The following command removes the configuration for a MAP service named *map_1* from the configuration for the current context:

```
no map-service map_1
```

mme-service

Creates an Mobility Management Entity (MME) service or configures an existing MME service and enters the MME Service Configuration Mode for EPC networks in the current context.

Product

MME

Privilege

Administrator

Syntax

```
mme-service service_name [ -noconfirm ]
```

```
no mme-service service_name
```

no

Removes the specified MME service from the context.

service_name

Specifies the name of the MME service. If *service_name* does not refer to an existing service, the new service is created if resources allow.

service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enter the MME Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 8 MME service can be configured on a system which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

 **Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-mme-service)#
```

MME Service Configuration Mode commands are defined in the *MME Service Configuration Mode Commands* chapter.

Caution: This is a critical configuration. The MME service can not be configured without this configuration. Any change to this configuration would lead to restarting the MME service and removing or disabling this configuration will stop the MME service.

Example

The following command enters the existing MME Service Configuration Mode (or creates it if it does not already exist) for the service named *mme-service1*:

```
mme-service mme-service1
```

The following command will remove *mme-service1* from the system:

```
no mme-service mme-service1
```

mobile-ip fa newcall

Configures settings that effect all FA services in the current context.

Product

FA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address {  
accept | reject }  
}
```

```
no mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address  
}
```

```
no mobile-ip fa { multiple-dynamic-reg-per-nai | newcall duplicate-home-address  
}
```

multiple-dynamic-reg-per-nai: Disables all FA services in the current context from simultaneously setting up multiple dynamic home address registrations that have the same NAI.

newcall duplicate-home-address: Reset this option to its default of reject.

multiple-dynamic-reg-per-nai

This keyword allows all FA services in the current context to simultaneously setup multiple dynamic home address registrations that have the same NAI.

```
duplicate-home-address { accept | reject }
```

Default: **reject**

accept: The new call is accepted and the existing call is dropped.

reject: The new call is rejected with an Admin Prohibited code.

Usage

Use this command to set the behavior of all FA services in the current context.

Example

To configure all FA services to accept new calls and drop the existing call when the new call requests an IP address that is already in use by an existing call, enter the following command:

```
mobile-ip fa newcall duplicate-home-address accept
```

To enable all FA services in the current context to allow all FA services in the current context to simultaneously setup multiple dynamic home address registrations that have the same NAI, enter the following command:

```
mobile-ip fa multiple-dynamic-reg-per-nai
```

mobile-ip ha assignment-table

This command creates a Mobile IP HA assignment table and enters Mobile IP HA Assignment Table Configuration Mode.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip ha assignment-table atable_name [ -noconfirm ]
```

```
no mobile-ip ha assignment-table atable_name
```

no

This keyword deletes the specified assignment table

atable_name

The name of the MIP HA assignment table to create or edit.

-noconfirm

This keyword specifies that the assignment table should be created with no further confirmation by the user.

Usage

Use this command to create a new MIP HA assignment table or edit an existing MIP HA assignment table.

Important: A maximum of 8 MIP HA assignment tables can be configured per context with a maximum of 8 MIP HA assignment tables across all contexts.

Important: A maximum of 256 non-overlapping hoa-ranges can be configured per MIP HA Assignment table with a maximum of 256 non-overlapping hoa-ranges across all MIP HA Assignment tables.

Example

The following command creates a new MIP HA assignment table name *MIPHAtable1* and enters MIP HA Assignment Table Configuration Mode without asking for confirmation from the user:

```
mobile-ip ha assignment-table MIPHAtable1
```

mobile-ip ha newcall

Configures the behavior of all HA services when duplicate home addresses and duplicate IMSI sessions occur for new calls.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip ha newcall { duplicate-home-address { accept | reject } | duplicate-imsi-session { allow | disallow | global-disallow } }
```

```
no mobile-ip ha newcall { duplicate-home-address | duplicate-imsi-session }
```

```
no mobile-ip ha newcall { duplicate-home-address | duplicate-imsi-session }
```

duplicate-home-address: Reset the option to its default of reject.

duplicate-imsi-session: Reset the option to its default of allow.

```
duplicate-home-address { accept | reject }
```

Default: **reject**

Configures the HA to either accept or reject new calls if the new call requests a static IP home address that is already assigned to an existing call from an IP address pool in the same destination context.

accept: The new call is accepted and the existing call is dropped.

reject: The new call is rejected with an Admin Prohibited code.

```
duplicate-imsi-session { allow | disallow | global-disallow }
```

Default: **allow**

Configures the HA to either permit or not permit multiple sessions for the same IMSI.

allow: Allows multiple sessions for the same IMSI.

disallow: If a Mobile node already has an active session and a new sessions is requested using the same IMSI, the currently active session is dropped and the new session is accepted.

global-disallow: Enables HA services in this context to accept a new session and disconnect any other session(s) having the same IMSI being processed in this context. In addition, a request is sent to all other contexts containing HA services to do the same.

Important: In order to ensure a single session per IMSI across all contexts containing HA services, the global-disallow option must be configured in every context.

Usage

Use this command to set the behavior of all HA services for new calls.

Example

To configure all HA services to accept new calls when the new call requests a static IP that is already assigned from an IP pool in the same destination context, enter the following command:

```
mobile-ip ha newcall duplicate-home-address accept
```

To configure all HA services to drop an active call and accept a new one that uses the same IMSI, enter the following command:

```
mobile-ip ha newcall duplicate-imsi-session disallow
```

mobile-ip ha reconnect

Sets the behavior of all HA services to reconnect dropped calls.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip { ha reconnect [ static-homeaddr [ dynamic-pool-allocation ] ] }  
no mobile-ip { ha reconnect [ static-homeaddr [ dynamic-pool-allocation ] ] }
```

static-homeaddr

The home address is a static IP address.

dynamic-pool-allocation

Allows a dynamic pool to accept a static address allocation.

Usage

Use this command to reset the HA behavior for new calls.

Example

```
mobile-ip ha reconnect  
mobile-ip ha reconnect static-homeaddr  
mobile-ip ha reconnect static-homeaddr dynamic-pool-allocation  
no mobile-ip ha reconnect  
no mobile-ip ha reconnect static-homeaddr
```

mpls bgp forwarding

This command globally enables the MPLS BGP forwarding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mpls bgp forwarding
```

no

Disables MPLS BGP forwarding configured on the system.

Usage

Use this command to globally enable the MPLS BGP forwarding. By enabling this command, the BGP VPNv4 routes need not have an underlying LSP to forward the IP packets. If this command is not enabled, then the nexthop for the BGP routes must be reachable via LDP.

Caution: This command should be enabled ONLY when all the BGP peering where VPNv4 routes are exchanged are one hop away.

Example

Following command enables the MPLS BGP forwarding on system:

```
mpls bgp forwarding
```

mpls ip

This command globally enables the MPLS forwarding of IPv4 packets along normally routed paths.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mpls ip
```

no

Disables MPLS forwarding of IPv4 packets configured on the system. **no mpls ip** stops dynamic label distribution on all the interfaces irrespective of interface configuration.

Usage

Use this command to globally enable the MPLS forwarding of IPv4 packets along normally routed paths for the whole context. It still does not start label distribution over an interface until mpls has been enabled for the interface as well. This command changes the context to MPLS IP configuration mode for MPLS protocols specific configuration.

Caution: This feature is not enabled by default.

Example

Following command enables MPLS forwarding of IPv4 packets along normally routed paths:

```
mpls ip
```

nw-reachability server

This command adds/deletes a reachability-detect server and configures parameters for retrying the failure-detection process. When network reachability is enabled, a ping request is sent to this device. If there is no response after a specified number of retries, the network is deemed failed. Execute this command multiple times to configure multiple network reachability servers.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
nw-reachability server server_name [ interval seconds ] [ local-addr ip_addr ] [ num-retry num ] [ remote-addr ip_addr ] [ timeout seconds ]
```

```
no nw-reachability server server_name
```

no

Delete the reference to the specified network reachability server.

server_name

A name for the network device that is sent ping packets to test for network reachability.

interval *seconds*

Default: 60 seconds

Specifies the frequency in seconds for sending ping requests. *seconds* must be an integer from 1 through 3600.

local-addr *ip_addr*

Specifies the IP address to be used as the source address of the ping packets; If this is unspecified, an arbitrary IP address that is configured in the context is used. *ip_addr* must be an IP v4 address in dotted decimal notation.

num-retry *num*

Default: 5

Specifies the number of retries before deciding that there is a network-failure. *num* must be an integer from 0 through 100.

remote-addr *ip_addr*

Specifies the IP address of a network element to use as the destination to send the ping packets for detecting network failure or reachability. *ip_addr* must be an IP v4 address in dotted decimal notation.

timeout *seconds*

Default: 3 seconds

Specifies how long to wait, in seconds, before retransmitting a ping request to the remote address. *seconds* must be an integer from 1 through 10.

Usage

Use this command to set up a network device on a destination network that is used ensure that Mobile IP sessions can reach the required network from the HA.

 **Important:** Refer to the HA Configuration Mode command `policy nw-reachability-fail` to configure the action that should be taken when network reachability fails.

 **Important:** Refer to the subscriber config mode command `nw-reachability-server` to bind the network reachability to a specific subscriber.

 **Important:** Refer to the `nw-reachability server server_name` keyword of the `ip pool` command in this chapter to bind the network reachability server to an IP pool.

Example

To set a network device called InternetDevice with the IP address of `192.168.100.10` as the remote address that is pinged to determine network reachability and use the address `192.168.200.10` as the origination address of the ping packets sent, enter the following command:

```
nw-reachability server InternetDevice local-addr 192.168.200.10 remote-addr 192.168.100.10
```

network-requested-pdp-context activate

Configures the mobile station(s) (MSs) for which network initiated PDP contexts are supported.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-requested-pdp-context activate address ip_address dst-context
context_name imsi imsi apn apn_name
```

```
no network-requested-pdp-context activate { address ip_address dst-context
context_name }
```

no

Disables the system's ability to accept network-requested PDP contexts on the specified interface.

address *ip_address*

Specifies the static IP address of the MS.

ip_address must be expressed in dotted decimal notation.

dst-context *context_name*

Specifies the name of the destination context configured on the system containing the static IP address pool in which the MS's IP address is configured.

context_name must be from 1 to 79 alpha and/or numeric characters and is case sensitive.

imsi *imsi*

Specifies the International Mobile Subscriber Identity (IMSI) of the MS.

imsi must be from 1 to 15 numeric characters.

apn *apn_name*

Specifies the Access Point Name (APN) that is passed to the SGSN by the system.

apn_name must be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to specify the MS(s) for which network initiated PDP contexts are supported.

When a packet is received for an MS that does not currently have a PDP context established, the system checks the configuration of this parameter to determine if the destination IP address specified in the packet is specified by this parameter. If the address is not specified, then the system discards the packet. If the address is specified, the system uses the configured IMSI and APN to determine the appropriate SGSN from the Home Location Register (HLR). The system communicates with the HLR through the interworking node configured using the `network-requested-pdp-context gsn-map` command.

Once the session is established, the destination context specified by this command is used in place of the one either configured within the specified APN template or returned by a RADIUS server during authentication.

This command can be issued multiple times supporting network initiated PDP contexts for up to 1000 configured addresses per system context.

Example

The following command enables support for network initiated PDP contexts for an MS with a static IP address of *20.13.5.40* from a pool configured in the destination context *pdn1* with an IMSI of *3319784450* that uses an APN template called *isp1*:

```
network-requested-pdp-context activate address 20.13.5.40 dst-context  
pdn1 imsi 3319784450 apn isp1
```

network-requested-pdp-context gsn-map

Configures the IP address of the interworking node that is used by the system to communicate with the HLR and optionally sets the GTP version to use.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-requested-pdp-context gsn-map ip_address [ gtp-version { 0 | 1 } ]
```

```
no network-requested-pdp-context gsn-map
```

no

Deletes a previously configured gsn-map node.

ip_address

Specifies the IP address of the gsn-map node.

ip_address must be an IPv4 or IPv6 IP address entered using dotted decimal notation or an IPv6 IP address using colon (:) separated notation.

[**gtp-version** { 0 | 1 }]

Default: 1

Specifies the gtp version used.

Usage

Communications from the system to the HLR must go through a GSN-map interworking node that performs the protocol conversion from GTPC to SS7.

The UDP port for this communication is 2123.

Support for network requested PDP contexts must be configured within source contexts on the system. Only one gsn-map node can be configured per source context.

The source context also contains the GGSN service configuration that specifies the IP address of the Gn interface. If multiple GGSN services are configured in the source context, one is selected at random for initiating the Network Requested PDP Context Activation procedure.

Communication with the gsn-map node is done over the Gn interface configured for the GGSN service. The IP address of that interface is used as the system's source address.

Example

The following command configures the system to communicate with a gsn-map node having an IP address of 192.168.2.5:

```
network-requested-pdp-context gsn-map 192.168.2.5
```

network-requested-pdp-context hold-down-time

Configures the time duration to that the system will wait after the SGSN rejects an attempt for a network-requested PDP context creation for the subscriber.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-requested-pdp-context hold-down-time time
```

time

Default: 60

The time interval is measured in seconds and can be configured to any integer value between 0 and 86400.

Usage

Packets received during this time period would be discarded, rather than being used to cause another network-requested PDP context creation attempt for the same subscriber. After the time period has expired, any subsequent packets received would cause another network-requested PDP context creation procedure to begin.

Example

The following command configures a hold-down-time of *120* seconds:

```
network-requested-pdp-context hold-down-time 120
```

network-requested-pdp-context interval

Configures the minimum amount of time that must elapse between the deletion of a network initiated PDP context and the creation of a new one for the same MS.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-requested-pdp-context interval time
```

time

Default: 60

Specifies the minimum amount of time that must pass before the system allows another network-requested PDP context for a specific MS after the previous context was deleted.

time is measured in seconds and can be configured to any integer value from 0 to 86400.

Usage

Once an MS deletes a PDP context that initiated from the network, the system automatically waits the amount of time configured by this parameter before allowing another network initiated PDP context for the same MS.

Example

The following command specifies that the system waits *120* seconds before allowing another network requested PDP context for an MS:

```
network-requested-pdp-context interval 120
```

network-requested-pdp-context sgsn-cache-time

Configures the time duration that the GGSN keeps the SGSN/subscriber pair cached in its local memory.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-requested-pdp-context sgsn-cache-time time
```

time

Default: 300

The time interval is measured in seconds and can be configured to any integer value between 0 and 86400.

Usage

For an initial network-requested PDP context creation, the system contacts the HLR (via the GSN-MAP interworking node) to learn which SGSN is currently servicing the subscriber. The system keeps that information in cache memory for the configured time, so that future network-requested PDP context creations for that subscriber can be initiated without having to contact the HLR again.

Example

The following command configures an sgsn-cache-time of 500 seconds:

```
network-requested-pdp-context sgsn-cache-time 500
```

operator

Configures a context-level operator account within the current context.

Product

All

Privilege

Security Administrator

Syntax

```
operator user_name [ encrypted ] password password [ ecs ] [ expiry-date
date_time ] [ li-administration ] [ noecs ] [ timeout-absolute abs_seconds ] [
timeout-min-absolute abs_minutes ] [ timeout-idle idle_seconds ] [ timeout-min-
idle idle_minutes ]
```

```
no operator user_name
```

no

Removes a previously configured context-level operator account.

user_name

Specifies a name for the account. *user_name* must be from 1 to 32 alpha and/or numeric characters.

[**encrypted**] **password** *password*

Specifies the password to use for the user which is being given context-level operator privileges within the current context. The **encrypted** keyword indicates the password specified uses encryption. *password* must be from 1 to 63 alpha and/or numeric characters without encryption and must be from 1 to 127 alpha and/or numeric characters when encryption has been indicated. The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

ecs

Default: ACS-specific configuration commands not allowed.
Permits the specific user to access ACS-specific configuration commands from Exec Mode only.

expiry-date *date_time*

The date and time that this account expires. Enter the date and time in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

li-administration

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this parameter.

noecs

Default: Enabled.

Prevents the specific user to access ACS-specific configuration commands.

timeout-absolute *abs_seconds*

Default: 0

This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum amount of time, in seconds, the context-level operator may have a session active before the session is forcibly terminated. *abs_seconds* must be a value in the range from 0 through 300000000.

The special value 0 disables the absolute timeout.

timeout-min-absolute *abs_minutes*

Default: 0

Specifies the maximum amount of time, in minutes, the context-level operator may have a session active before the session is forcibly terminated. *abs_minutes* must be a value in the range from 0 through 300000000.

The special value 0 disables the absolute timeout.

timeout-idle *idle_seconds*

Default: 0

This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum amount of idle time, in seconds, the context-level operator may have a session active before the session is terminated. *idle_seconds* must be an integer from 0 through 300000000.

The special value 0 disables the idle timeout.

timeout-min-idle *idle_minutes*

Default: 0

Specifies the maximum amount of idle time, in minutes, the context-level operator may have a session active before the session is terminated. *idle_minutes* must be a value in the range from 0 through 300000000.

The special value 0 disables the idle timeout.

Usage

Create new context-level operator or modify existing operator's options, in particular, the timeout values. Operator users have read-only privileges. They can maneuver across multiple contexts, but cannot perform configuration operations. Refer to the *Command Line Interface Overview* chapter for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following command creates a context-level operator account named *user1* with ACS control:

```
operator user1 password secretPassword ecs
```

operator

The following command removes a previously configured context-level operator account named *user1*:

```
no operator user1
```

optimize pdsn inter-service-handoff

Controls the optimization of the system's handling of inter-PDSN handoffs.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
optimize pdsn inter-service-handoff
```

```
[ default | no ] optimize pdsn inter-service-handoff
```

default

Resets the command to its default setting of enabled.

no

Disables the feature.

Usage

When more than one PDSN service is defined in a context, each PDSN-Service acts as an independent PDSN. When a Mobile Node (MN) moves from one PDSN service to another PDSN service, by rule, it is an inter-PDSN handoff. This command optimizes PDSN handoffs between PDSN Services that are defined in the same context in the system.

The default for this parameter is enabled. The no keyword disables this functionality.

When enabled, the system treats handoffs happening between two PDSN services in the same context as an inter-PDSN handoff. Existing PPP session states and connection information is reused. If the inter-PDSN handoff requires a PPP restart, then PPP is restarted. The optimized inter-service-handoff may not restart the PPP during handoffs allowing the MN to keep the same IP address for the Simple IP session.

Example

```
optimize pdsn inter-service-handoff
```

pdg-service

Creates a new PDG service or specifies an existing PDG service and enters the PDG Service Configuration Mode. A maximum of 16 PDG services can be created. This limit applies per ASR 5000 chassis and per context.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
pdg-service name
```

```
no pdg-service name
```

```
pdg-service name
```

Specifies the name of a new or existing PDG service.

name must be from 1 to 63 alpha and/or numeric characters and must be unique across all FNG services within the same context and across all contexts.

```
no pdg-service name
```

Deletes the specified PDG service.

Usage

Use this command in Context Configuration Mode to create a new PDG service or modify an existing one. Executing this command enters the PDG Service Configuration Mode.

Example

The following command configures an PDG service named *pdg_service_1* and enters the PDG Service Configuration Mode:

```
pdg-service pdg_service_1
```

pdf-service

Creates a new, or specifies an existing, PDIF service and enters the PDIF Service Configuration Mode.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] pdf-service name [ -noconfirm ]
```

name

Specifies the name of a new or existing PDIF service. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to create a new or enter an existing PDIF service.

Entering this command results in the following prompt:

```
[context_name]hostname(config-pdf-service)#
```

PDIF Service Configuration Mode commands are defined in the *PDIF Service Configuration Mode Commands* chapter.

Example

The following command configures a PDIF service called *pdf2* and enters the PDIF Service Configuration Mode:

```
pdf-service pdf2
```

pdsn-service

Creates/deletes a packet data service or specifies an existing PDSN service for which to enter the Packet Data Service Configuration Mode for the current context.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

pdsn-service *name*

no

Indicates the packet data service specified is to be removed.

name

Specifies the name of the PDSN service to configure. If *name* does not refer to an existing service, the new service is created if resources allow. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Enter the PDSN Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Example

The following command will enter the PDSN Service Configuration Mode creating the service *sampleService*, if necessary.

```
pdsn-service sampleService
```

The following command will remove *sampleService* as being a defined PDSN service.

```
no pdsn-service sampleService
```

pgw-service

Creates an P-GW service or specifies an existing P-GW service and enters the P-GW Service Configuration Mode for the current context.

Product

P-GW

Privilege

Administrator

Syntax

```
pgw-service service_name [ -noconfirm ]
```

```
no pgw-service service_name
```

service_name

Specifies the name of the P-GW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.

service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

```
no pgw-service service_name
```

Removes the specified P-GW service from the context.

Usage

Enter the P-GW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

 **Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-pgw-service)#
```

P-GW Service Configuration Mode commands are defined in the *P-GW Service Configuration Mode Commands* chapter.

Use this command when configuring the following eHRPD and SAE components: P-GW.

Example

■ pgw-service

The following command enters the existing P-GW Service Configuration Mode (or creates it if it does not already exist) for the service named *pgw-service1*:

```
pgw-service pgw-service1
```

The following command will remove *pgw-service1* from the system:

```
no pgw-service pgw-service1
```

policy

Enters an existing accounting policy or creates a new one where accounting parameters are configured.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
[ no ] policy accounting name
```

no

Removes the specified accounting policy from the context.

name

Specifies the name of the existing or new accounting policy. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to enter the Accounting Policy Configuration mode to edit an existing accounting policy or configure a new policy.

Entering this command results in the following prompt:

```
[context_name]hostname(config-accounting-policy)#
```

Accounting Policy Configuration Mode commands are defined in the *Accounting Policy Configuration Mode Commands* chapter.

Example

The following command enters the Accounting Policy Configuration Mode for a policy named *acct5*:

```
policy accounting acct5
```

policy-group

This command deletes/creates and enters the Policy-Group Configuration Mode within the current destination context for flow-based traffic policing to a subscriber session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] policy-group name policy_group
```

no

Deletes configured policy group within the context.

policy_group

Specifies the name of Policy-Group and can consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

Usage

Use this command to form a policy group from a set of configured Policy-Maps. A policy group supports up to 16 policies for a subscriber session flow.

Example

Following command configures a policy group *policy_group1* for a subscriber session flow.

```
policy-group name policy_group1
```

policy-map

This command deletes/creates and enters the Traffic Policy-Map Configuration Mode within the current destination context to configure the flow-based traffic policing for a subscriber session flow.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] policy-map name policy_name
```

no

Deletes configured Policy-Map within the context.

policy_name

Specifies the name of Policy-Map and must consist of from 1 to 15 alpha and/or numeric characters in length and is case sensitive.

Usage

Use this command to enter Traffic Policy-Map Configuration Mode and to set the Class-Map and corresponding traffic flow treatment to traffic policy for a subscriber session flow.

Example

Following command configures a policy map *policy1* where other flow treatments is configured.

```
policy-map name policy1
```

ppp

Configures point-to-point protocol parameters for the current context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ppp { acfc { receive { allow | deny } | transmit { apply | ignore | reject } } |
auth-retry suppress-aaa-auth | chap fixed-challenge-length length | dormant
send-lcp-terminate | echo-max-retransmissions num_retries | echo-retransmit-
timeout msec | first-lcp-retransmit-timeout milliseconds | lcp-authentication-
discard retry-alternate num_discard | lcp-authentication-reject retry-alternate
| lcp-start-delay delay | lcp-terminate connect-state | lcp-terminate mip-
lifetime-expiry | lcp-terminate mip-revocation | max-authentication-attempts num
| max-configuration-nak num | max-retransmissions number | max-terminate number
| mru packet_size | negotiate default-value-options | peer-authentication
user_name [ encrypted ] password password ] | pfc { receive { allow | deny } |
transmit { apply | ignore | reject } } | reject-peer-authentication |
renegotiation retain-ip-address | retransmit-timeout milliseconds }
```

```
no ppp { auth-retry suppress-aaa-auth | chap fixed-challenge-length | dormant
send-lcp-terminate | lcp-authentication-discard retry-alternate num_discard |
lcp-authentication-reject retry-alternate | lcp-start-delay | lcp-terminate
connect-state | reject-peer-authentication | renegotiation retain-ip-address }
```

```
default lcp-authentication-discard retry-alternate num_discard
```

default

Restores the system defaults for the specific command/keyword.

```
no ppp { auth-retry suppress-aaa-auth | chap fixed-challenge-length |
dormant send-lcp-terminate | lcp-authentication-discard retry-alternate
num_discard | lcp-authentication-reject retry-alternate | lcp-start-delay
| lcp-terminate connect-state | lcp-terminate mip-lifetime-expiry | lcp-
terminate mip-revocation | negotiate default-value-options | reject-peer-
authentication | renegotiation retain-ip-address }
```

Disables, deletes, or resets the specified option.

In case of **no ppp renegotiation retain-ip-address** the initially allocated IP address will be released and a new IP address will be allocated during PPP renegotiation.

```
acfc { receive { allow | deny } | transmit { apply | ignore | reject } }
```

Configures PPP Address and Control Field Compression (ACFC) parameters.

```
receive { allow | deny }
```

Default: **allow**

This keyword specifies whether to allow Address and Control Field Compressed PPP packets received from the Peer. During LCP negotiation, the local PPP side indicates whether it can handle ACFC compressed PPP packets.

When `allow` is specified, the local PPP side indicates that it can process ACFC compressed PPP packets and compressed packets are allowed. When `deny` is specified, the local PPP side indicates that it cannot handle ACFC compressed packets and compressed packets are not allowed.

transmit { `apply` | `ignore` | `reject` }

Default: `ignore`

Specifies how Address and Control Field Compression should be applied for PPP packets transmitted to the Peer. During LCP negotiation, the Peer indicates whether it can handle ACFC compressed PPP packets.

When `apply` is specified, if the peer requests ACFC, the request is accepted and ACFC is applied for transmitted PPP packets. When `ignore` is specified, if the peer requests ACFC, the request is accepted, but ACFC is not applied for transmitted PPP packets. When `reject` is specified, if the peer requests ACFC, the request is rejected and ACFC is not applied to transmitted packets.

auth-retry suppress-aaa-auth

Default: `no auth-retry suppress-aaa-auth`

This option does not allow PPP authentication retries to the AAA server after the AAA server has already authenticated a session. PPP locally stores the username and password, or challenge response, after a successful PPP authentication. If the Mobile Node retries the PAP request or CHAP-Response packet to the PDSN, PPP locally compares the incoming username, password or Challenge Response with the information stored from the previous successful authentication. If it matches, PAP ACK or CHAP Success is sent back to the Mobile Node, without performing AAA authentication. If the incoming information does not match with what is stored locally, then AAA authentication is attempted. The locally stored PPP authentication information is cleared once the session reaches a connected state.

Important: This option is not supported in conjunction with the GGSN product.

chap fixed-challenge-length *length*

Default: Disabled. PAP CHAP uses a random challenge length.

Normally PPP CHAP uses a random challenge length from 17 to 32 bytes. This command allows you to configure a specific fixed challenge length of from 4 through 32 bytes.

length must be an integer from 4 through 32.

dormant send-lcp-terminate

Indicates a link control protocol (LCP) terminate message is enabled for dormant sessions.

Important: This option is not supported in conjunction with the GGSN product.

echo-max-retransmissions *num_retries*

Default: 3

Configures the maximum number of retransmissions of LCP ECHO_REQ before a session is terminated in an always-on session.

num_retries must be a value in the range of 1 to 16.

echo-retransmit-timeout *msec*

Default: 3000

Configures the timeout, in milliseconds, before trying LCP ECHO_REQ for an always-on session. msec must be a value in the range of 100 to 5000.

first-lcp-retransmit-timeout *milliseconds*

Default: 3000

Specifies the number of milliseconds to wait before attempting to retransmit control packets. This value configures the first retry. All subsequent retries are controlled by the value configured for the **ppp retransmit-timeout** keyword.

milliseconds must be a value in the range 100 through 5000.

lcp-authentication-discard retry-alternate *num_discard*

Default: Disabled.

This keyword sets the number of discards up to which authentication option is discarded during LCP negotiation and retries starts to allow alternate authentication option.

num_discard must be an integer from 0 through 5. Recommended value is 2.

lcp-authentication-reject retry-alternate

Default: Disabled. No alternate authentication option will be retried.

The action that is taken if the authentication option is rejected during LCP negotiation and retry the allowed alternate authentication option.

lcp-start-delay *delay*

Default: 0

The delay in milliseconds before link control protocol (LCP) is started. *delay* must be an integer from 0 through 5000.

lcp-terminate connect-state

This option enables sending an LCP terminate message to the Mobile Node when a PPP session is disconnected if the PPP session was already in a connected state.

Note that if the no keyword is used with this option, the PDSN must still send LCP Terminate in the event of an LCP/PCP negotiation failure or PPP authentication failure, which happens during connecting state.

Important: This option is not supported in conjunction with the GGSN product.

lcp-terminate mip-lifetime-expiry

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to MIP Lifetime expiry (default).

Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to MIP Lifetime expiry.

lcp-terminate mip-revocation

This option configures the PDSN to send a LCP Terminate Request when a MIP Session is terminated due to a Revocation being received from the HA (default).

Note that if the no keyword is used with this option, the PDSN does not send a LCP Terminate Request when a MIP session is terminated due to a Revocation being received from the HA.

max-authentication-attempts *num*

Default: 1

Configures the maximum number of time the PPP authentication attempt is allowed. *num* must be an integer in the range from 1 through 10.

max-configuration-nak *num*

Default: 10

This command configures the maximum number of consecutive configuration REJ/NAKs that can be sent during CP negotiations, before the CP is terminated. *num* must be an integer in the range from 1 through 20.

max-retransmission *number*

Default: 5

Specifies the maximum number of times control packets will be retransmitted. *number* must be a value from 1 to 16.

max-terminate *number*

Default: 2

Sets the maximum number of PPP LCP Terminate Requests transmitted to the Mobile Node. *number* must be an integer from 0 through 16.

Important: This option is not supported in conjunction with the GGSN product.

mrp *packet_size*

Default: 1500

Specifies the maximum packet size that can be received in bytes. *packet_size* must be an integer from 128 to 1500.

negotiate default-value-options

Default: Disabled

Enable the inclusion of configuration options with default values in PPP configuration requests.

The PPP standard states that configuration options with default values should not be included in Configuration Request (LCP, IPCP etc) packets. If the option is missing in the Configuration Request, the peer PPP assumes the default value for that configuration option.

When negotiate default-value-options is enabled, configuration options with default values are included in the PPP configuration Requests.

peer-authenticate *user_name* [[**encrypted**] **password** *password*]

Specifies the user name and an optional password required for point-to-point protocol peer connection authentications. *user_name* must be from 1 to 63 alpha and/or numeric characters. The keyword **password** is optional and if specified *password* must be from 1 to 63 alpha and/or numeric characters. The password specified must be in an encrypted format if the optional keyword **encrypted** was specified. The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

```
ppc { receive { allow | deny } | transmit { apply | ignore | reject } }
```

Configures Protocol Field Compression (PFC) parameters.

```
receive { allow | deny }
```

Default: allow

This keyword specifies whether to allow Protocol Field Compression (PFC) for PPP packets received from the Peer. During LCP negotiation, the local PPP side indicates whether it can handle Protocol Field Compressed PPP packets.

When allow is specified, the peer is allowed to request PFC during LCP negotiation. When deny is specified, the Peer is not allowed to request PFC during LCP negotiation.

```
transmit { apply | ignore | reject }
```

Default: ignore

This keyword specifies how Protocol field Compression should be applied for PPP packets transmitted to the Peer. During LCP negotiation, the Peer indicates whether it can handle PFC compressed PPP packets.

When apply is specified, if the peer requests PFC, it is accepted and PFC is applied for transmitted PPP packets. When ignore is specified, If the peer requests PFC, it is accepted but PFC is not applied for transmitted packets. When reject is specified, all requests for PCF from the peer are rejected.

```
reject-peer-authentication
```

Default: Enabled

If disabled, re-enables the system to reject peer requests for authentication.

```
renegotiation retain-ip-address
```

Default: Enabled

If enable retain the currently allocated IP address for the session during PPP renegotiation (Simple IP) between FA and Mobile node.

If disabled, the initially allocated IP address will be released and a new IP address will be allocated during PPP renegotiation.

```
retransmit-timeout milliseconds
```

Default: 3000

Specifies the number of milliseconds to wait before attempting to retransmit control packets.

milliseconds must be a value in the range 100 through 5000.

Usage

Modify the context PPP options to ensure authentication and communication for PPP sessions have fewer dropped sessions.

Example

The following commands set various PPP options.

```
ppp dormant send-lcp-terminate
```

```
ppp max-retransmission 3
```

```
ppp peer-authenticate user1 password secretPwd
```

```
ppp peer-authenticate user1
```

```
ppp retransmit-timeout 1000
```

The following command disables the sending of LCP terminate messages for dormant sessions.

```
no ppp dormant send-lcp-terminate
```

ppp magic-number

This command manages magic number checking during LCP Echo message handling.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ppp magic-number receive ignore
```

```
[ no | default ] ppp magic-number receive ignore
```

no

Disables the specified behavior.

default

Restores the system defaults for the specific command/keyword.

receive ignore

Default: Disabled.

Ignores the checking of magic number at PDSN during LCP Echo message handling.

If a valid magic numbers were negotiated for the PPP endpoints during LCP negotiation and LCP Echo

Request/Response have invalid magic numbers, enabling of this command will ignore the checking of magic number during LCP Echo message handling.

Usage

Use this command to allow the system to ignore invalid magic number during LCP Echo Request/Response handling.

Example

The following command allows the invalid magic number during LCP Echo Request/Response negotiation:

```
ppp magic-number receive ignore
```

ppp statistics

This command changes the manner in which some PPP statistics are calculated.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ppp statistics success-sessions { lcp-max-retry | misc-reasons | remote-terminated }
```

```
no ppp statistics success-sessions { lcp-max-retry | misc-reasons | remote-terminated }
```

no

Disable the specified behavior.

lcp-max-retry

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and lcp-max-retry.

misc-reasons

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and misc-reasons.

remote-terminated

Alters statistics calculations so that statistic ppp successful session is the sum of successful sessions and remote-terminated.

Usage

Use this command to alter how certain PPP statistics are calculated.

Caution: Use caution when using this command. This command alters the way that some PPP statistics are calculated. Please consult your designated service representative before using this command

Example

The following command alters the statistic ppp successful session so that it displays the sum of successful sessions and lcp-max-retry:

```
ppp statistics success-sessions lcp-max-retry
```

The following command disables the alteration of the statistic ppp successful session:

■ ppp statistics

```
no ppp statistics success-sessions lcp-max-retry
```

proxy-dns intercept-list

Enters the HA Proxy DNS Configuration Mode and defines a name of a redirect rules list for the domain name servers associated with a particular FA or group of FAs.

Important: HA Proxy DNS Intercept is a license-enabled feature.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] proxy-dns intercept-list name
```

no

Removes the intercept list from the system.

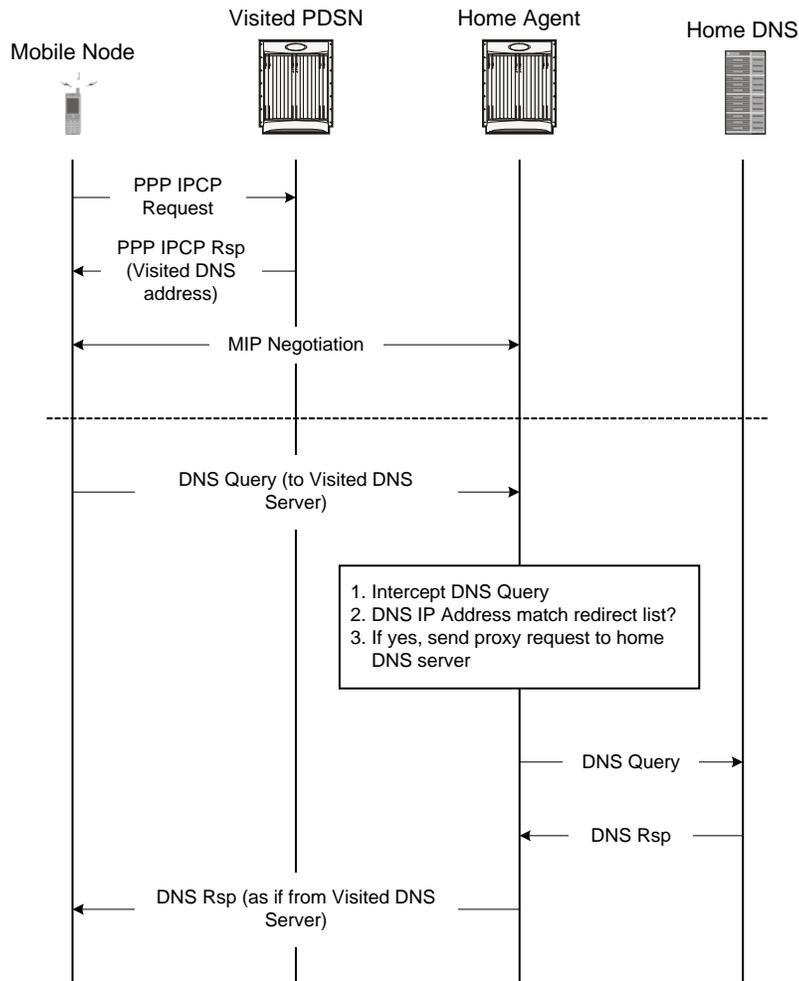

proxy-dns intercept-list name

Defines the rules list and enters the Proxy DNS Configuration Mode.
name must be a string from 1 to 63 characters in length.

Usage

Use this command to define a name for a list of rules pertaining to the IP addresses associated with the foreign network's DNS. Up to 128 rules of any type can be configured per rules list. Upon entering the command, the system switches to the HA Proxy DNS Configuration Mode where the lists can be defined. Up to 64 separate rules lists can be configured in a single AAA context. This command and the commands in the HA Proxy DNS Configuration Mode provide a solution to the Mobile IP problem that occurs when a MIP subscriber, with a legacy MN or MN that does not support IS-835D, receives a DNS server address from a foreign network that is unreachable from the home network. The following flow shows the steps that occur when this feature is enabled:

proxy-dns intercept-list

By configuring the Proxy DNS feature on the Home Agent, the foreign DNS address is intercepted and replaced with a home DNS address while the call is being handled by the home network.

Example

The following command creates a proxy DNS rules list named *list1* and places the CLI in the HA Proxy DNS Configuration Mode:

```
proxy-dns intercept-list list1
```

radius accounting

Configures the current context's RADIUS accounting function options.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting { archive [ stop-only ] | deadtime dead_minutes | detect-dead-server { consecutive-failures count | keepalive | response-timeout seconds } | interim interval seconds | max-outstanding msgs | max-pdu-size octets | max-retries tries | max-transmissions trans | timeout idle_seconds | unestablished-sessions }
```

```
no radius accounting { archive | detect-dead-server | interim interval | max-transmissions | unestablished-sessions }
```

```
default radius accounting { deadtime | detect-dead-server | interim interval seconds | max-outstanding | max-pdu-size | max-retries | max-transmissions | timeout }
```

no

Removes earlier configuration for the specified keyword.

default

Configures this command with the default settings.

archive [stop-only]

Default: enabled

Enables archiving of RADIUS Accounting messages in the system after the accounting message has exhausted retries to all available RADIUS Accounting servers. All RADIUS Accounting messages generated by a session are delivered to the RADIUS Accounting server in serial. That is, previous RADIUS Accounting messages from the same call must be delivered and acknowledged by the RADIUS Accounting server before the next RADIUS Accounting message is sent to the RADIUS Accounting server.

stop-only specifies archiving of STOP accounting messages only.

deadtime *dead_minutes*

Default: 10

Specifies the number of minutes to wait before attempting to communicate with a server which has been marked as unreachable. *dead_minutes* must be an integer from 0 through 65535.

detect-dead-server { consecutive-failures *count* | keepalive | response-timeout *seconds* }

consecutive-failures *count*: Default: 4. Specifies the number of consecutive failures, for each AAA manager, before a server is marked as unreachable. *count* must be an integer from 0 through 1000.

keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default is disabled.

response-timeout *seconds*: Specifies the number of seconds for each AAA manager to wait for a response to any message before a server is detected as failed, or in a down state. *seconds* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters have to be met before a server is considered unreachable, or dead.

interim interval *seconds*

Default: Disabled

Specifies the time interval (in seconds) for sending accounting INTERIM-UPDATE records. *seconds* must be an integer from 50 through 4000000.

Important: If RADIUS is used as the accounting protocol for the GGSN product, other commands are used to trigger periodic accounting updates. However, these commands would cause RADIUS STOP/START packets to be sent as opposed to INTERIM-UPDATE packets. Also note that accounting interim interval settings received from a RADIUS server take precedence over those configured on the system.

max-outstanding *msgs*

Default: 256

Specifies the maximum number of outstanding messages a single AAA manager instance will queue. *msgs* must be an integer from 1 through 4000.

max-pdu-size *octets*

Default: 4096

Specifies the maximum sized packet data unit which can be accepted/generated in bytes (octets). *octets* must be an integer from 512 through 4096.

max-retries *tries*

Default: 5

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable and the detect dead servers consecutive failures count is incremented. *tries* must be an integer from 0 through 65535.

Once the maximum number of retries is reached this is considered a single failure for the consecutive failures count for detecting dead servers.

max-transmissions *trans*

Default: Disabled

Sets the maximum number of transmissions for a RADIUS Accounting message before the message is declared as failed. *trans* must be an integer from 1 through 65535.

timeout *seconds*

Default: 3

Specifies the amount of time to wait for a response from a RADIUS server before retransmitting a request. *seconds* must be an integer from 1 through 65535.

unestablished-sessions

Indicates RADIUS STOP events are to be generated for sessions which were initiated but never fully established.

Usage

Manage the RADIUS accounting options according to the RADIUS server used for the context.

Example

The following commands specify accounting options.

```
radius accounting detect-dead-server consecutive-failures 5
```

```
radius accounting max-pdu-size 1024
```

```
radius accounting timeout 16
```

The following commands disable/clear the options.

```
no radius accounting interim interval 10
```

```
no radius accounting unestablished-sessions
```

radius accounting algorithm

This command specifies the fail-over/load-balancing algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting algorithm { first-n n | first-server | round-robin }
```

```
default radius accounting algorithm
```

default

Configures this command with the default settings.

Default: **first-server**

first-n n

Default: 1 (Disabled)

Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. The full set of accounting data is sent to each of the *n* AAA servers. Response from any one of the servers would suffice to proceed with the call. On receiving an ACK from any one of the servers, all retries are stopped.

n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Example

The following command specifies to use the round-robin algorithm to select the RADIUS server:

```
radius accounting algorithm round-robin
```

radius accounting apn-to-be-included

Configures the APN name to be included for RADIUS accounting.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting apn-to-be-included { gi | gn }
```

```
default radius accounting apn-to-be-included
```

default

Configures this command with the default settings.

gi

Specifies the usage of Gi APN name in the RADIUS accounting request. Gi APN represents the APN received in the Create PDP context request message from the SGSN.

gn

Specifies the usage of Gn APN name in the RADIUS accounting request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to configure the APN name for RADIUS Accounting. This can be set to either gi or gn.

Example

The following command specifies the usage of Gn APN name in the RADIUS accounting request:

```
radius accounting apn-to-be-included gn
```

radius accounting billing-version

This command configures billing-system version of RADIUS accounting servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting billing-version version
```

```
default radius accounting billing-version
```

default

Configures this command with the default setting.
Default: 0

version

Specifies the billing-system version, and must be an integer from 0 through 4294967295.

Usage

Use this command to configure the billing-system version of RADIUS accounting servers.

Example

The following command configures the billing-system version of RADIUS accounting servers as 10:

```
radius accounting billing-version 10
```

radius accounting gtp trigger-policy

This command configures the RADIUS accounting trigger policy for GTP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting gtp trigger-policy [ standard | ggsn-preservation-mode ]  
default radius accounting gtp trigger-policy
```

default

Resets the RADIUS accounting trigger policy to standard behavior for GTP session.

standard

This keyword sets the RADIUS accounting trigger policy to standard behavior which is configured for GTP session for GGSN service.

ggsn-preservation-mode

This keyword sends RADIUS Accounting Start when the GTP message with private extension of preservation mode is received from SGSN.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature. For more information on GGSN preservation mode, refer *GGSN Service Mode Commands* chapter.

Usage

Use this command to set the trigger policy for the AAA accounting for a GTP session.

Example

The following command sets the RADIUS accounting trigger policy for GTP session to standard:

```
default radius accounting gtp trigger-policy
```

radius accounting ha policy

Configures the RADIUS accounting policy for HA sessions.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting ha policy { session-start-stop | custom1-aaa-res-mgmt }
```

session-start-stop

Specifies to send Accounting Start when the session is connected, and send Accounting Stop when the session is disconnected. This is the default behavior.

custom1-aaa-res-mgmt

Accounting Start/Stop messages are generated to assist special resource management done by AAA servers. It is similar to the session-start-stop accounting policy, except for the following differences:

- Accounting Start is also generated during MIP session handoffs.
- No Accounting stop is generated when an existing session is overwritten and the new session continues to use the IP address assigned for the old session.
- Accounting Start is generated when a new call overwrites an existing session.

Usage

Use this command to set the behavior of the AAA accounting for an HA session.

Example

Use the following command to set the HA accounting policy to **custom1-aaa-res-mgmt**:

```
radius accounting ha policy custom1-aaa-res-mgmt
```

radius accounting interim volume

This command configures the volume of uplink and downlink volume octet counts that triggers RADIUS interim accounting.

Product

GGSN, PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting interim volume { downlink bytes uplink bytes | total bytes | uplink bytes downlink bytes }
```

```
no radius accounting interim volume
```

no

Disables volume based RADIUS accounting.

downlink bytes uplink bytes

Specifies the downlink to uplink volume limit for RADIUS Interim accounting, in bytes. *bytes* must be an integer from 100000 through 4000000000.

total bytes

Specifies the total volume limit for RADIUS interim accounting in bytes. *bytes* must be an integer from 100000 through 4000000000.

uplink bytes downlink bytes

Specifies the uplink to downlink volume limit for RADIUS interim accounting in bytes. *bytes* must be an integer from 100000 through 4000000000.

Usage

Use this command to trigger RADIUS interim accounting based on the volume of uplink and downlink bytes.

Example

The following command triggers RADIUS interim accounting when the total volume of uplink and downlink bytes reaches *110000*:

```
radius accounting interim volume total 110000
```

radius accounting ip remote-address

This command configures IP remote address-based RADIUS accounting parameters.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius accounting ip remote-address { collection | list list_id }
```

no

Removes earlier configuration for the specified keyword.

collection

Enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting. This should be enabled in the AAA Context. It is disabled by default.

list *list_id*

Enters the Remote Address List Configuration Mode. This mode configures a list of remote addresses that can be referenced by the subscriber's profile.

list_id must be an integer from 1 through 65535.

Usage

This command is used as part of the Remote Address-based Accounting feature to both configure remote IP address lists and enable the collection of accounting data for the addresses in those lists on a per-subscriber basis.

Individual subscriber can be associated to remote IP address lists through the configuration/specification of an attribute in their local or RADIUS profile. (Refer to the **radius accounting** command in the Subscriber Configuration mode.) When configured/specified, accounting data is collected pertaining to the subscriber's communication with any of the remote addresses specified in the list.

Once this functionality is configured on the system and in the subscriber profiles, it must be enabled by executing this command with the collection keyword.

Example

```
radius accounting ip remote-address collection
```

radius accounting keepalive

Configures the keepalive authentication parameters for the RADIUS accounting server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting keepalive { calling-station-id id | consecutive-response
number | framed-ip-address ip_address | interval seconds | retries number |
timeout seconds | username name }
```

```
no radius accounting keepalive framed-ip-address
```

```
default radius accounting keepalive { calling-station-id | consecutive-response
| interval | retries | timeout | username }
```

no

Removes configuration for the specified keyword.

default

Configures this command with the default settings.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication.
id must be an alpha and/or numeric string of 1 through 15 characters in length.
Default: 0000000000000000

consecutive-response *number*

Configures the number of consecutive authentication response after which the server is marked as reachable.
number must be an integer from 1 through 5.
Default: 1

framed-ip-address *ip_address*

Configures the framed-ip-address to be used for the keepalive accounting.
ip_address must be specified using the standard IPv4 dotted decimal notation.

interval *seconds*

Configures the time interval between the two keepalive access requests.
Default: 30 seconds

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable.

number must be an integer from 3 through 10.
Default: 3

timeout *seconds*

Configures the time interval between each keepalive access request retries.
seconds must be an integer from 1 through 30.
Default: 3

username *name*

Configures the username to be used for the authentication.
name must be an alpha and/or numeric string of 1 through 127 characters in length.
Default: Test-Username

Usage

Configures the keepalive authentication parameters for the RADIUS accounting server.

Example

The following command sets the user name for the RADIUS keepalive access requests to *Test-Username2*:

```
radius accounting keepalive username Test-Username2
```

The following command sets the number of retries to 4:

```
radius accounting keepalive retries 4
```

radius accounting rp

Configures the current context's RADIUS accounting R-P originated call options.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting rp { handoff-stop { immediate | wait-active-stop } | tod
minute hour | trigger-event { active-handoff | active-start-param-change |
active-stop } | trigger-policy { airlink-usage [ counter-rollover ] | custom [
active-handoff | active-start-param-change | active-stop ] | standard } |
trigger-stop-start }
```

```
no radius accounting rp { tod minute hour | trigger-event { active-handoff |
active-start-param-change | active-stop } | trigger-stop-start }
```

```
default radius accounting rp { handoff-stop | trigger-policy }
```

no

Removes earlier configuration for the specified keyword.

default

Configures this command with the default settings.

```
handoff-stop { immediate | wait-active-stop }
```

Default: **wait-active-stop**

Specifies the behavior of generating accounting STOP when handoff occurs.

- **immediate**: Indicates that accounting STOP should be generated immediately on handoff, i.e. not to wait active-stop from the old PCF.
- **wait-active-stop**: Indicates that accounting STOP is generated only when active-stop received from the old PCF when handoff occurs.

```
tod minute hour
```

Specifies the time of day a RADIUS event is to be generated for accounting. Up to four different times of the day may be specified through separate commands.

minute must be an integer from 0 through 59.

hour must be an integer from 0 through 23.

```
trigger-event { active-handoff | active-start-param-change | active-stop
}
```

Default: **active-handoff**: Disabled

active-start-param-change: Enabled

active-stop: Disabled

Configures the events for which a RADIUS event is generated for accounting as one of the following:

- **active-handoff**: Disables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Instead, two R-P events occur (one for the Connection Setup, and the second for the Active-Start).
- **active-start-param-change**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.
- **active-stop**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: This keyword has been obsoleted by the **trigger-policy** keyword. Note that if this command is used, if the context configuration is displayed, radius accounting rp configuration is represented in terms of the trigger-policy.

```
trigger-policy { airlink-usage [ counter-rollover ] | custom [ active-
handoff | active-start-param-change | active-stop ] | standard }
```

Default:**airlink-usage**: Disabled

custom:

- **active-handoff**: Disabled
- **active-start-param-change**: Disabled
- **active-stop**: Disabled
- **standard**: Enabled

Configures the overall accounting policy for R-P sessions as one of the following:

- **airlink-usage [counter-rollover]**: Designates the use of Airlink-Usage RADIUS accounting policy for R-P, which generates a start on Active-Starts, and a stop on Active-Stops.

If the **counter-rollover** option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than $(2^{32} - 1)$ in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^{32} thus ensuring the accuracy of the count. The system, may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped. Note that a STOP/START pair is never generated unless the subscriber RP session is in the Active state, since octet/packet counts are not accumulated when in the Dormant state.

- **custom**: Specifies the use of custom RADIUS accounting policy for R-P. The custom policy can consist of the following:
 - **active-handoff**: Enables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Normally two R-P events will occur (one for the Connection Setup, and the second for the Active-Start).
 - **active-start-param-change**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.

Important: Note that a custom trigger policy with only **active-start-param-change** enabled is identical to the **standard** trigger-policy.

- **active-stop**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Important: If the `radius accounting rp trigger-policy custom` command is executed without any of the optional keywords, all custom options are disabled.

- **standard:** Specifies the use of Standard RADIUS accounting policy for R-P in accordance with IS-835B.

trigger-stop-start

Specifies that a stop/start RADIUS accounting pair should be sent to the RADIUS server when an applicable R-P event occurs.

Usage

Use this command to configure the events for which a RADIUS event is sent to the server when the accounting procedures vary between servers.

Example

The following command enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF:

```
radius accounting rp trigger-event active-stop
```

The following command generates the STOP only when active-stop received from the old PCF when handoff occurs:

```
default radius accounting rp handoff-stop
```

radius accounting server

Configures RADIUS accounting server(s) in the current context for accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius [ mediation-device ] accounting server ip_address [ encrypted ] key value
[ acct-on { enable | disable } ] [ acct-off { enable | disable } ] [ max msgs ]
[ oldports ] [ port port_number ] [ priority priority ] [ type { mediation-
device | standard } ] [ admin-status { enable | disable } ] [ -noconfirm ]
```

```
no radius [ mediation-device ] accounting server ip_address [ oldports | port
port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

mediation-device

Enables mediation-device specific AAA transactions use to communicate with this RADIUS server.

Important: If this option is not used, the system, by default, enables standard AAA transactions.

ip_address

Specifies the IP address of the accounting server. *ip_address* must be specified in dotted decimal notation for IPv4 or colon notation for IPv6. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[**encrypted**] **key value**

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The key *value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.

The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

acct-on { enable | disable }

Default: **disable**

Enables and disables sending of the Accounting-On message when a new RADIUS server is added to the configuration.

When enabled, the Accounting-On message is sent when a new RADIUS server is added in the configuration. However, if for some reason the Accounting-On message cannot be sent at the time of server configuration

(for example, if the interface is down), then the message is sent as soon as possible. Once the Accounting-On message is sent, if it is not responded to after the configured RADIUS accounting timeout, the message is retried the configured number of RADIUS accounting retries. Once all retries have been exhausted, the system no longer attempts to send the Accounting-On message for this server.

acct-off { **enable** | **disable** }

Default: **enable**

Disables and enables the sending of the Accounting-Off message when a RADIUS server is removed from the configuration.

The Accounting-Off message is sent when a RADIUS server is removed from the configuration, or when there is an orderly shutdown. However, if for some reason the Accounting-On message cannot be sent at this time, it is never sent. The Accounting-Off message is sent only once, regardless of how many accounting retries are enabled.

max *msgs*

Default: 0

Specifies the maximum number of outstanding messages that may be allowed to the server. *msgs* must be an integer from 1 through 256.

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port *port_number*

Default: 1813

Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

type { **mediation-device** | **standard** }

Default: **standard**

mediation-device: Obsolete keyword.

Specifies the type of AAA transactions to use to communicate with this RADIUS server.

standard: Use standard AAA transactions.

admin-status { **enable** | **disable** }

Enables or disables the RADIUS authentication/accounting/ charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS accounting servers with which the system is to communicate for accounting.

Up to 128 RADIUS servers can be configured per context. The servers can be configured as Accounting, Authentication, charging servers, or any combination thereof.

Example

```
radius accounting server 1.2.3.4 key sharedKey port 1024 max 127
```

```
radius accounting server 1.2.5.6 encrypted key scrambledKey oldports  
priority10
```

```
no radius accounting server 1.2.5.6
```

The following command sets the accounting server with mediation device transaction for AAA server 1.2.3.4:

```
radius mediation-device accounting server 1.2.3.4 key sharedKey port 1024  
max 127
```

radius algorithm

Configures the RADIUS authentication server selection algorithm for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius algorithm { first-server | round-robin }
```

```
default radius algorithm
```

default

Configures this command with the default settings.

first-server | round-robin

Default: **first-server**

first-server: Authentication data is sent to the first available server based upon the relative priority of each configured server.

round-robin: Authentication data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configure relative priority of the servers.

Usage

Set the context's RADIUS server selection algorithm to ensuring proper load distribution through the servers available.

Example

```
radius algorithm first-server
```

```
radius algorithm round-robin
```

radius allow

Sets the system behavior for allowing subscriber sessions when RADIUS accounting and/or authentication is unavailable.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius allow { accounting-down | authentication-down }
```

no

Removes earlier configuration for the specified keyword.

authentication-down

Default: Disabled

Allows sessions while authentication is not available (down).

accounting-down

Default: Enabled

Allows sessions while accounting is unavailable (down).

Usage

Allow sessions during system troubles when the risk of IP address and/or subscriber spoofing is minimal. The denial of sessions may cause dissatisfaction with subscribers at the cost/expense of verification and/or accounting data.

Example

```
radius allow authentication-down  
no radius allow authentication-down  
radius allow accounting-down  
no radius allow accounting-down
```

radius attribute

Configures the system's RADIUS identification parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius attribute { nas-identifier id | nas-ip-address address primary_address [
backup second_address ] [ nexthop-forwarding-address nexthop_address ] [ vlan
vlan_id ] [ mpls-label input in_label_value output out_label_value1
out_label_value1 ] }
```

```
no radius attribute { nas-identifier | nas-ip-address }
```

```
default radius attribute nas-identifier
```

no

Removes earlier configuration for the specified keyword.

default

Configures this command with the default settings.

nas-identifier *id*

Specifies the attribute name by which the system will be identified in Access-Request messages. *id* must be a case-sensitive alpha and/or numeric string of 1 through 32 characters in length.

nas-ip-address address *primary_address*

Specifies the AAA interface IP address(es) to used to identify the system. Up to two addresses can be configured.

primary_address : The IP address of the primary interface to use in the current context. This must be specified in dotted decimal notation for IPv4 or colon notation for IPv6.

backup *second_address*

Specifies the IP address of the secondary interface to use in the current context. This must be in dotted decimal notation for IPv4 or colon notation for IPv6.

mpls-label input *in_label_value* | output *out_label_value1* [*out_label_value2*]

This command configures the traffic from the specified AAA client NAS IP address to use the specified MPLS labels.

- *in_label_value* is the MPLS label that identifies inbound traffic destined for the configured NAS IP address.

- *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to the packets sent from the specified NAS IP address.
 - *out_label_value1* is the inner output label.
 - *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

Important: This option is available only when nexthop-forwarding gateway is also configured with **nexthop-forwarding-address** keyword.

nexthop-forwarding-address *next_hop_address*

Configures the next hop IP address for this NAS IP address.

next_hop_address must be an IPv4 address or an IPv6 address in standard format.

vlan *vlan_id*

Configures VLAN ID to be associated with the next-hop IP address.

vlan_id must be an integer from 1 through 4094.

Usage

This is necessary for NetWare Access Server usage such as the system must be identified to the NAS. The system supports the concept of the active nas-ip-address. The active nas-ip-address is defined as the current source ip address for RADIUS messages being used by the system. This is the content of the nas-ip-address attribute in each RADIUS message.

The system will always have exactly one active nas-ip-address. The active nas-ip-address will start as the primary nas-ip-address. However, the active nas-ip-address may switch from the primary to the backup, or the backup to the primary. The following events will occur when the active nas-ip-address is switched:

- All current in-process RADIUS accounting messages from the entire system are cancelled. The accounting message is re-sent, with retries preserved, using the new active nas-ip-address. Acct-Delay-Time, however, is updated to reflect the time that has occurred since the accounting event. The value of Event-Timestamp is preserved.
- All current in-process RADIUS authentication messages from the entire system are cancelled. The authentication message is re-sent, with retries preserved, using the new active nas-ip-address. The value of Event-Timestamp is preserved.
- All subsequent in-process RADIUS requests uses the new active nas-ip-address.

The system uses a revertive algorithm when transitioning active NAS IP addresses as described below:

- If the configured primary nas-ip-address transitions from UP to DOWN, and the backup nas-ip-address is UP, then the active nas-ip-address switches from the primary to the backup nas-ip-address
- If the backup nas-ip-address is active, and the primary nas-ip-address transitions from DOWN to UP, then the active nas-ip-address switches from the backup to the primary nas-ip-address

Example

```
radius attribute nas-ip-address 1.2.3.4

no radius attribute nas-identifier sampleID
```

■ radius attribute

radius authenticate

Enables (allows) and disables (prevents) the authentication of user names that are blank or empty. This is enabled by default.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] radius authenticate null-username
```

default

Configures this command with the default settings for authenticating, sending Access-Request messages to the AAA server, all user names, including NULL user names.

no

Disables sending an Access-Request message to the AAA server for user names (NAI) that are blank.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for user names (NAI) that are blank (NULL).

Example

To disable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
no radius authenticate null-username
```

To re-enable sending Access-Request messages for user names (NAI) that are blank, enter the following command:

```
radius authenticate null-username
```

radius authenticate apn-to-be-included

Configures the APN name to be included for RADIUS authentication.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] radius authenticate apn-to-be-included { gi | gn }
```

default

Configures this command with the default settings.

gi

Specifies the usage of Gi APN name in the RADIUS authentication request. Gi APN represents the APN received in the Create PDP Context Request message from the SGSN.

gn

Specifies the usage of Gn APN name in the RADIUS authentication request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to configure the APN name for RADIUS authentication. This can be set to either gi or gn.

Example

The following command specifies the usage of Gn APN name in the RADIUS authentication request.

```
radius authenticate apn-to-be-included gn
```

radius authenticator-validation

Enables (allows) and disables (prevents) the MD5 authentication of RADIUS user. This is enabled by default.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] radius authenticator-validation
```

no

Disables MD5 authentication validation for an Access-Request message to the AAA server.

default

Enables MD5 authentication validation for an Access-Request message to the AAA server.

no

Disable sending an Access-Request message to the AAA server for usernames (NAI) that are blank.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for MD5 validation.

Example

To disable MD5 authentication validation for Access-Request messages for usernames (NAI), enter the following command:

```
no radius authenticator-validation
```

To enable MD5 authentication validation for Access-Request messages for usernames (NAI), enter the following command:

```
radius radius authenticator-validation
```

radius change-authorize-nas-ip

Defines the NAS IP address and UDP port on which the current context will listen for Change of Authorization (COA) messages and Disconnect Messages (DM). If the NAS IP address is not defined with this command, any COA or DM messages from the RADIUS server are returned with a Destination Unreachable error.

Product

PDSN, FA, HA, GGSN, LNS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius change-authorize-nas-ip ip_address [ encrypted ] key value [ port
port ] [ event-timestamp-window window ] [ no-nas-identification-check ] [ no-
reverse-path-forward-check ] [ mpls-label input in_label_value | output
out_label_value1 [ out_label_value2 ]
```

no

Deletes the NAS IP address information which disables the system from receiving and responding to COA and DM messages from the RADIUS server.

ip_address

Specifies the NAS IP address of the current context's AAA interface that was defined with the **radius attribute** command.

ip_address can either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

[**encrypted**] **key value**

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The *key value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.

The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

port *port*

Default: 3799

The UDP port on which to listen for COA and DM messages.

event-timestamp-window *window*

Default: 300 seconds

window must be an integer from 0 through 4294967295.

When a COA or DM request is received with an event-time-stamp, if the current-time is greater than received-pkt-event-time-stamp plus event-time-stamp-window, the packet is silently discarded

When a COA or DM request is received without the event-timestamp attribute, the packet is silently discarded.

If *window* is specified as 0 (zero), this feature is disabled; the event-time-stamp attribute in COA or DM messages is ignored and the event-time-stamp attribute is not included in NAK or ACK messages.

no-nas-identification-check

Disables the context from checking the NAS Identifier/ NAS IP Address while receiving the CoA/DM requests.

By default this check is enabled.

no-reverse-path-forward-check

Disables the context from checking whether received COA or DM packets are from one of the AAA servers configured in the current context. Only the src-ip address in the received COA or DM request is validated and the port and key are ignored.

reverse-path-forward-check is enabled by default.

When reverse-path-forward-check is disabled, CoA and DM messages are accepted from any AAA server.

```
mpls-label input in_label_value | output out_label_value1 [out_label_value2 ]
```

This command configures COA traffic to use the specified MPLS labels.

- *in_label_value* is the MPLS label that identifies inbound COA traffic.
- *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to COA response.
 - *out_label_value1* is the inner output label.
 - *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

Usage

Use this command to enable the current context to listen for COA and DM messages.

Any one of the following RADIUS attributes may be used to identify the subscriber:

- **3GPP-IMSI**: The subscriber's IMSI. It may include the 3GPP-NSAPI attribute to delete a single PDP context rather than all of the PDP contexts of the subscriber when used with the GGSN product.
- **Framed-IP-address**: The subscriber's IP address.
- **Acct-Session-Id**: Identifies a subscriber session or PDP context.

Important: For the GGSN product, the value for Acct-Session-Id that is mandated by 3GPP is used instead of the special value for Acct-Session-Id that we use in the RADIUS messages we exchange with a RADIUS accounting server.

Important: When this command is used in conjunction with the GGSN, CoA functionality is not supported.

Example

Specify the IP address *192.168.100.10* as the NAS IP address, a key value of *123456* and use the default port of *3799*, by entering the following command:

```
radius change-authorize-nas-ip 192.168.100.10 key 123456
```

radius change-authorize-nas-ip

Following disables the nas-identification-check for the above parameters:

```
radius change-authorize-nas-ip 192.168.100.10 key 123456 no-nas-  
identification-check
```

radius charging

Configures basic RADIUS options for Active Charging Services.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] radius charging { deadtime dead_minutes | detect-dead-server {
consecutive-failures count | response-timeout seconds } | max-outstanding msgs |
max-retries tries | max-transmissions transmissions | timeout idle_seconds }
```

no

Removes configuration for the specified keyword.

default

Configures this command with the default settings.

deadtime *dead_minutes*

Default: 10

Specifies the number of minutes to wait before attempting to communicate with a server which has been marked as unreachable. *dead_minutes* must be an integer from 0 through 65535.

detect-dead-server { **consecutive-failures** *count* | **response-timeout** *seconds* }

consecutive-failures *count*: Default: 4. Specifies the number of consecutive failures, for each AAA manager, before a server is marked as unreachable. *count* must be an integer from 0 through 1000.
response-timeout *seconds*: Specifies the number of seconds for each AAA manager to wait for a response to any message before a server is detected as failed, or in a down state.

max-outstanding *msgs*

Default: 256

Specifies the maximum number of outstanding messages a single AAA manager instance will queue. *msgs* must be an integer from 1 through 4000.

max-retries *tries*

Default: 5

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable and the detect dead servers consecutive failures count is incremented. *tries* must be an integer from 0 through 65535.

max-transmissions *transmissions*

Default: Disabled

■ radius charging

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with the **max-retries** for each server.

When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted or once the configured number of maximum transmissions is reached. For example, if 3 servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried 4 times (once plus 3 retries), the secondary server is tried 4 times, and then a third server is tried 4 times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.

transmissions must be an integer from 1 through 65535.

timeout *idle_seconds*

Default: 3

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages. *idle_seconds* must be an integer from 1 through 65535.

Usage

Manage the basic Charging Service RADIUS options according to the RADIUS server used for the context.

Example

```
radius charging detect-dead-server consecutive-failures 6
```

```
radius charging timeout 300
```

radius charging accounting algorithm

This command specifies the fail-over/load-balancing algorithm to be used for selecting RADIUS servers for charging services.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius charging accounting algorithm { first-n n | first-server | round-robin }
```

first-n *n*

Default: 1 (Disabled)

Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. Response from any one of the *n* AAA servers would suffice to proceed with the call. The full set of accounting data is sent to each of the *n* AAA servers.

n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the accounting algorithm to use to select RADIUS servers for charging services configured in the current context.

Example

The following command specifies to use the round-robin algorithm to select the RADIUS server:

```
radius charging accounting algorithm round-robin
```

radius charging accounting server

Configures RADIUS charging accounting servers in the current context for Active Charging Services prepaid accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging accounting server ip_address [ encrypted ] key value [ max msgs
] [ max-rate max_rate ] [ oldports ] [ port port_number ] [ priority priority ]
[ admin-status { enable | disable } ] [ -noconfirm ]
```

```
no radius charging accounting server ip_address [ oldports | port port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies IP address of the accounting server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[**encrypted**] *key value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The *key value* must be a string of 1 to 15 alpha and/or numeric characters, or when encrypted a string of 1 to 30 alpha and/or numeric characters.

The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *msgs*

Default: 0

Specifies the maximum number of outstanding messages that may be allowed to the server. *msgs* must be integer from 0 through 4000.

max-rate *max_rate*

Default: Disabled

Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.

max_rate must be an integer from 1 through 1000.

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

port *port_number*

Default: 1813

Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority.

admin-status { **enable** | **disable** }

Enables or disables the RADIUS authentication/ accounting/charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS charging accounting server(s) with which the system is to communicate for Active Charging Services prepaid accounting requests. Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

Example

```
radius charging accounting server 1.2.3.4 key sharedKey port 1024 max 127
radius charging accounting server 1.2.5.6 encrypted key scrambledKey
oldports priority 10

no radius charging accounting server 1.2.5.6
```

radius charging algorithm

Configures the RADIUS authentication server selection algorithm for Active Charging Services for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging algorithm { first-server | round-robin }
```

```
default radius charging algorithm
```

default

Configures this command with the default settings.

Default: **first-server**

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Set the context's RADIUS server selection algorithm for Active Charging Services to ensure proper load distribution through the servers available.

Example

```
radius algorithm first-server
```

```
radius algorithm round-robin
```

radius charging server

Configures the RADIUS charging server(s) in the current context for Active Charging Services prepaid authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging server ip_address [ encrypted ] key value [ max msgs ] [ max-rate max_rate ] [ oldports ] [ port port_number ] [ priority priority ] [ admin-status { enable | disable } ] [ -noconfirm ]
```

```
no radius charging server ip_address [ oldports | port port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the server. *ip_address* must be specified using the standard IPv4 dotted decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[**encrypted**] **key** *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The *value* must be a string of 1 to 15 alpha and/or numeric characters, or when encrypted a string of 1 to 30 alpha and/or numeric characters. The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *msgs*

Default: 256

Specifies the maximum number of outstanding messages that may be allowed to the server. *msgs* must be an integer from 0 through 4000.

max-rate *max_rate*

Default: Disabled

Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.

max_rate must be an integer from 1 through 1000.

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

port *port_number*

Default: 1812

Specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535.

priority *priority*

Default: 1000

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority.

admin-status { **enable** | **disable** }

Enables or disables the RADIUS authentication/accounting/charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS charging server(s) with which the system is to communicate for Active Charging Services prepaid authentication requests.

Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

Example

```
radius charging server 1.2.3.4 key sharedKey port 1024 max 127
```

```
radius charging server 1.2.5.6 encrypted key scrambledKey oldports  
priority 10 ]
```

```
no radius server 1.2.5.6
```

radius dictionary

This command configures the RADIUS dictionary for RADIUS prepaid charging.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius dictionary *dictionary*

default radius dictionary

default

Configures the default dictionary.

dictionary *dictionary*

Specifies the dictionary to use.

The possible values are described in the following table.

Table 15. RADIUS Dictionary Types

Dictionary	Description
3gpp	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in 3GPP 32.015.
3gpp2	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists of all the attributes in the standard dictionary, and all of the attributes specified in IS-835.
customXX	<p>These are customized dictionaries. For information on custom dictionaries, please contact your local service representative.</p> <p>XX is the integer value of the custom dictionary.</p> <hr/> <p> Important: RADIUS dictionary <i>custom23</i> should be used in conjunction with Active Charging Service (ACS).</p> <hr/>
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all the attributes in the starent-vs1 dictionary and incorporates additional VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.

■ radius dictionary

Dictionary	Description
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.
starent-vsa1	This dictionary consists not only of the 3gpp2 dictionary, but also includes vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.

Usage

Use this command to assign the RADIUS dictionary according to the RADIUS server used for the context.

Example

The following command sets *custom23* as dictionary for prepaid charging:

```
radius dictionary custom23
```

radius group

This command has been deprecated and is replaced by AAA Server Group configurations. See the *AAA Server Group Configuration Mode Commands* chapter.

radius ip vrf

This command associates the default AAA group with a Virtual Routing and Forwarding (VRF) Context instance for GRE tunnel interface configuration. By default the VRF is NULL, which means that default AAA group is associated with global routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius ip vrf vrf_name
```

```
no radius ip vrf
```

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance.

vrf_name is name of a pre-configured virtual routing and forwarding (VRF) context configured in Context Configuration Mode through **ip vrf** command.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a GRE tunnel interface.

By default the VRF is NULL, which means that default AAA group is associated with global routing table.

Example

Following command associates VRF context instance *GRE_vrf1* with this AAA group:

```
radius ip vrf GRE_vrf1
```

radius keepalive

Configures the keepalive authentication parameters for the RADIUS server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] radius keepalive [ calling-station-id id | consecutive-response number | encrypted | interval seconds | password | retries number | timeout seconds | username name | valid-response access-accept [ access-reject ] ]
```

default

Configures this command with the default settings.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication. *id* must be an alpha and/or numeric string of 1 through 15 characters in length.

Default: 0000000000000000

consecutive-response *number*

Configures the number of consecutive authentication response after which the server is marked as reachable. *number* must be integer from 1 through 5.

Default: 1

encrypted password

Designates use of encryption for the password. *password* must be an alpha and/or numeric string of 1 through 64 characters in length.

Default: Test-Password

interval *seconds*

Configures the time interval between the two keepalive access requests.

Default: 30 seconds

password

Configures the password to be used for the authentication. *password* must be an alpha and/or numeric string of 1 through 64 characters in length.

Default: Test-Password

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable. *number* must be an integer from 3 through 10.

Default: 3

timeout *seconds*

Configures the time interval between each keepalive access request retries. *seconds* must be an integer from 1 through 30.

Default: 3 seconds

username *name*

Configures the username to be used for the authentication. *name* must be an alpha and/or numeric string of 1 through 127 characters in length.

Default: Test-Username

valid-response access-accept [*access-reject*]

Configures the valid response for the authentication request.

If *access-reject* is configured, then both access-accept and access-reject are considered as success for the keepalive authentication request.

If *access-reject* is not configured, then only access-accept is considered as success for the keepalive access request.

Default: **keepalive valid-response access-accept**

Usage

Use this command to configure the Keepalive Authentication parameters for the RADIUS server.

Example

The following command sets the user name for the RADIUS keepalive access requests to *Test-Username2*:

```
radius keepalive username Test-Username2
```

The following command sets the number of retries to 4:

```
radius keepalive retries 4
```

radius mediation-device

See the `radius accounting server` command.

radius probe-interval

Configures the interval duration between two RADIUS authentication probes.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
radius probe-interval seconds
```

```
default radius probe-interval
```

default

Configures this command with the default settings.

seconds

Default: 3

Specifies the amount of time in seconds to wait before sending another probe authentication request to a RADIUS server. *seconds* must be an integer from 1 through 65535.

Usage

Use this command for Home Agent Geographical Redundancy (HAGR) support to set the duration between two authentication probes to the RADIUS server.

Example

Following command sets the authentication probe interval to 30 seconds.

```
radius probe-interval 30
```

radius probe-max-retries

Configures the number of retries for RADIUS authentication probe response.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
radius probe-max-retries retries
```

```
default radius probe-max-retries
```

default

Configures this command with the default settings.

retries

Default: 5

Specifies the number of retries for RADIUS authentication probe response before the authentication is declared as failed.

retries must be an integer from 1 through 65535.

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the number of attempts to send RADIUS authentication probe without a response before the authentication is declared as failed.

Example

The following command sets the maximum number of retries to 6:

```
radius probe-max-retries 6
```

radius probe-timeout

Configures the timeout duration to wait for a response for RADIUS authentication probes.

Product

GGSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
radius probe-timeout idle_seconds
```

```
default radius probe-timeout
```

default

Configures the default setting.

idle_seconds

Default: 3

Specifies the number of seconds to wait for response from the RADIUS server before resending the authentication probe.

idle_seconds must be an integer from 1 through 65535.

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the duration to wait for response before re-sending the RADIUS authentication probe to the RADIUS server.

Example

The following command sets the authentication probe timeout to *120* seconds:

```
radius probe-timeout 120
```

radius server

Configures RADIUS authentication server(s) in the current context for authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius server ip_address [ encrypted ] key value [ max msgs ] [ max-rate
max_rate ] [ oldports ] [ port port_number ] [ priority priority ] [ probe | no-
probe ] [ probe-username user_name ] [ probe-password [ encrypted ] password
password ] [ type { mediation-device | standard } ] [ admin-status { enable |
disable } ] [ -noconfirm ]
```

```
no radius server ip_address [ oldports | port port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address

Specifies the IP address of the server. *ip_address* must be specified in dotted decimal notation for IPv4 or colon notation for IPv6. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[**encrypted**] **key** *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted. The *value* must be a string of 1 to 15 alpha and/or numeric characters or a string of 1 to 30 alpha and/or numeric characters when encrypted.

The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

max *msgs*

Default: 256

Specifies the maximum number of outstanding messages that may be allowed to the server. *msgs* must be an integer from 0 through 4000.

max-rate *max_rate*

Specifies the rate (number of messages per second), at which the authentication messages should be sent to the RADIUS server.

max_rate must be an integer from 1 through 1000.

Default: disabled

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

port *port_number*

Default: 1812

Specifies the port number to use for communications.

port_number must be an integer from 1 through 65535.

priority *priority*

Default: 1000

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be a value in the range 1 through 1000 where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

probe

Enable probe messages to be sent to the specified RADIUS server.

no-probe

Disable probe messages from being sent to the specified RADIUS server. This is the default behavior.

probe-username *username*

The user name sent to the RADIUS server to authenticate probe messages. *user_name* must be an alpha and/or numeric string of 1 through 127 characters in length.

probe-password [**encrypted**] **password** *password*

The password sent to the RADIUS server to authenticate probe messages.

encrypted: This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

password *password*: Specifies the probe-user password for authentication. *password* must be an alpha and/or numeric string of 1 through 63 characters in length.

type { **mediation-device** | **standard** }

Specifies the type of transactions the RADIUS server accepts.

mediation-device: Specifies mediation-device specific AAA transactions. This device is available if you purchased a transaction control services license. Contact your local sales representative for licensing information.

standard: Specifies standard AAA transactions. (Default)

admin-status { **enable** | **disable** }

Enables or disables the RADIUS authentication/accounting/charging server functionality, and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command is used to configure the RADIUS authentication server(s) with which the system is to communicate for authentication.

Up to 128 RADIUS servers can be configured per context. The servers can be configured as Accounting, Authentication, charging servers, or any combination thereof.

Example

```
radius server 1.2.3.4 key sharedKey port 1024 max 127
```

```
radius server 1.2.5.6 encrypted key scrambledKey oldports priority 10
```

```
no radius server 1.2.5.6
```

radius trigger

This command enables specific RADIUS triggers.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius trigger { ms-timezone-change | qos-change | rai-change | rat-change | serving-node-change | uli-change }
```

default radius trigger

no

Disables the specified RADIUS trigger.

default

Configures the default setting.
Default: All RADIUS triggers are enabled.

ms-timezone-change

Specifies to enable RADIUS trigger for MS time zone change.

qos-change

Specifies to enable RADIUS trigger for Quality of Service change.

rai-change

Specifies to enable RADIUS trigger for Routing Area Information change.

rat-change

Specifies to enable RADIUS trigger for Radio Access Technology change.

serving-node-change

Specifies to enable RADIUS trigger for Serving Node change.

uli-change

Specifies to enable RADIUS trigger for User Location Information change.

Usage

Use this command to enable RADIUS triggers.

Example

The following command enables RADIUS trigger for RAT change:

```
radius trigger rat-change
```

route-access-list extended

This command configures an access list for filtering routes based on a specified range of IP addresses.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
route-access-list extended identifier { deny | permit } ip { network_parameter }
{ mask_parameter }
```

```
no route-access-list extended identifier { deny | permit } ip {
network_parameter } { mask_parameter }
```

no

Deletes the specified route access list.

identifier

A value to identify the route access list.

identifier must be an integer from 100 through 999.

deny

Deny routes that match the specified criteria.

permit

Permit routes that match the specified criteria.

network_parameter

This specifies the network portion of the route to match. The network portion of the route is mandatory and must be expressed in one of the following ways:

ip_address wildcard_mask: A network address and wildcard mask expressed in IPv4 dotted decimal notation. (192.168.100.0 0.0.0.255)

any : Match any network address.

host *network_address* : Match the specified network address exactly. *network_address* must be an IPv4 address specified in dotted decimal notation.

mask_parameter

This specifies the mask portion of the route to match. The mask portion of the route is mandatory and must be expressed in one of the following ways;

mask_address wildcard_mask: A mask address and wildcard mask expressed in IPv4 dotted decimal notation. (255.255.255.0 0.0.0.255)

any : Match any network mask.

host *mask_address* : Match the specified mask address exactly. *mask_address* must be an IPv4 address specified in dotted decimal notation.

Usage

Use this command to create an extended route-access-list that matches routes based on network addresses and masks.

Example

Use the following command to create an extended route-access-list:

```
route-access-list extended 100 permit ip 192.168.100.0 0.0.0.255  
255.255.255.0 0.0.0.255
```

route-access-list named

This command configures an access list for filtering routes based on a network address and net mask.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
route-access-list named list_name { deny | permit } { ip_address/mask | any } [ exact-match ]
```

```
no route-access-list named list_name { deny | permit } { ip_address/mask | any } [ exact-match ]
```

no

Deletes the specified route access list.

list_name

A name that identifies the route access list. *list_name* must be a string of 1 through 79 alphanumeric characters in length.

deny

Deny routes that match the specified criteria.

permit

Permit routes that match the specified criteria.

ip_address/mask

The IP address (in dotted-decimal notation) and the number of subnet bits, representing the subnet mask in shorthand. This variable must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

any

Match any route.

exact-match

Match the IP address prefix exactly.

Usage

Use this command to create route-access lists that specify routes that are accepted.

Example

Use the following command to create a route access list named *list27* that permits routes that match *192.168.1.0/24* exactly:

```
route-access-list named list27 permit 192.168.1.0/24 exact-match
```

To delete the list, use the following command:

```
no route-access-list named list27 permit 192.168.1.0/24 exact-match
```

route-access-list standard

This command configures an access-list for filtering routes based on network addresses.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
route-access-list standard identifier { permit | deny } { ip_address
wildcard_mask | any | host network_address }
```

```
no route-access-list standard identifier { permit | deny } { ip_address
wildcard_mask | any | host network_address }
```

no

Deletes the specified route access list.

identifier

This is a value that identifies the route-access-list. This must be an integer from 1 through 99.

deny

Deny routes that match the specified criteria.

permit

Permit routes that match the specified criteria.

ip_address wildcard_mask

The IP address and subnet mask to match for routes. Both *ip_address* and *wildcard_mask* must be entered in IPv4 dotted decimal notation. (192.168.100.0 255.255.255.0)

any

Match any route.

host *network_address*

Routes must match the specified network address as if it had a 32-bit network mask. *network_address* must be an IPv4 address specified in dotted decimal notation.

Usage

Use this command to create route-access-lists that specify routes that are accepted.

Example

Use the following command to create a route access list with an identifier of *10* that permits routes:

```
route-access-list standard 10 permit 192.168.1.0 255.255.255.0
```

To delete the list, use the following command:

```
no route-access-list standard 10 permit 192.168.1.0 255.255.255.0
```

route-map

This command creates a route-map that is used by the routing features and enters Route-map Configuration mode. A route-map allows redistribution of routes. A routemap has a list of match and set commands associated with it. The match commands specify the conditions under which redistribution is allowed and the set commands specify the particular redistribution actions to be performed if the criteria specified by match commands are met. Route-maps are used for detailed control over route distribution between routing processes. Up to eight route-maps can be created in each context. Refer to the *Route-map Configuration Mode Commands* chapter for more information.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
route-map map_name { deny | permit } seq_number
```

```
no route-map map_name
```

no

Deletes the specified route-map.

map_name

The name of the route-map to create or edit. This is a string of characters from 1 through 69 characters long.

deny

If the deny parameter is specified and the match command criteria are met, the route is not redistributed and any other route maps with the same map name are not examined. Set commands have no affect on deny route-maps.

permit

If the permit parameter is specified, and the match criteria are met, the route is redistributed as specified by set actions. If the match criteria are not met, the next route map with the same name is tested.

seq_number

The sequence number that indicates the position a new route map is to have in the list of route maps already configured with the same name. Route maps with the same name are tested in ascending order of their sequence numbers. This must be an integer from 1 through 65535.

Usage

Use this command to create route maps that allow redistribution of routes based on specified criteria and set parameters for the routes that get redistributed. The chassis supports a maximum of 64 route maps per context.

Example

To create a route map named map1 that permits routes that match the specified criteria, use the following command:

```
route-map map1 permit 10
```

To delete the route-map, enter the following command:

```
no route-map map1 permit 10
```

router

This command enables the OSPF routing functionality and enters the OSPF Configuration Mode. Refer to the *OSPF Configuration Mode Commands* chapter for details on OSPF Configuration mode commands.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
router { ospf rip | bgp as_number | ospfv3 }
```

no

Disables the specified routing support in the current context.

ospf

Enable OSPF routing in this context and enter OSPF Configuration Mode.

bgp as_number

Enable a BGP routing service for this context and assign it the specified AS number. *as_number* must be an integer from 1 through 65535.

Important: BGP routing is supported only for use with the HA.

ospfv3

Enable OSPFv3 routing in this context and enter OSPFv3 Configuration mode.

Usage

Use this command to enable and configure OSPF and BGP routing in the current context.

Important: You must obtain and install a valid OSPF or BGP-4 feature use license key to use OSPF and BGP routing features. Refer to the *System Administration Guide* for details on obtaining and installing feature use license keys.

Example

The following command enables the OSPF routing functionality and enters the OSPF Configuration Mode:

```
router ospf
```

The following command enables a BGP routing service with an AS number of *100*, and enters the BGP Configuration Mode:

```
router bgp 100
```

server

Configures remote server access protocols for the current context. This command is used to enter the specified protocols configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
server { ftpd | named | sshd | telnetd | tftpd }
no server { ftpd | named | sshd | telnetd | tftpd } [ kill ]
```

no

Disables the specified service.

ftpd

Enters the FTP Server Configuration Mode.

Important: The FTPD server can only be configured in the local context.

named

Starts the named server.

sshd

Enters the SSH Server Configuration Mode.

Important: The SSHD server allows only three unsuccessful login attempts before closing a login session attempt.

telnetd

Enters the Telnet Server Configuration Mode.

Important: The TELNET server allows only three unsuccessful login attempts before closing a login session attempt.

tftpd

Enters the TFTP Server Configuration Mode.

Important: The TFTPD server can only be configured in the local context.

kill

Indicates all instances of the server are to be stopped.

This option only works with the **ftpd**, **sshd**, **telnetd**, and **tftpd** commands.

Usage

Enter the Context Configuration Mode for the appropriate, previously defined context, to set the server option(s). Repeat the command as needed to enable/disable more than one option server daemon.

Example

```
server ftpd
server named
no server tftpd
server sshd
server telnetd
no server telnetd kill
```

service-redundancy-protocol

Configures Interchassis Session Redundancy services for the current context. This command is used to enter the Service Redundancy Protocol Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
service-redundancy-protocol
```

Usage

Enter the configuration mode to set the service redundancy protocol options.

Example

The following command enters Service Redundancy Protocol Configuration Mode.

```
service-redundancy-protocol
```

sgsn-service

This command creates an SGSN service instance and enters the SGSN Service Configuration Mode. This mode configures or edits the configuration for an SGSN service which controls the SGSN functionality.

An SGSN mediates access to GPRS/UMTS network resources on behalf of user equipment (UE) and implements the packet scheduling policy between different QoS classes. It is responsible for establishing the packet data protocol (PDP) context with the GGSN.

 **Important:** For details about the commands and parameters, check the *SGSN Service Configuration Mode* chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn-service svrc_name
```

```
no sgsn-service svrc_name
```

no

Remove the configuration for the specified SGSN service from the configuration of the current context.

svrc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific SGSN service.

Usage

Use this command to create, edit, or remove an SGSN service

Example

The following command creates an SGSN service named *sgsn1* in the current context:

```
sgsn-service sgsn1
```

The following command removes the *sgsn* service named *sgsn1* from the configuration for the current context:

```
no sgsn-service sgsn1
```

sgs-service

This command creates an SGS service instance and enters the SGS Service Configuration Mode.

Product

MME

Privilege

Administrator

Syntax

sgs-service *name*

no sgs-service *name*

no

Remove the configuration for the specified SGS service from the configuration of the current context.

name

A unique string of 1 to 63 alphanumeric characters that identify the specific SGS service.

Usage

Enter the SGS Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-sgs-service)#
```

SGS Service Configuration Mode commands are defined in the *SGS Service Configuration Mode Commands* chapter.

Example

The following command creates an SGS service named *sgs1* in the current context:

```
sgs-service sgs1
```

The following command removes the SGS service named *sgs1* from the configuration for the current context:

```
no sgs-service sgs1
```

sgtp-service

This command creates an SGTP service instance and enters the SGTP Service Configuration Mode. This mode configures the GPRS Tunneling Protocol (GTP) related settings required by the SGSN to support GTP-C (control plane) messaging and GTP-U (user data plane) messaging.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgtp-service svc_name
```

```
no sgtp-service svc_name
```

no

Remove the configuration for the specified SGTP service from the configuration of the current context.

svc_name

A unique string of 1 to 63 alphanumeric characters that identify the specific SGTP service.

Usage

Use this command to create, edit, or remove an SGTP service

Example

The following command creates an SGTP service named *sgtp1* in the current context:

```
sgtp-service sgtp1
```

The following command removes the sgsn service named *sgtp1* from the configuration for the current context:

```
no sgtp-service sgtp1
```

sgw-service

Creates an S-GW service or specifies an existing S-GW service and enters the S-GW Service Configuration Mode for the current context.

Product

S-GW

Privilege

Administrator

Syntax

```
sgw-service service_name [ -noconfirm ]
```

```
no sgw-service service_name
```

service_name

Specifies the name of the S-GW service. If *service_name* does not refer to an existing service, the new service is created if resources allow.

service_name must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

```
no sgw-service service_name
```

Removes the specified S-GW service from the context.

Usage

Enter the S-GW Service Configuration Mode for an existing service or for a newly defined service. This command is also used to remove an existing service.

A maximum of 256 services (regardless of type) can be configured per system.

 **Caution:** Large numbers of services greatly increase the complexity of management and may impact overall system performance (for example, resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Entering this command results in the following prompt:

```
[context_name]hostname(config-sgw-service)#
```

S-GW Service Configuration Mode commands are defined in the *S-GW Service Configuration Mode Commands* chapter.

Use this command when configuring the following SAE components: S-GW.

Example

■ **sgw-service**

The following command enters the existing S-GW Service Configuration Mode (or creates it if it does not already exist) for the service named *sgw-service1*:

```
sgw-service sgw-service1
```

The following command will remove *sgw-service1* from the system:

```
no sgw-service sgw-service1
```

ssh

Generates public and private keys for use with the configured SSH server for the current context and sets the public/private key pair to specified values.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ssh { generate key | key data length octets } [ type { v1-rsa | v2-rsa | v2-dsa } ]
```

```
no ssh key [ type { v1-rsa | v2-rsa | v2-dsa } ]
```

```
no ssh key [ type { v1-rsa | v2-rsa | v2-dsa } ]
```

This command clears configured SSH keys. If type is not specified, all SSH keys are cleared.

generate key

This command generates a public/private key pair which is to be used by the SSH server. The generated key pair is in use until the command is issued again.

key data length octets

This command sets the public/private key pair to be used by the system where *data* is the encrypted key and *length* is the length of the encrypted key in octets. *data* must be an alpha and/or numeric string of 1 to 1023 characters and *octets* must be a value in the range of 0 through 65535.

```
[ type { v1-rsa | v2-rsa | v2-dsa } ]
```

Specifies the type of SSH key to generate. If type is not specified, all three key types types are generated.

v1-rsa: SSH v1 RSA host key only

v2-rsa: SSH v2 DSA host key only

v2-dsa: SSH v2 RSA host key only

Important: For maximum security, it is recommended that only SSH v2 be used. **v2-rsa** is the recommended key type.

Usage

Generate secure shell keys for use in public key authentication.

