management Protocol (SNMP) on your access point/bridge.

[Chapter 18, “Managing Firmware and Configurations,”](#) describes how to manipulate the Flash file system, how to copy configuration files, and how to archive (upload and download) software images.

[Chapter 19, “Configuring System Message Logging,”](#) describes how to configure system message logging on your access point/bridge.

[Chapter 20, “Configuring Repeater and Standby Access Points and Workgroup Bridge Mode,”](#) describes how to configure the access point/bridge as a repeater access point or workgroup bridge.

[Chapter 21, “Troubleshooting,”](#) provides troubleshooting procedures for basic problems with the access point/bridge.

[Appendix A, “Protocol Filters,”](#) lists some of the protocols that you can filter on the access point/bridge.

[Appendix B, “MIB List,”](#) lists the Simple Network Management Protocol (SNMP) Management Information Bases (MIBs) that the access point/bridge supports for this software release.

Appendix C, “Error and Event Messages,” lists the CLI error and event messages and provides an explanation and recommended action for each message.

### Note

Use the Cisco Product Identification (CPI) tool to locate your product serial number before submitting a web or phone request for service. You can access the CPI tool from the Cisco Technical Support Website by clicking the **Tools & Resources** link under Documentation & Tools. Choose **Cisco Product Identification Tool** from the Alphabetical Index drop-down list, or click the **Cisco Product Identification Tool** link under Alerts & RMAs. The CPI tool offers three search options: by product ID

or model name; by tree view; or for certain products, by copying and pasting **show** command output. Search results show an illustration of your product with the serial number label location highlighted. Locate the serial number label on your product and record the information before placing a service call.

## Submitting a Service Request

Using the online TAC Service Request Tool is the fastest way to open S3 and S4 service requests. (S3 and S4 service requests are those in which your network is minimally impaired or for which you require product information.) After you describe your situation, the TAC Service Request Tool provides recommended solutions. If your issue is not resolved using the recommended resources, your service request is assigned to a Cisco TAC engineer. The TAC Service Request Tool is located at this URL:

<http://www.cisco.com/techsupport/servicerequest>

For S1 or S2 service requests or if you do not have Internet access, contact the Cisco TAC by telephone. (S1 or S2 service requests are those in which your production network is down or severely degraded.) Cisco TAC engineers are assigned immediately to S1 and S2 service requests to help keep your business operations running smoothly.

To open a service request by telephone, use one of the following numbers:

Asia-Pacific: +61 2 8446 7411 (Australia: 1 800 805 227)

EMEA: +32 2 704 55 55

USA: 1 800 553-2447

For a complete list of Cisco TAC contacts, go to this URL:

<http://www.cisco.com/techsupport/contacts>

## Definitions of Service Request Severity

To ensure that all service requests are reported in a standard format, Cisco has established severity definitions.

**Severity 1 (S1)**—Your network is “down,” or there is a critical impact to your business operations. You and Cisco will commit all necessary resources around the clock to resolve the situation.

**Severity 2 (S2)**—Operation of an existing network is severely degraded, or significant aspects of your business operation are negatively affected by inadequate performance of Cisco products. You and Cisco will commit full-time resources during normal business hours to resolve the situation.

**Severity 3 (S3)**—Operational performance of your network is impaired, but most business operations remain functional. You and Cisco will commit resources during normal business hours to restore service to satisfactory levels.

**Severity 4 (S4)**—You require information or assistance with Cisco product capabilities, installation, or configuration. There is little or no effect on your business operations.