Example

```
ssh generate key
```

■ ssh

```
ssh key g6j93fw59cx length 128
```

subscriber

Configures the specified subscriber for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
subscriber { default | name user_name } asn-service-info mobility [ ipv4 | ipv6  
| ipv6-ipv4 ]
```

```
no subscriber { default | name user_name }
```

no

Indicates the subscriber specified is to be removed from the list of allowed users for the current context.

default | **name** *user_name*

default: Enters the Subscriber Configuration Mode for the context's default subscriber settings.

name *user_name*: Specifies the user which is to be allowed to use the services of the current context. *user_name* must be from 1 to 127 alpha and/or numeric characters.

asn-service-info mobility: This configuration indicates the type of mobility supported and enabled in the ASN.

Usage

Enter the Subscriber Configuration Mode for actual users as well as for a default subscriber for the current context.

NAS uses the specified parameter for `asn-service-info mobility` to indicate and pack the mobility support field for IPv4, IPv6, or both, in the Service-Info attribute in the Access-request. RADIUS sends back this attribute in the Access-accept message by indicating respective bits to authorize the service indicated by NAS.

Important: A maximum of 128 subscribers and/or administrative users may be locally configured per context.

Example

```
subscriber default  
  
no subscriber default  
  
subscriber name user1  
  
no subscriber name user1
```

■ subscriber

threshold available-ip-pool-group

Configures context-level thresholds for IP pool utilization for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold available-ip-pool-group low_thresh [ clear high_thresh ]
```

low_thresh

Default: 10

The low threshold IP pool utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.

low_thresh can be configured to any integer value between 0 and 100.

clear *high_thresh*

Default: 10

The high threshold IP pool utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated.

high_thresh can be configured to any integer value between 0 and 100. The default is 10

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When IP address pools are configured on the system, they can be assigned to a group. IP address pool utilization thresholds generate alerts or alarms based on the utilization percentage of all IP address contained in the pool group during the specified polling interval.

All configured public IP address pools that were not assigned to a group are treated as belonging to the same group. Individual configured static or private pools are each treated as their own group.

Alerts or alarms are triggered for IP address pool utilization based on the following rules:

- **Enter Condition:** Actual IP address utilization percentage per pool group \leq Low Threshold
- **Clear Condition:** Actual IP address utilization percentage per pool group $>$ High Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

The following table describes the possible methods for configuring IP pool utilization thresholds:

Table 16. IP Pool Utilization Thresholds - Configuration Methods

Method	Description
--------	-------------

■ `threshold available-ip-pool-group`

Method	Description
Context-level	A single IP pool utilization threshold can be configured for all IP pool groups within a given system context. If a single threshold is configured for all pool groups, separate alerts or alarms can be generated for each group. This command configures that threshold.
IP address pool-level	Each individual IP address pool can be configured with its own threshold. Thresholds configured for individual pools take precedence over the context-level threshold that would otherwise be applied (if configured). In the event that two IP address pools belonging to the same pool group are configured with different thresholds, the system uses the pool configuration that has the greatest low threshold for that group.

Example

The following command configures a context-level IP pool utilization low threshold percentage of *10* and a high threshold of *35* for an system using the Alarm thresholding model:

```
threshold available-ip-pool-group 10 clear 35
```

threshold ha-service init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for an HA service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold ha-service init-rrq-rcvd-rate high_thresh [ clear low_thresh ]  
no threshold ha-service init-rrq-rcvd-rate
```

no

Deletes the alert or alarm.

high_thresh

Default: 0

The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default: 0

The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or less than a specified number of calls per second.

Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter Condition:** Actual number of calls setup per second > High Threshold
- **Clear Condition:** Actual number of calls setup per second ≤ Low Threshold

Example

The following command configures a number of calls setup per second threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold ha-service init-rrq-rcvd-rate 1000 clear 500
```

threshold ip-pool-free

Set an alarm or alert based on the percentage of IP addresses that are unassigned in an IP pool. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold ip-pool-free low_thresh [ clear high_thresh ]
```

low_thresh

Default: 0

The low threshold percentage of addresses available in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *high_thresh*

Default: 0

The high threshold percentage of addresses available in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of unassigned IP addresses in any pool is equal to or less than a specified percentage of the total number of addresses in the pool.

Alerts or alarms are triggered for percentage of IP address pool free based on the following rules:

- **Enter Condition:** Actual percentage of IP addresses free per pool \leq Low Threshold
- **Clear Condition:** Actual percentage of IP addresses free per pool $>$ High Threshold

Important: This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are unused low threshold percentage of 10 and a high threshold of 35 for a system using the Alarm thresholding model:

```
threshold ip-pool-free 10 clear 35
```

threshold ip-pool-hold

Set an alert based on the percentage of IP addresses from an IP pool that are on hold. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold ip-pool-hold high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold percentage of addresses on hold in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 0

The low threshold percentage of addresses on hold in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises below the low threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the percentage of IP addresses on hold in any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.

Alerts or alarms are triggered for percentage of IP address pool addresses on hold based on the following rules:

- **Enter Condition:** Actual percentage of IP addresses on hold per pool > High Threshold
- **Clear Condition:** Actual percentage of IP addresses on hold per pool ≤ Low Threshold

 **Important:** This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are on high threshold percentage of 35 and a low threshold of 10 for an system using the Alarm thresholding model:

```
threshold ip-pool-hold 35 clear 10
```

■ threshold ip-pool-hold

threshold ip-pool-release

Set an alert based on the percentage of IP addresses from an IP pool that are in the release state. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold ip-pool-release high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold percentage of addresses in the release state in an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default:0

The low threshold percentage of addresses in the release state in an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises below the low threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of IP addresses the release state in any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.

Alerts or alarms are triggered for percentage of IP address pool addresses in the release state based on the following rules:

- **Enter Condition:** Actual percentage of IP addresses in the release state per pool > High Threshold
- **Clear Condition:** Actual percentage of IP addresses in the release state per pool ≤ Low Threshold

 **Important:** This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are in the release state high threshold percentage of 35 and a low threshold of 10 for a system using the Alarm thresholding model:

```
threshold ip-pool-release 35 clear 10
```

■ threshold ip-pool-release

threshold ip-pool-used

This command sets an alert based on the percentage of IP addresses that have been assigned from an IP pool. This command affects all IP pools in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold ip-pool-used high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold percentage of addresses assigned from an IP pool that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 0

The low threshold percentage of addresses assigned from an IP pool that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated. It may be configured to any integer value between 0 and 100.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert or an alarm when the number of IP addresses assigned from any pool is equal to or greater than a specified percentage of the total number of addresses in the pool.

Alerts or alarms are triggered for percentage of IP address pool addresses used based on the following rules:

- **Enter Condition:** Actual percentage of IP addresses used per pool > High Threshold
- **Clear Condition:** Actual percentage of IP addresses used per pool ≤ Low Threshold

 **Important:** This command is overridden by the settings of the **alert-threshold** keyword of the **ip pool** command.

Example

The following command configures a context-level IP pool percentage of IP addresses that are used high threshold percentage of 35 and a low threshold of 10 for an system using the Alarm thresholding model:

```
threshold ip-pool-used 35 clear 10
```

threshold monitoring

Enables thresholding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] threshold monitoring available-ip-pool-group
```

no

Disables threshold monitoring for the specified value.

available-ip-pool-group

Enables threshold monitoring for IP pool thresholds at the context level and the IP address pool-level.

Refer to the **threshold available-ip-pool-group** command, the **threshold ip-pool-x** commands and the **alert-threshold** keyword of the **ip pool** command for additional information on these values.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the `starentMIB(8164).starentTraps(2)` section of the *SNMP MIB Reference*.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called **threshold** for which active and event logs can be generated. As with other system facilities, logs are generated. Log messages pertaining to the condition of a monitored value are generated with a severity level of **WARNING**.

- **Alarm System:** High threshold alarms generated within the specified polling interval are considered “outstanding” until a the condition no longer exists and/or a condition clear alarm is generated.

“Outstanding” alarms are reported to through the system’s alarm subsystem and are viewable through the system’s CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 17. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
-------	------------	------	--------------

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

Refer to the **threshold poll** command in Global Configuration Mode Commands for information on configuring the polling interval over which IP address pool utilization is monitored.

Example

the following command enables threshold monitoring for IP pool thresholds at the context level and the IP address pool-level:

```
threshold monitoring available-ip-pool-group
```

threshold pdsn-service init-rrq-rcvd-rate

Set an alarm or alert based on the average number of calls setup per second for a PDSN service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold pdsn-service init-rrq-rcvd-rate high_thresh [ clear low_thresh ]
```

```
no threshold pdsn-service init-rrq-rcvd-rate
```

no

Deletes the alert or alarm.

high_thresh

Default: 0

The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 1000000.

clear *low_thresh*

Default:0

The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or less than a specified number of calls per second.

Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter Condition:** Actual number of calls setup per second > High Threshold
- **Clear Condition:** Actual number of calls setup per second ≤ Low Threshold

Example

The following command configures a number of calls setup per second threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold pdsn-service init-rrq-rcvd-rate 1000 clear 500
```

udr-module active-charging-service

This command creates the User Data Record (UDR) module and enters the UDR Module Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
udr-module active-charging-service
```

Usage

Use this command to create the UDR module for the context, and configure the UDR module for active charging service records. You must be in a non-local context when specifying this command, and you must use the same context when specifying the EDR module command.

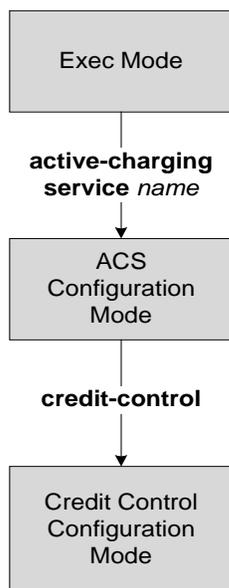

Example

```
udr-module active-charging-service
```

Chapter 50

Credit Control Configuration Mode Commands

The Credit Control Configuration Mode is used to configure prepaid services for Diameter/RADIUS applications.

apn-name-to-be-included

This command configures whether the virtual or real APN name is sent in Credit Control Application (CCA) messaging.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
apn-name-to-be-included { gn | virtual }
```

```
default apn-name-to-be-included
```

default

Configures the default setting for this command.

Default: **gn**

gn

Sends Gn APN name in the CCA messages.

virtual

Sends virtual APN name, if configured in the APN Configuration Mode, in the CCA messages.

Usage

Use this command to configure the APN information in CCA messages. Virtual APN name can be set to be sent in CCA messages if it is configured in the APN Configuration Mode.

Example

The following command sets the virtual APN name to be sent in CCA message:

```
apn-name-to-be-included virtual
```

diameter dictionary

This command configures the Diameter Credit Control dictionary for the Active Charging Service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary { dcca-custom1 | dcca-custom10 | dcca-custom11 | dcca-  
custom12 | dcca-custom13 | dcca-custom14 | dcca-custom15 | dcca-custom16 | dcca-  
custom17 | dcca-custom18 | dcca-custom19 | dcca-custom2 | dcca-custom20 | dcca-  
custom3 | dcca-custom4 | dcca-custom5 | dcca-custom6 | dcca-custom7 | dcca-  
custom8 | dcca-custom9 | standard }
```

default diameter dictionary

default

Configures the default setting for this command.

Default: standard dictionary

dcca-custom1 ... dcca-custom20

Specifies a custom Diameter dictionary.

standard

Specifies the standard Diameter dictionary.

Default: Enabled

Usage

Use this command to select the Diameter dictionary for Active Charging Service.

Example

The following command selects the standard Diameter dictionary:

```
diameter dictionary standard
```

diameter dynamic-rules request-quota

This command is used to request quota immediately in the CCR sent to Gy interface when the traffic matches the dynamic rules with Online AVP enabled and received over Gx interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dynamic-rules request-quota { on-traffic-match | on-receiving-rule }  
default diameter dynamic-rules request-quota
```

default

Configures the default setting for this command.

Default: **on-receiving-rule**

on-traffic-match

Specifies to request quota only when there is a traffic matching the dynamic rules with Online AVP enabled.

on-receiving-rule

Specifies to request quota on receiving a dynamic rule with Online AVP enabled.

Usage

Use this command to request quota when the traffic matches the dynamic rules with Online AVP enabled.

Example

The following command specifies to request quota on receiving a dynamic rule with Online AVP enabled:

```
diameter dynamic-rules request-quota on-receiving-rule
```

diameter gsu-with-only-infinite-quota

This command configures whether to accept/reject CCA messages that contain **Granted-Service-Unit** AVP with only infinite quota grants from the server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter gsu-with-only-infinite-quota { accept-credit-control-answer | reject-credit-control-answer }
```

```
default diameter gsu-with-only-infinite-quota
```

default

Configures the default setting for this command.
Default: **reject-credit-control-answer**

accept-credit-control-answer

Specifies to accept the Credit-Control-Answer message.

reject-credit-control-answer

Specifies to reject the Credit-Control-Answer message.

Usage

Use this command to accept/reject CCA messages that contain **Granted-Service-Unit** AVP with only infinite quota grants from the server.

Example

The following command specifies to accept CCA with **Granted-Service-Unit** AVP containing only Infinite quota:

```
diameter gsu-with-only-infinite-quota accept-credit-control- answer
```

diameter ignore-returned-rulebase-id

This command configures to accept/ignore rulebase ID in **Rulebase-Id** AVP returned by the Diameter server in CCA message.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] diameter ignore-returned-rulebase-id
```

default

Configures the default setting for this command.

Default: Accept

no

Specifies to accept the rulebase ID received from Diameter server in CCA.

Usage

Use this command to ignore/accept rulebase ID returned from the Diameter server in CCA.

Example

This following command specifies to ignore rulebase ID returned from Diameter server in CCA:

```
diameter ignore-returned-rulebase-id
```

diameter mscf-final-unit-action terminate

This command enables either to terminate a PDP session immediately when the Final-Unit-Action (FUA) in a particular MSCC is set as TERMINATE and the quota is exhausted for that service, or to terminate the session after all other MSCCS (categories) have used up their available quota.

Important: This command is only available in 10.2 and later releases.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
diameter mscf-final-unit-action terminate { category | session { on-per-mscc-  
exhaustion | on-all-mscc-exhaustion } }
```

```
default diameter mscf-final-unit-action terminate
```

default

Configures the default setting for this command.

Default: Same as `diameter mscf-final-unit-action terminate category`

diameter mscf-final-unit-action terminate category

This is the standard behavior wherein the category is terminated if the Final-Unit-Indication AVP comes with TERMINATE for a given MSCC.

diameter mscf-final-unit-action terminate session on-per-mscc-exhaustion

When the FUA in a particular MSCC is set as TERMINATE and the quota is exhausted for that service, the session will be terminated immediately irrespective of the state of the other MSCCS.

diameter mscf-final-unit-action terminate session on-all-mscc-exhaustion

When the FUA in a particular MSCC is set as TERMINATE and the quota is exhausted for that service, the session termination will be initiated after all the other MSCCS (categories) have used up their available quota. There will no more CCR(U) messages sent requesting for quota after receiving the FUA as TERMINATE in the MSCC level.

Usage

Use this command to terminate a PDP session immediately when the Final-Unit-Action (FUA) in a particular MSCC is set as TERMINATE and the quota is exhausted for that service, or to terminate the session after all other MSCCS (categories) have used up their available quota.

Example

diameter msc-final-unit-action terminate

The following command terminates the PDP session after quota exhausts for all MSCCs when MSCC FUA is set to TERMINATE:

```
diameter msc-final-unit-action terminate session on-all-mscc-exhaustion
```

diameter msc-per-ccr-update

This command configures sending single/multiple **Multiple-Services-Credit-Control** (MSCC) AVP in CCR-U messages.

Important: This command is only available in StarOS 8.3 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter msc-per-ccr-update { multiple | single }
```

```
default diameter msc-per-ccr-update
```

default

Configures the default setting for this command.

Default: **multiple**

multiple

Specifies sending multiple **Multiple-Services-Credit-Control** AVP in a single CCR-U message.

single

Specifies sending only one **Multiple-Services-Credit-Control** AVP in a CCR-U message.

Usage

Use this command to configure sending single/multiple **Multiple-Services-Credit-Control** AVP in CCR-U messages.

Example

The following command configures sending a single MSCC AVP in CCR-U messages:

```
diameter msc-per-ccr-update single
```

diameter origin host

This command is obsolete. See the [diameter origin endpoint](#) command.

diameter origin endpoint

This command configures the Diameter Credit Control Origin Endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter origin endpoint endpoint_name [ realm realm_name ]
```

```
no diameter origin endpoint
```

no

Removes the Diameter Credit Control Origin Endpoint configuration.

endpoint_name

Specifies the Diameter Credit Control Origin Endpoint.

endpoint_name must be the endpoint's name, and an alpha and/or numeric string of 1 through 63 characters in length.

realm *realm_name*

Specifies the Diameter Credit Control Realm ID.

realm_name must be a string of 1 through 127 characters in length.

Usage

Use this command to configure the Diameter Credit Control Origin Endpoint.

The endpoint to configure should be pre-configured. For information on creating and configuring a Diameter endpoint, in the Context Configuration Mode, see the **diameter endpoint** command.

Example

The following command configures a Diameter Credit Control Origin Endpoint named *test*:

```
diameter origin endpoint test
```

diameter peer-select

This command configures the Diameter credit control primary and secondary hosts for DCCA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.x:

```
diameter peer-select peer peer_name [ realm realm_name ] [ secondary-peer
secondary_peer_name [ realm realm_name ] ] [ imsi-based start-value
imsi_start_value end-value imsi_end_value ]
```

```
no diameter peer-select [ imsi-based start-value imsi_start_value end-value
imsi_end_value ]
```

In StarOS 9.0 and later for UMTS deployments:

```
diameter peer-select peer peer_name [ realm realm_name ] [ secondary-peer
secondary_peer_name [ realm realm_name ] ] [ imsi-based { [ prefix | suffix ]
imsi/prefix/suffix_start_value } [ to imsi/prefix/suffix_end_value ] ]
```

```
no diameter peer-select [ imsi-based { [ prefix | suffix ]
imsi/prefix/suffix_start_value } [ to imsi/prefix/suffix_end_value ] ]
```

no

Removes previously configured Diameter credit control peer selection setting.

peer *peer_name*

Specifies the primary host name.

peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

imsi-based start-value *imsi_start_value end-value imsi_end_value*

Available only in StarOS 8.3 and earlier releases.

Specifies peer selection based on International Mobile Subscriber Identification (IMSI) range.

start-value *imsi_start_value* specifies the start of range in integer value of IMSI, and **end-value** *imsi_end_value* specifies the end of range in integer value of IMSI.

imsi-based { [**prefix** | **suffix**] *imsi/prefix/suffix_start_value* } [**to**
imsi/prefix/suffix_end_value]

In this release, available only for UMTS deployments.

Specifies peer selection based on IMSI prefix or suffix or IMSI range.

prefix: Specifies the prefix range

suffix: Specifies the suffix range

imsi/prefix/suffix_start_value: Specifies the IMSI/prefix/suffix start value. *prefix/suffix* must be IMSI prefix/suffix, and must be an integer from 1 through 15 characters in length.

imsi/prefix/suffix_end_value: Specifies the IMSI/prefix/suffix end value. *prefix/suffix* must be IMSI prefix/suffix, and must be an integer from 1 through 15 characters in length, and must be greater than the start value.

Important: If *prefix/suffix* is used, the lengths of both start and end *prefix/suffix* must be equal. If the **prefix** or **suffix** keyword is not specified, it will be considered as suffix.

realm *realm_name*

The *realm_name* must be an alpha and/or numeric string of 1 through 127 characters in length, and can contain punctuation characters. The realm may typically be a company or service name.

secondary-peer *secondary_peer_name*

Specifies a name for the secondary host to be used for failover processing. When the route-table does not find an AVAILABLE route, the secondary host performs a failover processing if the [diameter session failover](#) command is set.

secondary_peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and can contain punctuation characters.

Usage

Use this command to configure Diameter credit control host selection.

If the **diameter peer-select** command is not configured, and if multiple peers are configured in the endpoint, the available peers configured in the endpoint are automatically chosen in a load-balanced round-robin manner.

In StarOS 9.0 and later, a prefix or suffix of IMSI or IMSI range can be configured. If *prefix* or *suffix* keyword is not specified, it will be considered as suffix. Up to 64 peer selects can be configured. At any time either *prefix* or *suffix* mode can be used in one DCCA config. If the *prefix/suffix* mode is used, the start and end *prefix/suffix* lengths must be equal.

StarOS 9.0 and later supports peer selection using *prefix* or *suffix* of IMSI or IMSI range. Subscribers are now assigned to a primary OCS instance based on the value of the IMSI *prefix* or *suffix* of a length of 1 to 15 digits. If the *prefix* or *suffix* keyword is not specified, it will be considered as suffix. Up to 64 peer selects can be configured. At a time either *prefix* or *suffix* mode can be used in one DCCA config. If *prefix* or *suffix* mode is used, the lengths of all *prefix/suffix* must be equal.

Each primary OCS may have a designated secondary OCS in case of failure of the primary. It will be the responsibility of the GGSN to use the appropriate secondary OCS in case of primary failure. The secondary OCS for each primary OCS will be one of the existing set of OCSs.

Example

The following command configures a Diameter credit control peer named *test* and the realm *companyx*:

```
diameter peer-select peer test realm companyx
```

The following command configures IMSI-based Diameter credit control peer selection in the IMSI range of *1234567890* to *1234567899*:

```
diameter peer-select peer star imsi-based start-value 1234567890 end-value 1234567899
```

■ diameter peer-select

The following command configures IMSI-based DCCA peer selection with IMSI suffix of *100* through *200*:

```
diameter peer-select peer test_peer realm test_realm secondary-peer  
test_sec_realm realm test_realm2 imsi-based suffix 100 to 200
```

diameter pending-timeout

This command configures the maximum time period to wait for response from a Diameter peer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter pending-timeout duration
```

```
default diameter pending-timeout
```

default

Disables DCCA resending message at pending-timeout.

duration

Specifies the timeout duration in seconds.

duration must be an integer from 1 through 300.

after-expiry-try-secondary-host

This keyword is deprecated. This can now be managed using the **retry-after-tx-expiry** and **go-offline-after-tx-expiry** keywords in the [failure-handling](#) command.

Usage

Use this command to set the maximum time for Diameter credit control to receive a response from its peer. DCCA refers to this as the Tx Timer. Typically, this should be configured to a value smaller than the response-timeout value of Diameter Endpoint Configuration Mode. That value is typically too large for DCCA's purposes.

If DCCA gets a “no available routes” error before pending-timeout expires, then DCCA tries to send to the secondary host (if one has been configured). If DCCA gets no response and pending-timeout expires, then DCCA either tries the secondary host or gives up. This can now be managed using the [failure-handling](#) command.

If routing has failed, i.e., the attempt to the primary host, as well as, the attempt to the secondary host (if that has been configured), then the processing configured by the [failure-handling](#) CLI command is performed. The routing (i.e., returning a good response, no response or an error response such as “no available routes”) is controlled by Diameter Endpoint Configuration Mode. That uses a watchdog timer (called Tw Timer) to attempt a different route to a host. Multiple routes could be attempted. If there's no response before the endpoint's configured response-timeout expires, then “no available routes” is the routing result. The routing logic remembers the status of routes, so it can return “no available routes” immediately, without using any timers.

The default case will disable DCCA resending message at Tx (pending-timeout). So messages are retried only at Tw (device watchdog timeout) by diabase or at response-timeout by DCCA.

diameter pending-timeout

Example

The following command configures a Diameter Credit Control Pending Timeout setting of *20* seconds:

```
diameter pending-timeout 20
```

diameter result-code

This command enables sending GTP Create-PDP-Context-Rsp message with cause code based on the DCCA result code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter result-code { authorization-rejected | user-unknown } use-gtp-cause-code { authentication-failure | no-resource-available }
```

```
default diameter result-code { authorization-rejected | user-unknown } use-gtp-cause-code
```

authorization-rejected

Result code received as DIAMETER_AUTHORIZATION_REJECTED(5003).

user-unknown

Result code received as DIAMETER_USER_UNKNOWN(5030).

use-gtp-cause-code

Cause code to be sent in GTP response.

authentication-failure

To send GTP cause code GTP_USER_AUTHENTICATION_FAILED in GTP response.

no-resource-available

To send GTP cause code GTP_NO_RESOURCES_AVAILABLE in GTP response (default cause code).

Usage

On receiving result-code as AUTHORIZATION-REJECTED or DIAMETER_USER_UNKNOWN from DCCA server, the cause code can either be sent as GTP_NO_RESOURCE_AVAILABLE or GTP_AUTHENTICATION_FAILED in GTP create-PDP-Context response message, based on this CLI configuration. By default, GTP_NO_RESOURCE_AVAILABLE is sent.

Example

The following command sets the deny cause as user authentication failure when the CCA-Initial has the result code DIAMETER_AUTHORIZATION_REJECTED(5003):

```
diameter result-code authorization-rejected use-gtp-cause-code authentication-failure
```

■ diameter result-code

diameter send-ccri

This command configures when to send CCR-Initial for the subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter send-ccri { session-start | traffic-start }  
default diameter send-ccri
```

default

Configures the default setting for this command.

Default: **session-start**

session-start

Specifies to send CCR-I when the PDP context is being established (on receiving Create-PDP-Context-Request).

traffic-start

Specifies to delay sending CCR-I until the first data packet received from the subscriber.

Usage

Use this command to configure when to send CCR-Initial for the subscriber session.

Example

The following command configures to send CCR-I on traffic detection and not on context creation:

```
diameter send-ccri traffic-start
```

diameter session failover

This command enables/disables Diameter Credit Control Session Failover. When enabled, the secondary peer is used in the event the main peer is unreachable.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] diameter session failover
```

default

Configures the default setting for this command.

Default: Depends on the **failure-handling** configuration

no

If the primary server is not reachable, failover is not triggered and the session is torn down. No failover action is taken.

Usage

Use this command to enable/disable Diameter Credit Control Session Failover.

The **failure-handling** configuration comes into effect only if **diameter session failover** is present in the configuration. The failover can be overridden by the server in the response message, and it takes precedence.

Example

The following command enables Diameter Credit Control Session Failover:

```
diameter session failover
```

end

Returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

Exits the current mode and returns to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

failure-handling

This command configures the Diameter Credit Control Failure Handling (CCFH) behavior in the event of communication failure with the prepaid server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
failure-handling { initial-request | terminate-request | update-request } {
continue [ go-offline-after-tx-expiry | retry-after-tx-expiry ] | retry-and-
terminate [ retry-after-tx-expiry ] | terminate }

default failure-handling [ initial-request | terminate-request | update-request
]
```

```
default failure-handling [ initial-request | terminate-request | update-
request ]
```

Configures the default CCFH setting.

initial-request: The default setting is **terminate**.

update-request: The default setting is **retry-and-terminate**.

terminate-request: The default setting is **retry-and-terminate**.

initial-request

Specifies the message type as CCR-Initial.

terminate-request

Specifies the message type as CCR-Terminate.

update-request

Specifies the message type as CCR-Update.

continue

Specifies the CCFH setting as continue. The online session is converted into offline session. The associated PDP Context is established (new sessions) or not released (ongoing sessions).

retry-and-terminate

Specifies the CCFH setting as retry-and-terminate. The user session will continue for the duration of one retry attempt with the prepaid server. In case there is no response from both primary and secondary servers the session is torn down.

terminate

Specifies the CCFH setting as terminate. All type of sessions (initial or update) are terminated in case of failure.

go-offline-after-tx-expiry

Specifies to start offline charging after Tx expiry.

retry-after-tx-expiry

Specifies to retry after Tx expiry. Enables secondary-host, if up, to take over after Tx expiry.

Usage

Use this command to select the CCFH behavior. The specified behavior is used for sessions when no behavior is specified by the prepaid server. By default, the CCFH is taken care at response-timeout except for terminate setting.

If the Credit-Control-Failure-Handling AVP is received from the server, the received setting will be applied to all the message types.

The following table indicates the CCFH behavior for the combination of different CCFH settings, and the corresponding CLI commands.

CCFH Setting	CLI Command	Behavior at Tx	Behavior at RT	Secondary is Up	Secondary is Down
Initial-request Message Type					
Continue	initial-request continue	N/A	Continue	Secondary takes over after RT	Offline after another RT. No more quota requests are performed for any rating group within the session after DCCA failure (even if connectivity to DCCA is restored)
	initial-request continue go-offline-after-tx-expiry	Offline	N/A	Offline at Tx	Offline at Tx
	initial-request continue retry-after-tx-expiry	Continue	N/A	Secondary takes over after Tx	Offline after another Tx
Retry-and-terminate	initial-request retry-and-terminate	N/A	Retry	Secondary takes over after RT	Terminate after another RT
	initial-request retry-and-terminate retry-after-tx-expiry	Retry	N/A	Secondary takes over after Tx	Terminate after another Tx
Terminate	initial-request terminate	Terminate	N/A	Terminate after Tx	Terminate after Tx
Update-request Message Type					
Continue	update-request continue	N/A	Continue	Secondary takes over after RT	Offline after another RT

CCFH Setting	CLI Command	Behavior at Tx	Behavior at RT	Secondary is Up	Secondary is Down
	<code>update-request continue go- offline-after-tx- expiry</code>	Offline	N/A	Offline at Tx	Offline at Tx
	<code>update-request continue retry- after-tx-expiry</code>	Continue	N/A	Secondary takes over after Tx	Offline after another Tx
Retry-and-terminate	<code>update-request retry-and-terminate</code>	N/A	Retry	Secondary takes over after RT	Sends CCR-T after another RT
	<code>update-request retry-and-terminate retry-after-tx- expiry</code>	Retry	N/A	Secondary takes over after Tx	Sends CCR-T after another Tx
Terminate	<code>update-request terminate</code>	Terminate	N/A	Sends CCR-T after Tx	Sends CCR-T after Tx
Terminate-request Message Type					
Continue	<code>terminate-request continue</code>	N/A	Retry	CCR-T is sent to secondary after RT	Terminate after another RT
	<code>terminate-request continue go- offline-after-tx- expiry</code>	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
	<code>terminate-request continue retry- after-tx-expiry</code>	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
Retry-and-terminate	<code>terminate-request retry-and-terminate</code>	N/A	Retry	CCR-T is sent to secondary after RT	Terminate after another RT
	<code>terminate-request retry-and-terminate retry-after-tx- expiry</code>	Retry	N/A	CCR-T is sent to secondary after Tx	Terminate after another Tx
Terminate	<code>terminate-request terminate</code>	Terminate	N/A	Terminate after Tx	Terminate after Tx

Example

The following command sets the Credit Control Failure Handling behavior for initial request message type to **retry-and-terminate**:

```
failure-handling initial-request retry-and-terminate
```

■ failure-handling

mode

This command configures the Prepaid Credit Control mode to RADIUS or Diameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
mode { diameter | radius }
```

default mode

default

Configures the default prepaid credit control mode.
Default: **diameter**

diameter

Enables Diameter Credit Control Application (DCCA) for prepaid charging.

radius

Enables RADIUS Credit Control for prepaid charging.

Usage

Use this command to configure the prepaid charging application mode between Diameter or RADIUS credit control.

Example

The following command specifies to use RADIUS prepaid credit control application:

```
mode radius
```

pending-traffic-treatment

This command controls the pass/drop treatment of traffic while waiting for definitive credit information from the server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
pending-traffic-treatment { { { forced-reauth | trigger | validity-expired }
drop | pass } | { { noquota | quota-exhausted } buffer | drop | pass } }
```

```
default pending-traffic-treatment { forced-reauth | noquota | quota-exhausted |
trigger | validity-expired }
```

default

Configures the default setting for this command.

Default: **drop**

forced-reauth

Sets the Diameter credit control pending traffic treatment to forced reauthorization.

trigger

Sets the Diameter credit control pending traffic treatment to trigger.

validity-expired

Sets the Diameter credit control pending traffic treatment to validity expired.

noquota

Sets the Diameter credit control pending traffic treatment to no quota.

quota-exhausted

Sets the Diameter credit control pending traffic treatment to quota exhausted.

buffer

Specifies to tentatively count/time traffic, and then buffer traffic pending arrival of quota. Buffered traffic will be forwarded and fully charged against the quota when the quota is eventually obtained and the traffic is passed.

drop

Specifies to drop any traffic when there is no quota present.

pass

Specifies to pass all traffic more or less regardless of quota state.

Usage

Use this command to set the Diameter credit control pending traffic treatment while waiting for definitive credit information from the server.

This CLI command is different than the **failure-handling** CLI command, which specifies behavior in the face of an actual timeout or error, as opposed to the behavior while waiting. See also the **buffering-limit** CLI command in Active Charging Service Configuration Mode.

Example

The following command sets the Diameter credit control pending traffic treatment to drop any traffic when there is no quota present:

```
pending-traffic-treatment noquota drop
```

quota

This command is used to set various time-based quotas in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ default | no } quota { holding-time | validity-time }
```

holding-time *holding_time*

Specifies the Quota Holding Time (QHT).

holding_time must be an integer from 1 through 4000000000.

validity-time *validity_time*

Specifies the validity lifetime of the quota.

validity_time must be an integer from 1 through 65535.

Usage

Use this command to set the prepaid credit control quotas.

Example

The following command sets the prepaid credit control request holding time to *30000* seconds:

```
quota holding-time 30000
```

quota request-trigger

This command configures the action on the packet that triggers the credit control application to request quota.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
quota request-trigger { exclude-packet-causing-trigger | include-packet-causing-trigger }
```

```
{ default | no } quota request-trigger
```

default quota request-trigger

Configures the default setting for this command.

Default: **include-packet-causing-trigger**

no

Same as the **default quota request-trigger** command.

exclude-packet-causing-trigger

Specifies to exclude the packet causing threshold limit violation trigger.

include-packet-causing-trigger

Specifies to include the packet causing threshold limit violation trigger.

Usage

Use this command to configure action on the packet that triggers the credit control application to request quota, whether the packet should be excluded/included in the utilization information within the quota request.

Example

The following command sets the system to exclude the packets causing threshold limit triggers from accounting of prepaid credit of a subscriber:

```
quota request-trigger exclude-packet-causing-trigger
```

quota time-threshold

This command configures the time threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
quota time-threshold { abs_time_value | percent percent_value }  
{ default | no } quota time-threshold
```

default

Configures the default setting for this command.
Default: Disabled

no

Disables time threshold for prepaid credit control quota.

abs_time_value

Specifies the absolute threshold time in seconds for configured time quota in prepaid credit control charging. *abs_time_value* must be an integer from 1 through 86400. To disable this assign 0.
Default: 0 (Disabled)

percent *percent_value*

Specifies the time threshold value in percentage of configured time quota in DCCA. *percent_value* must be an integer from 1 through 100.

Usage

Use this command to set the time threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control time threshold to 400 seconds:

```
quota time-threshold 400
```

quota units-threshold

This command is used to set the unit threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
quota unit-threshold { abs_unit_value | percent percent_value }  
{ default | no } quota units-threshold
```

default

Configures the default setting for this command.
Default: Disabled

no

Disables unit threshold for DCCA quota.

abs_unit_value

Specifies the absolute threshold value in units for the configured units quota in prepaid credit control application.
abs_unit_value must be an integer from 1 through 4000000000. To disable this assign 0.
Default: 0 (Disabled)

percent *percent_value*

Specifies the time threshold value in percentage of configured units quota in DCCA.
percent_value must be an integer from 1 through 100.

Usage

Use this command to set the units threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control time threshold to *160400* units:

```
quota units-threshold 160400
```

quota volume-threshold

This command is used to set the volume threshold limit for subscriber quota in the prepaid credit control service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
quota volume-threshold { abs_vol_value | percent percent_value }  
{ default | no } quota volume-threshold
```

default

Configures the default setting for this command.
Default: Disabled

no

Disables volume threshold for prepaid credit control quota.

abs_vol_value

Specifies the absolute threshold volume in bytes to configured volume quota in prepaid credit control.
abs_vol_value must be an integer from 1 through 4000000000. To disable this assign 0.
Default: 0 (Disabled)

percent *percent_value*

Specifies the volume threshold value in percentage of configured volume quota in prepaid credit control.
percent_value must be an integer from 1 through 100.

Usage

Use this command to set the volume threshold for prepaid credit control quotas.

Example

The following command sets the prepaid credit control volume threshold to *160400* bytes:

```
quota volume-threshold 160400
```

radius usage-reporting-algorithm

This command configures the usage reporting algorithm for RADIUS prepaid using DCCA.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius usage-reporting-algorithm { cumulative | relative }  
default radius usage-reporting-algorithm
```

default

Configures the default setting for this command.
Default: **cumulative**

cumulative

Specifies that the total accumulated usage of quota be reported in every accounting interim.

relative

Specifies that the quota usage be reported per accounting interim, i.e. since the previous usage report.

Usage

Use this command to configure the usage reporting algorithm for RADIUS prepaid using DCCA.

Example

The following command configures the usage reporting algorithm for RADIUS prepaid using DCCA to *relative*:

```
radius usage-reporting-algorithm relative
```

redirect-indicator-received

This command configures the action on buffered packet when redirect-indicator is received from the RADIUS server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect-indicator-received { discard-buffered-packet | reprocess-buffered-
packet }
```

```
{ default | no } redirect-indicator-received
```

default

Configures the default setting for this command.

Default: **discard-buffered-packet**

no

Disables the redirect-indicator-received configuration.

discard-buffered-packet

Specifies to discard the buffered packet.

reprocess-buffered-packet

Specifies to redirect the buffered packet on receiving a redirect-indicator from the RADIUS server.

Usage

Use this command to configure the action taken on buffered packet when redirect-indicator is received. Diameter can return a redirect URL but not a redirect indicator, however RADIUS can return a redirect indicator. In this situation, any subsequent subscriber traffic would match ruledefs configured with cca redirect-indicator, and charging actions that have flow action redirect-url should be configured. However, some handsets do not retransmit, so there will be no subsequent packets. On configuring reprocess-buffered-packet, the ruledefs are reexamined to find a new charging action, which may have flow action redirect-url configured.

Example

The following command configures the action taken on buffered packet when redirect-indicator is received to reprocess-buffered-packet:

```
redirect-indicator-received reprocess-buffered-packet
```

timestamp-rounding

This command configures how to convert exact time into the units that are used in quotas.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
timestamp-rounding { ceiling | floor | roundoff }  
default timestamp-rounding
```

default

Configures the default timestamp-rounding setting.
Default: **roundoff**

ceiling

This keyword round-off to the smallest integer greater than the fraction.
If the fractional part of the seconds is greater than 0, then this keyword adds 1 to the number of seconds and discard the fraction.

floor

This keyword always discards the fractional part of the second.

roundoff

This keyword sets the fractional part of the seconds to nearest integer value. If fractional value is greater than or equal to 0.5 it adds 1 to the number of seconds and discards the fractional part of second.

Usage

Use this command to configure how to convert exact time into the units that are used in quotas for CCA charging.
The specified rounding will be performed before system attempts any calculation. For example using round-off, if the start time is 1.4, and the end time is 1.6, then the calculated duration will be 1 (i.e., $2 - 1 = 1$).

Example

The following command sets the CCA timestamp to nearest integer value second; i.e. 34:12.23 to 34:12.00:

```
timestamp-rounding roundoff
```

trigger type

This command enables or disables triggering a credit reauthorization when the named values in the subscriber session changes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] trigger type { cellid | lac | qos | rat | serving-node sgsn } +
default trigger type
```

default

Sets the default trigger type setting.

no

Removes the previously configured trigger type.

cellid

Sets the trigger based on change in cell identity or service area code (SAC).

lac

Sets the trigger based on change in Location Area Code.

qos

Sets the trigger based on change in the Quality of Service (QoS).

rat

Sets the trigger based on change in the Radio Access Technology (RAT).

serving-node

Sets the trigger based on change in serving node. The serving node change causes the credit control client to ask for a re-authorization of the associated quota.

sgsn

Sets the trigger based on change in the IP address of SGSN.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to set the credit control reauthorization trigger.

Example

The following command selects a credit control trigger as **lac**:

```
trigger type lac
```

usage-reporting

This command configures the ACS Credit Control usage reporting type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
usage-reporting quotas-to-report based-on-grant { report-only-granted-volume }
default usage-reporting quotas-to-report
```

default

Configures the default setting for this command.
Default: Disabled

report-only-granted-volume

This keyword is used to suppress the input and output octets. If the GSU comes with CC-Total-Octets, then the device will send total, input and output octets in USU. If it comes with Total-Octets, the device will send only Total-Octets in USU.

Usage

Use this command to configure reporting usage only for granted quota. On issuing this command, the **Used-Service-Unit** AVP will report quotas based on grant i.e, only the quotas present in the **Granted-Service-Unit** AVP.

With this command only the units for which the quota was granted by the DCCA server will be reported irrespective of the reporting reason.

Example

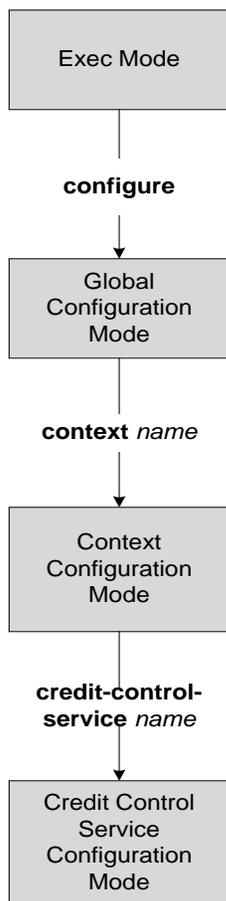

The following command configures to report usage based only on granted quota:

```
usage-reporting quotas-to-report based-on-grant
```

Chapter 51

Credit Control Service Configuration Mode Commands

The Credit Control Service Configuration Mode is used to create and manage Credit Control Service.

diameter dictionary

This command configures the Diameter dictionary to be used for this Credit Control Service instance.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary { custom1 | standard }
```

```
default diameter dictionary
```

default

Configures the default setting.

```
dictionary { custom1 | standard }
```

Specifies the Diameter dictionary to be used.

custom1: Specifies the custom dictionary **custom1**.

standard: Specifies the standard dictionary.

Usage

Use this command to configure the Diameter dictionary to be used for this Credit Control Service instance.

Example

The following command configures the standard Diameter dictionary:

```
diameter dictionary standard
```

diameter endpoint

This command configures the Diameter Credit Control Interface Endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter endpoint endpoint_name  
{ default | no } diameter endpoint
```

default

Configures the default setting.

no

Removes the previous Diameter endpoint configuration.

endpoint_name

Specifies the Diameter endpoint name.

endpoint_name must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to configure the Diameter Credit Control Interface Endpoint.

Example

The following command configures the Diameter Credit Control Interface Endpoint named *test135*:

```
diameter endpoint test135
```

■ end

end

This command exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

failure-handling

This command configures the Diameter failure handling behavior.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
failure-handling { initial-request | terminate-request | update-request } {
diameter-result-code result_code [ to result_code ] | peer-unavailable |
request-timeout } action { continue | retry-and-continue | retry-and-terminate |
terminate }
```

```
{ default | no } failure-handling { initial-request | terminate-request |
update-request } { diameter-result-code result_code [ to result_code ] | peer-
unavailable | request-timeout }
```

default

Configures the default setting.

no

Removes the previous failure handling configuration.

initial-request | terminate-request | update-request

initial-request: Specifies failure handling for Initial Request.

terminate-request: Specifies failure handling for Terminate Request.

update-request: Specifies failure handling for Update Request.

diameter-result-code | peer-unavailable | request-timeout

diameter-result-code *result_code* [**to** *result_code*]: Specifies Diameter result code(s) for failure handling.

result_code must be an integer from 3000 through 9999.

to *result_code*: Specifies the range of Diameter result codes.

peer-unavailable: Specifies failure handling for peer being unavailable.

request-timeout: Specifies failure handling for request timeouts.

action { continue | retry-and-continue | retry-and-terminate | terminate }

Specifies the failure handling action.

continue: Continue the session without credit control.

retry-and-continue: Retry and, even if credit control is not available, continue.

retry-and-terminate: Retry and then terminate.

terminate: Terminate the session.

Usage

Use this command to configure the Diameter failure handling behavior.

Example

The following command configures initial request failure handling behavior for Diameter result codes *3001* to *4001* with terminate action:

```
failure-handling initial-request diameter-result-code 3001 to 4001  
action terminate
```

request timeout

This command configures the timeout period for Diameter requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
request timeout timeout
```

```
{ default | no } request timeout
```

default

Configures the default setting.

no

Removes the previous request timeout configuration.

timeout

Specifies the timeout period in seconds, and must be an integer from 1 through 300.

Usage

Use this command to configure the Diameter request timeout value, after which the request is deemed to have failed. This timeout is an overall timeout, and encompasses all retries with the server(s).

Example

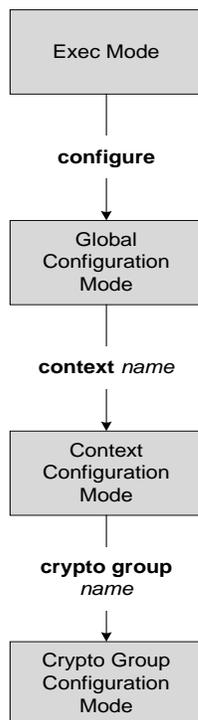

The following command configures the timeout period to *150* seconds:

```
request timeout 150
```

Chapter 52

Crypto Group Configuration Mode Commands

The Crypto Group Configuration Mode is used to configure crypto (tunnel) groups for providing fail-over redundancy for IPSec tunnels to packet data networks (PDNs).

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

match address

Associates an access control list (ACL) to the crypto group.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match address acl_name [ preference ]
```

no

Deletes a previously configured ACL association.

acl_name

The name of the ACL being matched to the crypto group.

preference

The priority of the ACL.

The ACL preference is factored when a single packet matches the criteria of more than one ACL.

preference can be configured to any integer value from 0 to 4294967295. "0" is the highest priority.

If multiple ACLs are assigned the same priority, the last one entered will be used first.

Important: The priorities are only compared for ACLs matched to other groups or to policy ACLs (those applied to the entire context).

Usage

IP ACLs are associated with crypto groups using this command. Both the crypto group and the ACLs must be configured in the same context.

ISAKMP crypto maps can then be associated with the crypto group. This allows user traffic matching the rules of the ACL to be handled according to the policies configured as part of the crypto map.

Example

The following command associates an ACL called *corporate_acl* to the crypto group:

```
match address corporate_acl
```

match ip pool

Matches the specified IP pool to the current crypto group. This command can be used multiple times to match more than one IP pool.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match ip pool pool-name pool_name
```

no

Delete the matching statement for the specified IP pool from the crypto group.

pool_name

The name of an existing IP pool that should be matched.

Usage

Use this command to set the names of IP pools that should be matched in the current crypto group.

Example

The following command sets a rule for the current crypto group that will match an IP pool named **ippool1**:

```
match ip pool pool-name ippool1
```

switchover

Configures the fail-over properties for the crypto group as part of the Redundant IPsec Fail-Over feature.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] switchover auto [ do-not-revert ]
```

no

Disables the automatic switchover of tunnels. This applies to both primary-to-secondary and secondary-to-primary switches.

auto

Default: Enabled

Allows the automatic switchover of tunnels.

do-not-revert

Default: Disabled

Disables the automatic switchover of secondary tunnels to primary tunnels.

Usage

This command configures the fail-over options for the Redundant IPsec Fail-over feature.

If the automatic fail-over options are disabled, tunneled traffic must be manually switched to the alternate tunnel (or manually activated if no alternate tunnel is configured and available) using the following command in the Exec Mode:

```
crypto-group group_name activate { primary | secondary }
```

For a definition of this command, see the **crypto-group** section of the Exec Mode Commands chapter of this guide.

Example

The following command disables the automatic secondary-to-primary switchover:

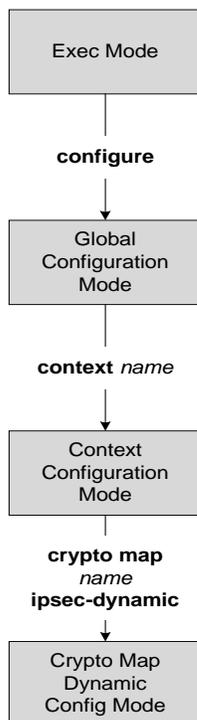

```
switchover auto do-not-revert
```

Chapter 53

Crypto Map Dynamic Configuration Mode Commands

The Crypto Map Dynamic Configuration Mode is used to configure IPSec tunnels that are created as needed to facilitate subscriber sessions using Mobile IP or L2TP.

Modification(s) to an existing dynamic crypto map configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.

■ end

end

Returns the CLI prompt to to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the DYnamic Crypto Map configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

set

Configures parameters for the dynamic crypto map.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
set { control-dont-fragment { clear-bit | copy-bit | set-bit } | isakmp
natt [keepalive time ] | pfs { group1 | group2 | group5 } | phase1-idtype {
id-key-id | ipv4-address } [ mode { aggressive | main } ] | phase2-idtype
{ ipv4-address | ipv4-address-subnet } | security-association lifetime {
keepalive | kilo-bytes kbytes | seconds secs } | transform-set
transform_name [ transform-set transform_name2 ... transform-set
transform_name6 ] }
no set { pfs | security-association lifetime {keepalive | kilo-bytes |
seconds } | phase1-idtype | phase2-idtype | transform-set transform_name [
transform-set transform_name2 ... transform-set transform_name6 ] }
```

no

Deletes the specified parameter or resets the specified parameter to the default value.

control-dont-fragment { clear-bit | copy-bit | set-bit }

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet. Options are:

- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit**: Sets the DF bit in the outer IP header (sets it to 1).

isakmp natt [keepalive *time*]

Enable IPsec NAT Traversal.

keepalive *time*: The time to keep the NAT connection alive in seconds. *time* must be an integer of from 1 through 3600 seconds.
must be an integer of from 1 through 3600 seconds.

pfs { group1 | group2 | group5 }

Specifies the modp Oakley group (also known as the Diffie-Hellman (D-H) group) that is used to determine the length of the base prime numbers that are used for Perfect Forward Secrecy (PFS).

- **group1** : Diffie-Hellman Group1 (768-bit modp)
- **group2** :- Diffie-Hellman Group2 (1024-bit modp)
- **group5** :- Diffie-Hellman Group5 (1536-bit modp)

```
phase1-idtype { id-key-id | ipv4-address } [ mode { aggressive | main } ]
```

Sets the IKE negotiations Phase 1 payload identifier.

Default: ipv4-address

id-key-id: Use ID_KEY_ID as the Phase 1 payload identifier.

ipv4-address: Use IPV4_ADDR as the Phase 1 payload identifier.

mode { **aggressive** | **main** }: Specify the IKE mode.

```
phase2-idtype { ipv4-address | ipv4-address-subnet }
```

Sets the IKE negotiations Phase 2 payload identifier.

Default: ipv4-address-subnet

ipv4-address: Use IPV4_ADDR as the Phase 2 payload identifier.

ipv4-address-subnet: Use IPV4_ADDR_SUBNET as the Phase 2 payload identifier.

```
security-association lifetime { keepalive | kilo-bytes kbytes | seconds secs }
```

Defaults:

- **keepalive**: Disabled
- **kilo-bytes**: 4608000 kbytes
- **seconds**: 28800 seconds

This keyword specifies the parameters that determine the length of time an IKE Security Association (SA) is active when no data is passing through a tunnel. When the lifetime expires, the tunnel is torn down.

Whichever parameter is reached first expires the SA lifetime.

- **keepalive** : The SA lifetime expires only when a keepalive message is not responded to by the far end.
- **kilo-bytes** *kbytes* : This specifies the amount of data in kilobytes to allow through the tunnel before the SA lifetime expires. *kbytes* must be an integer from 2560 through 4294967294.
- **seconds** *secs* : The number of seconds to wait before the SA lifetime expires. *secs* must be an integer from 1200 through 86400.

Important: If the dynamic crypto map is being used in conjunction with Mobile IP and the Mobile IP renewal timer is less than the crypto map's SA lifetime (either in terms of kilobytes or seconds), then the **keepalive** parameter **must** be configured.

```
transform-set transform_name [ transform-set transform_name2 ...  
transform-set transform_name6 ]
```

This keyword specifies the name of a transform set configured in the same context that will be associated with the crypto map. Refer to the command **crypto ipsec transform-set** for information on creating transform sets.

You can repeat this keyword up to 6 times on the command line to specify multiple transform sets.

transform_name is the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

Usage

Use this command to set parameters for a dynamic crypto map.

Example

The following command sets the PFS group to Group1:

```
set pfs group1
```

The following command sets the SA lifetime to 50000 KB:

```
set security-association lifetime kilo-bytes 50000
```

The following command sets the SA lifetime to 10000 seconds:

```
set security-association lifetime seconds 10000
```

The following command enables the SA to re-key when the tunnel lifetime expires:

```
set security-association lifetime keepalive
```

The following command defines transform sets tset1 and tset2:

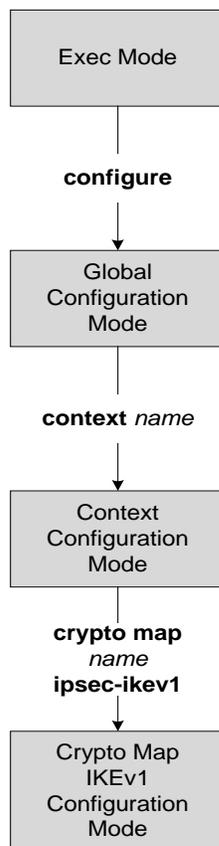

```
set transform-set tset1 transform-set tset2
```

Chapter 54

Crypto Map IKEv1 Configuration Mode Commands

The Crypto Map IKEv1 Configuration Mode is used to configure properties for IPSec tunnels that will be created using the Internet Key Exchange (IKE) that operates within the framework of the Internet Key Exchange version 1 (IKEv1).

Modification(s) to an existing IKEv1 crypto map configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

match address

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match address acl_name priority
```

no

Removes a previously matched ACL.

acl_name

The name of the ACL that the crypto map is to be matched with.

acl_name can be from 1 to 79 alpha and/or numeric characters and is case sensitive.

priority

Default: 0

Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.

The preference can be configured to any integer value from 0 to 4294967295. "0" is the highest priority.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to be routed over an IPsec tunnel.

Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPsec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named *ACLlist1* and sets the crypto maps priority to the highest level.

```
match address ACLlist1 0
```

match crypto group

Matches or associates the crypto map a crypto group configured in the same context.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match crypto group group_name { primary | secondary }
```

no

Deletes a previously configured crypto group association.

group_name

The name of the crypto group and can consist of from 1 to 127 alpha and/or numeric characters in length and is case sensitive.

primary

Specifies that the policies configured as part of this crypto map will be used for the primary tunnel in the Redundant IPSec Tunnel Failover feature.

secondary

Specifies that the policies configured as part of this crypto map will be used for the secondary tunnel in the Redundant IPSec Tunnel Failover feature.

Usage

Use this command to dictate the primary and secondary tunnel policies used for the Redundant IPSec Tunnel Failover feature.

At least two policies must be configured to use this feature. One policy must be configured as the primary, the other as the secondary.

Example

The following command associates the crypto map to a crypto group called *group1* and dictates that it will serve as the primary tunnel policy:

```
match crypto group group1 primary
```

match ip pool

Matches the specified IP pool to the current IKEv1 crypto map. This command can be used multiple times to change more than one IP pool.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match ip pool pool-name pool_name
```

no

Delete the matching statement for the specified IP pool from the crypto map.

pool_name

The name of an existing IP pool that should be matched.

Usage

Use this command to set the names of IP pools that should be matched in the current crypto map.

Important: If an IP address pool that is matched to a IKEv1 crypto map is resized, removed, or added, the corresponding security association must be cleared in order for the change to take effect. Refer to the **clear crypto** command in the Exec mode for information on clearing security associations.

Example

The following command sets a rule for the current crypto map that will match an IP pool named *ippool1*:

```
match ip pool pool-name ippool1
```

set

Configures parameters for the dynamic crypto map.

Product

PDSN, HA, GGSN, SCM

Privilege

Security Administrator, Administrator

Syntax

```
set { control-dont-fragment { clear-bit | copy-bit | set-bit } | ikev1
natt [ keepalive time ] | pfs { group1 | group2 | group5 } | phase1-idtype
{ id-key-id | ipv4-address [ mode { aggressive | main } ] | phase2-idtype
{ ipv4-address | ipv4-address-subnet } | security-association lifetime {
disable-phase2-rekey | keepalive | kilo-bytes kbytes | seconds secs }
transform-set transform_name [ transform-set transform_name2 ... transform-set
transform_name6 ]
no set { ikev1 natt | pfs | phase1-idtype | phase2-idtype | security-
association lifetime { disable-phase2-rekey | keepalive | kilo-bytes |
seconds } | transform-set transform_name [ transform-set transform_name2
... transform-set transform_name6 ]
```

```
control-dont-fragment { clear-bit | copy-bit | set-bit }
```

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet. Options are:

- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit** : Sets the DF bit in the outer IP header (sets it to 1).

```
ikev1 natt [ keepalive time ]
```

Specifies IKE parameters.

natt: Enables IPsec NAT Traversal.

keepalive *time*: The time to keep the NAT connection alive in seconds. *time* must be an integer of from 1 through 3600 seconds.

```
pfs { group1 | group2 | group5 }
```

Specifies the modp Oakley group (also known as the Diffie-Hellman (D-H) group) that is used to determine the length of the base prime numbers that are used for Perfect Forward Secrecy (PFS).

- **group1** : Diffie-Hellman Group1 (768-bit modp)
- **group2** :- Diffie-Hellman Group2 (1024-bit modp)
- **group5** :- Diffie-Hellman Group5 (1536-bit modp)

```
phase1-idtype { id-key-id | ipv4-address [ mode { aggressive | main } ]
```

Sets the IKE negotiations Phase 1 payload identifier. Default: id-key-id

id-key-id: ID KEY ID

ipv4-address: ID IPV4 Address

- mode: Configures IKE mode
- aggressive: IKE negotiation mode: AGGRESSIVE
- main: IKE negotiation mode: MAIN

phase2-idtype { **ipv4-address** | **ipv4-address-subnet** }

Sets the IKE negotiations Phase 2 payload identifier.

Default: ipv4-address-subnet

- ipv4-address**: Use IPV4_ADDR as the Phase 2 payload identifier.
- ipv4-address-subnet**: Use IPV4_ADDR_SUBNET as the Phase 2 payload identifier.

security-association lifetime { **disable-phase2-rekey** | **keepalive** | **kilo-bytes** *kbytes* | **seconds** *secs* }

Defaults:

- disable-phase2-rekey**: Rekeying is enabled by default
- keepalive**: Disabled
- kilo-bytes**: 4608000 kbytes
- seconds**: 28800 seconds

This keyword specifies the parameters that determine the length of time an IKE Security Association (SA) is active when no data is passing through a tunnel. When the lifetime expires, the tunnel is torn down.

Whichever parameter is reached first expires the SA lifetime.

- disable-phase2-rekey** : If this keyword is specified, when the lifetime expires, the Phase2 SA is not rekeyed.
- keepalive** : The SA lifetime expires only when a keepalive message is not responded to by the far end.
- kilo-bytes** kbytes : This specifies the amount of data in kilobytes to allow through the tunnel before the SA lifetime expires. kbytes must be an integer from 2560 through 4294967294.
- seconds** secs : The number of seconds to wait before the SA lifetime expires. secs must be an integer from 1200 through 86400.

Important: If the dynamic crypto map is being used in conjunction with Mobile IP and the Mobile IP renewal timer is less than the crypto map's SA lifetime (either in terms of kilobytes or seconds), then the **keepalive** parameter **must** be configured.

transform-set *transform_name* [**transform-set** *transform_name2* ...
transform-set *transform_name6*]

This keyword specifies the name of a transform set configured in the same context that will be associated with the crypto map. Refer to the command **crypto ipsec transform-set** for information on creating transform sets.

You can repeat this keyword up to 6 times on the command line to specify multiple transform sets.

transform_name is the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

no

Deletes the specified parameter or resets the specified parameter to the default value.

Usage

Use this command to set parameters for a dynamic crypto map.

Example

The following command sets the PFS group to Group1:

```
set pfs group1
```

The following command sets the SA lifetime to 50000 KB:

```
set security-association lifetime kilo-bytes 50000
```

The following command sets the SA lifetime to 10000 seconds:

```
set security-association lifetime seconds 10000
```

The following command enables the SA to re-key when the tunnel lifetime expires:

```
set security-association lifetime keepalive
```

The following command defines transform sets tset1 and tset2.

```
set transform-set tset1 transform-set tset2
```

Chapter 56

Crypto Map IKEv2-IPv6 Payload Configuration Mode Commands

The Crypto Map IKEv2-IPv6 Payload Configuration Mode is used to assign the correct IPsec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

■ exit

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Returns to the previous mode.

ipsec

Configures the IPsec transform set to be used for this crypto template payload.

Product

P-GW

Privilege

Administrator

Syntax

```
ipsec transform-set list name
```

```
no ipsec transform-set list
```

```
list name
```

Specifies the context configured IPsec transform set name to be used in the crypto template payload. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to list the IPsec transform set(s) to use in this crypto template payload.

Example

The following command configures IPsec transform sets named *ipset1* and *ipset2* to be used in this crypto template payload:

```
ipsec transform-set list ipset1 ipset2
```

lifetime

Configures the number of seconds for IPsec Child SAs derived from this crypto template payload to exist.

Product

P-GW

Privilege

Administrator

Syntax

```
lifetime sec [ kilo-bytes kbytes ]
```

default lifetime

default

Returns the lifetime value to the default setting of 86400.

sec

Default: 86400

Specifies the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist. *sec* must be an integer from 60 to 604800.

kilo-bytes *kbytes*

Specifies lifetime in kilo-bytes for IPsec Child Security Associations derived from this Crypto Map. *kbytes* must be an integer value from 1 to 2147483648.

Usage

Use this command to configure the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist.

Example

The following command configures the IPsec child SA lifetime to be 120 seconds:

```
lifetime 120
```

rekey

Configures child security association rekeying.

Product

P-GW

Privilege

Administrator

Syntax

```
rekey [ keepalive ]
```

```
[ default | no ] rekey
```

default

Returns the feature to the default setting of disabled.

no

Disables this feature.

keepalive

If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default rekeying is only performed if there has been data exchanged since the previous rekey.

Usage

Use this command to enable or disable the ability to rekey IPsec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the PDIF will not originate rekeying operations and will not process CHILD SA rekeying requests from the MS.

Example

The following command disables rekeying:

```
no rekey
```

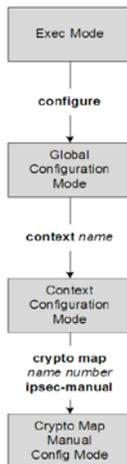

Chapter 57

Crypto Map Manual Configuration Mode Commands

The Crypto Map Manual Configuration Mode is used to configure static IPsec tunnel properties.

Modification(s) to an existing crypto map manual configuration will not take effect until the related security association has been cleared. Refer to the clear crypto security-association command located in the Exec Mode Commands chapter of the Command Line Interface Reference for more information.

 **Important:** Because manual crypto map configurations require the use of static security keys (associations), they are not as secure as crypto maps that rely on dynamically configured keys. Therefore, it is recommended that they only be used for testing purposes.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

match address

Matches or associates the crypto map to an access control list (ACL) configured in the same context.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match address acl_name [ priority ]
```

no

Removes a previously matched ACL.

acl_name

The name of the ACL that the crypto map is to be matched with.

acl_name can be from 1 to 47 alpha and/or numeric characters and is case sensitive.

priority

Default: 0

Specifies the preference of the ACL. The ACL preference is factored when a single packet matches the criteria of more than one ACL.

The preference can be configured to any integer value from 0 to 4294967295. "0" is the highest priority.

Important: The priorities are only compared for ACLs matched to other crypto maps or to policy ACLs (those applied to the entire context).

Usage

ACLs matched to crypto maps are referred to as crypto ACLs. Crypto ACLs define the criteria that must be met in order for a subscriber data packet to be routed over an IPsec tunnel.

Prior to routing, the system examines the properties of each subscriber data packet. If the packet properties match the criteria specified in the crypto ACL, the system will initiate the IPsec policy dictated by the crypto map.

Example

The following command sets the crypto map ACL to the ACL named **ACLlist1** and sets the crypto maps priority to the highest level.

```
match address ACLlist1 0
```

set control-dont-fragment

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
set control-dont-fragment { clear-bit | copy-bit | set-bit }  
default set control-dont-fragment { clear-bit | copy-bit | set-bit }
```

clear-bit

Clears the DF bit from the outer IP header (sets it to 0).

copy-bit

Copies the DF bit from the inner IP header to the outer IP header. This is the default action.

default

Sets / Restores default value assigned to a specified parameter.

set-bit

Sets the DF bit in the outer IP header (sets it to 1).

Usage

Use this command to clear, copy, or set the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Example

The following command sets the DF bit in the outer IP header.

```
set control-dont-fragment set-bit
```

set peer

Configures the IP address of the peer security gateway that the system will establish the IPsec tunnel with.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] set peer gw_address
```

no

Removes a previously configured peer address.

gw_address

The IP address of the peer security gateway with which the IPsec tunnel will be established.

Usage

Once the manual crypto map is fully configured and applied to an interface, the system will establish an IPsec tunnel with the security gateway specified by this command.

Because the tunnel relies on statically configured parameters, once created, it never expires; it exists until its configuration is deleted.

Example

The following command configures a security gateway address of 192.168.1.100 for the crypto map to establish a tunnel with.

```
set peer 192.168.1.100
```

set session-key

Configures session key parameters for the manual crypto map.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
set session-key { inbound | outbound } { ah ah_spi [ encrypted ] key ah_key
| esp esp_spi [ encrypted ] cipher encryption_key [ encrypted ]
authenticator auth_key }
no set session-key { inbound | outbound }
```

no

Removes previously configured session key information.

inbound

Specifies that the key(s) will be used for tunnels carrying data sent by the security gateway.

outbound

Specifies that the key(s) will be used for tunnels carrying data sent by the system.

ah ah_spi

Configures the following session key information for the Authentication Header (AH) protocol:

ah_spi : The security parameter index (SPI) used to identify the AH security association (SA) between the system and the security gateway.

The SPI can be configured to any integer value from 256 to 4294967295.

encrypted

Indicates the key provided is encrypted.

The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key**, **cipher**, and/or **authenticator** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

key ah_key

Configures the following session key information for the Authentication Header (AH) protocol:

ah_key : The key used by the system to de/encapsulate IP packets using the AH protocol.

The key must be entered as either a string or a hexadecimal number beginning with "0x".

esp esp_spi

Configures security parameter index (SPI) for the Encapsulating Security Payload (ESP) protocol. The SPI is used to identify the ESP security association (SA) between the system and the security gateway.

esp_spi : The SPI value. It can be configured to any integer value from 256 to 4294967295.

cipher *encryption_key*

Specifies the key used by the system to de/encrypt the payloads of IP packets using the ESP protocol. *encryption_key* must be entered as either a string or a hexadecimal number beginning with "0x".

authenticator *auth_key*

Specifies the key used by the system to authenticate the IP packets once encryption has been performed. *auth_key* must be entered as either a string or a hexadecimal number beginning with "0x".

Usage

Manual crypto maps rely on the use of statically configured keys to establish IPSec tunnels. This command allows the configuration of the static keys.

Identical keys must be configured on both the system and the security gateway in order for the tunnel to be established.

This command can be entered up to two time for the same crypto map: once to configure inbound key properties, and once to configure outbound key properties.

Example

The following command configures a manual crypto map with the following session key properties:

- Keys are for tunnels initiated by the system to the security gateway.
- ESP will be used with an SPI of 310.
- Encryption key is sd23r9skd0fi3as.
- Authentication key is sfd23408imi9yn.

```
set session-key outbound esp 310 cipher sd23r9skd0fi3as authenticator  
sfd23408imi9yn
```

set transform-set

Configures the name of a transform set that the crypto map is associated with.

Product

PDSN, HA, GGSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] set transform-set transform_name
```

no

Removes a previously configured transform set association.

transform_name

Specifies the name of the transform set and must be an alpha and/or numeric string from 1 to 127 characters and is case sensitive.

Usage

System transform sets contain the IPSec policy definitions for crypto maps. Refer to the command *crypto ipsec transform-set* for information on creating transform sets.

Important: Transform sets must be configured prior to configuring session key information for the crypto map.

Example

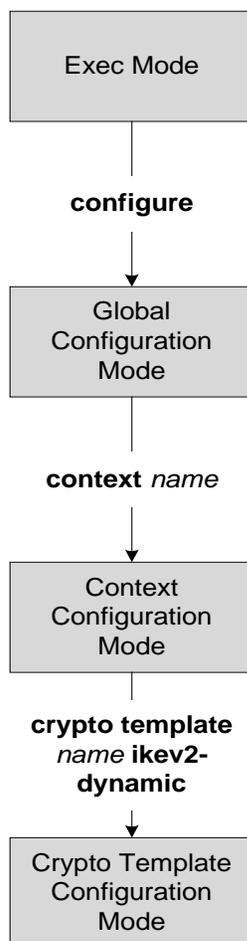

The following command associates a transform set named *esp_tset* with the crypto map:

```
set transform-set esp_tset
```

Chapter 58

Crypto Template Configuration Mode Commands

The Crypto Template Configuration Mode is used to configure an IKEv2 IPsec policy. It includes most of the IPsec parameters and IKEv2 parameters for cryptographic and authentication algorithms etc. A security gateway service will not function without a configured crypto template. Only one crypto template can be configured per service.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

authentication

Configures the subscriber authentication method used for the PDIF service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
authentication { eap-profile name [ second-phase eap-profile name ] | gateway {
encrypted key value | key value } | pre-shared-key { encrypted key value | key
value } }
```

```
eap-profile name [ second-phase eap-profile name ]
```

Specifies that authentication is to be performed using a named EAP profile. *name* must be from 1 to 127 alpha and/or numeric characters. Entering this keyword places the CLI in the EAP Authentication Configuration Mode.

A second-phase eap profile name is only required for installations using multiple authentication. *name* must be from 1 to 127 alpha and/or numeric characters.

```
gateway { encrypted key value | key value }
```

Specifies the pre-shared gateway key used for gateway authentication.

encrypted key *value*: Specifies that the pre-shared key used for authentication is encrypted. *value* must be between 1 and 255 alpha and/or numeric characters.

key *value*: Specifies that the pre-shared key used for authentication is clear text. *value* must be between 1 and 255 alpha and/or numeric characters.

```
pre-shared-key { encrypted key value | key value }
```

Specifies that a pre-shared key is to be used for authenticating a subscriber in the service.

encrypted key *value*: Specifies that the pre-shared key used for authentication is encrypted. *value* must be between 1 and 255 alpha and/or numeric characters.

key *value*: Specifies that the pre-shared key used for authentication is clear text. *value* must be between 1 and 255 alpha and/or numeric characters.

Usage

Use this command to specify the type of authentication performed for subscribers attempting to access the service using this crypto template.

Entering the **authentication eap-profile** command results in the following prompt:

```
[context_name]hostname(cfg-crypto-tmpl-eap-key)#
```

EAP Authentication Configuration Mode commands are defined in the “EAP Authentication Configuration Mode Commands” chapter.

Example

The following command enables authentication via an EAP profile named *eap23* for subscribers using the service with this crypto template:

```
authentication eap-profile eap23
```

ca-certificate list

Used to bind an X.509 CA root certificate to a crypto template.

Product

All

Privilege

Administrator

Syntax

```
ca-certificate list ca-cert-name name [ ca-cert-name name ]
```

```
no ca-certificate
```

no

Removes a CA root certificate from the list.

name

An alpha and/or numeric string of 1 - 127 characters.

Usage

Used to bind an X.509 CA root certificate to a template.

Example

Use the following example to add a CA root certificate to a list:

```
ca-certificate listname
```

ca-crl list

Binds one or more Certificate Authority-Certificate Revocation Lists (CA-CRLs) to this crypto template.

Product

All

Privilege

Administrator

Syntax

```
ca-crl list ca-crl-name name [ ca-crl-name name ] +
```

```
no ca-crl
```

no

Removes the CA-CRL configuration from this template.

ca-crl-name *name*

Specifies the CA-CRL to associate with this crypto template. *name* must be an existing CA-CRL name and be from 1 to 129 alpha and/or numeric characters. Multiple lists can be configured for a crypto template.

Usage

Use this command to associate a CA-CRL name with this crypto template.

CA-CRLs are configured in the Global Configuration Mode. For more information about configuring CA-CRLs, refer to the **ca-crl name** command in the *Global Configuration Mode Commands* chapter.

Example

The following example binds CA-CRLs named CRL-5 and CRL-7 to this crypto template:

```
ca-crl list ca-crl-name CRL-5 ca-crl-name CRL-7
```

certificate

Used to bind an X.509 trusted certificate to a crypto template.

Product

All

Privilege

Administrator

Syntax

```
[ no ] certificate name name
```

no

Removes any applied certificate or prevents the certificate from being included in the Auth Exchange response payload.

name *name*

An alpha and/or numeric string of 1 - 127 characters.

Usage

Can be used to bind an X.509 certificate to a template, or include or exclude it from the Auth Exchange response payload.

Example

Use the following example to prevent a certificate from being included in the Auth Exchange payload:

```
no certificate
```

control-dont-fragment

Controls the don't fragment (DF) bit in the outer IP header of the IPsec tunnel data packet.

Product

All

Privilege

Administrator

Syntax

```
control-dont-fragment { clear-bit | copy-bit | set-bit }
```

```
{ clear-bit | copy-bit | set-bit }
```

Configures the option to perform on the DF bit.

- **clear-bit**: Clears the DF bit from the outer IP header (sets it to 0).
- **copy-bit**: Copies the DF bit from the inner IP header to the outer IP header. This is the default action.
- **set-bit**: Sets the DF bit in the outer IP header (sets it to 1).

Usage

A packet is encapsulated in IPSec headers at both ends. The new packet can copy the DF bit from the original unencapsulated packet into the outer IP header, or it can set the DF bit if there is not one in the original packet. It can also clear a DF bit that it does not need.

Example

The following command sets the DF bit in the outer IP header:

```
control-dont-fragment set-bit
```

default

Restores the default values for the selected parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { authentication gateway | certificate | dns-handling | dos cookie-
challenge detect-dos-attack | ikev2-ikesa { ignore-rekeying-requests |
keepalive-user-activity | max-retransmission | mobike | policy error-
notification | rekey | retransmission-timeout | setup-timer } | keepalive | nai
| natt }
```

authentication gateway

Configures the default pre-shared gateway key used for authentication.

certificate

Configures the system to remove the certificate for a given crypto template.

dns-handling

Configures the system to use normal dns handling.

dos cookie-challenge detect-dos-attack

Configures the system to disable any Denial of Service attacks.

```
ikev2-ikesa { ignore-rekeying-requests | keepalive | max-retransmission |
mobike | policy error-notification | rekey | retransmission-timeout |
setup-timer }
```

Configures the system to use the following ikev2-ikesa defaults:

- **ignore-rekeying-requests:** Ignore any IKE_SA rekeying requests received.
- **keepalive-user-activity:** Keepalive messages received from peer will not reset the user inactivity timer.
- **max-retransmission:** Set the number of IKEv2 IKE exchange request retransmissions if the corresponding response has not been received. Default is 5.
- **mobike:** Set MOBIKE to disable.
- **policy error-notification:** Set the default policy error notification method to send error notify messages to the MS.
- **rekey:** Set the default rekeying of IKE_SA to disabled.

- **retransmission-timeout**: Set the maximum number of milliseconds to elapse before an IKEv2 IKE exchange request is retransmitted if the corresponding IKEv2 IKE exchange response has not been received to 500.
- **setup timer**: Set the number of seconds to elapse before a non-fully-established IKEv2 IKE SA is terminated to 60.

keepalive

Enable Dead Peer Detection for all SAs derived from this crypto template.

nai

Set the default NAI parameters to be used for the crypto template (IDr) to none

natt

Enable NAT-T initiation for all SAs derived from this crypto template.

Usage

Use these commands to restore default parameters.

Example

Use the following command to disable MOBIKE by default:

```
default mobike
```

dns-handling

Adds a custom option to define the ways a DNS address is returned based on proscribed circumstances described below.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] dns-handling { normal | custom }
```

default

Configures the default condition as **normal**. By default, PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

normal

This is the default action. PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

custom

Configures the PDIF to behave as described in the Usage section below.

Usage

During IKEv2 session setup, MS may or may not include INTERNAL_IP4_DNS in the Config Payload (CP). PDIF may obtain one or more DNS addresses for the subscriber in DNS NVSE from a proxy-MIP Registration Reply message. If Multiple Authentication is used, these DNS addresses may be also received in Diameter AVPs during the first authentication phase, or in RADIUS attributes in the Access Accept messages during the second authentication phase.

In **normal** mode, by default PDIF always returns the DNS address in the config payload in the second authentication phase if one is received from either the configuration or the HA.

In **custom** mode, depending on the number of INTERNAL_IP4_DNS, PDIF supports the following behaviors:

- If MS includes no INTERNAL_IP4_DNS in Config Payload: PDIF doesn't return any INTERNAL_IP4_DNS option to MS, whether or not PDIF has received one(s) in DNS NVSE from HA or from local configurations.
- If MS requests one or more INTERNAL_IP4_DNS(s) in Config Payload, and if P-MIP NVSE doesn't contain any DNS address or DNS address not present in any config, PDIF omits INTERNAL_IP4_DNS option to MS in the Config Payload.
- And if P-MIP NVSE includes one DNS address (a.a.a.a / 0.0.0.0), then PDIF sends one INTERNAL_IP4_DNS option in Config Payload back to the MS.
- If Primary DNS is a.a.a.a and Secondary DNS is 0.0.0.0, then a.a.a.a is returned (i.e. only one instance of DNS attribute present in the config payload).

- If Primary DNS is 0.0.0.0 and Secondary DNS is a.a.a.a, then a.a.a.a is returned (i.e. only one instance of DNS attribute present in the config payload). PDIF does not take 0.0.0.0 as a valid DNS address that can be assigned to the MS.
- And if P-MIP NVSE includes two DNS addresses (a.a.a.a and b.b.b.b) or configurations exists for these two addresses, then PDIF sends two INTERNAL_IP4_DNSs in the CP for the MS (typically known as primary and secondary DNS addresses).

Example

The following configuration applies the **custom** dns-handling mode:

```
dns-handling custom
```

dos cookie-challenge notify-payload

Configure the cookie challenge params for IKEv2 INFO Exchange notify payloads for the given crypto template.

Product

All

Privilege

Administrator

Syntax

```
dos cookie-challenge notify-payload [ half-open-sess-count { start integer |
stop integer } ]
```

```
[ default | no ] cookie-challenge detect-dos-attack
```

default

Default is to disabled condition.

no

Prevents Denial of Service cookie transmission. This is the default condition.

half-open-sess-count start | stop

The **half-open-sess-count** is the number of half-open sessions per IPsec manager. A session is defined as half-open if a PDIF has responded to an IKEv2 INIT Request with an IKEv2 INIT Response, but no further message was received on that particular IKE SA.

- *start*: The functionality will start when the current half-open-sess-count exceeds the start count. The start count is an integer from 0 to 100000.
- *stop*: The functionality will stop when the current half-open-sess-count drops below the stop count. The stop count number is an integer from 0 to 100000. It is always less than or equal to the start count number

Important: The start count value 0 is a special case whereby this feature is always enabled. In this event, both **start** and **stop** must be 0.

Usage

This feature (which is disabled by default) helps prevent malicious Denial of Service attacks against the server by sending a challenge cookie. If the response from the sender does not incorporate the expected cookie data, the packets are dropped.

Example

The following example configures the cookie challenge to begin when the half-open-sess-count reaches 50000 and stops when it drops below 20000:

```
dos cookie-challenge notify-payload half-open-sess-count start 5000 stop  
2000
```

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

ikev2-ikesa

Configures parameters for the IKEv2 IKE Security Associations within this crypto template.

Product

All

Privilege

Administrator

Syntax

```
ikev2-ikesa { keepalive-user-activity | max-retransmissions number |
retransmission-timeout msec | policy error-notification [ invalid-message-id |
invalid-syntax ] rekey | setup-timer sec | transform-set list name }

default ikev2-ikesa { max-retransmissions | policy error-notification [ invalid-
message-id | invalid-syntax ] rekey | retransmission-timeout | setup-timer }

no ikev2-ikesa { keepalive-user-activity | list name / policy error-notification
[ invalid-message-id | invalid-syntax ] | rekey }
```

no ikev2-ikesa

Disables a previously enabled parameter.

keepalive-user-activity

Default is no keepalive-user-activity. Activate to reset the user inactivity timer when keepalive messages are received from peer.

max-retransmissions *number*

Default: 5

Specifies the maximum number of retransmissions of an IKEv2 IKE exchange request if a response has not been received. *number* must be an integer from 1 to 8.

policy error-notification

Default is to enable. Default policy is to generate an IKEv2 Invalid Message ID error when PDIF receives an out-of-sequence packet.

retransmission-timeout *msec*

Default: 500

Specifies the timeout period in milliseconds before a retransmission of an IKEv2 IKE exchange request is sent (if the corresponding response has not been received). *msec* must be an integer from 300 to 15000.

rekey

Specifies if IKESA rekeying should occur before the configured lifetime expires (at approximately 90% of the lifetime interval). Default is not to re-key.

setup-timer *sec*

Default: 16

Specifies the number of seconds before a IKEv2 IKE Security Association, that is not fully established, is terminated. *sec* must be an integer from 1 to 3600.

transform-set list *name*

Specifies the name of context-level configured IKEv2 IKE Security Association transform set. *name* must be an existing IKEv2 IKESA Transform Set and be from 1 to 127 alpha and/or numeric characters.

list

A space-separated list of IKEv2-IKESA SA transform sets to be used for deriving IKEv2 IKE Security Associations from this crypto template. A minimum of one transform-set is required; maximum configurable is six.

Usage

Use this command to configure parameters for the IKEv2 IKE Security Associations within this crypto template.

Example

The following command configures the maximum number of IKEv2 IKESA request retransmissions to 7:

```
ikev2-ikesa max-retransmissions 7
```

The following command configures the IKEv2 IKESA request retransmission timeout to 400:

```
ikev2-ikesa retransmission-timeout 400
```

The following command configures the IKEv2 IKESA transform set list name to *ikesa43*:

```
ikev2-ikesa transform-set list ikesa43
```

keepalive

Configures keepalive or dead peer detection for security associations used within this crypto template.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
keepalive [ interval sec ] [ timeout sec ] [ num-retry num ]
```

```
default keepalive [ interval ] [ timeout ] [ num-retry ]
```

```
no keepalive
```

no

Disables keepalive messaging.

interval *sec*

Default: 10

Specifies the amount of time in seconds that must elapse before the next keepalive request is sent. *sec* must be an integer from 10 to 3600.

timeout *sec*

Default: 10

Specifies the amount of time in seconds that the system will wait without receiving a reply before retrying the keepalive request. *sec* must be an integer from 10 to 3600.

num-retry *num*

Default: 2

Specifies the number of times the system will retry a non-responsive peer before defining the peer as off-line or out-of-service. *num* must be an integer from 1 to 100.

Usage

Use this command to set parameters associated with determining the availability of peer servers.

Example

The following command sets a keepalive interval to three minutes, the timeout to 30 seconds, and the retry attempts number to 5:

```
keepalive interval 180 timeout 30 num-retry 5
```

max-childsa

Defines a soft limit for the number of Child SAs Child SAs per IKEv2 policy.

Product

FNG

Privilege

Security Administrator, Administrator

Syntax

```
max-childsa <1 . . 4> [ overload action < ignore | terminate > ]
```

```
max-childsa < 1 . . 4 >
```

Specifies a soft limit for the maximum number of Child SAs per IKEv2 policy, which can be from 1 to 4.

overload-action

The action taken when the specified soft limit for the maximum number of Child SAs is reached, as follows:

- **ignore:** The IKEv2 stack ignores the specified soft limit for Child SAs.
- **terminate:** The IKEv2 stack rejects any new Child SAs if the specified soft limit is reached.

Usage

The FNG maintains two maximum Child SA values per IKEv2 policy. The first is a system-enforced maximum value, which is four Child SAs per IKEv2 policy. The second is a configurable soft maximum value, which can be a value between one and four. This command defines the soft limit for the maximum number of Child SAs per IKEv2 policy.

Example

The following command specifies a soft limit of 2 Child SAs with the overload action of terminate.

```
max-childsa 2 overload action terminate
```

nai

Configures the NAI parameters to be used for the crypto template IDr.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] nai idr name id-type {rfc822-addr | fqdn | ip-addr | key-id }
```

default

Configures the default command **no nai idr**. As a result, the default behavior is for the PDIF-service IP address to be sent as the IDr value of type ID_IP_ADDR.

no

no nai idr configures the value whereby the PDIF service IP address is sent as the IDr value with the type ID_IP_ADDR. This is the default condition.

idr name

name is a string of up to 79 alpha and/or numeric characters.

id-type { rfc822-addr | fqdn | ip-addr | key-id }

Configures the NAI IDr **id-type** parameter. If no id-type is specified, then rfc822-addr is assumed.

- **rfc822-addr**: configures NAI Type ID_RFC822_ADDR.
- **fqdn**: configures NAI Type ID_FQDN.
- **ip-addr**: configures NAI Type ID_IP_ADDR.
- **key-id**: configures NAI Type ID_KEY_ID.

Usage

The configured IDr is sent from the PDIF to the MS in the first IKEv2 AUTH response.

Example

The following command configures the NAI IDr to the default condition.

```
no naidr
```

natt

Configures Network Address Translation - Traversal (NAT-T) for all security associations associated with this crypto template. This feature is disabled by default.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] natt [ send-keepalive ]
```

default

Disables NAT-T for all security associations associated with this crypto template.

no

Disables NAT-T for all security associations associated with this crypto template.

send-keepalive

Sends NAT-Traversal keepalive messages.

Usage

Use this command to configure NAT-T for security associations within this crypto template.

Example

The following command disables NAT-T for this crypto template:

```
no natt
```

payload

Creates a new, or specifies an existing, crypto template payload and enters the Crypto Template Payload Configuration Mode.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] payload name match childsa [ match { ipv4 | ipv6 } ]
```

no

Removes a currently configured crypto template payload.

name

Specifies the name of a new or existing crypto template payload. *name* must be from 1 to 127 alpha and/or numeric characters.

match childsa [match { ipv4 | ipv6 }]

Filters IPSec Child Security Association creation requests for subscriber calls using this payload. Further filtering can be performed by applying the following:

- **ipv4**: Configures this payload to be applicable to IPSec Child Security Association requests for IPv4.
- **ipv6**: Configures this payload to be applicable to IPSec Child Security Association requests for IPv6.

Usage

Use this command to create a new or enter an existing crypto template payload. The payload mechanism is a means of associating parameters for the Security Association (SA) being negotiated.

Two payloads are required: one each for MIP and IKEv2. The first payload is used for establishing the initial Child SA Tunnel Inner Address (TIA) which will be torn down. The second payload is used for establishing the remaining Child SAs. Note that if there is no second payload defined with home-address as the *ip-address-allocation* then no MIP call can be established, just a Simple IP call.

Currently, the only available match is for ChildSA, although other matches are planned for future releases. Omitting the second match parameter for either IPv4 or IPv6 will make the payload applicable to all IP address pools.

Crypto Template Payload Configuration Mode commands are defined in the Crypto Template Payload Configuration Mode Commands chapter.

Example

The following command configures a crypto template payload called *payload5* and enters the Crypto Template Payload Configuration Mode:

```
payload payload5 match childsa
```

peer network

Configures a list of allowed peer addresses on this crypto template.

Product

All

Privilege

Administrator

Syntax

```
peer network ip_address {/mask | mask ip_mask } [ encrypted pre-shared-key key | pre-shared-key key ]
```

```
no peer network ip_address mask ip_mask
```

no

Removes the specified peer network IP address from this crypto template.

```
network ip_address {/mask | mask ip_mask }
```

Specifies the IP address of the peer network in IPv4 dotted decimal notation or IPv6 colon separated notation. */mask* specifies the subnet mask bits. *mask* must be an integer value from 1 to 32 for IPv4 addresses and 1 to 128 for IPv6 addresses.

mask *ip_mask* specifies the subnet mask in dotted decimal notation for IPv4 addresses and colon-separated notation for IPv6 addresses.

```
[ encrypted pre-shared-key key | pre-shared-key key ]
```

encrypted pre-shared key *key*: Specifies that an encrypted pre-shared key is to be used for IPSec authentication for the address range. *key* must be a string or hexadecimal sequence from 16 to 64.

pre-shared key *key*: Specifies that a pre-shared key is to be used for IPSec authentication for the address range. *key* must be a string or hexadecimal sequence from 1 to 32.

Usage

Use this command to configure a list or range of allowed peer network IP addresses for this template.

Example

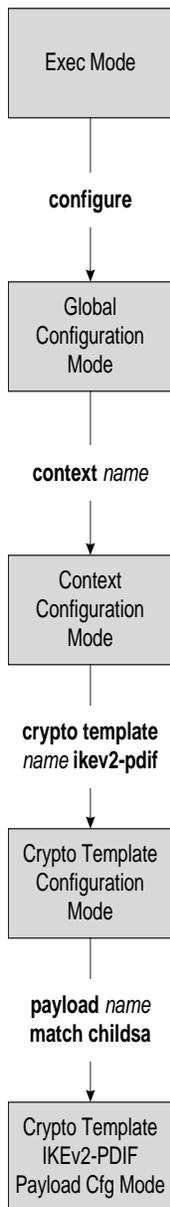

The following command configures a set of IP addresses with starting address of 1.2.3.4 and a bit mask of 8:

```
peer network 1.2.3.4/8
```

Chapter 59

Crypto Template IKEv2-Dynamic Payload Configuration Mode Commands

The Crypto Template IKEv2-Dynamic Payload Configuration Mode is used to assign the correct IPSec transform-set from a list of up to four different transform-sets, and to assign Mobile IP addresses. There should be two payloads configured. The first must have a dynamic addressing scheme as this is how the ChildSA gets a TIA address. The second payload supplies the ChildSA with a HoA, which is the default setting for *ip-address-allocation*.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Sets or restores the default value for the specified parameter.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
default { ignore-rekeying-requests | ip-address-allocation lifetime | maximum-  
child-sa | rekey | tsi | tsr }
```

ignore-rekeying-requests

Configures the system to ignore IPSec SA rekey requests.

ip-address-allocation

Configures the crypto map payload IP address allocation scheme to be the home address.

lifetime

Configures the default lifetime for IPSec Child SAs derived from this crypto template. **lifetime:** 86400 seconds.

maximum-child-sa

Configures the maximum number of IPSec Child SAs to be derived from an IKEv2 IKE SA by default.

rekey

Configures the system to disable Child SA rekeying.

tsi

Configures the default TSi payload to be that of the mobile endpoint.

tsr

Configures the default TSr payload option.

Usage

Configures system defaults.

Example

Use the following configuration to set the TSi payload start-address to be that of the mobile endpoint:

```
default tsi
```

■ default

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

ignore-rekeying-requests

Ignores CHILD SA rekey requests from the PDIF.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
ignore-rekeying-requests
```

Usage

Prevents creation of a CHILD SA based on this crypto template.

Example

The following command prevents creation of a CHILD SA based on this crypto template:

```
ignore-rekeying-requests
```

ip-address-allocation

Configures IP address allocation for subscribers using this crypto template payload. Configure two payloads per crypto template. The first must have a dynamic address to assign a TIA to the ChildSA. The second payload is configured after a successful MIP initiation and can use the default HoA option.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
ip-address-allocation { dynamic | home-address | static }
```

```
default ip-address-allocation
```

dynamic

Specifies that the IP address for the subscriber is allocated from a dynamic IP pool.

home-address

Specifies that the IP address for the subscriber is allocated by the Home Agent. This is the default setting for this command.

static

Specifies that the IP address for the subscriber is a static simple IP address.

Usage

Use this command to configure how ChildSA payloads are allocated IP addresses for this crypto template.

Example

The following command is for the first ChildSA and will ensure that it gets a TIA address from an IP address pool:

```
ip-address-allocation dynamic
```

The following command is for the second ChildSA and will ensure that it gets a HoA address from the HA:

```
default ip-address-allocation
```

ipsec

Configures the IPsec transform set to be used for this crypto template payload.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipsec transform-set list name
```

no

Specifies the IPsec transform set to be deleted. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be from 1 to 127 alpha and/or numeric characters.

list *name*

Specifies the context configured IPsec transform set name to be used in the crypto template payload. This is a space-separated list. From 1 to 4 transform sets can be entered. *name* must be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to list the IPsec transform set(s) to use in this crypto template payload.

Example

The following command configures IPsec transform sets named *ipset1* and *ipset2* to be used in this crypto template payload:

```
ipsec transform-set list ipset1 ipset2
```

lifetime

Configures the number of seconds for IPsec Child SAs derived from this crypto template payload to exist.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
lifetime sec
```

```
default lifetime
```

sec

Default: 86400

Specifies the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist. *sec* must be an integer from 60 to 86400.

```
default lifetime
```

Sets the lifetime to its default value of 86400 seconds.

Usage

Use this command to configure the number of seconds for IPsec Child Security Associations derived from this crypto template payload to exist.

Example

The following command configures the IPsec child SA lifetime to be 120 seconds:

```
lifetime 120
```

maximum-child-sa

Configures the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
maximum-child-sa num
```

```
default maximum-child-sa
```

num

Default: 1

Specifies the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association. *num* must be 1.

```
default maximum-child-sa
```

Sets the maximum number of Child SAs to its default value of 1.

Usage

Use this command to configure the maximum number of IPsec child security associations that can be derived from a single IKEv2 IKE security association.

Example

The following command configures the maximum number of child SAs to 1:

```
maximum-child-sa 1
```

rekey

Configures IPsec Child Security Association rekeying.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] rekey [ keepalive ]
```

no

Disables this feature.

keepalive

If specified, a session will be rekeyed even if there has been no data exchanged since the last rekeying operation. By default, rekeying is only performed if there has been data exchanged since the previous rekey.

Usage

Use this command to enable or disable the ability to rekey IPsec Child SAs after approximately 90% of the Child SA lifetime has expired. The default, and recommended setting, is not to perform rekeying. No rekeying means the PDIF will not originate rekeying operations and will not process CHILD SA rekeying requests from the UE.

Example

The following command disables rekeying:

```
no rekey
```

tsi

Configures the IKEv2 Initiator Traffic Selector (TSI) payload address options.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
tsi start-address { any { end-address any } | endpoint { end-address endpoint }  
}
```

```
any { end-address any }
```

Configures the TSi payload to allow all all IP addresses.

```
endpoint { end-address endpoint }
```

Configures the TSi payload start-address to be that of the Mobile endpoint. This is the default value. *endpoint* is the mobile endpoint netmask.

Usage

On receiving a successful IKE_SA_INIT Response from PDIF, the MS sends an IKE_AUTH Request for the first EAP-AKA authentication. If the MS is capable of doing multiple-authentication, it includes the MULTI_AUTH_SUPPORTED Notify payload in the IKE_AUTH Request. MS also includes an IDi payload containing the NAI, SA, TSi, TSr, and CP (requesting IP address and DNS address) payloads.

Example

Use the following example to configure a TSi payload that allows all addresses:

```
tsi start-address any end-address any
```

tsr

Configures the IKEv2 Responder Traffic Selector (TSr) payload address options.

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
tsr start-address ipv4 address end-address ipv4 address
```

start-address *ipv4 address*

Configures the TSr payload to include the TSr start IPv4 address of an address range for the Phase 1 multiple traffic selector feature.

end-address *ipv4 address*

Configures the TSr payload start-address to include the TSr end IPv4 address of an address range for the Phase 1 multiple traffic selector feature.

Usage

As part of Phase 1 of the Multiple Traffic Selector feature, this command is used to specify an IPv4 address range in the single TSr payload that the PDG/TTG returns in the last IKE_AUTH message. This TSr is Child SA-specific.

Example

Use the following example to configure a TSr payload that specifies an IPv4 address range for the payload:

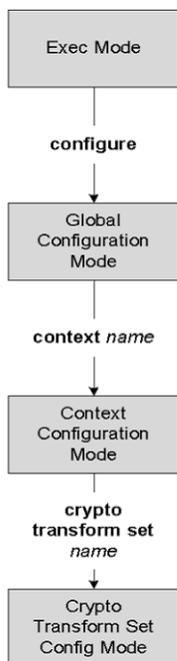

```
tsr start-address ipv4 address end-address ipv4 address
```

Chapter 60

Crypto Transform Set Configuration Mode Commands

The Crypto Transform Set Configuration Mode is used to configure properties for system transform sets.

Transform Sets are used to define IPSec security associations (SAs). IPSec SAs specify the IPSec protocols to use to protect packets.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

mode

Configures the IPSec encapsulation mode.

Product

PDSN, HA, GGSN, PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
mode { transport | tunnel }
```

transport

Default: Disabled

Specifies that the transform set only protects the upper layer protocol data portions of an IP datagram, leaving the IP header information unprotected.

Important: This mode should only be used if the communications end-point is also the cryptographic end-point.

tunnel

Default: Enabled

Specifies that the transform set protects the entire IP datagram as displayed in the following figure.

This mode should be used if the communications end-point is different from the cryptographic end-point as in a VPN.

Usage

This command specifies the encapsulation mode for the transform set.

Example

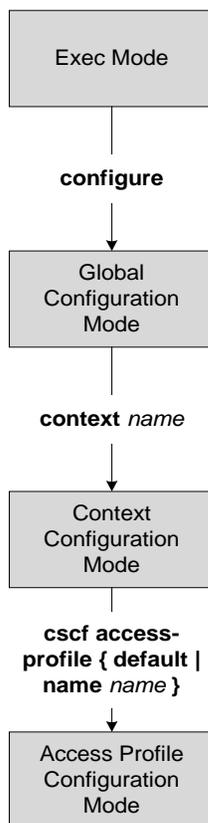

The following command configures the transforms set's encapsulation mode to transport:

```
mode transport
```

Chapter 61

CSCF Access Profile Configuration Mode Commands

The Access Profile Configuration Mode is used to set commands supporting the use of signaling compression, authentication, and SIP timers for subscribers accessing the system from varying network types.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-security-type

Sets the type of access security for a P-CSCF/A-BG.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] access-security-type ipsec-3gpp-cscf
```

no

Disables the selected access security type.

ipsec-3gpp-cscf

Security mechanism 3GPP/3GPP2 IPsec.

Usage

Use this command to enable or disable an access security type for a P-CSCF or A-BG.

Example

Enables 3GPP/3GPP2 IPsec access security on P-CSCF or A-BG:

```
access-security-type ipsec-3gpp-cscf
```

Disables 3GPP/3GPP2 IPsec access security on P-CSCF or A-BG:

```
no access-security-type ipsec-3gpp-cscf
```

authentication

Sets the authentication method to use for subscribers using this access profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] authentication { aka-v1 | md5 }
```

no

Disables the selected authentication type.

aka-v1 | md5

aka-v1: Specifies that the AKA-v1 algorithm will be used for subscribers using this access profile.

md5: Specifies that the MD5 algorithm will be used for subscribers using this access profile. This is the default setting for this command.

Usage

Use this command to set the authentication method used for subscribers using this access profile.

Example

The following command sets the authentication type for subscribers using this access profile to **md5**:

```
authentication md5
```

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

sigcomp

Enables signalling compression for the Access Profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sigcomp [ force ]
```

no

Disables signalling compression for the Access Profile.

force

Specifies that signaling compression is to be forced for the access type. When this feature is enabled, messages received by the P-CSCF/A-BG that are not compressed are rejected.

Usage

Use this command to enable signalling compression for the specific Access Profile.

timeout

Sets timeout values for CSCF and SIP transactions for subscribers using this Access Profile.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
timeout sip { 3gpp-d sec | 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | d sec |
invite-expiry sec | t1 msec | t2 sec | t4 sec }

default timeout sip { 3gpp-d | 3gpp-t1 | 3gpp-t2 | 3gpp-t4 | d | invite-expiry |
t1 | t2 | t4 }
```

```
sip { 3gpp-d sec | 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | d sec |
invite-expiry sec | t1 msec | t2 sec | t4 sec }
```

Sets transaction and expiry timers for SIP.

3gpp-d *sec*: This time is used to control the retransmission of 200OK messages to INVITEs after an ACK is sent. The ACK transaction is cleared after this period. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646.

Default: 64*T1 (128 seconds, recommended minimum)

3gpp-t1 *msec*: This timer is used to control the time interval between each retransmission. The interval doubles after each retransmission. This is used by P-CSCF/A-BG only when it sending message toward the UE. Example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport. *msec* must be an integer from 0 to 2147483646.

Default: 2000 ms (2 secs, recommended minimum).

3gpp-t2 *sec*: This timer is used to control the period for which the request continues to get retransmitted. This is used by P-CSCF/A-BG only when it sending message toward the UE. This timer is applicable both for reliable and unreliable transport.

sec must be an integer from 0 to 2147483646.

Default: 16 seconds (recommended minimum).

3gpp-t4 *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered. The buffered response for the retransmitted non-invite request should be sent within that interval. This timer is applicable only for unreliable transport.

sec must be an integer from 0 to 2147483646.

Default: 17 seconds (recommended minimum).

d *sec*: This time is used to control the retransmission of 200OK to INVITE after ACK is sent. The ACK transaction will be cleared after this interval. This timer is applicable only for unreliable transport.

sec must be an integer from 0 to 2147483646.

Default: 64*T1 (32 seconds, recommended minimum)

invite-expiry *sec*: This timer is used by SIP while acting as UA Role and no final response is received for the INVITE request sent. This timer is applicable for both reliable and unreliable transport.

sec must be an integer from 0 to 2147483646.

Default: 100 seconds (recommended minimum).

t1 *msec*: Specifies the time interval (in milliseconds) between each retransmission. The interval doubles after each retransmission, for example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport.

■ timeout

msec must be an integer from 0 to 2147483646.

Default: 500 milliseconds (recommended minimum).

t2 sec: This timer is used to control the period for which the request keeps getting retransmitted. This timer is applicable both for reliable and unreliable transport.

sec must be an integer from 0 to 2147483646. The recommended minimum value for this parameter is 4 seconds.

Default: 64*T1 (32 seconds)

t4 sec: This timer is used to control the period for which the final response to non-invite transaction should be buffered so as to send the buffered response for the retransmitted non-invite request within that interval. This timer is applicable only for unreliable transport.

sec must be an integer from 0 to 2147483646.

Default: 5 seconds (recommended minimum).

default

Sets/restores default value assigned for specified parameter.

Usage

Use this command to configure SIP Stack timers and CSCF service specific timers for subscriber traffic using this Access Profile.

Example

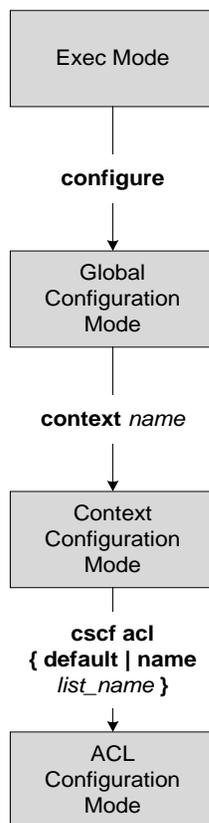

The following command sets the SIP d timer to 64 seconds:

```
timeout sip d 64
```

Chapter 62

CSCF ACL Configuration Mode Commands

The CSCF ACL (Access Control List) Configuration Mode is used to configure session permissions (permit/deny access) within the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF ACL entry at the bottom or end of the ACL. Use this command in conjunction with the **permit** and/or **deny** commands.

Product

SCM

Privilege

Administrator

Syntax**after**

Usage

Add this command before the **permit** and/or **deny** commands to place the entry at the end of the ACL.

before

Places the CSCF ACL entry at the beginning or top of the ACL. Use this command in conjunction with the **permit** and/or **deny** commands.

Product

SCM

Privilege

Administrator

Syntax**before**

Usage

Add this command before the **permit** and/or **deny** commands to place the entry at the beginning of the ACL.

deny

Configures the system to deny subscriber sessions based on criteria matching the received packet.

Product

SCM

Privilege

Administrator

Syntax

```
deny { any | destination aor aor | log { any | destination aor aor | source {
address ip_address | aor aor } | source { address ip_address | aor aor } }
no deny { any | destination aor aor | source { address ip_address | aor aor } }
```

any

Filters all CSCF sessions.

destination aor aor

Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

```
log { any | destination aor aor | source { address ip_address | aor aor }
}
```

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility acl-log** command in the Exec mode. Specifies the criteria that packets will be compared against. The following criteria is supported:

- **any**
- **destination aor aor**
- **source address ip_address**
- **source aor aor**

```
source { address ip_address | aor aor }
```

Filters session based on the source IP address or AoR.

- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

```
no deny { any | destination aor aor | source { address ip_address | aor aor } }
```

Removes specified filter criteria.

Usage

Specifies the subscriber sessions to deny based on the criteria specified.

Example

The following command denies access to subscribers with a source address of 1.2.3.4:

```
deny source address 1.2.3.4
```

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

permit

Configures the system to allow subscriber sessions based on criteria matching the received packet.

Product

SCM

Privilege

Administrator

Syntax

```
permit { any | destination aor aor | log { any | destination aor aor | source {
address ip_address | aor aor } | source { address ip_address | aor aor } }
no permit { any | destination aor aor | source { address ip_address | aor aor } }
```

any

Filters all CSCF sessions.

destination aor aor

Filters sessions based on the destination AoR.
aor must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

```
log { any | destination aor aor | source { address ip_address | aor aor
} }
```

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility acl-log** command in the Exec mode. Specifies the criteria that packets will be compared against. The following criteria is supported:

- **any**
- **destination aor aor**
- **source address ip_address**
- **source aor aor**

```
source { address ip_address | aor aor }
```

Filters session based on the source IP address or AoR.

- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

```
no permit { any | destination aor aor | source { address ip_address | aor aor } }
```

Removes specified filter criteria.

Usage

Specifies the subscriber sessions to permit based on the criteria specified.

Example

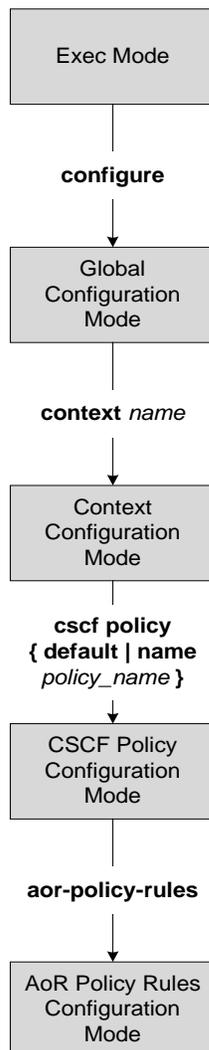

The following command permits access to subscribers with a destination AoR of `$.@abc123.com`:

```
permit destination aor $.@abc123.com
```

Chapter 63

CSCF AoR Policy Rules Configuration Mode Commands

The CSCF AoR Policy Rules Configuration Mode is used to manage AoR policy profiles within the system. Both default and user-defined profiles can be managed in this mode.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ permit

after

Places the CSCF policy entry at the bottom or end of the policy list. Use this command in conjunction with the **aor** command.

Product

SCM

Privilege

Administrator

Syntax

after

Usage

Add this command before the **aor** command to place the entry at the end of the policy list.

aor

Configures an AoR profile and enters the AoR Profile Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] aor aor_name
```

no

Removes the AoR profile from the system.

aor_name

Specifies a name for the AoR profile.

aor_name must be from 1 to 79 alpha and/or numeric characters in length.

Usage

Use this command to create or modify an AoR profile and enter the CSCF Policy Rules Configuration Mode.

Entering this command results in the following prompt:

```
[context_name]hostname(config-aor_name-aor)#
```

CSCF Policy Rules Configuration Mode commands are defined in the CSCF Policy Rules Configuration Mode Commands chapter of this guide.

Example

The following command creates an AoR profile named *aor5* and enters the AoR Profile Configuration Mode:

```
aor aor5
```

before

Places the CSCF policy entry at the top or beginning of the policy list. Use this command in conjunction with the **aor** command.

Product

SCM

Privilege

Administrator

Syntax**before**

Usage

Add this command before the **aor** command to place the entry at the beginning of the policy list.

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

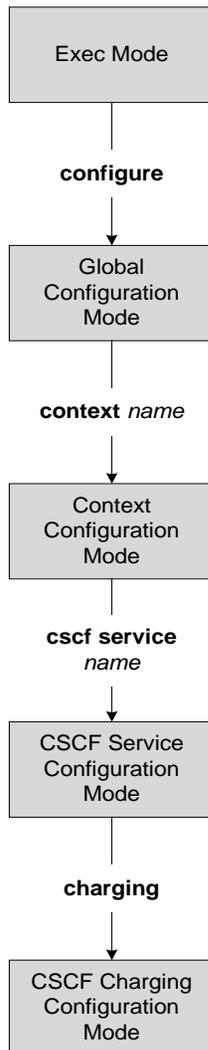

Usage

Return to the previous mode.

Chapter 64

CSCF Charging Configuration Mode Commands

The CSCF Charging Configuration Mode is used to manage CSCF service policy profiles within the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exclude

Configures the service to exclude SIP requests from the Rf charging configuration.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] exclude { custom sip_method | invite | notify | register | subscribe |  
update | message }
```

no

Removes the exclusion of the specified SIP request message type.

custom sip_method

Specifies CUSTOM SIP requests that are to be excluded from Rf charging.

sip_method can be a name of any SIP method and be from 1 to 31 alpha and/or numeric characters.

invite

Specifies that INVITE SIP requests are to be excluded from Rf charging.

notify

Specifies that NOTIFY SIP requests are to be excluded from Rf charging.

register

Specifies that REGISTER SIP requests are to be excluded from Rf charging.

subscribe

Specifies that SUBSCRIBE SIP requests are to be excluded from Rf charging.

update

Specifies that UPDATE SIP requests are to be excluded from Rf charging.

message

Specifies that MESSAGE SIP requests are to be excluded from Rf charging.

Usage

Use this command to exclude specific SIP requests from Rf charging.

Example

The following command configures the service to exclude SIP REGISTER requests from Rf charging:

■ exclude

exclude register

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

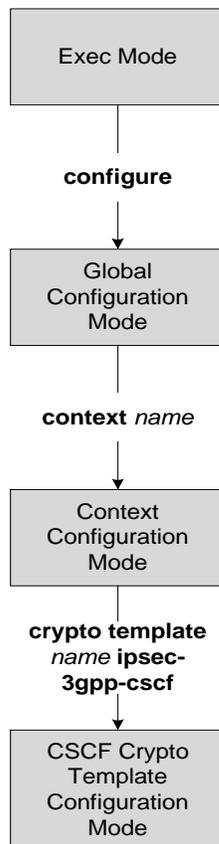

Usage

Return to the previous mode.

Chapter 65

CSCF Crypto Template Configuration Mode Commands

The CSCF Crypto Template Configuration Mode is used to configure a P-CSCF IPsec policy. It includes most of the IPsec parameters and Internet Key Exchange version 1 (IKEv1) parameters for cryptographic and authentication algorithms etc. A P-CSCF service will not support IPsec without a configured crypto template. Only one crypto template can be configured per P-CSCF service.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

ipsec

Configures parameters for the 3GPP/3GPP2 P-CSCF security associations within this crypto template.

Product

SCM

Privilege

Security Administrator, Administrator

Syntax

```
ipsec transform-set list list_name
```

```
transform-set list name
```

transform-set: Specifies a context-level IPsec security association transform set to be used for deriving 3GPP/3GPP2 P-CSCF security associations from this crypto template.

list list_name: A space separated list of 3GPP/3GPP2 P-CSCF security association transform sets. *list_name* must be an existing 3GPP/3GPP2 P-CSCF transform set and be from 1 to 127 alpha and/or numeric characters.

Important: A minimum of one transform set is required. A maximum of four transform sets may be specified.

Usage

Use this command to configure parameters for the 3GPP/3GPP2 P-CSCF security associations within this crypto template.

Example

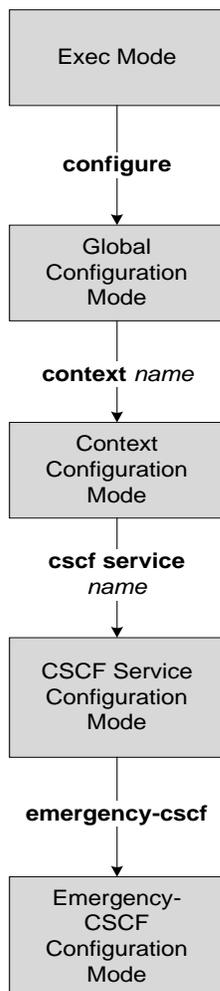

The following command configures the 3GPP/3GPP2 P-CSCF transform set list name to *ikev1list1*:

```
ipsec transform-set list ikev1list1
```

Chapter 66

CSCF Emergency-CSCF Configuration Mode Commands

The Emergency-CSCF Configuration Mode is used to set commands supporting the role of the CSCF service as an Emergency CSCF.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

privacy

Enables privacy support on the E-CSCF.

Product

SCM

Privilege

Administrator

Syntax

```
[ no | default ] privacy
```

```
no | default
```

Removes privacy support from the E-CSCF.

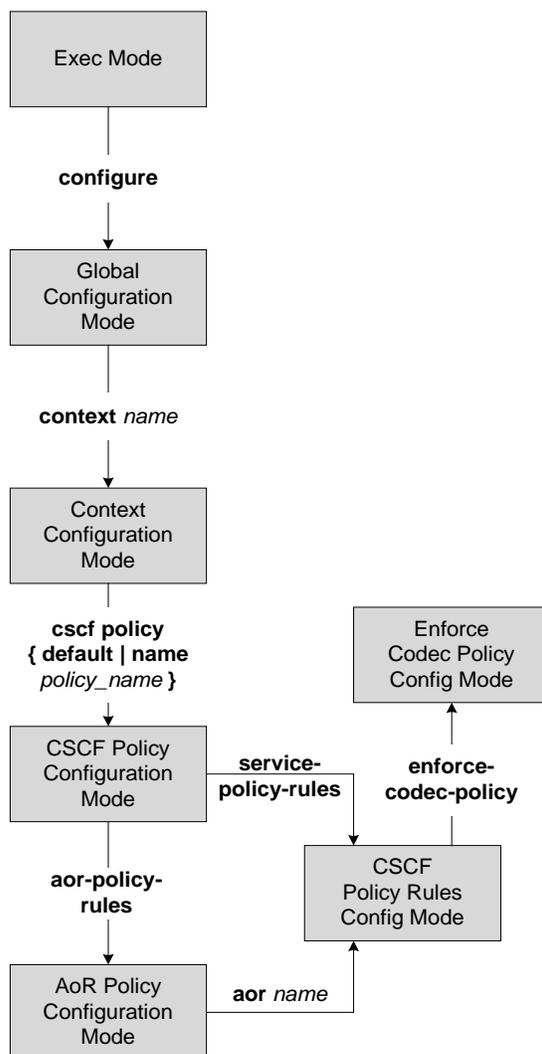

Usage

Use this command to enable privacy support for Emergency CSCF service.

Chapter 67

CSCF Enforce Codec Policy Configuration Mode Commands

The CSCF Enforce Codec Policy Configuration Mode is used to manage audio and video codec policies within the system. The parameters defined in this chapter are derived from IETF RFC 3551: “RTP Profile for Audio and Video Conferences with Minimal Control”.

■ privacy

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

dynamic-codec

Creates a list of dynamic codecs supported by the system.

Product

SCM

Privilege

Administrator

Syntax

```
dynamic-codec { audio encoding_name | video encoding_name } [ clock_rate ] [ channels ]
```

```
default dynamic-codec
```

```
no dynamic-codec [ encoding_name ] [ clock_rate ] [ channels ]
```

```
audio encoding_name | video encoding_name
```

audio *encoding_name*: Specifies the encoding name of the dynamic audio codec added to the allowed codec list. *encoding_name* must be from 1 to 49 alpha and/or numeric characters.

video *encoding_name*: Specifies the encoding name of the dynamic video or audio-video codec added to the allowed codec list. *encoding_name* must be from 1 to 49 alpha and/or numeric characters.

```
[ clock_rate ] [ channels ]
```

clock_rate: Specifies the sampling rate of the codec. *clock_rate* must be an integer from 0 to 1000000.

channels: Specifies the number of channels required by the codec. *channels* must be an integer from 1 to 1000000.

Valid dynamic audio codecs:

Encoding Name	Clock Rate (Hz)	Channels
G726-40	8,000	1
G726-32	8,000	1
G726-24	8,000	1
G726-16	8,000	1
G729D	8,000	1
G729E	8,000	1
GSM-EFR	8,000	1
L8	Variable	Variable
RED	See RFC3551	
VDVI	Variable	1

Valid dynamic video codecs:

Encoding Name	Clock Rate (Hz)
H263-1998	90,000

default

Specifies that the default list of dynamic codecs is added to the allowed codecs list. Default dynamic codecs: H263 and AMR.

no dynamic-codec [*encoding_name*] [*clock_rate*] [*channels*]

Specifies that all dynamic codecs are removed from the allowed codecs list. If an *encoding_name* is specified, then only the codec specified by the *encoding_name* is removed. Furthermore, if a supporting *clock_rate* and/or *channels* are specified, then only the *encoding_name* with the specified *clock_rate* and/or *channels* is removed.

Usage

Use this commands to create a list of supported dynamic audio and video codecs in the system. When a request is received by the CSCF, the SDP fields in the message are checked to determine the codec being used. The codec in the SDP fields must match a codec in the allowed codec list or the CSCF rejects the request.

Example

The following command adds the GSM-EFR codec to the allowed dynamic codec list:

```
dynamic-codec GSM-EFR
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

static-codec

Creates a list of static codecs supported by the system.

Product

SCM

Privilege

Administrator

Syntax

```
static-codec { audio payload_type | video payload_type }
```

```
default static-codec
```

```
no static-codec [ payload_type ]
```

audio payload_type | video payload_type

audio payload_type: Specifies the audio codec added to the allowed codecs list. *payload_type* must be an integer from 0 to 95. Default value is 5.

Valid static audio codecs:

0: PCMU	7: LPC	14: MPA	21: unassigned
1: reserved	8: PCMA	15: G728	22: unassigned
2: reserved	9: G722	16: DVI4	23: unassigned
3: GSM	10: L16	17: DVI4	
4: G723	11: L16	18: G729	
5: DVI4	12: QCELP	19: reserved	
6: DVI4	13: CN	20: unassigned	

video payload_type: Specifies the video or audio-video codec added to the allowed codecs list. *payload_type* must be an integer from 0 to 95. Default value is 5.

Valid static video codecs:

24: unassigned	28: nv	32: MPV	72-76: reserved
25: CelB	29: unassigned	33: MP2T	77-95: unassigned
26: JPEG	30: unassigned	34: H263	
27: unassigned	31: H261	35-71: unassigned	

default

Specifies that the default list of static codecs is added to the allowed codecs list. The default static codec is 5: DVI4.

```
no static-codec [ payload_type ]
```

Specifies that all static codecs are removed from the allowed codecs list. If a *payload_type* is specified, then only the codec specified by the *payload_type* is removed.

Usage

Use this commands to create a list of supported static audio and video codecs in the system. When a request is received by the CSCF, the SDP fields in the message are checked to determine the codec being used. The codec in the SDP fields must match a codec in the allowed codec list or the CSCF rejects the request.

Example

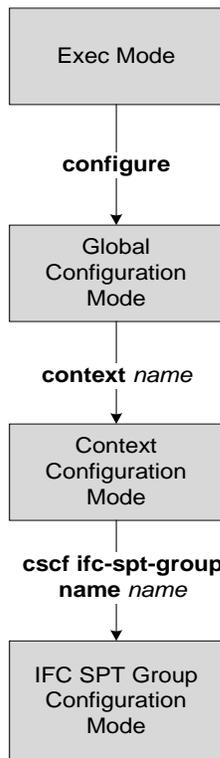

The following command adds the G729 audio codec to the allowed codecs list:

```
static-codec 18
```

Chapter 68

CSCF iFC SPT Group Mode Commands

The CSCF iFC SPT Group Configuration Mode is used to associate individual SPT conditions with an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

spt-condition

Assigns iFC SPT conditions to an existing iFC SPT group.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ no ] spt-condition id cond_id
```

no

Removes the specified CSCF iFC SPT condition from the iFC SPT group.

spt-condition id *cond_id*

Specifies the name of an existing iFC SPT condition.
cond_name must be an integer from 1 to 200.

Usage

Use this command to associate individual SPT conditions with an iFC SPT group.

Important: An iFC SPT group may be associated with multiple SPT conditions.

Example

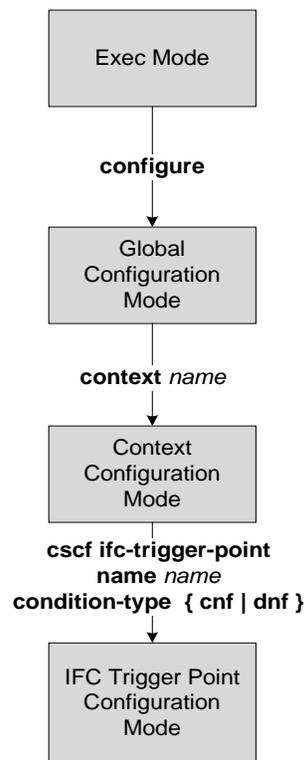

The following command assigns 2 to an iFC SPT group:

```
spt-condition id 2
```

Chapter 69

CSCF iFC Trigger Point Mode Commands

The CSCF iFC Trigger Point Configuration Mode is used to associate an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group with an iFC trigger point.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

spt-group

Assigns an existing iFC SPT group to an iFC trigger point.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ no ] spt-group id group_id
```

no

Removes the specified CSCF iFC SPT group from the iFC trigger point.

spt-group id *group_id*

Specifies the ID of an existing iFC SPT group.
group_id must be an integer from 1 to 200.

Important: An iFC SPT group can be assigned to more than one iFC trigger point.

Usage

Use this command to associate an iFC SPT group with an iFC trigger point.

Example

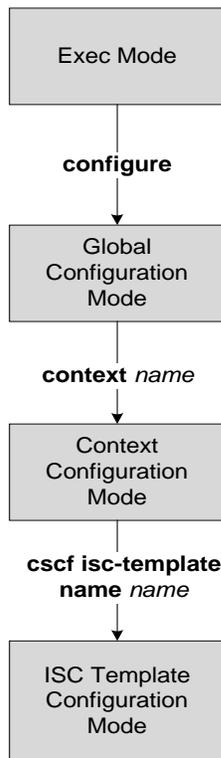

The following command assigns iFC SPT group 2 to an iFC trigger point:

```
spt-group id 2
```

Chapter 70

CSCF ISC Template Configuration Mode Commands

The CSCF ISC Template Configuration Mode is used to configure the IMS Service Control (ISC) interface within the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cnsa

Core Network Service Authorization (CNSA) related commands used to create media profile and service ids.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
cnsa { media-profile-id profile_id | service-id service_id [ service_id ]...[  
service_id ] }
```

```
no cnsa { media-profile-id | service-id [ service_id ] [ service_id ]...[  
service_id ] }
```

media-profile *profile_id*

Specifies the cnsa media profile id.

profile_id must be an integer from 0 to 10.

The media profile id is assigned to a service policy using the **cnsa-media-profile** command under CSCF Service configuration.

Important: You can only create one media profile id per ISC template.

service-id *service_id*

Specifies the cnsa service id(s). These ids represent URN parameters which are ICSI (IMS Communication Service Identifier) values that are mapped to a service profile through a media profile id.

service_id must be from 1 to 79 alpha and/or numeric characters.

```
no cnsa { media-profile-id | service-id [ service_id ] [ service_id ]...  
[ service_id ] }
```

Removes a media profile or service id(s).

Usage

Use this command to configure cnsa media profile ids and service ids. Information for core network authorization is received from HSS. It contains a list of service ids and a media profile id. Since the media profile id is an integer value, the S-CSCF needs to have a static database that contains the mapping between the integer value and the subscribed media profile. The media profile id is assigned to this service policy using the **cnsa-media-profile** command under CSCF Service configuration.

The S-CSCF selects the service profile based on the media profile id set and the policies, such as enforce-codec-policy and video-sessions, will be matched with the incoming request. Other policies, if configured, will be ignored in this scenario.

Example

The following command defines the media profile id as 2:

```
cnsa media-profile-id 2
```

The following command defines several service ids:

```
cnsa service-id xxx:exampletelephony.version1 xxx:abc.com
```

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

filter-criteria

Configure the filter criteria to be used by this template.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] filter-criteria id criteria_id
```

no

Removes the specified filter criteria.

id *criteria_id*

Specifies the ID of existing filter criteria to be used by this template. The particular criteria applied to a subscriber will be based on the priority parameter.

criteria_id must be an integer from 1 to 200.

Important: Filter criteria can be assigned to more than one ISC template.

Usage

Use this command to configure the filter criteria to be used by this template.

Example

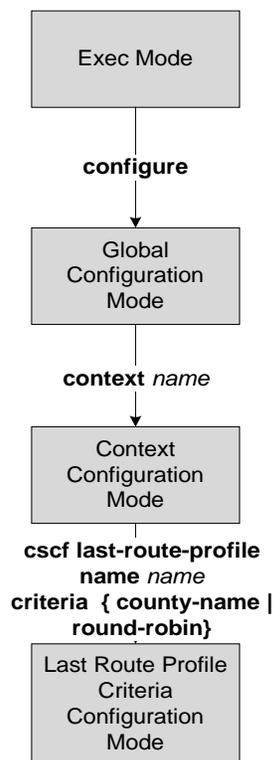

The following command identifies the filter criteria 1:

```
filter-criteria id 1
```

Chapter 71

CSCF Last Route Profile Criteria Configuration Mode Commands

The CSCF Last Route Profile Criteria Configuration Mode is used to configure county names and assign them Last Routing Option (LRO) numbers to be used by the CSCF last route profile. The S-CSCF forwards emergency call packets to the correct Public Safety Answering Point (PSAP) based on this criteria, which it receives from a peer server.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

county-name

Configure county names and assign them Last Routing Option (LRO) numbers to be used by the CSCF last route profile.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

county-name *county_name* **lro-number** *value*

[**no**] **county-name** *county_name*

county_name

Specifies the county name.

county_name must be from 1 to 79 alpha and/or numeric characters in length.

lro-number *value*

Specifies an existing LRO number.

value can be a maximum of ten digits in length.

no **county-name** *county_name*

Removes the specified county name.

Usage

Use this command to configure county names and assign them LRO numbers.

Important: You may configure up to 100 county names.

Example

The following command creates a county name called *norfolk* and assigns it an LRO number of *8884384357*:

```
county-name norfolk lro-number 8884384357
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

lro-number

Configure the Last Routing Option (LRO) numbers to be used by the CSCF last route profile.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
lro-number value
```

```
lro-number value
```

Specifies the LRO number.
value can be a maximum of ten digits in length.

```
no
```

Removes the specified LRO number.

Usage

Use this command to configure LRO numbers.

Important: You may configure up to 100 LRO numbers.

Example

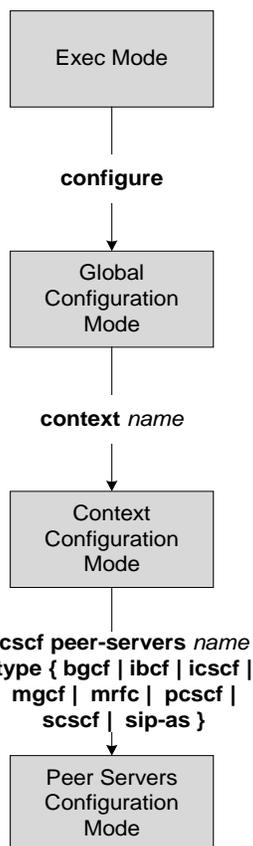

The following command creates an LRO number set at *8884384357*:

```
lro-number 8884384357
```

Chapter 72

CSCF Peer Servers Configuration Mode Commands

The CSCF Peer Servers Configuration Mode is used to configure peer servers (for next-hop session routes) within the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

hunting-method

Configures the method by which servers in this group are contacted.

Product

SCM

Privilege

Administrator

Syntax

```
hunting-method { round-robin | sequence-on-failure | weighed }
```

```
default hunting-method
```

```
round-robin | sequence-on-failure | weighed
```

Specifies the hunting method for the servers in this group.

round-robin: Specifies that the servers will be used in round-robin fashion. This is the default setting.

sequence-on-failure: Specifies that the servers will be used sequentially if a failure occurs on a server (i.e., first peer server is always used, except on failure, during which next peer server in the list will be used).

weighed: Specifies that the peer servers in this group have a set “weight” that determines use as compared to the other like-configured peer servers. The actual weight of the peer server is configured in the **server** command in this mode.

```
default
```

Specifies that the servers will be used in round-robin fashion.

Usage

Use this command to configure the method that is used by the system to connect to servers in this group.

Example

The following command sets the hunting method for servers in this group to contact sequentially only when a server fails:

```
hunting-method sequence-on-failure
```

server

Configures the name, IP address, and port of servers belonging to this group and enters the Server Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

```
server name { address ip_address | domain domain_name } [ port number ] [
transport { tcp | udp } ] [ weight number ]
```

```
no server name
```

name

Specifies a name for the server. *name* must be from 1 to 79 alpha and/or numeric characters in length.

address *ip_address*

Specifies the IP address of the server. *ip_address* is expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

domain *domain_name*

Specifies the domain name of the peer server. *domain_name* must be from 1 to 255 alpha and/or numeric characters in length.

port *number*

Specifies the port number of the server.
number must be an integer value from 1 to 65535.

transport { **tcp** | **udp** }

Specifies the transport type (TCP or UDP).

weight *number*

Default: 5
Specifies a weighted number for the specific peer server for load balancing purposes. *number* must be an integer value from 1 to 10. Higher weight implies larger server capability (and more routed requests).

Important: This keyword is only valid if the **weighed** keyword is applied to the **hunting-method** command in this mode.

no server *name*

Removes the specified server from the group.

Usage

Use this command to configure servers belonging to this group and enter the Server Configuration Mode. Entering this command results in the following prompt:

```
[ context_name ] hostname ( config-server_name-peer-server ) #
```

Server Configuration Mode commands are defined in the *CSCF Peer Server Monitoring Configuration Mode Commands* chapter.

Example

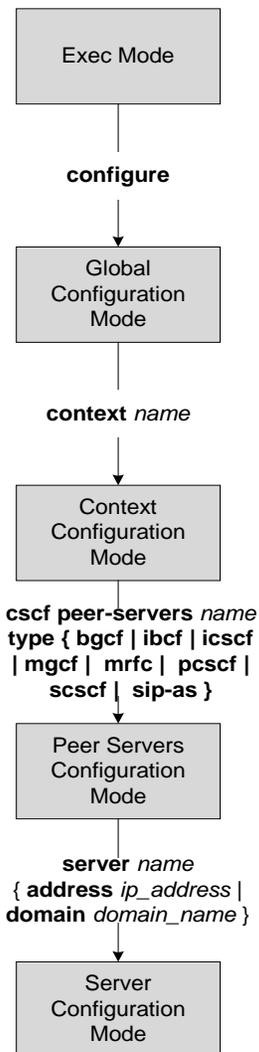

The following command configures a server named *scscf5* with an IP address of *1.2.3.4* and a port number of *5060*:

```
server scscf5 address 1.2.3.4 port 5060
```

Chapter 73

CSCF Peer Server Monitoring Configuration Mode Commands

The CSCF Peer Server Monitoring Configuration Mode is used to configure an individual peer server's monitoring parameters and operational mode. It also associates a network session template with the server.

■ server

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

■ exit

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

ims-capable

Indicates whether the peer server belongs to a 3GPP/IMS network or a non-IMS network such as the Internet. This command is used to determine at the S-CSCF whether SIP signaling inter-working is needed when the calls are forwarded to external networks.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] ims-capable
```

no

Removes the identification of “IMS capable” from the selected peer server.

Usage

Use this command to identify a peer server as IMS capable allowing the S-CSCF to use SIP signalling inter-working when forwarding calls to non-IMS capable networks.

lro-selection-profile

Binds a CSCF last route profile with the peer server.

Product

SCM

Privilege

Administrator

Syntax

```
lro-selection-profile name profile_name
```

```
no lro-selection-profile
```

```
lro-selection-profile name profile_name
```

profile_name must be an existing CSCF last route profile and be from 1 to 79 alpha and/or numeric characters.

```
no lro-selection-profile
```

Removes CSCF last route profile from the peer server group.

Usage

Use this command to identify a CSCF last route profile to use for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

Example

The following command assigns a CSCF last route profile named *lro1* to the peer server group:

```
lro-selection-profile name lro1
```

The following command removes a CSCF last route profile from the peer server group:

```
no lro-selection-profile
```

mode

Sets the peer server mode to either active or standby. By default, peer servers are in active mode.

Product

SCM

Privilege

Administrator

Syntax

```
mode { active | standby }
```

active

Defines the mode of the CSCF peer server as active.

standby

Defines the mode of the CSCF peer server as standby.

Usage

Use this command to set the peer server mode to either active or standby.

Example

The following command sets the peer server's mode to standby:

```
mode standby
```

monitor-status

Sets parameters for monitoring the status of peer servers.

Product

SCM

Privilege

Administrator

Syntax

```
monitor-status [ monitor-interval seconds ] [ monitor-message options ] [ monitor-response-timer seconds ]
```

```
no monitor-status
```

monitor-interval *seconds*

Default: 30

Specifies the interval that peer server monitoring will occur.
seconds must be an integer from 1 to 65535.

monitor-message options

Specifies that SIP message (OPTIONS) are to be sent periodically after each monitoring interval.

monitor-response-timer *seconds*

Default: 180

Specifies the interval that the CSCF will wait for responses from the peer server.
seconds must be an integer from 1 to 65535.

no

Disables peering server status monitoring.

Usage

Use this command to set parameters for monitoring the status of a peer server.

Example

The following command sets the monitoring interval to three minutes (180 seconds) and the response timer to six minutes (360 seconds):

```
monitor-status monitor-interval 180 monitor-response-timer 360
```

nw-session-template

Specifies a session template for sessions terminating from the peer server group.

Product

SCM

Privilege

Administrator

Syntax

```
nw-session-template name template-name
```

```
no nw-session-template
```

name *template-name*

template-name must be an existing session template created in the Session Template Configuration Mode.

no

Removes session template from the peer server group.

Usage

Use this command to identify a session template to use for sessions terminating from the peer server group.

Example

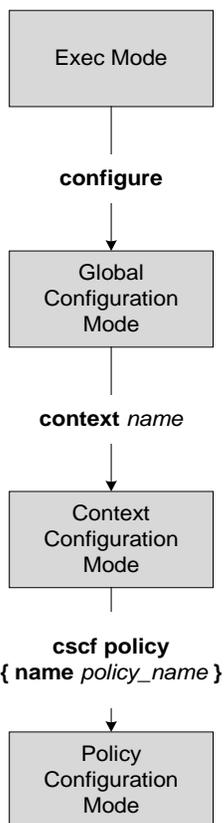

The following command identifies a session template named *template-25* to use for sessions terminating from the peer server group:

```
nw-session-template template-25
```

Chapter 74

CSCF Policy Configuration Mode Commands

The CSCF Policy Configuration Mode is used to manage AoR policy profiles within the system. User-defined profiles can be managed in this mode.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aor-policy-rules

Specifies that the newly created policy is an AoR policy and enters the AoR Policy Rules Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

aor-policy-rules

Usage

Use this command to create an AoR policy group and enter the AoR Policy Rules Configuration Mode. Entering this command results in the following prompt:

```
[context_name]hostname(config-aor-policy)#
```

AoR Policy Configuration Mode commands are defined in the *CSCF AoR Policy Rules Configuration Mode Commands* chapter.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

service-policy-rules

Specifies that the newly created policy is a service policy and enters the Service Policy Rules Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

service-policy-rules

Usage

Use this command to create a service policy group and enter the CSCF Policy Rules Configuration Mode. Entering this command results in the following prompt:

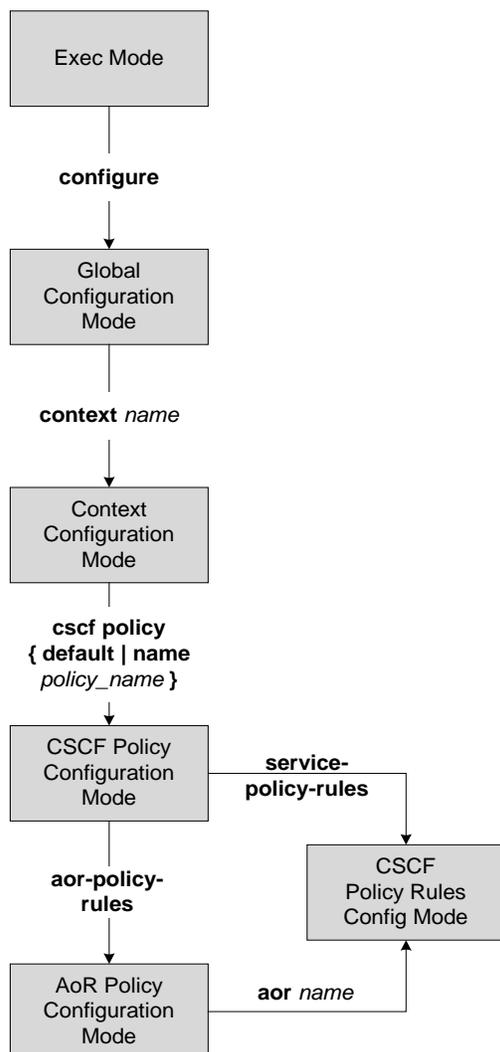

```
[context_name]hostname(config-service-policy)#
```

Service Policy Rule Configuration Mode commands are defined in the *CSCF Policy Rules Configuration Mode Commands* chapter.

Chapter 75

CSCF Policy Rules Configuration Mode Commands

The CSCF Policy Rules Configuration Mode is used to manage CSCF AoR and service policy profiles within the system.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ service-policy-rules

allow-noauth

Configures the policy to allow unauthenticated access. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] allow-noauth
```

```
default | no
```

Disables the allow-noauth functionality for this policy.

Usage

Use this command to allow access to subscribers without authenticating them.

allow-unsecure

Configures the policy to allow access to the system without a security association. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] allow-unsecure
```

```
default | no
```

Disables the allow-unsecure functionality for this policy.

Usage

Use this command to enable the policy to provide subscriber access to system without a security association.

authorization

Configures the policy to allow early bandwidth authorization. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] authorization early-bandwidth
```

default | no

Disables the early bandwidth authorization functionality for this policy.

Usage

Use this command to enable the policy to provide early bandwidth authorization.

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

enforce-codec-policy

Enters the Enforce Codec Policy Command Mode where allowed static and dynamic codec lists are managed.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] enforce-codec-policy
```

default | no

Disables the codec policy.

Usage

Use this command to enter the Enforce Codec Policy Configuration Mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-policy-enforce-codec)#
```

CSCF Enforce Codec Policy Mode commands are defined in the *Enforce Codec Policy Configuration Mode Commands* chapter in this guide.

■ exit

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

max-cscf-concurrent-sessions

Configures the maximum number of concurrent sessions allowed per subscriber.

Product

SCM

Privilege

Administrator

Syntax

```
max-cscf-concurrent-sessions number
```

```
default max-cscf-concurrent-sessions
```

number

Default: 5

Specifies the number of concurrent sessions allowed per subscriber for this policy. *number* must be an integer from 1 to 100.

default

Resets defaults for this command.

Usage

Use this command to set the maximum number of allowed sessions per subscriber for this policy.

If enabled, the **subscriber-policy-override** command in the CSCF Service Configuration Mode overrides the service-level policy.

Example

The following command sets the maximum number of concurrent sessions for a subscriber using this policy to 7:

```
max-cscf-concurrent-sessions 7
```

policy

Configures the overload response for this policy. When the P-CSCF/A-BG becomes congested, this overload policy is used to reject subsequent sessions or redirect them to another server.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
policy overload { redirect address1 [ weight weight1 ] [ address2 [ weight
weight2 ] ] ... | reject [ use-reject-code { admin-prohibited | insufficient-
resources } ] }
```

```
default policy overload
```

```
no policy overload redirect address1[address2] ...
```

```
redirect address1 [ weight weight1 ] [ address2 [ weight weight2 ] ] ...
```

Specifies that upon policy overload, the system will redirect the session to another CSCF.
address1 must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
weight weight1: Defines the priority of the redirect address.
weight1 must be an integer from 1 to 10. Default is 1.

```
reject [ use-reject-code { admin-prohibited | insufficient-resources } ]
```

Specifies that upon policy overload, the system will reject the session. This is the default setting.
use-reject-code: Specifies that a reject code will be returned upon policy overload.
 • **admin-prohibited**: Specifies that the “admin-prohibited” reject code will be returned upon policy overload.
 • **insufficient-resources**: Specifies that the “insufficient resources” reject code will be returned upon policy overload. This is the default reject code.

```
default policy overload
```

Resets defaults for this command.

```
no policy overload redirect address1 [ address2 ] ...
```

Removes configured policy overload redirect address(es).

Usage

Use this command to define the response to an overload condition on the P-CSCF/A-BG using this AoR policy.

Example

The following command configures the policy overload response to redirect to a series of CSCFs with IP address of 1.2.3.4, 1.2.3.5, and 1.2.3.6 with respective priorities (weights) of 1, 3, and 2:

```
policy overload redirect 1.2.3.4 weight 1 1.2.3.5 weight 3 1.2.3.6 weight  
2
```

qos

Configures QoS bandwidth settings for uplink and downlink.

Product

SCM

Privilege

Administrator

Syntax

```
qos bandwidth { downlink| uplink } [ peak value ]
```

```
bandwidth { downlink| uplink }
```

downlink: Configures the downlink bandwidth.

uplink: Configures the uplink bandwidth.

```
peak value
```

Peak value of bandwidth in kilobits per second (kbit/s).

value must be an integer from 1 to 99999999.

Usage

The P-CSCF/A-BG fills the required bandwidth for downlink and uplink from the Session Description Protocol (SDP) in the message when communicating with an external policy server via Rx/Tx/Gq. Use this command to configure the peak uplink and downlink bandwidth to be used when the SDP does not contain bandwidth.

Example

Set the peak uplink bandwidth to 256 kbit/s:

```
qos bandwidth uplink peak 256
```

video-sessions

Configures the policy to allow video bearers. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] video-sessions
```

default | no

Disables the “allow video sessions” feature.

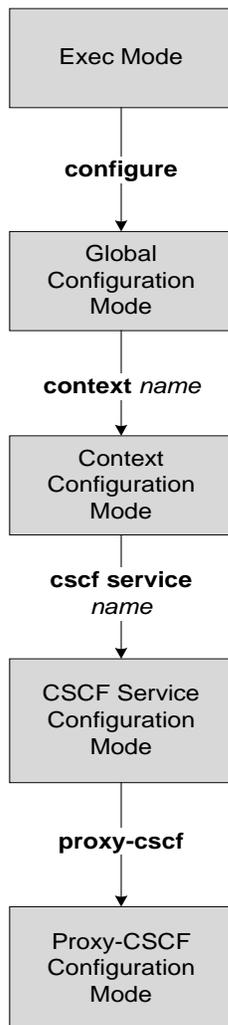

Usage

Use this command to allow video session via this policy.

Chapter 76

CSCF Proxy-CSCF Configuration Mode Commands

The Proxy-CSCF Configuration Mode is used to enable Diameter policy control within the service.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

allow

Enables the function to allow IMS interworking with RFC3261 SIP User Agents.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] allow rfc3261-ua-interworking
```

no

Disables the interworking capability.

Usage

Use this command to enable the P-CSCF/A-BG to allow IMS interworking with RFC3261 SIP User Agents.

authorization

Enables P-CSCF to authorize calls for all supported media types; both video and non-video calls will be authorized using external PCRF via Rx. Default is enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] authorization non-video
```

no

Disables external media authorization for non-video calls through Rx interface. Non-video calls will not be authorized through external PCRF.

If disabled,

- P-CSCF will send AAR only for “video” media.
- If the VOIP call is only for audio, then no AAR is sent.
- If the VOIP call includes audio and video, P-CSCF authorizes for “video” media by sending video information alone in AAR.

Usage

As Per 3GPP 29.214V8.5, P-CSCF will authorize VOIP calls for all supported media types. The P-CSCF sends all media information for all supported media types present in SDP in AAR message to PCRF via Rx. Use this command to authorize only the video calls.

diameter

This command:

- configures the Diameter dictionary used in this function.
- configures the policy control origin endpoint used in this function.
- enables the selection of a Diameter policy control peer server providing Rx/Tx/Gq applications for this service.
- configures the Diameter requested timeout value used in this function.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
diameter location-info { dictionary { e2custom01 | e2custom02 | e2custom03 |
e2custom04 | e2custom05 | e2custom06 | e2custom07 | e2custom08 | e2custom09 |
e2standard } | origin endpoint endpoint_name | peer-select peer peer_name [
peer-realm realm_name ] [ secondary-peer peer_name [ sec-peer-realm realm_name ]
] | request-timeout sec}
```

```
diameter policy-control { dictionary { Gq-custom | Gq-standard | Rq-custom | Rx-
rel8 | Rx-standard | Tx-standard | custom01 | custom02 | custom03 | custom04 |
custom05 | custom06 | custom07 | custom08 | custom09 } | origin endpoint
endpoint_name | peer-select peer peer_name [ peer-realm realm_name ] [
secondary-peer peer_name [ sec-peer-realm realm_name ] ] | request-timeout sec }
```

```
default diameter { location-info | policy-control } { dictionary | request-
timeout }
```

```
no diameter { location-info | policy-control } [ origin endpoint | peer-select ]
```

location-info

Defines the E2 interface for location information.

dictionary { e2custom01...e2custom09 | e2standard }

custom01...custom09: Specifies that a customer-specific (custom) dictionary is to be used for expansion and behaviors.

e2standard: Specifies that the E2-Standard-Dictionary is to be used.

Important: If this keyword is not configured, the system defaults to the default dictionary (e2standard). In the Proxy-CSCF configuration, at any time, the location-info dictionary can either be an explicitly configured dictionary or the default dictionary. Hence, there is no corresponding “no” CLI to disable the location-info dictionary setting.

policy-control

Defines external policy control.

dictionary { **Gq-custom** | **Gq-standard** | **Rq-custom** | **Rx-rel8** | **Rx-standard** | **Tx-standard** | **custom01...custom09** }

Gq-custom: Specifies that the Gq Operax dictionary is to be used.

Gq-standard: Specifies that the Gq standard dictionary is to be used.

Rq-custom: Specifies that the Rq custom dictionary is to be used.

Rx-rel8: Specifies that the Rx Release 8 dictionary is to be used.

Rx-standard: Specifies that the Rx standard dictionary is to be used.

Tx-standard: Specifies that the Tx standard dictionary is to be used.

custom01...custom09: Specifies that a customer-specific (custom) dictionary is to be used.

origin endpoint *endpoint_name*

Specifies the Diameter location-info or policy control endpoint name.

endpoint_name must be the endpoint's name and an alpha and/or numeric string of 1 through 63 characters in length.

peer-select peer *peer_name*

Specifies the name of the Diameter location-info or policy control peer server.

peer_name must be from 1 to 63 alpha and/or numeric characters in length.

Diameter peer servers are configured through the **diameter endpoint** command in the Context Configuration Mode. The **diameter endpoint** command is a generic command and can be found in the Cisco ASR 5000 Series Command Line Interface Reference.

peer-realm *realm_name*

Specifies the realm name for which the Diameter location-info or policy control peer server has responsibility.

realm_name must be from 1 to 63 alpha and/or numeric characters in length.

Important: If this keyword is not configured, the system defaults to the realm name configured for the selected peer server.

secondary-peer *peer_name*

Specifies the name of the secondary Diameter location-info or policy control peer server.

peer_name must be from 1 to 63 alpha and/or numeric characters in length.

sec-peer-realm *realm_name*

Specifies the realm name for which the secondary Diameter location-info or policy control peer server has responsibility.

realm_name must be from 1 to 63 alpha and/or numeric characters in length.

Important: If this keyword is not configured, the system defaults to the realm name configured for the selected peer server.

Important: The “`diameter location-info peer-select peer <primary_peer> peer-realm <primary_peer_realm> secondary-peer <secondary_peer> sec-peer-realm <secondary_peer_realm>`” CLI configures Peer Switching—selecting which peers the Diameter messages are routed to. When the secondary peer is configured, in case the primary fails, request messages are rerouted to the secondary. Note that the “`no diameter location-info peer-select`” CLI command will remove the entire Peer Switching CLI from the configuration.

```
request-timeout sec
```

Specifies the Diameter location-info or policy control requested timeout value in seconds.

sec must be an integer from 1 to 300.

Default: 10

Important: If this keyword is not configured, the system defaults to the default setting (10 seconds). In the Proxy-CSCF configuration, at any time, the request-timeout setting can either be an explicitly configured value or the default value. Hence, there is no corresponding “no” CLI to disable the request-timeout setting.

```
default diameter { location-info | policy-control } { dictionary | request-timeout }
```

Sets the Diameter’s location-info or policy control dictionary or requested timeout value as the default.

```
no diameter { location-info | policy-control } [ origin endpoint | peer-select ]
```

Removes the Diameter location-info or policy control origin endpoint or Diameter peer from the service.

Usage

Use this command to:

- define the Diameter dictionary to use for the service.
 - specify the Diameter origin endpoint.
 - specify a Diameter location-info or policy control peer server to support Rx/Tx/Gq applications.
 - specify the Diameter requested timeout value for this service.
-

Example

The following command configures the system to use the Tx standard Diameter dictionary for this service:

```
diameter policy-control dictionary Tx-standard
```

The following command sets the Diameter location-info origin endpoint to *test*:

```
diameter location-info origin endpoint test
```

The following command selects a Diameter policy control peer server with a name of *diam-2* and a realm name of *realm-6*:

```
diameter policy-control peer-select peer diam-2 peer-realm realm-6
```

emergency

Configures the function to allow or disallow the emergency-session or emergency-registration of a particular type.

Product

SCM (P-CSCF, A-BG, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] emergency { registration [ visited-ue ] | session [ 3gpp-ims-xml-body | anonymous | non-emergency-registered | 3 sdp-cs-media | visited-ue ]
```

default

Specifies that the emergency-session or emergency-registration of a particular type can be allowed.

no

Disallows the emergency-session or emergency-registration of a particular type.

registration

Allow emergency-registration. By default, it's allowed.

visited-ue: Allow emergency-registration from a visited UE. By default, it's allowed.

session

Specifies the type of emergency-session to be allowed or disallowed. By default, all are allowed.

3gpp-ims-xml-body: Allow 3GPP IM CN XML body to be added in 380 response messages.

anonymous: Allow anonymous subscribers (unregistered UEs) to initiate emergency sessions.

non-emergency-registered: Allow non-emergency registered subscribers to initiate emergency sessions.

sdp-cs-media: Allow emergency calls with SDP CS Media.

visited-ue: Allow emergency calls from visited UE.

Usage

Use this command to configure the function to allow or disallow the emergency-session or emergency-registration of a particular type.

Example

The following command configures the function to allow non-emergency registered subscribers to initiate emergency sessions:

```
emergency session non-emergency-registered
```

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

interrogating-cscf-role

Enables the function to also perform as an Interrogating-CSCF.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] interrogating-cscf-role
```

no

Disables the Interrogating-CSCF role in this function.

Usage

Use this command to enable the P-CSCF/A-BG to also perform as an Interrogating-CSCF.

Important: All Interrogating-CSCF functions have been moved to the Serving-CSCF exclusively in v10.0 and beyond.

message-max-size

Configures the maximum message body size in MESSAGE method.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
message-max-size limit
```

```
[ default | no ] message-max-size
```

limit

Default: 1024

Configures the maximum SIP message size limit in bytes for any SIP message buffer.

limit must be an integer from 512 to 65535.

Important: Message body size should be less than the max-sipmsg-size set in the CSCF Service Configuration Mode.

```
default | no
```

Returns/sets the maximum SIP message size to 1024 bytes.

Usage

Use this command to configure the maximum SIP message size for any SIP message buffer.

Example

The following command limits the SIP message size to 4000 bytes:

```
message-max-size 4000
```

network-id

Configures the Network Identifier.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] network-id id
```

id

The Network Identifier of the entity.

id must be from 1 to 79 alpha and/or numeric characters in length.

no

Removes the configured Network Identifier of the entity.

Usage

The Network Identifier is used by the P-CSCF or A-BG to fill the P-Visited-Network-ID header.

Example

Sets the Network Identifier to *pcscf01.company.com*:

```
network-id pcscf01.company.com
```

peer-sbc

Configures peer Session Border Controller (SBC) addresses from where the P-CSCF/A-BG service can receive requests.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] peer-sbc ip_address
```

ip_address

Specifies the IP address of a peer SBC for this P-CSCF/A-BG service.

ip_address is expressed in standard dotted decimal notation for IPv4 or colon notation for IPv6.

no

Removes the IP address of a peer SBC from this P-CSCF/A-BG service.

Usage

Use this command to specify peer Session Border Controller (SBC) addresses from where the P-CSCF/A-BG service can receive requests.

Important: This command must be entered multiple times if more than one SBC is present.

Example

The following commands identify three peer SBCs for a single P-CSCF/A-BG service:

```
peer-sbc 200.6.2.3
```

```
peer-sbc 200.6.2.10
```

```
peer-sbc 200.6.2.11
```

The following command removes the peer SBC with IP address *200.6.2.10* from the P-CSCF/A-BG service:

```
no peer-sbc 200.6.2.10
```

plmn-id

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
plmn-id mcc code mnc code
```

```
no plmn-id
```

```
mcc code
```

Specifies the Mobile Country Code for the mobile access network. *code* must be a three-digit integer from 200 to 999.

```
mnc code
```

Specifies the Mobile Network Code for the mobile access network. *code* must be a two or three-digit integer from 00 to 999.

```
no plmn-id
```

Removes the access network configuration for this P-CSCF/A-BG service.

Usage

Use this command to help match location specific emergency/service numbers when configuring translations. The **mcc** and **mnc** values are compared against those received in p-access-network-info headers as per 3GPP TS 24.229. If **mnc** is not provided in the criteria only **mcc** is compared.

Example

The following command identifies the mobile network with a MCC of *123* and a MNC of *12*:

```
plmn-id mcc 123 mnc 12
```

reg-preloaded-route

Enables the function to use the preloaded-route-headers received in REGISTER for routing at P-CSCF.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ default | no ] reg-preloaded-route
```

default

Disables the ability to use preloaded-route-headers for routing REGISTER.

no

Disables the ability to use preloaded-route-headers for routing REGISTER.

Usage

Use this command to enable or disable usage of preloaded-route-headers for routing REGISTER.

reg-service-route

Enables the function to use service routes when routing re-registrations.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

[no] **reg-service-route**

no

Disables the ability to use service routes for re-registration.

Usage

Use this command to enable the P-CSCF/A-BG service to use service routes when routing re-registrations.

reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
reliable-prov-resp { mandatory | optional }
```

```
[ no ] reliable-prov-resp
```

mandatory | **optional**

mandatory: Both inbound and outbound will request reliability.

optional(default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

no

Disables the reliability of provisional responses feature.

Usage

Use this command to enable/disable the reliability of provisional responses feature.

Example

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

The following command disables the reliability of provisional responses feature:

```
no reliable-prov-resp
```

restoration-procedure

Enables the P-CSCF/A-BG service to reject with a 504 response when it receives 3xx, 480, or “no response” to service request. This feature is disabled by default.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] restoration-procedure
```

no

Disables restoration procedure on the P-CSCF/A-BG service.

Usage

Restoration procedure is intended to handle unreachability of service-route header content. Enabling this command allows the P-CSCF/A-BG service to reject with a 504 response when it receives 3xx, 480, or “no response” to service request.

Example

Enables restoration procedure on the P-CSCF/A-BG service:

```
restoration-procedure
```

Disables restoration procedure on the P-CSCF/A-BG service:

```
no restoration-procedure
```

security-parameters

Enters the Security Configuration Mode in which Denial of Service (DOS) prevention commands can be configured.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

security-parameters

Usage

Use this command to enter the Security Configuration Mode.

Entering this command results in the following prompt:

```
[context_name]hostname(config-security-parameters)#
```

Security Configuration Mode commands are defined in the *CSCF Security Configuration Mode Commands* chapter in this guide.

sigcomp

Enables signaling compression for the P-CSCF/A-BG service and enters the Signaling Compression Configuration Mode.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sigcomp
```

```
no
```

Disables signaling compression for the P-CSCF/A-BG service.

Usage

Use this command to enable signaling compression for the P-CSCF/A-BG service and enter the CSCF Signaling Compression Configuration Mode.

Entering this command results in the following prompt:

```
[ context_name ] hostname (config-sigcomp) #
```

Signaling Compression Configuration Mode commands are defined in the *CSCF Signaling Compression Configuration Mode Commands* chapter in this guide.

sip-header

Enable SIP P-Access-Network-Info (PANI) or P-User-Database (PUD) header insertion for the P-CSCF/A-BG service.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sip-header insert { p-access-network-info | p-user-database }
```

p-access-network-info

Inserts PANI header in received request/response.

p-user-database

Inserts PUD header in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

no

Disables SIP PANI or PUD header insertion for the P-CSCF/A-BG service.

Usage

Enabling this command allows PANI header insertion in received requests/responses on the P-CSCF or A-BG. In addition, it allows PUD header insertion in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

Important: Use the **access-type** command to configure a ue-ip-address-range per access type. CSCF Service Configuration Mode commands are defined in the *CSCF Service Configuration Mode Commands* chapter in this guide.

sip-param

Enable the addition of “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] sip-param insert integrity-protected
```

no

Disables the addition of “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message for the P-CSCF/A-BG service.

Usage

Enabling this command allows the P-CSCF or A-BG to add the “integrity-protected” parameter in the authorization header of a SIP (REGISTER) message. The parameter will be used by the S-CSCF to decide which authentication mode to use to authenticate the user.

Example

Enables the addition of **integrity-protected** parameter:

```
sip-param insert integrity-protected
```

Disables the addition of **integrity-protected** parameter:

```
no sip-param insert integrity-protected
```

store-session-path

Enables the P-CSCF or A-BG to store and process the session path information, which includes the Route list, Record-Route list, Service-Route list, and ViaList.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] store-session-path
```

no

Disables the storing of session path information by the P-CSCF or A-BG. In addition, the P-CSCF/A-BG will not overwrite the Route list, Record-Route list, Service-Route list, or ViaList in the in-dialog request and responses.

Usage

Enabling this command allows the P-CSCF or A-BG to store and process the session path information.

Example

Enables the storage and processing of session path information:

```
store-session-path
```

Disables the storage and processing of session path information:

```
no store-session-path
```

subscribe

Enables subscription to signalling bearer loss via PCRF.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] subscribe signaling-bearer-loss
```

no

Disables subscription to signalling bearer loss via PCRF.

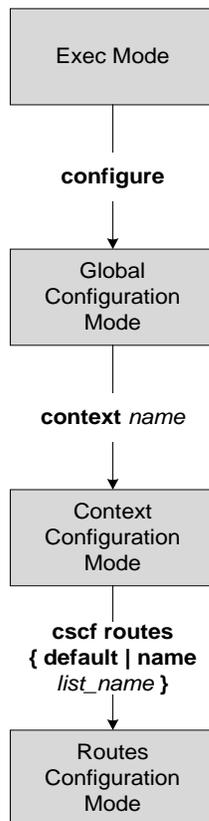

Usage

Use this command to enable or disable subscription to signalling bearer loss via PCRF.

Chapter 77

CSCF Routes Configuration Mode Commands

The CSCF Routes Configuration Mode is used to configure session forwarding within the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF route entry at the bottom or end of the route list. Use this command in conjunction with the **route** command.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

after

Usage

Add this command before the **route** command to place the entry at the end of the route list.

before

Places the CSCF route entry at the top or beginning of the route list. Use this command in conjunction with the **route** command.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

before

Usage

Add this command before the **route** command to place the entry at the beginning of the route list.

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

route

Configure the routing parameters for the context.

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
route { domain name | local { icscf | pcscf | scscf } | nexthop-address address
| peer-servers group_name | vpn name } [ [ mod-req-uri ] base-criteria criteria
[ filter-criterial criteria ] [ filter-criteria2 criteria ] ] [ log ]
```

```
no route { domain name | local { icscf | pcscf | scscf } | nexthop-address
address | peer-servers group_name | vpn name } base-criteria criteria [ filter-
criterial criteria ] [ filter-criteria2 criteria ]
```

domain name

Specifies a valid next-hop domain name. *name* must be from 1 to 79 alpha and/or numeric characters in length.

local { icscf | pcscf | scscf }

Specifies a local interrogating, serving, or proxy call/session control function to which all calls processed by the context will be routed.

nexthop-address ip_address

Specifies a next-hop address.

ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

peer-servers group_name

Specifies a configured peer server group.

group_name must be the name of a configured peer server group on this system.

vpn name

Specifies a configured VPN context on the system.

name must be a configured context name.

mod-req-uri

Specifies that a route lookup should be performed and the request URI modified.

base-criteria criteria

Specifies the base criteria that packets will be compared against. The following criteria is supported:

- **access-type type**: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:

- **3gpp-geran**: 3GPP Access Type
- **3gpp-utran-fdd**: 3GPP Access Type
- **3gpp-utran-tdd**: 3GPP Access type
- **3gpp2-1x**: 3GPP2 Access Type
- **3gpp2-1x-hrpd**: 3GPP2 Access Type
- **3gpp2-umb**: 3GPP2-UMB
- **ads1**: FixedLine Access Type
- **ads12**: FixedLine Access Type
- **ads12p**: FixedLine Access Type ADSL2+
- **docsis**: DOCSIS
- **gshdsl**: Fixed Line Access Type G.SHDSL
- **hds1**: Fixed Line Access Type
- **hds12**: Fixed Line Access Type
- **ids1**: Fixed Line Access Type
- **ieee-80211**: WLAN Access Type
- **ieee-80211a**: WLAN Access Type
- **ieee-80211b**: WLAN Access Type
- **ieee-80211g**: WLAN Access Type
- **ieee-80216e**: Wireless MAN Access Type
- **radsl**: Fixed Line Access Type
- **sds1**: Fixed Line Access Type
- **vdsl**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id name**: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor aor**: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address ip_address**: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor aor**: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:

- **day-of-month** *day*: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week** *day*: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
- **start** *date/time* [**end** *date/time*]: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats:
 YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

filter-criteria1 *criteria*

Specifies the filter criteria that packets that have passed the base criteria will be compared against. The following criteria is supported:

- **access-type** *type*: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
 - **3gpp-geran**: 3GPP Access Type
 - **3gpp-utran-fdd**: 3GPP Access Type
 - **3gpp-utran-tdd**: 3GPP Access type
 - **3gpp2-1x**: 3GPP2 Access Type
 - **3gpp2-1x-hrpd**: 3GPP2 Access Type
 - **3gpp2-umb**: 3GPP2-UMB
 - **ads1**: FixedLine Access Type
 - **ads12**: FixedLine Access Type
 - **ads12p**: FixedLine Access Type ADSL2+
 - **docsis**: DOCSIS
 - **gshdsl**: Fixed Line Access Type G.SHDSL
 - **hds1**: Fixed Line Access Type
 - **hds12**: Fixed Line Access Type
 - **ids1**: Fixed Line Access Type
 - **ieee-80211**: WLAN Access Type
 - **ieee-80211a**: WLAN Access Type
 - **ieee-80211b**: WLAN Access Type
 - **ieee-80211g**: WLAN Access Type
 - **ieee-80216e**: Wireless MAN Access Type
 - **rads1**: Fixed Line Access Type

- **sds1**: Fixed Line Access Type
- **vds1**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id name**: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor aor**: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address ip_address**: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor aor**: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:
- **day-of-month day**: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
- **day-of-week day**: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.
- **start date/time [end date/time]**: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month week**: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

filter-criteria2 criteria

Specifies the filter criteria that packets that have passed the base criteria and filter-criteria1 will be compared against. The following criteria is supported:

- **access-type type**: Filters sessions based on a specific access-type used by the subscriber. Possible access types are:
 - **3gpp-geran**: 3GPP Access Type
 - **3gpp-utran-fdd**: 3GPP Access Type
 - **3gpp-utran-tdd**: 3GPP Access type
 - **3gpp2-1x**: 3GPP2 Access Type

- **3gpp2-1x-hrpd**: 3GPP2 Access Type
- **3gpp2-umb**: 3GPP2-UMB
- **ads1**: FixedLine Access Type
- **ads12**: FixedLine Access Type
- **ads12p**: FixedLine Access Type ADSL2+
- **docsis**: DOCSIS
- **gshdsl**: Fixed Line Access Type G.SHDSL
- **hds1**: Fixed Line Access Type
- **hds12**: Fixed Line Access Type
- **ids1**: Fixed Line Access Type
- **ieee-80211**: WLAN Access Type
- **ieee-80211a**: WLAN Access Type
- **ieee-80211b**: WLAN Access Type
- **ieee-80211g**: WLAN Access Type
- **ieee-80216e**: Wireless MAN Access Type
- **rads1**: Fixed Line Access Type
- **sds1**: Fixed Line Access Type
- **vds1**: Fixed Line Access Type
- **any**: Filters all CSCF sessions.
- **carrier-id name**: Filters sessions based on the carrier's ID. *name* must be from 1 to 79 alpha and/or numeric characters in length.
- **destination aor aor**: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: The destination aor and carried-id criteria cannot occur in the same route rule.

- **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be a two or three-digit integer from 00 to 999.
- **source address ip_address**: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor aor**: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.
- **time-of-day**: Filters sessions based on the time of the day. Additional filter criteria for **time-of-day** is as follows:
 - **day-of-month day**: Filters session based on the day of the month. *day* must be an integer from 1 to 31.
 - **day-of-week day**: Filters session based on the day of the week. *day* must be an integer from 1 to 7 with 1 signifying Sunday and 7 signifying Saturday.

- **start** *date/time* [**end** *date/time*]: Filters sessions based on a start time to, optionally, an end time during the day. *date/time* must be integers in either of the following formats: YYYY:MM:DD:HH:mm or YYYY:MM:DD:mm:ss. YYYY: year range 2005 to 2099 MM: months (integer range 1 to 12) DD: days (integer range 1 to 31) HH: hours (integer range 0 to 23) mm: minutes (integer range 0 to 59) ss: seconds (integer range 0 to 59)
- **week-of-month** *week*: Filters sessions based on the week of the month. *week* must be an integer from 1 to 5.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

log

Enables logging for CSCF sessions meeting the criteria specified in the ACL. The logs can be viewed by executing the **logging filter active facility cscf-acl-log** command in the Exec mode.

```
no route { domain name | local { icscf | pcscf | scscf } | nexthop-
address address | peer-servers group_name | vpn name } base-criteria
criteria [ filter-criterial criteria ] [ filter-criteria2 criteria ]
```

Removes the specified routing parameters for the CSCF service.

Usage

Use this command to configure routing parameters for the service.

Important: Use the **before** or **after** command to place the route entry in the route list.

Example

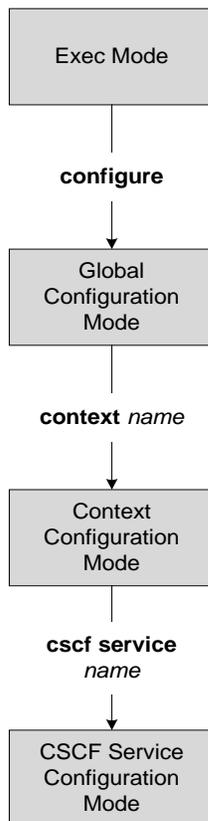

The following command is placed at the end of the route list and routes sessions to a peer server group named *icscf_peer5*, filters sessions with a base criteria of the source address (1.2.3.4) and a filter criteria of the destination AoR (*\$.@test.com*):

```
after route peer-servers icscf_peer5 base-criteria source address 1.2.3.4
filter-criterial destination aor $.@test.com
```

Chapter 78

CSCF Service Configuration Mode Commands

The CSCF Service Configuration Mode is used to create and manage CSCF services within the current context.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-service

Configures the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses. The access service lets the core service know where a packet needs to be routed.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
access-service name name
```

```
no access-service [ name name ]
```

name *name*

Specifies the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses.

name must be from 1 to 63 alpha and/or numeric characters.

Important: This command should only be issued in the core service configuration, however, multiple access services may be configured per core service.

no

Removes the access service.

Usage

Use this command to identify the name of the P-CSCF/A-BG access service from which the system receives requests and sends responses from/to the UEs. This command is used in systems that deploy two P-CSCF/A-BG services in bridging (Back-to-Back User Agent) mode configurations where an access service P-CSCF/A-BG faces the UE network and a core P-CSCF/A-BG faces the public network.

Example

The following command identifies the P-CSCF/A-BG access service named to the CSCF/A-BG core service:

```
access-service name HA3
```

access-type

Specifies the access types for IMS core.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
access-type { type } access-profile { default | name access_profile_name } | ue-
ip-address-range name ue_ip_name { address ip_address_mask | range
start_ip_address end_ip_address }
```

```
no access-type { type } [ access-profile | ue-ip-address-range [ name ue_ip_name
] ]
```

```
access-type { type }
```

```
3gpp-e-utran-fdd: 3GPP Access Type
```

```
3gpp-e-utran-tdd: 3GPP Access Type
```

```
3gpp-geran: 3GPP Access Type
```

```
3gpp-utran-fdd: 3GPP Access Type
```

```
3gpp-utran-tdd: 3GPP Access type
```

```
3gpp2-1x: 3GPP2 Access Type
```

```
3gpp2-1x-hrpd: 3GPP2 Access Type
```

```
3gpp2-umb: 3GPP2-UMB
```

```
ads1: FixedLine Access Type
```

```
ads12: FixedLine Access Type
```

```
ads12p: FixedLine Access Type ADSL2+
```

```
docsis: DOCSIS
```

```
gshdsl: FixedLine Access Type G.SHDSL
```

```
hds1: FixedLine Access Type
```

```
hds12: FixedLine Access Type
```

```

```

ieee-8023j: Ethernet Access Type
ieee-8023u: Ethernet Access Type
ieee-8023y: Ethernet Access Type
ieee-8023z: Ethernet Access Type
rads1: FixedLine Access Type
sds1: FixedLine Access Type
vds1: FixedLine Access Type

access-profile { **default** | **name** *access_profile_name* }

Associates an access type with a CSCF access profile. Different access types can refer to the same access profile.

ue-ip-address-range **name** *ue_ip_name* { **address** *ip_address_mask* | **range** *start_ip_address end_ip_address* }

Configures UE IP address/range for a specific access type.

ue_ip_name must be from 1 to 79 alpha and/or numeric characters.

address *ip_address_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific access-type applies to. *ip_address_mask* must be specified using the form “IP Address/Mask Bits” where the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.

range *start_ip_address end_ip_address*: Configure UE IP range for specific access-type.

- *start_ip_address* specifies the beginning of the range of addresses.
- *end_ip_address* specifies the end of the range of addresses.
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

no access-type { **type** } [**access-profile** | **ue-ip-address-range** [**name** *ue_ip_name*]]

Removes the specified access type from a CSCF access profile or UE IP address/range.

Usage

Use this command to associated the access types for a specified CSCF access profile or UE IP address/range name.

Important: Use the **sip-header** command to enable SIP P-Access-Network-Info (PANI) header insertion. CSCF Proxy-CSCF Configuration Mode commands are defined in the *CSCF Proxy-CSCF Configuration Mode Commands* chapter in this guide.

Example

The following command identifies the access type *ads1* and assigns it to access profile *ap1*:

```
access-type ads1 access-profile name ap1
```

allow-dereg

Allows the CSCF to send de-registration requests. Feature is disabled by default.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] allow-dereg
```

no

Disables the feature.

Usage

Use this command to allow the CSCF service to send de-registration requests.

If the UE stops sending keepalive packets, which ends the connection between the UE and the proxy, UE information is cleared from the Proxy-CSCF (P-CSCF) or Access Border Gateway (A-BG). If de-registration requests are enabled, any UE-related information that is shared with the Serving-CSCF (S-CSCF) will also be cleared.

bind

Binds the CSCF service to a logical IP interface and specifies the maximum number of sessions that can access this service over the specified interface.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
bind address ip_address [ access-ipsec-crypto-template template ] [ cscf-hostname host_name ] [ max-sessions max# ] [ port number ] [ reserved-call-capacity percentage ] [ transport tcp ] [ use-serviceport-towards-network ]
```

```
no bind address
```

address *ip_address*

Specifies the IP address of the interface to which the service is being bound.

ip_address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

access-ipsec-crypto-template *template*

Specifies the name of an existing IPsec CSCF crypto template to be used for accessing CSCF service by user equipment. Valid only for P-CSCF or A-BG.

template must be an existing IPsec CSCF crypto template and be from 1 to 127 alpha and/or numeric characters.

Important: The IPsec CSCF crypto template should be configured in the same context in which the P-CSCF is configured.

cscf-hostname *host_name*

Specifies the local host name of the CSCF service.

host_name must be an existing CSCF service name and be from 1 to 127 alpha and/or numeric characters.

Configuring this keyword associates the CSCF service with the AOR domain configured in the **default-aor-domain** command and uses the domain name in SIP headers.

Important: If this keyword is not configured, SIP headers will contain the IP address of the CSCF service instead of the domain name.

max-sessions *max#*

Default: 500,000

Specifies the maximum number of sessions managed by this service on this interface.

max# must be configured to any integer value from 0 to 500,000.

 **Important:** The total session capacity of the system is 500,000. **max-sessions** is also limited by the capacity in the license generated for the service. If licenses for PDSN/GGSN/HA are generated for *x* number of sessions, then the license for the CSCF service will be generated at 500,000-*x*. Hardware configuration and installed features can also affect the maximum number of sessions that can be supported.

port *number*

Default: 5060

Specifies the UDP port number.

number must be an integer value from 1 to 65534.

reserved-call-capacity *percentage*

Default: 10

Specifies the call capacity percentage per session manager (sessmgr).

percentage must be an integer value from 1 to 50.

transport **tcp**

Enables TCP transport for the address.

use-serviceport-towards-network

Enables use of service port for sending and receiving UDP messages from network elements.

no bind **address**

Removes the binding of the service to a specified interface.

Usage

Use this command to associated the service with a specific logical IP address. This command also configures the identity of the CSCF in SIP headers as either the domain name of the CSCF service or the IP address.

 **Important:** Multiple keywords can be used per bind command.

Example

The following command binds the CSCF service to a logical interface with an IP address of *1.2.3.4* and sets the maximum number of supported sessions for this interface at *250000*:

```
bind address 1.2.3.4 max-sessions 250000
```

charging

Enables Rf charging in this CSCF service for SIP messages.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] charging
```

default

Disables Rf charging in this CSCF service for SIP messages.

no

Disables Rf charging for this service.

Usage

Use this command to enable the RF charging feature in this service and enter the CSCF Charging Configuration Mode.

Entering this command results in the following prompt:

```
[ context_name ] hostname (config-cscf-charging) #
```

CSCF Charging Configuration Mode commands are defined in the *CSCF Charging Configuration Mode Commands* chapter in this guide.

cnsa-media-profile

Configures the media profile id to be set for a previously created service policy.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] cnsa-media-profile profile_id cscf-service-policy policy_name content-
type { application-3gpp-ims-xml | application-pidf-diff-xml | application-pidf-
partial-xml | application-pidf-xml | application-reginfo-xml | application-sdp |
application-xml | message-sipfrag | multipart-mixed | multipart-related | text-
plain }
```

no

Removes the media profile from the service policy.

cnsa-media-profile *profile_id*

Specifies the media profile id.

profile_id must be an integer from 0 to 10 and be an existing media profile id in the system. CNSA media profile ids are created and maintained in the CSCF ISC Template Configuration Mode.

cscf-service-policy *policy_name*

Assigns the media profile id to a service policy.

policy_name must be from 1 to 63 alpha and/or numeric characters and be an existing policy name in the system. Service policies are created and maintained in the CSCF Policy Configuration Mode.

```
content-type { application-3gpp-ims-xml | application-pidf-diff-xml |
application-pidf-partial-xml | application-pidf-xml | application-
reginfo-xml | application-sdp | application-xml | message-sipfrag |
multipart-mixed | multipart-related | text-plain }
```

Specifies the content type(s).

application-3gpp-ims-xml - format for exchanging information in SIP Requests and Responses as used within the 3GPP IM CN Subsystem

application-pidf-diff-xml - contains changed presence elements. Contains full presence document when there are many changes

application-pidf-partial-xml - contains only changed parts of PIDF-based presence information

application-pidf-xml - XML MIME entity that contains presence information

application-reginfo-xml - used in Notifications to SIP user agents about registration expiry

application-sdp - SDP session description

application-xml - content type for generic xml documents

message-sipfrag - contains subsets of well formed SIP messages

multipart-mixed - intended for use when the body parts are independent and need to be bundled in a particular order

multipart-related - intended for compound objects consisting of several inter-related body parts

text-plain - plain text

Important: You may specify multiple types of content.

Usage

Use this command to assign a media profile id to a service policy. The policies defined in the service policy apply to all subscribers using this service.

CNSA media profile ids are created and maintained in the CSCF ISC Template Configuration Mode. Service policies are created and maintained in the CSCF Policy Configuration Mode.

Example

The following command defines the media profile id as *2* and assigns it to *serv_policy3* with plain text content type.

```
cnsa-media-profile 2 cscf-service-policy serv_policy3 content-type text-plain
```

core-service

Configures a core service if:

- CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for Network Address Translation (NAT)

By default, no core-service name will be present.

Product

SCM (CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] core-service name service_name
```

no

Removes the core service.

core-service name *service_name*

Specifies the name of the core service.

service_name must be from 1 to 80 alpha and/or numeric characters.

Usage

Use this command to assign a core service to the CSCF/A-BG service.

Example

The following command identifies the core service:

```
core-service name servicel
```

default-aor-domain

Configures the domain name of the service.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] default-aor-domain alias
```

no

Removes the domain name from the service.

default-aor-domain *alias*

Specifies the domain name for the service.

alias is the name of the domain for this service and must be from 1 to 79 alpha and/or numeric characters in length.

Usage

Use this command to define the domain name of the service.

Example

The following command defines the domain name of the CSCF service as *business.com*:

```
default-aor-domain business.com
```

emergency-cscf

Enables the Emergency-CSCF for the service and enters the Emergency-CSCF Configuration Mode. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] emergency-cscf
```

no

Disables the E-CSCF for the service.

Usage

Use this command to enable the Emergency-CSCF feature and enter the Emergency-CSCF Configuration Mode.

Entering this command results in the following prompt:

```
[ context_name ] hostname ( config-cscf-service-emergency-cscf ) #
```

Emergency-CSCF Configuration Mode commands are defined in the *CSCF Emergency-CSCF Configuration Mode Commands* chapter in this guide.

Important: Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

history-info

Enables the addition of the history-info header to SIP requests in order to capture request URI information. By default, this command is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] history-info
```

```
default | no
```

Disables the inclusion of the history-info header.

Usage

Use this command to include the history-info header in SIP requests to capture the request URI information for routing or translation.

interface

Enables interface SIP statistic collection.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] interface statistics sip
```

default | no

Disables interface SIP statistic collection for this service.

Usage

Use this command to enable the collection of interface SIP statistics in this service.

interrogating-cscf

This command is not supported in this release.

ipv4-ipv6-interworking

Allows the P-CSCF to provide IPv4-IPv6 interworking when UEs are IPv6-only and the IMS core network is IPv4-only. Feature is disabled by default.

Product

SCM (P-CSCF)

Privilege

Administrator

Syntax

```
[ no ] ipv4-ipv6-interworking
```

no

Disables the feature.

Usage

Use this command to allow IPv4-IPv6 interworking functionality.

keepalive

Configures the CSCF to receive and respond to different types of keep-alive requests.

Product

SCM

Privilege

Administrator

Syntax

```
keepalive [ expire-timer sec [ max-retry num ] | max-retry num [ expire-timer
sec ] | method { crlf | stun } [ expire-timer sec [ max-retry num ] | max-retry
num [ expire-timer sec ] ] ]
```

```
default keepalive [ expire-timer | max-retry [ expire-timer ] | method [ expire-
timer | max-retry ] ]
```

```
no keepalive [ method { crlf | stun } ]
```

expire-timer *sec*

Default: 29

This value is used according to timed-keepalives parameter present in Path header. UEs are expected to send keepalive messages according to this time interval.

sec must be an integer from 24 to 150.

max-retry *num*

Default: 3

Specifies the maximum number of times the CSCF waits for the UE to send a keepalive request before it deletes the user information.

num must be an integer from 1 to 10.

method { **crlf** | **stun** }

Default: both methods enabled.

Specifies the method of keepalive messages supported by the CSCF.

crlf: “\r\n” string (CRLF packets) sent by UE

stun: STUN protocol messages (rfc3489-bis)

```
default keepalive [ expire-timer | max-retry [ expire-timer ] | method [
expire-timer | max-retry ] ]
```

Returns the command to the default settings. All methods are enabled by default. See keywords above for specific defaults.

```
no keepalive [ method { crlf | stun } ]
```

Disables the specified method of keepalive messages.

Usage

Use this command to configure how the CSCF manages keepalive requests.

Example

The following example sets the expire timer to *40* and the maximum retry parameter to *5*:

```
keepalive expire-timer 40 max-retry 5
```

li-packet-cable

Refer to the *Cisco ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

max-sipmsg-size

Configures the maximum SIP message size.

Product

SCM

Privilege

Administrator

Syntax

```
max-sipmsg-size limit
```

```
[ default | no ] max-sipmsg-size
```

limit

Default: 4096

Configures the SIP message size limit in bytes.

limit must be an integer from 1024 to 65535.

Important: Maximum SIP message size should be more than the message-max-size set in the CSCF Proxy-CSCF Configuration Mode.

```
default | no
```

Returns/sets the maximum SIP message size to 4096 bytes.

Usage

Use this command to configure the maximum SIP message size.

Example

The following command limits the SIP message size to 4500 bytes:

```
max-sipmsg-size 4500
```

media-bridging

Enables SDP modification that terminate media on CSCF. Feature is disabled by default.

Product

SCM (P-CSCF)

Privilege

Administrator

Syntax

```
[ no ] media-bridging
```

no

Disables the feature.

Usage

Use this command to allow termination of media on CSCF.

monitoring

Enables thresholds alerting for this CSCF service.

Product

SCM

Privilege

Administrator

Syntax

monitoring

Usage

Use this command to enable thresholds alerting for this CSCF service.

nat-policy

Configures a NAT (Network Address Translation) policy for the service if the CSCF service is performing one of the following functions:

- CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for NAT

Product

SCM(CSCF, A-BG)

Privilege

Administrator

Syntax

```
nat-policy policy_name { private-address { address ip_address_mask | default | range start_ip_address end_ip_address } | bridge-network { address ip_address_mask | range start_ip_address end_ip_address }
```

```
no nat-policy policy_name
```

```
nat-policy policy_name
```

Specifies a name for the NAT policy.

policy_name must be from 1 to 79 alpha and/or numeric characters.

```
private-address { address ip_address_mask | default | range start_ip_address end_ip_address }
```

Specifies the private-address policy type for nat-pool.

address *ip_address_mask*: Address for nat-policy policy type for nat-pool. Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific policy type applies to.

ip_address_mask must be specified using the form “IP Address/Mask Bits” where the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.

default: Default for nat-policy policy type for nat-pool. Default is defined as the address range specified by rfc1918.

- 10.0.0.0 - 10.255.255.255 (10/8 prefix)
- 172.16.0.0 - 172.31.255.255 (172.16/12 prefix)
- 192.168.0.0 - 192.168.255.255 (192.168/16 prefix)

range *start_ip_address end_ip_address*: Range for nat-policy policy type for nat-pool.

- *start_ip_address* specifies the beginning of the range of addresses.
- *end_ip_address* specifies the end of the range of addresses .
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

```
bridge-network { address ip_address_mask | range start_ip_address end_ip_address }
```

Specifies the bridge-network policy type for S-CSCF bridging.

address *ip_address_mask*: Address for bridge-network policy type for S-CSCF bridging. Specifies a combined IP address subnet mask bits to indicate what IP addresses the specific policy type applies to. *ip_address_mask* must be specified using the form “IP Address/Mask Bits” here the IP address must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6, and the mask bits are a numeric value, which is the number of bits in the subnet mask.

range *start_ip_address end_ip_address*: Range for bridge-network policy type for S-CSCF bridging.

- *start_ip_address* specifies the beginning of the range of addresses.
- *end_ip_address* specifies the end of the range of addresses.
- *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

no nat-policy *policy_name*

Removes the specified NAT policy from the service.

Usage

Generally, if a SIP packet has a VIA address (physical address that identifies where the service is located) different from the Source address, ALG functionality is invoked. Even if the VIA and Source addresses are the same, however, this command allows the ALG functionality to be started. For ALG to start, the VIA address should belong to one of the nat-policy address ranges.

Example

The following command identifies the NAT policy named *policy1* with a private-address policy type of *10.10.10.10 255.255.255.0*:

```
nat-policy policy1 private-address address 10.10.10.10 255.255.255.0
```

The following command identifies the NAT policy named *policy2* with a private-address range policy type of *172.162.23.23 172.162.23.230*:

```
nat-policy policy2 private-address address 172.162.23.23 172.162.23.230
```

The following command identifies the NAT policy named *policy3* with a default policy type:

```
nat-policy policy3 private-address default
```

nat-pool

Configures a NAT (Network Address Translation) pool for the service if the CSCF service is performing one of the following functions:

- P-CSCF services are run in bridging (Back-to-Back User Agent) mode
- A-BG is an Application-level Gateway (ALG) for NAT

By default, no nat-pool name will be present.

Product

SCM(P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
[ no ] nat-pool name pool_name
```

no

Removes the NAT pool from the service.

nat-pool name pool_name

Specifies the name of an existing NAT pool.

pool_name must be from 1 to 32 alpha and/or numeric characters.

Important: NAT pools are created in Context Configuration Mode with the **ip pool** command.

Usage

Use this command to assign a NAT pool to the P-CSCF/A-BG service.

Example

The following command identifies the NAT pool:

```
nat-pool name pool2
```

policy

Enables or disables early media support in P-CSCF. In addition, configures Interim-Interval value for CSCF accounting sessions and the congestion control threshold and tolerance values that are to be monitored on this CSCF service.

Product

SCM

Privilege

Administrator

Syntax

```
policy { accounting interim-interval value | allow-early-media | threshold
congestion-control [ system-cpu-utilization percent ] [ tolerance percent ] }

[ default | no ] policy { accounting interim-interval | allow-early-media |
threshold congestion-control tolerance }
```

accounting interim-interval *value*

Default: Disabled

Used to configure Interim-Interval value for CSCF accounting sessions.

value can be configured to any integer value from 50 to 7200. This value is sent in the “Acct-Interim-Interval” AVP of the accounting message. Based on the response message from accounting server, Interim-Interval timer is started.

allow-early-media

Default: Enabled

Allows early media by doing QoS commit during QoS Authorization in P-CSCF.

threshold congestion-control

Enables congestion-control.

system-cpu-utilization *percent*

Default: 80

The average percent utilization of a CPU in a PSC/PSC2 running the CSCF service as measured in 10 second intervals.

percent can be configured to any integer value from 0 to 100. This value becomes the upper threshold for triggering the CPU-based congestion for CSCF services.

tolerance *percent*

Default: 5

The percentage under a configured threshold that dictates the point at which the condition is cleared.

percent is an integer value from 1 to 25.

default

Returns the command to the default settings. See keywords above for specific defaults.

no

Disables the functionality.

Usage

Use this command to configure Interim-Interval value for CSCF accounting sessions.

You may also set QoS support during either the initial SDP response or the 200OK response to the INVITE. When this CLI is enabled, QoS commit is done during initial SDP answer. When disabled, QoS commit is done during 200OK INVITE. By default, this command is enabled.

In addition, thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the CSCF service (congested or clear). The tolerance parameter establishes the threshold at which the condition is cleared.

Important: When congestion is triggered, new CSCF calls are not rejected.

Example

The following command sets the upper threshold for CPU utilization for triggering congestion control at 90%.

```
policy threshold congestion-control system-cpu-utilization 90
```

The following command sets the tolerance to its default value of 5.

```
default policy threshold congestion-control tolerance
```

policy-name

Assigns a previously created service policy to this service.

Product

SCM

Privilege

Administrator

Syntax

```
policy-name name
```

```
no policy-name
```

```
policy-name name
```

Specifies the name of the service policy being assigned to this service.

name must be from 1 to 79 alpha and/or numeric characters and be an existing policy name in the system. Service policies are created and maintained in the CSCF Policy Configuration Mode.

```
no
```

Remove the assigned service policy from this service.

Usage

Use this command to assign a service policy to this service. The policies defined in the service policy apply to all subscribers using this service. Service policies are created and maintained in the CSCF Policy Configuration Mode.

Example

The following command assigns a service policy named *serv_policy3* to this service:

```
policy-name serv_policy3
```

proxy-cscf

Enables the Proxy-CSCF for the service and enters the Proxy-CSCF Configuration Mode. Default is disabled.

Product

SCM (P-CSCF)

Privilege

Administrator

Syntax

```
[ no ] proxy-cscf
```

no

Disables the P-CSCF for the service.

Usage

Use this command to enable the Proxy-CSCF feature and enter the Proxy-CSCF Configuration Mode. Entering this command results in the following prompt:

```
[ context_name ] hostname ( config-cscf-service-proxy-cscf ) #
```

Proxy-CSCF Configuration Mode commands are defined in the *CSCF Proxy-CSCF Configuration Mode Commands* chapter in this guide.

Important: The Proxy-CSCF is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.

recurse-on-redirect-resp

Enables the 3xx recursion feature. If enabled, the service will send further invites to the contacts specified upon receiving a 3xx redirect response. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] recurse-on-redirect-resp
```

```
no
```

Disables the 3xx recursion feature.

Usage

When enabled and on receipt of a 3xx response, the service will collect the SIP URIs present in the Contact header(s) of 3xx and recursively contact each one of them until the call succeeds. The contacts are tried serially. There is a maximum implementation limit of 50 URIs. Each contact, in turn, can send a 3xx response. The service will honor them and append the new contacts. When disabled, the service treats a 3xx response as the final failure response and declares the call attempt “failed”. By default, this feature is disabled.

Example

Enable recursion on 3xx:

```
recurse-on-redirect-resp
```

Disable recursion on 3xx:

```
no recurse-on-redirect-resp
```

reject-on-cnsa-failure

Enables rejection of messages on Core Network Service Authorization failure. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] reject-on-cnsa-failure
```

no

Disables the rejection of messages on Core Network Service Authorization failure.

Usage

Enables rejection of messages on Core Network Service Authorization failure. By default, this feature is disabled.

In a mobile originating case, S-CSCF checks for the presence of P-Preferred-Service (PPS) header. If the header is present, media profile authentication is successful and if the incoming ICSI (IMS Communication Service Identifier) value also matches with one of the values in the service_id list, then the request will be forwarded after replacing the PPS header with PAS (P-Asserted-Service). If media profile authentication fails, S-CSCF will check reject-on-cnsa-failure. If enabled, then call is rejected with 403 message. If disabled, a default ICSI is selected from the service_id list and will be put into PAS while forwarding the request by the S-CSCF on service authentication failure.

In PPS is not received by the S-CSCF and media profile authentication is successful, an ICSI from the service_id list, if present, is selected and will be added in PAS header. If media profile authentication fails, reject-on-cnsa-failure is checked. If enabled, call is rejected with 403 message. If disabled, PAS header is added if service_id list is present with an ICSI value.

Example

Enable rejection of messages on Core Network Service Authorization failure:

```
reject-on-cnsa-failure
```

Disable rejection of messages on Core Network Service Authorization failure:

```
no reject-on-cnsa-failure
```

release-call-on-media-loss

Release call on detection of media loss.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
release-call-on-media-loss media-type audio
```

```
no release-call-on-media-loss
```

no

Disables the release of SIP calls upon the detection of media loss.

Usage

Use this command to enable the release of SIP calls upon the detection of media loss.

Example

Enables the release of SIP calls upon the detection of media loss:

```
release-call-on-media-loss media-type audio
```

Enables the release of SIP calls upon the detection of media loss:

```
no release-call-on-media-loss
```

rfc3261-proxy

Enables RFC3261 proxy (SIP Proxy) for this service and enters the SIP Proxy Configuration Mode. Default is disabled.

Product

SCM (SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] rfc3261-proxy
```

default | no

Disables RFC3261 proxy in this service.

Usage

Use this command to enable the Sip Proxy feature and enter the SIP Proxy Configuration Mode. Entering this command results in the following prompt:

```
[ context_name ] hostname ( config-cscf-service-rfc3261-proxy ) #
```

SIP Proxy Configuration Mode commands are defined in the *CSCF SIP Proxy Configuration Mode Commands* chapter in this guide.

Important: The SIP Proxy is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.

serving-cscf

Enables Serving-CSCF for the service and enters the Serving-CSCF Command Mode. Default is disabled.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] serving-cscf
```

no

Disables S-CSCF for the service.

Usage

Use this command to enable the Serving-CSCF feature and enter the Serving-CSCF Configuration Mode. Entering this command results in the following prompt:

```
[ context_name ] hostname (config-cscf-service-serving-cscf) #
```

Serving-CSCF Configuration Mode commands are defined in the *CSCF Serving-CSCF Configuration Mode Commands* chapter in this guide.

Important: The Serving-CSCF is a license-enabled function of the Session Control Manager. Only one function (P-CSCF, S-CSCF, E-CSCF, SIP Proxy, or A-BG) can be enabled per service.

serving-cscf-list

Configure a list of Serving CSCFs and their capabilities.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ]serving-cscf-list server { address address | domain domain } { capability value | port num { capability value } }
```

```
no trusted-domain-entity address
```

```
server { address address | domain domain }
```

Specifies the S-CSCF server.

address *address*: IP addresses must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

domain *domain*: Domain names must be entered using from 1 to 80 alpha and/or numeric characters.

```
capability value
```

Specifies the capability of the S-CSCF server. *value* is assigned by the Service Provider and may be an integer from 1 to 999999.

```
port num
```

Specifies the port at which service is provided by the S-CSCF server. *num* may be an integer from 1 to 65535.

```
no
```

Removes an entry from this list.

Usage

Use this command to configure a list of Serving CSCFs and their capabilities.

Important: This command can be entered multiple times to identify multiple Serving CSCFs.

Example

The following command adds a S-CSCF with an IP address of *1.2.3.4* and a capability value of *75* to this service's list:

```
serving-cscf-list server address 1.2.3.4 capability 75
```

session-timer

Configures the session expiry for sessions (Session will expire at the configured value unless refreshed.) and the minimum number of seconds in a session timer (session-expires) value the system will allow.

Product

SCM

Privilege

Administrator

Syntax

```
session-timer { min-se sec [ session-expires sec ] | session-expires sec [ min-se sec ] }
```

```
default session-timer [ min-se ] [ session-expires ]
```

```
no session-timer
```

min-se *sec*

Default: 90

Specifies the minimum number of seconds the system will allow a session-expires value in a session request. *sec* must be an integer value between 90 and the value of the **session-expires** command.

session-expires *sec*

Default: 1800 (30 minutes)

Specifies the number of seconds a session is allowed exist before it expires. *sec* must be an integer value between 90 and 18000.

default session-timer [**min-se**] [**session-expires**]

Returns the command to the default settings.

no

Disables the session timer.

Usage

Use this command to set a session expiry value for all invites generated by the SCM and a minimum value for a session request session timer the system will allow. If a session is requested with a timer of less than this command's value, the system will reject the request with a "422 Session Interval Too Small" response code.

Example

The following command sets the session expiry for all sessions generated by the SCM to 60 minutes:

```
session-timer session-expires 3600
```

strict-outbound

When enabled, the CSCF rejects registration without outbound parameters from an already registered AoR (the AoR would have included outbound parameters in a previous registration). When disabled, the CSCF allows registration without outbound parameters from the previously registered AoR.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] strict-outbound
```

no

Disables the feature. This is the default behavior.

Usage

Use this command to reject registration from a previously registered AoR if the AoR fails to register with outbound parameters but included them in the previous registration.

subscriber-policy-override

Configures the system to allow the subscriber-based policy to override the service-based policy. Default is disabled.

Product

SCM

Privilege

Administrator

Syntax

```
[ default | no ] subscriber-policy-override
```

default | no

Removes the subscriber policy override from the service.

Usage

By default, if a conflict occurs between the subscriber-based policy and the service-based policy, the service policy takes precedence. Use this command to override the default behavior of the system and allow the subscriber-based policy to overrule the service policy.

subscription

Enables the registration event package for the service and configures a system-wide subscription lifetime for all subscribers to the service.

Product

SCM

Privilege

Administrator

Syntax

```
subscription package reg [ lifetime { default sec | max sec [ default sec ] |
min sec [ max sec ] [ default sec ] } ]
```

```
[ default | no ] subscription package reg
```

```
package reg lifetime { default sec | max sec | min sec }
```

default sec: Specifies the default amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to max sec -1. Default is 3761. default sec must be < or = to max sec and > or = to min sec.

The following keywords are specific to the S-CSCF functionality:

max sec: Specifies the maximum amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to 2147483646. Default is 86400. max sec must be > or = to min sec.

min sec: Specifies the minimum amount of time that a subscription can exist on the system. *sec* must be an integer from 60 to max sec -1. Default is 60. min sec must be < or = to max sec.

default

Returns the command to the default settings.

no

Disables the registration event package for the service.

Usage

Use this command to enable the registration event package for the service and control the amount of time subscriptions are allowed to exist on this service.

The system responds to subscriptions in the following manner:

Using default values:

- If a subscription with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a subscription with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.

If a subscription is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum subscription lifetime to 43200 (12 hours):

```
subscription package reg lifetime max 43200
```

support-content-type

Validates Content-Type in this CSCF service.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] support-content-type any
```

no

Disables the feature. If disabled, CSCF service rejects unsupported Content-Type with “415 Unsupported Media Type”.

Usage

Use this command to either allow any type of Content-Type or reject unsupported Content-Type.

Example

Allows any type of Content-Type for the CSCF service:

```
support-content-type any
```

Rejects unsupported Content-Type for the CSCF service:

```
no support-content-type any
```

tcp-proxy

Enables SIP TCP proxy for the CSCF service.

Product

SCM

Privilege

Administrator

Syntax

```
tcp-proxy [ port port_number ]
```

```
no tcp-proxy
```

```
port port_number
```

Default: 5062

Specifies the port used for SIP TCP proxy connections.

port_number must be an integer from 1 to 65534.

```
no
```

Disables SIP TCP proxy for the CSCF service

Usage

Use this command to enable SIP TCP proxy for the CSCF service.

Example

Enables SIP TCP proxy for the CSCF service on port *5062*:

```
tcp-proxy port5062
```

Disables SIP TCP proxy for the CSCF service:

```
no tcp-proxy
```

threshold

Configures the number of route failures that will trigger an alarm.

Product

SCM

Privilege

Administrator

Syntax

```
threshold route-failures high_thresh [ clear low_thresh ]
```

```
default threshold route-failures
```

```
route-failures high_thresh
```

Default: 5

The high threshold number of route failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* can be configured to any integer value between 0 and 60000.

```
clear low_thresh
```

Default: 5

The low threshold number of route failures that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* can be configured to any integer value between 0 and 60000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

```
default threshold route-failures
```

Returns the command to the default settings.

Usage

Use this command to set an alert or an alarm when the number of route failures exceeds the configured level. Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- Enter condition: Actual number of route failures > High Threshold
- Clear condition: Actual number of route failures £ Low Threshold

Example

The following command configures a route failures threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold route-failures 1000 clear 500
```

timeout

Sets timeout values for CSCF and SIP transactions.

Product

SCM

Privilege

Administrator

Syntax

```
timeout { hss-wait sec | no-answer sec | policy-interface sec | sip { 3gpp-d sec
| 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | d sec | idle-tcp-connection msec |
invite-expiry sec | t1 msec | t2 sec | t4 sec } }
```

```
timeout { hss-wait | no-answer | policy-interface | sip { 3gpp-d | 3gpp-t1 |
3gpp-t2 | 3gpp-t4 | d | idle-tcp-connection msec | invite-expiry | t1 | t2 | t4
} }
```

hss-wait *sec*

Default: 5

This timer is used by S-CSCF with HSS interface for timeout.
sec must be an integer from 0 to 2147483646.

no-answer *sec*

Default: 100

This timer is specially used for No-Answer Call Feature executed by S-CSCF. The timer will be started as soon as 180 Ringing response is received and No-Answer call feature is enabled. The value of this timer should be always less than INVITE Timeout used by DC-SIP.
sec must be an integer from 0 to 2147483646.

policy-interface *sec*

Default: 5

This timer is used by the P-CSCF/A-BG with Policy interface for timeout.
sec must be an integer from 0 to 2147483646.

```
sip { 3gpp-d sec | 3gpp-t1 msec | 3gpp-t2 sec | 3gpp-t4 sec | d sec |
idle-tcp-connection msec | invite-expiry sec | t1 msec | t2 sec | t4 sec
}
```

Sets transaction and expiry timers for SIP.

- **3gpp-d** *sec*: This timer is used to control the retransmission of 200OK messages to INVITEs after an ACK is sent. The ACK transaction is cleared after this period. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 64*T1 (128 seconds, recommended minimum)
- **3gpp-t1** *msec*: This timer is used to control the time interval between each retransmission. The interval doubles after each retransmission. This is used by P-CSCF/A-BG only when it sending message toward the UE. Example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable

transport. *msec* must be an integer from 0 to 4294967294. Default: 2000 ms (2 secs, recommended minimum).

- **3gpp-t2** *sec*: This timer is used to control the period for which the request continues to get retransmitted. This is used by P-CSCF/A-BG only when it sending message toward the UE. This timer is applicable both for reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 16 seconds (recommended minimum).
- **3gpp-t4** *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered. The buffered response for the retransmitted non-invite request should be sent within that interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 17 seconds (recommended minimum).
- **d** *sec*: This timer is used to control the retransmission of 200OK to INVITE after ACK is sent. The ACK transaction will be cleared after this interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 64*T1 (32 seconds, recommended minimum)
- **idle-tcp-connection** *msec*: This timer is used for closing idle TCP connections. If there is not activity in the TCP connection for the configuration duration, then the connection will be closed. *msec* must be an integer from 1000 (recommended minimum) to 4294967294. Default: 42000 milliseconds.
- **invite-expiry** *sec*: This timer is used by SIP while acting as UA Role and no final response is received for the INVITE request sent. This timer is applicable for both reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 100 seconds (recommended minimum).
- **t1** *msec*: Specifies the time interval (in microseconds) between each retransmission. The interval doubles after each retransmission, for example: T1, 2T1, 4T2, etc. This timer is applicable only for unreliable transport. *msec* must be an integer from 0 to 2147483646. Default: 500 milliseconds (recommended minimum).
- **t2** *sec*: This timer is used to control the period for which the request keeps getting retransmitted. This timer is applicable both for reliable and unreliable transport. *sec* must be an integer from 0 to 2147483646. The recommended minimum value for this parameter is 4 seconds. Default: 64*T1 (32 seconds)
- **t4** *sec*: This timer is used to control the period for which the final response to non-invite transaction should be buffered so as to send the buffered response for the retransmitted non-invite request within that interval. This timer is applicable only for unreliable transport. *sec* must be an integer from 0 to 2147483646. Default: 5 seconds (recommended minimum).

default

Returns the command to the default settings.

Usage

Use this command to configure SIP Stack timers and CSCF service specific timers.

Example

The following command sets the SIP d timer to 64 seconds:

```
timeout sip d 64
```

transport-switching

Sets the message size that triggers a transport protocol switch.

Product

SCM

Privilege

Administrator

Syntax

```
transport-switching policy protocol tcp trigger msg-size size
```

```
default transport-switching policy protocol tcp trigger msg-size
```

```
policy protocol tcp trigger msg-size size
```

Default: 1300

Specifies the size of the SIP message beyond which transport changes to TCP.

size can be configured to any integer value between 1300 and 65535.

```
default
```

Returns the size of the SIP message beyond which transport changes to TCP to 1300 bytes.

Usage

Use this command to configure the size of the SIP message beyond which transport changes to TCP.

Example

Switch to TCP transport protocol when the SIP message size is 4000 bytes or more:

```
transport-switching policy protocol tcp trigger msg-size 4000
```

trusted-domain-entity

Adds trusted network nodes (or entities) to a table used by this service to identify those nodes that can be trusted with subscriber information.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
trusted-domain-entity address [ foreign-network ]
```

```
no trusted-domain-entity address
```

```
trusted-domain-entity address
```

Specifies the IP address of the network node identified as a trusted entity by this service. *address* must be either an IP address or a domain name. IP addresses must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6. Domain names must be entered using from 1 to 80 alpha and/or numeric characters.

```
foreign-network
```

Entity belongs to Foreign Network.

```
no
```

Removes an entry from this service's trusted domain table.

Usage

Use this command to identify to the service the network entities that can be trusted with subscriber information by this service.

Important: This command can be entered multiple times to identify multiple trusted network entities.

Example

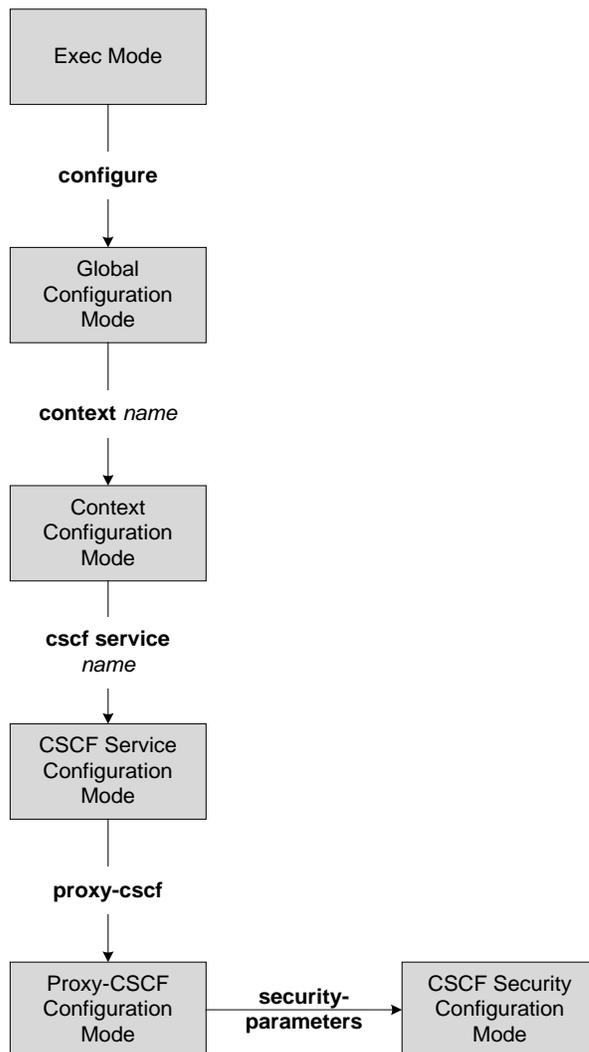

The following command adds a network node with an IP address of *1.2.3.4* to this service's trusted domain table:

```
trusted-domain-entity 1.2.3.4
```

Chapter 79

CSCF Security Configuration Mode Commands

The CSCF Security Configuration Mode is used to configure Denial of Service (DOS) prevention commands.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

auth-failure-weight

Sets a severity number for authorization failures used in calculating a value for determining when to suspend registration attempts.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
auth-failure-weight weight
```

```
default auth-failure-weight
```

weight

Default: 1

Assigns a weight to an authorization failure. Defines the severity of a single authorization failure. *weight* must be an integer from 1 to 5.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to define the severity of an authorization failure. This parameter is used in calculating the current number of authorization failures to compare to the **per-aor-failure-limit** and the **per-ip-failure-limit**. Configuring this command with a lower number causes the system to suspend registration attempts with repeated authorization failures much sooner than when configured with a higher number.

Example

The following command assigns a weight of 3 to an authorization failure:

```
auth-failure-weight 3
```

bad-request-weight

Sets a severity number for bad registration requests used in calculating a value for determining when to suspend registration attempts.

 **Important:** The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
bad-request-weight weight
```

```
default bad-request-weight
```

weight

Default: 2

Assigns a weight to a bad registration request. Defines the severity of a single bad request. *weight* must be an integer from 1 to 5.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to define the severity of bad registration request. This parameter is used in calculating the current number of request failures to compare to the **per-aor-failure-limit** and the **per-ip-failure-limit**. Configuring this command with a lower number causes the system to suspend registration attempts with repeated request failures much sooner than when configured with a higher number.

Example

The following command assigns a weight of 3 to a bad registration request:

```
bad-request-weight 3
```

dos-prevention

Enables the denial of service prevention feature.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] dos-prevention
```

```
[ default | no ]
```

Disables the denial of service prevention feature.

Usage

Use this command to enable the denial of service prevention feature. The default value for this command is disabled. When this command is enabled, the commands in this mode are enabled with default values configured.

Important: This command must be enabled before configuring other commands in this mode.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

■ exit

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

forking-contact-limit

Sets a limit on the number of contacts a user ID can register with the system.

 **Important:** The system will ignore the configuration of this command unless the `dos-prevention` command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
forking-contact-limit limit
```

```
default forking-contact-limit
```

limit

Default: 0

Sets the maximum number of contacts a user ID can register with the system. 0 specifies that unlimited contacts can be registered per user ID.

limit must be an integer from 0 to 10.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to limit the number of contacts a user ID can register with the system.

Example

The following command limits all users to 2 registered contacts on the system:

```
forking-contact-limit 2
```

greylist-duration

Configures the amount of time an AoR or IP address remains on a “grey list” after having crossed the registration authorization limit or the bad registration request limit.

 **Important:** The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
greylist-duration time
```

```
default greylist-duration
```

time

Default: 10

Defines the time, in minutes, that an AoR or IP address remains on a “grey list”.

time must be an integer from 5 to 1,440.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to specify the amount of time AoRs or IP addresses remain on a “grey list” after having crossed the registration authorization limit or the bad registration request limit. Limits are described in the **per-aor-failure-limit** command and the **per-ip-failure-limit** command.

Example

The following command sets the duration AoRs or IP addresses remain on a “grey list” to 30 minutes:

```
greylist-duration 30
```

per-aor-failure-limit

Sets a failure limit that, when exceeded, causes the suspension of registration attempts for the offending AoR.

 **Important:** The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
per-aor-failure-limit limit
```

```
default per-aor-failure-limit
```

limit

Default: 200

Defines the threshold for registration failures based on a calculation using weighted multipliers defined in **auth-failure-weight** and **bad-request-weight**.

limit must be an integer from 5 to 10,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to set a failure limit for registration attempts from an identified AoR. The following calculation determines when this threshold is reached for a specific AoR:

Current authorization failures ÷ **auth-failure-weight** = current failures per AoR

or

Total bad registration requests ÷ **bad-request-weight** = current failures per AoR

If **auth-failure-weight** = 2 and **bad-request-weight** = 1, and the **per-aor-failure-limit** = 100, then the tolerance for registration authentication failures = 50 per AoR and the tolerance for bad registration requests = 100 per AoR.

When an AoR reaches the failure limit, it is added to a “grey list” for a period of time as defined by the **greylist-duration** command.

Example

The following command sets the AoR failure limit to 300:

```
per-aor-failure-limit 300
```

per-ip-failure-limit

Sets a failure limit that, when exceeded, causes the suspension of registration attempts for the offending IP address.

Important: The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
per-ip-failure-limit limit
```

```
default per-ip-failure-limit
```

limit

Default: 100

Defines the threshold for registration failures based on a calculation using weighted multipliers defined in **auth-failure-weight** and **bad-request-weight**.

limit must be an integer from 5 to 10,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to set a failure limit for registration attempts from an identified IP address. The following calculation determines when this threshold is reached for any IP address:

Current authorization failures ÷ **auth-failure-weight** = current failures per AoR

or

Total bad registration requests ÷ **bad-request-weight** = current failures per AoR

If **auth-failure-weight** = 2 and **bad-request-weight** = 1, and the **per-ip-failure-limit** = 200, then the tolerance for registration authentication failures = 100 per each IP address and the tolerance for bad registration requests = 200 per each IP address.

When an IP address reaches the failure limit, it is added to a “grey list” for a period of time as defined by the **greylist-duration** command.

Example

The following command sets the IP address registration failure limit to 200:

```
per-ip-failure-limit 200
```

threshold-rate

Configures the rate per second at which the system must receive bad requests before it considers the requests a DoS attack.

 **Important:** The system will ignore the configuration of this command unless the **dos-prevention** command has been enabled.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
threshold-rate rate
```

```
default threshold-rate
```

rate

Default: 1

Specifies the rate per second that the system must receive bad requests to determine that it is under a DoS attack.

rate must be an integer from 1 to 1,000.

default

Sets /restores the default value assigned to the specified command.

Usage

Use this command to specify the threshold rate for bad requests. For example, if a malicious user sends bad requests at a rate of 5 per second and this parameter is set to 10, the system will not consider itself under a DoS attack.

Example

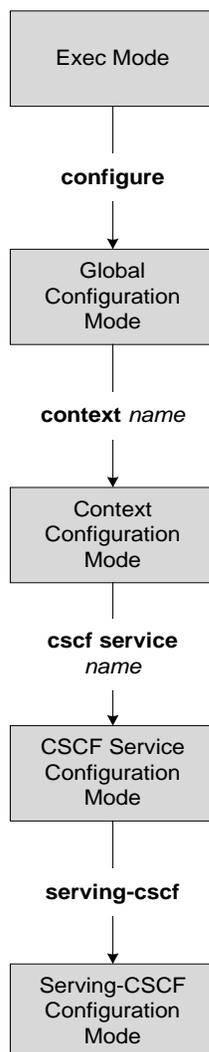

The following command sets the threshold rate to 5 bad requests per second:

```
threshold-rate 5
```

Chapter 80

CSCF Serving-CSCF Configuration Mode Commands

The Serving-CSCF Configuration Mode is used to set various commands supporting the role of the CSCF service as a Serving CSCF.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ threshold-rate

3gpp

Enables/disables functionality related to 3GPP Release 8 support. This command is disabled by default.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
3gpp Rel8 Cx { alias-indication | dynamic-password-change | ims-restoration |
num-auth-vectors value }
```

```
[ default | no ] 3gpp Rel8 Cx { alias-indication | dynamic-password-change |
ims-restoration | num-auth-vectors }
```

alias-indication

Enables alias indication functionality, a collaborative information exchange between the S-CSCF and HSS. Use this command to display alias information from the HSS.

If both the HSS and the S-CSCF support this feature, Alias Group IDs will be displayed in the output of the **show subscribers cscf-only full** command.

dynamic-password-change

Enables dynamic password change support on the S-CSCF service, as per 3GPP 33.203 release 8 version 8.8.0.

ims-restoration

Enables IMS restoration procedures on the S-CSCF service. Use this command to enable IMS REGISTER and INVITE restoration procedures defined in 3GPP TS 23.820.

num-auth-vectors *value*

Enables configurable value for SIP-Number-Auth-Items in MAR.

value must be an integer from 1 to 3. Default is 1.

SCSCF can retrieve multiple authentication vectors from HSS by setting SIP-Number-Auth-Items to an appropriate value. Previously, S-CSCF always set this value to "1". Using higher values helps to reduce MAR-MAA transactions.

default | no

Disables specified 3GPP Release 8 support feature.

Usage

Use this command to configure the S-CSCF to support 3GPP Release 8 functionality.

Example

The following command enables 3GPP Release 8 alias indication functionality on this service:

```
3gpp Rel8 Cx alias-indication
```

The following command disables 3GPP Release 8 dynamic password change support on this service:

```
no 3gpp Rel8 Cx dynamic-password-change
```

allow

Enables the function to allow IMS interworking with RFC3261 SIP User Agents.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] allow rfc3261-ua-interworking
```

no

Disables the interworking capability.

Usage

Use this command to enable the S-CSCF to allow IMS interworking with RFC3261 SIP User Agents.

authentication

Configures the authentication method used by the S-CSCF service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
authentication { aka-v1 value | allow-noauth [ invite | re-register | register ]
| allow-noipauth [ invite | re-register | register ] | allow-unsecure | aor-auth
| md5 value }
```

```
no authentication { aka-v1 | allow-noauth [ invite | re-register | register ] |
allow-noipauth [ invite | re-register | register ] | allow-unsecure | aor-auth |
md5 }
```

aka-v1 *value*

Specifies that AKA-v1 algorithm is used as the authentication type when accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

allow-noauth [*invite* | *re-register* | *register*]

Specifies that access to the S-CSCF service is allowed if authentication fails.

invite: Specifies that access to the S-CSCF service is allowed if authentication fails on INVITE requests only.

re-register: Specifies that access to the S-CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.

registration: Specifies that access to the S-CSCF service is allowed if authentication fails on REGISTER requests only.

allow-noipauth [*invite* | *re-register* | *register*]

Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails.

invite: Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails on INVITE requests only.

re-register: Specifies that access to the S-CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.

registration: Specifies that access to the S-CSCF service is allowed if early IMS-based IP authentication fails on REGISTER requests only.

allow-unsecure

Specifies that un-secure access is allowed to the S-CSCF service.

aor-auth

Specifies that authentication is based on the AoR when accessing the S-CSCF service.

md5 *value*

Specifies that the MD5 algorithm is used as the authentication type for accessing the S-CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

```
no authentication { aka-v1 | allow-noauth [ invite | re-register |
register ] | allow-noipauth [ invite | re-register | register ] | allow-
unsecure | aor-auth | md5 }
```

Disables the specified authentication method for the S-CSCF service.

Usage

Use this command to configure the authentication method used by the S-CSCF service.

Important: The S-CSCF supports multiple authorization schemes, but this requires disabling all authorization configured in the S-CSCF service so that it will send “Unknown” in the Sip-Authorization-Scheme AVP. This allows the HSS to dictate authorization. The following commands disable all authorization configured in the S-CSCF service to allow HSS to control authorization:

```
authentication allow-noipauth
allow rfc3261-ua-interworking
no authentication aka-v1
no authentication md5
```

Example

The following command configures the authentication method used by the S-CSCF service to MD5 with a preference of 3:

```
authentication md5 3
```

diversion-info

Enabling this command prompts the service to add a diversion header (draft-levy-sip-diversion-08) when the call is diverted to a different endpoint due to a call feature. By default, diversion-info is disabled.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] diversion-info
```

default | no

The service will not add a diversion header.

Usage

Use this command to enable the service to add a diversion header to call setup packets when calls are diverted due to the application of call features.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

■ exit

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

interrogating-cscf-role

Enables the function to also perform as an Interrogating-CSCF.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] interrogating-cscf-role
```

no

Disables the Interrogating-CSCF role in this function.

Usage

Use this command to enable the S-CSCF to also perform as an Interrogating-CSCF.

local-call-features

Enables/disables local call features. This command is disabled by default.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ default | no ] local-call-features
```

default | **no**

Disables local call features for this S-CSCF.

Usage

Use this command to enable local call features.

network-id

Configures the Network Identifier.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
network-id id
```

```
[ no ] network-id
```

id

The Network Identifier of the entity.

id must be from 1 to 79 alpha and/or numeric characters in length.

```
no network-id
```

Removes the configured Network Identifier of the entity.

Usage

The Network Identifier is used to compare with the P-Visited-Network-ID header received from P-CSCF to decide home or roaming subscriber at S-CSCF service.

Example

Sets the Network Identifier to *pcscf01.company.com*:

```
network-id pcscf01.company.com
```

policy

Configures the policy for Served User Routing in this S-CSCF service.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ default | no ] policy allow p-served-user-routing
```

```
allow p-served-user-routing
```

Enables Served User Routing functionality for this S-CSCF.

```
default | no
```

Disables Served User Routing functionality for this S-CSCF.

Usage

Use this command to enable/disable the policy for Served User Routing.

Example

The following command enables Served User Routing on this service:

```
policy allow p-served-user-routing
```

The following command disables Served User Routing on this service:

```
no policy allow p-served-user-routing
```

registration

Configures a registration lifetime for all subscribers to the service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
registration lifetime { default sec | max sec | min sec }
```

```
default registration lifetime
```

```
{ default sec | max sec | min sec }
```

default sec: Specifies the default amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max sec** -1. Default is 3600. *default sec* must be < or = to *max sec* and > or = to *min sec*.

max sec: Specifies the maximum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to 1209600. Default is 86400. *max sec* must be > or = to *min sec*.

min sec: Specifies the minimum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max sec** -1. Default is 60. *min sec* must be < or = to *max sec*.

```
default registration lifetime
```

Returns the command to the default settings.

Usage

Use this command to control the amount of time registrations are allowed to exist on this service.

The system responds to registrations in the following manner:

Using default values:

- If a registration with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a registration with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.
- If a registration is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum registration lifetime to 43200 (12 hours):

```
registration lifetime max 43200
```

reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
reliable-prov-resp { mandatory | optional }
```

```
no reliable-prov-resp
```

mandatory | **optional**

mandatory: Both inbound and outbound will request reliability.

optional (default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

no

Disables the reliability of provisional responses feature.

Usage

Use this command to enable/disable the reliability of provisional responses feature.

Example

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

sifc

Enables Shared Initial Filter Criteria (SiFC) functionality. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] sifc
```

default | no

Disables shared iFC functionality for this S-CSCF.

Usage

Use this command to configure the S-CSCF to share iFC functionality.

If both the HSS and the S-CSCF support this feature, subsets of iFC may be shared by several service profiles. The HSS downloads the unique identifiers of the shared iFC sets to the S-CSCF. The S-CSCF uses a locally administered database to map the downloaded identifiers onto the shared iFC sets.

If the S-CSCF does not support this feature, the HSS will not download identifiers of shared iFC sets.

Important: When using this feature option, the network operator is responsible for keeping the local databases in the S-CSCFs and HSSs consistent.

sip-header

Enable SIP P-User-Database (PUD) header insertion for the S-CSCF service.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
[ no ] sip-header insert p-user-database
```

p-user-database

Inserts PUD header in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

no

Disables SIP PUD header insertion for the S-CSCF service.

Usage

Enabling this command allows PUD header insertion in SIP (REGISTER) message and Invite from I-CSCF to S-CSCF.

sip-request

Configures SIP Request-related configuration in this S-CSCF service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
sip-request re-route { max-attempts attempts | response-code code }
```

```
default sip-request re-route max-attempts
```

```
no sip-request re-route response-code code
```

re-route

Specify SIP Request re-route related configuration.

max-attempts *attempts*

Specifies the maximum number of re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

attempts must be an integer from 1 to 10.

Default: 2

response-code *code*

Specifies the list of Response codes that will be considered as re-routable responses to a call attempt.

code must be a three-digit integer from 400 to 699.

Important: You may configure a maximum of five response code values per S-CSCF service.

default sip-request re-route max-attempts

Specifies a maximum number of two re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

no sip-request re-route response-code *code*

Disables the specified Response code.

Usage

Use this command to configure:

- list of Response codes that will be considered as re-routable responses to a call attempt.
- the maximum number of re-route attempts that a S-CSCF should allow for a given call before passing the negative response upstream.

■ sip-request

Example

The following command configures the maximum number of re-route attempts to 5:

```
sip-request re-route max-attempts 5
```

tas

Configures the S-CSCF to perform Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] tas
```

default | no

Disables the TAS feature for this S-CSCF.

Usage

Use this command to configure the S-CSCF to perform TAS functions.

tas-service

Identifies the name of the service configured on the system performing Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
tas-service name
```

```
no tas-service
```

name

Specifies the name of the service configured on the system performing TAS functions. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing service.

no

Removes the TAS name from the S-CSCF configuration.

Usage

Use this command to identify the name of the service configured on the system performing TAS functions

Example

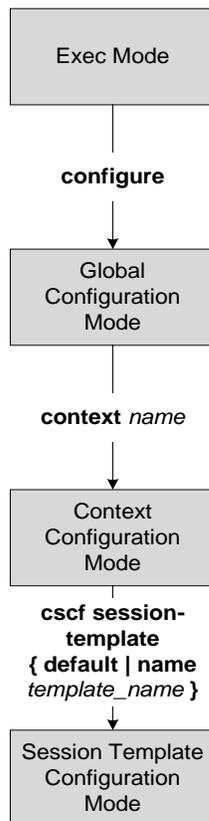

The following command identifies the TAS service name as *scscf3*:

```
tas-service scscf3
```

Chapter 81

CSCF Session Template Configuration Mode Commands

The CSCF Session Template Configuration Mode is used to classify users and/or domains (AoRs) within the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

inbound-cscf-acl

Configures the ACL to use for inbound sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

```
inbound-cscf-acl { default | name acl_name }
```

```
no inbound-cscf-acl name acl_name
```

```
default | name acl_name
```

default: Specifies that the default ACL should be used for inbound sessions using this template.

name *acl_name*: Specifies an existing ACL to use for inbound sessions using this template. *acl_name* must be the name of an existing ACL.

```
no inbound-cscf-acl name acl_name
```

Removes the ACL from this template.

Usage

Use this command to identify an ACL to use on inbound sessions using this template.

Example

The following command sets the inbound ACL for this template to an ACL named *acl_in22*:

```
inbound-cscf-acl name acl_in22
```

outbound-cscf-acl

Configures the ACL to use for outbound sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

```
outbound-cscf-acl { default | name acl_name }
```

```
no outbound-cscf-acl name acl_name
```

```
default | name acl_name
```

default: Specifies that the default ACL should be used for outbound sessions using this template.

name *acl_name*: Specifies an existing ACL to use for outbound sessions using this template. *acl_name* must be the name of an existing ACL.

```
no outbound-cscf-acl name acl_name
```

Removes the ACL from this template.

Usage

Use this command to identify an ACL to use on outbound sessions using this template.

Example

The following command sets the outbound ACL for this template to an ACL named *acl_out22*:

```
outbound-cscf-acl name acl_out22
```

policy-profile

Configures an AoR policy group to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

```
policy-profile { default | name profile_name }
```

```
no policy-profile name profile_name
```

```
default | name profile_name
```

default: Specifies that the default policy group will be used for sessions using this template.

name *profile_name*: Specifies an existing policy group. *profile_name* must be an existing CSCF policy group.

```
no policy-profile name profile_name
```

Removes the policy group from the template.

Usage

Use this command to specify a policy group for the template.

Example

The following command specifies that a policy group called *aor_grp1* will be used for sessions using this template:

```
policy-profile name aor_grp1
```

route-list

Configures a route group to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

```
route-list { default | name group_name }
```

```
no route-list name group_name
```

```
default | name group_name
```

default: Specifies that the default route group will be used for sessions using this template.

name *group_name*: Specifies an existing route group. *group_name* must be an existing peer server group.

```
no route-list name group_name
```

Removes the route group from this template.

Usage

Use this command to specify a route group for the template.

Example

The following command specifies an accounting server group called *route_grp2* that will be used for sessions using this template:

```
route-list name route_grp2
```

translation-list

Configures a translation list to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

```
translation-list { default | name list_name }
```

```
no translation-list name list_name
```

```
default | name list_name
```

default: Specifies that the default translation list will be used for sessions using this template.

name *list_name*: Specifies an existing translation list. *list_name* must be an existing translation list.

```
no translation-list name list_name
```

Removes the translation list from this template.

Usage

Use this command to specify a translation list for the template.

Example

The following command specifies a translation list called *trans_list6*:

```
translation-list name trans_list6
```

urn-service-list

Configures an URN service list to be used for sessions using this template.

Product

SCM

Privilege

Administrator

Syntax

```
urn-service-list { default | name list_name }
```

```
no urn-service-list name list_name
```

```
default | name list_name
```

default: Specifies that the default URN service list will be used for sessions using this template.

name *list_name*: Specifies an existing URN service list name. *list_name* must be from 1 to 79 alpha and/or numeric characters and be an existing URN service list.

```
no urn-service-list name list_name
```

Removes the service list from this template.

Usage

Use this command to specify a URN service list for this template. URN service lists are configured in the URN Service List Configuration Mode.

Example

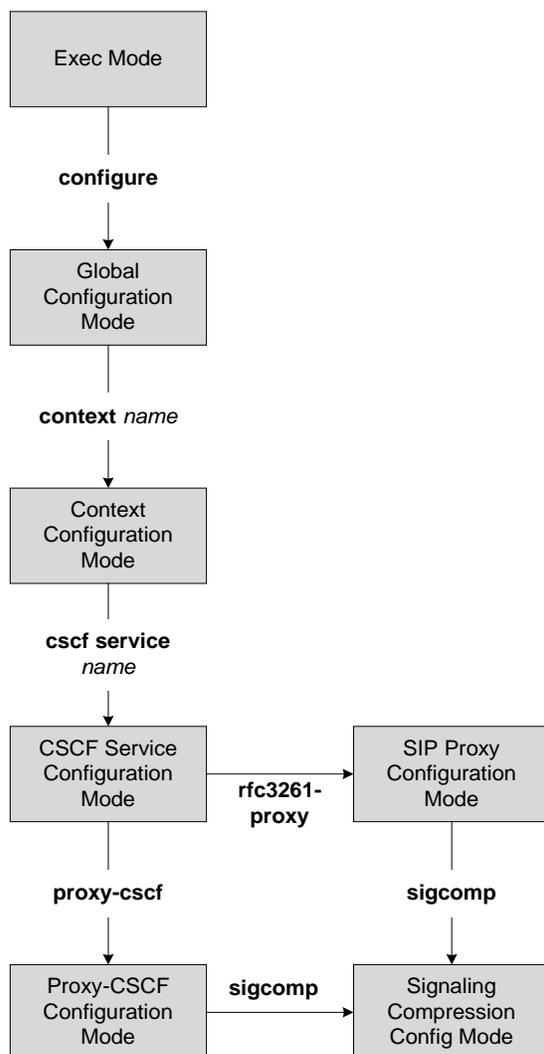

The following command specifies that a URN service list named *urn_list5* will be used for sessions using this template:

```
urn-service-list name urn_list5
```

Chapter 82

CSCF Signalling Compression Configuration Mode Commands

The CSCF Signalling Compression Configuration Mode is used to set memory allocation parameters in support of SIP signalling compression. More information regarding signalling compression refer to the IETF RFC 3320 “Signaling Compression (SigComp)”.

■ urn-service-list

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

compression-mode

Configures the dynamic compression mode to be used while sending a SigComp message. Simple dynamic mode is the default.

Product

SCM

Privilege

Administrator

Syntax

```
compression-mode { multiple-dynamic | simple-dynamic | static | update-dynamic }
```

```
default compression-mode
```

```
multiple-dynamic | simple-dynamic | static | update-dynamic
```

Default: **simple-dynamic**

multiple-dynamic: A maximum of four dynamic states will be created per compartment. The dynamic states are updated for each message by deleting the oldest dynamic state and creating the new one. The dynamic states will be updated in FIFO (First In, First Out) order.

simple-dynamic: Only one dynamic state will be created per compartment. The same state will be used for compression.

static: No dynamic states will be created. Only static dictionary will be used for compression.

update-dynamic: Only one dynamic state will be created per compartment, but the dynamic state will be updated for every new message.

```
default compression-mode
```

Returns the dynamic compression mode to simple dynamic.

Usage

Use this command to configure the dynamic compression mode to be used.

Example

The following command sets the compression mode to multiple dynamic:

```
compression-mode multiple-dynamic
```

The following command completely disables the creation of dynamic states for compression:

```
compression-mode static
```

decompression-memory-size

Sets the amount of memory available for decompressing one SigComp message. A portion of the allocated memory is used to buffer the message before it is decompressed. The memory is allocated for each SigComp message and is reclaimed once decompression is completed.

Product

SCM

Privilege

Administrator

Syntax

```
decompression-memory-size { 128k | 16k | 32k | 64k | 8k }
```

```
default decompression-memory-size
```

```
128k | 16k | 32k | 64k | 8k
```

Default: **8k**

Specifies the amount of memory (in kilobytes) to allocate for decompressing one SigComp message.

```
default
```

Returns the command to the default settings.

Usage

Use this command to set the memory size used to decompress a single SigComp message.

Example

The following command sets the memory size for decompressing SigComp messages to 16k:

```
decompression-memory-size 16k
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

state-memory-size

Sets the memory allocated to a compartment for the creation of state. Compartments are application-specific groupings of messages that relate to a peer endpoint. The system allocates memory per compartment. The memory is reclaimed when the system determines that the compartment is no longer required.

Product

SCM

Privilege

Administrator

Syntax

```
state-memory-size { 4k | 8k }
```

```
default state-memory-size
```

4k | 8k

Default: **4k**

Specifies the amount of memory to allocate to a compartment for the creation of state.

default

Returns the command to the default settings.

Usage

Use this command to specify a memory size allocated to message groupings for the creation of state.

Example

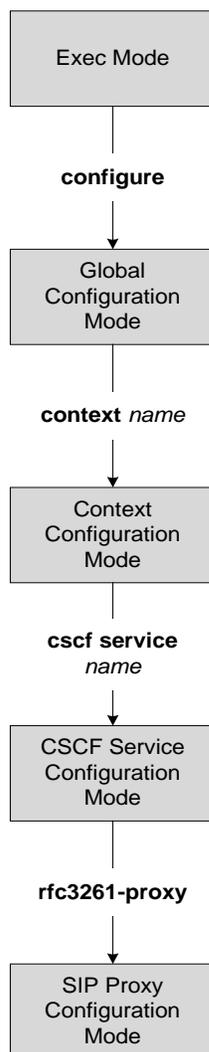

The following command sets the state memory size to **8k**:

```
state-memory-size 8k
```

Chapter 83

CSCF SIP Proxy Configuration Mode Commands

The SIP Proxy Configuration Mode is used to set various commands supporting the role of the CSCF service as a RFC3261-compliant SIP proxy server.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ state-memory-size

as-call

Enabling this command causes request-URIs in INVITE messages to be updated with the result of the translation before being passed to an Application Server. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] as-call invite-request-uri update
```

default | no

The translation result is ignored.

Usage

Use this command to update the request-URI in INVITE messages with the result of the translation before passing it to an AS.

authentication

Configures the authentication method used by the CSCF service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
authentication { aka-v1 value | allow-noauth [ invite | re-register | register ]
| allow-noipauth [ invite | re-register | register ] | allow-unsecure | aor-auth
| md5 value }
```

```
no authentication { aka-v1 | allow-noauth [ invite | re-register | register ] |
allow-noipauth [ invite | re-register | register ] | allow-unsecure | aor-auth |
md5 }
```

aka-v1 *value*

Specifies that AKA-v1 algorithm is used as the authentication type when accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

allow-noauth [*invite* | *re-register* | *register*]

Specifies that access to the CSCF service is allowed if authentication fails.

invite: Specifies that access to the CSCF service is allowed if authentication fails on INVITE requests only.

re-register: Specifies that access to the CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.

registration: Specifies that access to the CSCF service is allowed if authentication fails on REGISTER requests only.

allow-noipauth [*invite* | *re-register* | *register*]

Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails.

invite: Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails on INVITE requests only.

re-register: Specifies that access to the CSCF service is allowed if authentication fails on RE-REGISTER requests when the request is integrity-protected only.

registration: Specifies that access to the CSCF service is allowed if early IMS-based IP authentication fails on REGISTER requests only.

allow-unsecure

Specifies that un-secure access is allowed to the CSCF service.

aor-auth

Specifies that authentication is based on the AoR when accessing the CSCF service.

md5 *value*

Specifies that the MD5 algorithm is used as the authentication type for accessing the CSCF service. *value* specifies a preference - the lower the value, the higher the preference. *value* must be an integer from 1 to 1000.

Important: In order to change a priority level, you must remove the original value and configure a new one.

```
no authentication { aka-v1 | allow-noauth [ invite | re-register |
register ] | allow-noipauth [ invite | re-register | register ] | allow-
unsecure | aor-auth | md5 }
```

Disables the specified authentication method for the CSCF service.

Usage

Use this command to configure the authentication method used by the CSCF service.

Important: The S-CSCF supports multiple authorization schemes, but this requires disabling all authorization configured in the S-CSCF service so that it will send “Unknown” in the Sip-Authorization-Scheme AVP. This allows the HSS to dictate authorization. The following commands disable all authorization configured in the S-CSCF service to allow HSS to control authorization:

```
authentication allow-noipauth

allow rfc3261-ua-interworking

no authentication aka-v1

no authentication md5
```

Example

The following command configures the authentication method used by the CSCF service to MD5 with a preference of 3:

```
authentication md5 3
```

diversion-info

Enabling this command prompts the service to add a diversion header (draft-levy-sip-diversion-08) when the call is diverted to a different endpoint due to a call feature. By default diversion-info is disabled.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] diversion-info
```

```
default | no
```

The service will not add a diversion header.

Usage

Use this command to enable the service to add a diversion header to call setup packets when calls are diverted due to the application of call features.

emergency

Configures the function to allow or disallow the emergency-session or emergency-registration of a particular type.

Product

SCM (P-CSCF, A-BG, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] emergency { registration [ visited-ue ] | session [ 3gpp-ims-xml-body | anonymous | non-emergency-registered | 3 sdp-cs-media | visited-ue ]
```

default

Specifies that the emergency-session or emergency-registration of a particular type can be allowed.

no

Disallows the emergency-session or emergency-registration of a particular type.

registration

Allow emergency-registration. By default, it's allowed.

visited-ue: Allow emergency-registration from a visited UE. By default, it's allowed.

session

Specifies the type of emergency-session to be allowed or disallowed. By default, all are allowed.

3gpp-ims-xml-body: Allow 3GPP IM CN XML body to be added in 380 response messages.

anonymous: Allow anonymous subscribers (unregistered UEs) to initiate emergency sessions.

non-emergency-registered: Allow non-emergency registered subscribers to initiate emergency sessions.

sdp-cs-media: Allow emergency calls with SDP CS Media.

visited-ue: Allow emergency calls from visited UE.

Usage

Use this command to configure the function to allow or disallow the emergency-session or emergency-registration of a particular type.

Example

The following command configures the function to allow non-emergency registered subscribers to initiate emergency sessions:

```
emergency session non-emergency-registered
```

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

registration

Configures a registration lifetime for all subscribers to the service.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
registration lifetime { default sec | max sec | min sec }
```

```
default registration lifetime
```

```
{ default sec | max sec | min sec }
```

default sec: Specifies the default amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max sec** -1. Default is 3600. *default sec* must be < or = to **max sec** and > or = to *min sec*.

max sec: Specifies the maximum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to 1209600. Default is 86400. **max sec** must be > or = to *min sec*.

min sec: Specifies the minimum amount of time that a registration can exist on the system. *sec* must be an integer from 60 to **max sec** -1. Default is 60. *min sec* must be < or = to **max sec**.

```
default registration lifetime
```

Returns the command to the default settings.

Usage

Use this command to control the amount of time registrations are allowed to exist on this service.

The system responds to registrations in the following manner:

Using default values:

- If a registration with an expiration value lower than the service's minimum (60) is received, the service will respond with a 423 Interval Too Small message.
- If a registration with an expiration value higher than the service's maximum (2147483646) is received, the service will automatically reduce the expiration value to the default value.
- If a registration is received missing the "Expires" value, or the value is malformed, the service will automatically respond with 3761 in the 200OK message.

Example

The following command configures the maximum registration lifetime to *43200* (12 hours):

```
registration lifetime max 43200
```

reliable-prov-resp

Enables/disables the reliability of provisional responses feature.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
reliable-prov-resp { mandatory | optional }
```

```
no reliable-prov-resp
```

mandatory | **optional**

mandatory: Both inbound and outbound will request reliability.

optional (default): Reliability is imposed by inbound side. Only if inbound call requests reliability will outbound also request reliability.

no

Disables the reliability of provisional responses feature.

Usage

Use this command to enable/disable the reliability of provisional responses feature.

Example

The following command sets the reliability of provisional responses feature to mandatory:

```
reliable-prov-resp mandatory
```

The following command disables the reliability of provisional responses feature:

```
no reliable-prov-resp
```

sifc

Enables Shared Initial Filter Criteria (SiFC) functionality. This command is disabled by default.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] sifc
```

default | no

Disables shared iFC functionality for this SIP Proxy.

Usage

Use this command to configure the SIP Proxy to share iFC functionality.

If both the HSS and the SIP Proxy support this feature, subsets of iFC may be shared by several service profiles. The HSS downloads the unique identifiers of the shared iFC sets to the SIP Proxy. The SIP Proxy uses a locally administered database to map the downloaded identifiers onto the shared iFC sets.

If the SIP Proxy does not support this feature, the HSS will not download identifiers of shared iFC sets.

Important: When using this feature option, the network operator is responsible for keeping the local databases in the S-CSCFs and HSSs consistent.

sigcomp

Enables signaling compression for the SIP Proxy service and enters the Signaling Compression Configuration Mode.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ no ] sigcomp
```

no

Disables signaling compression for the CSCF service.

Usage

Use this command to enable signaling compression for the SIP Proxy service and enter the CSCF Signaling Compression Configuration Mode.

Entering this command results in the following prompt:

```
[ context_name ] hostname (config-sigcomp) #
```

Signaling Compression Configuration Mode commands are defined in the *CSCF Signaling Compression Configuration Mode Commands* chapter in this guide.

tas

Configures the SIP Proxy to perform Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
[ default | no ] tas
```

```
default | no
```

Disables the TAS feature for this SIP Proxy.

Usage

Use this command to configure the SIP Proxy to perform TAS functions.

tas-service

Identifies the name of the service configured on the system performing Telephony Application Server (TAS) functions.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

```
tas-service name
```

```
[ default | no ] tas-service
```

name

Specifies the name of the service configured on the system performing TAS functions. *name* must be from 1 to 63 alpha and/or numeric characters and be an existing service.

```
default | no
```

Removes the TAS name from the SIP Proxy configuration.

Usage

Use this command to identify the name of the service configured on the system performing TAS functions. The `ims-sh-service` commands are defined in the Context Configuration Mode Commands chapter in this guide.

Example

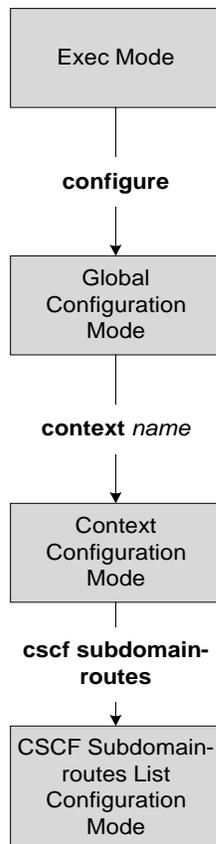

The following command identifies the TAS service name as `scscf3`:

```
tas-service scscf3
```

Chapter 84

CSCF Subdomain-route List Configuration Mode Commands

The CSCF Subdomain-route List Configuration Mode is used to configure the subdomain-routes for the I-CSCF. These subdomain-routes are used to send messages over the Ma-interface (I-CSCF interface toward AS).

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the subdomain-route at the bottom or end of the subdomain-routes list. Use this command in conjunction with the **route** command.

Product

SCM (I-CSCF)

Privilege

Administrator

Syntax**after**

Usage

Add this command before the **route** command to place the route at the end of the subdomain-routes list.

before

Places the subdomain-route at the beginning or top of the subdomain-routes list. Use this command in conjunction with the **route** command.

Product

SCM (I-CSCF)

Privilege

Administrator

Syntax**before**

Usage

Add this command before the **route** command to place the route at the beginning of the subdomain-routes list.

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

route

Creates a route entry to be used in the subdomain-routes list for the I-CSCF.

Product

SCM (I-CSCF)

Privilege

Administrator

Syntax

```
[ no ] route peer-servers name [ log ] base-criteria destination aor aor
```

no

Removes specified route entry.

peer-servers name

Specifies the name of a peer server group.

name must be an existing peer server group from 1 to 79 alpha and/or numeric characters in length.

log

Enables logging for CSCF sessions meeting the criteria specified. The logs can be viewed by executing the **logging filter active facility cscf** command in the Exec mode.

base-criteria destination aor aor

Filters routes based on the destination AoR.

aor must be an existing AoR from 1 to 79 alpha and/or numeric characters in length.

Important: AoR regular expressions are supported. Refer to the *SCM Engineering Rules Appendix* in the *Session Control Manager Administration Guide* for more information about regular expressions.

Usage

Use this command to create and order routes in the subdomain-routes list for the I-CSCF. I-CSCF, upon receiving the terminating request, checks the subdomain-route list for matches. If a match is found, the routing will happen based on it. Otherwise, I-CSCF performs a User Location Query (Location-Information-Request) before proceeding.

Example

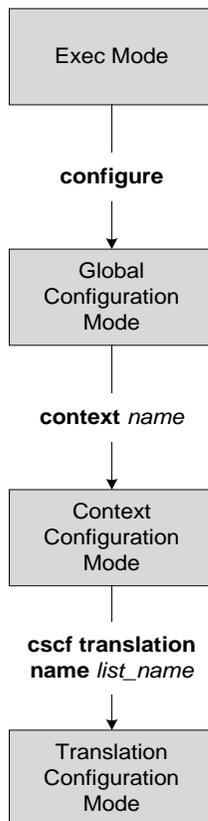

The following command creates a route for the subdomain-routes list to peer server group *ps5* with a destination AoR of *\$.@abc123.com*:

```
route peer-servers ps5 base-criteria destination aor $.@abc123.com
```

Chapter 85

CSCF Translation Configuration Mode Commands

The CSCF Translation Configuration Mode is used to configure session re-addressing within the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

after

Places the CSCF translation entry at the bottom or end of the translation list. Use this command in conjunction with the **uri-readdress** command.

Product

SCM

Privilege

Administrator

Syntax**after**

Usage

Add this command before the **uri-readdress** command to place the entry at the end of the translation list.

before

Places the CSCF translation entry at the top or beginning of the translation list. Use this command in conjunction with the **uri-readdress** command.

Product

SCM

Privilege

Administrator

Syntax**before**

Usage

Add this command before the **uri-readdress** command to place the entry at the beginning of the translation list.

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

uri-readdress

Configures readdress criteria for URI translations.

Product

SCM

Privilege

Administrator

Syntax

```
uri-readdress type trans_type [ log ] { base-criteria criteria } [ filter-criterial criteria ] [ filter-criteria2 criteria ]
```

```
no uri-readdress type trans_type { base-criteria criteria } [ filter-criterial criteria ] [ filter-criteria2 criteria ]
```

type *trans_type*

Specifies that the translation list (*trans_type*) entry is to be identified as one of the following:

blocking-cid: Identifies the translation list entry type as “call ID blocking”.
cancel-blocking-cid: Identifies the translation list entry type as “cancel call ID blocking”.
cancel-cid: Identifies the translation list entry type as “cancel call ID display”.
cancel-cw: Identifies the translation list entry type as “cancel call-waiting”.
cfbl-off: Identifies the translation list entry type as “call forward busy line off”.
cfbl-on: Identifies the translation list entry type as “call forward busy line on”.
cfna-off: Identifies the translation list entry type as “call forward no answer off”.
cfna-on: Identifies the translation list entry type as “call forward no answer on”.
cfu-off: Identifies the translation list entry type as “call forward unconditional off”.
cfu-on: Identifies the translation list entry type as “call forward unconditional on”.
cid: Identifies the translation list entry type as “call ID display”.
cw-off: Identifies the translation list entry type as “call-waiting off”.
cw-on: Identifies the translation list entry type as “call-waiting on”.
directory-assistance: Identifies the translation list entry type as “directory assistance”.
emergency: Identifies the translation list entry type as “emergency”.
international: Identifies the translation list entry type as “international”.
local: Identifies the translation list entry type as “local”.
long-distance: Identifies the translation list entry type as “long-distance”.
none: Identifies the translation list entry type as “any”.
operator-assistance: Identifies the translation list entry type as “operator assistance”.
premium-service: Identifies the translation list entry type as “premium service”.
service: Identifies the translation list entry type as “special service”.
tollfree: Identifies the translation list entry type as “toll free”.

log

Enables logging for CSCF sessions meeting the readdress criteria for URI translations.

base-criteria *criteria*

Specifies the base criteria that packets will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.

- **destination aor aor**: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).
- **source address ip_address**: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor aor**: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

filter-criterial *criteria*

Specifies the filter criteria that packets that have passed the base criteria will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.
- **destination aor aor**: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).
- **source address ip_address**: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor aor**: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

filter-criteria2 *criteria*

Specifies the filter criteria that packets that have passed the base criteria and filter criteria1 will be compared against. The following criteria is supported:

- **any**: Filters all CSCF sessions.
- **destination aor aor**: Filters sessions based on the destination AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

Important: AoR regular expressions are supported. Refer to the SCM Engineering Rules Appendix in the Session Control Manager Administration Guide for more information about regular expressions.

- **plmn-id mcc mcc_code mnc mnc_code**: Filters sessions based on the mobile country and network codes. *mcc_code* must be a three-digit integer from 200 to 999. *mnc_code* must be either a two or three-digit integer from 00 to 999 or **any** (any MNC code).

- **source address** *ip_address*: Filters sessions based on source IP address. *ip_address* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.
- **source aor** *aor*: Filters sessions based on the source AoR. *aor* must be an existing AoR from 1 to 79 characters in length.

```
no uri-readdress type trans_type { base-criteria criteria } [ filter-criterial criteria ] [ filter-criteria2 criteria ]
```

Remove the readdress configuration.

Usage

Use this command to readdress URIs based on specified criteria and enters the URI Readdress Configuration Mode. Readdressing can be used for:

- **Mobility**: When roaming in a visited domain.
- **Service Aliases**: Resolving well-known addresses via SIP-AS.
- **Number Translation**: Adding or deleting prefixes such as +1 to/from PSTN numbers.
- **Voice VPNs**: Using inter-office extensions to dial remote offices.

Entering this command results in the following prompt:

```
[context_name]hostname(config-uri-readdress)#
```

URI readdress commands are defined in the *CSCF URI Readdress Configuration Mode Commands* chapter of this reference.

Example

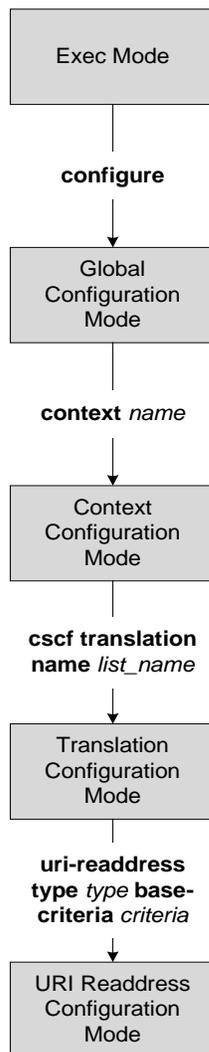

The following command readdresses sessions to a domain named *service.com*, filters sessions with a base criteria of the source address (*1.2.3.4*) and a filter criteria of the destination AoR (*\$.@test.com*):

```
uri-readdress type service base-criteria source address 1.2.3.4 filter-criterial destination aor $.@test.com
```

Chapter 86

CSCF URI Readdress Configuration Mode Commands

The URI Readdress Configuration Mode is used to set URI translations.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action

Adjusts a target address to route sessions to appropriate locations.

Product

SCM

Privilege

Administrator, Config-administrator

Syntax

```
action { addstring | deletenum_chars | modifystring } position num target {
destination | source } { aor | domain | user }
```

no action

add string | **delete** *num_chars* | **modify** *string*

add string: Adds a specified string to a location indicated by the **position** keyword for the targeted source or destination address component (aor, domain, or user). *string* must be from 1 to 79 alpha and/or numeric characters.

delete num_chars: Deletes a number of characters starting from a location specified by the **position** keyword for the targeted source or destination address component (aor, domain, or user). *num_chars* must be an integer from 1 to 79.

modify string: Modifies a specified string in a location starting with the **position** keyword for the targeted source or destination address component (aor, domain, or user). The number of characters in the *string* variable will replace the same number in the address. *string* must be from 1 to 79 alpha and/or numeric characters.

position *num*

Specifies the position in the target string where the action is to occur. *num* must be an integer from 1 to 79.

target { **destination** | **source** }

Species that the action is to occur within the source or destination address.

aor | **domain** | **user**

aor: Specifies that the action is applied to AoRs in the targeted source or destination address.

domain: Specifies that the action is applied to domains in the targeted source or destination address.

user: Specifies that the action is applied to users in the targeted source or destination address.

no

Disables target address to route sessions.

Usage

Use this command to manipulate SIP packets matching the criteria in the uri-readdress command.

Example

The following command prepends a “+1” to a destination AoR:

```
action add +1 position 1 target destination aor
```

The following command removes the first two characters from the destination AoR:

```
action delete 2 position 1 target destination aor
```

The following command replaces characters 2 through 4 with the characters “abc” in the destination AoR:

```
action modify abc position 2 target destination aor
```

Chapter 87

CSCF URN List Configuration Mode Commands

The CSCF URN List Configuration Mode is used to map URNs to URIs for emergency and local call services.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cscf-urn-service-mapping

Adds an entry to the service URN mapping table that maps uniform resource names (URNs) to URIs in order to direct specific service-oriented identifiers to the proper location in a network. The table is used after CSCF translation if the result is a local service.

Product

SCM

Privilege

Administrator

Syntax

```
[ no ] cscf-urn-service-mapping urn urn uri uri
```

no

Removes an entry from the service URN mapping table.

urn *urn*

Specifies the URN to be routed via a URL to the appropriate destination. *urn* must be from 1 to 79 alpha and/or numeric characters.

uri *uri*

Specifies the URI used to route the URN to the appropriate location. *uri* must be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to add an entry to the service URN mapping table that routes a translated URN to a URI for local services.

Important: Service URN mapping tables are limited to 30 URN to URI mapping entries.

Example

The following command map URN *business* to URI *corp@123.45.678.9:5020* and adds it to the service URN mapping table:

```
cscf-urn-service-mapping urn business uri corp@123.45.678.9:5020
```

end

Exits the current mode and returns to the Exec Mode.

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

server-interface

This is a restricted command. In StarOS 9.0 and later, this command is deprecated.

Chapter 90

DHCP Service Configuration Mode Commands

The Dynamic Host Control Protocol (DHCP) Configuration Mode is used to create and manage DHCP service instances for the current context.

allow

This command allows the specified options on the DHCP service.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] allow { dhcp-inform | dhcp-relay-agent-auth-suboption | dhcp-relay-agent-  
option | dhcp-server rapid-commit }
```

no

Disables an option on the DHCP service.

dhcp-inform

Enables the sending of DHCP inform after configuration for address recovery.

dhcp-relay-agent-auth-suboption

Enables the sending of DHCP relay agent authentication suboption in all outgoing messages.

dhcp-relay-agent-option

Enables the sending of DHCP relay agent option in all outgoing messages.

dhcp-server rapid-commit

Enables support of the rapid commit feature for DHCP server functionality, as defined in RFC 4039.

Usage

Use this command to enable/disable options on the DHCP service.

Example

The following command enables support of the rapid commit feature for DHCP server functionality:

```
allow dhcp-server rapid-commit
```

bind

This command binds the DHCP service to a logical IP interface facilitating the system's connection to the DHCP server. This command also configures traffic from the specified DHCP service bind address to use the specified Multiple Protocol Label Switching (MPLS) labels.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
bind address ip_address [ next-hop-forwarding-address nexthop_ip_address [ mpls-label input in_mpls_label_value output out_mpls_label_value1 [ out_mpls_label_value2 ] ]
```

```
no bind address ip_address
```

no

Removes a previously configured binding.

ip_address

Specifies the IP address of an interface in the current context through which the communication with the DHCP server occurs. *ip_address* must be expressed in dotted decimal notation.

next-hop-forwarding-address *nexthop_ip_address*

Specifies the next hop gateway address for in MPLS network to which the packets with MPLS labels will be forwarded.

nexthop_ip_address must be expressed in IPv4/IPv6 notation.

mpls-label input *in_mpls_label_value*

This keyword specifies the MPLS label to identify inbound traffic destined for the configured DHCP service bind address *ip_address*.

in_mpls_label_value is the MPLS label that will identify inbound traffic destined for the configured DHCP service and must be an integer from 16 through 1048575.

Important: This keyword is license-enabled and available with valid MPLS feature license only.

Caution: For DHCP over MPLS feature to work in StarOS 9.0 onward **dhcp ip vrf** command must be configured in DHCP service. Without **dhcp ip vrf** command the DHCP service using MPLS labels will not be started and as a part of DHCP over MPLS configuration in StarOS 9.0 onward this keyword is a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

```
output out_mpls_label_value1 [ out_mpls_label_value2 ]
```

This keyword adds the MPLS label to the outbound traffic sent from the configured DHCP service bind address *ip_address*. The labels *out_mpls_label_value1* and *out_mpls_label_value2* identify the MPLS labels to be added to packets sent from the specified dhcp service bind address. *out_mpls_label_value1* is the inner output label and must be an integer from 16 through 1048575. *out_mpls_label_value2* is the outer output label and must be an integer from 16 through 1048575.

Important: This keyword is license-enabled and available with valid MPLS feature license only.

Usage

Use this command to associate or tie the DHCP service to a specific logical IP address previously configured in the current context and bound to a port. Once bound, the logical IP address or interface is used in the giaddr field of the DHCP packets.

When this command is executed, the DHCP service is started and begins the process of requesting addresses from the DHCP server and storing them in cache memory for allocation to PDP contexts.

This command can also be used to configure MPLS labels for inbound and outbound traffic through this DHCP address.

Only one interface can be bound to a service.

For DHCP over MPLS feature to work in StarOS 9.0 onward **dhcp ip vrf** command must be configured in DHCP service. Without **dhcp ip vrf** command the DHCP service using MPLS labels will not be started.

Caution: As a part of DHCP over MPLS configuration **mpls-label input** keyword in **bind address** command is also a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

Example

The following command binds the DHCP service to the interface with an IP address of 192.168.1.210:

```
bind address 192.168.1.210
```

default

Restores DHCP service parameters to their factory default settings.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
default { dhcp { deadtime | detect-dead-server { consecutive-failures } |  
server-selection-algorithm } | lease-duration | max-retransmissions |  
retransmission-timeout | T1-threshold | T2-threshold }
```

```
dhcp { deadtime | detect-dead-server { consecutive-failures } | server-  
selection-algorithm }
```

Restores the following DHCP parameters to their respective default settings:

- **deadtime**: Default 10 minutes
- **detect-dead-server { consecutive-failures }**: Default 5
- **server-selection-algorithm**: Default First-server

lease-duration

Restores the lease-duration parameter to its default setting of 86400 seconds.

max-retransmissions

Restores the max-retransmissions parameter to its default setting of 5.

retransmission-timeout

Restores the retransmission-timeout parameter to its default setting of 3000 milli-seconds.

T1-threshold

Restores the T1-threshold parameter to its default setting of 50%.

T2-threshold

Restores the T2-threshold parameter to its default setting of 88%.

Usage

After system parameters have been modified, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the dhcp deadtime parameter to its default setting of 10 minutes:

■ default

```
default dhcp deadtime
```

dhcp client-identifier

This command configures behavior relating to inclusion of client identifier DHCP option in DHCP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
dhcp client-identifier { msisdn | none }
```

```
default dhcp client-identifier
```

default

Sets the behavior of DHCP client identifier to default; i.e. not to include client identifier option in any DHCP message.

msisdn

Default: disabled

Specifies that subscriber's MSISDN be included in client-identifier option of the relevant DHCP messages.

Important: This keyword is GGSN license controlled.

none

Default: enabled

Specifies that DHCP client-identifier option would not be included in any DHCP messages. This is the default behavior.

Usage

Use this command to configure behavior relating to inclusion or exclusion of DHCP client identifier option from DHCP messages.

Example

The following command specifies that DHCP client-identifier option be excluded from DHCP messages:

```
dhcp client-identifier none
```

dhcp deadtime

Configures the amount of time that the system waits prior to re-communicating with a DHCP server that was previously marked as down.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp deadtime max_time
```

max_time

Default: 10 minutes

Specifies the maximum amount of time to wait before communicating with DHCP server that were previously unreachable.

max_time is measured in minutes and can be configured to any integer value from 1 to 65535.

Usage

If the system is unable to communicate with a configured DHCP server, after a pre-configured number of failures the system marks the server as being down.

This command specifies the amount of time that the system waits prior to attempting to communicate with the downed server.

Important: If all DHCP servers are down, the system will immediately treat all DHCP servers as active, regardless of the deadtime that is specified.

Refer to the **dhcp detect-dead-server** and **max-retransmissions** commands for additional information on the process the system uses to mark a server as down.

Example

The following command configures the system to wait 20 minutes before attempting to re-communicate with a dhcp server that was marked as down:

```
dhcp deadtime 20
```

dhcp detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a DHCP server as down.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp detect-dead-server consecutive-failures max_number
```

```
consecutive-failures max_number
```

Default: 5

Specifies the number of failures that could occur before marking a DHCP server as down.

max_number could be configured to any integer value from 1 to 1000.

Usage

This command works in conjunction with the *max-retransmissions* parameter to set a limit to the number of communication failures that can occur with a configured DHCP server.

The *max-retransmissions* parameter limits the number of attempts to communicate with a server. Once that limit is reached, the system treats it as a single failure. This parameter limits the number of consecutive failures that can occur before the system marks the server as down and communicate with the server of next highest priority.

If all of the configured servers are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority server again.

If the system receives a message from a DHCP server that was previously marked as down, the system immediately treats it as being active.

Example

The following command configures the system to allow 8 consecutive communication failures with a DHCP server before it marks it as down:

```
dhcp detect-dead-server consecutive-failures 8
```

dhcp ip vrf

This command provides the DHCP-over-MPLS support and associates the specific DHCP service with a pre-configured Virtual Routing and Forwarding (VRF) Context instance for virtual routing and forwarding.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
dhcp ip vrf vrf_name
```

```
no dhc ip vrf
```

no

Removes/disassociates configured IP Virtual Routing and Forwarding (VRF) context instance.

vrf_name

Specifies the name of a pre-configured VRF context instance to be associated with a DHCP service.

vrf_name is name of a pre-configured virtual routing and forwarding (VRF) context configured in context configuration mode and associated with the IP Pool used by the DHCP service.

Usage

Use this command to enable the DHCP-over-MPLS support and to associate/disassociate a pre-configured VRF context to a DHCP service for this feature.

By default the VRF is NULL, which means that DHCP service is bound with binding address given by **bind address** command only.

VRF is not a critical parameter for the DHCP Service but bind address is a critical parameter for DHCP Service, and while starting DHCP Service, if this command is configured, then the bind address should be present in that VRF, and If this command is not configured, bind address should be present in the context where DHCP Service is configured.

For DHCP over MPLS feature to work in StarOS 9.0 onward this command must be configured in DHCP service. Without this command the DHCP service using MPLS labels will not be started.

Caution: As a part of this configuration **mpls-label input** keyword in **bind address** command is also a critical parameter for the DHCP-Service. Any change in its value will result in DHCP-service restart and clearing of the existing calls.

Example

Following command associates VRF context instance *dhcp_vrf1* with this DHCP service:

```
dhcp ip vrf dhcp_vrf1
```

dhcp server

Configures DHCP servers with which the DHCP service is to communicate.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp server ip_address [ priority priority ]
```

```
no dhcp server ip_address
```

no

Deletes a previously configured DHCP server.

ip_address

Specifies the IP address of the DHCP server expressed in dotted decimal notation.

priority *priority*

Specifies the priority of the server if multiple servers are configured.

priority can be configured to any integer value from 1 to 1000. 1 is the highest priority.

Usage

Use this command to configure the DHCP server(s) that the system is to communicate with. Multiple servers can be configured each with their own priority. Up to 20 DHCP servers can be configured. All DHCP messages are sent/received on UDP port 67.

Important: If a server is removed, all calls having an IP address allocated from the server will be released.

Example

The following command configures a DHCP server with an IP address of 192.168.1.200 and a priority of 1:

```
dhcp server 192.168.1.200 priority 1
```

dhcp server selection-algorithm

Specifies the algorithm used to select DHCP servers with which to communicate when multiple servers are configured.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp server selection-algorithm { first-server | round-robin }
```

first-server

Default: Enabled

Selects the first-server algorithm to be used. This algorithm dictates that the system select the DHCP servers according to their priority starting with the highest priority server. The system communicates with the server of the next highest priority only when the previous server is unreachable.

round-robin

Default: Disabled

Selects the round-robin algorithm to be used. This algorithm dictates that the system communicates with the servers in a circular queue according to the server's configured priority starting with the highest priority server. The next request is communicated with the next highest priority server, and so on until all of the servers have been used. At this point, the system starts from the highest priority server.

Usage

Use this command to determine how configured DHCP servers are utilized by the system.

Example

The following command configures the DHCP service to use the round-robin selection algorithm:

```
dhcp server selection-algorithm round-robin
```

end

Exits the context configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the context configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

lease-duration

Configures the minimum and maximum allowable lease times that are accepted in responses from DHCP servers.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
lease-duration min min_time max max_time
```

min *min_time*

Default: 600

Specifies the minimum acceptable lease time.

min_time is measured in seconds and can be configured to any integer value from 600 to 3600.

max *max_time*

Default: 86400

Specifies the maximum acceptable lease time.

max_time is measured in seconds and can be configured to any integer value from 10800 to 4294967295.

Usage

To reduce the call setup time, the system requests IP addresses from the DHCP server in blocks rather than on a call-by-call basis. Each address received has a corresponding lease time, or time that it is valid. The values configured by command represent the minimum and maximum times that the system allows and negotiates for the lease(s).

If the DHCP server responds with values that are out of the range specified by the min and max values, the system accumulates warning statistics. Responses that fall below the minimum value are rejected by the system and the system contacts the DHCP server with the next highest priority. Responses that are greater than the maximum value are accepted.

When half of the lease time has expired, the system automatically requests a lease renewal from the DHCP server. This is configured using the **T1-threshold** command.

Example

The following command configures the minimum allowable lease time for the system to be 1000 and the maximum to be 36000:

```
lease-duration min 1000 max 36000
```

max-retransmissions

Configures the maximum number of times that the system attempts to communicate with unresponsive DHCP server before it is considered a failure.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
max-retransmissions max_number
```

max_number

Default: 5

Specifies the maximum number of re-attempts the system tries when no response is received from a DHCP server.

max_number can be configured to any integer value from 1 to 20.

Usage

This command works in conjunction with the *dhcp detect-dead-server* parameter to set a limit to the number of communication failures that can occur with a configured DHCP server.

When the value specified by this parameter is met, a failure is logged. The *dhcp detect-dead-server* parameter specifies the number of consecutive failures that could occur before the server is marked as down.

In addition, the **retransmission-timeout** command controls the amount of time between re-tries.

Example

The following command configures the maximum number of times the system re-attempts communication with a DHCP server that is unresponsive to 5:

```
max-retransmissions 5
```

retransmission-timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the DHCP server.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
retransmission-timeout time
```

time

Default: 10000

Specifies the time that the system waits before retrying to communicate with the DHCP server.

time is measured in milliseconds and can be configured to any integer value from 100 to 20000.

Usage

This command works in conjunction with the **max-retransmissions** command to establish a limit on the number of times that communication with a DHCP server is attempted before a failure is logged. This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 1000 milliseconds:

```
retransmission-timeout 1000
```

T1-threshold

Configures the DHCP T1 timer as a percentage of the allocated IP address lease.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

T1-threshold *percentage*

percentage

Default: 50%

The percentage of the allocated IP address lease time at which the DHCP call-line state is changed to “RENEWING”. It can be configured to any integer value from 40 to 66%.

Usage

This command is used to identify the time at which a subscriber must renew their DHCP lease as a percentage of the overall lease time. (Refer to the **lease-duration** command in this chapter for information on configuring the IP address lease period.)

For example, if the lease-duration was configured to have a maximum value of 12000 seconds, and this command is configured to 40%, then the subscriber would enter the RENEWING state after 4800 seconds.

Example

The following command configures the T1 threshold to 40%:

```
T1-threshold 40
```

T2-threshold

Configures the DHCP T2 timer as a percentage of the allocated IP address lease.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

T2-threshold *percentage*

percentage

Default: 88%

The percentage of the allocated IP address lease time at which the DHCP call-line state is changed to “REBINDING”. It can be configured to any integer value from 67 to 99%.

Usage

This command is used to identify the time at which a subscriber re-binds their DHCP leased IP address as a percentage of the overall lease time. (Refer to the **lease-duration** command in this chapter for information on configuring the IP address lease period.)

For example, if the lease-duration was configured to have a maximum value of 12000 seconds, and this command is configured to 70%, then the subscriber would enter the REBINDING state after 8400 seconds.

Example

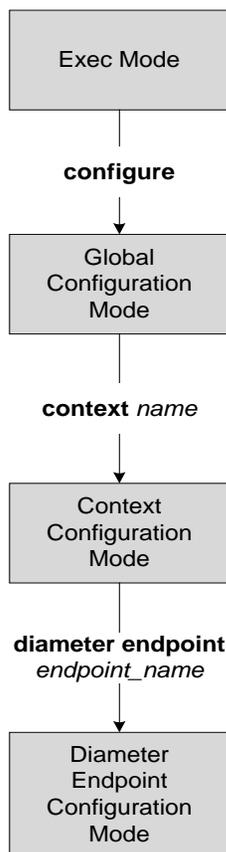

The following command configures the T1 threshold to 70%:

```
T2-threshold 70
```

Chapter 91

Diameter Endpoint Configuration Mode Commands

Diameter Endpoint Configuration Mode is accessed from the Context Configuration Mode. The base Diameter protocol operation is configured in the Diameter Endpoint Configuration Mode.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cea-timeout

This command configures the Capabilities-Exchange-Answer (CEA) message timeout duration for Diameter sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cea-timeout timeout
```

```
default cea-timeout
```

default

Configures the default CEA timeout setting.

timeout

Specifies the timeout duration, in seconds, to make the system wait for this duration for CEA message.

timeout must be an integer from 1 through 120.

Default: 30 seconds

Usage

Use this command to configure the CEA timer, i.e., how long to wait for the Capabilities-Exchange-Answer message.

Example

The following command sets the Diameter CEA timeout to 16 seconds:

```
cea-timeout 16
```

connection retry-timeout

This command configures the Diameter Connection Retry Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
connection retry-timeout timeout
```

```
default connection retry-timeout
```

default

Configures the default Connection Retry Timeout setting.

timeout

Specifies the connection retry timeout duration, in seconds, and must be an integer from 1 through 3600.

Default: 30 seconds

Usage

Use this command to configure the Diameter Connection Retry Timeout parameter.

Example

The following command sets the Diameter Connection Retry Timer to *120* seconds:

```
connection retry-timeout 120
```

connection timeout

This command configures the Diameter Connection Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
connection timeout timeout
```

```
default connection timeout
```

default

Configures the default Diameter Connection Timeout setting.

```
connection timeout timeout
```

timeout specifies the connection timeout duration, in seconds, and must be an integer from 1 through 30.

Default: 30 seconds

Usage

Use this command to configure the Diameter Connection Timeout parameter.

Example

The following command sets Diameter connection timeout to *16* seconds:

```
connection timeout 16
```

device-watchdog-request

This command manages transport failure algorithm and configures the number of Device Watchdog Requests (DWRs) that will be sent before a connection is closed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
device-watchdog-request max-retries retry_count
```

```
default device-watchdog-request max-retries
```

default

Configures the default setting.

retry_count

Specifies the maximum number of DWRs, and must be an integer from 1 through 10.

Default: 1

Usage

Use this command to configure the number of DWRs to be sent before closing the connection from a Diameter endpoint.

Example

The following command sets the DWRs to 3:

```
device-watchdog-request max-retries 3
```

dpa-timeout

This command configures the Disconnect-Peer-Answer (DPA) message timeout duration for Diameter session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
dpa-timeout timeout
```

```
default dpa-timeout
```

default

Configures the default DPA message timeout setting.

timeout

Specifies the DPA message timeout duration, in seconds, and must be an integer from 1 through 60.

Default: 30 seconds

Usage

Use this command to set the timer for DPA message timeout during Diameter connection session. This makes the system wait for this duration for DPA message.

Example

The following command sets the Diameter DPA timeout to *16* seconds:

```
dpa-timeout 16
```

dynamic-peer-discovery

Configures the system to dynamically locate peer Diameter servers by means of DNS.

Product

MME

Privilege

Administrator

Syntax

```
dynamic-peer-discovery [ protocol { sctp | tcp } ]  
  
{ default | no } dynamic-peer-discovery
```

default

Configures the default setting.
Default: disabled

no

Removes the configuration.

protocol { sctp | tcp }

Configures peer discovery to use a specific protocol.

sctp: Specifies that the Streaming Control Transmission Protocol (SCTP) is to be used for peer discovery.

tcp: Specifies that the Transmission Control Protocol (TCP) is to be used for peer discovery.

Default: TCP

Usage

Use this command to configure the system to dynamically locate peer Diameter servers by means of DNS.

Configure the **dynamic-peer-realm** command to locate Diameter servers using Naming Authority Pointer (NAPTR) queries. If the peer realm command is not configured, configuring this command will still allow applications to trigger an NAPTR query on their chosen realms.

The preferred transport protocol is TCP to resolves instances were multiple NAPTR responses with same priority are received. The one using the TCP transport protocol will be chosen. If the transport protocol is confiured through the CLI, then the configured protocol is given preference.

The IP address version will be the same as that of the origin host address configured for the endpoint. For IPv4 endpoints, A-type DNS queries will be sent to resolve FQDNs. For IPv6 endpoints, AAAA-type queries are sent.

Example

The following command configures the system to dynamically locate peer Diameter servers using SCTP:

```
dynamic-peer-discovery protocol sctp
```

dynamic-peer-realm

Configures the name of the realm where peer Diameter servers can be dynamically discovered.

Product

MME

Privilege

Administrator

Syntax

```
[ no ] dynamic-peer-realm realm_name
```

no

Removes the specified dynamic peer realm name from this endpoint configuration.

realm_name

Specifies the name of the peer realm where peer Diameter server are to be dynamically discovered.

realm_name must be an existing realm, and must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to locate Diameter servers using Naming Authority Pointer (NAPTR) queries.

Multiple realms can be configured. Even if the **dynamic-peer-discovery** command is not enabled, the realm configuration(s) will trigger dynamic peer discovery on all diabase instances.

Example

The following command configures a peer realm, used for dynamic peer discovery, with a name of *service-provider.com*:

```
dynamic-peer-realm service-provider.com
```

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the Diameter Endpoint Configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

max-outstanding

This command specifies the maximum number of Diameter messages that any application can send to any one peer, awaiting responses.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
max-outstanding messages
```

```
{ default | no } max-outstanding
```

no

Disables the maximum outstanding messages configuration.

default

Configures the default setting.

messages

Specifies the maximum outstanding peer transmit window size setting, and must be an integer from 1 through 4096.

Default: 256

Usage

Use this command to set the unanswered Diameter messages that any application may send to any one peer, awaiting responses. An application will not send any more Diameter messages to that peer until it has disposed of at least one of those queued messages. It disposes a message by either receiving a valid response or by discarding the message due to no response.

Example

The following command sets the Diameter maximum outstanding messages setting to *1024*:

```
max-outstanding 1024
```

■ origin address

origin address

This command has been deprecated. See the [origin host](#) and [origin realm](#) commands.

origin host

This command sets the origin host for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
origin host host_name address ip_address [ port port_number ] [ accept-incoming-connections ] [ address ip_address_secondary ]
```

```
no origin host host_name address ip_address [ port port_number ]
```

no

Removes the origin host configuration.

host_name

Specifies the host name to bind the Diameter endpoint.

host_name must be the local Diameter host name, and must be a string of 1 through 255 characters in length.

address *ip_address*

Specifies the IP address to bind the Diameter endpoint. This address must be one of the addresses of a chassis interface configured within the context in which Diameter is configured.

ip_address must either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

port *port_number*

Specifies the port number for the Diameter endpoint (on inbound connections).

port_number must be an integer from 1 through 65535.

accept-incoming-connections

Specifies to accept inbound connection requests for the specified host.

address *ip_address_secondary*

Specifies the secondary bind address for the Diameter endpoint. This address must be one of the addresses of a chassis interface configured within the context in which Diameter is configured.

ip_address_secondary must either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

Usage

Use this command to set the bind address for the Diameter endpoint.

■ origin host

Diameter agent on chassis listens to standard TCP port 3868 and also supports the acceptance of any incoming TCP connection from external server.

The command **origin host** *host-name* must be entered exactly once. Alternatively, the **origin host** *host-name* **address** *ip_address* [**port** *port_number*] command may be entered one or more times. The host names should be unique across all endpoints within the context. The address values or address/port combinations should be unique across all endpoints within the context.

Example

The following command sets the origin host name to *test* and the IP address to *1.1.1.1*:

```
origin host test address 1.1.1.1
```

origin realm

This command configures the realm to use in conjunction with the origin host.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] origin realm realm_name
```

no

Removes the origin realm configuration.

realm_name

Specifies the realm to bind the Diameter endpoint. The realm is the Diameter identity. The originator's realm must be present in all Diameter messages. The origin realm can typically be a company or service name. *realm_name* must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to set the realm for the Diameter endpoint. Diameter agent on chassis listens to standard TCP port 3868 and also supports the acceptance of any incoming TCP connection from external server.

Example

The following command sets the origin realm to *companyx*:

```
origin realm companyx
```

peer

This command specifies a peer address for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
peer peer_name [ realm realm_name ] { address ip_address [ [ port port_number ]
[ connect-on-application-access ] [ send-dpr-before-disconnect disconnect-cause
disconnect_cause ] [ sctp ] ] + | fqdn fqdn [ [ port port_number ] [ send-dpr-
before-disconnect disconnect-cause disconnect_cause ] ] }
```

```
no peer peer_name [ realm realm_name ]
```

no

Removes the specified peer configuration.

peer_name

Specifies the peer's name.

peer_name must be an alpha and/or numeric string of 1 through 63 characters in length, and allows punctuation characters.

realm *realm_name*

Specifies the realm of this peer.

realm_name must be an alpha and/or numeric string of 1 through 127 characters in length. The realm name can be a company or service name.

address *ip_address*

Specifies the Diameter peer IP address. This address must be the IP address of the device the chassis is communicating with.

ip_address can either be an IPv4 address expressed in dotted decimal notation, or an IPv6 address expressed in colon notation.

fqdn *fqdn*

Specifies the Diameter peer fully qualified domain name (FQDN).

fqdn must be an alpha and/or numeric string of 1 through 127 characters in length.

port *port_number*

Specifies the port number for this Diameter peer.

port_number must be an integer from 1 through 65535.

connect-on-application-access

Specifies to activate peer on first application access.

send-dpr-before-disconnect

Specifies to send Disconnect-Peer-Request (DPR).

disconnect-cause

Specifies to send Disconnect-Peer-Request to the specified peer with the specified disconnect reason. The disconnect cause must be an integer from 0 through 2, for one of the following:

- REBOOTING(0)
- BUSY(1)
- DO_NOT_WANT_TO_TALK_TO_YOU(2)

sctp

To use Stream Control Transmission Protocol (SCTP) for this peer.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to add a peer to the Diameter endpoint.

Example

The following command adds the peer named *test* with IP address *1.1.1.1* using port *126*:

```
peer test address 1.1.1.1 port 126
```

response-timeout

This command configures the Response Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
response-timeout timeout
```

```
default response-timeout
```

default

Configures the default Response Timeout setting.

timeout

Specifies the response timeout duration, in seconds, and must be an integer from 1 through 300.

Default: 60 seconds

Usage

Use this command to configure the Response Timeout parameter.

Example

The following command sets the response timeout to *100* seconds:

```
response-timeout 100
```

route-entry

This command creates an entry in the route table for Diameter peer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
route-entry { [ host host_name ] [ peer peer_id [ weight priority ] ] [ realm
realm_name { application credit-control peer peer_id [ weight value ] | peer
peer_id [ weight value ] } ] }
```

```
no route-entry { [ host host_name ] [ peer peer_id ] [ realm realm_name {
application credit-control peer peer_id | peer peer_id } ] }
```

no

Disables the specified route-entry table configuration.

host *host_name*

Specifies the Diameter server's host name.

host_name must be an alpha and/or numeric string of 1 through 63 characters in length.

realm *realm_name*

Specifies the realm name. The realm may typically be a company or service name.

realm_name must be an alpha and/or numeric string of 1 through 127 characters in length.

application credit-control

Specifies the credit control application, i.e. DCCA or RADIUS.

peer *peer_id*

Specifies the peer ID of Diameter endpoint route.

peer_id must be an alpha and/or numeric string of 1 through 63 characters in length.

weight *priority*

Specifies the priority for a peer in the route table.

The peer with the highest weight is used. If multiple peers have the highest weight, selection is by round-robin mechanism.

priority must be an integer from 0 through 255.

Default: 10

Usage

Use this command to create a route table for Diameter application.

■ route-entry

When a Diameter client starts to establish a session with a realm/application, the system searches the route table for the best match. If an entry has no host specified, then the entry is considered to match the requested value. Similarly, if an entry has no realm or application specified, then the entry is considered to match any such requested value. The best match algorithm is to prefer specific matches for whatever was requested, i.e., either realm/application or host/realm/application. If there are no such matches, then system looks for route table entries that have wildcards.

Example

The following command creates a route entry with the host name *dcca_host1* and peer ID *dcca_peer* with priority weight of *10*:

```
route-entry host dcca_host1 peer dcca_peer weight 10
```

route-failure

This command controls how action after failure or recovery after failure is performed for the route table.

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

```
route-failure { deadtime seconds | recovery-threshold percent percentage |  
result-code result_code | threshold counter }
```

```
default route-failure { deadtime | recovery-threshold | threshold }
```

```
no route-failure result-code result_code
```

no

Disables the route-failure configuration.

default

Configures the default setting for the specified parameter.

deadtime *seconds*

Specifies the time duration, in seconds, for which system keeps the route FAILED status. When this time expires, the system changes the status to AVAILABLE.

seconds must be the deadtime duration, in seconds, and must be an integer from 1 through 86400.

Default: 60 seconds

recovery-threshold percent *percentage*

Specifies how to reset the failure counter when provisionally changing the status from FAILED to AVAILABLE.

For example, if a failure counter of 16 caused the status to change to FAILED. After the configured deadtime expires, the status changes to AVAILABLE. If this keyword is configured with 75 percent, the failure counter will be reset to 12, i.e., 75 percent of 16.

percentage must be the value in percentage of the counter which caused FAILED, and must be an integer from 1 through 99.

Default: 90 percent

result-code *result_code*

Configures which answer messages are to be treated as failures, in addition to requests that time out.

Up to 16 different result codes can be specified.

result_code must be an integer from 0 through 4,294,967,295.

threshold *counter*

Configures the number of errors that causes the status to become FAILED.

counter must be an integer from 0 through 4,294,967,295.

The error counter begins at zero, and whenever there is a good response it decrements (but not below zero) or increments (but not above this threshold).

Default: 16

Usage

Use this command to control how failure/recovery is performed for the route table. After a session is established, it is possible for the session to encounter errors or Diameter redirection messages that cause the Diameter protocol to re-use the route table to switch to a different route.

Each Diameter client within the chassis maintains counters relating to the status of each of its connections to different hosts (when the destination is realm/application without a specific host, the host name is kept as "", i.e., blank).

Moreover, those counters are further divided according to which peer is used to reach each host. Each Diameter client maintains a status of each peer-to-host combination. Under normal good conditions the status will be AVAILABLE, while error conditions might cause the status to be FAILED.

Only combinations that are AVAILABLE will be used. If none are AVAILABLE, then system attempts the secondary peer if failover is configured and system can find an AVAILABLE combination there. If nothing is AVAILABLE, system uses a FAILED combination.

Example

The following command configures the time duration for route failure to 90 seconds:

```
route-failure deadtime 90
```

tls

This command enables/disables the Transport Layer Security (TLS) support between a Diameter client and Diameter server node.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
tls { certificate certificate | password password | privatekey private_key }
```

```
default tls
```

default

Disables the TLS support at Diameter endpoint.

certificate *certificate*

Specifies the certificate for TLS support.

certificate must be an encrypted certificate, and must be an alpha and/or numeric string of 700 through 900 characters in length.

password *password*

Specifies the password for TLS support.

password must be an encrypted password, and must be an alpha and/or numeric string of 6 through 50 characters in length.

privatekey *private_key*

Specifies the private key for TLS support.

private_key must be an encrypted key, and must be an alpha and/or numeric string of 900 through 1500 characters in length.

Usage

Use this command to configure TLS support between a Diameter client and Diameter server node. By default, TLS is disabled.

Important: Both the Diameter client and server must be configured with TLS enabled or TLS disabled; otherwise, the Diameter connection will be rejected.

Example

The following commands enable the TLS between a Diameter client and Diameter server node:

■ tls

```

tls certificate "-----BEGIN CERTIFICATE-----
\nMIICGDCCAYECAgEBMA0GCSqGSIb3DQEBAUAMFcx CzAJBgNVBAYTA1VTMRMwEQYD\nVQQKE

```

```

tls password password_for_TLS

```

use-proxy

This command enables/disables Diameter proxy for the Diameter endpoint.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] use-proxy
```

no

Disables Diameter proxy for the current endpoint.

This command at endpoint level will actually equip an application to use Diameter proxy to route all its messages to external peer.

Usage

By default, the use-proxy configuration is disabled.

This command equips an application to use Diameter proxy to route all its messages to external peer. The proxy acts as an application gateway for Diameter. It gets the configuration information at process startup and decides which Diameter peer has to be contacted for each application. It establishes the peer connection upon finding no peer connection already exists.

Each proxy task will automatically select one of the host names configured with the **origin host** CLI command. Multiple proxy tasks will not use the same host names, so there should be at least as many host names as proxy tasks. Otherwise, some proxy tasks will not be able to perform Diameter functionality. The chassis automatically selects which proxy tasks are used by which managers (i.e., ACSMgrs/SessMgrs), without verifying whether the proxy task is able to perform Diameter functionality.

To be able to run this command, the Diameter proxy must be enabled. In the Global Configuration Mode, see the **require diameter-proxy** CLI command.

Example

The following command enables Diameter proxy for the current endpoint:

```
use-proxy
```

The following command disables Diameter proxy for the current endpoint:

```
no use-proxy
```

vsa-support

This command allows DIABASE to use vendor IDs configured in the dictionary for negotiation of the Diameter peers' capabilities irrespective of the supported vendor IDs received in CEA message.

Product

GGSN

Privilege

Administrator

Syntax

```
vsa-support { all-from-dictionary | negotiated-vendor-ids }
```

```
default vsa-support
```

default

This default configuration allows the DIABASE to use the vendor IDs satisfying capabilities negotiation.

all-from-dictionary

This keyword allows DIABASE to use the vendor IDs from the dictionary as indicated in the CER message from Diameter peers.

negotiated-vendor-ids

This keyword allows DIABASE to use the supported vendor IDs satisfying capability negotiation.

Usage

Use this command to set DIABASE to use the vendor IDs from the dictionary or use the vendor IDs satisfying the capabilities negotiation.

Example

The following command enables DIABASE to use the vendor IDs specified in the dictionary:

```
vsa-support all-from-dictionary
```

watchdog-timeout

This command configures the Watchdog Timeout parameter.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
watchdog-timeout timeout
```

```
{ default | no } watchdog-timeout
```

no

Disables the watchdog timeout configuration.

default

Configures the default watchdog timeout setting.

timeout

Specifies the timeout duration, in seconds, and must be an integer from 6 through 30.

Default: 30 seconds

Usage

Use this command to configure the Watchdog Timeout parameter for the Diameter endpoint. If this timer expires before getting a response from the destination, other route to the same destination is tried, as long as the retry count setting has not been exceeded (see the [device-watchdog-request](#) CLI command) and as long as the response timer has not expired (see the [response-timeout](#) CLI command).

Example

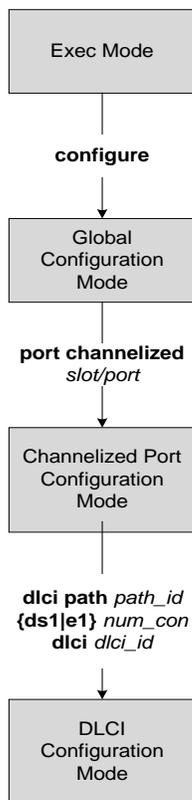

The following command sets the watchdog timeout setting to 15 seconds:

```
watchdog-timeout 15
```

Chapter 92

DLCI Configuration Mode Commands

The DLCI configuration mode provides the commands to configure, bind and manage the DLCI associated with a specific port defined in the parent configuration mode, Channelized Port configuration mode.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind link

This command configures an association (binds) between an IP interface or a pre-configured routing SS7/Frame Relay link and the specific port being configured with the Channelized Port configuration commands.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bind link peer-nsei nse_id ns-vci ns-vc_id
```

peer-nsei *nse_id*

Defines the end-point network service entity identifier (NSEI). The NSEI must be an integer from 0 to 65535.

ns-vc-id *ns-vc_id*

Defines the network service virtual circuit identifier (NSVCI). The NSVCI must be an integer from 0 to 65535.

no

Deletes the bind configuration from the Operator Policy.

Usage

Bind this port to network service entity 2 and network service VC 234.

Example

```
bind link peer-nsei 2 ns-vci 234
```

end

Exits this sub-configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode and return to the Exec mode.

■ exit

exit

Exits the this sub-configuration mode and returns to the parent configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous configuration mode.

shaping

Defines egress traffic shaping to control flow for this DLCI.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shaping *type*

default **shaping**

shaping *type*

The following types of shaping provide flow management:

- **cir**: Committed Info Rate
- **cir-eir**: Committed Info Rate with Excess Rate
- **ppr**: Peak Packet Rate
- **wfq**: Weighted Fair Queuing

default

Resets the DLCI configuration to the system default.

Usage

Use this command to identify the type of signal shaping to be used on the DLCI.

Example

shaping *cir*

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.

This command with the **no** keyword is required to bring a port into service.

Example

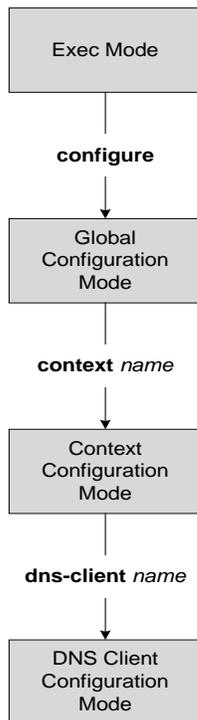

Use the following command to disable the DLCI:

```
no shutdown
```

Chapter 93

DNS Client Configuration Mode Commands

The DNS Client Configuration Mode is used to manage the system's DNS interface and caching parameters.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind address

Binds the DNS client to a pre-configured logical IP interface.

Product

MME, SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
bind address ip_address [ port number ]
```

```
no bind address
```

no

Removes the binding of the client to a specified interface.

ip_address

Specifies the IP address of the interface to which the DNS client is being bound. *ip_address* must be expressed in IPv4 dotted decimal notation.

port *number*

Default: 6011

Specifies the UDP port number of the interface to which the DNS client is being bound. *number* must be an integer value from 1 to 65535.

Usage

Use this command to associated the client with a specific logical IP address.

Example

The following command binds the DNS client to a logical interface with an IP address of *1.2.3.4* and a port number of *6000*:

```
bind address 1.2.3.4 port 6000
```

cache algorithm

Configures the method of use of the DNS VPN and session cache.

Product

MME, SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
cache algorithm { central | local } { FIFO | LRU | LFU }  
default cache algorithm { central | local }
```

default

Sets the DNS VPN and session cache method to default setting.

central | local

central: Specifies the central proctlet (VPN manager)

local: Specifies the local proctlet (session manager)

FIFO | LRU | LFU

FIFO: First in first out. This is the default setting for the central proctlet.

LRU: Least recently used. This is the default value for the local proctlet.

LFU: Least frequently used.

Usage

Use this command to configure the method by which entries are added and removed from the DNS cache.

Example

The following command configures the cache algorithm for the central proctlet to least frequently used (LFU):

```
cache algorithm central lfu
```

cache size

Configures the maximum number of entries allowed in the DNS cache.

Product

MME, SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
cache size { central | local } max_size
```

```
default cache size { central | local }
```

default

Sets the maximum number of entries allowed in the DNS cache to default setting.

```
{ central | local } max_size
```

central max_size: Specifies the maximum number of entries allowed in the central procket cache.

max_size must be an integer value from 100 to 65535 in length. The default value for the central procket is 50000.

local max_size: Specifies the maximum number of entries allowed in the local procket cache. *max_size* must be an integer value from 100 to 65535 in length. The default value for the local procket is 1000.

Usage

Use this command to configure the maximum number of entries allowed in the DNS cache.

Example

The following command configures the cache size of the central procket to *20000*:

```
cache size central 20000
```

cache ttl

Configures the DNS cache time to live (TTL) for positive and negative responses.

Product

MME, SCM, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
cache ttl { negative | positive } seconds
```

```
default cache ttl { negative | positive }
```

```
no cache [ ttl { negative | positive } ]
```

no

Disables any or all configured DNS cache parameters.

default

Sets the DNS cache time to live for positive and negative responses to default setting.

```
{ negative | positive } seconds
```

negative seconds: Specifies the time to live for negative responses. *seconds* must be an integer value from 60 to 86400. The default value is 60 seconds.

positive seconds: Specifies the time to live for positive responses. *seconds* must be an integer value from 60 to 86400. The default value is 86400 seconds (1 day).

Usage

Use this command to adjust the DNS cache time to live.

Example

The following commands set the TTL DNS cache to 90 seconds for negative responses and 43200 seconds for positive responses:

```
cache ttl negative 90
```

```
cache ttl positive 43200
```

case-sensitive

Configures the case sensitivity requirement for responses to DNS requests.

Product

MME, SCM, SGSN

Privilege

Administrator

Syntax

```
[ default | no ] case-sensitive response
```

default

Returns the command to its default setting of disabled.

no

Disables the requirement for case sensitivity for DNS responses.

Usage

Use this command to require case sensitivity (identical case usage between request and response) on all responses to DNS request messages.

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

■ exit

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

resolver

Configure the number of DNS query retries and the retransmission interval once the response timer times out.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
resolver { number-of-retries retries | retransmission-interval time }  
default { number-of-retries | retransmission-interval }
```

default

Use this keyword to reset the specified resolver configuration to the default.

number-of-retries *retries*

Configures the number of DNS query retries on DNS response timeout.

retries: enter an integer from 0 to 4. Default is 2 retries.

retransmission-interval *time*

Configures the initial retransmission interval, in seconds, for retransmission after the DNS response timeout. The retransmission interval doubles after each retry when only one server is configured. In case both primary and secondary servers are configured, the retransmission time is doubled for the last retry.

time: enter an integer from 2 to 5. Default is 3 seconds.

Usage

Set the DNS retransmission retries or the retransmission interval. Issue the command twice to configure both parameters, one-at-a-time.

Example

The following command sets the DNS resolver retries to 4:

```
resolver number-of-retries 4
```

round-robin answers

This command configures the DNS client to return the DNS results in round-robin fashion if multiple results are available for a DNS query.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] round-robin-answers
```

no

Removes the configured round robin method for DNS answer.

default

Disabled the round robin method for DNS answer.

Usage

Use this command to configure the DNS client to return the DNS results in round-robin fashion if multiple results are available for a DNS query.

Example

The following command configures the DNS client to use round robin method for DNS query answers:

```
default ] round-robin-answers
```

Chapter 94

EAP Authentication Configuration Mode Commands

The EAP Authentication Configuration Mode is used to configure the EAP authentication methods for the crypto template.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

eap-aka

Configures shared key values for the EAP-AKA authentication method used by subscribers using this crypto template.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
eap-aka { encrypted key hex | key hex }
```

encrypted key *hex*

Specifies that the shared key is to be encrypted. *hex* must be a 16-character alpha and/or numeric string or a hexadecimal number beginning with “0x”.

key *hex*

Specifies that the shared key is to be transmitted in clear text. *hex* must be a 16-character alpha and/or numeric string or a hexadecimal number beginning with “0x”.

Usage

Use this command to set shared key parameters for subscribers using the EAP-AKA authentication method.

Example

The following command configures a clear-text shared key value for the EAP-AKA method:

```
eap-aka key aa11223344556677
```

eap-gtc

Configures shared key values for the EAP-GTC authentication method used by subscribers using this crypto template.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
eap-gtc { encrypted key value | key value }
```

encrypted key *value*

Specifies that the shared key is to be encrypted. *value* must be a 16-character alpha and/or numeric string.

key *value*

Specifies that the shared key is to be transmitted in clear text. *value* must be a 16-character alpha and/or numeric string.

Usage

Use this command to set shared key parameters for subscribers using the EAP-GTC authentication method.

Example

The following command configures a clear-text shared key value for the EAP-GTC method:

```
eap-GTC key aa11223344556677
```

eap-md5

Configures shared key values for the EAP-MD5 authentication method used by subscribers using this crypto template.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
eap-md5 { encrypted key value | key value }
```

encrypted key *value*

Specifies that the shared key is to be encrypted. *value* must be a 16-character alpha and/or numeric string.

key *value*

Specifies that the shared key is to be transmitted in clear text. *value* must be a 16-character alpha and/or numeric string.

Usage

Use this command to set shared key parameters for subscribers using the EAP-MD5 authentication method.

Example

The following command configures a clear-text shared key value for the EAP-MD5 method:

```
eap-md5 key aa11223344556677
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

■ exit

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

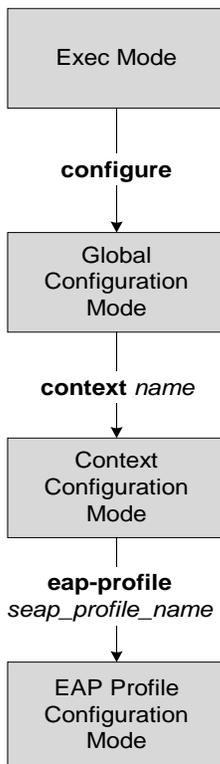

Usage

Returns to the previous mode.

Chapter 95

EAP Configuration Mode Commands

The EAP Configuration Mode is used to configure parameters comprising an Extensible Authentication Profile used to support EAP authentication on the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

max-retry

Configures the maximum number of times the system will retry communicating with another EAP device.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
max-retry num
```

```
default max-retry
```

num

Default: 16

Specifies the number of times to retry EAP communication with another device. *num* must be an integer from 1 to 65535.

Usage

Use this command to set a maximum retry number for communicating with other EAP devices.

Example

The following command sets the maximum number of retries to 50:

```
max-retry 50
```

mode

Configures the system as one of three types of EAP devices: authenticator pass-through, authenticator server, or peer.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
mode { authenticator-pass-through | authenticator-server | peer }
```

default mode

default

Configures the default mode of Authenticator-pass-through.

authenticator-pass-through

Configures the system as an authenticator pass-through allowing EAP authentication to be performed by another server.

This is the default setting for this command.

authenticator-server

Configures the system as an authenticator server. This allows the system to respond to EAP requests.

peer

Configures the system as a peer device requiring it to make EAP requests of another server or pass-through device.

Usage

Use this command to configure the system to perform as one of three types of EAP devices and configure settings in an EAP mode.

EAP Mode Configuration Mode commands are defined in the EAP Mode Configuration Mode Commands chapter.

Example

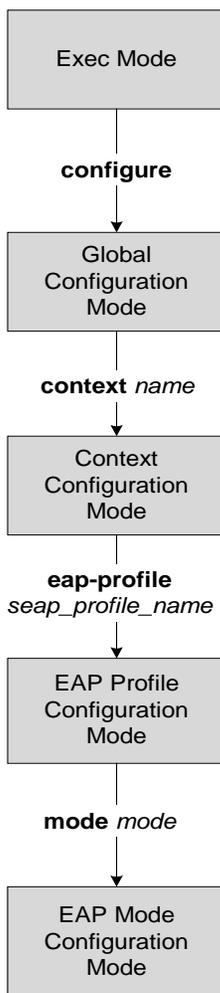

The following command configures the system to perform as an authenticator pass-through:

```
mode authenticator-pass-through
```

Chapter 96

EAP Mode Configuration Mode Commands

The EAP Mode Configuration Mode is used to configure EAP authentication method supported by the system.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the previous mode.

method

Configures the EAP method used for authentication.

Product

PDIF, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
method { eap-aka | eap-gtc | eap-md5 } [ priority num ]
```

eap-aka | **eap-gtc** | **eap-md5**

Specifies one of the following methods:

- **eap-aka**: Specifies that the EAP-AKA method is to be used for authentication.
- **eap-gtc**: Specifies that the EAP-GTC method is to be used for authentication.
- **eap-md5**: Specifies that the EAP-MD5 method is to be used for authentication.

priority *num*

Specifies a priority order for a specific EAP authentication method. *num* must be an integer from 1 to 65535.

Usage

Use this command to specify the EAP authentication method(s) to use and to place multiple methods in priority order.

Example

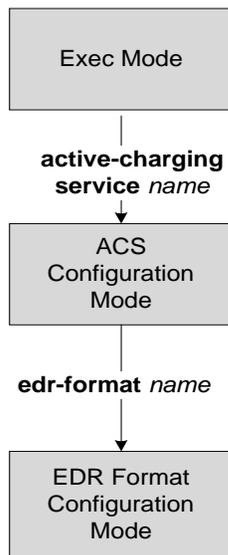

The following command sets EAP-AKA as one of the EAP authentication methods and places it as priority of 3:

```
method eap-aka priority 3
```

Chapter 97

EDR Format Configuration Mode Commands

The EDR Format Configuration Mode enables configuring Event Detail Record (EDR) formats.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

attribute

This command specifies the order of fields in EDRs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
attribute attribute { [ format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS |
YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds } ] [ localtime ] | [ { ip | tcp
} { bytes | pkts } { downlink | uplink } ] priority priority }
```

```
no attribute attribute [ priority priority ]
```

no

Removes the specified attribute.

attribute

Specifies the attribute.

attribute must be one of the following:

Attributes	Description
radius-called-station-id	Called Station ID of the mobile handling the flow.
radius-calling-station-id	Calling Station ID of the mobile handling the flow.
radius-fa-nas-identifier	RADIUS NAS identifier of Foreign Agent (FA).
radius-fa-nas-ip-address	RADIUS IP address of Foreign Agent (FA).
radius-nas-identifier	RADIUS NAS identifier.
radius-nas-ip-address	RADIUS NAS IP address.
radius-user-name	User name associated with the flow.
sn-3gpp2-always-on	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-bsid	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-esn	This option is obsolete. To configure this attribute see the rule-variable command.

Attributes	Description
sn-3gpp2-ip-qos	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-ip-technology	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-release-indicator	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-service-option	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-session-begin	This option is obsolete. To configure this attribute see the rule-variable command.
sn-3gpp2-session-continue	This option is obsolete. To configure this attribute see the rule-variable command.
sn-acct-session-id	Unique session identifier for accounting.

Attributes	Description
sn-app-protocol	<p>Application protocol for the flow. A value indicating the protocol, such as one of the following:</p> <ul style="list-style-type: none"> • ACS_PROTO_UNKNOWN = 0 • ACS_PROTO_IP=2 • ACS_PROTO_TCP=3 • ACS_PROTO_UDP=4 • ACS_PROTO_HTTP=5 • ACS_PROTO_HTTPS=6 • ACS_PROTO_FTP=7 • ACS_PROTO_FTP_CONTROL=8 • ACS_PROTO_FTP_DATA=9 • ACS_PROTO_WTP=10 • ACS_PROTO_WSP=11 • ACS_PROTO_WTP_WSP_CONNECTION_ORIENTED=12 • ACS_PROTO_WSP_CONNECTION_LESS=13 • ACS_PROTO_DNS=14 • ACS_PROTO_ICMP=15 • ACS_PROTO_POP3=16 • ACS_PROTO_SIP=17 • ACS_PROTO_SDP=18 • ACS_PROTO_SMTP=19 • ACS_PROTO_EMAIL=20 • ACS_PROTO_MMS=21 • ACS_PROTO_FILE_TRANSFER=22 • ACS_PROTO_WWW=23 • ACS_PROTO_RTP=24 • ACS_PROTO_RTSP=25 • ACS_PROTO_ICMPv6=31
sn-cf-category-classification-used	<p>For Category-based Content Filtering, specifies the last classification used by system for the flow, or blank if classification was never successfully performed. For URL Blacklisting, specifies category of the blacklisted URL in the Blacklist database.</p>

Attributes	Description
sn-cf-category-flow-action	<p>For Category-based Content Filtering, specifies the last action taken for the flow, or blank if content filtering was never performed. The following are the possible values:</p> <ul style="list-style-type: none"> • allow • content-insert • discard • redirect-url • terminate-flow <p>For URL Blacklisting, specifies the last action taken for the flow, or blank if Blacklist matching was never performed. The following are the possible values:</p> <ul style="list-style-type: none"> • discard • terminate-flow • redirect-url • www-reply-code-terminate-flow
sn-cf-category-policy	Specifies the category policy identifier that was used by Category-based Content Filtering for the flow, or blank if content filtering was never attempted for the flow.
sn-cf-category-rating-type	<p>For Category-based Content Filtering, specifies the type, either “static” or “dynamic” that was last successfully performed for the flow, or blank if content filtering was never successful for the flow.</p> <p>For URL Blacklisting, specifies “blacklisting”.</p>
sn-cf-category-unknown-url	Identifier for unknown URL under content filtering action. It holds either “1” for unknown URLs or “0” for the URLs having static rating in its database.
sn-closure-reason	<p>Reason for the termination of the flow/EDR:</p> <ul style="list-style-type: none"> • 0: Normal end of flow • 1: End of flow by handoff processing • 2: Subscriber session terminated • 3: Inter-chassis Session Recovery switchover • 12: Completion of transaction
sn-content-label	Identifier of text label for content-id.
sn-correlation-id	RADIUS correlation identifier.
sn-direction	<p>Direction of the first packet for the flow. It has following values:</p> <ul style="list-style-type: none"> • toMobile: This value appears when direction of first packet is towards mobile node. • fromMobile: This value appears when direction of first packet is towards mobile node. • unknown: This value appears when the original originator of a flow can not be determined (e.g. a flow that is interrupted due to a Inter-chassis Session Recovery switchover).
sn-duration	Duration between the last and first packet for the record.
sn-end-time [<i>format</i>] <i>localtime</i>	Timestamp for last packet of flow in UTC.

■ attribute

Attributes	Description
sn-fa-correlation-id	RADIUS Correlation Identifier of the Foreign Agent (FA).
sn-fa-ip-address	Foreign Agent (FA) IP address
sn-filler-blank	Keeps attributes place blank.
sn-filler-zero	Fills '0' for this attribute place.
sn-flow-end-time	<p>The time of flow-end EDR generation—when EDRs are generated at hagr, session-end, timeout, or normal-end-signaling conditions.</p> <p>sn-start-time and sn-end-time fields of flow end-condition EDRs cannot be used to determine the duration of the flow if intermediate EDRs are generated (rule-match or transaction-complete or any other intermediate EDR).</p> <p>sn-start-time field in an EDR gives the time the first packet was received after the last EDR was generated. So, whenever an EDR is generated, this field is reset to the time the EDR gets generated. So the sn-start-time field in flow end-condition EDRs may not have the time of the first packet received on that flow. It will have the time at which the last EDR was generated or the first packet time if no EDR was generated for that flow.</p> <p>sn-end-time field gives the time at which the last packet on the flow was received. Flow end-condition EDRs may not be generated immediately after receiving the last packet. For example, in case of session-end or timeout EDRs, last packet time and EDR generation time may be different.</p> <p>sn-flow-start-time gives the time of the first packet of the flow (irrespective of whether intermediate EDRs were generated), and sn-flow-end-time gives the time when EDRs are generated at hagr, session-end, timeout or normal-end-signaling conditions. The values of these fields will be populated in EDRs only for hagr, session-end, timeout and normal-end-signaling EDRs.</p>
sn-flow-id	Flow-id assigned internally by the ACS module to each flow.
sn-flow-start-time	<p>The time of the first packet of the flow (irrespective of whether intermediate EDRs were generated).</p> <p>Also see, sn-flow-end-time.</p>
sn-format-name	Name of the EDR/UDR format used.
sn-group-id	Sequence group ID of the record.
sn-ha-ip-address	Home Agent (HA) IP address.
sn-nat-binding-timer	Port chunk hold timer.
sn-nat-gmt-offset	GMT offset of the node generating NAT bind record.
sn-nat-ip	NAT IP address of the port chunk.
sn-nat-last-activity-time-gmt	The time when the last flow in a specific NAT set of flows was seen.
sn-nat-port-block-end	Last port number of the port chunk.
sn-nat-port-block-start	Starting port number of the port chunk.
sn-nat-port-chunk-alloc-dealloc-flag	Indicates whether the port chunk is allocated or released.
sn-nat-port-chunk-alloc-time-gmt	Indicates when the port chunk was allocated.

Attributes	Description
<code>sn-nat-port-chunk-dealloc-time-gmt</code>	Indicates when the port chunk was released.
<code>sn-nat-realm-name</code>	Name of the NAT realm.
<code>sn-nat-subscribers-per-ip-address</code>	Subscriber(s) per NAT IP address.
<code>sn-parent-protocol</code>	Indicates parent protocol of flow.
<code>sn-rulebase</code>	Name of the ACS rulebase applied.
<code>sn-sequence-no</code>	Unique sequence number (per <code>sn-sequence-group</code> and <code>radius-nas-ip-address</code>) of EDR identifier and linearly increasing in EDR file.
<code>sn-server-port</code>	TCP/UDP port number of the server in a subscriber's data flow.
<code>sn-start-time [format <i>format</i>] localtime</code>	Timestamp for last packet of flow in UTC.
<code>sn-subscriber-nat-flow-ip</code>	NAT IP address of NAT-enabled subscriber.
<code>sn-subscriber-nat-flow-port</code>	NAT port number of NAT-enabled subscriber.
<code>sn-subscriber-port</code>	TCP/UDP port number of the Mobile handling subscriber data flow.
<code>sn-volume-amt { ip tcp } { bytes pkts } { uplink downlink }</code>	Protocol-specific uplink/downlink volume amount in bytes/packets for EDR.
<code>sn-volume-dropped-amt { ip tcp } { bytes packets } { downlink uplink }</code>	Protocol-specific uplink/downlink dropped volume amount in bytes/packets for EDR.
<code>sn-volume-ip-with-rtsp-or-rtp bytes { downlink priority uplink }</code>	Shows the collected EDRs that contains the total bytes of an RTSP flow and the RTP flows controlled by it in uplink or downlink direction, or CSV position priority of this field. If <code>uplink</code> or <code>downlink</code> is not specified it shows the total of both.
<code>transaction-downlink-bytes</code>	Total downlink bytes for the transaction.
<code>transaction-downlink-packets</code>	Total downlink packets for the transaction.
<code>transaction-uplink-bytes</code>	Total uplink bytes for the transaction.
<code>transaction-uplink-packets</code>	Total uplink packets for the transaction.

```
format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS |  
YYYYMMDDHHMMSS | seconds }
```

Specifies the timestamp format.

localtime

Specifies timestamps with the local time. By default, timestamps are displayed in GMT.

```
{ ip | tcp } { bytes | pkts } { downlink | uplink }
```

Specifies bytes/packets sent/received from/by mobile.

priority *priority*

Specifies the position priority of the value within the EDR record. Lower numbered priorities (across all **attribute**, **event-label**, and **rule-variable**) occur first.

priority must be an integer from 1 through 65535. Up to 50 position priorities (across all **attribute**, **event-label**, and **rule-variable**) can be configured.

Usage

Use this command to set the attributes and priority for EDR file format.

A particular field in EDR format can be entered multiple times at different priorities. While removing the EDR field using the **no attribute** command either you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional **priority** keyword.

Example

The following is an example of this command:

```
attribute radius-user-name priority 12
```

end

This command returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

event-label

This command specifies an optional event ID to use in the generated billing records.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
event-label label priority priority
```

```
no event-label
```

no

Removes previously configured event label for EDR attribute.

label

Specifies event label for attribute to be used for EDR format.

label must be an alpha and/or numeric string of 1 through 63 characters in length.

priority *priority*

Indicates the CSV position of event ID in EDR record.

priority must be an integer from 1 through 65535.

Usage

Use this command to set the event ID and its position in EDR file format.

Example

```
event-label radius_csv1 priority 23
```

exit

This command exits the EDR Format Configuration Mode and returns to the ACS Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the ACS Configuration Mode.

rule-variable

Specifies the order of fields in the EDR.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
rule-variable protocol rule priority priority [ in-quotes ]
```

```
no rule-variable protocol rule [ priority priority ]
```

no

Removes the previously configured rule variable protocol rule and/or priority for EDR attribute.

protocol rule

Specifies the rule variable for EDR format.

protocol must be one of the following with specified rule:

- **bearer 3gpp**: 3GPP bearer-related configuration:
 - **charging-id**: Charging ID of the bearer flow
 - **imei**: IMEI or IMEISV (depending on the case) associated with the bearer flow. Only available in StarOS 8.1 and later releases.
 - **imsi**: Specific Mobile Station Identification Number.
 - **rat-type**: RAT type associated with the bearer flow. Only available in StarOS 8.1 and later releases.
 - **sgsn-address**: SGSN associated with the bearer flow. Only available in StarOS 8.1 and later releases. For MIPv6 calls, sgsn-address field is populated with HSGW address.
 - **user-location-information**: User location information associated with the bearer flow. Only available in StarOS 8.1 and later releases.
- **bearer 3gpp2**: 3GPP2 bearer-related configuration:
 - **always-on**
 - **bsid**
 - **esn**
 - **ip-qos**
 - **ip-technology**
 - **release-indicator**
 - **service-option**
 - **session-begin**
 - **session-continue**

- **bearer ggsn-address**: GGSN IP address field. For MIPv6 calls, ggsn-address field in EDR will be populated with PGW address.
- **dns**: Domain Name System (DNS) related configuration:
 - **answer-name**
 - **previous-state**
 - **query-name**
 - **return-code**
 - **state**
 - **tid**
- **file-transfer**: File transfer related configuration:
 - **chunk-number**
 - **current-chunk-length**
 - **declared-chunk-length**
 - **declared-file-size**
 - **filename**
 - **previous-state**
 - **state**
 - **transferred-file-size**
- **ftp**: File Transfer Protocol (FTP) related configuration:
 - **client-ip-address**
 - **client-port**
 - **command name**
 - **connection-type**
 - **filename**
 - **pdu-length**
 - **pdu-type**
 - **previous-state**
 - **reply code**
 - **server-ip-address**
 - **server-port**
 - **session-length**
 - **state**
 - **url**
 - **user**
- **http**: Hypertext Transport Protocol (HTTP) related configuration:
 - **attribute-in-data**—dynamic header field in application payload
 - **attribute-in-url**—dynamic header field in URL

- content disposition
- content length
- content type
- header-length
- host
- payload-length
- pdu-length
- previous-state
- referer
- reply code
- request method
- session-length
- state
- transaction-length
- transfer-encoding
- uri
- url
- user-agent
- version
- x-header—extension header
- icmp: Internet Control Message Protocol (ICMP) related configuration:
 - code
 - type
- icmpv6: Internet Control Message Protocol Version 6 (ICMPv6) related configuration:
 - code
 - type
- imap: Internet Message Access Protocol (IMAP) related configuration:
 - cc
 - command
 - content
 - date
 - final-reply
 - from
 - mail-size
 - mailbox-size
 - message-type
 - previous-state

- session-length
 - session-previous-state
 - session-state
 - state
 - subject
 - to
- ip: Internet Protocol (IP) related configuration:
 - dst-address
 - protocol
 - server-ip-address
 - src-address
 - subscriber-ip-address
 - total-length
 - version
- mms: Multimedia Message Service (MMS) related configuration:
 - bcc
 - cc
 - content location
 - content type
 - date [format { MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS }]
 - from
 - message-size
 - previous-state
 - response status
 - state
 - subject
 - tid
 - to
- p2p protocol: Peer-to-peer protocol related configuration
- pop3: Post Office Protocol version 3 (POP3) related configuration:
 - command name
 - mail-size
 - pdu-length
 - pdu-type
 - previous-state
 - reply status
 - session-length

- state
- user-name
- rtcp: RTP Control Protocol (RTCP) related configuration:
 - control-session-flow-id
 - jitter
 - rtsp-id
 - uri
- rtp: Real-time Transfer Protocol (RTP) related configuration:
 - control-session-flow-id
 - pdu-length
 - rtsp-id
 - session-length
 - uri
- rtsp: Real Time Streaming Protocol (RTSP) related configuration:
 - command-id
 - content type
 - date
 - previous-state
 - reply code
 - request method 1: play method
 - request method 2: setup method
 - request method 3: pause method
 - request method 4: record method
 - request method 5: options method
 - request method 6: redirect method
 - request method 7: describe method
 - request method 8: announce method
 - request method 9: teardown method
 - request method 10: get-parameter method
 - request method 11: set-parameter method
 - request packet
 - rtp-uri
 - session-id
 - session-length
 - state
 - uri
 - uri sub-part

- **user-agent**
- **sdp**: Session Description Protocol (SDP) related configuration:
 - **connection-ip-address**
 - **media-audio-port**
 - **media-video-port**
- **secure-http**: HTTPS related configuration
- **sip**: Session Initiation Protocol (SIP) related configuration:
 - **call-id**
 - **content type**
 - **from**
 - **previous-state**
 - **reply code**
 - **request method**
 - **request packet**
 - **state**
 - **to**
 - **uri**
 - **uri sub-part**
- **smtp**: Simple Mail Transfer Protocol (SMTP) related configuration:
 - **command name**
 - **mail-size**
 - **pdu-length**
 - **previous-state**
 - **recipient**
 - **reply status**
 - **sender**
 - **session-length**
 - **state**
- **tcp**: Transmission Control Protocol (TCP) related configuration:
 - **dst-port**
 - **duplicate**
 - **flag**
 - **out-of-order**
 - **payload-length**
 - **previous-state**
 - **src-port**
 - **state**

- **traffic-type**: Traffic type of flow (voice or non-voice depending upon flow type).
- **udp**: User Datagram Protocol (UDP) related configuration:
 - **dst-port**
 - **src-port**
- **voip-duration**: Duration of voice call, in seconds. For a flow in which voice call end is detected, output will be a non-zero value. For other flows it will be zero.
- **wsp**: Wireless Session Protocol (WSP) related configuration
 - **content type**
 - **host**
 - **pdu-length**
 - **pdu-type**
 - **reply code**
 - **session-length**
 - **tid**
 - **total-length**
 - **url**
 - **user-agent**
- **wtp**: Wireless Transaction Protocol (WTP) related configuration
 - **gtr**—Group Transmission Flag
 - **pdu-length**
 - **pdu-type**
 - **previous-state**
 - **state**
 - **tid**
 - **transaction class**
 - **ttr**—Trailer Transmission flag

Important: For more information on protocol-based rules, see the *ACS Ruledef Configuration Mode Commands* chapter.

priority *priority*

Specifies the CSV position of protocol rule related information in EDR.
priority must be an integer from 1 through 65535.

in-quotes

Specifies placing double quotes (“ ”) around the specified EDR field in the EDR.

Important: At the present time this keyword is only valid for the MMS protocol **to** and **subject** fields. **rule-variable mms to priority *priority* [in-quotes]** **rule-variable mms subject priority *priority* [in-quotes]**

Usage

Use this command to set the rule variables priority for EDR file format.

A particular field in an EDR format can be entered multiple times at different priorities. While removing the EDR field using the **no rule-variable** command you can remove all occurrences of a particular field by specifying the field name or a single occurrence by additionally specifying the optional **priority** keyword.

Example

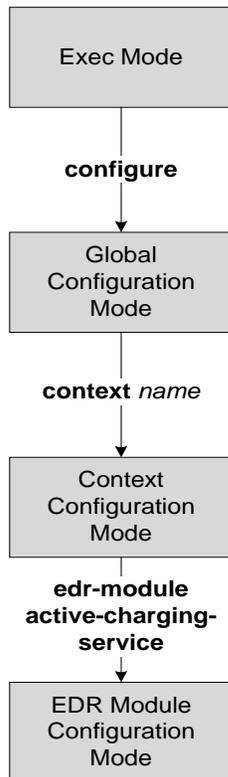

The following is an example of this command:

```
rule-variable tcp dst-port priority 36
```

Chapter 98

EDR Module Configuration Mode Commands

The EDR Module Configuration Mode is accessed from the Context Configuration Mode.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cdr

This command configures the EDR/UDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cdr [ [ push-interval value ] [ push-trigger space-usage-percent
trigger_percentage ] [ remove-file-after-transfer ] [ transfer-mode { pull |
push primary { encrypted-url encrypted_url | url url } [ via local-context ] [
secondary { encrypted-secondary-url encrypted_secondary_url | url secondary_url
} ] } ] + | use-harddisk ]
```

```
no cdr [ remove-file-after-transfer | use harddisk ] +
```

```
default cdr [ push-interval | push-trigger space-usage-percent | remove-file-
after-transfer | transfer-mode [ push via ] | use harddisk ] +
```

no

Disables the configured CDR storage and CDR file processing in this mode:

- **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.
- **use-harddisk**: Disables data storage on the SMC hard disk.

Important: **use-harddisk** keyword is only available on an ASR 5000 chassis.

default

Configures the default setting for the specified keyword(s):

- **push-interval**: 300 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Pull
- **push via**: LC is used for push
- **use harddisk**: Disabled

Important: **use-harddisk** keyword is available only on the ASR 5000 chassis.

push-interval *value*

Specifies the transfer interval, in seconds, to push EDR and UDR files to an external file server. *value* must be an integer from 60 through 3600.

Default: 300 seconds

push-trigger space-usage-percent *trigger_percentage*

Specifies the EDR/UDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server.

trigger_percentage specifies the EDR/UDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.

Default: 80 percent

remove-file-after-transfer

Specifies that the system must delete EDR/UDR files after they are transferred to the external file server.

Default: Disabled

transfer-mode { **pull** | **push primary** { **encrypted-url** *encrypted_url* | **url** *url* } [**via local-context**] [**secondary** { **encrypted-secondary-url** *encrypted_secondary_url* | **secondary-url** *secondary_url* }] }

Specifies the EDR/UDR file transfer mode—how the EDR and UDR files are transferred to an external file server.

- **pull**: Specifies that the L-ESS is to pull the CDR files.
- **push**: Specifies that the system is to push CDR files to the configured L-ESS.
- **primary encrypted-url** *encrypted_url*: Specifies the primary URL location in encrypted format to which the system pushes the CDR files.
encrypted_url must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- **primary url** *url*: Specifies the primary URL location to which the system pushes the CDR files.
url must be an alpha and/or numeric string of 1 through 1024 characters in the “//user:password@host:[port]/directory” format.
- **via local-context**: Configuration to select LC/SPIO for transfer of CDRs. The system pushes the EDR files via SPIO in the local context.
- **encrypted-secondary-url** *encrypted_secondary_url*: Specifies the secondary URL location in encrypted format to which the system pushes the CDR files when the primary location is unreachable or fails.
encrypted_secondary_url must be the location name in an encrypted format, and must be an alpha and/or numeric string of 1 through 1024 characters in length.
- **secondary-url** *secondary_url*: Specifies the secondary URL location to which the system pushes the CDR files when the primary location is unreachable or fails.
secondary_url must be an alpha and/or numeric string of 1 through 1024 characters in //user:password@host:[port]/directory format.

use-harddisk

Specifies that on ASR 5000 chassis the hard disk on the SMC be used to store EDR/UDR files. On configuring to use the hard disk for EDR/UDR storage, EDR/UDR files are transferred from RAMFS on the PSC to the hard disk on the SMC.

Default: Disabled

Important: `use-harddisk` keyword is only available on ASR 5000 chassis.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure how the charging data records (CDR) are moved and stored.

Run this command on the ASR 5000 chassis only from the local context. Running this command in any other context will cause a failure and result in an error message.

The `use-harddisk` keyword is only available on ASR 5000 chassis. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message “Failure: Please Check if CDRMOD is running in this context or not.”

This config can be applied either in the EDR/UDR module, but will be applicable both to the EDR and UDR modules. Configuring in one of the modules prevents the configuration to be done in the other module.

If PUSH transfer mode is selected, the L-ESS server URL to which the CDR files need to be transferred to must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur
- After switching from the primary server, 30 minutes elapses

When changing `transfer-mode` from pull to push, disable the PULL from L-ESS and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains `udr` directory created within it.

When changing `transfer-mode` from push to pull, after changing, enable PULL on the L-ESS. Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.

Example

The following command retains a copy of the data file after it has been transferred to the storage location:

```
no cdr remove-file-after-transfer
```

end

This command returns the CLI prompt to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

exit

This command exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

file

This command configures EDR file parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
file [ charging-service-name { include | omit } ] [ compression { gzip | none }
] [ current-prefix string ] [ delete-timeout seconds ] [ directory
directory_name ] [ edr-format-name ] [ exclude-checksum-record ] [ field-
separator { hyphen | omit | underscore } ] [ file-sequence-number rulebase-seq-
num ] [ headers ] [ name file_name ] [ reset-indicator ] [ rotation [ num-
records number | time seconds | volume bytes ] ] [ sequence-number { length
length | omit | padded | padded-six-length | unpadded } ] [ storage-limit limit
] [ single-edr-format ] [ time-stamp { expanded-format | rotated-format | unix-
format } ] [ trailing-text string ] [ trap-on-file-delete ] [ xor-final-record ]
+
```

```
default file [ charging-service-name ] [ compression ] [ current-prefix ] [
delete-timeout ] [ directory ] [ edr-format-name ] [ field-separator ] [ file-
sequence-number ] [ headers ] [ name ] [ reset-indicator ] [ rotation { num-
records | time | volume } ] [ sequence-number ] [ storage-limit ] [ time-stamp ]
[ trailing-text ] +
```

default

Configures the default setting for the specified keyword(s).

charging-service-name { include | omit }

Specifies the inclusion/exclusion of charging service name in the file name.

- **include**: Specifies to include the charging service name in EDR file name.
- **omit**: Specifies to exclude the charging service name in EDR file name.

compression { gzip | none }

Specifies compression of EDR files.

- **gzip**: Enables GNU zip compression of the EDR file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

current-prefix *string*

Specifies a string to add to the beginning of the EDR file that is currently being used to store EDR records. *string* must be an alpha and/or numeric string of 1 through 31 characters in length.

Default: curr

delete-timeout *seconds*

Specifies a time period, in seconds, when completed EDR files are deleted. By default, files are never deleted. *seconds* must be an integer from 3600 through 31536000.

Default: Disabled

directory *directory_name*

Specifies a subdirectory in the default directory in which to store EDR files.

directory_name must be an alpha and/or numeric string of 1 through 191 characters in length.

Default: /records/edr

edr-format-name

Specifies creation of separate files for EDRs that have different formats. The EDR format name will be included in the file name.

exclude-checksum-record

When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic redundancy check (CRC) of all preceding records from the EDR file.

Default: Disabled, inserts checksum record into the EDR file header.

field-separator [**hyphen** | **omit** | **underscore**]

Specifies the field inclusion/exclusion type of separators between two fields of EDR file name:

- **hyphen**: Specifies the field separator as “-” (hyphen) symbol between two fields.
 - **omit**: Removes or omits the field separator between two fields.
 - **underscore**: Specifies the field separator as “_” (underscore) symbol between two fields.
-

file-sequence-number **rulebase-seq-num**

Specifies that the file name sequence numbers be unique per rulebase and EDR format name combination.

headers

Includes a file header summarizing the record layout.

name *file_name*

Default: edr

Specifies a string to be used as the base file name for EDR files.

file_name must be an alpha and/or numeric string of 1 through 31 characters in length. The file name format is as follows:

base_rulebase_format_sequencenum_timestamp

- *base*: Specifies type of record in file or contains the operator-specified string.

Default: edr

- *rulebase*: Specifies the name of the ACS rulebase. EDRs from different rulebases go into different EDR files.
- *format*: Specifies the name of the EDR format if **single-edr-format** is specified else the format field (and the trailing underscore) is omitted from the file name.
- *sequencenum*: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all EDR files on the system.

- *timestamp*: Contains a timestamp based on file creation time in UTC time in MMDDYYYYHHMMSS format.

EDR files that have not been closed have a string added to the beginning of their filenames.

Filename for an EDR file in CSV format that contains information for rule base named *rulebase1* and an EDR schema named *edr_schema1* appears as follows:

```
edr_rulebase1_edr_schema1_00005_01302006143409
```

If the file name is not configured it will create files for EDRs/UDRs/FDRs (xDRs) with following template with limits to 256 characters:

```
basename_ChargSvcName_timestamp_SeqNumResetIndicator_FileSeqNumber
```

- *basename*: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ACS.
- *ChargSvcName*: A system context-based configurable text string that uniquely identifies a specific context-based charging service
- *timestamp*: Date and time at the instance of file creation. Date and time in the form of “MMDDYYYYHHmmSS” where HH is a 24-hour value from 00-23
- *SeqNumResetIndicator*: A one-byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 to 255, which is incremented by a value of 1 for the following conditions:
 - Failure of an ACS software process on an individual PSC.
 - Failure of the system such that a second system takes over. (For example: a backup or standby system put in place according to Interchassis Session Recovery.)
 - File Sequence Number (FileSeqNumber) rollover from 999999999 to 0
- *FileSeqNumber*: Unique file sequence number for the file with 9 digit integer having range from 000000000 to 999999999. It is unique on each system.

File name for a closed xDR file in CSV format that contains information for ACS system *xyz_city1* and charging service name *prepaid2* with timestamp *12311969190000*, and file sequence number counter reset indicator to *002* for file sequence number *034939002* appears as follows:

```
xyz_city1_prepaid2_12311969190000_002_034939002
```

File name for a running xDR file, not closed, in CSV format that contains information for the same parameters for file sequence number *034939003* prefixed with *curr_* and appears as follows:

```
curr_xyz_city1_prepaid2_12311969190000_002_034939002
```

reset-indicator

Specifies inclusion of the reset indicator counter value from 0 through 255 in EDR file name, and is incremented (by one) whenever any of the following conditions occur:

- An ACSMgr/SessMgr process fails.
- A peer chassis has taken over in compliance with our Interchassis Session Recovery feature.
- The sequence number, see **sequence-number** keyword, has rolled over to zero.

rotation { **num-records** *number* | **time** *seconds* | **volume** *bytes* }

Specifies when to close an EDR file and create a new one.

- **num-records** *number*: Specifies the number of records that should be added to the file. When the number of records in the file reaches the specified value, the file is complete.

number must be an integer 100 through 10240.

Default: 1024

- **time** *seconds*: Specifies the period of time to wait before closing the EDR file and creating a new one.

seconds must be an integer from 30 through 86400.

Default: 3600 seconds

- **volume** *bytes*: Specifies the maximum size of the EDR file before closing it and creating a new one.

bytes must be an integer from 51200 to 62914560. Note that a higher setting may improve the compression ratio when the compression keyword is set to `gzip`.

Default: 102400 bytes

sequence-number { **length** *length* | **omit** | **padded** | **padded-six-length** | **unpadded** }

Specifies including/excluding sequence number in the file name.

- **length** *length*: Includes the sequence number with the specified length.

length must be the file sequence number length with preceding zeroes in the file name, and must be an integer from 1 through 9.

Important: The **length** configuration is applicable in both EDR and UDR modules. When applied in both modules without the **file udr-seq-num** configuration, the minimum among the two values will come into effect for both the modules. With the **file udr-seq-num** config, each module will use its own value of **length**.

- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

Default: **padded**

single-edr-format

Creates separate files for EDRs having different formats.

Default: Disabled

storage-limit *limit*

Specifies deleting files when the specified amount of space, in bytes, is used up for EDR/UDR file storage on the PSC RAM.

On an ASR 5000 chassis, *limit* must be an integer from 10485760 through 536870912.

Default: 33554432

time-stamp { **expanded-format** | **rotated-format** | **unix-format** }

Specifies the timestamp of when the file was created to be included in the file name.

- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the time stamp format to YYYYMMDDHHMMSS format.

- **unix-format**: Specifies the UNIX format of *x.y*, where *x* is the number of seconds since 1/1/1970 and *y* is the fractional portion of the current second that has elapsed.

trailing-text *string*

Specifies the inclusion of arbitrary text string in the file name.
string must be an alpha and/or numeric string of 1 through 30 characters in length.

trap-on-file-delete

This keyword instructs the system to send an SNMP notification (trap) when an EDR/UDR file is deleted due to lack of space.
Default: Disabled

xor-final-record

Specifies inserting an xor checksum (in place of the CRC checksum) into the EDR file header if the **exclude-checksum-record** is left at its default setting.
Default: Disabled

+

More than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure EDR file characteristics.

Example

The following command sets the prefix of the current active EDR file to *Current*:

```
file current-prefix Current
```

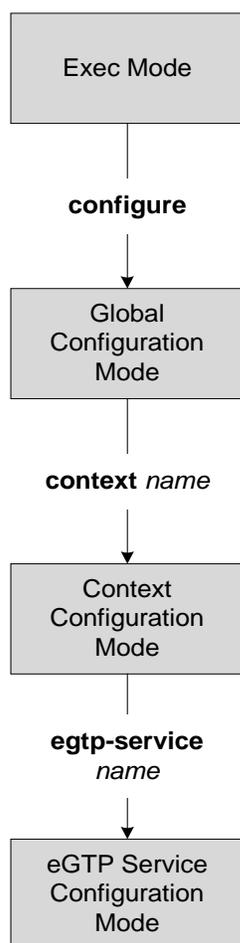

The following command sets the base file name to *EDRfile*:

```
file name EDRfile
```

Chapter 99

eGTP Service Configuration Mode Commands

The eGTP Service Configuration Mode is used to create and manage eGTP interface types and associated parameters.

associate

Configures an association with a GTP-U service where parameters are applied to the GTP-U data flow.

Product

P-GW

Privilege

Administrator

Syntax

```
associate gtpu-service name
```

```
no associate gtpu-service
```

no

Removes the association to the configured GTP-U service from this service.

gtpu-service *name*

Associates a GTP-U service with this eGTP service. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to associate a GTP-U service with this eGTP service.

Example

The following command associates this eGTP service with a GTP-U service named *gtpu3*:

```
associate gtpu-service gtpu3
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Administrator

Syntax

Usage

Change the mode back to the Exec mode.

■ exit

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Administrator

Syntax

exit

Usage

Return to the previous mode.

gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) plane settings for this service.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

```
gtpc { bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-
address ipv6_address [ ipv4-address ipv4_address ] } | echo-interval seconds |
ip qos-dscp { forwarding_type } | max-retransmissions num | retransmission-
timeout seconds }

no gtpc { bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-
address ipv6_address [ ipv4-address ipv4_address ] } | echo-interval }

default gtpc { echo-interval | ip qos-dscp | max-retransmissions |
retransmission-timeout }
```

no

Disables or removes the configured GTP-C setting.

default

Resets the specified parameter to its default value.

```
bind { ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-
address ipv6_address [ ipv4-address iv4p_address ] }
```

Binds the service to an interface with an IPv4 address, IPv6 address or both.

ipv4-address *ipv4_address* [**ipv6-address** *ipv6_address*]: Binds this service to the IPv4 address of a configured interface. Optionally, bind the service to a configured interface with an IPv6 address. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation. *ipv6_address* must be entered as a standard IPv6 address in colon-separated notation.

ipv6-address *ipv6_address* [**ipv4-address** *ipv4_address*]: Binds this service to the IPv6 address of a configured interface. Optionally, bind the service to a configured interface with an IPv4 address. *ip6_address* must be entered as a standard IPv6 address in colon-separated notation. *ipv4_address* must be entered as a standard IPv4 address in dotted decimal notation.

echo-interval *seconds*

Default: 60

Configures the duration between the sending of echo messages. *seconds* must be an integer value from 60 to 3600.

```
ip qos-dscp { forwarding_type }
```

Default: **af11**

Specifies the IP QoS DSCP per-hop behavior to be marked on the outer header of signalling packets originating from the LTE component. This is a standards-based feature (RFC 2597). The following forwarding types are supported:

af11: Designates the use of Assured Forwarding 11 per-hop behavior

af12: Designates the use of Assured Forwarding 12 per-hop behavior

af13: Designates the use of Assured Forwarding 13 per-hop behavior

af21: Designates the use of Assured Forwarding 21 per-hop behavior

af22: Designates the use of Assured Forwarding 22 per-hop behavior

af23: Designates the use of Assured Forwarding 23 per-hop behavior

af31: Designates the use of Assured Forwarding 31 per-hop behavior

af32: Designates the use of Assured Forwarding 32 per-hop behavior

af33: Designates the use of Assured Forwarding 33 per-hop behavior

af41: Designates the use of Assured Forwarding 41 per-hop behavior

af42: Designates the use of Assured Forwarding 42 per-hop behavior

af43: Designates the use of Assured Forwarding 43 per-hop behavior

be: Designates the use of Best Effort forwarding per-hop behavior

ef: Designates the use of Expedited Forwarding per-hop behavior typically dedicated to low-loss, low-latency traffic.

The assured forwarding behavior groups are listed in the table below.

	Class 1	Class 2	Class 3	Class 4
Low Drop	AF11	AF21	AF31	AF41
Medium Drop	AF12	AF22	AF32	AF42
High Drop	AF13	AF23	AF33	AF43

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.

max-retransmissions *num*

Default: 4

Configures the maximum number of retries for packets. *num* must be an integer from 0 through 15.

retransmission-timeout *seconds*

Default: 5

Configures the control packet (echo message) retransmission timeout in GTP, in seconds. *seconds* must be an integer value from 1 through 20.

Usage

Use this command to configure GTP-C settings for the current service. This interface assumes the characteristics of an S11 reference point on the S-GW or MME.

Example

The following command binds the service to a GTP-C interface with an IP address of *112.334.556.778*:

```
gtpc bind address 112.334.556.778
```

interface-type

Configures the interface type used by this service.

Product

MME, P-GW, S-GW

Privilege

Administrator

Syntax

```
interface-type { interface-mme | interface-pgw-ingress | interface-sgsn |  
interface-sgw-egress | interface-sgw-ingress }
```

```
{ interface-mme | interface-pgw-ingress | interface-sgsn | interface-sgw-  
egress | interface-sgw-ingress }
```

interface-mme: Specifies that the interface has the characteristics of an eGTP MME S11 reference point to/from an S-GW.

interface-pgw-ingress: Specifies that the interface has the characteristics of an eGTP P-GW S5/S8 reference point from an S-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.

interface-sgsn: Specifies that the interface has the characteristics of an eGTP S-GW S4 reference point to/from an SGSN.

interface-sgw-egress: Specifies that the interface has the characteristics of an eGTP S-GW S5/S8 reference point to an eGTP P-GW. The interface assumes the characteristics of either a GTP-C (control Plane) or GTP-U (user plane) reference point.

interface-sgw-ingress: Specifies that the interface has the characteristics of:

- an eGTP-C S-GW S11 reference point from the MME.
- an eGTP-U S-GW S1-U reference point from the eNodeB.

Usage

Use this command to specify the type of interface this service uses. By configuring this command, the interface takes on the characteristics of the selected type.

Example

The following command configures the interface bound to this service to maintain the characteristics of an eGTP-C S-GW S11 reference point from an MME:

```
interface-type interface-sgw-ingress
```

validation-mode

Configures the type of validation to be performed on messages received by this service.

Product

P-GW

Privilege

Administrator

Syntax

```
validation-mode { custom1 | standard }
```

```
default validation-mode
```

default

Returns the command to the default setting of **standard**.

```
{ custom1 | standard }
```

custom1: Specifies that the message should be validated based on a vendor-specific set of mandatory elements.

standard: Specifies that the message should be validated based on the set of mandatory elements as defined in 3GPP 29.274.

Usage

Use this command to specify the type of validation performed on messages received by this service. The information elements contained in messages have mandatory elements and conditional elements. The standard set of elements, as defined by 3GPP 29.274 is checked if this command is set to “standard”. The custom1 setting is for a vendor-specific set of mandatory elements.

Example

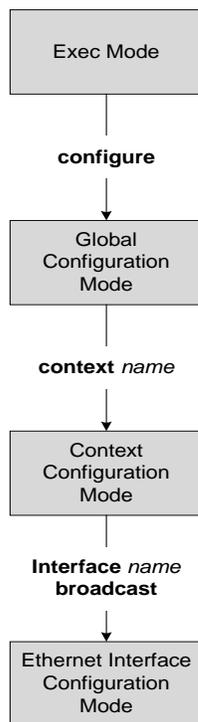

The following command sets the validation mode for incoming messages to standard:

```
validation-mode standard
```

Chapter 100

Ethernet Interface Configuration Mode Commands

The Ethernet Interface Configuration Mode is used to create and manage the IP interfaces for addresses, address resolution options, etc.

crypto-map

Applies the specified IPsec crypto-map to this interface.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
crypto-map map_name [ secondary-address sec_ip_addr ]
```

no

Deletes the application of the crypto map on this interface.

map_name

Specifies the name of the crypto map being applied. The name can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

secondary-address *sec_ip_addr*

Applies the crypto map to the secondary address for this interface that is specified by *sec_ip_addr*. *sec_ip_addr* must be specified using the standard IPv4/IPv6 notation.

Usage

In order for ISAKMP and/or manual crypto maps to work, they must be applied to a specific interface using this command. Dynamic crypto maps should **not** be applied to interfaces. The crypto map must be configured in the same context as the interface.

Example

To apply the IPSEC crypto map named `cmap1` to this interface, use the following command:

```
crypto-map cmap1
```

description

Configures the description text for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Clears the description for the interface.

text

Specifies the descriptive text to use. *text* must be 0 to 79 alpha and/or numeric characters with no spaces or a quoted string of printable characters

Usage

Set the description to provide useful information on the interface's primary function, services, end users, etc. Any information useful may be provided.

Example

description *sampleInterfaceDescriptiveText*

■ end

end

Exits the interface configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the interface configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

ip

Configures the IP options for the current interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip { access-group acl_name { in | out } [ priority-value ] | address ip_address
ip_mask [ secondary | srp-activate ] | arp { arpa | timeout seconds } }
```

```
no ip { access-group acl_name { in | out } | address ip_address | arp { arpa |
timeout } }
```

no

Disables and/or restores the option to the system default.

```
access-group acl_name { in | out } [ priority-value ]
```

acl_name specifies the access control list to be added/removed from the group. The ACL rules must be configured in the same context as the interface.

In Release 8.1 and later, *acl_name* must be an alpha and/or numeric string of 1 through 47 characters in length.

In Release 8.0 and earlier, *acl_name* must be an alpha and/or numeric string of 1 through 79 characters in length.

The direction must also be specified as either inbound or outbound using the keywords **in** and **out**, respectively.

priority-value: Default: 0. If more than one ACL is applied, *priority-value* specifies the priority in which they will be compared against the packet. If not specified, the priority is set to 0. *priority-value* must be an integer from 0 through 4294967295. If access groups in the list have the same priority, the last one entered is used first.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

```
address ip_address ip_mask [ secondary | srp-activate ]
```

Configures the IP address for the interface specifying the networking mask as well. *ip_address* and *ip_mask* must be specified using the standard IPv4/IPv6 notation.

The **secondary** keyword is used to configure a secondary IP address on the interface. This is referred to as multi-homing of the interface.

The **srp-activate** Activates the IP address for Interchassis Session Redundancy.

```
arp { arpa | timeout seconds }
```

Important: These keywords have been replaced by the **R_arp** command in the Global Configuration Mode. For backwards compatibility, however, these keywords are accepted as valid.

Usage

Create and manage the IP interfaces for the associated context.

Example

The following command configures the access group for the current context:

```
ip access-group sampleAccessGroup
```

```
ip address 1.2.3.4 0.0.0.128 secondary
```

The following command sets the address resolution protocol timeout.

```
ip arp timeout 1800
```

The following commands remove the associated IP address and disable ARP for the interface, respectively.

```
no ip address 1.2.3.4
```

```
no ip arp arpa
```

ip mtu

Configures the Maximum Transmission Unit (MTU) for this IP interface.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip mtu mtu-size
```

no

Deletes the MTU value.

Usage

On ASR 5000 we support IP MTU with a normal interface and point-to-point interface (for OLC port). The maximum MTU size allowed with an OLC port is 1600, the maximum MTU size allowed with an Ethernet port is 2048. The default MTU size is 1500.

Example

The following command sets the MTU value to the default.

```
ip mtu 1500
```

ip ospf authentication-key

This command configures the password for the authentication with neighboring routers.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf authentication-key [ encrypted ] password auth_key
```

```
no ip ospf authentication-key
```

no

Deletes the authentication key.

encrypted

Use this keyword if you are pasting a previously encrypted authentication key into the CLI command.

password *auth_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to set the authentication key used when authenticating with neighboring routers.

Example

To set the authentication key to 123abc, use the following command;

```
ip ospf authentication-key password 123abc
```

Use the following command to delete the authentication key;

```
no ip ospf authentication-key
```

ip ospf authentication-type

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf authentication-type { message-digest | null | text }  
no ip ospf authentication-type { message-digest | null | text }
```

no

Disable this function.

message-digest

Set the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the type of authentication to use when authenticating with neighboring routers.

Example

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```

ip ospf cost

This command configures the cost associated with sending a packet over the logical interface.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf cost value
```

```
no ip ospf cost
```

no

Disable this function.

value

Default: 10

The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

Usage

Use this command to set the cost associated with routes from the interface.

Example

Use the following command to set the cost to 20;

```
ip ospf cost 20
```

Use the following command to disable the cost setting;

```
no ip ospf cost
```

ip ospf intervals

This command configures the interval or delay type, and the interval or delay time in seconds, for OSPF communications.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf { dead-interval value | hello-interval value | retransmit-interval value | transmit-delay value }
```

```
no ip ospf { dead-interval | hello-interval | retransmit-interval | transmit-delay }
```

no

Deletes the value set and returns the value to its default.

dead-interval *value*

Default: 40

The interval, in seconds, that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

Default: 10

The interval, in seconds between sending hello packets. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

Default: 5

The interval, in seconds, between LSA (Link State Advertisement) retransmissions. *value* must be an integer from 1 through 65535.

transmit-delay *value*

Default: 1

The interval, in seconds, that the router should wait before transmitting a packet. *value* must be an integer from 1 through 65535.

Usage

Use this command to set the intervals or delays for OSPF communications.

Example

To set the dead-interval to 100, use the following command;

```
ip ospf dead-interval 100
```

To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command'

```
no ip ospf dead-interval
```

ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf message-digest-key key_id md5 [ encrypted ] password authentication_key  
no ip ospf message-digest-key key_id
```

no

Deletes the key.

message-digest-key *key_id*

Specifies the key identifier number. *key_id* must be an integer from 1 through 255.

encrypted

Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example

To create a key with the ID of 25 and a password of 123abc, use the following command;

```
ip ospf message-digest-key 25 md5 password 123abc
```

To delete the same key, enter the following command;

```
no ip ospf message-digest-key 25
```

ip ospf network

Configures the OSPF network type.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }
```

```
no ip ospf network
```

no

Disable this function.

broadcast

Sets the network type to broadcast.

non-broadcast

Sets the network type to non-broadcast multi access (NBMA).

point-to-multipoint

Sets the network type to point-to-multipoint.

point-to-point

Sets the network type to point-to-point.

Usage

Use this command to specify the OSPF network type.

Example

To set the OSPF network type to broadcast, enter the following command;

```
ip ospf network broadcast
```

To disable the OSPF network type, enter the following command;

```
no ip ospf network
```

ip ospf priority

This command designates the OSPF router priority.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf priority value
```

```
no ip ospf priority value
```

no

Disable this function.

value

The priority value to assign. This must be an integer from 0 through 255.

Usage

Use this command to set the OSPF router priority.

Example

To set the priority to 25, enter the following command:

```
ip ospf priority 25
```

To disable the priority, enter the following command:

```
no ip ospf priority
```

ipv6 access-group

Specifies the name of the ACL group to assign the interface to. You can filter for either inbound or outbound traffic.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 access-group group name { in | out } { priority-value }
```

no

Removes a previously configured access group association.

group_name

Specifies the name of the access group. *group_name* must be an alpha and/or numeric string of 1 to 79 characters.

in

Applies the filter to the inbound traffic.

Specify a *priority_value* for the access group from 0 to 4294967295. The lower values indicate a higher priority.

out

Applies the filter to the outbound traffic.

Specify a *priority-value* for the access group from 0 to 4294967295. The lower values indicate a higher priority.

priority-value

Default: 0

Specifies the priority of the access group. 0 is the highest priority. If *priority-value* is not specified the priority is set to 0. *priority-value* must be a value from 0 to 4294967295.

If access groups in the list have the same priority, the last one entered is used first.

Usage

Use this command to specify the ACL group to assign the interface to. Specify an ACL group name with this command.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

Example

■ ipv6 access-group

Use the following command to associate the `group_1` access group with the current IPv6 profile for inbound access:

```
ipv6 access-group group_1 in 1
```

ipv6 address

Specifies the address and subnet mask.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
ipv6 address ip_address
```

ip_address

Specifies an individual host IP address to add to this host pool.

ip_address is the IP address in colon separated notation.

Usage

Configures the IPv6 address and subnet mask for a specific interface.

ipv6 router advertisement

Enables or disables the system to send IPv6 router advertisements.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 router advertisement
```

Usage

Enables sending of router advertisements on the interface. All of the pool prefixes in the context (belonging to the interface) will be advertised in the router advertisement.

The router-lifetime in the advertisement is sent as 0 to indicate to the receiver that the sender cannot be a default-router. For all the prefixes (pools), the valid and preferred lifetime are sent as default. The router-advertisement is sent every 600 seconds.

If the pool-prefix is deleted, then an router-advertisement is sent for that particular prefix with the valid and preferred time set to 0.

policy-forward

Configure the system for redirecting the HA packets to new HA during existing HA upgradation.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
policy-forward { icmp unreachable next-hop ip address | unconnected-address  
next-system ip address }
```

```
no policy-forward unconnected-address
```

```
no policy-forward unconnected-address
```

Deletes the policy forwarding configuration for unconnected address for the current interface.

```
icmp unreachable next-hop ip address
```

Specifies routing of Internet Control Message Protocol (icmp) unreachable is required in overlapping pool configuration. *ip address* must be an IP address expressed in IPv4/IPv6 notation.

```
unconnected-address next-system ip address
```

Specifies address of next system HA to handle processing during HA upgrade. *ip address* must be an IP address expressed in IPv4/IPv6 notation.

Usage

Use this command to set the redirecting policy for IP packets from existing HA to new HA during upgradation. To configure this command both keyword will be in separate interface.

Important: It is a customer specific command.

Example

To configure existing HA system for redirecting the HA packets to new HA during existing HA upgrade enter the following commands:

```
policy-forward unconnected-address next-system ip address
```

```
policy-forward icmp unreachable next-hop ip address
```

pool-share-protocol

Configure the primary or secondary system for the IP pool sharing protocol and enter IPSP configuration mode.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
pool-share-protocol { primary address | secondary address } [ mode { active |
inactive | check-config } ]
```

```
no pool-share-protocol
```

```
no pool-share-protocol
```

Deletes the IP pool sharing protocol information from the current interface.

```
primary address
```

On the secondary system, define the IP address of an interface on the primary system that has identical IP pools configured for use with the IP pool sharing protocol. *address* must be an IP address expressed in IP v4 dotted decimal notation.

```
secondary address
```

On the primary system, define the IP address of an interface on the secondary system that has identical IP pools configured for use with the IP pool sharing protocol. *address* must be an IP address expressed in IP v4 dotted decimal notation.

```
mode {active | inactive | check-config}
```

This is an optional command to manage the mode for IP pool sharing protocol for primary or secondary HA.

active: Activates the IP pool sharing protocol mode.

inactive: Inactivates the IP pool sharing protocol mode.

check-config: Verify the IP pool sharing protocol configuration.

Usage

Use this command to set the IP address of the primary or secondary system for use with the IP pool sharing protocol and enter ipsp configuration mode. This command must be configured for an interface in each context that has IP pools configured. Refer to the System Administration and Configuration Guide for information on configuring and using the IP pool sharing protocol.

Important: Both the primary and secondary systems must be in the same subnet.

Important: For information on configuring and using IPSP refer to the System Administration and Configuration Guide.

Important: To reserve free addresses on primary HA for this command use reserved-free-percentage command in *IPSP Configuration Mode Commands* of this guide.

Example

To configure a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10
```

To inactivate a secondary system with an IP address of 192.168.100.10 for use with the IP pool sharing protocol, enter the following command:

```
pool-share-protocol secondary 192.168.100.10 mode inactive
```

port-switch-on-L3-fail

This command causes the line card port to which the current interface is bound to switch over to the port on the redundant line card when connectivity to the specified IP address is lost.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
port-switch-on-L3-fail address { ip_address | ipv6_address } [ minimum-switchover-period switch_time ] [ interval int_time ] [ timeout time_out ] [ num-retry number ]
```

```
no port-switch-on-L3-fail
```

no

Disable port switchover on failure.

ip_address

The IP address to monitor for connectivity. ‘ip_address’ must be in either ipv4 format or IPv6 format

minimum-switchover-period *switch_time*

Default: 120 seconds

After a switchover occurs, another switchover cannot occur until the amount of time specified has elapsed. *switch_time* must be an integer in the range from 1 to 3600.

interval *int_time*

Default: 60 seconds

This specifies how often, in seconds, monitoring packets are sent to the IP address being monitored. *int_time* must be an integer in the range from 1 to 3600.

timeout *time_out*

Default: 3 seconds

This specifies how long to wait without a reply before resending monitoring packets to the IP address being monitored. *time_out* must be an integer in the range from 1 to 10.

num-retry *number*

Default: 5

This value specifies how many times to retry sending monitor packets to the IP address being monitored before performing the switchover operation. *number* must be an integer in the range from 1 to 100.

Usage

Use this command to monitor a destination in your network to test for L3 connectivity. The destination being monitored should be reachable from both the active and standby line cards.

Example

The following command enables port switchover on connectivity failure to the IP address 192.168.10.100 using default values:

```
port-switch-on-L3-fail address 192.168.10.100
```

The following command disables port switchover on connectivity failure:

```
no port-switch-on-L3-fail
```

vlan-map

This command sets a single next-hop IP address so that multiple vlans can use a single next-hop gateway. **vlan-map** is associated with a specific interface.

Product

PDSN, HA, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
vlan-map next-hop ip_address
```

next-hop *ip_address*

This keyword defines an IP address for the next-hop gateway.

ip_address: Can be either an IPv4 or IPv6 address in standard format.

Usage

Use vlan-map to combine multiple vlan links to go through a single IP address. This feature is used in conjunction with nexthop forwarding and overlapping IP pools.

After configuring the vlan-map, move to the Port Ethernet configuration mode to attach the vlan-map to a specific vlan.

Example

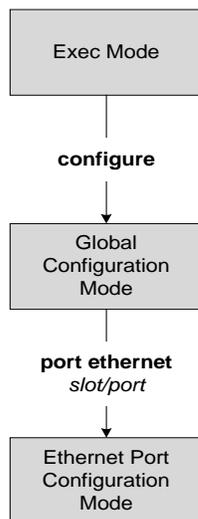

The following command sets an IPv4 for a next-hop gateway.

```
vlan-map next-hop 123.123.123.1
```

Chapter 101

Ethernet Port Configuration Mode Commands

The Ethernet Port Configuration Mode is used to create and manage Ethernet ports and their bindings between contexts.

bind interface

Configures an association (binds) between a virtual IP interface or an SS7 or Frame Relay link to a specific context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bind interface interface_name context_name
```

no

Indicates the virtual interface specified is to be unbound from the context.

interface_name

Specifies the name of the virtual interface to be bound to the context. *interface_name* must be from 1 to 79 alpha and/or numeric characters.

context_name

Specifies the name of the context to be bound to the virtual port. *context_name* must refer to a previously configured context.

Usage

Bind an interface to a context to allow the context to provide service.

Example

```
bind interface sampleVirtual sampleContext
```

```
no bind interface sampleVirtual sampleContext
```

default

Restores the port's default speed and communication mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { medium | preferred slot | threshold { value } }
```

medium

Restores the default values for the medium options as follows:

- **SPIO** and fast ethernet line cards: auto
- Gigabit ethernet line card: auto

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

threshold { value }

Restores the specified port-level threshold parameter to its default value(s). The possible values are:

- **high-activity** : High port activity threshold settings
- **monitoring** : Threshold monitoring configuration settings
- **rx-utilization** : Receive port utilization threshold settings
- **tx-utilization** : Transmit port utilization threshold settings

Usage

Restores port-level parameters to their default values.

Example

```
default medium
```

■ description

description

Sets the port descriptive text.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
description text
```

```
no description
```

no

Clears the description for the port.

text

Specifies the descriptive text to use. *text* must be 1 to 79 alpha and/or numeric characters with no spaces or a quoted string using printable characters.

Usage

Set the description to provide useful information on the port's primary function, services, end users, etc. Any information useful may be provided.

Example

```
description samplePortDescriptiveText
```

```
description "This is a sample description"
```

end

Exits the port configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the port configuration mode and returns to the global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

flow-control

Enables and disables flow control on the Quad Gig-E linecard (QGLC).

Product

PDSN, SGSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] flow-control
```

```
no flow-control
```

Disables flow control on the specified port

Usage

Flow control is enabled by default on the QGLC and can be disabled using the **no** command on a per-port basis. This command does not work on Fast Ethernet or Gigabit Ethernet line cards (FELC, GELC) which do not support flow control.

Example

After flow control has been disabled, use the following command to enable flow control:

```
flow-control
```

ingress-mode

Labels this port as an ingress port.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ingress-mode
```

no

Disables ingress port tag.

Usage

Use this command to label this port in order for the session manager to recognize the interface from which IP data packets are being received. This command should be used in single context configurations. In single context configurations, the ingress port can only be identified if labeled.

link aggregation

Used to aggregate ports on a Quad Gig-E line card (QGLC) and set LACP parameters.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] link aggregation { master | member | group N } [ lacp { active | passive } ] [ rate { auto | slow | fast } ]
```

```
default link-aggregation lacp
```

no

This command deletes the Ethernet port from any group it might be in. If the port was the Master of a group, the whole group would be deleted.

master

This command creates the Master port for the aggregated group.
group N is an integer between 1..1023.

member

This command makes the port a member of the aggregated group.
group N is an integer between 1..1023.

lacp { active | passive }

Configures the Link Aggregation Control Protocol.

active mode sends out LACP packets periodically.

passive mode only responds to LACP packets received.

rate { auto | fast | slow }

Configures the rate at which the LACP sends packet and timeout events.

auto = the rate is controlled by the peer

fast = 1sec

slow = 30sec

default

Configures LACP default settings. Defaults are **active** and **slow**.

Usage

Configure from one to four ports on a QGLC to be in an aggregation group on the chassis to link to an aggregation group on a remote switch. Very large files can be downloaded across all ports in a group, which makes for a faster download when compared to serial downloads over a single link.

■ link aggregation

Example

The following example configures the port to be the Master for Group 2:

```
link aggregation master group 2
```

media

Configures the port interface type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
media { rj45 | sfp }
```

```
    rj45 | sfp
```

rj45: sets the physical interface to RJ-45 connectors.

sfp: sets the physical interface connection to SFP gigabit.

Usage

Set the media option when the physical cabling interface is changed.

Example

The following commands are entered one-at-a-time to set the physical interface to RJ-45 and SFP:

```
media rj45
```

```
media sfp
```

medium

Configures the port speed and communication mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
medium { auto | speed { 10 | 100 | 1000 } duplex { full | half } }
```

```
auto | speed { 10 | 100 | 1000 } duplex { full | half }
```

Default: **auto**

Optionally sets the speed of the interface and the communication mode.

auto: configures the interface to auto negotiate the interface speed.

speed { 10 | 100 | 1000 }: specifies the speed to use at all times.

duplex { full | half }: sets the communication mode of the interface to either **full** or **half** duplex.

Important: Ethernet networking rules dictate that if a device whose interface is configured to auto-negotiate is communicating with a device that is manually configured to support full duplex, the first device will negotiate to the manually configured speed of the second device but will only communicate in half duplex mode.

Usage

Set the medium options when the physical interface changes.

Example

The following configures the port's speed and communication mode to be auto negotiated.

```
medium auto
```

The following command configures the port's interface speed to gigabit with full duplex communication.

```
medium speed 1000 duplex full
```

preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery.

Default: non-revertive operation

Product

PDSN, FA, HA, SGSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] preferred slot slot#
```

no

Disables revertive, or auto-recovery, operation for selected port.

slot#

Identifies the physical chassis slot where the line card or SPIO card is installed.

Usage

This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.

Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.

This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as “preferred” on the LC in slot 17 while ports 5 through 8 are “preferred” on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Important: This command is not supported on all platforms.

Example

```
preferred slot 17
```

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, the port is enabled with the use of the **no** keyword.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[**no**] **shutdown**

no

Enables the port. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.

This command is necessary to bring a port into service by enabling it via the **no** keyword.

Example

Use the following command to disable the port:

```
shutdown
```

Use the following command to enable the port for service:

```
no shutdown
```

snmp trap link-status

Enables/disables the generation of an SNMP trap for link status changes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap link-status
```

no

Disables the sending of traps for link status changes.

Usage

Enable link status change traps when a monitoring facility can use the information or if there are trouble shooting activities are in progress.

Example

Use the following command to disable sending of traps:

```
no snmp trap link-status
```

srp virtual-mac-address

Configures the SRP virtual MAC address for the port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
srp virtual-mac-address MAC_Address
```

```
no srp virtual-mac-address
```

no

Disables the SRP virtual MAC addressing for Ethernet ports. The block of virtual MAC addresses is not saved.

Usage

The SRP virtual MAC address is applied to the port when the chassis is in SRP ACTIVE state. The default is **no srp virtual-mac-address**.

Important: This command is not supported on all platforms.

Example

Use the following command to enable the SRP's virtual MAC addressing:

```
srp virtual-mac-address MAC_Address
```

threshold high-activity

Configures thresholds for high port activity for the port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold high-activity high_thresh [ clear low_thresh ]
```

high_thresh

Default: 50

The high threshold high port activity percentage that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 50

The low threshold high port activity percentage that maintains a previously generated alarm condition. If the activity percentage falls below the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.

Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port > High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

■ threshold high-activity

The following command configures a high port utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold high-activity 70 clear 50
```

threshold monitoring

Enables thresholding for port-level values.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] threshold monitoring
```

no

Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the `starentMIB(8164).starentTraps(2)` section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of **WARNING**.

- **Alarm System:** High threshold alarms generated within the specified polling interval are considered “outstanding” until a the condition no longer exists and/or a condition clear alarm is generated.

“Outstanding” alarms are reported to through the system’s alarm subsystem and are viewable through the system’s CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 18. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

This command enables thresholding for port-level values. Refer to the **threshold high-activity**, **threshold rx-utilization**, and **threshold tx-utilization** commands in this chapter for

■ threshold monitoring

information on configuring these values. In addition refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference for information on configuring the polling interval over which these values are monitored.

threshold rx-utilization

Configures thresholds for receive port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold rx-utilization high_thresh [ clear low_thresh ]
```

high_thresh

Default: 80

The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.

The percentage can be configured to any integer value between 0 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 80

The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.

The percentage can be configured to any integer value between 0 and 100.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

 **Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data > High Threshold
- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

■ threshold rx-utilization

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```

threshold tx-utilization

Configures thresholds for transmit port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold tx-utilization high_thresh [ clear low_thresh ]
```

high_thresh

Default: 80

The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.

The percentage can be configured to any integer value between 0 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 80

The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.

The percentage can be configured to any integer value between 0 and 100.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

 **Important:** Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data > High Threshold
- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

■ **threshold tx-utilization**

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```

vlan

Creates/deletes a VLAN tag and enters VLAN configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
vlan tag [ inline-process ] [ subscriber-vlan ] [ -noconfirm ]
```

```
no vlan tag
```

no

Deletes the VLAN with the specified tag.

tag

A tag that you specify to identify the VLAN. The tag must be unique and not used by any other VLANs on any other ports in the system. *tag* must be an integer from 1 through 4095.

inline-process

Do not use this keyword. This is a restricted keyword. It sets this VLAN for special processing for packets received from an external inline server.

subscriber-vlan

Designates the VLAN type as a subscriber VLAN. This keyword must be specified if the VLAN is to be associated with specific subscribers. Refer to the `ip vlan` command in the Subscriber Configuration Mode chapter of this reference for additional information on Subscriber-VLAN associations.

Important: To maintain optimal performance, this keyword should **not** be specified for VLANs that are not to be associated with subscribers.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Virtual LANs (VLANs) provide greater flexibility in the configuration and use of contexts and services. They are configured as “tags” on a per-port basis and allow more complex configurations to be implemented. The VLAN tag allows a single physical port to be bound to multiple logical interfaces that can be configured in different contexts. Therefore, each Ethernet port can be viewed as containing many logical ports when VLAN tags are employed.

 **Important:** VLANs are supported in conjunction with ports on the Ethernet 10/100 and 1000 line cards and on the four-port Quad Gig-E Line Card (QGLC). (VLAN tagging is not supported for SPIO ports.) The system supports the configuration of VLANs as follows:

 **Important:** Ethernet 1000 Line Card/QGLC: 1024 VLANs per card. QGLC supports 511 VLANs per port.

 **Important:** Ethernet 10/100 Line Card: Maximum of 256 VLANs per port and a maximum of 1016 VLANs per Line Card. (VLANs on all the ports of a single 10/100 Line Card can not add up to more than 1016.)

 **Important:** In order to change the type (using/removing the **subscriber-vlan** keyword) for VLANs that are already configured, the VLAN must first be deleted and then reconfigured as desired.

Example

The following example creates a VLAN and assign it the tag of 100:

```
vlan 100
```

Chapter 102

Exec Mode Commands (A-C)

This section includes the commands **aaa test** through **crypto-group**

The Exec Mode is the initial entry point into the command line interface system. Exec mode commands are useful in troubleshooting and basic system monitoring.

Exec Mode

aaa test

This command tests AAA functionality between the system and a remote server.

Product

PDSN, HA, GGSN, SGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
aaa test { accounting username user_name | authenticate user_name password |
session user_name password }
```

```
accounting username user_name
```

Tests RADIUS or GTPP accounting functionality for the specified user.

user_name must be the name of a user configured on the RADIUS or CFG server.

Important: GTPP is used only in conjunction with the GGSN or SGSN product.

```
authenticate user_name password
```

Tests RADIUS authentication functionality for the specified user.

user_name is the name of a user configured on the RADIUS server. *password* is the user's password.

```
session user_name password
```

Tests both RADIUS authentication and RADIUS or GTPP accounting functionality for the specified user.

user_name is the name of a user configured on the RADIUS server. *password* is the user's password.

Important: GTPP is used only in conjunction with the GGSN or SGSN product.

Usage

This command is used to test RADIUS-based authentication and RADIUS or GTPP accounting. This command may be useful for diagnosing problems with subscribers and access to the system and/or billing data.

Example

The following command verifies accounting for a user named *user1*:

```
aaa test accounting username user1
```

The following command tests authentication for a user named *user1* with the password *abc123*:

```
aaa test authentication user1 abc123
```

The following command tests both accounting and authentication for the user named *user1* with the password *abc123*:

```
aaa test session user1 abc123
```

active-charging service

This command creates an active charging service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
active-charging service acs_service_name [ -noconfirm ]
```

acs_service_name

Specifies name of the active charging service.

acs_service_name must be the name of the active charging service and must be an alpha and/or numeric string of 1 through 15 characters in length.

If the named service does not exist, it is created, and the CLI mode changes to the ACS Configuration Mode wherein the service can be configured.

If the named service already exists, the CLI mode changes to the ACS Configuration mode wherein the specified active charging service can be configured.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create an active charging service in the system. This command can be used directly in Exec Mode after issuing the **require active-charging** command in the Global Configuration Mode. This command allows an operator (rather than security administrators and administrators) to configure the ACS functionality only.

Important: Operators need special CLI privilege for ACS functionality to be able to use this CLI command.

Example

The following command creates an active charging service named *test*:

```
active-charging service test
```

alarm

This command is used to disable the internal audible alarm on the system management card.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
alarm cutoff
```

Usage

Alarm cutoff disables the audible alarm. The alarm may be enabled following this command if an event within the system results in the audible alarm being enabled.

Example

```
alarm cutoff
```

aps

This command enables the operator to perform APS administrative operations.

Important: This command is available beginning in Release 11.0.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
aps { clear slot#/port# | exercise slot#/port# | lockout slot#/port# | switch {
force | manual } slot#/port# }
```

clear slot#/port#

Clear last switch command on specified channelized port.

slot#/port# : Enter appropriate CLC2 slot number (valid range 17 - 48) and appropriate port number (valid range 1 - 4).

exercise slot#/port#

Test the APS protocol on line connected to port.

slot#/port# : Enter appropriate CLC2 slot number (valid range 17 - 48) and appropriate port number (valid range 1 - 4).

lockout slot#/port#

Prevent the working port from switching to the protection port.

slot#/port# : Enter appropriate CLC2 slot number (valid range 17 - 48) and appropriate port number (valid range 1 - 4).

switch { **force** | **manual** } slot#/port#

Switch to either the working port or the protection port:

- **force** : Forces a switch of ports, even if there is an active alarm state.
- **manual** : Implements a switch of ports if there are no active alarms.

slot#/port# : Enter appropriate CLC2 slot number (valid range 17 - 48) and appropriate port number (valid range 1 - 4).

Usage

This command enables someone in the Operations group to perform administrative/maintenance APS tasks such as testing the APS protocol, switching the working port to the protection port, and locking out the switching function.

Example

The following command starts an APS protocol test on port 2 of card 27:

```
exercise27/2
```

autoconfirm

This command disables or enables confirmation for certain commands. This command affects the current CLI session only.

Important: Use the **autoconfirm** command in the Global Configuration Mode to change the behavior for all future CLI sessions.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] autoconfirm
```

Usage

When **autoconfirm** is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When **autoconfirm** is disabled, the confirmation questions never appear. Disabling **autoconfirm** is active for the current session only.
By default **autoconfirm** is enabled.

Example

The following command enables command confirmation:

```
autoconfirm
```

The following command disables command confirmation for the duration of the current CLI session:

```
no autoconfirm
```

bulkstats force

This command is used to manage the system statistics for collection and delivery to the configured server.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
bulkstats force { gather | transfer }
```

gather

Immediately collects the system statistics.

transfer

Immediately send the currently collected statistics to the configured server.

Usage

When the current system statistics are desired immediately as opposed to the normal scheduled collection and delivery intervals issue this command.

Troubleshooting the system may require the review of statistics at times when the scheduled delivery is not timely.

Example

The following causes the chassis to immediately collect system statistics. This would be in anticipation of a transfer command.

```
bulkstats force gather
```

The following command causes the chassis to immediately send all collected statistics to the configured server.

```
bulkstats force transfer
```

card busy-out

This command moves processes from the source packet processing card to the destination packet processing card, or disables the packet processing card from accepting any new calls. When busy-out is enabled, the packet processing card stops receiving new calls but continues to process calls until they are completed. The command prompt is returned once the command is initiated. The busy-out procedure is completed in background.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
card busy-out { migrate from src_slot to dst_slot } [ -noconfirm ]
```

```
no card busy-out
```

no card busy-out

Disables busy-out. The packet processing card is re-enabled to accept new calls.

migrate from *src_slot* **to** *dst_slot*

This keyword moves processes from the specified source packet processing card to the specified destination packet processing card. The command prompt is returned once the command is initiated. The card migration is completed in background.

src_slot indicates the source slot number of the card whose processes will be migrated from. *dst_slot* indicates the destination slot number of the card processes will be migrated to.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Migrating a packet processing card changes the active/standby status of a packet processing card. This results in the active sessions/processes being moved to the newly active card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

The destination slot specified must contain a packet processing card which is in the standby state for the command to complete successfully.

Caution: Caution should be taken in using this command. Depending on the number of active sessions being migrated, some subscribers may experience service interruptions.

Using busy-out to refuse new calls on a packet processing card allows you to take a card out of service without any interruptions to the end user. An individual system can be taken completely out of service gracefully by enabling busy-out on all packet processing cards and waiting for current calls to complete. The **show card** info command shows if busy-out is enabled.

 **Important:** When a packet processing card fails, is migrated, or is restarted for any reason busy-out is reset to disabled, the default behavior.

 **Important:** This command is not supported on all platforms.

Example

The following command migrates the active processes from the packet processing card in slot *12* to the card in slot *14*. This command executes after you provide confirmation of the request.

```
card migrate from 12 to 14
```

The following command sets the packet processing card in slot *1* to stop accepting new calls:

```
card busy-out 1
```

card halt

This command halts a card. A card reboot must be issued to bring the card back into service after it is halted.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
card halt slot_num [ -force ] [ -noconfirm ]
```

slot_num

Indicates the slot number of the card of interest.

-force

Over-rides any warnings to force the card to be halted.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Halt a card to stop the card for maintenance or emergency situations.

Caution: Caution should be taken in using this command as halting a card which has no redundancy card available may cause a service interruption and loss of active sessions.

Caution: The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate halt regardless of warnings and no confirmation from the user.

Important: This command is not supported on all platforms.

Example

The following command temporarily stops the card in slot 1.

```
card halt 1
```

The following commands force the card to halt and indicate no confirmation is to take place, respectively.

```
card halt 17 -force -noconfirm
```

```
card halt 17 -noconfirm
```

card reboot

This performs a reset of the target card. Rebooting a packet processing or line card will result in the card downloading the image from the system management card.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
card reboot target_slot [ -force ] [ -noconfirm ]
```

target_slot

Indicates the slot number of the card which is the target of the reboot.

-force

Indicates the reboot is to take place ignoring any state or usage warnings that might be generated.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

A reboot is used to reset the card and receive a new download. This may be useful when a card is not responding or when it is necessary to cause the card to reload its image and restart.

 **Important:** Caution should be taken in using this command as rebooting a card which has no redundancy card available may cause a service interruption and loss of active sessions.

 **Caution:** The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate reboot regardless of warnings and no confirmation from the user.

 **Important:** This command is not supported on all platforms.

Example

The following will cause the card in slot 8 to reboot without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card reboot 8 -noconfirm
```

The following command will cause the card in slot 8 to reboot regardless of any warnings. The user must provide confirmation prior to this command executing.

■ card reboot

```
card reboot 8 -force
```

The following command will cause the card in slot 8 to reboot regardless of any warnings with no additional user confirmation.

```
card reboot 8 -force -noconfirm
```

card restart

This performs a soft-reset of the target card causing all application processes to restart.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
card restart target_slot [ -force ] [ -noconfirm ]
```

target_slot

Indicates the slot number of the card which is the target of the restart.

-force

Indicates the restart is to take place ignoring any state or usage warnings that might be generated.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Restarting a card may be useful when a card is not performing as expected (performance drop, increased response delays, etc.). A restart may be preferred to a reboot as the card becomes available in less time than a reboot.

When this command is issued for an active card, the user is prompted for confirmation unless the **-force** and/or **-noconfirm** keywords are used. Because the reboot of standby or redundant cards is non-service impacting, the reboot proceeds immediately after the command execution without user confirmation.

Important: Caution should be taken in using this command as restarting a card which has no redundant card available may cause a service interruption and loss of active sessions.

Important: This command is not supported on all platforms.

Caution: The **-force** and **-noconfirm** options should only be used concurrently by experienced users as this will cause an immediate restart regardless of warnings and no confirmation from the user.

Example

The following will cause the card in slot 8 to restart without any confirmation from the user. The card will not reboot if there are any warnings generated.

```
card restart 8 -noconfirm
```

card restart

The following command will cause the card in slot 8 to restart regardless of any warnings. The user must provide confirmation prior to this command executing.

```
card restart 8 -force
```

The following command will cause the card in slot 8 to restart regardless of any warnings with no additional user confirmation.

```
card restart 8 -force -noconfirm
```

card switch

This is the command for managing the line cards and their active/standby status.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
card switch [ from < target_slot> ] [ -noconfirm ]
```

```
[ to < target_slot> ]
```

Indicates the card which is to become the active card specified as *target_slot*.

```
-noconfirm
```

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Line card switch overs change the active/standby status of a line card. This is useful when there is a maintenance activity on the active card which requires removing the card from service.

 **Caution:** Caution should be taken in using this command. Depending on the amount of bandwidth/traffic being switched, some subscribers may experience service interruptions.

 **Important:** This command is not supported on all platforms.

Example

The following command switches the active/standby status of the line cards in slots 17 and 18. This command only executes after you provide confirmation of the request.

```
card switch from 17 to 18
```

The following switches the active/standby status of the line cards in slots 17 and 18. This command executes immediately with no additional user confirmation.

```
card switch from 17 to 18 -noconfirm
```

card upgrade

This command upgrades the programmable memory on a card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
card upgrade slot_number[ -noconfirm ]
```

card upgrade

Upgrades programmable memory on the specified card. Must be followed by a slot number of card to upgrade.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Caution: Use this command only if instructed by or working with Technical Support.

Usage

You can only initiate an upgrade if:

- there is no migration occurring,
- the card is active or standby,
- there is no online upgrade in progress.

Important: The following operations are not allowed while a card is upgrading: change edc requirement (config), change card [no] shutdown (config), change card active (config), change card redundancy (config), card halt (exec), card reboot (exec), start an online upgrade.

Important: Level unlock operations are ignored while a card is upgrading.

Important: This command is not supported on all platforms.

Example

The following command initiates a packet processing card upgrade on slot number 10:

```
card upgrade 10
```

cdr-push

This command initiates manual push of CDR files to L-ESS.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
cdr-push { all | local-filename file_name }
```

all

Specifies to push all CDR files to the configured URL.

local-filename *file_name*

Specifies to push the specified file to the configured URL.

file_name must be the absolute path of local file name to push, and must be a string of 1 through 1023 characters in length.

Usage

Use this command to manually push CDR files to the configured L-ESS.

For information on configuring the L-ESS, see the **cdr** command in the EDR Module Configuration Mode Commands/UDR Module Configuration Mode Commands chapters.

On ASR 5000 chassis, run this command only from the local context. If you are in any other context, you will see this failure message: “Failure: Manual PUSH of CDRs supported only in the local context”

Example

The following command pushes all CDR files to the URL:

```
cdr-push all
```

■ clear

clear

The following commands clear a variety of items including statistics, conditions, alarms, sessions, and files:

clear aaa

This command clears all AAA statistics in the current context.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear aaa local counters
```

Usage

Clearing the AAA statistics which may be useful when monitoring the statistics manually. Clearing resets the counters to zero.

The keyword **local** is not intended to imply the local context defined for all systems. Rather, the keyword **local** indicates the statistics within the current context are to be cleared.

Example

The following command zeroes out all the AAA statistics in the current context.

```
clear aaa local counters
```

clear active-charging analyzer statistics

This command is used to clear protocol analyzer statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging analyzer statistics [ name protocol_name ] [ [ | { grep
grep_options | more } ]
```

name *protocol_name*

Clears statistics for the specified protocol analyzer.

If this keyword is not specified all statistics are cleared.

protocol_name must be one of the following:

- **dns**
- **file-transfer**
- **ftp**
- **http**
- **icmp**
- **icmpv6**
- **imap**
- **ip**
- **ipv6**
- **mms**
- **p2p** [**application**]: Peer-to-peer analyzer. The supported applications are:
 - **actsync**
 - **aimini**
 - **applejuice**
 - **ares**
 - **armagettron**
 - **battlefld**
 - **bittorrent**
 - **blackberry**
 - **citrix**
 - **clubpenguin**
 - **crossfire**
 - **ddlink**

- directconnect
- dofus
- edonkey
- facebook
- facetime

Important: The **facetime** protocol is available only in releases 9.0 and 11.0. This protocol is not available in release 10.0.

- fasttrack
- feidian
- fiesta
- filetopia
- florensia
- freenet
- fring
- gadu_gadu
- gamekit

Important: The **gamekit** protocol is available only in releases 9.0 and 11.0. This protocol is not available in release 10.0.

- guildwars
- gnutella
- halflife2
- hamachivpn
- iax
- icecast
- imesh
- iptv
- irc
- isakmp
- iskoot
- jabber
- kontiki
- manolito
- maplestory
- meebo
- mgcp

■ clear active-charging analyzer statistics

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

■ clear active-charging analyzer statistics

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear ACS analyzer statistics.

Example

The following command clears active charging service analyzer information for TCP analyzer:

```
clear active-charging analyzer statistics name tcp
```

clear active-charging charging-action statistics

This command is used to clear ACS charging action statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging charging-action statistics [ name string ] [ | { grep  
grep_options | more } ]
```

name *string*

Clears detailed information for specific protocol analyzer.
string must be the name of an existing charging action.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear active charging action statistics.

Example

The following command clears active charging action statistics information for charging action named **pre-paid**:

```
clear active-charging charging-action statistics name pre-paid
```

clear active-charging content-filtering category statistics

This command is used to clear category-based content filtering statistics for the specified rulebase.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging content-filtering category statistics [ rulebase name  
rulebase_name | all ] [ | { grep grep_options | more } ]
```

all

Clears the statistics of each and every configured rulebase.

rulebase_name

rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to category-based content filtering statistics.

Example

The following command clears category-based content filtering statistics information for Rulebase named *cf_rule1*:

```
clear active-charging content-filtering category statistics rulebase name  
cf_rule1
```

clear active-charging credit-control statistics

This command clears credit control statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging credit-control statistics [ group group_name ]
```

group *group_name*

Clears statistics for the specified credit control group.

group_name must be the name of a credit control group, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear credit control statistics.

Example

The following command clears statistics information for credit control:

```
clear active-charging credit-control statistics
```

clear active-charging edr-format statistics

Clears ACS statistics for the specified EDR format.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging edr-format statistics [ name edr_format ]
```

name *edr_format*

Specifies name of the EDR format for which you want to clear the statistics.

edr_format must be the name of a configured EDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Important: If an EDR format name is not specified statistics for all EDR formats are cleared.

Usage

Use this command to clear the accumulated statistics for the specified EDR format.

Example

The following command clears the statistics for all EDR formats:

```
clear active-charging edr-format statistics
```

clear active-charging edr-udr-file statistics

This command is used to clear EDR/UDR file related statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging edr-udr-file statistics
```

Usage

Use this command to clear EDR and UDR file statistics.

Example

The following command clears statistical information for EDR and UDR files:

```
clear active-charging edr-udr-file statistics
```

clear active-charging firewall statistics

This command clears Active Charging Stateful Firewall statistics.

Product

FW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging firewall statistics [ callid call_id | domain-name
domain_name | nat-realm nat_realm | protocol { icmp | ip | other | tcp | udp } |
username user_name ] [ acsmgr instance instance_id ] [ | { grep grep_options |
more } ]
```

acsmgr instance *instance_id*

Specifies an ACS Manager instance ID.

instance_id must be an integer from 1 through 65535.

callid *call_id*

Specifies a call identification number.

call_id must be an eight-digit HEX number.

domain-name *domain_name*

Specifies a domain name for the statistics.

domain_name must be a string of 1 through 127 characters in length.

nat-realm *nat_realm*

Specifies a NAT realm name for the statistics.

nat_realm must be a string of 1 through 31 characters in length.

protocol { **icmp** | **ip** | **other** | **tcp** | **udp** }

Specifies protocol for the stats.

- **icmp**
- **ip**
- **other**: Protocols other than TCP, UDP, and ICMP
- **tcp**
- **udp**

username *user_name*

Specifies a user name for the statistics.

user_name must be a string of 1 through 127 characters in length.

grep *grep_options* | **more**

Indicates that the output of the command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear Stateful Firewall statistics.

Example

The following command clears all Stateful Firewall statistics:

```
clear active-charging firewall statistics
```

clear active-charging firewall track-list

This command clears the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

Product

FW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging firewall track-list attacking-servers
```

Usage

Use this command to clear the list of servers being tracked for involvement in any DOS attacks.

Example

The following command clears the list of servers being tracked for involvement in any DOS attacks:

```
clear active-charging firewall track-list attacking-servers
```

clear active-charging fw-and-nat policy statistics

This command clears statistics for all or a specific firewall-and-NAT policy.

Product

FW, NAT

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging fw-and-nat policy statistics { all | name policy_name } [
| { grep grep_options | more } ]
```

all

Displays information for all firewall-and-NAT policies configured.

name *policy_name*

Displays information for the specified firewall-and-NAT policy.

policy_name must be the name of a firewall-and-NAT policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear statistics for all or a specific firewall-and-NAT policy.

Example

The following command clears statistics for the firewall-and-NAT policy named *test123*:

```
clear active-charging fw-and-nat policy statistics name test123
```

clear active-charging group-of-ruledefs statistics

This command clears statistical information related to Active Charging Service group of ruledefs.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging group-of-ruledefs statistics [ name group_of_ruledefs ] [ | { grep grep_options | more } ]
```

name *group_of_ruledefs*

Specifies name of the group of ruledefs for which statistics must be cleared. *group_of_ruledefs* must be the name of an existing group of ruledefs, and must be a string of 1 through 63 characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear statistical information related to all or specified Active Charging Service group of ruledefs.

Example

The following command clears statistical information related to the group of ruledefs named *ruledef_group12*:

```
clear active-charging group-of-ruledefs statistics name ruledef_group12
```

clear active-charging nat statistics

This command clears NAT realm statistics.

Product

NAT

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging nat statistics [ nat-realm nat_realm ] [ | { grep  
grep_options | more } ]
```

clear active-charging nat statistics

This command when issued in the local context clears statistics for all NAT realms in all contexts. When issued in a specific context, this command clears statistics for all NAT realms in that context.

clear active-charging nat statistics nat-realm *nat_realm*

This command when issued in the local context clears statistics for the specified NAT realm in all contexts. When issued in a specific context, this command clears statistics for the specified NAT realm in that context.

nat-realm *nat_realm*

Specifies name of the NAT realm.

nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

grep *grep_options* | **more**

Specifies that the command's output be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear NAT realm statistics.

Example

The following command when issued in the local context, clears NAT realm statistics for NAT realms named *test135* in all contexts:

```
clear active-charging nat statistics nat-realm test135
```

clear active-charging rulebase statistics

This command clears ACS rulebase statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging rulebase statistics [ name rulebase_name ] [ | { grep  
grep_options | more } ]
```

rulebase_name

Clears statistics for specified ACS rulebase.

rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear ACS rulebase statistics.

Example

The following command clears statistics for the ACS rulebase named *postpaid*:

```
clear active-charging rulebase statistics name postpaid
```

clear active-charging ruledef statistics

This command clears ACS rule definition statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging ruledef statistics [ charging | firewall | name  
ruledef_name ] [ [ | { grep grep_options | more } ]
```

charging

Clears statistics for all configured Charging ruledefs.

firewall

Clears statistics for all configured Stateful Firewall ruledefs.

name *ruledef_name*

Clears statistics for the specified ACS ruledef.

ruledef_name must be the name of an existing ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear ACS ruledef statistics.

Example

The following command clears all ruledef statistics:

```
clear active-charging ruledef statistics
```

clear active-charging subsystem

This command clears all ACS subsystem information.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging subsystem
```

Usage

Use this command to clear all ACS subsystem information.

Example

The following command clears all ACS subsystem information:

```
clear active-charging subsystem
```

clear active-charging tcp-proxy statistics

This command clears ACS TCP Proxy statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging tcp-proxy statistics [ all | ip-layer | rulebase  
rulebase_name | tcp-layer ]
```

all

Clears all TCP Proxy statistics.

ip-layer

Clears TCP Proxy statistics for IP layer.

rulebase *rulebase_name*

Clears TCP Proxy statistics for the specified rulebase.

rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

tcp-layer

Clears TCP Proxy statistics for TCP layer.

Usage

Use this command to clear TCP Proxy statistics.

Example

The following command clears TCP Proxy statistics for the rulebase named *test14*:

```
clear active-charging tcp-proxy statistics rulebase test14
```

clear active-charging tpo policy statistics

This command clears TPO policy statistics.

Important: This is a restricted command. For more information contact your local sales representative.

Product

TPO

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging tpo policy statistics [ name tpo_policy_name ]
```

name *tpo_policy_name*

Clears statistics for the specified TPO policy.

tpo_policy_name must be the name of a TPO policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear TPO policy statistics.

- “**clear active-charging tpo policy statistics**” command clears statistics for all TPO policies configured in the active charging service.
- “**clear active-charging tpo policy statistics name tpo_policy_name**” command clears statistics for the specified TPO policy.

Example

The following command clears statistics for the TPO policy named *policy12*:

```
clear active-charging tpo policy statistics name policy12
```

clear active-charging tpo profile statistics

This command clears TPO profile statistics.

Important: This is a restricted command. For more information contact your local sales representative.

Product

TPO

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging tpo profile statistics [ name tpo_profile_name ]
```

name *tpo_profile_name*

Clears statistics for the specified TPO profile.

tpo_profile_name must be the name of a TPO profile, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear TPO profile statistics.

- “**clear active-charging tpo profile statistics**” command clears statistics for all TPO profiles configured in the active charging service.
- “**clear active-charging tpo profile statistics name** *tpo_profile_name*” command clears statistics for the specified TPO profile.

Example

The following command clears statistics for the TPO profile named *profile12*:

```
clear active-charging tpo profile statistics name profile12
```

clear active-charging url-blacklisting statistics

This command clears URL Blacklisting feature related statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear active-charging url-blacklisting statistics [ rulebase name rulebase_name  
] [ [ | { grep grep_options | more } ] ]
```

rulebase name *rulebase_name*

Clears URL Blacklisting information for the specified rulebase.

rulebase_name must be the name of a rulebase, and must be a string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that the output of the command must be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear URL Blacklisting feature related statistics, optionally for a specific rulebase.

Example

The following command clears URL Blacklisting feature related statistics for *rulebase12*:

```
clear active-charging url-blacklisting statistics rulebase name  
rulebase12
```

clear administrator

This command ends the session of an administrative user specified by either user name or session ID.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear administrator { name user_name | session id id_num}
```

name *user_name*

Identifies the user name of the administrative user.

session id *id_num*

Identifies the ID number of the administrative user session as displayed in the **show administrators session id** command output.

Usage

This command is used to terminate command line interface sessions for other administrative users.

Example

The following command ends the session of the administrative user identified as user1:

```
clear administrator name user1
```

The following command ends the session of the administrative user with the session ID of 3:

```
clear administrator session id 3
```

clear alarm

Clears outstanding alarm conditions

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear alarm { all | chassis | id num | port slot/port | slot slot }
```

all

Clear all outstanding alarms

chassis

Clears chassis-wide and fan tray alarms

id *num*

Clears a specific alarm by its internal alarm ID. *num* is the internal alarm identification number.

port *slot/port*

Clears alarms for the specified port. *slot/port* is the port to clear alarms for. *slot* is the slot that the card is installed in and *port* is the port on that card.

slot *slot*

Clears alarms for the specified slot. *slot* is the slot to clear alarms for.

Usage

Use this command to clear outstanding alarm conditions.

Example

To clear all outstanding alarms, use the following command:

```
clear alarm all
```

To clear all alarms for slot 7, enter the following command:

```
clear alarm slot 7
```

clear alcap

This command clears the Access Link Control Application Part (ALCAP) session statistics of ALCAP service associated with Home-NodeB Gateway (HNB-GW) service instance configured and running on a system.

Product

HNB-GW

Privilege

Operator

Syntax

```
clear alcap statistics [ alcap-service alcap_svc_name [ aal2-node aal2_node_name  
[ aal2-path aal2_path_id ] ] ]
```

alcap-service *alcap_svc_name*

Specifies the name of the ALCAP service of which statistics is to clear.

alcap_svc_name identifies the name of the ALCAP service to clear all service statistics.

aal2-node *aal2_node*

Specifies the name of the ATM Adaptation Layer 2 (AAL2) node to clear the ALCAP service statistics for specific node.

aal2_node_name is name of the AAL2 node configured in ALCAP service for which statistics is to clear.

aal2-path *aal2_path_id*

Specifies the identity number of the AAL2 path on specific ATM Adaptation Layer 2 (AAL2) node to clear the ALCAP service statistics for specific AAL2 path on particular AAL2 node.

aal2_path_id is the identifier of the AAL2 path on AAL2 node for which statistics is to clear.

Usage

This command is used to clear the sessions statistics and counters for ALCAP service.

Example

The following command clears the service session statistics of ALCAP service named as *alcap_hnb_svc1*:

```
clear alcap statistics alcap-service alcap_hnb_svc1
```

clear asngw-service

This command clears the service session statistics of an ASN GW service specified by either service name or trusted peer address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear asngw-service statistics [ name svc_name | peer-address ip_address ]
```

name *svc_name*

Identifies the name of the ASN GW service to clear all service statistics.

peer-address *ip_address*

Identifies the IP address of the ASN GW peer to clear all service statistics.

Usage

This command is used to terminate command line interface sessions for ASN GW services.

Example

The following command clears the service session statistics of ASN GW service named asn_svc1:

```
clear asngw-service statistics name asn_svc1
```

clear asnpc-service

This command clears the service session statistics of an ASN paging controller service specified by either ASN PC service name or trusted paging controller peer address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear asnpc-service statistics [ name svc_name | peer-address ip_address ]
```

name *svc_name*

Identifies the name of the ASN PC service to clear all service session statistics.

peer-address *ip_address*

Identifies the IP address of the ASN PC peer to clear all service statistics.

Usage

This command is used to terminate command line interface sessions for ASN PC services.

Example

The following command clears the service session statistics of ASN PC service named as `asnpc_svc1`:

```
clear asnpc-service statistics name asnpc_svc1
```

clear apn statistics

Deletes all previously gathered statistics for either a specific APN or all APNs configured with the given context.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear apn statistics [ name apn_name ]
```

name *apn_name*

Specifies the name of a specific APN configured in the context for which to clear statistics.

apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Statistics for a single APN can be cleared using the **name** keyword. Statistics for all APNs in the context can be deleted by entering the command with no keywords.

If this command is executed from within the local context with no keywords, statistics will be cleared for every APN configured on the system regardless of context. In addition, if the name keyword is used when executing from within the local context, statistics for all APNs configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for an apn called isp1:

```
clear apn statistics isp1
```

clear bcmcs statistics

Clears BCMCS statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear bcmcs statistics [ pdsn-service service_name ]
```

pdsn-service *service_name*

Defines a specific PDSN service for which to clear BCMCS-specific statistics. This value must be a string consisting of up to 63 characters.

Usage

Use this command to clear accumulated BCMCS statistics. You may specify an individual PDSN or peer to selectively clear statistics.

Example

```
clear bcmcs statistics
```

```
clear bcmcs statistics pdsn-service service_name
```

clear blacklisted-gtpu-bind-address

Clears the GTP-U loopback address blacklisted by a specific RNC as defined for a specific IuPS Service configuration.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear blacklisted-gtpu-bind-address ip_address rnc-id rnc_id mcc mcc_num mnc mnc_num iups-service name
```

ip_address

Specifies the IP loopback address that has been blacklisted. This loopback address was originally defined with the **associate-gtpu-bind-address** command in the Radio-Network-Controller configuration mode of the IuPS Service.

ip_address must be specified using the standard IPv4 dotted decimal notation.

Usage

This command enables this loopback address to be used for future RAB-assignment requests.

Example

```
clear blacklisted-gtpu-bind-address 1.1.1.1 rnc-id 2 mcc 123 mnc 321 iups-  
service iups1
```

clear **bssap+ statistics**

Clears/deletes the statistics for Base Station System Application Part plus in a Gs service sessions.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
clear bssap+ statistics [ gs-service gs_svc_name ] [ vlr { name vlr_name | isdn-  
number E164_ISDN_Num } ]
```

gs-service *gs_svc_name*

Specifies the name of a specific Gs service to clear the BSSAP+ information.

gs_svc_name is the name of a configured Gs service for which BSSAP+ is applied and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

vlr { **name** *vlr_name* | **isdn-number** *E164_ISDN_Num* }

Specifies the name of the VLR or SS7 address in E.164 ISDN format to clear the BSSAP+ information.

name *vlr_name* is name of the VLR must be an alpha and/or numeric string of 1 to 63 characters.

E164_VLR_num is an ISDN number for VLR per E.164 number plan and must be a numerical string of 1 to 15 digits.

Usage

Use this command to delete or clear the statistics of BSSAP+ application on a system.

Example

The following command clears the information about BSSAP+ in a Gs service named *gssvc1*.

```
clear bssap+ statistics gs-service gssvc1
```

clear bulkstats

Clears counters and accumulated bulk statistics related information.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear bulkstats { counters | data }
```

counters

Clears the counters maintained by the system's "bulkstats" facility.

data

Clears any accumulated data that has not been transferred. This includes any "completed" files that haven't been successfully transferred.

Usage

Once bulk statistics collection is enabled, the system stores the information until the specified transfer criteria is met or until a manual transfer is initiated. The system maintains counters for the "bulkstats" software facility. (Refer to the **data** keyword for the **show bulkstats** command for information on viewing the counters.)

This command can be used to delete bulk statistics information that has been collected but not transferred and/or to clear the counters that have been maintained.

Example

The following command clears bulk statistics-related counters:

```
clear bulkstats counters
```

clear config

This command replaces the active configuration source file with an empty configuration where possible.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear config [ -noconfirm ]
```

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Clear the current configuration when a complete over right is desired or if it is necessary to start from an empty configuration.

Important: Clearing the configuration will cause the active configuration source file to be empty and of no use in configuring the system to an active state providing service.

Important: It is suggested that this command only be performed on configurations which have been backed up for easy restoration.

Example

The following command clears the active configuration after the user provides confirmation of the request.

```
clear config
```

The following command clears the active configuration source file immediately with no user confirmation.

```
clear config -noconfirm
```

clear congestion-control statistics

Clears the congestion control statistics for all instances of the specified manager type.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear congestion-control statistics { allmgr | asngwmgr | asnpcmgr | hamgr |
gtpcmgr | ipsecmgr | imsimgr | l2tpmgr }
```

allmgr

Clears the statistics for all A11 Manager instances.

asngwmgr

Clears the statistics for all ASN GW Manager instances

asnpcmgr

Clears the statistics for all ASN PC-LR Manager instances

hamgr

Clears the statistics for all HA Manager instances.

gtpcmgr

Clears the statistics for all GTPC Manager instances.

ipsecmgr

Clears the statistics for all IPSEC Manager instances.

imsimgr

Clears the statistics for all IMSI Manager instances.

l2tpmgr

Clears the statistics for all L2TP Manager instances.

Usage

Use this command to statistics for all instances of the specified manager.

Important: When this command is issued in any context other than the local context, only instances of the specified manager for the current context have the statistics cleared. When the current context is the local context, all instances of the specified manager type in all contexts have the statistics cleared.

Example

Clear the statistics for all instances of the A11 manger, by entering the following command:

```
clear congestion-control statistics allmgr
```

clear content-filtering category statistics

This command clears the Category-based Content Filtering application statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear content-filtering category statistics [ facility srdbmgr instance  
instance_value ]
```

```
facility srdbmgr instance instance_value
```

Clears logged events for the specified SRDB Manager instance.

instance_value must be an integer from 1 through 8.

In StarOS 9.0 and later releases, *instance_value* must be an integer from 1 through 10000.

Usage

Use this command to clear all Category-based Content Filtering application statistics, or statistics for a specific SRDB Manager instance.

Example

The following command clears all Category-based Content Filtering application statistics:

```
clear content-filtering category statistics
```

clear crash

The clear crash command removes a specific crash file or all crash files.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear crash [ list | number crash_num ]
```

list | **number** *crash_num*

list: removes all crash files.

number *crash_num*: removes only the crash file specified as *crash_num* which must be within the range of 1 through 30.

Usage

Clear crashes for general maintenance activities in cleaning out old, unused, or files which are of no importance.

Example

The following will remove all crash files.

```
clear crash list
```

The following command will remove only crash file 27.

```
clear crash number 27
```

clear credit-control statistics

This command is used to clear credit control statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear credit-control statistics cc-service cc_service_name
```

cc-service *cc_service_name*

Specifies the credit control service name.

cc_service_name must be an existing Credit Control service, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to clear active credit control statistics.

Example

The following command clears the configured credit control statistics for a service named *service1*:

```
clear credit-control statistics cc-service service1
```

clear crypto

The clear crypto command clears crypto associations or crypto statistics.

Product

PDSN, HA, GGSN, PDG/TTG, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear crypto { isakmp [ tag map_name | peer peer_ip ] | security-association {
counters tag map_name [ tx | rx ] | tag map_name | peer peer_ip } | statistics {
ikev2 | ipsec-3gpp-cscf } [service-ip-address ip-address | service-name name ] }
```

```
isakmp [ tag map_name | peer peer_ip ]
```

When no keywords are specified, this command clears all of the ISAKMP security associations for the current context.

tag map_name: Clears the ISAKMP SAs for the specified crypto map. *map_name* is the name of an existing crypto map.

peer peer_ip: Deletes the ISAKMP SAs for the specified peer. *peer_ip* must be entered in standard IPv4 notation.

```
security-association { counters map map_name [ tx | rx ] | tag map_name |
peer peer_ip }
```

counters tag map_name [tx | rx]: Resets the counters for the specified crypto map. *map_name* is the name of an existing crypto map. **tx** specifies that only the transmit SA counters are reset. **rx** specifies that only the receive SA counters are reset. If neither **tx** or **rx** are specified, both transmit and receive SA counters are reset.

tag map_name: Tears down a Security Association (SA) for the specified crypto map. *map_name* is the name of an existing crypto map.

peer peer_ip: Clears the SAs for all tunnels who have the peer at the specified IP address. *peer_ip* must be entered in standard IPv4 notation.

 **Caution:** Modification(s) to an existing crypto map and/or ISAKMP policy configuration will not take effect until the related security association has been cleared.

```
statistics { ikev2 | ipsec-3gpp-cscf } [ service-ip-address ip-address |
service-name name ]
```

ikev2: Clears global IKEv2 statistics for the current context.

ipsec-3gpp-cscf: Clears global CSCF IPsec statistics for the current context.

service-ip-address ip-address: Clears statistics for the specified service-ip address. **service-name name**: Clears statistics for the specified service name.

Usage

Clear SAs and apply changes to the crypto map or clear the crypto statistics for this context.

■ clear crypto

Example

The following clears all IKEv2 crypto statistics for the current context:

```
clear crypto statistics ikev2
```

clear cs-network statistics

This command clears the HNB-Circuit Switched (CS) network service associated for an HNB-GW service instance.

Product

HNB-GW

Privilege

Operator

Syntax

```
clear cs-network statistics [ name cs_svc_name | ranap-only | rtp-only | sccp-only ]
```

name *cs_svc_name*

This keyword is used to clear the session statistics based on the HNB-CS Network service name *cs_svc_name* configured and running on this system.

cs_svc_name must be an existing HNB-CS Network service, and be from 1 to 63 alpha and/or numeric characters in length.

ranap-only

This keyword is used to clear the session statistics limited to Radio Access Network Application Protocol (RANAP) traffic only for specified HNB-CS Network service.

rtp-only

This keyword is used to clear the session statistics limited to Real Time Protocol (RTP) traffic only for specified HNB-CS Network service.

sccp-only

This keyword is used to clear the session statistics limited to Signaling Connection Control Part (SCCP) traffic only for specified HNB-CS Network service.

Usage

Use this command to clear the session statistics for overall session or in selected part of user session for HNB-CS Network services configured and running on a system.

Example

The following command clears the session statistics for RANAP part of session for the HNB-CS Network service *hnb_CS_1*:

```
clear cs-network statistics namehnb_CS_1 ranap-only
```

clear cscf service

Resets statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN).

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear cscf service { diameter { location-info | policy-control } statistics [
service-name service_name | vpn-name name ] | li-packet-cable statistics
[service-name service_name] | performance-counters name service_name |
statistics name service_name { all | calls | ip-security | message | package-
name { message-summary | presence | reg | winfo } | registrations | sigcomp |
tcp { msrp | sip } | vpn-name name { all | calls | ip-security | message |
package-name { message-summary | presence | reg | winfo } | registrations |
sigcomp | tcp { msrp | sip } } }
```

```
diameter { location-info | policy-control } statistics [ service-name
service_name | vpn-name name ]
```

Clears Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.

service-name *service_name*: Specifies the name of a CSCF service for which the statistics will be reset. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

vpn-name *name*: Specifies the name of a context in which all statistics for all services will be reset. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

```
li-packet-cable statistics [ service-name service_name ]
```

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

```
performance-counters name service_name
```

Clears all CSCF performance counters for a specific CSCF service configured on this system.

service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters

```
statistics name service_name { all | calls | ip-security | message |
package-name { message-summary | presence | reg | winfo } | registrations
| sigcomp | tcp tcp { msrp | sip } | vpn-name name { all | calls | ip-
security | message | package-name { message-summary | presence | reg |
winfo } | registrations | sigcomp | tcp tcp { msrp | sip } } }
```

Clears service statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

all: Clears all CSCF service statistics.

calls: Clears statistics related to CSCF calls.

ip-security: Clears statistics related to CSCF IPsec.

message: Clears statistics for the SIP method MESSAGE.

package-name: Clears statistics for the associated event package.

- **message-summary**: Clears statistics for the “message-summary” event package.
- **presence**: Clears statistics for the “presence” event package.
- **reg**: Clears statistics for the “reg” event package.
- **winfo**: Clears statistics for the “watcher-info” event package.

registrations: Clears statistics related to CSCF registrations, re-registrations, and de-registrations.

sigcomp: Clears statistics related to CSCF sigcomp.

tcp: Displays session statistics related to CSCF TCP.

- **msrp**: Clears statistics related to CSCF MSRP TCP.
- **sip**: Clears statistics related to CSCF SIP TCP.

vpn-name name: Clears statistics for a specific CSCF service configured in a specific context on this system. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

 **Important:** This keyword must be followed by another statistics-related keyword.

Usage

Use this command to reset statistics counters for CSCF services. This command will reset the counters in the output of the **show cscf service statistics** command.

 **Important:** This command will not clear current registered users and current CSCF sessions.

Example

The following command resets all statistics for a service named *cscf1*:

```
clear cscf service statistics name cscf1 all
```

clear cscf sessions

Clears statistics for CSCF sessions on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear cscf sessions { counters { calls | subscription } service service_name |
service service_name { all | aor aor | session-id id }
```

```
counters { calls | subscription } service service_name
```

Clears counters for all CSCF sessions matching the filter criteria.

calls: Counters associated with calls in CSCF service.

subscription: Counters associated with subscriptions in CSCF service.

service *service_name*: Counters on specific CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

```
service service_name { all | aor aor | session-id id }
```

Clears session information for all CSCF sessions matching the filter criteria.

service *service_name*: Session statistics on specific CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

- **all**: Specifies that session statistics are to be cleared for all sessions on this service.
- **aor** *aor*: Specifies that session statistics are to be cleared for sessions at this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.
- **session-id** *id*: Specifies that session statistics are to be cleared for sessions with this ID. *id* must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear session information for CSCF sessions.

Example

The following command resets all session statistics for a service named *cscf1*:

```
clear cscf sessions service cscf1 all
```

clear cscf sip

Resets SIP statistics counters for a specific CSCF service, all CSCF services, or for all services within a specified context (VPN) or interface.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear cscf sip statistics [ name service_name [ interface { domain name domain_name | ip address ip_address } ] | vpn-name name ]
```

name *service_name*

Specifies the name of a CSCF service for which the SIP statistics will be reset. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

interface { **domain name** *domain_name* | **ip address** *ip_address* }

SIP statistics will be reset in this interface.

domain name *domain_name*: Specifies the domain associated with the CSCF service. *domain_name* must be an existing domain and be from 1 to 64 alpha and/or numeric characters.

ip address *ip_address*: Specifies the destination or source ip address associated with the CSCF service.

vpn-name *name*

Specifies the name of a context in which all SIP statistics for all services will be reset. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

Usage

Use this command to reset SIP counters found in the output of the **show cscf sip** command.

Example

The following command resets the SIP statistics for a service named *cscf1*:

```
clear cscf sip statistics name cscf1
```

clear cscf subscription

Clears all subscriptions for a named service or for individual subscribers within the service.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear cscf subscription service service_name { all | from-aor subscriber_aor to-aor resource_aor }
```

service *service_name*

Specifies the name of a CSCF service for which the subscription(s) will be cleared. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

all | **from-aor** *subscriber_aor* **to-aor** *resource_aor*

all: Removes all CSCF subscriptions for the specified service.

from-aor *subscriber_aor*: Removes all CSCF subscriptions for a specified subscriber in a specified service.

subscribed-to *resource_aor*: Removes all CSCF subscriptions for a specified subscriber in a specified service with a specified subscribed-to resource AoR.

Usage

Use this command to clear subscriptions to enforce policies. This command initiates a SUBSCRIBE request with Expires as 0 in the corresponding subscription dialog.

Example

The following command clear all subscriptions for a CSCF service named *cscf1*:

```
clear cscf subscription service cscf1 all
```

clear diameter aaa-statistics

This command clears Diameter AAA statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear diameter aaa-statistics [ all | [ group aaa_group ] server diameter_server ] [ | { grep grep_options | more } ]
```

all

Clears all Diameter server statistics.

group *aaa_group*

Clears Diameter server statistics for the specified AAA group.

aaa_group must be the name of a AAA group, and must be a string of 1 through 64 characters in length.

server *diameter_server*

Clears Diameter server statistics for the specified Diameter server.

diameter_server must be the name of a Diameter server, and must be a string of 1 through 64 characters in length.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear Diameter AAA statistics.

Example

The following command clears Diameter server statistics for the specified AAA group:

```
clear diameter aaa-statistics group aaa_group
```

clear diameter statistics

This command clears Diameter statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear diameter statistics [ [ proxy ] endpoint endpoint_name [ peer-host host_id
[ peer-realm realm_id ] ] ] [ | { grep grep_options | more } ]
```

endpoint *endpoint_name*

Clears endpoint related statistics.

endpoint_name must be the name of an endpoint, and must be a string of 1 through 63 characters in length.

proxy

Clears proxy related statistics.

peer-host *host_id*

Clears statistics for the specified Diameter peer host ID.

host_id must be the Diameter peer host ID, and must be a string 1 through 255 characters in length.

peer-realm *realm_id*

Clears statistics for the specified Diameter peer realm.

realm_id must be the Diameter peer realm ID, and must be a string 1 through 127 characters in length.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear Diameter statistics.

Example

The following command clears all Diameter statistics for the specified endpoint:

```
clear diameter statistics endpoint endpoint_name
```

clear dhcp statistics

Deletes all previously gathered statistics for either a specific DHCP server or all DHCP servers configured within the given context.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear dhcp statistics [ dhcp-service svc_name | server ip_address ]
```

dhcp-service *svc_name*

The name of a specific DHCP service for which to clear statistics.

svc_name is the name of the DHCP service and can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

server *ip_address*

Specifies the IP address of a specific DHCP server configured in the context for which to clear statistics.

ip_address must be entered in dotted decimal notation.

Usage

Statistics for a single server can be cleared using the **server** keyword. Statistics for all DHCP servers in the context can be deleted by entering the command with no keywords.

This command can be executed from any context configured on the system.

If this command is executed from within the local context with no keywords, statistics will be cleared for every DHCP server configured on the system regardless of context. In addition, if the server keyword is used when executing from within the local context, statistics for all DHCP servers configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for all configured DHCP servers within the context:

```
clear dhcp statistics
```

clear dns-client

Clears DNS cache and/or statistics for a specified DNS client.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear dns-client name { cache [ query-name name | query-type { A | SRV } ] | statistics }
```

dns-client *name*

Defines the name of the DNS client whose cache and/or statistics are being cleared. *name* must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

cache [**query-name** *name* | **query-type** { **A** | **SRV** }]

Specifies that the cache for the defined DNS client is to be cleared.

query-name *name*: Filters DNS results based on the domain name. *name* must be from 1 to 255 characters in length. *name* is the domain name used to perform the DNS query. *name* is different from the actual domain name which is resolved. For example, to resolve the SIP server for *service.com*, the query name is *_sip._udp.service.com* and the query type is **SRV**.

query-type:

- **A**: Filters DNS results based on domain IP address records (A records).
- **SRV**: Filters DNS results based on service host records (SRV records).

statistics

Specifies that statistics for the defined DNS client are to be cleared.

Usage

Use this command to clear DNS cache and/or statistics for a specified DNS client.

Example

The following command clears statistics for a DNS client named *domain1.com*:

```
clear dns-client domain1.com statistics
```

clear egtpc

Clears enhanced GPRS Tunneling Protocol control plane statistics and counters found in show command outputs and bulk statistics associated with all eGTP-C-related services or those defined by the parameters in this command.

Product

MME, P-GW, S-GW

Privilege

Operator

Syntax

```
clear egtpc statistics [ egtp-service name | interface-type { interface-mme |
interface-pgw-ingress | interface-sgsn | interface-sgw-egress | interface-sgw-
ingress } | mme-address ip_address | pgw-address ip_address | sgsn-address
ip_address | sgw-address ip_address ]
```

egtp-service *name*

Clears all statistics and counters associated with a specific eGTP service name. *name* must be an existing eGTP service name and be from 1 to 63 alpha and/or numeric characters.

interface-type { **interface-mme** | **interface-pgw-ingress** | **interface-sgw-egress** | **interface-sgw-ingress** }

interface-mme: Clears statistics and counters derived from all MME interface types associated with this system.

interface-pgw-ingress: Clears statistics and counters derived from all P-GW ingress interface types associated with this system.

interface-sgw-egress: Clears statistics and counters derived from all S-GW egress interface types associated with this system.

interface-sgsn: Clears statistics and counters derived from all SGSN S4 interface types associated with this system.

interface-sgw-ingress: Clears statistics and counters derived from all S-GW ingress interface types associated with this system.

mme-address *ip_address*

Clears all statistics and counters derived from a specific MME IP address. *ip_address* must be an existing MME IP address and be specified in IPv4 dotted decimal notation or IPv6 colon-separated notation.

pgw-address *ip_address*

Clears all statistics and counters derived from a specific P-GW IP address. *ip_address* must be an existing P-GW IP address and be specified in IPv4 dotted decimal notation or IPv6 colon-separated notation.

sgw-address *ip_address*

Clears all statistics and counters derived from a specific S-GW IP address. *ip_address* must be an existing S-GW IP address and be specified in IPv4 dotted decimal notation or IPv6 colon-separated notation.

■ clear egtpc

sgsn-address *ip_address*

Clears all statistics and counters derived from a specific SGSN S4 IP address. *ip_address* must be an existing SGSN S4 IP address and be specified in IPv4 dotted decimal notation or IPv6 colon-separated notation.

Usage

Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all eGTP-C-related services or for specific interfaces, services, or IP addresses as specified by parameters in this command.

Example

The following command clears eGTP-C statistics and counter associated with all P-GW ingress interfaces configured on this system:

```
clear egtpc statistics interface-type interface-pgw-ingress
```

The following command clears eGTP-C statistics and counter associated with all MME interfaces configured on this system:

```
clear egtpc statistics interface-type interface-mme
```

clear firewall

This command is obsolete.

clear fng-service statistics

Deletes all previously gathered statistics for a specific FNG service or all FNG services configured within a context.

Product

FNG

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear fng-service statistics {name service_name}
```

name *service_name*

Specifies the name of a specific FNG service configured in the context for which to clear statistics.

service_name is the name of the FNG service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Statistics for a single FNG service can be cleared using the **name** keyword. Statistics for all FNG services in the context can be deleted by entering the command with no keywords.

If this command is executed from within the local context with no keywords, statistics will be cleared for every FNG service configured on the system regardless of context. In addition, if the **name** keyword is used when executing from within the local context, statistics for all FNG services configured with the specified name will be cleared regardless of context.

Example

The following command clears statistics for an FNG service named fng1:

```
clear fng-service statistics name fng1
```

clear gmm-sm statistics

Deletes all previously gathered GMM-SM statistics within the given context based on the specified criteria.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gmm-sm statistics [ gmm-only | sm-only ] [ gprs-service svrc_name [ nsei
nse_id | routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id ] ] | [ sgsn-
service svrc_name [ rnc mcc mcc_id mnc mnc_id rnc-id rnc_id | routing area mcc
mcc_id mnc mnc_id lac lac_id rac rac_id ] ]
```

gmm-only

Enter this keyword to display only GPRS mobility management (GMM) information for other specified keyword parameters for the current context.

sm-only

Enter this keyword to display only session management (SM) information for other specified keyword parameters for the current context.

gprs-service *svrc_name*

Enter this keyword to display the statistics for the specified GPRS service. The display request can be narrowed by adding additional keywords.

svrc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

nsei

Enter this keyword to display the GMM/SM session statistics for the identified network service entity (NSEI).

sgsn-service *svrc_name*

Enter this keyword to display the statistics for the specified SGSN service. The display request can be narrowed by adding additional keywords.

svrc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

rnc

Enter this keyword to fine-tune the display of the GMM/SM session statistics just for the specified (rnc-id) radio network controller (RNC).

rnc-id *rnc_id*

Enter this keyword to identify the specific RNC.

rnc_id must be an integer from 0 through 4095.

■ clear gmm-sm statistics

```
routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id
```

Enter the **routing-area** keyword to fine-tune the display of the GMM/SM session statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.

```
mcc mcc_id
```

Enter this keyword to specify the mobile country code (MCC) as part of the identification of the RNC or RA. *mcc_id* must be an integer from 100 through 999.

```
mnc mnc_id
```

Enter this keyword to specify the mobile network code (MNC) as part of the identification of the RNC or RA. *mnc_id* must be an integer from 00 through 999.

```
lac lac_id
```

Enter this keyword to specify the location area code (LAC) as part of the identification of the RNC or RA. *lac_id* must be an integer from 1 through 65535.

```
rac rac_id
```

Enter this keyword to specify the routing area code (RAC) as part of the identification of the RNC or RA. *rac_id* must be an integer from 1 through 255.

Usage

Use this command to delete statistics for the GMM/SM session configurations for SGSN services.

Example

The following command deletes GMM/SM statistics for a specific routing area defined for the GPRS service:

```
clear gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mnc 131  
lac 24 rac 11
```

The following command clears all collected information for GMM/SM statistics:

```
clear gmm-sm statistics verbose
```

clear gtpc statistics

Deletes all previously gathered GTPC (GTPv0, GTPv1-C, GTPv1-U) statistics within the given context based on the specified criteria.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtpc statistics [ apn apn_name ] [ custom1 ] [ ggsn-service ggsn_name ] [ sgsn-address sgsn_address ]
```

apn *apn_name*

Specifies the name of an APN configured in the context for which to delete GTPC statistics.
apn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

custom1

Clears the statistics of GTP-C messages for preservation mode and free of charge service. This keyword is customer-specific license enabled and used for Preservation-Mode and Free-of-Charge Service which are enabled under customer-specific license. For more information on this support, contact your local representative.

ggsn-service *ggsn_name*

Specifies the name of a GGSN service configured in the context for which to delete GTPC statistics.
ggsn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

sgsn-address *sgsn_address*

Specifies the IP address of an SGSN for which to delete GTPC statistics.
sgsn_address must be expressed in dotted decimal notation.

Usage

GT-C statistics can be cleared for a single APN, GGSN service, or SGSN. All GTPC statistics in the context can be deleted by entering the command with no keywords.

This command can be executed from any context configured on the system.

If this command is executed from within the local context with no keywords, all GTPC statistics will be cleared regardless of context.

GTPP statistics are not affected by this command.

Example

The following command clears all GTPC statistics within the context:

```
clear gtpc statistics
```

- clear gtpc statistics

clear gtp statistics

Deletes all previously gathered GTPP statistics within the given context based for either single or all charging gateway functions (CGFs).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtp statistics [ cgf-address ip-address ]
```

cgf-address *cgf_address*

Deletes statistics for a particular CGF.

cgf_address is the IP address of the CGF for which statistics are to be deleted. It must be expressed in dotted decimal notation

Usage

Statistics for a single CGF can be cleared using the **cgf-address** keyword. Statistics for all CGFs in the context can be deleted by entering the command with no keywords.

This command can be executed from any context configured on the system.

If this command is executed from within the local context with no keywords, statistics will be cleared for every CGF configured on the system regardless of context. In addition, if the **cgf-address** keyword is used when executing from within the local context, statistics for all CGFs configured with the specified name will be cleared regardless of context.

Example

The following command deletes all GTPP statistics for a CGF with an IP address of 192.168.1.42:

```
clear gtp statistics cgf-address 192.168.1.42
```

clear gtp storage-server local file statistics

This command clears AAA proxy GTPP group level statistics for CDRs stored on the local SMC hard disk.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtp storage-server local file statistics [ group name name ]
```

Usage

If executed from the local context, this command clears statistics for all GTPP groups configured on the system. If executed from the context within which the storage servers (SMC hard disk) is configured, statistics are deleted for only that context.

clear gtp storage-server statistics

Clears statistics for configured GTP storage servers (GSS).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear gtp storage-server statistics
```

Usage

If executed from the local context, this command clears statistics for all GTP storage servers configured on the system. If executed from the context within which the servers are configured, statistics are deleted for only those servers.

clear gtpu statistics

Clears enhanced GPRS Tunneling Protocol user plane statistics and counters found in show command outputs and bulk statistics associated with all GTP-U-related services or those defined by the parameters in this command.

Product

P-GW, S-GW

Privilege

Operator

Syntax

```
clear gtpu statistics [ gtpu-service name | peer-address ip_address ]
```

gtpu-service *name*

Clears all statistics and counters associated with a specific GTP-U service name. *name* must be an existing GTP-U service name and be from 1 to 63 alpha and/or numeric characters.

peer-address *ip_address*

Clears all statistics and counters derived from a specific peer IP address. *ip_address* must be an existing peer IPv4 or IPv6 address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

Usage

Use this command to clear running statistics and counters found in show command and bulk statistics outputs for all GTP-U-related services or for specific services or IP addresses as specified by parameters in this command.

Example

The following command clears GTP-U statistics and counter associated with a GTP-U service name *gtpu-12* configured on this system:

```
clear gtpu statistics gtpu-service gtpu-12
```

clear hd-storage-policy

Clears statistic information for HD storage policies configured on the system.

Product

HSGW, P-GW, S-GW

Privilege

Operator

Syntax

```
clear hd-storage-policy statistics { all | name name }
```

```
statistics { all | name name }
```

all: Specifies that ACR statistic information for all HD storage policies configured on the system is to be cleared.

name *name*: Specifies that ACR statistic information for an HD storage policy with the specified name is to be cleared.

Usage

Use this command to clear statistics for HD storage policies configured on the system.

Example

The following command clears statistics for an HD storage policy named *pgwsgw*:

```
clear hd-storage-policy statistics name pgwsgw
```

clear hnbgw sessions

This command clears the active/dormant session information about registered HNB(s) on Home-NodeB Gateway (HNB-GW) service instances configured and running on this system based on different filter criterias.

Product

HNB-GW

Privilege

Operator

Syntax

```
clear hnbgw sessions { all | cell-id cell_id | hnb-address hnb_ip_address | hnb-local-id hnb_id | hnbgw-service hnbgw_svc_name | hnbid hnb_glbl_id | mcc mcc mnc mnc [-noconfirm] [ lac lac | rac rac ] }
```

all

This keyword is used to clear the summarized or full information of all registered HNB sessions on an HNB-GW service instance running on system. Clearing the statistics can be filtered based on given filtering criterias.

cell-id *cell_id*

This keyword is used to clear the of HNB session statistics based on the registered cell id as *cell_id* on an HNB-GW service instance.

cell_id is the identification number of the Femto cell where user/subscriber is geographically located and must be an integer between 0 through 268435455.

hnb-address *hnb_ip_address*

This keyword is used to clear the session statistics of HNB session(s) based on the registered HNB IP address *hnb_ip_address* on an HNB-GW service instance.

hnb_ip_address is an IP address expressed in IPv4 notation.

hnb-local-id *hnb_id*

This keyword is used to clear the session statistics of HNB session(s) based on the registered local id of HNB as *hnb_id* on an HNB-GW service instance.

hnb_id is the local identification of a registered HNB in HNB-GW service instance and must be an integer between 1 through 255.

hnbgw-service *hnbgw_svc_name*

This keyword is used to clear the session statistics of registered HNB session(s) based on the HNB-GW service name *hnbgw_svc_name* configured and running on this system.

hnbgw_svc_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

hnbid *hnb_glbl_id*

This keyword is used to clear the statistics of HNB session(s) based on the registered global id of HNB as *hnb_glbl_id* on an HNB-GW service instance.

hnb_globl_id is the global identification of a registered HNB in HNB-GW service instance and must be an integer between 1 through 255.

mcc *mcc*

This keyword is used to clear statistics of HNB session(s) based on the registered Mobile Country Code (MCC) identification number of the UE as *mcc* on an HNB-GW service instance. *mcc* must be an integer between 101 through 999.

mnc *mnc*

This keyword is used to clear the statistics of HNB session(s) based on the registered Mobile Network Code (MCC) identification number of the UE as *mcc* on an HNB-GW service instance. *mnc* must be an integer between 00 through 999.

lac *lac*

This keyword is used to clear the statistics of HNB session(s) based on the registered Location Area Code (LAC) identification number of the UE as *lac* on an HNB-GW service instance. *lac* must be an integer between 1 through 65535.

rac *rac*

This keyword is used to clear the statistics of HNB session(s) based on the registered Radio Access Code (RAC) identification number of the UE as *rac* on an HNB-GW service instance. *rac* must be an integer between 1 through 255.

rnc *rnc*

This keyword is used to clear the statistics of HNB session(s) based on the registered Radio Network Code (RAC) identification number of the HNB as *rnc* on an HNB-GW service instance. *rnc* must be an integer between 1 through 65535.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: The Operator privilege does not have access to this keyword.

Usage

Use this command to clear the session statistics of all or specific registered HNB session(s) or in selected part of user session for HNB-GW services configured and running on this system.

Example

The following command clears the session statistics for all registered HNBs on the HNB-GW service named *hnbgw1*:

```
clear hnbgw sessions hnbgw-service hnbgw1
```

clear hnbgw statistics

This command clears the HNB-GW service and HNB related statistics from an HNB-GW node.

Product

HNB-GW

Privilege

Operator

Syntax

```
clear hnbgw statistics { hnbgw-service hnbgw_svc_name [ gtpu-only | hnbap-only |
ranap-only | rtp-only | rua -only | sccp-only | sctp-only ] | hnbid
hnb_identifier [ gtpu-only | hnbap-only | ranap-only | rtp-only | rua -only ] }
```

hnbgw-service *hnbgw_svc_name*

This keyword is used to clear the session statistics based on the HNB-GW service name *hnbgw_svc_name* configured and running on this system.

hnbgw_svc_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

hnbid *hnb_identifier*

This keyword is used to clear the session statistics based on Home-NodeB *hnb_identifier* which is connected to this system through an HNB-GW service.

hnb_identifier must be an identifier for HNB from 1 to 255 alpha and/or numeric characters in length.

gtpu-only

This keyword is used to clear the statistics limited to GTP-U traffic only for selected HNB/HNB-GW service.

hnbap-only

This keyword is used to clear the statistics limited to Home NodeB Application Part (HNBAP) traffic only for selected HNB/HNB-GW service.

ranap-only

This keyword is used to clear the session statistics limited to Radio Access Network Application Protocol (RANAP) traffic only for selected HNB/HNB-GW service.

rtp-only

This keyword is used to clear the session statistics limited to Real Time Protocol (RTP) traffic only for selected HNB/HNB-GW service.

rua-only

This keyword is used to clear the session statistics limited to RANAP User Adaptation (RUA) traffic only for selected HNB/HNB-GW service.

sccp-only

This keyword is used to clear the session statistics limited to Signaling Connection Control Part (SCCP) traffic only for selected HNB-GW service.

sctp-only

This keyword is used to filter the session statistics display limited to Stream Control Transmission Protocol (SCTP) traffic only for selected HNB-GW service.

Usage

Use this command to clear the session statistics for overall session or in selected part of user session for HNB-GW services and/or HNBs configured and running on this system.

Example

The following command clear the session statistics for HNBAP part of session details for the HNB-GW service named *hnbgw1*:

```
clear hnbgw statistics hnbgw-service hnbgw1 hnbap-only
```

The following command clears the session statistics for RANAP part of session for the HNB identified as *102*:

```
clear hnbgw statistics hnbid 102 ranap-only
```

clear hsgw-service

Clears statistic information for HSGW services configured on the system.

Product

HSGW

Privilege

Operator

Syntax

```
clear hsgw-service statistics { all | name name }
```

```
statistics { all | name name }
```

all: Specifies that HSGW service statistic information for all HSGW services configured on the system is to be cleared.

name *name*: Specifies that HSGW service statistic information for an HSGW service with the specified name is to be cleared.

Usage

Use this command to clear statistics for HSGW services configured on the system.

Example

The following command clears statistics for an HSGW service named *hsgw3*:

```
clear hsgw-servicey statistics name hsgw3
```

clear hss-peer-service

Clears statistic information for HSS peer services configured on the system.

Product

MME

Privilege

Operator

Syntax

```
clear hss-peer-service [ statistics [ service name ]
```

```
statistics [ service name ]
```

statistics: Specifies that HSS peer service statistic information for all HSS peer services configured on the system is to be cleared.

service *name*: Specifies that HSS peer service statistic information for a specific HSS peer service is to be cleared.

Usage

Use this command to clear statistics for HSS peer services configured on the system.

Example

The following command clears statistics for an HSS peer service named *hss4*:

```
clear hss-peer-service statistics service name hss4
```

clear ims-authorization

This command clears statistics for all or for a specified IMS Authorization Service.

Product

GGSN, SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear ims-authorization { policy-control statistics [ ims-auth-service
service_name ] | service statistics [ name service_name ] } [ | { grep
grep_options | more } ]
```

ims-auth-service *service_name*

Clears statistics for the specified IMSA service.

service_name must be the name of an IMSA service, and must be a string of 1 through 64 characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to clear IMSA Service statistics.

Example

The following command clears IMSA policy-control statistics for an IMSA service named *test_service*:

```
clear ims-authorization policy-control statistics ims-auth-service
test_service
```

clear ip access-group statistics

This command clears all interface ACL statistics and the context level ACL statistics that have been configured in the current context. Be aware that updating an access list also causes all ip access-groups utilizing the list to be cleared.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
clear ip access-group statistics
```

Usage

Use this command to clear all interface ACL statistics and the context level ACL statistics that have been configured in the current context.

Example

The following command clears the ACL statistics:

```
clear ip access-group statistics
```

clear ip arp

Clears the address resolution protocol cache for a given IP address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear ip arp ip_address
```

ip_address

Specifies the IP address for which to clear the ARP cache. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Clear the ARP cache when network changes have occurred for the case where the cached data may cause undue overhead in routing of packets.

Example

The following command clears the ARP cache for the IP address `1.2.3.4`:

```
clear ip arp 1.2.3.4
```

clear ip bgp peer

Resets BGP connections for all peers or for specified peers in the current context.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
clear ip bgp peer { ip_address | all | as as_num } [ in | out | soft | vpn4 ]
```

ip_address

The IP address of the neighbor for which BGP connections should be reset. *ip_address* is an IPv4 address in dotted-decimal notation.

all

Reset BGP connections for all peers.

as *as_num*

Reset BGP connections for all peers in the specified AS. *as_num* must be an integer from 1 through 65535.

in

Soft reconfigure inbound updates.

out

Soft reconfigure outbound updates.

soft

Soft reconfigure inbound and outbound updates.

vpn4

Clears bgp sessions with the vpn4 address family.

Usage

Use this command to BGP information for the current context.

Example

The following command resets BGP connections for all neighbors:

```
clear ip bgp peer all
```

clear ip localhosts

This command removes the host specified from the current context's local host list for IP address mappings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear ip localhosts [ host_name ]
```

host_name

Specifies the name of the host to be removed. Value must be a string from 1 to 1023 characters. When omitted, all local host name mappings will be removed.

Usage

Clear a host name when it is no longer valid for the current context to access. The host name specified will be unrecognized by the current context once the command is performed.

Example

```
clear ip localhosts  
clear ip localhosts 1.2.3.4  
clear ip localhosts remoteABC
```

clear ip ospf process

Clears OSPF database information for the current context and re-establishes neighbor adjacency.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear ip ospf process
```

Usage

Use this command to clear the OSPF database information for the current context and re-establishes neighbor adjacency.

Example

The following command clears the OSPF database information for the current context and re-establishes neighbor adjacency:

```
clear ip ospf process
```

clear ipv6 neighbors

Clears an ipv6 address from the neighbor cache.

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

```
clear ipv6 neighbors ip_address
```

Usage

Clears a specific address from the neighbor cache.

Example

Use the following example to clear `3ffe:ffff:101::230:6eff:fe04:d9aa/48`:

```
clear ipv6 neighbors 3ffe:ffff:101::230:6eff:fe04:d9aa/48
```

clear l2tp

Clears all or specific L2TP statistics or clears and disconnects all or specified sessions or tunnels.

Product

PDSN, GGSN, LNS

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear l2tp { statistics [ lac-service service_name | lns-service service_name |
peer-address ip_address ] | tunnels { all [clear-sa] | callid call_id | lac-
service service_name [ clear-sa ] | lns-service service_name | peer-address
ip_address [ clear-sa ] } }
```

```
statistics [ lac-service service_name | lns-service service_name | peer-
address ip_address ]
```

With no optional keywords specified, this command clears all L2TP statistics for the current context.

lac-service *service_name*: Clears all L2TP statistics for the specified LAC service in the current context.

lns-service *service_name*: Clears all L2TP statistics for the specified LNS service in the current context.

peer-address *ip_address*: Clears all L2TP statistics for the destination (peer LNS) at the specified IP address. The IP address is specified using the standard IPv4 dotted decimal notation.

```
tunnels { all [ clear-sa ] | callid call_id | lac-service service_name [
clear-sa ] | peer-address ip_address [ clear-sa ] }
```

all: Clears all tunnels in the current context.

lac-service *service_name*: Clears all tunnels in the current context that belong to the specified LAC service and closes the tunnels.

lns-service *service_name*: Clears all tunnels in the current context that belong to the specified LNS service and closes the tunnels.

peer-address *ip_address*: Clears all tunnels in the current context whose destination (peer LNS) is the system at the specified IP address. The IP address is specified using the standard IPv4 dotted decimal notation.

callid *call_id*: Uses the unique identifier that specifies a particular tunnel in the system to clear that tunnel and disconnect it. The output of the command **show l2tp tunnels** contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.

clear-sa: If any security associations have been established they are cleared.

Usage

Clear L2TP all or specific L2TP statistics or clear sessions in a tunnel and disconnect the tunnel.

Example

To clear all L2TP statistics for the current context, use the following command:

clear l2tp statistics

To clear all L2TP statistics for the LAC service named lac1, use the following command:

```
clear l2tp statistics lac-service lac1
```

Use the following command to clear L2TP statistics for the LNS peer at the IP address 10.10.10.100:

```
clear l2tp statistics peer-address 10.10.10.100
```

The following command clears and closes all tunnels in the current context:

```
clear l2tp tunnels all
```

The following command clears and closes all tunnels for the LAC service named lac2:

```
clear l2tp tunnels lac-service lac2
```

The following command clears and closes all tunnels the peer at the IP address 10.10.10.110:

```
clear l2tp tunnels peer-address 10.10.10.110
```

clear lawful-intercept

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

clear lma-service statistics

Clears Local Mobility Anchor statistics and counters found in show command outputs and bulk statistics associated with all LMA services or a specific service defined by the parameter in this command.

Product

P-GW

Privilege

Operator

Syntax

```
clear lma-service statistics [ name service_name ]
```

name *service_name*

Clears statistics and counters for a specific LMA service name. *name* must be an existing LMA service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear statistics and counters in show command outputs and bulk statistics for all LMA services or for a specific LMA service.

Example

The following command clears statistics and counters for an LMA service named *lma3*:

```
clear lma-service statistics name lma3
```

clear local-user

Clears information pertaining to local-user administrative accounts.

Product

All

Privilege

Security Administrator

Syntax

```
clear local-user { database [ -noconfirm ] | statistics | username name logout
}
```

database [-noconfirm]

Clears the local-user database. This command deletes all information for all local-user accounts.

 **Caution:** Use this command only in the event of security concerns or to address concerns of the local-user account database integrity.

statistics

Clears statistics pertaining to local-user accounts.

username *name* logout

Removes lockouts associated with specific local-user accounts.

name is the name of the local-user account and can consist of from 3 to 16 alpha and/or numeric characters and is case sensitive.

Usage

This command can be used to remove local-user account lockouts, reset local-user-related statistics to 0, or to delete the local-user database.

Example

The following command removes the lockout placed on a local-user account named *SecureAdmin*:

```
clear local-user username SecureAdmin logout
```

clear mag-service statistics

Clears Mobile Access Gateway statistics and counters found in show command outputs and bulk statistics associated with all MAG services or a specific service defined by the parameter in this command.

Product

HSGW, S-GW

Privilege

Operator

Syntax

```
clear mag-service statistics [ name service_name ]
```

name *service_name*

Clears statistics and counters for a specific MAG service name. *name* must be an existing MAG service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear statistics and counters in show command outputs and bulk statistics for all MAG services or for a specific MAG service.

Example

The following command clears statistics and counters for a MAG service named *mag1*

```
clear mag-service statistics name mag1
```

clear maximum-temperatures

Clears information pertaining to component maximum temperatures.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear maximum-temperatures
```

Usage

Reset the timestamp to the current time and clear previous maximum temperatures for all temperature monitored components. This may be useful when preparing to study system performance, monitor usage, or trouble shoot the administrative interfaces.

Example

The following command resets the maximum temperature statistics for all monitored chassis components.

```
clear maximum-temperatures
```

clear mipfa statistics

This command clears the statistics for the mobile IP foreign agent. The statistics for a specific foreign agent service may be cleared by explicit command.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear mipfa statistics [ fa-service name | peer-address ip_address ]
```

```
fa-service name | peer-address ip_address
```

fa-service *name*: Indicates the statistics for a specific service are to be cleared where the service is as specified by *name*. “Total sessions” counters for all peers associated with the service are also reset. *name* must be an existing FA service name.

peer-address *ip_address*: Indicates the statistics for the specific IP address, *ip_address*, are to be cleared. “Total sessions” counter for the specified peer is also reset. The IP address is specified using the standard IPv4 dotted decimal notation.

Usage

Clear all statistics for the MIP foreign agent or for a specific service. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example

The following clears all statistics for the mobile IP foreign agent.

```
clear mipfa statistics
```

The following command clears the statistics for the example service only.

```
clear mipfa statistics fa-service sampleService
```

```
clear mipfa statistics peer-address 1.2.3.4
```

clear mipha statistics

This command clears the statistics for the mobile IP home agent. The statistics for a home agent service may be cleared by explicit command.

Product

HA

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear mipha statistics [ ha-service name | peer-address ip_address ]
```

```
ha-service name | peer-address ip_address
```

ha-service *name*: indicates the statistics for a specific service are to be cleared where the service is as specified by *name*. “Total sessions” counters for all peers associated with the service are also reset. *name* must be an existing HA service name.

peer-address *ip_address*: indicates the statistics for the specific IP address, are to be cleared. “Total sessions” counter for the specified peer is also reset. The IP address is specified using the standard IPv4 dotted decimal notation.

Usage

Clear all statistics for the MIP home agent or for a specific service. This may be useful in monitoring performance and troubleshooting as the statistics may be cleared at a well known time and then collected and transferred for review.

Example

The following clears all statistics for the mobile IP foreign agent.

```
clear mipha statistics
```

The following command clears the statistics for the example service only.

```
clear mipha statistics ha-service sampleService
```

```
clear mipha statistics peer-address 1.2.3.4
```

clear mme-service db record

This command clears the MME database records all instances of session manager running for MME service filtered with IMSI or GUTI as criteria.

Product

MME

Privilege

Inspector

Syntax

```
clear mme-service db record { imsi imsi_identifier | callid call_id | guti plmn
plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value } [ | { grep
grep_options | more } ]
```

imsi *imsi_identifier*

This keyword specifies the filter criteria as International Mobile Subscriber Identity (IMSI) *imsi_identifier* to clear the database records of a session instance. *imsi_identifier* is a 15 character IMSI field which identifies the subscriber's home country and carrier. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

callid *call_id*

This keyword specifies the filter criteria as call id *call_id* to clear the database records of a session instance. *call_id* must be specified as an 8-byte hexadecimal number.

guti **plmn** *plmn_id* **group-id** *mme_grp_id* **code** *mme_code* **m-tmsi** *mtmsi_value*

This set of keyword specifies the filter criteria as Globally Unique Temporary Identifier (GUTI) to clear the database records for MME service.

The GUTI is constructed from the GUMMEI and the M-TMSI where GUMMEI is constructed from PLMN (MMC and MNC) *plmn_id* and MME Identifier is constructed from an MME Group ID (MMEGI) *mme_grp_id* and an MME Code (MMEC) *mme_code*.

Within the MME, the mobile is identified by the M-TMSI *mtmsi_value*

Usage

Use this command to clear/remove database records for all or a particular instance of session manager for MME services on this system with IMSI or GUTI as filter criteria.

Example

The following command clears the summary database records of a session instance for subscriber having IMSI as 123455432112345 in the MME service:

```
clear mme-service db record imsi 123455432112345
```

clear mme-service db statistics

This command clears the MME database statistics for MME sessions for all or specific session instances on this system.

Product

MME

Privilege

Inspector

Syntax

```
clear mme-service db statistics [ instance smgr_instance ]
```

instance *smgr_instance*

This keyword specifies that MME database statistics are to be removed for a specific instance of session manager running for MME service.

smgr_instance must be specified as an instance ID in the range 0 through 4294967295. If instance is not specified database statistics of all instances will be removed.

Usage

Use this command to clear/remove database statistics for all or a particular instance of session manager for MME services on this system.

Example

The following command removes/clears the database statistics of all instances of the MME service on a system:

```
clear mme-service db statistics
```

clear mme-service statistics

This command clears the service statistics of an MME service specified by various criteria.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
clear mme-service statistics [ emm-only [ mme-service mme_svc_name | peer-id
peer_identifier ] ] | esm-only [ mme-service mme_svc_name | peer-id
peer_identifier ] | slap [ mme-service mme_svc_name | peer-id peer_identifier ]
| sctp [ mme-service mme_svc_name ] ]
```

emm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS mobility management (EMM) related statistics.

esm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to clear all EPS session management (ESM) related statistics.

slap

This keyword sets the filter criteria as MME service name of peer MME identifier to clear all S1-AP statistics.

sctp

This keyword sets the filter criteria as MME service name of peer MME identifier to clear all SCTP statistics.

mme-service *mme_svc_name*

This keyword sets the filter criteria as MME service name to clear all service statistics.

peer-id *peer_identifier*

This keyword sets the filter criteria as identifier of MME peer to clear all service statistics.

Usage

This command is used to clear the statistical information of an MME service based on various filter criteria.

Example

The following command clears the service session statistics of all MME service on a system:

```
clear mme-service statistics
```

■ clear mme-service statistics

clear multicast-sessions

Disconnects broadcast-multicast sessions based on specified criteria.

Product

PDSN, GGSN

Privilege

Security Administrator Operator

Syntax

```
clearmulticast-sessions [ -noconfirm ] [ keywords ] [ verbose ]
```

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

all

Disconnects all multicast sessions.

callid *call_id*

Clears the call specified by *call_id*. The call ID must be specified as an 8-digit hexadecimal number.

card-num *psc_num*

The slot number of the packet processing by which the multicast session is processed. *psc_num* is a slot number from 1 through 7 or 10 through 16

flowid *id*

Clears calls for a specific BCMCS flow, defined by *id*. The flow ID must be a hexadecimal number

flowid-type [**flow** | **program**]

Clears multicast sessions according to the type of flow.

flow: Clears all multicast sessions for the flow ID type “flow”.

program: Clears all multicast sessions for the flow ID type “program”.

mcast-address *ipv4_address*

Clear multicast sessions for a specific multicast address. Must be followed by the IP address of an interface, using dotted decimal notation.

pcf *ipv4_address*

Clears multicast sessions connected via the packet control function defined by *ipv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

pdsn_service *name*

Clears multicast sessions connected to the packet data service *name*. The packet data service must have been previously configured.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

Usage

Clear multicast sessions to aid in troubleshooting the system when no additional subscribers may connect or when a specific service or remote address may be having connection problems. This command may also be useful when preparing for maintenance activities such that connects may be cleared to perform any necessary procedures.

The keywords are filters that modify or filter the criteria for deciding which sessions to clear and are described below. Multiple keywords can be entered on a command line.

When multiple keywords are specified, the multicast sessions deleted must meet the specifications of all of the keywords.

Example

The following command clears the broadcast-multicast sessions having multicast address *1.2.3.4*:

```
clear multicast-sessions mcast-address 1.2.3.4
```

The following command clears the broadcast-multicast session(s) having call id *00004e22*:

```
clear multicast-sessions callid 00004e22
```

clear orbem statistics

Clears the CORBA element manager interface related statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear orbem statistics
```

Usage

Clear the statistics to reset them to zero for the object request broker element manager interface. This may be useful when preparing to study system performance, monitor usage, or trouble shoot the administrative interfaces.

Example

The following command resets the statistics for the ORB element manager.

```
clear orbem statistics
```

```
■ clear pdg-service statistics
```

clear pdg-service statistics

Deletes all previously gathered statistics for a specific PDG service or all PDG services configured within a context.

Product

PDG/TTG

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear pdg-service statistics [ name service_name ]
```

name *service_name*

Specifies the name of a specific PDG service configured in the context for which to clear statistics.

service_name is the name of the PDG service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Usage Statistics for a single PDG service can be cleared using the name keyword. Statistics for all PDG services in the context can be deleted by entering the command with no keywords.

If this command is executed from within the local context with no keywords, statistics will be cleared for every PDG service configured on the system regardless of context. In addition, if the name keyword is used when executing from within the local context, statistics for all PDG services configured with the specified name will be cleared regardless of context.

Example

Example(s) The following command clears statistics for a PDG service named *pdg1*:

```
clear pdg-service statistics pdg1
```

clear pgw-service

Clears PDN Gateway statistics and counters found in show command outputs and bulk statistics associated with all P-GW services or a specific service defined by the parameter in this command.

Product

P-GW

Privilege

Operator

Syntax

```
clear pgw-service statistics { all | name service_name }
```

all

Clears statistics and counters for all P-GW services on the system.

name *service_name*

Clears statistics and counters for a specific P-GW service name. *name* must be an existing P-GW service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear statistics and counters in show command outputs and bulk statistics for all P-GW services or for a specific P-GW service.

Example

The following command clears statistics and counters for an P-GW service named *pgw5*:

```
clear lma-service statistics name pgw5
```

clear port

Clears port related statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear port { datalink counters { all | slot/port } | npu counters { all | slot/port [ untagged | vlan tag_id ] }
```

datalink

Clear the data link port statistics.

npu

Clear statistics for the network processing unit port.

all

Clear counters for all datalink or NPU ports.

slot/port

Clear the statistics for the specified slot and port number.

untagged

Clear NPU statistics for all ports that do not have a VLAN tag.

vlan tag_id

Clear NPU statistics for the port that has the specified VLAN tag ID. *tag_id* must be a previously configured VLAN tag id.

Usage

Manually clear the statistics for a specified port. This is useful when preparing to trouble shoot or monitor the system.

Example

The following command clears the data link related statistics for port 1 in slot 17.

```
clear port datalink counters 17/1
```

The following command clears the network processing unit related statistics for port 1 in slot 17.

```
clear port npu counters 17/1
```

clear ppp statistics

Clears point-to-point protocol related statistics. All PPP statistics may be cleared or just those for a specific packet data service may be cleared.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear ppp statistics [ ggsn-service ggsn_name | lns-service lns_name | pcf-  
address [ pcf_ip_addr | all ] | pdsn-service pdsn_name ]
```

ggsn-service *ggsn_name*

Display statistics only for the time the session is connected to the specified *ggsn_name*.

lns-service *lns_name*

Display statistics only for the time the session is connected to the specified *lns_name*.

pcf-address [*pcf_ip_addr* | **all**]

Display statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. *pcf_ip_addr* must be specified using the standard IPv4 dotted decimal notation.

pdsn-service *pdsn_name*

Specifies the service as *pdsn_name* which is to have only its statistics cleared.

Usage

Allows you to manually reset PPP statistics when it is desired to have counts begin again from a specific point in time.

Example

The following clears the statistics for all PPP counters and services.

```
clear ppp statistics
```

The following clears only the point-to-point protocol statistics for the service named *sampleService*.

```
clear ppp statistics pdsn-service sampleService
```

clear prepaid 3gpp2 statistics

This command clears all of the statistics counters for 3GPP2 Pre-paid accounting. Statistics may be cleared for all services or for an individual service.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear prepaid 3gpp2 statistics { all | { ggsn-service | ha-service | lns-service  
| pdsn-service } { all | name service_name } }
```

all

This keyword clears prepaid statistics for all services.

ggsn-service

Clear statistics for GGSN service(s).

ha-service

Clear statistics for HA service(s).

lns-service

Clear statistics for LNS service(s).

pdsn-service

Clear statistics for PDSN service(s).

```
{ all | name service_name }
```

all: Clear statistics for all services of the specified type.

name service_name: Clear statistics for the service named *service_name* of the specified service type.

Usage

Use this command to clear Pre-paid statistics for a particular named service or for all services.

Example

To clear statistics for a PDSN service name PDSN1, enter the following command:

```
clear prepaid 3gpp2 statistics pdsn-service name PDSN1
```

clear prepaid wimax

This command clears all of the statistics counters for WiMAX prepaid accounting. Statistics may be cleared for all services or for an individual service.

Product

ASN GW

Privilege

Operator

Syntax

```
clear prepaid wimax statistics { all | asngw-service { all | name service_name }
| ha-service { all | name service_name } }
```

all

This keyword clears prepaid statistics for all services.

asngw-service

Clears prepaid statistics for ASN GW service(s).

ha-service

Clears prepaid accounting statistics for HA service(s).

```
{ all | name service_name }
```

all: Clears statistics for all services of the specified type.

name service_name: Clears statistics for the service named *service_name* of the specified service type.

Usage

Use this command to clear prepaid WiMAX accounting statistics for named service or for all services.

Example

The following command clears prepaid WiMAX accounting statistics for an ASN GW service name *asn1*:

```
clear prepaid wimax statistics asngw-service name asn1
```

clear ps-network statistics

This command clears the HNB-Packet Switched (PS) network service associated for an HNB-GW service instance.

Product

HNB-GW

Privilege

Operator

Syntax

```
clear ps-network statistics [ name cs_svc_name | gtpu-only | ranap-only | rtp-only | sccp-only ]
```

name *ps_svc_name*

This keyword is used to clear the session statistics based on the HNB-PS network service name *ps_svc_name* configured and running on this system.

ps_svc_name must be an existing HNB-PS Network service, and be from 1 to 63 alpha and/or numeric characters in length.

gtpu-only

This keyword is used to clear the session statistics limited to GTP-U traffic only for specified HNB-PS Network service.

ranap-only

This keyword is used to clear the session statistics limited to Radio Access Network Application Protocol (RANAP) traffic only for specified HNB-PS Network service.

sccp-only

This keyword is used to clear the session statistics limited to Signaling Connection Control Part (SCCP) traffic only for specified HNB-PS Network service.

Usage

Use this command to clear the session statistics for overall session or in selected part of user session for HNB-CS Network services configured and running on a system.

Example

The following command clears the session statistics for RANAP part of session for the HNB-PS Network service *hnb_PS_1*:

```
clear ps-network statistics namehnb_PS_1 ranap-only
```

clear qos npu stats

Clears information pertaining to NPU QoS priority queue bandwidth allocation and sharing.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear qos npu stats inter-subscriber traffic slot slot_num
```

```
inter-subscriber traffic slot slot_num
```

Clears inter-subscriber traffic statistics for the application or line card installed in the specified slot. *slot_num* indicates the number of the chassis slot in which the card is installed and can be configured to any integer value from 1 through 48.

Usage

Allows you to manually reset statistics pertaining to NPU QoS priority queue bandwidth allocation.

Example

The following command clears statistics for a card installed in chassis slot 4:

```
clear qos npu stats inter-subscriber traffic slot 4
```

clear radius accounting archive

This command clears archived RADIUS accounting messages associated with a AAA group, or all the archived RADIUS accounting messages in the context in which the command is executed depending on the option chosen. The scope of the command is limited to the context in which it is executed including for local context.

 **Important:** This command is only available in StarOS 8.3 and later. For more information, please contact your local service representative.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clear radius accounting archive { all | radius group group_name } [ -noconfirm ]
```

all

Clears all archived RADIUS accounting messages in the context.

radius group *group_name*

Clears all archived RADIUS accounting messages for the specified group.

group_name must be the name of a RADIUS group, and must be a string of 0 through 64 characters in length.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to clear the archived RADIUS accounting messages associated with a AAA group, or all the archived RADIUS accounting messages in the context in which the command is executed.

Example

Use the following command to clear all archived RADIUS accounting messages for the group named *test12*.

```
clear radius accounting archive radius group test12
```

clear radius counters

Clears statistics for RADIUS servers and server group. The statistics for all RADIUS servers or server group may be cleared or only a specified server.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear radius counters { all | radius group group_name | server ip_address [ port number ] }
```

```
all | radius group group_name | server ip_address [ port number ]
```

all: Clears statistics for all servers.

server *ip_address* [**port** *number*]: Clears statistics only for the server specified by *ip_address*. Optionally specify the port which is to have its RADIUS statistics cleared, where port number must be an integer from 0 through 65535. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

radius group *group_name*: Clears all configured authentication / accounting servers in the specified RADIUS group. *group_name* must be name of server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

Usage

Clear the statistics to reset them to zero prior to logging or monitoring the system for troubleshooting, performance measurements, etc.

Example

The following command clears the statistics for all RADIUS servers.

```
clear radius counters all
```

The following command resets the statistics only for the server *1.2.3.4*.

```
clear radius counters server 1.2.3.4
```

The following command resets the statistics only for the server group named *star1*.

```
clear radius counters radius group star1
```

clear rohc statistics

This command clears statistics and counters collected since the last reload or clear command was issued for ROHC IP header compression.

Product

PDSN

Privilege

Administrator, Config-administrator, Operator, Inspector

Syntax

```
clear rohc statistics [ pdsn-service pdsnsvc_name | asngw-service <  
asngwsvc_name >
```

pdsn-service *pdsnsvc_name*

Clear ROHC statistics and counters for the specified PDSN service.

asngw-service *asngwsvc_name*

Clear ROHC statistics and counters for the specified ASNGW service.

Usage

Use this command to clear ROHC statistics for all services or for a specific PDSN or ASNGW service.

Example

The following command clears ROHC statistics and counters for the PDSN service named *pdsn1*:

```
clear rohc statistics pdsn-service pdsn1
```

clear rp service-option

Clears the R-P interface service option statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear rp service-option statistics [ number option_num | pdsn-service pdsn_name ]
```

number *option_num* | **pdsn-service** *pdsn_name*

Default: clear the statistics for all service options and all packet data services.

number *option_num*: specifies the R-P service option number for which the statistics are to be cleared.

option_num must be a value in the range 0 through 1000.

pdsn-service *pdsn_name*: specifies the service as *pdsn_name* which is to have only its statistics cleared.

Usage

Clear the R-P service option statistics prior to monitoring the system for bench marking or for detecting areas of further research.

Example

The following resets the service option statistics for service option 23 and packet data service *sampleService*, respectively.

```
clear rp service-option statistics number 23
```

```
clear rp service-option statistics pdsn-service sampleService
```

clear rp statistics

Clears the R-P interface statistics. The statistics for a specific packet data server or peer node may be cleared if specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear rp statistics [ pdsn-service name | peer-address [ peer_address | all ] ]
```

```
pdsn-service name | peer-address [ peer_address | all ]
```

Default: clear all R-P associated statistics.

pdsn-service *name*: specifies the packet data service specified by *name* is to have its statistics reset.

peer-address [*peer_address* | **all**]: specifies that statistics for the specified peer, or all peers, are to be cleared. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Clear the statistics to prepare for monitoring the system.

Example

The following command resets all the associated statistics for the R-P interfaces.

```
clear rp statistics
```

The following clears the statistics for the packet data service *sampleService*.

```
clear rp statistics pdsn-service sampleService
```

The following command resets the statistics associated with peer node with IP address *1.2.3.4*.

```
clear rp statistics peer-address 1.2.3.4
```

clear session disconnect-reasons

Clears the session disconnect reason statistics for all sessions on the system.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear session disconnect-reasons
```

Usage

Sets the counters for session disconnect reasons to zero (0) in preparation for a monitoring or troubleshooting session.

Example

```
clear session disconnect-reasons
```

clear session setuptime

Clears the session setup time statistics for PCFs or SGSNs. If no keyword is specified the summary statistics displayed by the **show session setuptime** command are cleared.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear session setuptime { pcf { pcf_addr | all } | sgsn { sgsn_addr | all } }
```

```
pcf { pcf_addr | all }
```

pcf_addr: Clear the setup time counters for the PCF at the specified IP address. *pcf_addr* must be an IP v4 address expressed in dotted decimal notation.

all: Clear the setup time counters for all PCFs.

```
sgsn { sgsn_addr | all }
```

sgsn_addr: Clear the setup time counters for the SGSN at the specified IP address. *sgsn_addr* must be an IP v4 address expressed in dotted decimal notation.

all: Clear the setup time counters for all SGSNs.

Usage

Sets the counters for session disconnect reasons to zero (0) in preparation for a monitoring or troubleshooting session.

Example

To clear the statistics for the PCF at IP address 192.168.100.10, enter the following command:

```
clear session setuptime pcf 192.168.100.10
```

clear session subsystem

Clears all session subsystem statistics for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear session subsystem
```

Usage

Clear the statistics in preparation for a troubleshooting or monitoring session so that the counters are at a well known values.

Example

```
clear session subsystem
```

clear sgs-service

Clears SGs service statistics for all SGs services, known Visitor Location Registers (VLRs), or a specific SGs service or VLR name.

Product

All

Privilege

Operator

Syntax

```
clear sgs-service { statistics [ name name ] | vlr-status [ service-name name ]  
[ vlr-name name ] }
```

statistics [name name]

Specifies that statistics for all SGs services or a specific SGs service are to be cleared.

name name: Specifies that the statistics for the SGs service identified with the *name* variable are to be cleared. *name* must be an existing SGs service and be from 1 to 63 alpha and/or numeric characters.

vlr-status [service-name name] [vlr-name name] }

Specifies that statistics for all VLRs, a VLR related to a SGs service, or a specific VLR are to be cleared.

service-name name: Specifies that the SGs statistics for the VLR identified with the SGs service *name* variable are to be cleared. *name* must be an existing SGs service and be from 1 to 63 alpha and/or numeric characters.

vlr-name name: Specifies that the SGs statistics for the VLR identified with the VLR *name* variable are to be cleared. *name* must be an existing VLR name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear statistics for all SGs services, known Visitor Location Registers (VLRs), or a specific SGs service or VLR name.

Example

The following command clears statistics for an SGs service named *sgs2*:

```
clear sgs-service statistics name sgs2
```

clear sgtpc statistics

Clears all SGTPC statistics for the current context.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear sgtpc statistics [ gsn-address ipv4_address | sgtp-service sgtp_srvc_name ]
```

gsn-address *ipv4_address*

Identify the interface to a specific GGSN to clear the GTPU packet statistics for that interface.

ipv4_address: Enter a standard IPv4 address in dotted decimal format.

sgtp-service *sgtp_srvc_name*

Identify the interface for a specific SGTP service to clear the GTPU packet statistics for that interface.

sgtp_srvc_name: Enter a string of 1 to 63 alphanumeric characters to identify the SGTP service. Must be the name of an active SGTP service.

Usage

Use this command to clear the statistics in preparation for a troubleshooting or monitoring session.

Important: Statistics are vital for troubleshooting. We recommend that you check with your Cisco support personnel prior to clearing these statistics.

Example

```
clear sgtpc statistics sgtp-service SGSN1sgtp12
```

clear sgtpu statistics

Clears all SGTPU statistics for the current context.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear sgtpu statistics [ ggsn-address ipv4_address | gprs-service gprs_srvc_name
nsei nse_id | iups-bind-address ipv4_address | iups-service iups_srvc_name |
rnc-address ipv4_address | sgtp-service sgtp_srvc_name ]
```

ggsn-address *ipv4_address*

Identify the interface to a specific GGSN to clear the GTPU packet statistics for that interface.

ipv4_address: Enter a standard IPv4 address in dotted decimal format.

gprs-service *gprs_srvc_name* **nsei** *nse_id*

Identify the interface for a specific network service entity of a GPRS service to clear the GTPU packet statistics for that interface.

gprs_srvc_name: Enter a string of 1 to 63 alphanumeric characters to identify the GPRS service. Must be the name of an active GPRS service.

nse_id: Enter an integer from 0 to 65535.

iups-bind-address *ipv4_address*

Identify the bind address for the IuPS interface to clear the GTPU packet statistics for that interface.

ipv4_address: Enter a standard IPv4 address in dotted decimal format.

iups-service *iups_srvc_name*

Identify the interface for a specific IuPS service to clear the GTPU packet statistics for that interface.

gprs_srvc_name: Enter a string of 1 to 63 alphanumeric characters to identify the IuPS service. Must be the name of an active IuPS service.

rnc-address *ipv4_address*

Identify the interface for a specific RNC to clear the GTPU packet statistics for that interface.

ipv4_address: Enter a standard IPv4 address in dotted decimal format.

sgtp-service *sgtp_srvc_name*

Identify the interface for a specific SGTP service to clear the GTPU packet statistics for that interface.

sgtp_srvc_name: Enter a string of 1 to 63 alphanumeric characters to identify the SGTP service. Must be the name of an active SGTP service.

Usage

Use this command to clear the statistics in preparation for a troubleshooting or monitoring session.

■ clear sgtpu statistics

Important: Statistics are vital for troubleshooting. We recommend that you check with your Cisco support personnel prior to clearing these statistics.

Example

```
clear sgtpu statistics gprs-service SGSN1Gprs1 nsei 2445
```

clear sgw-service statistics

Clears Serving Gateway statistics and counters found in show command outputs and bulk statistics associated with all S-GW services or a specific service defined by the parameter in this command.

Product

S-GW

Privilege

Operator

Syntax

```
clear sgw-service statistics { all | name service_name }
```

all

Clears statistics and counters for all S-GW services configured on the system.

name *service_name*

Clears statistics and counters for a specific S-GW service name. *service_name* must be an existing S-GW service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to clear statistics and counters in show command outputs and bulk statistics for all S-GW services or for a specific S-GW service.

Example

The following command clears statistics and counters for an S-GW service named *sgw3*:

```
clear sgw-service statistics name sgw3
```

clear snmp trap

Clears all SNMP event trap notifications from the buffer.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear snmp trap { history | statistics }
```

history

Clears all SNMP historical trap information from system buffer.

statistics

Clears all SNMP event trap information from system buffer.

Usage

Use this command to empty the buffer of all SNMP trap notifications.

Example

Following command clears the all historical SNMP traps from the system buffer:

```
clear snmp trap history
```

clear srp checkpoint statistics

Clears the SRP checkpoint interface statistics.

Product

HA, GGSN PDIF

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear srp checkpoint statistics
```

Usage

Clears the srp checkpoint statistics to prepare for srp monitoring.

Example

The following command resets all the associated statistics for srp checkpoint.

```
clear srp checkpoint statistics
```

clear srp statistics

Clears the SRP statistics.

Product

HA, GGSN PDIF

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear srp statistics
```

Usage

Clears the srp statistics to prepare for srp monitoring.

Example

The following command resets all the associated statistics for srp.

```
clear srp statistics
```

clear subscribers

Disconnects subscribers based on specified criteria.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
clear subscribers [ keywords ] [ verbose ] [ -noconfirm ]
```

The keywords are filters that modify or filter the criteria for deciding which subscriber sessions to clear and are described below. Multiple keywords can be entered on a command line.

When multiple keywords are specified, the subscriber sessions deleted must meet the specifications of all of the keywords.

For example; if you enter the following command:

```
clear subscribers ip-pool pool1 card-num 1
```

Only subscriber sessions that were assigned an IP address from the IP pool named *pool1* and are also being processed by the processing card in slot *1* are cleared. All other subscriber sessions that do not meet these criteria remain and are not cleared.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: The Operator privilege does not have access to this keyword.

active

Only disconnects subscribers who currently have active sessions.

all

Disconnects all subscribers.

Important: The Operator privilege does not have access to this keyword.

apn *name*

Clears all PDP contexts accessing a specific access point name (APN).

apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

asn-peer-address *ip_address*

Clears information for subscribers on an ASN GW trusted peer.

ip_address is the IPv4 address of the ASN GW peer server in dotted decimal notation.

asngw-service *service_name*

Clears counters for subscribers accessing the ASN GW service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

asnpc-service *service_name*

Clears counters for subscribers accessing the ASN PC service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

callid *id*

Clears the call specified by *call_id*. The call ID must be specified as a 4-byte hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. *card_num* is a slot number from 1 through 7 or 10 through 16.

ccoa-only

This option clears the subscribers that registered a MIP co-located COA directly with the HA.

This option is only valid when MIPHA session license is enabled.

configured-idle-timeout [< | > | **greater-than** | **less-than**] *value*

Disconnects subscribers whose idle timeout matches the specified criteria. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.

<: Filters output so that only information less than the specified value is cleared.

>: Filters output so that only information greater than the specified value is cleared.

greater-than: Filters output so that only information greater than the specified value is cleared.

less-than: Filters output so that only information less than the specified value is cleared.

value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

connected-time [< | > | **greater-than** | **less-than**] *value*

Disconnects subscribers who have been connected for the specified length of time.

<: Filters output so that only information less than the specified value is cleared.

>: Filters output so that only information greater than the specified value is cleared.

greater-than: Filters output so that only information greater than the specified value is cleared.

less-than: Filters output so that only information less than the specified value is cleared.

value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

cscf-service *service_name*

Clears all subscribers from the specified CSCF service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters.

css-delivery-sequence *name*

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

css-service *name*

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsolete.

dhcp-server *address*

Clears all PDP contexts that currently possess an IP address assigned from a specific DHCP server. *dhcp_address* is the IP address of the DHCP server expressed in dotted decimal notation.

dormant

Only disconnect subscriber sessions that are dormant (not transmitting or receiving data).

fa *address*

Disconnects all subscribers connected to the foreign agent specified by *fa_address*. The address must be specified using the standard IPv4 dotted decimal notation.

fa-service *name*

Disconnects all subscribers connected to the foreign agent specified by *fa_name*. The foreign agent name must have been previously defined.

firewall { **not-required** | **required** }

Clears all subscriber information for the specified subscribers:

not-required: Subscribers for whom firewall processing is not-required.

required: Subscribers for whom firewall processing is required.

firewall-policy *fw_policy_name*

This keyword is obsolete.

fng-service *service_name*

Clears subscriber sessions connected to the FNG service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters.

ggsn-service *name*

Clears all PDP contexts accessing a specific GGSN service.

ggsn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

gprs-service *name*

Clears all PDP contexts associated with the 2G SGSN. This keyword can be used with filtering keywords that are part of the **clear subscriber** command set.

Using this keyword can trigger a network-initiated service request (paging) procedure.

name identifies a specific GPRS service configuration. The name consists of 1 to 63 alphanumeric characters.

```
gsm-traffic-class { background | conversational | interactive { priority } | streaming }
```

Subscribers whose traffic matches the specified 3GPP traffic class.

- **background**: 3GPP QoS background class.
- **conversational**: 3GPP QoS conversational class.
- **interactive**: 3GPP QoS interactive class. Must be followed by a traffic priority. priority can be configured to any integer value from 1 to 3.
- **streaming**: 3GPP QoS streaming class.

gtp-version

Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1).

The following filter keywords are valid with this command:

active-charging-service, apn, asngw-service, asnpc-service, asn-peer-address, bearer-establishment, callid, card-num, coaa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, fa, fa-service, firewall, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, ha, ha-ipsec-service, ha-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, network-requested, network-type, pcf, pdg-service, pdif-service, pdsn-service, plmn-type, rulebase, rx-data, session-time-left, sgsn-address, sgsn-service, tx-data, username, grep, more

ha *address*

Disconnects all subscribers connected to the home agent specified by *ha_address*. The address must be specified using the standard IPv4 dotted decimal notation.

ha-ipsec-only

Disconnects all MIP HA sessions with IPsec tunnels.

ha-service *name*

Disconnects all subscribers connected to the home agent specified by *ha_name*. The home agent name must have been previously defined.

hsgw-service *name*

Disconnects subscribers using this HRPD Serving Gateway (HSGW) service configured on this system. *name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

```
idle-time [ < | > | greater-than | less-than ] value
```

Disconnects subscribers whose idle time matches the specified length of time.

<: Filters output so that only information less than the specified value is cleared.

>: Filters output so that only information greater than the specified value is cleared.

greater-than: Filters output so that only information greater than the specified value is cleared.

less-than: Filters output so that only information less than the specified value is cleared.

value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

ims-auth-service *name*

Disconnects subscribers using this IMS Authorization Service configured on this system. *name* must be an existing IMS Authorization Service and be from 1 to 63 alpha and/or numeric characters.

imsi *id*

Disconnects the subscriber with the specified *id*. The IMSI (International Mobile Subscriber Identity) ID is a 50-bit field which identifies the subscriber's home country and carrier. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

ip-alloc-method {*aaa-assigned* | *dhcp* [*relay-agent* | *proxy-client*] | *dynamic-pool* | *l2tp-lns-assigned* | *mip-ha-assigned* | *ms-provided-static* | *not-ms-provided-static* | *static pool* }

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

- **aaa-assigned**: Selects subscribers whose IP Addresses were assigned by AAA.
- **dhcp**: Selects subscribers whose IP Addresses were assigned by DHCP.
- **relay-agent**: Selects subscribers whose IP Addresses were assigned by the DHCP Relay Agent
- **proxy-client**: Selects subscribers whose IP Addresses were assigned by the DHCP Proxy Client
- **dynamic-pool**: Selects subscribers whose IP Addresses were assigned from a dynamic IP address pool.
- **l2tp-lns-assigned**: Selects subscribers whose IP Addresses were assigned by the Layer 2 Tunneling Protocol Network Server.
- **mip-ha-assigned**: Selects subscribers whose IP Addresses were assigned by the Mobile IP Home Agent.
- **ms-provided-static**: Selects subscribers whose IP Addresses were provided by the Mobile Station.
- **not-ms-provided-static**: Selects subscribers whose IP Addresses were not provided by the Mobile Station.
- **static-pool**: Selects subscribers whose IP Addresses were assigned from a static IP address pool.

ip-address *address*

Disconnects all subscribers connected to the specified *ip_address*. The address must be specified using the standard IPv4 dotted decimal notation.

ip-pool *name*

Disconnects all subscribers assigned addresses from the IP address pool *pool_name*. *pool_name* must be the name of an existing IP pool or IP pool group.

ipv6-address *address*

Clears all subscribers connected to the specified IPv6 *address*.

ipv6-prefix *prefix*

Clears subscribers from a specific IPv6 address prefix.

lac *address*

Disconnects all calls to the peer LAC (L2TP access concentrator) specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

lac-service *name*

Disconnects all calls for this LAC service. *name* is a string of 1 to 63 characters.

lma-service *name*

Disconnects subscribers using this LMA service configured on this system. *name* must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

lns *address*

Disconnects calls to the peer LNS (L2TP network server) specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

lns-service *name*

Disconnects calls associated with the LNS service named *name*. *name* is a string of 1 to 63 characters.

long-duration-time-left [< | > | **greater-than** | **less-than**] *value*

Disconnects subscriber sessions whose time left for the maximum duration of their session matches the length of time specified.

<: Filters output so that only information less than the specified value is cleared.

>: Filters output so that only information greater than the specified value is cleared.

greater-than: Filters output so that only information greater than the specified value is cleared.

less-than: Filters output so that only information less than the specified value is cleared.

value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

mag-service *name*

Disconnects subscribers using this Mobile Access Gateway (MAG) service configured on this system. *name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

mip-udp-tunnel-only

This option clears the subscribers that negotiated MIP-UDP tunneling with the HA.

This option is only valid when MIP NAT Traversal license is enabled.

mme-address *ipv4_addr*

Disconnects subscribers using this peer Mobility Management Entity (MME). *ipv4_addr* must be an existing peer MME IPv4 address and be specified in dotted decimal notation.

mme-only

Disconnects all MME subscriber sessions on the system.

mme-service *name*

Disconnects subscribers using this MME service configured on this system. *name* must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.

msid *id*

Disconnects the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

In case of **enforce imsi-min equivalence** is enabled on the chassis and MIN or IMSI numbers supplied, this filter will clear subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.

clear subscribers msid 111110123456789 or

clear subscribers msid 0123456789

will clear any subscriber with a MSID that match the lower 10 digits of MSID supplied, i.e. 0123456789.

msisdn *msisdn*

Clears information for the mobile user identified by Mobile Subscriber ISDN Number (MSISDN). *msisdn* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

nat { **not-required** | **required** [**nat-ip** *nat_ip_address* | **nat-realm** *nat_realm*] }

Clears all subscriber information for the specified subscribers:

not-required: Subscribers for whom NAT processing is not required.

required: Subscribers for whom NAT processing is required.

Important: The **nat-ip** keyword is only available in StarOS 8.3 and later.

nat-ip *nat_ip_address*: Subscribers for whom NAT processing is enabled and are using the specified NAT IP address. *nat_ip_address* specifies the NAT IP address and must be a standard IPv4 address.

nat-realm *nat_realm*: Subscribers for whom NAT processing is enabled and are using the specified NAT realm. *nat_realm* specifies the NAT realm name and must be a string from 1 through 63 characters in length.

network-requested

Disconnect subscriber sessions that were initiated by the GGSN network requested create PDP context procedure.

network-type { **gre** | **ipv4** | **ipv6** | **ipip** | **l2tp** | **mobile-ip** | **proxy-mobile-ip** }

Disconnects subscriber sessions based on the network type. The following network types can be selected:

- **gre**: Generic Routing Encapsulation (GRE) per RFC 2784
- **ipv4**: Internet Protocol version 4 (IPv4)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **ipip**: IP-in-IP encapsulation per RFC 2003
- **l2tp**: Layer 2 Tunneling Protocol encryption per RFC 2661
- **mobile-ip**: Mobile IP
- **proxy-mobile-ip**: Proxy Mobile IP

```
pcf [ < | > | less-than | greater-than ] ipv4_address [ [ < | > | less-  
than | greater-than ] ipv4_address ]
```

Displays information for subscribers connected via the packet control function with a specific or range of IP address *ipv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

- <: Filters output so that only information less than the specified IPv4 address value is displayed.
- >: Filters output so that only information greater than the specified IPv4 address value is displayed.
- less-than**: Filters output so that only information less than the specified IPv4 address value is displayed.
- greater-than**: Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

```
pdsn-service name
```

Disconnect all subscribers connected to the packet data service *pdsn_name*. The packet data service must have been previously configured.

```
pdg-service service_name
```

Disconnects subscriber sessions that are using the PDG service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters.

```
pdif-service service_name
```

Clears counters for subscribers accessing the Packet Data Interworking Function (PDIF) service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters.

```
pgw-only { all | imsi id ebi id | pgw-service name | sgw-address  
ipv4_addr }
```

all: Disconnects all subscribers for all P-GW services on this system.

imsi *id* **ebi** *id*: Disconnects subscribers based on their International Mobile Subscriber Identification (IMSI). *id* must be the 3 digit MCC (Mobile Country Code), follow by the 2 or 3 digits of the MNC (Mobile Network Code) and the MSIN (Mobile Subscriber Identification Number). *id* should not exceed 15 digits. Example: 123-45-678910234 must be entered as 12345678910234

The EBI (EPS Bearer Identity) *id* must be a valid EBI and be an integer value from 5 to 15.

pgw-service *name*: Disconnects all subscribers using this P-GW service. *name* must be an existing P-GW service and be from 1 to 63 alpha and/or numeric characters.

sgw-address *ipv4_addr*: Disconnects all subscribers using this S-GW IP address. *ipv4_addr* must be an existing IPv4 address and be specified in dotted-decimal notation.

```
plmn-type { home | roaming | visiting }
```

For GGSN, disconnect subscribers whose subscriber type matches the specified type.

```
qci { number }
```

Disconnects subscribers based on their QCI identity. *number* must be an integer value from 0 to 9.

```
rx-data [ < | > | greater-than | less-than ] value
```

Disconnects subscribers who have received the specified number of bytes of data.

<: Filters output so that only information less than the specified value is cleared.
>: Filters output so that only information greater than the specified value is cleared.
greater-than: Filters output so that only information greater than the specified value is cleared.
less-than: Filters output so that only information less than the specified value is cleared.
value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 18446744073709551615.

s5-proto { **gtp** | **pmip** }

Disconnects subscribers based on their S5 interface protocol type.

gtp: Indicates that the GTP protocol is used on the S5 interface for the subscribers being disconnected.

pmip: Indicates that the PMIP protocol is used on the S5 interface for the subscribers being disconnected.

session-time-left [**<** | **>** | **greater-than** | **less-than**] *value*

The amount of time left for the subscriber session.

<: Filters output so that only information less than the specified value is cleared.

>: Filters output so that only information greater than the specified value is cleared.

greater-than: Filters output so that only information greater than the specified value is cleared.

less-than: Filters output so that only information less than the specified value is cleared.

value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 4294967295.

sgsn-address *address*

Clears all PDP contexts currently being facilitated by a specific SGSN.

address is the IP address of the SGSN expressed in dotted decimal notation.

sgsn-service *name*

Clears all PDP contexts associated with SGSN. This keyword can be used with filtering keywords that are part of the **clear subscriber** command set.

Using this keyword can trigger a network-initiated service request (paging) procedure.

name identifies a specific SGSN-service configuration. The name consists of 1 to 63 alphanumeric characters.

sgw-only

Disconnects all S-GW subscriber sessions on the system.

sgw-service *name*

Disconnects subscribers using this Serving Gateway (S-GW) service configured on this system. *name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

tx-data [**<** | **>** | **greater-than** | **less-than**] *value*

Disconnects subscribers who have transmitted the specified number of bytes of data.

<: Filters output so that only information less than the specified value is cleared.

>: Filters output so that only information greater than the specified value is cleared.

greater-than: Filters output so that only information greater than the specified value is cleared.

less-than: Filters output so that only information less than the specified value is cleared.

value: If no other filtering options are specified only output matching *value* is cleared. If *value* is not specified all data is cleared. *value* must be an integer from 0 through 18446744073709551615.

username *name*

Disconnect the subscriber with the specified username

name is the username of the subscriber to be cleared. *name* must be a sequence of characters and/or wildcard characters ('\$ and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes ('). For example; '\$'.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Clear subscribers sessions to aid in troubleshooting the system when no additional subscribers may connect or when a specific service or remote address may be having connection problems. This command may also be useful when preparing for maintenance activities such that connects may be cleared to perform any necessary procedures.

Related commands to clear subscription data - *for SGSN use only*

- **admin-disconnect-behavior clear-subscription** - for a 2G SGSN, this command in the GPRS Service configuration mode enables the SGSN to clear subscription data after the administrative disconnect - **clear subscribers all** has been issued. ♦
 - **admin-disconnect-behavior clear-subscription** - for a 3G SGSN, this command in the SGSN Service configuration mode enables the SGSN to clear subscription data after the administrative disconnect - **clear subscribers all** has been issued. ♦
-

Example

The following examples illustrate the basic command usage as well as the redirection of the command output. Not all options are exemplified as all options follow the same basic constructs.

The following are basic subscriber clearing examples.

```
clear subscribers username user1
```

```
clear subscribers ha sampleService
```

```
clear subscribers ip-pool poolName verbose
```

The following command disconnects users connected to the foreign agent with IP address 1.2.3.4.

```
clear subscribers fa 1.2.3.4
```

The following redirects the output of the command to the more command for paging of the output to allow easier viewing of all output by the user. This example highlights the use of the verbose option as well.

```
clear subscribers all verbose | more
```

■ clear super-charger

clear super-charger

Deletes the subscriber's backed-up subscription data.

Product

SGSN

Privilege

Administrator, Security Administrator

Syntax

```
clear super-charger { imsi | all }
```

imsi

Defines a specific subscriber's international mobile subscriber identity (IMSI) number.

imsi - up to 15 digits. This number includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number).

all

Instructs the SGSN to delete subscription data for all super charger subscribers.

Usage

Use this command to clear (delete) the subscription data records for one or all subscribers with super charger subscription configuration

Example

The following command deletes the backed up records for the subscriber identified by the IMSI *90121882144672*.

```
clear super-charger imsi 90121882144672
```

cli

This command specifies command line interface (CLI) session behavior

Product

All

Privilege

Security Administrator, Administrator, Operator, inspector

Syntax

```
cli { history | stop-on-first-error }  
no cli { history | stop-on-first-error }
```

no

Disables the specified keyword functionality.

history

Default: Enabled

Enables command line history for the current command line session.

stop-on-first-error

Default: Disabled

When this is enabled, when a configuration file is loaded, on the first syntax error the system stops loading the configuration file.

Usage

This command controls CLI settings pertaining to the maintenance of a per-session command history and syntax error monitoring during configuration file loading.

By default, the system maintains a list of commands executed during each CLI session. This list is referred to as a history.

In addition, the system can be configured to stop loading a configuration if a syntax error is detected. By default, the system identifies the error but continues to process the configuration file.

Example

The following command disables the keeping of a CLI history for the current session:

```
no cli history
```

clock set

Sets the system time.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clock set date_time
```

date_time

Specifies the date and time to set the system clock. Specified as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2 digit second in the range 00 through 59.

Usage

Set the clock to adjust the system clock for such things as timing drift, day-light savings adjustment, etc. New settings are immediately applied to all CPUs in the system.

Important: This command should only be used if there is no NTP server enabled for any context. If NTP is running on the system, this command returns a failure.

Example

The following commands set the system clock where one sets the exact second as well.

```
clock set 2003:08:23:02:30
```

```
clock set 2003:08:23:02:30:30
```

configure

Sets the mode to the global configure mode. May also be used to set the mode to the configure mode and pre-load the configuration referred to by the options.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
configure [ url [ verbose ] ]
```

url

Specifies the location of a configuration file to pre-load. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

- [**file:**] { /flash | /pcmcial | /hd } [/directory]/file_name
- tftp:**//{ host [:port#] } [/directory]/file_name
- [**http:** | **ftp:** | **sftp:**]//[username [:password] @] { host } [:port#] [/directory]/file_name

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.

filename is the actual file of interest.

username is the user to be authenticated.

password is the password to use for authentication.

host is the IP address or host name of the server.

port# is the logical port number that the communication protocol is to use.

verbose

Displays each the line number and actual line content from the configuration as it is processed.

Usage

If no URL is specified, executing this command causes the CLI to enter the Global Configuration Mode. If a URL is specified, executing this command loads the specified configuration file.

Example

The following simply changes the mode to the command line interface global configuration mode.

```
configure
```

■ **configure**

The following command loads a configuration file from the node *sampleNode* given the path specified and a local file, respectively.

```
configure ftp://sampleNode/pub/glob.cfg
```

```
configure /pcmcia1/pub/glob.cfg verbose
```

context

Sets the current context to the context specified.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
context name
```

name

Specifies the context of interest. Must be a previously defined context.

Usage

Change the current context when it is desired to configure and/or manage a specific context.

Example

The following sets the current context to the *sampleContext* context.

```
context sampleContext
```

copy

Copies files from one location to another. Allows files to be copied to/from locally as well as from one remote location to another.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
copy from_url to_url [ passive ] [ -noconfirm ]
```

from_url

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

•ASR 5000:

- [**file:**]{ /flash | /pcmcia1 | /hd }[/directory]/file_name
- tftp:**//{ host[:port#] }[/directory]/file_name
- [**http:** | **ftp:** | **sftp:**]//[username [:password]@] { host }[:port#] [/directory]/file_name

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.

filename is the actual file of interest.

username is the user to be authenticated.

password is the password to use for authentication.

host is the IP address or host name of the server.

port# is the logical port number that the communication protocol is to use.

to_url

Specifies the destination of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

•ASR 5000:

- [**file:**]{ /flash | /pcmcia1 | /hd }[/directory] /file_name
- tftp:**//{ host[:port#] } [/directory] /file_name
- [**ftp:** | **sftp:**] / / [username [:password]@] { host } [:port#] [/directory] /file_name

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.

filename is the actual file of interest.

username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

passive

Indicates the file copy is to use the passive mode.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Use of the **-noconfirm** option allows the over writing of an existing file if the destination file already exists.

Usage

Copy configuration files, log files, etc., to provide backups of data through the network.

Example

The following copies files from the local */flash/pub* directory to remote node *remoteABC*'s */pcmcia2/pub* directory with and without confirmation respectively.

```
copy http://remoteABC/pub/june.cfg /flash/pub/june.cfg
```

```
copy tftp://remoteABC/pub/june.cfg /pcmcia2/pub/june.cfg -noconfirm
```

The following copies files from remote node *remoteABC* to remote node *remote123*.

```
copy ftp://remoteABC/pub/may.cfg ftp://remote123/pub/may.cfg
```

crash copy

Copies individual crash files (one-at-a-time) and optionally the core dump file from the stored crash records on the chassis to a user-specified location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
crash copy number number url to_url [ core ]
```

number *number*

The identification number of the crash record. *number* must be an integer representing a valid record number selected from a range of 1 to 120. To determine the numeric identity of a specific crash file, use the **show crash list** command in Exec mode.

url *to_url*

Specifies the destination of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

- [**file:**] { /flash | /pcmcia1 | /hd } [/directory] /
- tftp:**//{ *host* [:*port#*] } [/directory] /
- [**ftp:** | **sftp:**]//[*username* [:*password*] @] { *host* } [:*port#*] [/directory] /

Important: Use of the SMC hard drive is not supported in this release.

directory: the name of the target directory.

username: the username to be authenticated to provide access to targeted server.

password: the username's password to be authenticated.

host: the IP address or host name of the targeted server.

port#: the number of the target server's logical port used for the selected communication protocol.

Important: Do **not** specify a target filename as this will prevent the file from writing to the target server. The system generates and provides a timestamp-based filename that appears at the destination when the copy command completes.

core

Including this keyword as part of the command instructs the system to copy the core dump to the targeted storage server. The core cannot be copied alone; it must be part of a **crash copy** action included when copying a crash file.

Usage

Copy crash files of core dump to another location for backup or analysis.

Example

The following uses **ftp** to copy stored record number 5 and the core dump from the crash record list to a targeted remote node directory called *crasharchive* through port 22 of the targeted server *remoteABC* with access through user *homeboy* whose password is *secret.7.word*.

```
crash copy number 5 url ftp://homeboy:secret.7.word@  
remoteABC:22/crasharchive/ core
```

crypto-group

Allows the manual switchover of redundant IPSec tunnels belonging to a specific crypto group.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
crypto-group name group_name activate { primary | secondary }
```

group_name

group_name is the name of the crypto group to which the tunnels to be switched are associated.

```
activate { primary | secondary }
```

Allows you to specify which tunnel to activate (i.e. is to facilitate user traffic):

- **primary**: Switch traffic to the primary tunnel in the group.
- **secondary**: Switch traffic to the secondary tunnel in the group.

Usage

This command is used in conjunction with the Redundant IPSec Tunnel Fail-over feature.

Use this command to manually switch traffic to a specific tunnel in a crypto group if the automatic switchover options have been disabled. Refer to the **switchover** command in the Crypto Group configuration mode for more information.

Example

The following command manually switches user traffic to the secondary tunnel in the crypto group called *group1*:

```
crypto-group group1 activate secondary
```

Chapter 103

Exec Mode Commands (D-S)

This chapter contains the commands in the Exec Mode from **debug** to **start crypto security-association**.

■ debug

debug

The following commands send information to the logging facility for review:

debug ip

Enables/disables the debug options for IP debugging. If logging is enabled, results are sent to the logging system.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip { arp | interface | route }
```

no

Indicates the IP debugging is to be disabled for the IP interfaces/function specified.

arp | interface *name* | route

Specifies which IP interfaces/function to debug.

arp: indicates debug is to be enabled for the address resolution protocol.

interface: indicates debug is to be enabled for the IP interfaces.

route: indicates debug is to be enabled for the route selection and updates.

Usage

The debug IP command is valuable when troubleshooting network problems between nodes. The debugging is stopped by using the **no** keyword.

 **Caution:** Issuing this command could negatively impact system performance depending on system configuration and/or loading.

Example

The following commands enable/disable debugging for ARP.

```
debug ip arpno debug ip arp
```

The following enables/disables debugging for IP interfaces.

```
debug ip interface
```

```
no debug ip interface
```

The following enables/disables debugging for routing.

```
debug ip routeno debug ip route
```

debug ip bgp

This command enables BGP debug flags. If logging is enabled, results are sent to the logging system.

Product

HA

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip bgp { all | event | filters | fsm | keepalives | updates {
inbound | outbound } }
```

no

Disable the specified BGP debug flags.

all

Enable all BGP debug flags.

event

Enable debugging of all BGP protocol events.

filters

Enable debugging of all BGP filters.

fsm

Enable debugging of BGP Finite State Machine

keepalives

Enable debugging of all BGP keepalives.

updates {inbound | outbound}

Enable debugging of BGP updates.

inbound: Debug all BGP inbound updates.

outbound: Debug all BGP outbound updates.

Usage

Use this command to enable or disable BGP debug flags.

Example

The following command disables all BGP debug flags enabled by any of the debug ip bgp commands:

```
no debug ip bgp all
```

The following command enables all BGP debug flags:

```
debug ip bgp all
```

debug ip ospf all

This command enables all OSPF debug flags. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf all
```

no

Disable all OSPF debug flags.

Usage

Use this command to enable or disable all OSPF debug flags.

Example

The following command disables all OPSF debug flags enabled by any of the debug ip ospf commands:

```
no debug ip ospf all
```

The following command enables all OSPF debug flags:

```
debug ip ospf all
```

debug ip ospf event

This command enables debugging of OSPF protocol events. If logging is enabled, results are sent to the logging system. If no keywords are specified, all events are enabled for debugging.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf event [ abr | asbr | vl | lsa | os | router ]
```

no

Disable debugging the specified OSPF event. If no keywords are specified, all events are disabled.

abr

Specifies debugging of ABR events.

asbr

Specifies debugging of ASBR events.

vl

Specifies debugging of VL events.

lsa

Specifies debugging of link state advertisement (LSA) events.

os

Specifies debugging of OS events.

router

Specifies debugging of router events.

Usage

Use this command to output debug information for OSPF events.

Example

To enable all event debug information, enter the following command;

```
debug ip ospf event
```

To disable all event debug information, enter the following command;

■ debug ip ospf event

no debug ip ospf event

debug ip ospf ism

This command enables OSPF Interface State Machine (ISM) troubleshooting, based on ISM information type. If no keywords are specified all ISM information types are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf ism [ events | status | timers ]
```

no

Disable debugging the specified ISM information. If no keywords are specified, all information is disabled.

events

Enable debugging ISM event information.

status

Enable debugging ISM status information.

timers

Enable debugging ISM timer information.

Usage

Use this command to output ISM debug information.

Example

To enable all ISM debug information, enter the following command;

```
debug ip ospf ism
```

To disable all ISM debug information, enter the following command;

```
no debug ip ospf ism
```

debug ip ospf lsa

This command enables troubleshooting on OSPF Link State Advertisements (LSAs), based on the specific LSA option. If no keywords are specified, all options are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf lsa [ flooding | generate | install | refresh | maxage | refresh ]
```

no

Disables the specified LSA debug information. If no keyword is specified, all LSA debug information is disabled.

flooding

Enable LSA flooding information.

generate

Enable LSA generation information.

install

Enable LSA install information.

maxage

Enable LSA maxage information in seconds. The maxage is equal to 3600 seconds.

refresh

Enable LSA refresh information.

Usage

Use this command to output debug information for LSAs.

Example

To enable all LSA debug information, enter the following command;

```
debug ip ospf lsa
```

To disable all LSA debug information, enter the following command;

```
no debug ip ospf lsa
```

debug ip ospf nsm

This command enables troubleshooting OSPF Neighbor State Machines (NSMs), based on the specific NSM information type. If no keyword is specified, all NSM information types are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf nsm [ status | events | timers ]
```

no

Disables the debugging the specified NSM information type. If no keyword is specified, all information types are disabled.

events

Enables debugging NSM event information.

status

Enables debugging NSM status information.

timers

Enables debugging NSM timer information.

Usage

Use this command to output debug information for OSPF NSMs

Example

To enable all NSM debug information, enter the following command;

```
debug ip ospf nsm
```

To disable all NSM debug information, enter the following command;

```
no debug ip ospf nsm
```

debug ip ospf packet

This command enables troubleshooting of specific OSPF packet information. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf packet { all | dd | hello | ls-ack | ls-request | ls-update  
} [ send | recv ] [ detail ]
```

no

Disable debugging of the specified packet information.

all

Enable debugging all OSPF packet information.

dd

Enable debugging database descriptions.

hello

Enable debugging hello packets.

ls-ack

Enable debugging link state acknowledgements.

ls-request

Enable debugging link state requests.

ls-update

Enable debugging link state updates.

send

Enable debugging only on sent packets.

recv

Enable debugging only on received packets.

detail

Enable detailed information in the debug output.

■ debug ip ospf packet

Usage

Use this command to output specific OSPF packet information.

Example

To enable all packet debug information, enter the following command;

```
debug ip ospf packet all
```

To disable all route debug information, enter the following command;

```
no debug ip ospf packet all
```

debug ip ospf route

This command sets the route calculation method to use in debugging OSPF routes. If no route calculation method is specified, all methods are enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf route [ ase | ia | install | spf ]
```

no

Disables debugging of route information. If no keyword is specified all information types are disabled.

ase

Enables debugging information on external route calculations.

ia

Enables debugging information on Inter-Area route calculations.

install

Enables debugging information on route installation.

spf

Enables debugging information on SPF route calculations.

Usage

Use this command to output debug information for OSPF routes.

Example

To enable all route debug information, enter the following command;

```
debug ip ospf route
```

To disable all route debug information, enter the following command;

```
no debug ip ospf route
```

debug ip ospf router

This command sets the debug option for OSPF router information. If no keyword is specified, all router information is enabled. If logging is enabled, results are sent to the logging system.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] debug ip ospf router [ interface | redistribute ]
```

no

Disables the specified router debug information. If no keyword is specified, all router information is disabled.

interface

Enables router interface information.

redistribute

Enables router redistribute information.

Usage

Use this command to output debug information for the OSPF router.

Example

To enable all router debug information, enter the following command;

```
debug ip ospf router
```

To disable all router debug information, enter the following command;

```
no debug ip ospf router
```

default terminal

Restores the system default value for the terminal options.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
default terminal { length | width }
```

length | width

length: reset the terminal length to the system default.

width: restores the system default terminal width.

Usage

Restore the default terminal settings when the current paging and display wraps inappropriately or pages to soon.

Example

The following sets the default length then width in two commands.

```
default terminal length
```

```
default terminal width
```

delete

Removes the specified file(s) permanently from the local.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
delete filepath [ -noconfirm ]
```

filepath

Specifies the location of the file to delete. The path must be formatted according to the following format:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

```
•[ file: ] { /flash | /pcmcial | /hd }[ directory ] file_name
```

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name
filename is the actual file of interest

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Use of the **-noconfirm** option should be done with extra care to ensure the file is specified accurately as there is no method of recovering a file that has been deleted.

Usage

Deleting files is a maintenance activity which may be part of periodic routine procedures to reduce system space utilization.

Example

The following removes files from the local */flash/pub* directory.

```
delete /flash/pub/june03.cfg
```

dhcp force

Tests the lease-renewal for DHCP-assigned IP addresses for a particular subscriber.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
dhcp force lease-renewal { callid id | imsi imsi [ nsapi nsapi ] | msid msid }
```

callid *id*

Clears the call specified by *call_id*. The call ID must be specified as a 4-byte hexadecimal number.

imsi *msid*

Disconnects the subscriber with the specified *msid*. The IMSI (International Mobile Subscriber Identity) ID is a 50-bit field which identifies the subscriber's home country and carrier. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

nsapi *nsapi*

A specific Network Service Access Point Identifier (NSAPI). *nsapi* is an integer value from 5 to 15.

msid *id*

Disconnects the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

Usage

Use this command tests a forced IP address lease renewal for a specific subscriber.

Example

The following command tests DHCP lease renewal for a subscriber with an MSID of 1234567:

```
dhcp force lease-renewal msid 1234567
```

dhcp test

Tests DHCP functions for a particular DHCP service.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
dhcp test dhcp-service svc_name [ all | server ip_address ]
```

dhcp-service *svc_name*

The name of the DHCP service. It can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

all

Tests DHCP functionality for all servers.

server *ip_address*

Tests DHCP functionality for the server.

ip_address is the IP address of the DHCP server in dotted-decimal notation.

Usage

Once DHCP functionality is configured on the system, this command can be used to verify that it is configured properly and that it can successfully communicate with the DHCP server.

Executing this command causes the system to request and allocate an IP address and then release it.

If a specific DHCP server is not specified, then each server configured in the service is tested.

Example

The following command tests the systems ability to get an IP address from all servers a DHCP service called DHCP-Gi is configured to communicate with:

```
dhcp test dhcp-service DHCP-Gi all
```

diameter disable endpoint

This command disables a diameter peer without removing the peer's configuration.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
diameter disable endpoint endpoint_name peer peer_id
```

endpoint *endpoint_name*

Specifies the endpoint in which the peer is configured.

endpoint_name must be the name of the endpoint, and must be an alpha and/or numeric string of 1 through 63 characters in length.

peer *peer_id*

Specifies the peer to be disabled.

peer_id must be the diameter peer host name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to administratively disable a diameter peer without removing the peer configuration. This command will tear down all connections on the specified peer (by sending a DPR if the configuration demands the same at peer level configuration). The peer will remain in disabled state until it is enabled again. Also see the **diameter enable endpoint** command.

Example

This command disables the diameter peer *peer12*:

```
diameter disable endpoint endpoint1 peer peer12
```

diameter enable endpoint

This command enables a diameter peer that is disabled.

Product

PDIF, SCM

Privilege

Security Administrator, Administrator

Syntax

```
diameter enable endpoint endpoint_name peer peer_id
```

endpoint *endpoint_name*

Specifies the endpoint in which the peer is configured.

endpoint_name must be the endpoint name, and must be a string of 1 through 63 characters in length.

peer *peer_id*

Specifies the peer to be enabled.

peer_id must be the diameter peer host name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to administratively enable a diameter peer. Also see the **diameter disable endpoint** command.

Example

This command enables the diameter peer *peer12*:

```
diameter enable endpoint endpoint1 peer peer12
```

diameter reset connection

This command resets individual TCP/SCTP connections.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
diameter reset connection { endpoint endpoint_name peer peer_id }
```

endpoint *endpoint_name*

Resets connection to the specified endpoint.

endpoint_name must be the endpoint name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

peer *peer_id*

Resets connection to the specified peer.

peer_id must be the Diameter peer host name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to reset the TCP/SCTP connections for the specified endpoint/peer. With this command, the connection will be closed temporarily after DPR/DPA. If there is any traffic to be sent to the particular peer, then the connection will be re-established.

This command overrides the endpoint configured in any other configuration mode.

This command is applicable only when the specified peer is enabled.

Example

This command resets connection to the endpoint named *test123*:

```
diameter reset connection endpoint test123
```

diameter reset route failure

This command resets the failed route status of Diameter destination-host combination via peer to AVAILABLE status.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
diameter reset route failure [ endpoint endpoint_name ] [ host host_name ] [ peer peer_id ]
```

endpoint *endpoint_name*

Resets paths to the specified endpoint.

endpoint_name must be a string of 1 through 63 characters in length.

host *host_name*

Resets the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis having a specific host name to AVAILABLE.

host_name must be the Diameter host name, and must be a string of 1 through 63 characters in length.

peer *peer_id*

Resets the FAILED status of all Diameter destination-host combination routes via a peer having specific peer-Id for every Diameter client within the chassis to AVAILABLE.

peer_id must be the Diameter peer host name, and must be a string of 1 through 63 characters in length.

Usage

Use this command to reset the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis to AVAILABLE status.

This command also resets the failure counts used to determine the AVAILABLE/FAILED status of destination-host combination.

When executed from local context, this command matches all contexts. If an optional keyword is not supplied, a wildcard is used for the value.

The status of every matching combination of destination-host via peer for every matching Diameter client within the chassis will be reset to AVAILABLE. The failure counts that are used to determine AVAILABLE/FAILED status will also be reset.

Also see the **route-entry** and **route-failure** CLI commands in the Diameter Endpoint Configuration Mode.

Default value: N/A

Example

The following command resets the FAILED status of all Diameter destination-host combination routes via peer for every Diameter client within the chassis for specified endpoint name to AVAILABLE.

```
diameter reset route failure endpoint endpoint_name
```

directory

Lists the files in a specified location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
directory filepath [ -size ] [ -reverse ] [ -time ]
```

filepath

Specifies the directory path to list the contained files. The path must be formatted according to the following format:

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

```
•[ file: ] { /flash | /pcmcial | /hd }[ /directory ] /file_name
```

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name

filename is the actual file of interest

-size

Indicates the size of each file should be displayed in the output.

-reverse

Indicates the order of files listed should be in descending order (z-aZ-A9-0). Default is to sort in ascending order (0-9A-Za-z).

-time

Indicates the last modification timestamp of each file should be displayed in the output.

Usage

Lists such things as log and crash files from multiple nodes within the network.

The optional arguments may be specified individually or in any combination.

Example

The following command will list the files in the local */flash/pub* directory sorted in reverse order.

```
directory /flash/pub -reverse
```

disable

Prevents the system from making requests of a selected RADIUS server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
disable radius [ accounting | charging [ accounting ] ] server address [ port
num ] [ group name ]
```

accounting | **charging** | **charging accounting**

Specifies the type of RADIUS server to disable.

server *address*

Identifies the RADIUS server by IP address.

address is specified using the standard IPv4 or IPv6 dotted decimal notation.

port *num*

Default: 1812 (authentication) 1813 (accounting)

Specifies the port number of the RADIUS server being disabled.

num must be the configured port number of the RADIUS server being disabled and be 0 to 65535 numeric characters in length.

group *name*

Default: default

Specifies the RADIUS group to which the server belongs. Use this option in the event that the RADIUS server belongs to multiple groups and you only want to disable the server within the specific group.

name must be the name of a configured RADIUS Server group and be 1 to 63 characters in length.

Usage

Use this command to gracefully stop the system from making requests of a specific RADIUS server.

Example

The following command disables a RADIUS accounting server with an IP address of 1.2.3.4, the default accounting server port number, and that resides in the “Group5” server group:

```
disable radius accounting server 1.2.3.4 group Group5
```

dns-client

This command performs DNS query on the basis of specified DNS client name, DNS query domain name, and type of query criteria.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
dns-client dns_client_name [ query-type { A | AAAA | NAPTR | SRV } ] query-name
query_domain_name
```

dns-client *dns_client_name*

Defines the name of the DNS client whose cache and/or statistics are to be queried. *dns_client_name* is an existing DNS client and must be from alpha and/or numeric string of 1 through 64 characters.

query-type { A | NAPTR | SRV }]

Default: **A**

This keyword specifies that the type of query to perform for the defined DNS client is to be displayed.

- **A**: Filters DNS results based on domain IPv4 address records (A records). This is the default query type.
- **AAAA**: Filters DNS results based on domain IPv6 address records (AAAA records)..
- **NAPTR**: Filters DNS results based on Naming Authority Pointer records (NAPTR).
- **SRV**: Filters DNS results based on service host records (SRV records).

query-name *query_domain_name*

This keyword filters the DNS results based on the query domain name.

query_domain_name must be from 1 to 255 characters in length. *query_domain_name* is the domain name used to perform the DNS query and is different from the actual domain name which is resolved. For example, to resolve the SIP server for *service.com*, the query name is *_sip._udp.service.com* and the query type is **SRV**.

Usage

Use this command to perform DNS query on the basis of DNS Client name and filters the query results based on query type and query name. This command also populates the result into DNS Cache. This command used the current context to DNS request.

Example

The following command displays statistics for a DNS client named *test_dns* with query type for IP address as *A* and query name as *domain1.com*:

```
dns-client test_dns query-type A query-name domain1.com
```

■ dns-client

enable

Allows the system to start making requests of a selected RADIUS server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
enable radius [ accounting | charging | [ accounting ] ] server address [ port
num ] [ group name ]
```

accounting | **charging** | **charging accounting**

Specifies the type of RADIUS server to enable.

server *address*

Identifies the RADIUS server by IP address.

address is specified using the standard IPv4 or IPv6 dotted decimal notation.

port *num*

Default: 1812 (authentication) 1813 (accounting)

Specifies the port number of the RADIUS server being enabled.

num must be the configured port number of the RADIUS server being enabled and must be 0 to 65535 numeric characters in length.

group *name*

Default: default

Specifies the RADIUS group to which the server belongs. Use this option in the event that the RADIUS server belongs to multiple groups and you only want to disable the server within the specific group.

name must be the name of a configured RADIUS Server group and be 1 to 63 characters in length.

Usage

Use this command to allow the system to start making requests of a specific RADIUS server.

Example

The following command enables a RADIUS accounting server with an IP address of 1.2.3.4, the default accounting server port number, and that resides in the “Group5” server group:

```
enable radius accounting server 1.2.3.4 group Group5
```

exit

Exits the current CLI session.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

exit

Usage

Use this command to close the current CLI session.

filesystem

Used this command to check, format, or repair the PCMCIA, the Compact Flash on the SMC, or the HD Raid storage device.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
filesystem { check | format | repair } { /flash | /pcmcia1 | /hd-raid } [ card  
card_num ]
```

Format the file system on the specified device.

Usage

Check, format, or repair all directories and files from the PCMCIA card(s), the Compact Flash and/or the HD Raid storage device and re-establish the file system.

Example

The following command formats the PCMCIA card located in slot 1 on the SMC:

```
filesystem format /pcmcia1
```

filesystem synchronize

Use this command to manage the switch processor cards and their active/standby status, and to synchronize the filesystem between the active device and the standby device.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
filesystem synchronize [ /flash | /pcmcia1 | all ] [ checkonly ] [ from card_num  
| to card_num ] [ -noconfirm ]
```

Synchronize the file system on the specified device.

Usage

Synchronize the file system on a PCMCIA card and/or the Compact Flash.

gtpc test echo

Tests the ability of a GGSN service to exchange GTP-C echo request messages with the specified SGSN(s).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
gtpc test echo src-address gn_address { all | sgsn-address ip_address }
```

src-address *gn_address*

Specifies the IP address of a Gn interface configured on the system.

gn_address must be expressed in dotted decimal notation.

Important: The IP address of the system's Gn interface must be bound to a configured GGSN service prior to executing this command.

all

Specifies that GTP-C echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

sgsn-address *ip_address*

Specifies that GTP-C echo requests will be sent to a specific SGSN.

ip_address is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

Usage

This command tests the GGSN's ability to exchange GPRS Tunneling Protocol control plane (GTP-C) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring.

This command must be executed from within the context in which the GGSN service is configured.

Refer also to the `gtpu test` command.

Example

The following command issues GTP-C echo packets from a GGSN service bound to address 192.168.157.32 to an SGSN with an address of 192.168.157.2:

```
gtpc test echo src-address 192.168.157.32 sgsn-address 192.168.157.2
```

gtpm interim now

Check points current GTPM accounting messages and identifies which types of interim CDRs are to be generated and sent to the external charging/storage servers (e.g., a CFG or a GSS). The impact of this command is immediate.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
gtpm interim now [active-charging egcdr | apn apn_name | callid call_id | cdr-
types { gcdr | mcdr | scdr } | dhcp-server ip_address | gprs-service svc_name |
ggsn-service svc_name | imsi imsi [ ip-address sub_address [ username name ] now
| nsapi nsapi [ ip-address sub-address [ username name ] | username name ] ] |
ip-address sub_address [ username name ] | ip-pool pool_name | mcc mcc_number
mnc mnc_number | msisdn msisdn_num | sgsn-address ip_address | sgsn-service
svc_name | username name ] +
```

active-charging

This feature is specific to the GGSN and is documented separately. See .

apn apn_name

Initiates GTPM interim accounting for all PDP contexts accessing the specified APN.

apn_name can be from 1 to 62, case sensitive, alphanumeric characters.

callid call_id

Identifies a specific call.

call_id must be followed by an 8-digit HEX number.

cdr-types { mcdr | scdr }

Specifies the CDR types to be generated by the SGSN:

This keyword is specific to the SGSN.

gcdr - Instructs the GGSN to only generate G-CDRs.

mcdr - Instructs the SGSN to only generate M-CDRs

scdr - Instructs the SGSN to only generate S-CDRs.

dhcp-server ip_address

Identifies the DHCP server where the IP address (defined with the **ip address** keyword) was allocated.

Must be followed by the IP address of the DHCP server.

ip_address: Must be specified using dotted decimal notation.

ggsn-address ip_address

This keyword is specific to the GGSN.

Specifies the IP address of the interface to the GGSN.

ip_address: Must be specified using dotted decimal notation.

ggsn-service *svc_name*

This keyword is specific to the GGSN.

Initiates GTPM interim accounting for all PDP contexts currently being facilitated by the specified GGSN service.

svc_name can be from 1 to 63 , case sensitive, alphanumeric characters.

gprs-service *svc_name*

This keyword is specific to the SGSN.

Initiates GTPM interim accounting for all PDP contexts currently being facilitated by the specified GPRS service.

This keyword is specific to the SGSN.

svc_name can be from 1 to 63 , case sensitive, alphanumeric characters.. Must be an already defined GPRS service name.

imsi *imsi* [**ip-address** *sub_address* [**username** *name*] | **nsapi** *nsapi* [**ip-address** *sub-address* [**username** *name*] | **username** *name*]]

Initiates GTPM interim accounting for a specific International Mobile Subscriber Identity (IMSI) number. The request could be further filtered using any of the following keywords:

- **ip-address**: Interim accounting will be performed for the address specified by *sub_address*. The command can be further filtered by specifying a specific username (*name*) with that address.
 - **nsapi**: Interim accounting will be performed for a specific Network Service Access Point Identifier (NSAPI). *nsapi* is an integer value from 5 to 15. The command can be further filtered by specifying a specific ip address (*sub_address*) and/or a username (*name*) with that address, or just a specific username.
-

ip-address *sub_address* [**username** *name*]

Initiates GTPM interim accounting for the address specified.

sub_address is the IP address of the subscriber and must be expressed in dotted decimal notation.

The command can be further filtered by specifying **username** with that address.

name is the subscriber's name and can be a sequence of characters and/or wildcard characters ('\$' and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes ('). For example; '\$'.

ip-pool *pool_name*

This keyword is applicable to the GGSN only.

Initiates GTPM interim accounting for all PDP contexts that were allocated IP addresses from the specified pool.

pool_name can be from 1 to 31 alpha and/or numeric characters and is case sensitive.

mcc *mcc_number* **mnc** *mnc_number*

mcc_number Specifies the mobile country code (MCC) portion of the PLMN's identifier and can be configured to any 3-digit integer value between 100 and 999.

mnc_number Specifies the mobile network code (MNC) portion of the PLMN's identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

msisdn *msisdn_num*

This keyword configures the SGSN to include the Mobile Subscribers Integrated Services Digital Network identifier in generated CDRs (M-CDRs and/or the S-CDRs).

This keyword is applicable for SGSN only.

msisdn_number - Must be followed by a valid MSISDN number, consisting of 1 to 15 digits.

sgsn-address *ip_address*

This keyword is specific to the GGSN.

Initiates GTPM interim accounting for all PDP contexts currently being facilitated by the specified SGSN.

ip_address is the IP address of the SGSN and must be expressed in dotted decimal notation.

sgsn-service *svc_name*

Initiates GTPM interim accounting for all PDP contexts currently being facilitated by the specified SGSN service.

This keyword is specific to the SGSN.

svc_name can be from 1 to 63 , case sensitive, alphanumeric characters.. Must be an already defined SGSN service name.

username *name*

Initiates GTPM interim accounting for all PDP contexts for the subscriber specified.

name is the subscriber's name and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

+

More than one of the above keywords can be entered within a single command.

Usage

This command causes GTPM accounting CDRs to immediately be generated for all active sessions that are in the current context. If executed within the local context, CDRs will be generated for all active sessions regardless of context.

The sending of the CDRs is paced so as not to overload the accounting server.

Example

The following command causes CDRs to immediately be generated:

```
gtpm interim now
```

gtpm interim now active-charging egcdr

Check points current GTPM accounting messages for active charging immediately.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
gtpm interim now active-charging egcdr [ callid call_id | imsi imsi | msid msid
| rulebase rbase_name | session-id sess_id | username name ]
```

callid *call_id*

Initiates GTPM interim accounting for a session with the specific call ID. *call_id* must be an 8-digit hexadecimal number.

imsi *imsi*

Initiates GTPM interim accounting for a specific International Mobile Subscriber Identity (IMSI) number. *imsi* must be a sequence of hexadecimal digits and wildcard characters - \$ matches a single character and * matches multiple characters

msid *msid*

Initiates GTPM interim accounting for a specific Mobile Station Identifier (MSID) number. *msid* must be a sequence of up to 24 digits and wildcard characters - \$ matches a single character and * matches multiple characters

rulebase *rbase_name*

Initiates GTPM interim accounting for sessions that use the named active charging rulebase. *rbase_name* must be an alpha and/or numeric string of from 1 through 24 characters.

session-id *sess_id*

Initiates GTPM interim accounting for a specific active charging session. *sess_id* must be the name of a current active charging session.

username *name*

Initiates GTPM interim accounting for all PDP contexts for the subscriber specified. *name* is the subscriber's name and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

This command causes GTPM accounting eG-CDRs to immediately be generated for active charging sessions that meet the specified criteria.

The sending of the CDRs is paced so as not to overload the accounting server.

■ `gtpp interim now active-charging egcdr`

Example

The following command causes eG-CDRs to immediately be generated for active charging sessions using the rulebase named `rulebase1`:

```
gtpp interim now active-charging egcdr rulebase rulebase1
```

gtp storage-server commit

Causes the GTPP storage server to save all buffered packets to the hard drive.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
gtp storage-server commit now
```

Usage

Upon execution, this command is relayed by the system to the GTPP Storage Server (GSS) causing the GSS to save all buffered packets to the hard drive. It also causes the GSS to delete all CDRs that have been acknowledged by the CGF. The deleted CDRs are saved in a separate file.

Note that this command must be executed from within the context in which the GSS is configured.

Refer to the **gtp storage-server** command in the Context Configuration Mode for more information.

gtpptest

Tests the system's ability to communicate with configured CGF(s).

Product

GGSN

Privilege

Operator, Config-Administrator, Administrator

Syntax

```
gtpptest [ accounting { all | cgf-server cgf_address } ] | [ storage-server [ address ip-addr port udp-port ] ]
```

all

Tests all CGFs configured within the given context.

cgf-server *cgf_address*

Tests a specific CGF configured within the given context.

ip_address is the IP address of the CGF expressed in dotted decimal notation.

storage-server [**address** *ip-address* **port** *udp-port*]

Test the connectivity and provide round trip time for the echo request sent to GTPP Storage-Server configured in the requested context.

ip_address is the IP address of the GSS expressed in dotted decimal notation and *udp-port* is the port defined for GTPP Storage Server.

Usage

This command is used to verify the configuration of and test the system's ability to communicate with one or all configured GSS/CGFs for monitoring or troubleshooting purposes.

When executed, this command causes the system to send GTPP echo packets to the specified GSS/CGF(s).

The command's response will display whether the GSS/CGF is active or unreachable.

Example

The following command tests communication with a CGF having an IP address of 192.168.1.5:

```
gtpptest accounting cgf-server 192.168.1.5
```

The following command tests communication with a GSS configured in requested context

```
gtpptest storage-server
```

The following command verify communication with a GSS, having IP address *192.156.12.10* and port *50000*, without configuring it in a context

```
gtpptest storage-server address 192.156.12.10 port 50000
```

gtpu test echo

Tests the ability of a GGSN service to exchange GTP-U echo request messages with the specified SGSN(s).

Product

GGSN

Privilege

Operator, Config-Administrator, Administrator

Syntax

```
gtpu test echo src-address gn_address { all | sgsn-address ip_address }
```

src-address *gn_address*

Specifies the IP address of a Gn interface configured on the system.
gn_address must be expressed in dotted decimal notation.

Important: The IP address of the system's Gn interface must be bound to a configured GGSN service prior to executing this command.

all

Specifies that GTP-U echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

sgsn-address *ip_address*

Specifies that GTP-U echo requests will be sent to a specific SGSN.
ip_address is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

Usage

This command tests the GGSN's ability to exchange GPRS Tunneling Protocol user plane (GTP-U) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring.
This command must be executed from within the context in which the GGSN service is configured.
Refer also to the `gtpc test` command.

Example

The following command issues GTP-U echo packets from a GGSN service bound to address 192.168.157.43 to an SGSN with an address of 192.168.1.52:

```
gtpu test echo src-address 192.168.157.43 sgsn-address 192.168.1.52
```

gtpv0 test echo

Tests the ability of a GGSN service to exchange GTPv0 echo request messages with the specified SGSN(s).

Product

GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
gtpv0 test echo src-address gn_address { all | sgsn-address ip_address }
```

src-address *gn_address*

Specifies the IP address of a Gn interface configured on the system.

gn_address must be expressed in dotted decimal notation.

Important: The IP address of the system's Gn interface must be bound to a configured GGSN service prior to executing this command.

all

Specifies that GTPv0 echo requests will be sent to all SGSNs that currently have sessions with the GGSN service.

sgsn-address *ip_address*

Specifies that GTPv0 echo requests will be sent to a specific SGSN.

ip_address is the address of the SGSN to send the requests to and must be expressed in dotted decimal notation.

Usage

This command tests the GGSN's ability to exchange GPRS Tunneling Protocol version 0 (GTPv0) packets with the specified SGSNs which can be useful troubleshooting and/or monitoring.

This command must be executed from within the context in which the GGSN service is configured.

Refer also to the `gtpc test` and `gtpu test` commands.

Example

The following command issues GTPv0 echo packets from a GGSN service bound to address 192.168.1.33 to an SGSN with an address of 192.168.1.42:

```
gtpv0 test echo src-address 192.168.1.33 sgsn-address 192.168.1.42
```

hd raid

Performs the RAID management operations on the ASR 5000 hard drive.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
hd raid { check | { create { local1 | remote1 } [ -force ] [ -noconfirm ] } | {
  overwrite { local1 | remote1 } [ -force ] [ -noconfirm ] } | { select { local1 |
  remote1 } [ -force ] [ -noconfirm ] } | { insert { local1 | remote1 } [ -force ]
  [ -noconfirm ] } | { remove { local1 | remote1 } [ -force ] [ -noconfirm ] } }
```

check

Starts a background check on RAID disks unless the RAID is running in degraded mode.

-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

create local1 | remote1

Overwrites the specified disk to create a new RAID that could run in degraded mode.on the specified drive: *local1*: specifies the RAID is to be established on the primary SMC. *remote1*: specifies the RAID is to be established on the backup SMC.

-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

overwrite local1 | remote1

Overwrites the specified disk and adds it to the current running RAID to construct a fully mirrored array.

local1: specifies the primary SMC is to be added to the current RAID. *remote1*: specifies the backup SMC is to be added to the current RAID.

-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

select local1 | remote1

Selects the specified disk to assemble a RAID when two unrelated RAID disks are present in the system. The resulting RAID runs in degraded mode.

local1: specifies the primary SMC is to assemble the RAID. *remote1*: specifies the backup SMC is to assemble the RAID.

-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

insert local1 | remote1

Inserts the specified disk to the running RAID causing it to recover from degraded mode.

local1: specifies the primary SMC is to be inserted into the RAID. *remote1*: specifies the backup SMC is to be inserted into the RAID.

-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

remove local1 | remote1

Removes the specified disk from the running RAID causing it to run in degraded mode or to fail.

local1: specifies the primary SMC is to be removed from the RAID. *remote1*: specifies the backup SMC is to be removed from the RAID.

-noconfirm: instructs system not to display “are you sure” prompts.. **-force:** instructs the system to enforce the action and override warnings.

Usage

All commands need confirmation unless the **-noconfirm** is included in the command. If the result will bring down a running RAID, you have to force the command using **-force**.

RAID commands are needed to intervene in the following situations:

- the hard disk controller task can not determine the correct operation,
- administrator action is required by policy
- the administrator wants to wipe out an unused disk.

In an automated system, the policies created with this CLI address the possibility of a manually partitioned disk, a disk resulting from a different version of software, a partially constructed disk, or the case of two unrelated disks in the system.

To reduce administrator intervention, a set of policies can be configured to set the default action using the commands in the HD RAID configuration mode. These **hd raid** commands are described in the HD RAID Configuration Mode chapter of the Command Line Interface Reference.

Example

The following instructs the system to setup a RAID on the primary SMC hard drive.

```
hd raid create local1 -force
```

host

Used to resolve the IP address or logical host name information via DNS query.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
host { host_name | host_ip_address }
```

host_name | *host_ip_address*

Specifies host for which IP information is to be displayed.

host_name: specifies the logical host name for which the IP address is to be displayed (via DNS lookup).

host_ip_address: specifies the IP address for which the associated logical host name(s) are to be displayed (via reverse DNS lookup).

Usage

Verify DNS information which affects connections and packet routing.

Example

The following will resolve the host information for *remoteABC* and *1.2.3.4*.

```
host remoteABC
```

```
host 1.2.3.4
```

interface sent gratuitous-arp

Use this command to configure the system to allow the manual generation of G-ARPs in case of a failure during inter-node online upgrade. If the chassis is not active, an error message displays.

Product

All

Privilege

Security Administrator, Administrator, Operator, or Inspector with li-administrator permissions

Syntax

```
interface name send gratuitous-arp ip-address
```

Usage

This command generates a G-ARP for the IP-ADDR specified and sends it out for the interface.

Example

The following generate a G-ARP for IP address *192.168.100.10*.

```
interface interface_1 send gratuitous-arp 192.168.100.10
```

lawful-intercept

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

lawful-intercept packet-cable

Refer to the ASR 5000 Lawful Intercept Configuration Guide for a description of this command.

lawful-intercept ssdf

Refer to the *ASR 5000 Lawful Intercept Guide* for a description of this command.

logging active

Enables/disables logging for active internal log files.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
logging active [ copy runtime filters ] [ event-verbosity event_level ] [ pdu-  
data format ] [ pdu-verbosity pdu_level ]
```

```
no logging active
```

no

Indicates the internal logging is to be disabled.

copy runtime filters

When this command is issued, it makes a copy of the runtime filters and makes that copy the filters for the current logging session.

event-verbosity *event_level*

Specifies the level of verbosity to use in logging of events as one of:

- **min** - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- **concise** - displays detailed information about the event, but does not provide the event source within the system.
- **full** - displays detailed information about event, including source information, identifying where within the system the event was generated.

pdu-data *format*

Specifies output format for packet data units when logged as one of:

- **none** - output is in raw format (unformatted).
- **hex** - output being displayed in hexadecimal format.
- **hex-ascii** - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

pdu-verbosity *pdu_level*

Specifies the level of verbosity to use in logging of packet data units as a value from 1 to 5 where 5 is the most detailed.

Usage

■ logging active

Adjust the active logging levels when excessive log file sizes are being generated or, conversely, not enough information is being sent to the active log files for adequate troubleshooting support. The **no** keyword is used to disable internal logging.

 **Important:** A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

 **Important:** Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

Example

The following sets the active logging for events to the maximum.

```
logging active event-verbosity full
```

The following command sets the active logging for packet data units to level 3 and sets the output format to the main-frame style hex-ascii.

```
logging active pdu-data hex-ascii pdu-verbosity 3
```

The following disables internal logging.

```
no logging active
```

logging filter

Sets the logging filtering options for all or individual facilities.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
logging filter active facility facility level severity_level [ critical-info |
no-critical-info ]
```

active

Indicates only active processes are to have logging options set.

facility *facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **aal2**: AAL2 protocol logging facility
- **acl-log**: Access Control List logging facility
- **acsetrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **alcap**: ALCAP protocol logging facility
- **alcapmgr**: ALCAPMgr logging facility
- **all**: All facilities
- **asngwmgr**: ASN Gateway Manager facility
- **asnpcmgr**: ASN Paging Controller Manager facility
- **bfd**: BFD protocol logging facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bindmux**: IPCF BindMux Manager
- **bssap+**: Base Station Sub-system Application Part+ protocol facility for login interface between the SGSN and the MSC/VLR (2.5G and 3G)

- **bssgp**: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
- **cap**: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
- **cli**: CLI logging facility
- **credit-control**: Credit Control facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **cscftmgr**: SIP CSCFTT Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **cx-diameter**: Cx Diameter Messages facility
- **dcardctrl**: IPSEC Daughtercard Controller logging facility
- **dcardmgr**: IPSEC Daughtercard Manager logging facility
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: Dynamic Host Configuration Protocol logging facility
- **dhcpx6**: DHCPv6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase messages facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-dns**: Diameter DNS subsystem
- **diameter-ecs**: ACS Diameter signaling facility
- **diameter-hdd**: Diameter HDD Interface facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSEC Data Path facility
- **drvctrl**: Driver Controller facility
- **eap-ipsec**: EAP
- **eap-sta-s6a-s13-s6b-diameter**: EAP/STA/S6A/S13/S6B Diameter messages facility
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface facility
- **egtpc**: eGTP-C logging facility
- **egtpmgr**: eGTP manager logging facility
- **egtpu**: eGTP-U logging facility

- **event-notif**: Event Notification Interface logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **fng**: FNG logging facility
- **gmm**:
 - For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
 - For 3G: Logs the access application layer (above the RANAP layer)
- **gprs-app**: GPRS Application logging facility
- **gprs-ns**: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages facility
- **gss-gcdr**: GTP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility
- **gtpcmgr**: GTP-C protocol Manager logging facility
- **gtp**: GTP-PRIME protocol logging facility
- **gtpu**: GTP-U protocol logging facility
- **gtpumgr**: GTPU Demux manager
- **gx-ty-diameter**: Gx/Ty Diameter messages facility
- **gy-diameter**: Gy Diameter messages facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **hdctrl**: HD Controller logging facility
- **hnb-gw**: HNB-GW (3G Femto GW) logging facility
- **hnbmgr**: HNBMgr (3G Femto GW DemuxMgr) logging facility
- **hss-peer-service**: HSS Peer Service facility
- **igmp**: IGMP
- **ikev2**: IKEv2
- **ims-authorization**: IMS Authorization Service facility
- **ims-sh**: HSS SH Service facility
- **imsimgr**: SGSN IMSI Manager facility
- **imsue**: IMSUE
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipms**: IPMS logging facility
- **ipsec**: IP Security logging facility
- **ipsg**: IP Service Gateway interface logging facility

- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility
- **kvstore**: KV Store facility
- **l2tp-control**: L2TP control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **ldap**: LDAP Messages
- **li**: Refer to the *ASR 5000 Lawful Intercept Interface Reference* for a description of this command.
- **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
- **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
- **local-policy**: Local Policy Service facility
- **m3ua**: M3UA Protocol logging facility
- **magmgr**: Mobile Access Gateway manager logging facility
- **map**: MAP Protocol logging facility
- **megadiammgr**: Megadiameter Manager (SLF Service) logging facility
- **mme-app**: Mobility Management Entity Application logging facility
- **mme-misc**: MME miscellaneous logging facility
- **mmedemux**: Mobility Management Entity Demux Manager logging facility
- **mmemgr**: MME Manager facility
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 logging facility
- **mpls**: MPLS protocol logging facility
- **mtp2**: MTP2 Service logging facility
- **mtp3**: MTP3 Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **npumgr-acl**: NPUMGR ACL logging facility
- **npumgr-flow**: NPUMGR FLOW logging facility
- **npumgr-fwd**: NPUMGR FWD logging facility
- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-port**: NPUMGR PORT logging facility
- **npumgr-recovery**: NPUMGR RECOVERY logging facility

- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF protocol logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer Detection logging facility
- **pccmgr**: IPCF PCC Manager library
- **pdg**: PDG logging facility
- **pdgdmgr**: PDG Demux Manager logging facility
- **pdif**: PDIF logging facility
- **pgw**: PDN Gateway logging facility
- **phs-control**: PHS X1/X5 and X2/X6 Interface logging facility
- **phs-data**: PHS Data logging facility
- **phs-eapol**: PHS EAPOL logging facility
- **phsgwmgr**: PHS Gateway Manager facility
- **phspcmgr**: PHS Paging Controller Manager facility
- **pmm-app**: PMM application logging facility
- **ppp**: PPP link and packet facilities
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Rf Diameter messages facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **rua**: RUA (3G Femto GW - RUA messages) logging facility
- **s1ap**: S1AP Protocol logging facility
- **sccp**: SCCP Protocol logging connection-oriented messages between RANAP and TCAP layers.
- **set**: Shared Configuration Task logging facility
- **sctp**: SCTP Protocol logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstrc**: session trace logging facility

- **sft**: Switch Fabric Task logging facility
- **sgs**: SGs protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN 'glue' interfaces, e.g., between PMM, MAP., GPRS-FSM, SMS.
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN MBMS Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stach manager to log binding and removing between layers
- **sgsn-system**: SGSNs System Components logging facility; used infrequently
- **sgsn-test**: SGSN Tests logging facility; used infrequently
- **sgtpcmgr**: SGSN GTPC Manager logging information exchange through SGTPC and the GGSN
- **sgw**: Serving Gateway facility
- **sh-diameter**: Sh Diameter messages facility
- **sitmain**: System Initialization Task main logging facility
- **sm-app**: SM Protocol logging facility
- **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
- **sndcp**: SNDCCP Protocol logging facility
- **snmp**: SNMP logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **ssh-ipsec**: SSH IP Security logging facility
- **ssl**: SSL (Secure socket layer messages) logging facility
- **stat::** Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **tcap**: TCAP Protocol logging facility
- **threshold**: threshold logging facility
- **ttg**: TTG logging facility
- **tucl**: TUCL logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **usertcp-stack**: User Tcp Stack
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

level *severity_level*

Specifies the level of information to be logged from the following list which is ordered from highest to lowest:

- critical - display critical events
- error - display error events and all events with a higher severity level
- warning - display warning events and all events with a higher severity level
- unusual - display unusual events and all events with a higher severity level
- info - display info events and all events with a higher severity level
- trace - display trace events and all events with a higher severity level
- debug - display all events

critical-info | **no-critical-info**

Default: critical-info enabled.

critical-info: specifies that events with a category attribute of critical information are to be displayed. Examples of these types of events can be seen at bootup when system processes and tasks are being initiated.

no-critical-info: specifies that events with a category attribute of critical information are not to be displayed.

Usage

Apply filters for logged data to collect only that data which is of interest.

Important: A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

Important: Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

Caution: Issuing this command could negatively impact system performance depending on the amount of system activity at the time of execution and/or the type of facility(ies) being logged.

Example

The following are selected examples used to illustrate the various options. Not all facilities will be explicitly shown as each follows the same syntax for options.

The following sets the level to log only warning information for all facilities.

```
logging filter active facility all level warning
```

The following enables the logging of critical information for the SNMP facility while setting the level to error.

```
logging filter active facility snmp level error critical-info
```

logging trace

Enables/disables the logging of trace information for specific calls, mobiles, or network addresses.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
logging trace { callid call_id | ipaddr ip_address | msid ms_id | username
user_name }
```

```
no logging trace { callid call_id | ipaddr ip_address | msid ms_id | username
user_name }
```

no

Indicates the logging of trace information is to be disabled.

```
callid call_id | ipaddr ip_address | msid ms_id | username user_name
```

callid *call_id*: specifies the exact call instance ID which is to have trace data logged. *call_id* is specified as a 4-byte hexadecimal number.

ipaddr *ip_address*: specifies the IP address for which trace information is to be logged. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

msid *ms_id*: specifies the mobile subscriber ID for which trace information is to be logged. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

username *user_name*: specifies a user who is to have trace information logged. *user_name* must refer to a previously configured user.

Usage

A trace log is useful in troubleshooting subscriber problems as well as for system verification by using a test subscriber. The **no** keyword is used to stop the logging of trace information.

Important: A maximum of 50,000 events may be stored in each log. Enabling more events for logging may cause the log to be filled in a much shorter time period. This may reduce the effectiveness of the log data as a shorter time period of event data may make troubleshooting more difficult.

Important: Once a log has reached the 50,000 event limit the oldest events will be discarded as new log entries are created.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers connected and the amount of data being passed.

Example

The following commands enables/disables trace information for user *user1*.

```
logging trace username user1no logging trace username user1
```

The following commands will enable/disable trace information logging for the user assigned IP address *1.2.3.4*.

```
logging trace ipaddr 1.2.3.4no logging trace ipaddr 1.2.3.4
```

The following enables/disables logging of trace information for call ID *FE80AA12*.

```
logging trace callid fe80aa12no logging trace callid fe80aa12
```

logs checkpoint

Performs check pointing operations on log data. Check pointing identifies logged data as previously viewed or marked. Check pointing results in log information since the last check point being displayed only, i.e., check pointed log data is not available for viewing.

Individual logs may have up to 50,000 events in the active log. Check pointing the logs will then result in at most 50,000 events being in the inactive log files. This gives a maximum of 100,000 events in total which are available for each facility logged.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
logs checkpoint
```

Usage

Check point log data to a set the log contents to a well know point prior to special activities taking place. This command may also be a part of periodic regular maintenance to manage log data.

The check pointing of logs moves the current log data to the inactive logs. Only the most recently check pointed data is retained in the inactive logs. A subsequent check pointing of the logs will result in the prior check pointed inactive log data being cleared and replaced with the newly check pointed data.

The check pointing of log data moves the active log data to be retained as the inactive log data. This results in the active log data, if displayed, having no data earlier than the point in time when the check pointing occurred.

Important: Check pointing of logs should be done periodically to avoid the logs becoming full. Logs which have 50,000 events logged will discard the oldest events first when new events are to be logged.

Example

```
logs checkpoint
```

mkdir

Creates a new directory in the local file system or in remote locations as specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
mkdir filepath
```

filepath

Specifies the directory path to create. The path must be formatted as follows:

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

```
•[file:] { /flash | /pcmcial | /hd } [ /directory ] /file_name
```

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name

filename is the actual file of interest

Usage

Create new directories as part of periodic maintenance activities to better organize stored files.

Example

The following creates the directory */flash/pub* in the local flash storage.

```
mkdir /flash/pub
```

mme offload

Initiates or stops the offload of UEs associated with a specified MME service.

Product

MME

Privilege

Inspector

Syntax

```
mme offload mme-service name { start mme-init-release-timeout seconds paging-init-timeout seconds | stop }
```

mme-service *name*

Specifies the name of the MME service from which UEs will be offloaded. *name* must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.

```
start mme-init-release-timeout seconds paging-init-timeout seconds | stop  
} [ -noconfirm ]
```

Sets the timeout for the initial release procedure and the paging procedure.

start mme-init-release-timeout *seconds*: Configures the timeout for triggering the IDLE MODE ENTRY procedure for UEs that are in the ECM_CONNECTED state. The cause of the IDLE MODE ENTRY will be “Load balancing TAU required”. *seconds* must be an integer value from 1 to 120.

paging-init-timeout *seconds*: Configures the timeout for triggering the PAGING procedure for UEs in the ECM_IDLE state. *seconds* must be an integer value from 1 to 120.

After returning the UEs to the ECM_CONNECTED state, the IDLE MODE ENTRY procedure is triggered with the “Load balancing TAU required” cause.

stop: Ends the offload process.

-noconfirm

Execute the command without any additional prompts or confirmation from the user.

Usage

Example

The following command sets the trigger to start offloading UEs from a service named *mme3* at 60 seconds and the paging trigger at 90 seconds:

```
mme offload mme-service mme3 start mme-init-release-timeout 60 paging-init-timeout 90
```

mme reset

Sends an S1 RESET message to a designated ENodeB to reset all UE-associated S1 connections.

Product

MME

Privilege

Inspector

Syntax

```
mme reset s1-peer peer_ID
```

s1-peer *peer-ID*

Specifies the ENodeB peer ID to which the REST message is to be sent. *peer_ID* must be an existing ENodeB peer ID and be an integer value from 1 to 4294967295.

Usage

Use this command to send an S1 RESET message to a designated ENodeB to reset all UE-associated S1 connections.

The S1 peer ID for an ENodeB can be identified by executing the **show mme-service enodeb-association** command available in this mode. The peer ID is presented in the “Peerid” field.

Example

The following command initiates the sending of an S1-peer reset message to an ENodeB with a peer ID of 22315734:

```
mme rest s1-peer 22315734
```

monitor protocol

Enters the system's protocol monitoring utility.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
monitor protocol
```

Usage

Useful for troubleshooting, this command provides a tool for monitoring protocol transactions between the system and other network nodes including the mobile station(s).

The following protocols can be monitored:

- SNMP
- RADIUS Authentication
- RADIUS Accounting
- A11 (R-P Interface) (PDSN only)
- Mobile IPv4
- A11MGR
- PPP
- A10 (PDSN only)
- User L3 (User Layer 3 protocols)
- USERTCP STACK
- L2TP
- L2TPMGR
- L2TP Data
- GTPC
- GTPCMGR
- GTPU
- GTPP

- DHCP (GGSN only)
- CDR
- DHCPV6
- RADIUS COA
- MIP Tunnel

- L3 Tunnel (Layer 3 Tunnel Protocols)
- CSS Data
- CSS Signaling

- EC Diameter (Diameter Enhanced Charging)
- SIP (IMS)
- IPSec IKE Inter-Node
- IPSec IKE Subscriber
- IPSG RADIUS Signal
- ROHC (Robust Header Compression) (PDSN only)
- WiMAX R6
- WiMAX Data
- SRP
- BCMCS SERV AUTH
- RSVP
- Mobile IPv6
- ASNGWMGR
- STUN
- SCTP: Enabling this option will display the SCTP protocol message packets on HNB-GW node.
- M3UA
- SCCP
- TCAP
- MAP
- RANAP
- GMM
- GPRS-NS
- BSSGP
- CAP
- MTP3
- LLC
- SNDCCP
- BSSAP+
- SMS
- PHS-Control
- PHS-Data
- DNS Client
- MTP2

- HNBAP: Enabling this option will display the HNB Application Part (HNBAP) protocol packets.
- RUA: Enabling this option will display the RANAP User Adaptation (RUA) protocol packets.
- EGTPC
- App Specific Diameter
- PHS-EAPOL
- ICAP
- Micro-Tunnel
- ALCAP: Enabling this option will display the Access Link Control Application Part (ALCAP) protocol message packets on HNB-GW node.
- SSL
- S1-AP
- NAS
- LDAP
- SGS
- AAL2: Enabling this option will display the ATM Adaptation Layer 2 (AAL2) protocol message packets on HNB-GW node.

Once the protocol has been selected, the utility monitors and displays every relative protocol message transaction.

Protocol monitoring is performed on a context-by-context-basis. Therefore, the messages displayed are only those that are transmitted/received within the system context from which the utility was executed.

Caution: Protocol monitoring can be intrusive to subscriber sessions and could impact system performance. Therefore, it should only be used as a troubleshooting tool.

Example

The following command opens the protocol monitoring utility:

```
monitor protocol
```

monitor subscriber

Enables the system's subscriber monitoring utility.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
monitor subscriber [ asn-peer-address bs_peer_address | callid call_id fng-peer-address ipv4_address | imsi imsi_value | ipaddr ip_address | ipv6addr ipv6_address | ipsg-peer-address ipsg_peer_address | msid ms_id | msisdn msisdn | next-call | pcf pcf_address | pdif-peer-address pdif_peer_address | peer-fa peer_fa_address | peer-lac lac_peer_address | sgsn-address sgsn_address | type { 1xrtt | asn-gw | asn-pc | closed-rp | ev-dorev0 | ev-doreva | interrogating-cscf | ggsn [ Next-Call By APN ] | ha | ipsg | lms | mme | pdif | proxy-cscf | rfc3261-proxy | serving-cscf } next-call | type bcmcs { next-call | next-service-request } | username user_name | Next-Call By APN ]
```

asn-peer-address *bs_peer_address*

Specifies the peer ASN Base Station IP address. Must be followed by IPv4 address in dotted decimal notation.

callid *call_id*

Specifies the call identification number assigned to the subscriber session by the system to be monitored. *call_id* is specified as a 4-byte hexadecimal number.

fng-peer-address *ipv4_address*

The specific FNG WLAN IP address.
ipv4_address must be entered in standard IPv4 notation.

imsi *imsi_value*

Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session to be monitored. *imsi_value* is an integer value from 1 to 15 characters.

ipaddr *ip_address*

Specifies the IP address of the subscriber session to be monitored.
ip_address must be specified using dotted decimal notation.

ipv6addr *ipv6_address*

Specifies the IPv6 address of the subscriber session to be monitored.
ipv6_address must be an IPv6 IP address entered using colon (:) separated notation.

ipsg-peer-address *ipsg_peer_address*

Specifies the peer IPSG IP address. Must be followed by IPv4 address in dotted decimal notation.

msid *ms_id*

Specifies the mobile subscriber identification number to be monitored.
ms_id must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

msisdn *msisdn*

Specifies the Mobile Subscriber ISDN number to be monitored.
msisdn must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

next-call

Specifies that the system will monitor the next incoming subscriber session.
 Entering this keyword will display the available options of protocols to select. For list of supported protocols with this keyword, refer **monitor protocol** command.

pcf *pcf_address*

Specifies the PCF IP address. Must be followed by IPv4 address in dotted decimal notation.

pdif-peer-address *pdif_peer_address*

Specifies the peer PDIF IP address. Must be followed by IPv4 address in dotted decimal notation.

peer-fa *peer_fa_address*

Specifies the peer FA IP address. Must be followed by IPv4 address in dotted decimal notation.

peer-lac *lac_peer_address*

Specifies the peer LAC IP address. Must be followed by IPv4 address in dotted decimal notation.

sgsn-address *sgsn_address*

Specifies the SGSN IP address. Must be followed by IPv4 address in dotted decimal notation.

type { **1xr**tt | **asngw** | **asnpc** | **evdorev0** | **evdoreva** | | **fng**
 | **interrogating-cscf** | **ggsn** [**Next-Call By APN**] | **ha** | **ipsg** | **lms** | **mme** |
openrp | | **pdif** | **proxy-cscf** | **rfc3261-proxy** | **serving-cscf** } **next-call**

Allows monitoring for specific subscriber types established in the system when next call occurs.

- **1xr**tt: Displays logs for cdma2000 1xRTT call session subscriber
- **asngw**: Displays logs for ASN GW call session subscriber
- **asnpc**: Displays logs for ASN PC/LR call session subscriber
- **evdorev0**: Displays logs for cdma2000 EVDO Rev0 call session subscriber
- **evdoreva**: Displays logs for cdma2000 EVDO RevA call session subscriber
- **fng**: Displays logs for the FNG session subscriber
- **interrogating-cscf**: Displays logs for Interrogating CSCF subscriber
- **ggsn**: Displays logs for UMTS GGSN call session subscriber

- **Next-Call By APN:** Display logs for next call on APN basis, where APN name can be any of Gi or Gn apn.
- **ha:** Displays logs for Home Agent call session subscriber
- **ipsg:** Displays logs for IPSG call session subscriber
- **lms:** Displays logs for LNS call session subscriber
- **mme:** Displays logs for MME session subscribers.
- **openrp:** Displays logs for OpenRP subscriber
- **pdif:** Displays logs for PDIF call session subscriber
- **proxy-cscf:** Displays logs for Proxy CSCF subscriber
- **rfc3261-proxy-cscf:** Displays logs for non-ims-proxy (RFC-3261 proxy) subscriber
- **serving-cscf:** Displays logs for Serving CSCF subscriber

type bcmcs {*next-call* / *next-service-request*}

Specifies the type of BCMCS call for the subscriber.

username *user_name*

Specifies the username of the subscriber to be monitored.

user_name refers to a previously configured user.

Usage

The monitor subscriber utility provides a useful tool for monitoring information about and the activity of either a single subscriber or all subscribers with active sessions within a given context.

The following items can be monitored:

- Control events
- Data events
- Event ID information
- Inbound events
- Outbound events
- Protocols (identical to those monitored by `command`)

Once the criteria has been selected, the utility will monitor and display every relative piece of information on the subscriber(s).

Important: Option Y for performing multi-call traces is only supported for use with the GGSN. This option is available when monitoring is performed using the “Next-Call” option. It allows you monitor up to 11 primary PDP contexts for a single subscriber.

Subscriber monitoring is performed on a context-by-context-basis. Therefore, the information displayed will be only that which is collected within the system context from which the utility was executed.

Caution: Subscriber monitoring can be intrusive to subscriber sessions and could impact system performance. Therefore, it should only be used as a troubleshooting tool.

■ monitor subscriber

Example

The following command enables monitoring for user *user1*.

```
monitor subscriber username user1
```

The following command will enable monitoring for the user assigned IP address *1.2.3.4*.

```
monitor subscriber ip-address 1.2.3.4
```

The following enables monitoring for call ID *FE80AA12*.

```
monitor subscriber callid fe80aa12
```

newcall policy

This command configures new call policies for busy-out conditions.

Product

PDSN, GGSN,, HNB-GW, MME, HA, LNS, P-CSCF, ASN GW, ASN PC/LR, SGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
newcall policy { asngw-service | asnpc-service | sgsn-service } {all | name
service_name } reject

newcall policy cscf-service { all | name service_name } { redirect
target_ip_address [ weight weight_num ] [ target_ipaddress2 [ weight weight_num
] ... target_ip_address16 [ weight weight_num ] | reject }

newcall policy { fa-service | lns-service | mipv6ha-service } { all | name
service_name } reject

newcall policy { ha-service | pdsn-service } { all | name service_name } {
redirect target_ip_address [ weight weight_num ] [ target_ipaddress2 [ weight
weight_num ] ... target_ip_address16 [ weight weight_num ] | reject }

newcall policy ggsn-service { apn name apn_name | all | name ggsn-service-name }
reject

newcall policy hnbgw-service {all | name service_name } reject

no newcall policy { fa-service | ggsn-service | ha-service | mipv6ha-service |
pdsn-service| pdsnclosedrpservice| lns-service } { all | name service_name }

no newcall policy { ha-service | pdsn-service } { all | name service_name }
redirect target_ip_address [ weightweight_num ] [ target_ip_address2 [ weight
weight_num ] ... target_ip_address16 [ weightweight_num ]

no newcall policy ggsn-service { apnname apn_name | all | name ggsn-service-name
} reject

no newcall policy { asngw-service | asnpc-service } { all | name service_name }

no newcall policy hnbgw-service { all | name service_name }

no newcall policy mme-service { all | name service_name }
```

no

Disables the new call policy for all or specified service of a service type.

```
newcall policy { asngw-service | asnpc-service } { all | name
service_name } reject
```

Creates a new call policy to reject the calls based on the specified ASN GW or ASN PC/LR service name or all services of this type.

asngw-service: Specifies the type of service as ASN GW for which new call policy is configured.

asnpc-service: Specifies the type of service as ASN PC/LR for which new call policy is configured.

name service_name: Specifies the name of the service for which new call policy is configured.

service_name is name of a configured ASN GW or ASN PC/LR service.

reject: Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For ASN GW and ASN PC/LR service rejection code is 81H (Registration Denied - administratively prohibited).

```
newcall policy { cscf-service | fa-service | lns-service | mipv6ha-
service } { all | name service_name } reject
```

Creates a new call policy that rejects calls based on the specified access point name.

```
no newcall policy { cscf-service | fa-service | ggsn-service | ha-service
| mipv6ha-service | pdsn-service | } { all | name service_name }
```

Removes a previously configured new call policy for the specified service

```
no newcall policy { ha-service | pdsn-service } { all | name service_name
} redirect target_ip_address [ weight weight_num ] [ target_ip_address2 [
weight weight_num ] ... target_ip_address16 [ weight weight_num ]
```

Deletes up to 16 IP addresses from the redirect policy. The IP addresses must be expressed in IP v4 dotted decimal notation

```
cscf-service | fa-service | ha-service | lns-service | mipv6ha-service |
mme-service | pdsn-service | pdsnclosedrpservice
```

Specifies the type of service for which to configure a new call policy. The following services are supported:

- **cscf-service:** A Call/Session Control Function service
- **fa-service:** A Foreign Agent service
- **ha-service:** A Home Agent service
- **lns-service:** An L2TP Network Server service
- **mipv6ha-service:** A Mobile IPv6 Home Agent service
- **pdsn-service:** A Packet Data Serving Node service

```
{ all | name service_name }
```

Specifies a filter for the new call policy. Whether the new call policy will be applied to all configured services or a specific one.

- **all:** Specifies that the new call policy will be applied to all instances of the selected service type.
- **name: service_name:** Specifies the name of a specific instance of the selected service type. service_name can be between 1 and 63 alpha and/or numeric characters and is case sensitive.

```
redirect target_ip_address [ weight weight_num ] [ target_ip_address2 [ weight weight_num ] ... target_ip_address16 [ weight weight_num ]
```

Configures the busy-out action. When a redirect policy is invoked, the service rejects new sessions and provides the IP address of an alternate destination. This command can be issued multiple times.

address: The IP address of an alternate destination expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

weight weight_num: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

Depending on the type of service that the policy is applied to, the following reason codes are reported as part of the reply:

- **ha service:** 88H (Registration Denied - unknown home agent address)
- **pdsn service:** 88H (Registration Denied - unknown PDSN address)

Important: The redirect option is not supported for use with FA and GGSN services.

```
newcall policy hnbgw-service { all | name service_name } reject
```

Creates a new call policy to reject the calls in specified HNB-GW service name instance or all HNB-GW services on the system.

name service_name: Specifies the name of the HNB-GW service for which new call policy is configured. *service_name* is name of a configured HNB-GW service.

reject: Specifies that the policy rejects all new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For HNB-GW service rejection code is 81H (Registration Denied - administratively prohibited).

```
newcall policy mme-service { all | name service_name } reject
```

Creates a new call policy to reject the calls based on the specified MME service name or all MME services on the system.

name service_name: Specifies the name of the MME service for which new call policy is configured. *service_name* is name of a configured MME service.

reject: Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the reason codes are reported as part of the reply to indicate the rejection. For MME service rejection code is 81H (Registration Denied - administratively prohibited).

```
reject
```

Specifies that the policy rejects new incoming calls. Depending on the type of service that the policy is applied to, the following reason codes are reported as part of the reply to indicate the rejection:

- **asngw service:** 81H (Registration Denied - administratively prohibited)
- **fa service:** 41H (administratively prohibited)

Important: When the newcall policy is set to reject for the FA service, the Busy Bit is set in the Agent Advertisement. Any further RRQs will be rejected with this code value.

- **ggsn service:** C7H (Rejected - no resources available)
- **ha service:** 81H (Registration Denied - administratively prohibited)

- **mipv6ha-service:** 81H (Registration Denied - administratively prohibited)
- **mme service:** 81H (Registration Denied - administratively prohibited)
- **pdsn service:** 81H (Registration Denied - administratively prohibited)

Usage

This command is used to busy-out specific system services prior to planned maintenance or for troubleshooting. This is required when operator find out that the system is somehow overloaded, or needs some kind of maintenances or so.

Example

The following command creates a new call policy to re-direct all new calls for all PDSN services to a device having an IP address of 192.168.1.23:

```
newcall policy pdsn-service all redirect 192.168.1.23
```

The following command creates a new call policy to reject all new calls for a GGSN service called ggsn1:

```
newcall policy ggsn-service name ggsn1 reject
```

The following command creates a new call policy to reject all new calls for an MME service called MME1:

```
newcall policy mme-service name MME1 reject
```

The following command creates a new call policy to reject all new calls for an HNB-GW service called *hnbgw1*:

```
newcall policy hnbgw-service name hnbgw1 reject
```

password change

Provides a mechanism for local-user administrative users to change their passwords.

Product

All

Privilege

All local-user administrative levels except as noted below

Syntax

```
password change [ local-user name ]
```

local-user *name*

Specifies the name of the local-user administrative user for which to change the password. *name* can be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

Important: This keyword is only available to local-users with an authorization level of security-administrator.

Usage

This command provides a mechanism for local-user administrative users to change their passwords. In addition, it also provides a mechanism for security-administrator local-users to change the password for other local-user accounts.

If the **local-user** keyword is not entered, the system prompts the user for their current password and for the new password. New passwords take effect at the next login. Users that have had their password changed by a security-administrator are prompted to change their passwords at their next login.

New passwords must meet the criteria dictated by the **local-user password** command options in the Global Configuration Mode.

Important: The system does not allow the changing of passwords unless the time limit specified by the **local-user password min-change-interval** has been reached.

Example

The following command, executed by a security-administrator, resets the password for a local-user name operator12:

```
password change local-user operator12
```

ping

Verifies ability to communicate with a remote node in the network by passing data packets between and measuring the response.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Important: Inspector privileges are granted for all variables except **count**. To initiate a ping count, you must have a minimum privilege level of Operator.

Syntax

```
ping host_ip_address [ broadcast ] [ count num_packets ] [ pattern
packet_pattern ] [ size octet_count ] [ src { src_host_name |
src_host_ip_address } ] [ | { grep grep_options | more } ]
```

host_ip_address

Identifies the remote node to which the ability to communicate with is to be verified.

host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

broadcast

Sends ping packets to broadcast addresses.

count *num_packets*

Default: 5

Specifies the number of packets to send to the remote host for verification. *num_packets* must be within the range 1 through 10000.

pattern *packet_pattern*

Default: each octet of the packet is encoded with the octet number of the packet.

Specifies a pattern to use to fill the internet control message protocol packets with. *packet_pattern* must be specified in hexadecimal format with a value in the range hexadecimal 0x0000 through 0xFFFF.

packet_pattern must begin with a '0x' followed by up to 4 hexadecimal digits.

size *octet_count*

Default: 56

Specifies the number of bytes each IP datagram. *octet_count* must be a value in the range 40 through 18432.

src { *src_host_name* | *src_host_ip_address* }

Default: originating system's IP address

Specifies an IP address to use in the packets as the source node.

src_host_name: specifies the source node using the node's logical host name which must be resolved via DNS lookup.

src_host_ip_address: specifies the source node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in *Command Line Interface Reference*.

Usage

This command is useful in verifying network routing and if a remote node is able to respond at the IP layer.

Example

The following command is the most basic and will report the results of trying to communication with remote node *remoteABC*.

```
ping remoteABC
```

The following will verify communication with the remote node *1.2.3.4* using *1000* packets.

```
ping 1.2.3.4 count 1000
```

The following verifies communication with remote node *remoteABC* while making it appears as though the source is remote node with IP address *1.2.3.4*.

```
ping remoteABC src 1.2.3.4
```

Important: It is important to note that the responses from the remote host to the ping packets will be rerouted to the host specified as the source.

ping6

Ping options for IPv6 addresses

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
ping6 { hostname | ipv6 address } [ count num ] [ flood ] [ pattern val ] [ size val ] [ src val ] [ interface string ]
```

hostname

Name of the host to be pinged.

ipv6 address

IPv6 address of host to be pinged.

count num

Sets the number of ping packets to be sent. *num* must be an integer between 1 - 10,000.

flood

Configures ping6 to send packets as quickly as possible, or 100 per second, whichever is faster.

pattern val

Specifies hex pattern to fill ICMP packets. *val* is in the range 0x0 - 0ffff

size val

Size of ICMP datagram in bytes. *val* is an integer from 40 - 18432. Default is 56.

src val

Specifies the source IP address.

interface string

Specifies the originating source interface name.

Usage

Ping command for IPv6. Note that the command is just “ping6, and not “pingv6.”

Example

Use this command to ping the IPv6 address `2001:0db8:85a3:0000:0000:8a2e:0370:7334`

```
ping6 2001:0db8:85a3:0000:0000:8a2e:0370:7334
```

port

Performs a manual switchover to an available redundant/standby line card or SPIO port.

Default: none.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
port switch to slot# / port#
```

slot#

Identifies the physical chassis slot where the line card or SPIO card is installed.

port#

Identifies the physical port on the line card or SPIO to automatically switch to.

Usage

This command is used to specify the redundant port on a Line Card (LC). When port redundancy is enabled, if an external network device or cable failure occurs that causes a link down failure on the port, then the redundant port is used.

Important: This command is not supported on all platforms.

Example

```
port switch to 17/1
```

ppp echo-test

Verifies the point-to-point link by sending link control protocol packets to the targeted users. This command will not

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator

Syntax

```
ppp echo-test { callid call_id | imsi imsi_id | ipaddr ip_address | msid ms_id |
username user_name } [ num_packets ] [ | { grep grep_options | more } ]
```

callid *call_id*

Specifies the exact call instance ID which is to have its PPP link verified. *call_id* is specified as a 4-byte hexadecimal number.

imsi *imsi_id*

Specifies the International Mobile Subscriber Identifier (IMSI) which is to have its PPP link verified.

ipaddr *ip_address*

Specifies the IP address which is to have its PPP link verified. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

msid *ms_id*

Specifies the mobile subscriber ID which is to have its PPP link verified. *ms_id* must be from 7 to 16 digits specified as an MIN, or RMI.

username *user_name*

Specifies a user which is to have its PPP link verified. *user_name* must refer to a previously configured user.

num_packets

Default 1

Specifies the number of test packets to generate. *num_packets* must be a value in the range from 1 through 1000000.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in *Command Line Interface Reference*.

Usage

Use the echo test to verify the point-to-point protocol communications.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers using the same name and/or if the number of packets used in the test is large.

Example

The following command tests the PPP link to user *user1*.

```
ppp echo-test username user1
```

The following command tests the PPP link to the user assigned IP address *1.2.3.4*.

```
ppp echo-test ipaddr 1.2.3.4
```

The following tests the PPP link associated with call ID *FE80AA12*.

```
ppp echo-test callid fe80aa12
```

radius interim

Check points current RADIUS accounting messages immediately

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
radius interim accounting now
```

Usage

The interim command may be part of a regiment of periodic activities to maintain the chassis. This command may also be useful in preparation for system monitoring or troubleshooting to set the list of messages to be displayed at a well known time.

radius test

Verifies the RADIUS servers functions for accounting and authentication.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
radius test { accounting | authentication | probe authentication server ip_addr
port port_no [ username username password password ] } { all | [ on ] | off ] |
radius group group_name user_name | server server_name port server_port }
user_name password
```

accounting

Test accounting server functionality.

authentication

Test authentication server functionality.

```
all | radius group group_name user_name | server server_name port
server_port
```

all: indicates all configured servers are to be tested.

server server_name port server_port: indicates only the server specified as *server_name* and *server_port* is to be tested. The server must have been previously configured.

radius group group_name user_name: tests all configured authentication servers in a specific RADIUS group for specific user. Must be followed by the RADIUS group name and user name.

group_name will be a string of size 1 to 63 character and specifies the name of server group configured in specific context for authentication/accounting.

on/off

Allows the user to turn radius test accounting on or off.

user_name

Specifies the RADIUS user who is to be verified. The user must have been previously configured.

password

Specifies the RADIUS user who is to have authentication verified. *password* is only applicable when the **authentication** keyword is specified.

Usage

Test the RADIUS accounting for troubleshooting the system for specific users or to verify all the system RADIUS accounting functions.

Example

The following verifies all RADIUS servers.

```
radius test accounting all
```

```
radius test authentication all
```

The following verifies the RADIUS accounting and authentication for user *user1* for the *sampleServer*.

```
radius test accounting server sampleServer port 5000 user1
```

```
radius test authentication server sampleServer port 5000 user1 dummyPwd
```

The following commands will verify the RADIUS accounting and authentication for RADIUS server group *star1* for the current context:

```
radius test accounting server sampleServer port 5000 user1
```

```
radius test authentication server sampleServer port 5000 user1 dummyPwd
```

```
radius test authentication all
```

The following verifies the RADIUS authentication server group *star1* for user *user1*.

```
radius test authentication radius group star1 user1
```

reload

Invokes a full system reboot.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
reload [ -noconfirm ]
```

-noconfirm

Execute the command without any additional prompts or confirmation from the user.

Usage

The system performs a hardware reset and reloads the highest priority boot image and configuration file specified in the boot.sys file. Refer to the **boot system priority** command in the Global Configuration Mode for additional information on configuring boot images, configuration files and priorities.

Important: To avoid the abrupt termination of subscriber sessions, it is recommended that a new call policy be configured and executed prior to invoking the reload command. This sets busy-out conditions for the system and allows active sessions to terminate gracefully. Refer to the **newcall** command in the Exec Mode for additional information.

Caution: Issuing this command causes the system to become unavailable for session processing until the reboot process is complete.

Example

The following command performs a hardware reset on the system:

```
reload
```

rename

Changes the name of an existing local file.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
rename from_filepath to_filepath [ -noconfirm ]
```

from_filepath

Specifies the path to the file/directory to be renamed. The path must be formatted according to the following format:

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

```
•[file: ] { /flash | /pcmcial | /hd } [ /directory ] /file_name
```

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name

filename is the actual file of interest

to_filepath

Specifies the new name of file/directory. The path must be formatted according to the following formats:

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

```
•[file: ] { /flash | /pcmcial | /hd } [ /directory ] /file_name
```

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name

filename is the actual file of interest

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Extreme caution should be taken when using the **-noconfirm** option. The paths to the source and the destination should be verified prior to performing the command.

■ rename

Usage

Rename files as part of regular system maintenance in conjunction with the delete command.

Example

The following renames the directory */pub* in the local PCMCIA1 device.

```
rename /pcmcia1/pub /pcmcia1/pub_old
```

reveal disabled commands

Enables the input of commands for features that do not have license keys installed. The output of the command **show cli** indicates when this is enabled. This command effects the current CLI session only. This is disabled by default.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
[ no ] reveal disabled commands
```

no

Do not show disabled commands.

Usage

When this is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command. When this is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

Example

Set the CLI to accept disabled commands and display the required feature for the current CLI session with the following command:

```
reveal disabled commands
```

Set the CLI to reject disabled commands and return an error message for the current CLI session:

```
no reveal disabled commands
```

rlogin

Attempts to connect to a remote host.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
rlogin { host_name | host_ip_address } [ user user_name ]
```

host_name | *host_ip_address*

Identifies the remote node to attempt to connect to.

host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.

host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

user *user_name*

Specifies a user name to attempt to connect as. *user_name* must be from to 1023 alpha and/or numeric characters.

Usage

Connect to remote network elements using rlogin.

Important: **rlogin** is not a secure method of connecting to a remote host. **ssh** should be used whenever possible for security reasons.

Example

The following connects to remote host *remoteABC* as user *user1*.

```
rlogin remoteABC user user1
```

The following connects to remote host *1.2.3.4* without any default user.

```
rlogin 1.2.3.4
```

rmdir

Removes (deletes) a local directory.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
rmdir path [ force ]
```

path

Specifies the directory path to remove. The must be formatted according to the following formats:
Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

directory is the directory name

filename is the actual file of interest

force

Over-rides any warnings to force deletion of the directory and any files contained therein.

Important: Use of the **force** keyword should be done with care to ensure the directory is specified accurately as there is no method to recover a directory which has been removed.

Usage

Remove old directories as part of regular maintenance.

Example

The following removes the local directory */pcmcial/pub*.

```
rmdir /pcmcial/pub
```

rotate-hd-file

This command rotates the current temp file manually.

Product

SGW, PGW, HSGW

Privilege

Security Administrator, Administrator

Syntax

```
rotate-hd-file diameter [ name policy_name ]
```

[**name** *policy_name*]

Specifies the hd-storage policy name. *policy_name* must be an existing HD Storage Policy name and must be an alpha and/or numeric string of 0 through 63 characters in length.

Usage

Use this command to manually rotate the Diameter HD stored files.

Example

The following command rotates Diameter files in the HD storage drive for files stored using the HD storage policy named CDR1:

```
rotate-hd-file diameter name CDR1
```

save configuration

Saves the current contexts configuration to a local or remote location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
save configuration url [ -redundant ] [ -noconfirm ] [ showsecrets ] [ verbose ]
```

url

Default: saves to the location of the active configuration currently loaded.

Specifies the location to store the configuration file(s). *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

•ASR 5000:

- file:** { /flash | /pcmcial | /hd } [/directory] /file_name
- tftp:** // { host [:port#] } [/directory] /file_name
- ftp:** | **sftp:** [// [username [:password] @] { host } [:port#] [/directory] /file_name

directory is the directory name.

filename is the actual file of interest.

Important: Configuration files should be named with a .cfg extension.

username is the user to be authenticated.

password is the password to use for authentication.

host is the IP address or host name of the server.

Important: *hostname* can **only** be used if the **networkconfig** parameter is configured for DHCP and the DHCP server returns a valid nameserver.

port# is the logical port number that the communication protocol is to use.

-redundant

This keyword directs the system to save the CLI configuration file to the local device, defined by the *url* variable, and then automatically copy that same file to the like device on the standby processing card, if available.

Important: This keyword will only work for local devices that are located on both the active and standby processing cards. For example, if you save the file to the /pcmcial device on the active processing card, that same type

■ save configuration

of device (card in Slot 1 of the standby processing card) must be available. Otherwise, a failure message is displayed. If saving the file to an external network (non-local) device, the system disregards this keyword.

Important: This keyword does not synchronize the local file system. If you have added, modified, or deleted other files or directories to or from a local device for the active processing card, then you must synchronize the local file system on both SMC cards.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Important: Caution should be exercised when using the **-noconfirm** option as this may cause the accidental over-write of data if the URL refers to an existing file.

showsecrets

This keyword causes the CLI configuration file to be saved with all passwords in plain text, rather than their default encrypted format.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

Usage

Backup the current configuration as part of periodic maintenance activities in case of emergencies.

Important: The saving of a configuration does not save the boot options as configured via the global configuration mode **boot** commands.

Example

The following saves the configuration data to the local file `/flash/pub/juneconfig.cfg` with no confirmation from the user:

```
save configuration /flash/pub/juneconfig.cfg -noconfirm
```

The following saves the configuration data to remote hoist `remoteABC` as `/pub/juneconfig.cfg`:

```
save configuration tftp://remoteABC/pub/juneconfig.cfg
```

save logs

Saves the current log file to a local or remote location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
save logs { url } [ active ] [ inactive ] [ callid call_id ] [ event-verbosity
evt_verbosity ] [ facility facility ] [ level severity_level ] [ pdu-data
pdu_format ] [ pdu-verbosity pdu_verbosity ] [ since from_date_time [ until
to_date_time ] ] [ | { grep grep_options | more } ]
```

url

Specifies the location to store the log file(s). *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.

filename is the actual file of interest.

username is the user to be authenticated.

password is the password to use for authentication.

host is the IP address or host name of the server.

Important: *hostname* can **only** be used if the **networkconfig** parameter is configured for DHCP and the DHCP server returns a valid nameserver.

port# is the logical port number that the communication protocol is to use.

active

Indicates output is to display data from active logs.

inactive

Indicates output is to display data from inactive logs.

callid *call_id*

Specifies a call ID for which log information is to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.

event-verbosity *evt_verbosity*

Specifies the level of verbosity to use in displaying of event data as one of:

- **min** - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- **concise** - displays detailed information about the event, but does not provide the event source within the system.
- **full** - displays detailed information about event, including source information, identifying where within the system the event was generated.

facility *facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **acl-log**: Access Control List logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **all**: All facilities
- **asf**: Voice Application Server Framework logging facility
- **asfprt**: ASF Protocol Task (SIP) logging facility
- **asngwmgr**: ASN Gateway Manager facility
- **asnpcmgr**: ASN Paging/Location-Registry Manager facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **cli**: CLI logging facility
- **credit-control**: Credit Control facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **cx-diameter**: Cx Diameter messages facility
- **dcardctrl**: IPSEC Daughtercard Controller logging facility (not used at this time)
- **dcardmgr**: IPSEC Daughtercard Manager logging facility (Not used at this time)
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: DHCP facility (GGSN product only)

- **dhost**: Distributed Host logging facility
- **diabase**: Diabase messages facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-ecs**: ACS Diameter signaling facility
- **diameter-hdd**: Diameter HDD Interface facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSEC Data Path facility
- **drvctrl**: Driver Controller facility
- **eap-sta-s6a-s13-s6b-diameter**: EAP/STA/S6A/S13/S6B Diameter messages facility
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages facility
- **gss-gcdr**: GTP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr**: GTP-C protocol Manager logging facility (GGSN product only)
- **gtp**: GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu**: GTP-U protocol logging facility (GGSN product only)
- **gx-ty-diameter**: Gx/Ty Diameter messages facility
- **gy-diameter**: Gy Diameter messages facility
- **h248prt**: H.248 Protocol logging facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **ims-authorizatn**: IMS Authorization Service facility
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipsec**: IP Security logging facility
- **ipsg**: IP Service Gateway interface logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility
- **l2tp-control**: L2TP control logging facility
- **l2tp-data**: L2TP data logging facility

- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **li**: Refer to the *ASR 5000 Lawful Intercept Guide* for the description of this command.
- **megadiammgr**: Megadiameter Manager (SLF Service) logging facility
- **mme-app**: MME application facility
- **mme-hss**: MME HSS Service facility
- **mme-misc**: MME miscellaneous logging facility
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager logging facility
- **mmgr**: SGSN/SS7 Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **multicast-proxy**: Multicast Proxy logging facility
- **netwstrg**: Network Storage facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **nsctrl**: Charging Service Controller facility (supported in conjunction with ECSv1)
- **nsmgr**: Charging Service Manager facility
- **nsproc**: Charging Service process facility
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF logging facility
- **p2p**: Peer-to-Peer detection logging facility
- **ppp**: PPP link and packet facilities
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Rf Diameter messages facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **sct**: Shared Configuration Task logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility

- **sft**: Switch Fabric Task logging facility
- **sh-diameter**: Sh Diameter messages facility
- **sipcdprt**: Sip Call Distributor facility
- **sitmain**: System Initialization Task main logging facility
- **snmp**: SNMP logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **ssh-ipsec**: SSH IP Security logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **threshold**: Threshold logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

level *severity_level*

Specifies the level of information to be logged, *severity_level*, from the following list which is ordered from highest to lowest:

- **critical** - display critical events
- **error** - display error events and all events with a higher severity level
- **warning** - display warning events and all events with a higher severity level
- **unusual** - display unusual events and all events with a higher severity level
- **info** - display info events and all events with a higher severity level
- **trace** - display trace events and all events with a higher severity level
- **debug** - display all events

pdu-data *pdu_format*

Specifies output format for the display of packet data units as one of:

- **none** - output is in raw format (unformatted).
- **hex** - output being displayed in hexadecimal format.
- **hex-ascii** - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

pdu-verbosity *pdu_verbosity*

Specifies the level of verbosity to use in displaying of packet data units as a value from 1 to 5 where 5 is the most detailed.

```
since from_date_time [ until to_date_time ]
```

Default: no limit.

since from_date_time: indicates only the log information which has been collected more recently than *from_date_time* is to be displayed.

until to_date_time: indicates no log information more recent than *to_date_time* is to be displayed. *until* defaults to current time when omitted.

from_date_time and *to_date_time* must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2 digit second in the range 00 through 59.

to_date_time must be a time which is more recent than *from_date_time*.

The use of the *until* keyword allows for a time range of log information while only using the *since* keyword will display all information up to the current time.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in *Command Line Interface Reference*.

Usage

Backup the current log file as part of periodic maintenance activities.

Example

The following saves the log to the local file `/flash/pub/junelogs.logs` with no confirmation from the user:

```
save logs /flash/pub/junelogs.logs -noconfirm
```

The following saves the configuration data to remote host `remoteABC` as `/pub/junelogs.logs`:

```
save logs tftp://remoteABC/pub/junelogs.logs
```

session trace

This command enable/disables the subscriber session trace functionality based on a specified subscriber device or ID on one or all instance of session on a specified UMTS/EPS network elements. It also clears/resets the statistics collected for subscriber session trace on a system.

Product

GGSN, MME, P-GW, S-GW

Privilege

Operator

Syntax

```
session trace { reset statistics | subscriber network-element { mme | pgw | sgw
| ggsn } {imei id } { imsi id } { interface { all | interface } } trace-ref id
collection-entity ip_address}
```

```
no session trace subscriber network-element [ mme | pgw | sgw | ggsn ] [ trace-
ref id ]
```

no

Disables the entire session trace or for a specific network element and/or trace reference.

reset statistics

Clears/resets the entire session trace statistical data collected on a system.

Caution: It is a system wide command and need to be careful while executing.

```
session trace subscriber network-element { mme | pgw | sgw | ggsn }
```

Identifies the network element that, in turn, identifies the interfaces where the session trace is to occur. Specific interfaces can be specified using the interface keyword described below.

ggsn: Specifies that the session trace is to occur on one or all interfaces on the GGSN.

mme: Specifies that the session trace is to occur on one or all interfaces on the MME.

pgw: Specifies that the session trace is to occur on one or all interfaces on the P-GW.

sgw: Specifies that the session trace is to occur on one or all interfaces on the S-GW.

```
imei id
```

Specifies the International Mobile Equipment Identification number of the subscribers UE. *id* must be the 8 digit TAC (Type Allocation Code) and 6 digit serial number. Only the first 14 digits of the IMEI/IMEISV are used to find the equipment ID.

```
imsi id
```

Specifies the International Mobile Subscriber Identification (IMSI). *id* must be the 3 digit MCC (Mobile Country Code), 2 or 3 digit MNC (Mobile Network Code), and the MSIN (Mobile Subscriber Identification Number). The total should not exceed 15 digits.

interface { **all** | *interface* }

Specifies the interfaces where the session trace application will collect data.

all: Specifies that all interfaces associated with the selected network element

interface: Specifies the interface type where the session trace application will collect trace data. The following interfaces are applicable for the network element type:

- GGSN:
 - gi**: Specifies that the interface where the trace will be performed is the Gi interface between the GGSN and RADIUS server.
 - gmb**: Specifies that the interface where the trace will be performed is the Gmb interface between the GGSN and BM-SC.
 - gn**: Specifies that the interface where the trace will be performed is the Gn interface between the GGSN and the SGSN.
 - gx**: Specifies that the interface where the trace will be performed is the Gx interface between the GGSN and PCRF.
- MME:
 - s1mme**: Specifies that the interface where the trace will be performed is the S1-MME interface between the MME and the eNodeB.
 - s3**: Specifies that the interface where the trace will be performed is the S3 interface between the MME and an SGSN.
 - s6a**: Specifies that the interface where the trace will be performed is the S6a interface between the MME and the HSS.
 - s10**: Specifies that the interface where the trace will be performed is the S10 interface between the MME and another MME.
 - s11**: Specifies that the interface where the trace will be performed is the S11 interface between the MME and the S-GW.
- P-GW:
 - gx**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.
 - s2a**: Specifies that the interface where the trace will be performed is the S2a interface between the P-GW and the HSGW.
 - s2b**: Specifies that the interface where the trace will be performed is the S2b interface between the P-GW and an ePDG.
 - s2c**: Specifies that the interface where the trace will be performed is the S2c interface between the P-GW and a trusted, non-3GPP access device.
 - s5**: Specifies that the interface where the trace will be performed is the S5 interface between the P-GW and the S-GW.
 - s6b**: Specifies that the interface where the trace will be performed is the S6b interface between the P-GW and the 3GPP AAA server.
 - s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the P-GW and the S-GW.
 - sgi**: Specifies that the interface where the trace will be performed is the SGi interface between the P-GW and the PDN.
- S-GW:

- **gxc**: Specifies that the interface where the trace will be performed is the Gxc interface between the S-GW and the PCRF.
- **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the S-GW and the MME.
- **s4**: Specifies that the interface where the trace will be performed is the S4 interface between the S-GW and an SGSN.
- **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the S-GW and the P-GW.
- **s8b**: Specifies that the interface where the trace will be performed is the S8b interface between the S-GW and the P-GW.

trace-ref *id*

Specifies the trace reference for the trace being initiated. *id* must be the MCC (3 digits), followed by the MNC (3 digits), then the trace ID number (3 byte octet string).

collection-entity *ip_address*

Specifies the IP address of the collection entity where session trace data is pushed. *ip_address* must be a valid IPv4 address and is specified in dotted decimal notation.

Usage

Use this command to initiate a session trace for a specified subscriber device or ID on one or all interfaces on a specified network element.

Important: Session trace configuration is performed in the *Global Configuration Mode* using the **session trace** command. Refer to the *Global Configuration Mode Commands* chapter for more information.

Example

The following command initiates a session trace on a P-GW S5 interface for a subscriber with an IMSI of 322233123456789 and sets the trace reference as 322233987654 and the collection entity IP address as 1.2.3.4:

```
session trace subscriber network-element pgw imsi 322233123456789
interface s5 trace-ref 322233987654 collection-entity 1.2.3.4
```

The following command initiates a session trace on an MME S6a interface for a subscriber with an IMSI of 322233123456789 and sets the trace reference as 322233987654 and the collection entity IP address as 1.2.3.4:

```
session trace subscriber network-element mme imsi 322233123456789
interface s6a trace-ref 322233987654 collection-entity 1.2.3.4
```

The following command initiates a session trace on a Gn interface on GGSN between GGSN and SGSN for a subscriber with an IMSI of 322233123456789 and sets the trace reference as 322233987654 and the collection entity IP address as 1.2.3.4:

```
session trace subscriber network-element ggsn imsi 322233123456789
interface gn trace-ref 322233987654 collection-entity 1.2.3.4
```

■ session trace

setup

Enters the system setup wizard which guides the user through a series of questions regarding the system basic configuration options such as initial context-level administrative users, host name, etc.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
setup
```

Usage

The setup wizard provides a user friendly interface for initial system configuration.

Important: If the configuration script generated by the setup wizard is applied when an existing configuration is in use the options which are common to both are updated and all remaining options are left unchanged.

Example

```
setup
```

sgsn clear-detached-subscriptions

Clear subscription data belonging to a subscriber who has already detached.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn clear-detached-subscriptions imsi imsi
```

imsi *imsi*

Specifies the international mobile subscriber identity (IMSI) of the subscriber session identifying the subscription data to be cleared.

imsi : Enter 1 to 15 digits.

Usage

This command can be issued on either a 2G or 3G SGSN to clear subscription data (including subscription information, and information for P-TMSI allocated, received authorization vectors, and NGAF flag values).

This command is only effective if the subscriber has already detached.

After the data is purged, the SGSN sends an appropriate message to the HLR.

Related Commands:

- To clear subscription data for subscribers that are currently attached, refer to the **admin-disconnect-behavior clear-subscription** commands described in the chapters for *GPRS Service Configuration Mode* or the *SGSN Service Configuration Mode*.

Example

```
sgsn clear-detached-subscriptions imsi 040501414199978
```

sgsn imsimgr

Enter commands to initiate an audit to enable managing the SGSN's IMSI manager's (IMSIMgr) IMSI table .

 **Important:** These commands are used primarily for troubleshooting purposes and are intended for the use of specially trained service representatives.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn imsimgr { add-record imsi sessmgr instance sessmgr# | audit-with sessmgr {
all | instance sessmgr# } | remove-record imsi }
```

add-record *imsi*

Adds a record for an IMSI to the IMSI manager's table and associates a specific session manager (SessMgr) with the IMSI.

imsi : Enter up to 15 digits. An IMSI consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

sessmgr instance *sessmgr#*

Identifies a specific Session Manager (SessMgr) associated with the IMSI.

sessmgr# : Enter up to 4 digits, 0 to 4095.

audit-with sessmgr { **all** | **instance** *sessmgr#* }

Initiate an IMSI audit with a specific Session Manager (SessMgr) or with all SessMgrs.

sessmgr# : Enter up to 4 digits, 0 to 4095.

remove-record *imsi*

Delete a specific IMSI from the IMSI table.

imsi : Enter up to 15 digits. An IMSI consists of the 3-digit MCC (mobile country code) + the 2- or 3-digit MNC (mobile network code) + the MSIN (mobile station identification number) for the remaining 10 or 9 digits (depending on the length of the MNC).

Usage

Use this command to manage the IMSIMgr's IMSI table, and to initiate an audit of one or more SessMgrs with the IMSIMgr so that the IMSI table has the correct IMSI-SessMgr association. After this audit, any IMSI in the IMSIMGR which is not found in any Sessmgr is deleted and similarly any missing entries at the IMSIMgr are created.

■ `sgsn imsimgr`

Example

Delete IMSI 044133255524211 from the audit table:

```
sgsn imsimgr remove-record 044133255524211
```

sgsn offload

This command instructs the SGSN to begin the offloading procedure and actually starts and stops the offloading of subscribers which is part of the SGSN's Gb (2G) or Iu (3G) Flex load redistribution functionality.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn offload [ gprs-service svrc_name | sgsn-service svrc_name ] svrc_name {
activating | connecting } [ nri-value | stop | t3312-timeout seconds ]
```

gprs-service *svrc_name*

A unique string of 1 to 63 alphanumeric characters that identifies a specific GPRS service that has already been defined for the 2G SGSN configuration.

sgsn-service *svrc_name*

A unique string of 1 to 63 alphanumeric characters that identifies a specific SGSN service that has already been defined for the 3G SGSN configuration.

activating

Instructs the SGSN to off load any subscribers sending an 'activate request' message.

connecting

Instructs the SGSN to off load any subscribers sending either an 'attach request' or a 'RAU request' message.

nri-value *nri-value*

Instructs the SGSN to check the P-TMSI and use the SGSN matching the configured NRI value to off load subscribers.

nri-value: Must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.

stop

Instructs the SGSN to stop offloading subscribers from the pool area.

t3312-timeout *seconds*

Configures the timer for sending period RAUs to the MS. Default is 4 seconds.

seconds: Must be an integer from 2 to 60.

Usage

Use this command to configured the offloading of subscribers which is a part of the SGSN's load redistribution operation. This command can be used anytime an SGSN is to be taken out of service.

■ **sgsn offload**

Example

The following command instructs the SGSN to notify all MS to detach and reattach.

```
sgsn offload gprs-service srvc_name activating nri-value nri_value
```

sgsn op

These commands instruct the SGSN to begin specific operations or functions.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn op { convert | nse { fr | ip | sgsn-invoke-trace } | show | ss7-rd ss7-
rd_id { destination | link | linkset | peer } }
```

```
convert point-code pt_code variant variant
```

This command accesses a built-in conversion tool to convert SS7 point codes, according to identified variants, from dotted-decimal format to decimal format and *visa versa*.

point-code *pt_code*: Enter an SS7 point code in either dotted-decimal format or decimal format.

variant *variant*: Identify the appropriate variant for the point code:

- ansi
- itu
- ttc

```
nse { fr operation | ip operation | sgsn-invoke-trace nse-id nse_id }
```

The **nse** command enables the operator to perform a range of live control functions (e.g, reset, block, unblock) for various types of virtual connections based on the signalling type of the NSE:

fr : Identifies a Frame Relay NSE.

ip : Identifies an IP NSE.

operation: Identifies the operation to be performed for the NSE connection (if available for the selected signalling type):

- block** **nse-id** *nse_id* - Blocks signal flow through all network service virtual connections (NSVC) for the specified NSE:
 - nse_id* : Enter an integer from 0 to 65535.
- bvc-flc-limit rate** *rate* **bvc-id** *bvc_id* **nse-id** *nse_id* - SGSN initiates flow control at the defined percentage rate to limit the flow through the BSSGP virtual connection (BVC) for the specified NSE and optionally for a specified BVC.
 - rate* : Enter an integer from 0 to 100.
 - bvc_id* : Enter an integer from 0 to 65000.
 - nse_id* : Enter an integer from 0 to 65535.
- bvc-reset** **bvc-id** *bvc_id* **nse-id** *nse_id* - SGSN initiates a BVC-Reset on the specified BVC and NSE:
 - bvc_id* : Enter an integer from 0 to 65000.
 - nse_id* : Enter an integer from 0 to 65535.
- nsvc** *nsvc_id* { **block** | **enable** | **disable** | **unblock** } *nse_id* - SGSN initiates NS-Block or NS-Unblock for the specified NSVC of the specified NSE:

- *nsvc_id* : Enter an integer from 0 to 65535.
- *nse_id* : Enter an integer from 0 to 65535.
- **reset nse-id** *nse_id* - SGSN initiates NS-Reset for all NSVC configured in the NSE.
- *nse_id* : Enter an integer from 0 to 65535.
- **unblock nse-id** *nse_id* - SGSN initiates NS-Unblock for all NSVC configured for the specified NSE.
- *nse_id* : Enter an integer from 0 to 65535.

sgsn-invoke-trace *nse_id nse_id record-type record_type trace-reference reference* [**mobile-id type id_type** | **trace-transaction-id trace_id**]:

Important: This command can be used for troubleshooting/debugging purposes and is primarily intended for the use of specially trained service representatives.

Instructs the SGSN (1) to send the BSSGP message SGSN-VOKE-TRACE to the BSC to initiate a BSC trace of a particular MS and (2) to define the type and triggering of the trace.

- *nse_id* : Identify the peer NSE, enter an integer from 0 to 65535.
- *record_type* : Select the type of trace to be performed:
 - **basic**
 - **handover**
 - **no-bss-trace**
 - **radio**
- **trace-reference** *reference* : Enter the trace reference ID - an integer from 0 to 65535.
- **mobile-id type id_type** : Select the appropriate mobile ID type for the MS that is to be traced:
 - **imei value value** - Specifies the mobile ID type as the unique International Mobile Equipment Identity.
 - value* : Enter the 15-digit IMEI value.
 - **imeisv value value** - Specifies the mobile ID type as the unique International Mobile Equipment Identity - with the two-digit software version number.
 - value* : Enter the 16-digit IMEISV value.
 - **imsi value value** - Specifies the mobile ID type as a network unique International Mobile Subscriber Identity.
 - value* : Enter the 15-digit IMSI value.
- **trace-transaction-id trace_id** : Enter the trace transaction ID - an integer from 0 to 65535.

show plmn-list smgr-inst *sessmgr#*

SGSN displays the configured PLMN list for the specified session manager (SessMgr):
sessmgr# : Enter up to 4 digits, 0 to 4095.

ss7-rd *ss7-rd_id* { **destination** | **link** | **linkset** | **peer** }

The **ss7-rd** commands assist with troubleshooting connections between the SGSN and the peer server.

ss7-rd_id : Enter a value between 1 and 12 that identifying the configured SS7 routing domain.

- **destination audit asp-instance** *asp_id* **peer-server-id** *peer_id* **psp-instance-id** *psp_id*

Initiate destination audit (DAUD) messages for all point codes reachable via the identified peer-server, which is in restricted/unavailable/congested state due to DRST/DUNA/SCON messages respectively from the far end.

- *asp_id* : Enter the relevant ASP configuration ID, an integer between 1 and 4.
- *peer_id* : Enter the relevant peer server configuration ID, an integer between 1 and 144.
- *psp_id* : Enter the relevant PSP configuration ID, an integer between 1 and 4

- **link procedure linkset-id** *linkset_id* **link-id** *link_id*

Initiates MTP3 network link management procedures for the specified link:

- **activate** -- activates the deactivated link.
- **deactivate** -- deactivates specified link.
- **deactivate-l2-only** -- deactivates the link only at the MTP3 layer.
- **inhibit** -- inhibits the link only if it does *not* make any desination unreachable.
- **uninhibit** -- uninhibits the inhibited link.
- *linkset_id* : Enter an integer between 1 and 144.
- *link_id* : Enter an integer between 1 and 16.

- **linkset-id procedure linkset-id** *linkset_id*

Initiates MTP3 network link management procedures for all the links in the specified linkset:

- **activate** -- activates the deactivated linkset.
- **deactivate** -- deactivates the linkset.
- **deactivate-l2-only** -- deactivates the linkset only at MTP3 layer.
- *linkset_id* : Enter an integer between 1 and 144.

- **peer message asp-instance** *asp_id* **peer-server-id** *peer_id* **psp-instance-id** *psp_id* :

Initiates one of the following SCTP/M3UA management messages from the identified link:

- **abort** - Sends an SCTP Abort message which aborts the SCTP association ungracefully.
- **activate** - Sends an M3UA ASP Active message to activate the link.
- **down** - Sends an M3UA ASP Down message to bring down the M3UA link.
- **establish** - Sends an SCTP INIT message to start the SCTP association establishment.
- **inactivate** - Sends an M3UA ASP Inactive message to deactivate the link.
- **inhibit** - Inhibits the M3UA link locally when the operator wants to lockout the link.
- **terminate** - Sends SCTP Shutdown message which closes the SCTP association gracefully.
- **un-inhibit** - Uninhibits the M3UA link.
- **up** - Sends an M3UA ASP UP message to bring up the M3UA link.
- *asp_id* : Enter the relevant ASP configuration ID, an integer between 1 and 4.
- *peer_id* : Enter the relevant peer server configuration ID, an integer between 1 and 144.
- *psp_id* : Enter the relevant PSP configuration ID, an integer between 1 and 4

Usage

In most cases, an operator will block/unblock/reset from the BSC-side. The **nse** commands cause the SGSN to initiate actions, usually for one of the following reasons:

- to resolve issues on the BSC-side,
- as part of an upgrade to the BSC,
- as part of link expansion,
- to resolve NSVC/BVC status mismatches observed between the SGSN and BSC.

The **sgsn-invoke-trace** command initiates the trace procedure where the BSC begins a trace record on a specified MS.

Example

Instruct the SGSN to initiate an NS-Block for all NSVC associated with Frame Relay NSE ID 2422:

```
sgsn op nse fr unblock nse-id 2422
```

Activate linkset 1 configured in SS7 routing domain 1:

```
sgsn op ss7-rd 1 linkset activate linkset-id 1
```

sgtpc test echo sgsn-address

Initiates SGTPC echo test procedure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgtpc test echo sgsn-address sgsn_ip_address { all | ggsn-address ggsn_ip_address }
```

sgsn-address *sgsn_ip_address*

Identify the IP address of the SGSN issuing the test.

sgsn_ip_address : Enter a standard IPv4 dotted decimal format.

all

Instruct the SGSN to send the GTPC echo request to all GGSNs having current sessions with the SGTP service.

ggsn-address *ggsn_ip_address*

Instructs the SGSN to send the GTPC echo request to the specified GGSN whether or not the GGSN has active sessions with the SGTP service.

ggsn_ip_address : Enter a standard IPv4 dotted decimal format.

Usage

This command initiates a test for the GTPC echo procedure -- echo from the specified SGSN to a specified GGSN or to all GGSNs that have sessions with the SGTP service. Issue the command from the Exec Mode within the context in which the SGTP service is configured.

Note that if the GGSN does not respond to the initial echo request, the echo requests will be retried for the max-retransmissions times.

Example

This SGSN with IP address of 1.1.1.1 sends an echo test to all GGSNs attached to the SGTP service:

```
sgtpc test echo sgsn-address 1.1.1.1 all
```

shutdown

Terminates all processes within the chassis.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
shutdown [ -noconfirm ]
```

-noconfirm

Execute the command without any additional prompts or confirmation from the user.

Usage

The system performs a hardware reset and reloads the highest priority boot image and configuration file specified in the boot.sys file. Refer to the **boot system priority** command in the Global Configuration Mode for additional information on configuring boot images, configuration files and priorities.

Important: To avoid the abrupt termination of subscriber sessions, it is recommended that a new call policy be configured and executed prior to invoking the **shutdown** command. This sets busy-out conditions for the system and allows active sessions to terminate gracefully. Refer to the **newcall** command in the Exec Mode for additional information.

Caution: Issuing this command causes the system to become unavailable for session processing until the reboot process is complete.

Example

The following command performs a hardware reset on the system:

```
shutdown
```

sleep

Pauses the CLI interface.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
sleep seconds
```

seconds

Specifies the number of seconds to pause. The number of seconds must be a value in the range from 1 through 3600.

Usage

Sleep is a command delay which is only useful when creating command line interface scripts such as predefined configuration files/scripts.

Example

The following will cause the CLI to pause for 30 seconds.

```
sleep 30
```

srp initiate-switchover

This command changes the device status on the primary and backup HA or GGSN systems configured for Interchassis Session Recovery support.

Product

HA, GGSN PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
srp initiate-switchover [ post-processing-timeout | reset-route-modifier |  
timeout seconds ] [ -noconfirm ]
```

post-processing-timeout

Specifies the timeout value in seconds to initiate the post-switchover process. The value must be an integer from 0 through 3600.

reset-route-modifier

During a switchover, reset the route-modifier to the initial value.

timeout *seconds*

Default: 300

Specifies the number of seconds before a forced switchover occurs. *seconds* must be a value in the range from 0 through 65535.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

This command executes a forced switchover from active to inactive. The command must be executed on the active system and switches the active system to the inactive state and the inactive system to an active state.

Example

The following initiates a switchover in 30 seconds.

```
srp initiate-switchover timeout 30
```

srp reset-auth-probe-fail

This command resets the auth probe monitor failure information.

Product

HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
srp reset-auth-probe-fail
```

Usage

This command resets the auth probe monitor failure information to 0.

srp terminate-post-process

This command forcibly terminates the post-switchover of primary and backup HA or GGSN systems configured for Interchassis Session Recovery (ICSR) support.

Product

HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
srp terminate-post-process [ -noconfirm ]
```

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to force the termination of post-switchover process.

Example

```
srp terminate-post-process
```

srp validate-configuration

Initiates a configuration validation check from the ACTIVE chassis.

Product

HA, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
srp validate-configuration
```

Usage

Validates the configuration for an active chassis.

ssh

Connects to a remote host using a secure interface.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
ssh { host_name | host_ip_address } [ port port_num ] [ user user_name ]
```

host_name | *host_ip_address*

Identifies the remote node to attempt to connect to.

host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.

host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

port *port_num*

Specifies a specific port to connect to where *port_num* must be a value in the range 1025 through 10000.

user *user_name*

Specifies a user name to attempt to connect as.

Usage

SSH connects to a remote network element using a secure interface.

Example

The following connects to remote host *remoteABC* as user *user1*.

```
ssh remoteABC user user1
```

The following connects to remote host *1.2.3.4* without any default user.

```
ssh 1.2.3.4
```

The following connects to remote host *1.2.3.4* via port *2047* without any default user.

```
ssh 1.2.3.4 port 2047
```

start crypto security-association

Initiates IKE negotiations.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
start crypto security-association cryptomap
```

cryptomap

This is the name of the crypto map policy to use when starting the IKE negotiations. *cryptomap* must be the name of an existing crypto map entered as an alpha and/or numeric string of from 1 to 127 characters.

Usage

Use this command to start IKE negotiations for IPSEC.

Example

The following command starts the IKE negotiations using the parameters set in the crypto map named *cryptomap1*:

```
start crypto security-association cryptomap1
```

system

These commands configure information about the system, accessible by the SNMP agent.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

```
system { carrier-id mcc mcc_num mnc mnc_num | contact name | description
description | hostname name | location location }
```

```
default system { contact | description | hostname | location }
```

```
no system carrier-id
```

```
carrier-id mcc mcc_num mnc mnc_num
```

Specifies the system's Carrier ID via the three-digit MCC (mobile country code) and three-digit MNC (mobile network code).

```
contact name
```

Specifies the system's contact name. *name* must be an alpha and/or numeric string from 0 to 255 characters in length.

```
description description
```

System description that will accept both text and some parameters, to include:

- %version%** - software version
- %build%** - software build number
- %chassis%** - chassis type ("asr5000")
- %staros%** - ID of the kernel revision
- %ostype%** - os type
- %hostname%** - system name
- %release%** - release
- %kerver%** - kernel version
- %machine%** - machine hardware name

description must be an alpha and/or numeric string from 1 to 255 characters in length.

Default: "%ostype% %hostname% %release% %kerver% %machine%"

After replacing the parameters with values, the string will be truncated if length is greater than 255.

```
hostname name
```

Specifies the system's host name (name of system). *name* must be an alpha and/or numeric string from 1 to 63 characters in length.

location *location*

Specifies the system's geographic or referenced location. *location* must be an alpha and/or numeric string from 0 to 255 characters in length.

default system { **contact** | **description** | **hostname** | **location** }

Sets/restores the default value assigned for specified parameter.

no system carrier-id

Removes the Carrier ID identified for the system.

Usage

Use this command to configure information about the system that is accessible by the SNMP agent.

Example

The following command identifies the system's location as *boston*:

```
system location boston
```

Chapter 104

Exec Mode (T-Z)

This section includes the commands **telnet** through **upgrade url-blacklisting database**.

telnet

Connects to a remote host using the terminal-remote host protocol.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
telnet { host_name | host_ip_address } [ port port_num ]
```

host_name | *host_ip_address*

Identifies the remote node to attempt to connect to.

host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.

host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

port *port_num*

Specifies a specific port to connect to where *port_num* must be a value in the range 1025 through 10000.

Usage

Telnet to a remote node for maintenance activities and/or troubleshooting when unable to do so directly.

Important: `telnet` is not a secure method of connecting between two hosts. `ssh` should be used whenever possible for security reasons.

Example

The following connects to remote host *remoteABC*.

```
telnet remoteABC
```

The following connects to remote host *1.2.3.4* port *2047*.

```
telnet 1.2.3.4 port 2047
```

terminal

Sets the number of rows or columns for output.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
terminal { length lines | width characters }
```

length *lines* | **width** *characters*

length *lines*: sets the terminal length in number of *lines* (rows) of text from 5 to 4294967295 lines or the special value of 0 (zero). The value 0 sets the terminal length to infinity.

width *characters*: sets the terminal width in number of *characters* from 5 to 512 characters.

Usage

Set the length to 0 (infinite) when collecting the output of a command line interface session which is part of a scripted interface.

Example

The following sets the length then width in two commands.

```
terminal length 66
```

```
terminal width 160
```

The following command sets the number of rows of the terminal to infinity.

```
terminal length 0
```

test alarm

Tests the alarm capabilities of the chassis.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
test alarm { audible | central-office { critical | major | minor } }
```

```
audible | central-office { critical | major | minor }
```

audible: indicates that the internal alarm on the system management card is to be tested for 10 seconds. The alarm status is returned to its prior state, i.e., if the audible alarm was enabled prior to the test, the alarm will again be enabled following the test.

central-office { critical | major | minor }: indicates the central office alarms are to be tested for the specified CO alarm.

Usage

Test the alarm capabilities of the chassis as periodic maintenance to verify the hardware for generation of the internal audible alarms is functional.

Example

```
test alarm audible

test alarm central-office critical

test alarm central-office major

test alarm central-office minor
```

timestamps

Enables/disables the generation of a timestamp in response to each command entered. The timestamp does not appear in any logs as it is a CLI output only. This command affects the current CLI session only. Use the **timestamps** command in the Global Configuration Mode to change the behavior for all future CLI sessions.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
[ no ] timestamps
```

no

Disables generation of timestamp output for each command entered. When omitted, the output of a timestamp for each entered command is enabled.

Usage

Enable timestamps when logging a CLI session on a remote terminal such that each command will have a line of text indicating the time when the command was entered.

traceroute

Collects information on the route data will take to a specified host.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Important: Inspector privileges are granted for all variables except **count** and **port**. To initiate a traceroute count or to target a specific port for a traceroute, you must have a minimum privilege level of Operator.

Syntax

```
traceroute { host_name | host_ip_address } [ count packets ] [ df ] [ maxttl
max_ttl ] [ minttl min_ttl ] [ port port_num ] [ size octet_count ] [ src {
src_host_name | src_host_ip_address } ] [ timeout seconds ] [ | { grep
grep_options | more } ]
```

host_name | host_ip_address

Identifies the remote node to trace the route to.

host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.

host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

count *packets*

Default: 3

Specifies the number of UDP probe packets to send.

df

Indicates the packets for the tracing of the route should not be fragmented. If a packet would require fragmenting then it is dropped and the result is the ICMP response "Unreachable, Needs Fragmentation" is received.

maxttl *max_ttl*

Default: 30

Specifies the maximum time to live, in seconds, for the route tracing packets. *max_ttl* must be specified as a value in the range of 1 through 255. It is an error if *max_ttl* is less than *min_ttl* whether *min_ttl* is specified or defaulted.

The time to live (TTL) is the number of hops through the network, i.e., it is not a measure of time.

minttl *min_ttl*

Default: 1

Specifies the minimum time to live, in seconds, for the route tracing packets. *min_ttl* must be specified as a value in the range of 1 through 255. It is an error if *min_ttl* is greater than *max_ttl* whether *max_ttl* is specified or defaulted.

The time to live (TTL) is the number of hops through the network, i.e., it is not a measure of time.

port *port_num*

Default: 33434

Specifies a specific port to connect to where *port_num* must be a value in the range 1 through 65535.

size *octet_count*

Default: 40

Specifies the number of bytes each packet. *octet_count* must be a value in the range 40 through 32768.

src { *src_host_name* | *src_host_ip_address* }

Default: originating system's IP address

Specifies an IP address to use in the packets as the source node.

src_host_name: specifies the remote node using the node's logical host name which must be resolved via DNS lookup.

src_host_ip_address: specifies the remote node using the node's assigned IP address specified using the standard IPv4 dotted decimal notation.

timeout *seconds*

Default: 5

Specifies the maximum time to wait for a response from each route tracing packet. *seconds* must be a value in the range 2 through 100.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 5000 Series-series Command Line Interface Reference.

Usage

Trace an IP route when troubleshooting network problems where certain nodes are having significant packet delays or packet loss. This can also be used to identify bottlenecks in the routing of data within the network.

Example

The following traces the route to remote host *remoteABC* and sends the output to the *more* command.

```
traceroute remoteABC | more
```

The following command traces the route to remote host *1.2.3.4*'s port *2047* waiting a maximum of 2 seconds for responses.

```
traceroute 1.2.3.4 port 2047 timeout 2
```

■ traceroute

update active-charging

This command updates specified active charging option(s) for the matching sessions.

Product

ACS, FW, NAT, TPO

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
update active-charging { switch-to-fw-and-nat-policy fw_nat_policy_name |
switch-to-rulebase rulebase_name | switch-to-tpo-policy tpo_policy_name } { all
| callid call_id | fw-and-nat-policy fw_nat_policy_name | imsi imsi | ip-address
ip_address | msid msid | rulebase rulebase_name | tpo-policy tpo_policy_name |
username user_name } [ -noconfirm ] [ [ | { grep grep_options | more } ]
```

switch-to-fw-and-nat-policy *fw_nat_policy_name*

Specifies the Firewall-and-NAT policy to switch to.

fw_nat_policy_name must be the name of a Firewall-and-NAT policy, and must be a string of 1 through 63 characters in length.

switch-to-rulebase *rulebase_name*

Specifies the rulebase to switch to.

rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

switch-to-tpo-policy *tpo_policy_name*

Specifies the TPO policy to switch to.

tpo_policy_name must be the name of a TPO policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

all

Updates rulebase/policy for all subscribers.

callid *call_id*

Updates rulebase/policy for Call Identification number specified here.

call_id must be an eight-digit HEX number.

fw-and-nat-policy *fw_nat_policy_name*

Updates rulebase/policy for sessions matching the Firewall-and-NAT policy specified here.

fw_nat_policy_name must be an alpha and/or numeric string of 1 through 63 characters in length.

imsi *imsi*

Updates rulebase/policy for International Mobile Subscriber Identification (IMSI) specified here.

imsi must be 3 digits of MCC (Mobile Country Code), 2 or 3 digits of MNC (Mobile Network Code), and the rest with MSIN (Mobile Subscriber Identification Number). The total should not exceed 15 digits. For example, 123-45-678910234 can be entered as 12345678910234.

ip-address *ip_address*

Updates rulebase/policy for IP address specified here.
ip_address must be an IPv4 or IPv6 address.

msid *msid*

Updates rulebase/policy for MSID specified here.
msid must be a string of 1 through 24 characters in length.

rulebase *rulebase_name*

Updates rulebase/policy for sessions matching the rulebase specified here.
rulebase_name must be an alpha and/or numeric string of 1 through 63 characters in length.

tpo-policy *tpo_policy_name*

Updates rulebase/policy for sessions matching the TPO policy specified here.
tpo_policy_name must be an alpha and/or numeric string of 1 through 63 characters in length.

username *user_name*

Updates rulebase/policy for user specified here.
user_name must be a sequence of characters and/or wildcard characters ('\$' and '*')> - string of 1 through 127 characters in length.

-noconfirm

Specifies that the command is to execute without any additional prompt and confirmation from the user.

| { **grep** *grep_options* | **more** }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to change specified active charging option(s) for the matching sessions.

Example

The following command changes the rulebase for sessions using the rulebase named *standard* to use the rulebase named *super*:

```
update active-charging switch-to-rulebase super rulebase standard
```

update cscf

This command will cause a NOTIFY to be triggered from S-CSCF with contact event as “shortened” and indicating the expiry timer value for each contact as “reauthentication-time” provided from CLI. The subscriber is supposed to send a fresh REGISTER message within “reauthentication-time”, which will be challenged by S-CSCF in order to accomplish reauthentication. If reauthentication does not occur/fails, the subscriber will be cleared after “reauthentication-time”.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
update cscf subscriber { all | username user_name } cscf-service service_name
reauthentication-time seconds [ verbose ]
```

```
subscriber { all | username user_name }
```

Updates cscf subscriber data.

all: Updates data for all subscribers within a specified S-CSCF service.

username *user_name*: Name of specific user within current context. can be between 1 and 127 alpha and/or numeric characters and is case sensitive.

```
cscf-service service_name
```

Specific configured S-CSCF service. *service_name* can be between 1 and 63 alpha and/or numeric characters and is case sensitive.

```
reauthentication-time seconds
```

Specify the time within which subscriber is expected to reauthenticate. *seconds* must be an integer from 1 to 86400 seconds.

```
verbose
```

Show detailed information.

Usage

This command is only applicable for an S-CSCF service.

Important: reauthentication-time should be greater than the current expiry time of the contact so that S-CSCF will initiate the NOTIFY message.

Example

The following command sets the reauthentication time for all CSCF subscribers in the *scscf1* S-CSCF service to 500 seconds:

```
update cscf subscriber all cscf-service scscf1 reauthentication-time 500
```

■ update cscf

update firewall policy

This command is obsolete.

update ip

When you update an IP Access list, this command forces the new version of the access list to be applied to any subscriber sessions that are currently using that list.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
update ip access-list list_name subscribers [ command_keyword ] [ filter_keywords ] [ | { grep grep_options | more } ]
```

list_name

This is the name of the IP Access list that you want to apply to the subscriber.

[*command_keyword*] [*filter_keywords*]

These are the same command keywords and filter keywords available for the **show subscribers** command.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 5000 Series Command Line Interface Reference.

Usage

Use this command to force existing subscriber sessions that are already using a specific IP Access list to have that IP Access list reapplied. This is useful when you edit an IP Access list and want to make sure that even existing subscriber sessions have the new changes applied.

Example

To apply the IP Access list named ACLlist1 to all existing subscribers that are already using that IP Access list, enter the following command:

```
update ip access-list ACLlist1 subscribers all
```

update qos policy map

Updates QoS profile information based on specific subscriber policy maps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
update qos policy-map map_name use-granted-profile-id id1 [ id2 ] [ id3 ]
subscribers [ command_keyword ] [ filter_keywords ] [ -noconfirm ] [ verbose ] [
match-requested-profile-id ] [ | { grep grep_options | more } ]
```

map_name

Specifies the name of the policy map. *map_name* can be from 1 to 15 alpha and/or numeric characters in length.

use-granted-profile-id *id1* [*id2*] [*id3*]

Specifies the profile IDs to update. Up to 3 different profile IDs can be specified. Each profile ID is specified as a hexadecimal value from 0x0 and 0xFFFF.

subscribers [*command_keyword*] [*filter_keywords*]

These are the same command keywords and filter keywords available for the **show subscribers** command.

[**-noconfirm**]

Updates matching subscribers without prompting for confirmation.

[**verbose**]

Displays details for the profile updates.

[**match-requested-profile-id**]

Causes the system to send session-updates only with profile-ids matching the profile-ids in the requested list.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Use this command to update subscriber session profile IDs based on the specified criteria.

■ update qos policy map

Example

The following command updates profile IDs *0x3E* and *0x4C* for all subscriber sessions and sends session-updates with the IDs:

```
update qos policy-map test use-granted-profile-id 0x3E 0x4C subscribers  
all match-requested-profile-id
```

update qos tft

Updates the subscribers TFT associated with the flow ID and direction.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
update qos tft flow-id flow-id flow-dir { forward | reverse } use-granted-
profile-id id1[id2] [id3] subscribers [ command_keyword ] [ filter_keywords ]
[-noconfirm ] [ verbose ] [ match-requested-profile-id ] [ | { grep grep_options
| more }
```

flow-id *flow-id*

When *flow-id* is specified, the session update will be sent only when the flow ID matches the flow-id and flow-direction.

The *flow-id* must be specified as a value in the range of 1 through 255.

flow-dir {forward | reverse}

The direction of the tft flow.

subscribers [*command_keyword*] [*filter_keywords*]

These are the same command keywords and filter keywords available for the **show subscribers** command.

Usage

Supports QoS updates based on subscriber TFTs.

Example

```
update qos tft flow-id 0 flow-dir reverse use-granted-profile-id 0x0
subscribers all -noconfirm
```

upgrade

This command installs major software releases to the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
upgrade { online | patch } image_url config cfg_url [ -noconfirm ]
```

online

Perform a software upgrade from one release version to another. The online upgrade is only available for software release 3.5 and higher.

patch

Install an interim, or patch, software release.

Important: Software Patch Upgrades are not supported in this release.

image_url

Specifies the location of a image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted according to one of the following formats:

- ASR 5000:
 - [**file:**]{ /flash | pcmcial | hd }[/directory]/file_name
 - [**http:** | **tftp:**]//{ host[:port#] }[/directory]/file_name

directory is the directory name.

filename is the actual file of interest.

host is the IP address or host name of the server.

port# is the logical port number that the communication protocol is to use.

Important: A file intended for use on an ASR 5000 uses the convention xxxxx.ASR5000.bin, where xxxxx is the software build information.

Important: When using the TFTP, it is advisable to use a server that supports large blocks, per RFC 2348. This can be implemented by using the “block size option” to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

config *config_path*

Specifies the location of a configuration file to use for system startup. This must be formatted according to the following format:

- ASR 5000:

•[**file:**]{ /**flash** | /**pcmcia1** | /**hd** }[/*path*]/*filename*

Where *path* is the directory structure to the file of interest, and *filename* is the name of the configuration file. This file typically has a **.cfg** extension.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use the **upgrade online** command to perform a software upgrade when upgrading from one software release version to another, providing that both versions support this feature. For example, you can use this method to upgrade from release version 3.5 (any build number) to version 4.0 (any build number), but you cannot use this method to upgrade from release version 3.0 to version 3.5 since version 3.0 does not support the feature.

Important: Software Patch Upgrades are not supported in this release.

Important: This command is not supported on all platforms.

Example

The following command performs a major software release upgrade from an older version to a newer version. In this example the new software image file is in a subdirectory on a tftp server, and the configuration file is in a subdirectory on the local flash.tftp://host[/path]/filename

```
upgrade online tftp://imageserver/images/image.bin config  
/flash/configurations/localconfig.cfg
```

upgrade content-filtering

This command upgrades the Static Rating Database (SRDB) for Category-based Content Filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
upgrade content-filtering category { database | rater-pkg }
```

```
upgrade content-filtering category database
```

This command triggers upgrade of the Category-based Content Filtering Static Rating Database (SRDB).

```
upgrade content-filtering category rater-pkg
```

This command triggers manual upgrade of the Dynamic Content-Filtering Rater Package (*rater.pkg* file). The *rater.pkg* file contains the models and feature counters that are used to return the dynamic content rating. The upgrade will trigger distribution of the *rater.pkg* to all the SRDBs.

Important: This command is customer specific. For more information, please contact your local sales representative.

Usage

Use this command to load the Static Rating Database (SRDB) in to memory for Category-based Content Filtering application, and/or to load the *rater.pkg* file.

If the default directory of */cf* does not exist on the flash, it will create the same. It also locates the recent full database and loads it into memory. This command also clears the old and excess incremental databases.

Important: This command is not supported on all platforms.

Example

The following command upgrades the SRDB for the Category-based Content Filtering application:

```
upgrade content-filtering category database
```

upgrade url-blacklisting database

This command upgrade the URL Blacklisting database.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
upgrade url-blacklisting database [ -noconfirm ]
```

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to upgrade and load URL Blacklisting database whenever required.

Example

```
upgrade url-blacklisting database
```

Chapter 105

Exec Mode Show Commands (A-C)

This section includes the commands **show aaa** through **show css service**.

show aaa

Use this command to view AAA statistics for the current context.

Product

PDSN, GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show aaa { group { all | name aaa_group_name } | local counters } [ | { grep
grep_options | more } ]
```

```
group { all | name aaa_group_name }
```

Displays AAA information.

- **all**: If the exec context is local, information for all the default AAA groups, and the AAA groups configured in all the contexts are displayed. If the exec context is not local, information for only the context-specific AAA groups are displayed.

- **name aaa_group_name**: Displays information of the specified AAA group.

aaa_group_name must be the name of a AAA group, and must be an alpha and/or numeric string of 0 through 64 characters in length.

local counters

Displays information for current context.

```
grep grep_options | more
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to view accounting and authentication statistics for the current context.

Example

The following command displays AAA statistics for the current context:

```
show aaa local counters
```

The following command displays AAA statistics for the AAA group *aaa_group1*:

```
show aaa group name aaa_group1
```

 **Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging analyzer statistics

This command displays statistic information for protocol analyzers.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging analyzer statistics [ name protocol [ verbose ] ] [ | {
grep grep_options | more } ]
```

name *protocol*

Displays detailed information for the specified protocol analyzer.

protocol must be an available analyzer name, and must be one of the following:

- dns
- file-transfer
- ftp
- http
- icmp
- icmpv6
- imap
- ip
- ipv6
- mms
- p2p
- pop3
- pptp
- rtcp
- rtp
- rtsp
- sdp
- secure-http
- sip
- smtp
- tcp
- tftp
- udp

- wsp

- wtp

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output is the standard level which is the concise mode.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistic information for active charging protocol analyzers.

Example

The following command displays detailed statistic information for all P2P protocol analyzers:

```
show active-charging analyzer statistics name p2p verbose
```

The following command displays detailed statistic information for all TCP protocol analyzers:

```
show active-charging analyzer statistics name tcp verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging bandwidth-policy

This command displays information on bandwidth policies configured in a service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging bandwidth-policy { all | name bandwidth_policy_name } [ | {  
grep grep_options | more } ]
```

all

Displays information for all bandwidth policies configured in the service.

name *bandwidth_policy_name*

Displays detailed information for the specified bandwidth policy.

bandwidth_policy_name must be the name of a bandwidth policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information on bandwidth policies configured in a service.

Example

The following command displays detailed information for the bandwidth policy named *standard*:

```
show active-charging bandwidth-policy name standard
```

show active-charging charging-action

This command displays information for charging actions configured in the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging charging-action { { { all | name charging_action_name } [
service name acs_service_name ] } | statistics [ name charging_action_name ] } [
| { grep grep_options | more } ]
```

all

Displays information for each configured charging action.

name *charging_action_name*

Displays detailed information for the specified charging action.

charging_action_name must be the name of a charging action, and must be an alpha and/or numeric string of 1 through 63 characters in length.

statistics

Displays statistical information for all configured charging actions.

service name *acs_service_name*

Displays information for all or a specific charging action in the specified ACS service.

acs_service_name must be the name of an ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for charging actions configured in a service.

Example

The following command displays a detailed information for all charging actions:

```
show active-charging charging-action all
```

■ show active-charging charging-action

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging content-filtering category policy-id

This command displays Content Filtering category policy definitions. This command is not available on StarOS 8.0 and earlier.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging content-filtering category policy-id { all | id policy_id }  
[ | { grep grep_options | more } ]
```

all

Displays definitions of all Content Filtering category policies.

id *policy_id*

Displays definitions of a specific Content Filtering category policy.

policy_id must be a CF policy ID, and must be an integer from 1 through 4294967295.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view Content Filtering category definitions for a specific/all Policy IDs.

Example

The following command displays Content Filtering category definitions for policy ID 3:

```
show active-charging content-filtering category policy-id id 3
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging content-filtering category statistics

This command displays category-based content filtering statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging content-filtering category statistics [ rulebase { name
rulebase_name | all } ] [ verbose ] [ | { grep grep_options | more } ]
```

```
rulebase { name rulebase_name | all }
```

Displays category-based content filtering statistics, either for all or for a specific rulebase.

- **name** *rulebase_name*: Specifies the rulebase.

rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **all**: Displays category-based content filtering statistics for each rulebase in the ACS service.

verbose

Specifies that the output should provide as much information as possible. If this option is not specified then the output is the standard level, which is the concise mode.

```
grep grep_options | more
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view category-based content filtering statistics for a specific rulebase, or cumulative statistics for all rulebases in the ACS service.

Example

The following command displays category-based content filtering statistics for the rulebase named *consumer*:

```
show active-charging content-filtering category statistics rulebase name
consumer
```

The following command displays cumulative category-based content filtering statistics for all rulebases in verbose mode:

```
show active-charging content-filtering category statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging content-filtering server-group

This command displays information for Content Filtering Server Group (CFSG) configured in the service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging content-filtering server-group [ name cfsg_name |
statistics [ name cfsg_name [ acsmgr instance instance [ priority priority ] ] |
verbose ] [ | { grep grep_options | more } ]
```

name *cfsg_name*

Specifies name of the CFSG.

cfsg_name must be the name of a CFSG, and must be an alpha and/or numeric string of 1 through 63 characters in length.

acsmgr instance *instance*

Specifies the manager instance.

instance must be an integer from 1 through 65535.

priority *priority*

Specifies priority of the server for which statistics has to be displayed.

priority must be an integer from 1 through 65535.

verbose

Specifies that the output display all available statistics of each ICAP server connection at each instance. If this option is not specified then the output is at the standard level, which is the concise mode.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view CFSG information/statistics.

show active-charging content-filtering server-group name *cfsg_name*: The output of this command displays detailed information for the specified CFSG.

show active-charging content-filtering server-group statistics name *cfsg_name*: The output of this command displays cumulative statistics for the specified CFSG. This will include all the instances and all the servers configured in the CFSG.

show active-charging content-filtering server-group statistics name *cfs_g_name* **acsmgr instance** *instance*: The output of this command displays the cumulative statistics of all the ICAP server connections on the specified manager instance.

show active-charging content-filtering server-group statistics name *cfs_g_name* **acsmgr instance** *instance* **priority** *priority*: The output of this command displays the statistics for the specified ICAP server connection on the specified manager instance.

show active-charging content-filtering server-group statistics verbose: The output of this command displays statistics of each ICAP server connection at each instance.

Example

The following command displays information for the CFSG named *test12*:

```
show active-charging content-filtering server-group name test12
```

The following command displays detailed information for all CFSGs:

```
show active-charging content-filtering server-group statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging credit-control

This command displays statistics for Diameter/RADIUS Prepaid Credit Control Service in the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging credit-control { statistics [ all | group group_name ] |
session-states [ rulebase rulebase_name ] [ content-id content_id ] } [ | { grep
grep_options | more } ]
```

```
statistics [ all | group group_name ]
```

Displays prepaid credit control statistics.

- **all**: Displays all available statistics.

- **group** *group_name*: Displays statistics for the specified credit control group.

group_name must be the name of a credit control group, and must be an alpha and/or numeric string of 1 through 63 characters in length.

```
session-states [ rulebase rulebase_name ] [ content-id content_id ]
```

Displays prepaid CCA session status based on rulebase and/or content ID.

- **rulebase** *rulebase_name*: Displays the CCA session state counts for the specified rulebase.

rulebase_name must be the name of a rulebase configured for credit control service, and must be an alpha and/or numeric string of 1 through 63 characters in length.

- **content-id** *content_id*: Displays CCA session state counts for the specified content ID.

content_id must be the content ID of a credit control service, and must be an integer from 1 through 65535.

```
grep grep_options | more
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view statistics for Diameter/RADIUS prepaid credit control service in the ACS service.

Example

The following command shows ACS statistics of configured Diameter or RADIUS Credit Control Application:

```
show active-charging credit-control statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging edr-format

This command displays information about EDR formats configured in the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging edr-format [ statistics ] [ all | name edr_format_name ] [
| { grep grep_options | more } ]
```

all

Displays information for all EDR formats.

statistics

Displays statistics for all or the specified EDR format.

If neither **all** nor **name** is specified, summarized statistics over all EDR formats is displayed.

name *edr_format_name*

Displays information for the specified EDR format.

edr_format_name must be the name of an existing EDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for EDR format(s) in the ACS service.

Example

The following command displays all configured EDR formats in the ACS service.

```
show active-charging edr-format all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging edr-udr-file

This command displays CDR flow control information. This command also displays the EDR and UDR file related information.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging edr-udr-file { flow-control-counters [ verbose ] |  
statistics } [ | { grep grep_options | more } ]
```

flow-control-counters [verbose]

Displays the counters for dropped EDR/UDR records. These counters are for when CDRMOD uses flow control to stop ACS/Session Managers from sending the records.

verbose displays detailed information.

statistics

Displays EDR and UDR file statistics.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view CDR flow control information.

Example

The following command displays EDR and UDR files statistics:

```
show active-charging edr-udr-file statistics
```

The following command displays CDR flow control information:

```
show active-charging edr-udr-file flow-control-counters
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging file-space-usage

This command displays the file space used by CDR/EDR files.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging file-space-usage [ | { grep grep_options | more } ]
```

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view CDR/EDR file space usage information. The context in which this command is used is not relevant.

show active-charging firewall statistics

This command displays Active Charging Stateful Firewall statistics.

Product

FW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging firewall statistics [ callid call_id | domain-name domain_name | nat-realm nat_realm | protocol { icmp | ip | other | tcp | udp } | username user_name ] [ acsmgr instance instance_id ] [ verbose ] [ | { grep grep_options | more } ]
```

acsmgr instance *instance_id*

Specifies the ACS/Session Manager instance ID.

instance_id must be an integer from 1 through 65535.

callid *call_id*

Specifies the call identification number.

call_id must be an eight-digit HEX number.

domain-name *domain_name*

Specifies the domain name.

domain_name must be a string of 1 through 127 characters in length.

nat-realm *nat_realm*

Specifies the NAT realm name.

nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

protocol { **icmp** | **ip** | **other** | **tcp** | **udp** }

Specifies the protocol:

- **icmp**
- **ip**
- **other**: Protocols other than TCP, UDP, and ICMP
- **tcp**
- **udp**

username *user_name*

Specifies the user name.

user_name must be a string of 1 through 127 characters in length.

show active-charging firewall statistics

verbose

Specifies that the output displays all available information. If this option is not specified then the output is the standard level, which is the concise mode.

grep *grep_options* | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view Stateful Firewall statistics. If you are in the local context, statistics for all contexts are displayed. Otherwise, only statistics of your current context are displayed.

Example

The following command displays Stateful Firewall statistics:

```
show active-charging firewall statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging firewall track-list

This command displays the list of servers being tracked for involvement in any Denial-of-Service (DOS) attacks.

Product

FW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging firewall track-list attacking-servers [ | { grep  
grep_options | more } ]
```

```
grep grep_options | more
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view details of servers being tracked for involvement in any DOS attack.

Example

The following command displays the list of servers being tracked for involvement in any DOS attacks:

```
show active-charging firewall track-list attacking-servers
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging flows

This command displays information for active charging flows.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging flows { all | [ connected-time [ < | > | greater-than |
less-than ] seconds ] [ flow-id flow_id ] [ full ] [ idle-time [ < | > |
greater-than | less-than ] seconds ] [ ip-address [ server | subscriber ] [ < |
> | IPv4 | greater-than | less-than ] address ] [ nat { not-required | required
[ nat-ip nat_ip_address ] } ] [ port-number [ server | subscriber ] [ < | > |
IPv4 | greater-than | less-than ] number ] [ rx-bytes [ < | > | greater-than |
less-than ] number ] [ rx-packets [ < | > | greater-than | less-than ] number ]
[ session-id session_id ] [ summary ] [ trans-proto { icmp | tcp | udp } ] [ tx-
bytes [ < | > | greater-than | less-than ] number ] [ tx-packets [ < | > |
greater-than | less-than ] number ] [ type flow_type ] } [ | { grep grep_options
| more } ]
```

all

Displays information for all active charging flows.

connected-time [< | > | greater-than | less-than] seconds

Displays information for flows filtered by connected time period.

- < *seconds*: Displays flows that have been connected less than the specified number of seconds.
- > *seconds*: Displays flows that have been connected more than the specified number of seconds.
- greater-than** *seconds*: Displays flows that have been connected more than the specified number of seconds.
- less-than** *seconds*: Displays flows that have been connected less than the specified number of seconds.

seconds must be an integer from 0 through 4294967295.

flow-id flow_id

Displays information for specified active charging flow ID.

full

Displays all available information for the specified flows.

idle-time [< | > | greater-than | less-than] seconds

Displays information for flows filtered by idle time period.

- < *seconds*: Displays flows that have been idle less than the specified number of seconds.
- > *seconds*: Displays flows that have been idle more than the specified number of seconds.

- **greater-than** *seconds*: Displays flows that have been idle more than the specified number of seconds.
- **less-than** *seconds*: Displays flows that have been idle less than the specified number of seconds.

seconds must be an integer from 0 through 4294967295.

```
ip-address [ server | subscriber ] [ < | > | IPv4 | greater-than | less-
than ] address
```

Displays information for flows filtered by IPv4 IP address.

- **server**: Specifies the IP address for a specific server.
- **subscriber**: Specifies subscriber details for this **ip-address**. *address* is an IPv4 IP address in the **x.x.x.x** format.
- **<** *address*: Specifies an IPv4 IP address that is lesser than *address*.
- **>** *address*: Specifies an IPv4 IP address that is greater than *address*.
- **greater-than** *address*: Specifies an IPv4 IP address that is greater than *address*.
- **less-than** *address*: Specifies an IPv4 IP address that is lesser than *address*.

address must be an IPv4 address in decimal notation.

```
nat { not-required | required [ nat-ip nat_ip_address [ nat-port nat_port
] ] }
```

Important: The **nat** keyword and options are only available in StarOS 8.3 and later releases.

Displays information for flows filtered by Network Address Translation (NAT) required or not required setting.

- **not-required**: Sessions with NAT processing not required.
- **required**: Sessions with NAT processing required.
- **nat-ip** *nat_ip_address*: Sessions using specified NAT IP address. *nat_ip_address* must be an IPv4 address in dotted decimal format.
- **nat-port** *nat_port*: Sessions using specified NAT IP address and NAT port number. *nat_port* must be an integer from 0 through 65535.

```
port-number [ server | subscriber ] [ < | > | IPv4 | greater-than | less-
than ] number
```

Displays information on flows filtered by port number.

- **server**: Specifies the port-number for a specific server.
- **subscriber**: Specifies subscriber details for this **port-number**. *number* must be an integer from 0 through 65535.
- **<** *number*: Specifies a port number that is less than the specified *port-number*.
- **>** *number*: Specifies a port number that is greater than the specified *port-number*.
- **greater-than** *number*: Specifies a port number that is greater than the specified *port-number*.
- **less-than** *number*: Specifies a port number that is less than the specified *port-number*.

rx-bytes [< | > | **greater-than** | **less-than**] *number*

Displays information on flows filtered by the number of bytes received in the flow.

- < *number*: Specifies the number of bytes that is less than the specified *rx-bytes*.
- > *number*: Specifies number of bytes that is greater than the specified *rx-bytes*.
- greater-than** *number*: Specifies number of bytes that is greater than the specified *rx-bytes*.
- less-than** *number*: Specifies number of bytes that is less than the specified *rx-bytes*.

number must be an integer from 0 through 18446744073709551615.

rx-packets [< | > | **greater-than** | **less-than**] *number*

Displays information on flows filtered by the number of packets received in the flow.

- greater-than** *number*: Specifies the number of packets that is greater than the specified *rx-packets*.
- less-than** *number*: Specifies the number of packets that is less than the specified *rx-packets*.

number must be an integer from 0 through 18446744073709551615.

session-id *session_id*

Displays detailed information for specific active charging session ID.

summary

Displays summary information for defined sessions, based on defined parameters.

trans-proto { **icmp** | **tcp** | **udp** }

Displays information on flows filtered by the transport protocol.

- icmp**: ICMP protocol type flow
 - tcp**: TCP protocol type flow
 - udp**: User Datagram Protocol (UDP) flows
-

tx-bytes [< | > | **greater-than** | **less-than**] *number*

Displays information on flows filtered by the number of bytes received in the flow.

- < *number*: Specifies the number of bytes that is less than the specified *tx-bytes*.
- > *number*: Specifies number of bytes that is greater than the specified *tx-bytes*.
- greater-than** *number*: Specifies number of bytes that is greater than the specified *tx-bytes*.
- less-than** *number*: Specifies number of bytes that is less than the specified *tx-bytes*.

number must be an integer from 0 through 18446744073709551615.

tx-packets [< | > | **greater-than** | **less-than**] *number*

Displays information on flows filtered by the number of packets received in the flow.

- greater-than** *number*: Specifies the number of packets that is greater than the specified *tx-packets*.
- less-than** *number*: Specifies the number of packets that is less than the specified *tx-packets*.

number must be an integer from 0 through 18446744073709551615.

type *flow_type*

Displays information on flows filtered by flow type of application protocol.

flow_type must be one of the following:

- **dns**
- **ftp**
- **http**
- **icmp**
- **icmpv6**
- **imap**
- **ip**
- **ipv6**
- **mms**
- **p2p**: P2P protocol type flows including one or more of the following applications:
 - **actsync**
 - **aimini**
 - **applejuice**
 - **ares**
 - **armagettron**
 - **battlefd**
 - **bittorrent**
 - **blackberry**
 - **citrix**
 - **clubpenguin**
 - **crossfire**
 - **ddlink**
 - **directconnect**
 - **dofus**
 - **edonkey**
 - **facebook**
 - **facetime**

Important: The **facetime** protocol is available only in releases 9.0 and 11.0. This protocol is not available in release 10.0.

- **fasttrack**
- **feidian**
- **fiesta**
- **filetopia**

■ show active-charging flows

- florensia
- freenet
- fring
- funshion
- gadu_gadu
- gamekit

Important: The **gamekit** protocol is available only in releases 9.0 and 11.0. This protocol is not available in release 10.0.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display charging flow type information.

Example

The following command displays a detailed flow information for a session ID of *test*:

```
show active-charging flows session-id test
```

The following command displays a detailed flow information for a P2P type session:

```
show active-charging flows full type p2p
```

The following command displays a detailed information for a P2P type flow:

```
show active-charging flows type p2p
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging flow-mappings

This command displays information about all the active flow mappings based on the applied filters.

Product

FW, NAT

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging flow-mappings [ all | call-id callid | [ nat { not-required
| required [ nat-realm realm_name ] } | trans-proto { tcp | udp } ] + [ | { grep
grep_options | more } ]
```

all

Displays the all the available active charging flow-mapping information.

call-id *callid*

Displays detailed information for specific calls.
callid must be an 8 digit Hex number.

nat { required [nat-realm *string*] not-required }

Displays the active charging flow mappings for which NAT is enabled or disabled.

trans-proto { tcp | udp }

Displays the transport layer.

grep *grep_options* | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the Active Charging flow-mapping details.

Example

The following command displays the total number of Active Charging flow-mappings:

```
show active-charging flow-mappings all
```

The following command displays the the flow-mappings for which NAT is enabled and the NAT-realm used is *natpool3*:

```
show active-charging flow-mappings nat required nat-realm natpool3
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging fw-and-nat policy

This command displays Firewall-and-NAT Policy information.

 **Important:** This command is only available in StarOS 8.1, and in StarOS 9.0 and later. For more information on this command please contact your local service representative.

Product

ACS, FW, NAT

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging fw-and-nat policy { { { all | name fw_nat_policy_name } [
service name acs_service_name ] } | { statistics { all | name fw_nat_policy_name
} } } [ | { grep grep_options | more } ]
```

all

Displays information for all Firewall-and-NAT policies configured, optionally all in a specified service.

name *fw_nat_policy_name*

Displays detailed information for the specified Firewall-and-NAT policy.

fw_nat_policy_name must be the name of the Firewall-and-NAT policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or the specified Firewall-and-NAT policy in the specified ACS service.

acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

statistics

Displays statistics for the all/specified Firewall-and-NAT policy.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view Firewall-and-NAT Policy information.

Example

The following command displays detailed information for the Firewall-and-NAT policy named *standard*:

```
show active-charging fw-and-nat policy name standard
```

show active-charging group-of-prefixed-urls

This command displays information on group of prefixed URLs configured in an ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging group-of-prefixed-urls { all | name prefixed_url_group } [ service name acs_service_name ] [ | { grep grep_options | more } ]
```

all

Displays information for all group of prefixed URLs configured in an ACS service.

name *prefixed_url_group*

Displays detailed information for the specified group of prefixed URLs.

prefixed_url_group must be the name of a group of prefixed URLs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or the specified group of prefixed URLs in the specified ACS service.

acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter

Usage

Use this command to view information on group of prefixed URLs configured in the ACS service.

Example

The following command displays for the group of prefixed URLs named *test123*:

```
show active-charging group-of-prefixed-urls name test123
```

show active-charging group-of-ruledefs

This command displays information on group of ruledefs configured in an ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging group-of-ruledefs { { all | name group_of_ruledefs } [
service name acs_service_name ] | statistics name group_of_ruledefs } [ | { grep
grep_options | more } ]
```

all

Displays information for all groups of ruledefs configured, optionally all in a specified ACS service.

name *group_of_ruledefs*

Displays detailed information for the specified group of ruledefs.

group_of_ruledefs must be the name of a group of ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or the specified group of ruledefs within the specified ACS service.

acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

statistics name *group_of_ruledefs*

Displays statistics for the specified group of ruledefs.

group_of_ruledefs must be the name of a group of ruledefs, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information on group of ruledefs configured in a ACS service.

Example

The following command displays information on all groups of ruledefs configured:

■ show active-charging group-of-ruledefs

```
show active-charging group-of-ruledefs all
```

show active-charging nat statistics

This command displays NAT realm statistics.

Product

NAT

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging nat statistics [ nat-realm nat_realm [ summary ] ] [ | {  
grep grep_options | more } ]
```

show active-charging nat statistics

This command when issued in the local context displays statistics for all NAT realms in all contexts. When issued in a specific context, this command displays statistics for all NAT realms in that context.

show active-charging nat statistics nat-realm *nat_realm*

This command when issued in the local context displays statistics for the specified NAT realm in all contexts. When issued in a specific context, this command displays statistics for the specified NAT realm in that context.

nat-realm *nat_realm*

Specifies the NAT realm's / NAT realm group's name.

nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

summary

When the *nat_realm* specified is a "pool group" and the **summary** option is used, summary statistics of all pools in the pool group is displayed.

When the *nat_realm* specified is a pool and the **summary** option is NOT used, all available statistics for the specified pool is displayed.

When the *nat_realm* specified is a "pool group" and the **summary** option is NOT used, all available statistics of each pool in the specified "pool group" is displayed.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view NAT realm statistics.

Example

■ show active-charging nat statistics

The following command when issued in the local context, displays NAT realm statistics for NAT realms named *test135* in all contexts:

```
show active-charging nat statistics nat-realm test135
```

show active-charging p2p-dynamic-rules

This command displays P2P Dynamic signature file information.

Product

P2P

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging p2p-dynamic-rules [ verbose ] [ acsmgr instance instance_id ] [ | { grep grep_options | more } ]
```

acsmgr instance instance_id

Specifies the ACS/Session Manager instance ID.

instance_id must be an integer from 1 through 65535.

verbose

Displays P2P Dynamic rule statistics in detail.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view P2P Dynamic signature file statistics/information.

Example

The following command displays P2P Dynamic rule information:

```
show active-charging p2p-dynamic-rules
```

show active-charging packet-filter

This command displays information on packet filters configured in an ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging packet-filter { all | name packet_filter_name } [ service
name acs_service_name ] [ | { grep grep_options | more } ]
```

all

Displays information for all packet filters configured, optionally all configured in an ACS service.

name *packet_filter_name*

Displays detailed information for the specified packet filter.

packet_filter_name must be the name of a packet filter, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or the specified packet filter in the specified ACS service.

acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information on packet filters configured in an ACS service.

Example

The following command displays information for the packet filter *filter12*:

```
show active-charging packet-filter name filter12
```

show active-charging rulebase

This command shows information for rulebases.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging rulebase { { { all | name rulebase_name } [ service name
acs_service_name ] } | statistics [ name rulebase_name ] } | [ | { grep
grep_options | more } ]
```

all

Displays details of all rulebases configured in the system.

name *rulebase_name*

Displays details of the specified rulebase.

rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays details of all or the specified rulebase configured in the specified ACS service.

acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

statistics

Displays statistical information for all or the specified rulebase.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view various statistics for a specific charging rulebase.

Example

The following command displays active charging rulebase statistics.

```
show active-charging rulebase statistics
```

The following command displays configurations and statistics for a rulebase named *rulebase_1*.

■ show active-charging rulebase

`show active-charging rulebase name rulebase_1`

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging ruledef

This command displays information for rule definitions (ruledefs) configured in the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging ruledef { all | charging | firewall | name ruledef_name |
post-processing | routing | statistics [ all { charging | firewall [ wide ] |
post-processing } | name ruledef_name [ wide ] ] } [ | { grep grep_options |
more } ]
```

all

Displays information for all ruledefs configured in the ACS service.

charging

Displays information for all Charging ruledefs configured in the ACS service.

firewall

Displays information for all Firewall ruledefs configured in the ACS service.

name *ruledef_name*

Displays detailed information for the specified ruledef.

ruledef_name must be the name of an existing ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

post-processing

 **Important:** This keyword is only available in StarOS 8.3 and later.

Displays information for all post-processing ruledefs configured in the ACS service.

routing

Displays information for all Routing ruledefs configured in the ACS service.

service *service_name*

This keyword is obsolete.

```
statistics [ all { charging | firewall [ wide ] | post-processing } |
name ruledef_name [ wide ] ]
```

Displays statistical information for all/specified ruledefs configured in the ACS service. If none of the optional arguments are supplied, statistics totaled for all ruledefs will be displayed.

■ show active-charging ruledef

- **all**: Displays statistics for all ruledefs of the specified type configured in the ACS service.
- **charging**: Displays statistics for all Charging ruledefs configured in the service.
- **firewall**: Displays statistics for all Firewall ruledefs configured in the service.
- **post-processing**: Displays statistics for all Post-processing ruledefs configured in the service.

Important: The **post-processing** keyword is only available in StarOS 8.3 and later.

- **name** *ruledef_name*: Displays statistics for the specified ruledef.
ruledef_name must be the name of a ruledef, and must be an alpha and/or numeric string of 1 through 63 characters in length.
- **wide**: Displays all available information in a single wide line.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information for ruledefs configured in the ACS service.

Example

The following command displays ACS ruledef statistics.

```
show active-charging ruledef statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging service

This command displays ACS service details.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging service { all | name acs_service_name } [ | { grep  
grep_options | more } ]
```

all

Displays information for all configured ACS services.

name *acs_service_name*

Displays detailed information for the specified ACS service.

acs_service_name must be the name of an ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view ACS service details.

Example

The following command displays details for the ACS service named *test1*.

```
show active-charging service name test1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging sessions

This command displays statistics for ACS sessions.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging sessions [ full [ wide ] | summary | display-dynamic-
charging-rules | dynamic-charging ] { [ all ] | [ filter_keyword ] + } [ | {
grep grep_options | more } ]
```

full [wide]

Displays all available information for the specified session.
Optionally all available information can be displayed in a single wide line.

summary

Displays summary information for defined sessions based on defined parameters.

display-dynamic-charging-rules

Displays information for the dynamic-charging rules configured per session under Gx/Ty interface support.

dynamic-charging

Displays information for dynamic charging sessions.

filter_keyword

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all command keywords. Multiple filter keywords can be entered on a command line.

When multiple filter keywords are specified, the output conforms to all of the filter keywords specifications.

For example, if you enter the following command:

```
show active-charging sessions full active-charging-service acs_1
```

Counters for active charging sessions active in ACS service *acs_1* with full details is displayed. Information for all other services is not displayed.

acsmgr instance *instance*

Displays session information for a specific ACS/Session Manager instance.

active-charging-service *acs_service_name*

Displays session information for the specified ACS service.

acs_service_name must be the name of an ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

all

Displays session information for all active charging sessions.

callid

Specifies the call identification number.

display-dynamic-charging-rules

Displays dynamic charging rules configured.

dynamic-charging

Displays session information for all dynamic charging sessions.

firewall { not-required | required }

Displays session information for sessions with Firewall Processing required or not required, as specified.

fw-and-nat policy *fw_nat_policy_name*

Displays information for the specified Firewall-and-NAT Policy.

fw_nat_policy_name specifies the Firewall-and-NAT policy name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

imsi

Specifies the International Mobile Subscriber Identity (IMSI) of the subscriber session.

ip-address

Specifies the IP address for the specific charging service.

msid

Displays active charging session information for a specific subscriber's Mobile Station Identification (MSID) number.

nat { not-required | required [nat-realm *nat_realm*] }

Displays session information for sessions with NAT required or not required, as specified.

nat-realm *nat_realm* specifies a NAT realm name. *nat_realm* must be an alpha and/or numeric string of 1 through 63 characters in length.

rulebase

Displays information for a rulebase that is configured in an active charging session.

rx-data

Displays the bytes received in the session.

session-id

Displays detailed session information for a specific session identification.

tx-data

Displays the bytes sent in the session.

type

Displays session information for specified DNS application type(s).

- dns**
- ftp**
- http**
- icmp**
- icmpv6**
- imap**
- ip**
- ipv6**
- mms**
- p2p**: Displays session information for a P2P application type:
 - actsync**
 - aimini**
 - applejuice**
 - ares**
 - armagettron**
 - battlefd**
 - bittorrent**
 - blackberry**
 - citrix**
 - clubpenguin**
 - crossfire**
 - ddlink**
 - directconnect**
 - dofus**
 - edonkey**
 - facebook**
 - facetime**

Important: The **facetime** protocol is available only in releases 9.0 and 11.0. This protocol is not available in release 10.0.

- fasttrack**
- feidian**

- fiesta
- filetopia
- florensia
- freenet
- fring
- funshion
- gadu_gadu
- gamekit

Important: The `gamekit` protocol is available only in releases 9.0 and 11.0. This protocol is not available in release 10.0.

- gnutella
- gtalk
- guildwars
- halflife2
- hamachivpn
- iax
- icecast

- wsp-connection-oriented

username

Displays session information for a specific user name.

dynamic-charging

Displays the all sessions having received at least one Gx message from Session Manager/IMS Authorization.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

show active-charging sessions

Usage

Use this command to display the configuration information for an active charging session.

Example

The following command displays full information of an active charging session.

```
show active-charging sessions full all
```

The following command displays an active charging session summary.

```
show active-charging sessions summary
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging subsystem

This command shows service and configuration counters for the ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging subsystem { all | facility acsmgr { all | instance
instance_value } [ rulebase name rulebase_name ] | sip } [ | { grep grep_options
| more } ]
```

all

Displays ACS subsystem information.

facility acsmgr [all | instance instance_value]

Displays logged events for all ACS/Session Managers or for a specific instance. *instance_value* must be an integer from 1 through 65535.

rulebase name rulebase_name

Displays rulebase statistics for the specified rulebase. *rulebase_name* must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

sip

Displays SIP related statistics.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view ACS/Session Manager information.

Example

The following command displays ACS subsystem information:

```
show active-charging subsystem all
```

■ show active-charging subsystem

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging tcp-proxy statistics

This command displays TCP Proxy statistics.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging tcp-proxy statistics [ all | ip-layer | rulebase  
rulebase_name | tcp-layer ] [ verbose ] [ | { grep grep_options | more } ]
```

all

Displays all TCP Proxy statistics aggregated over all rulebases, including for both IP and TCP layers.

ip-layer

Displays TCP Proxy statistics for IP layer.

rulebase rulebase_name

Displays TCP Proxy statistics for the specified rulebase.

rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

tcp-layer

Displays TCP Proxy statistics for TCP layer.

verbose

Displays detailed TCP Proxy statistics.

grep grep_options | more

Specifies that the output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view TCP Proxy statistics.

Example

The following command displays detailed TCP proxy statistics for the rulebase named *test14*:

```
show active-charging tcp-proxy statistics rulebase test14 verbose
```

■ show active-charging tcp-proxy statistics

show active-charging timedef

This command displays the details of timeslots configured in specified time definition(s).

Important: This command is only available in StarOS 8.1 and in StarOS 9.0 and later.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging timedef { all | name timedef_name } [ service name  
acs_service_name ] [ | { grep grep_options | more } ]
```

all

Displays information for all timedefs configured in the service.

name *timedef_name*

Displays detailed information for the specified timedef.

timedef_name must be the name of a timedef, and must be an alpha and/or numeric string of 1 through 63 characters in length.

service name *acs_service_name*

Displays information for all or a specific timedef configured in the specified ACS service.

acs_service_name must be the name of the ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

grep *grep_options* | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view details of timeslots configured in specified timedef(s) that have been configured for the Time-of-Day Activation/Deactivation of Rules feature.

Example

The following command displays timeslot details of all timedefs configured in the ACS service:

```
show active-charging timedef all
```

■ show active-charging timedef

show active-charging tpo policy statistics

This command displays TPO policy statistics.

 **Important:** This is a restricted command. For more information contact your local sales representative.

Product

TPO

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging tpo policy statistics [ all | name tpo_policy_name ] [ | {  
grep grep_options | more } ]
```

name *tpo_policy_name*

Displays detailed statistics for the specified TPO policy.

tpo_policy_name must be the name of a TPO policy, and must be an alpha and/or numeric string of 1 through 63 characters in length.

all

Displays statistics for all TPO policies configured in the active charging service.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view TPO policy statistics.

- “**show active-charging tpo policy statistics all**” command displays statistics for all TPO profiles configured in the active charging service.
- “**show active-charging tpo policy statistics name** *tpo_policy_name*” command displays statistics for the specified TPO policy.
- “**show active-charging tpo policy statistics**” command displays aggregated statistics for all TPO policies configured in the active charging service.

Example

The following command displays statistics for the TPO policy named *policy12*:

```
show active-charging tpo policy statistics name policy12
```

■ show active-charging tpo policy statistics

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging tpo profile statistics

This command displays TPO profile statistics.

Important: This is a restricted command. For more information contact your local sales representative.

Product

TPO

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging tpo profile statistics [ name tpo_profile_name | all ] [ |  
{ grep grep_options | more } ]
```

name *tpo_profile_name*

Displays detailed statistics for the specified TPO profile.

tpo_profile_name must be the name of a TPO profile, and must be an alpha and/or numeric string of 1 through 63 characters in length.

all

Displays statistics for all TPO profiles configured in the active charging service.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view TPO profile statistics.

- “**show active-charging tpo profile statistics all**” command displays statistics for all TPO profiles configured in the active charging service.
- “**show active-charging tpo profile statistics name** *tpo_profile_name*” command displays statistics for the specified TPO profile.
- “**show active-charging tpo profile statistics**” command displays aggregated statistics for all TPO profiles configured in the active charging service.

Example

The following command displays statistics for the TPO profile named *profile12*:

```
show active-charging tpo profile statistics name profile12
```

■ show active-charging tpo profile statistics

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging udr-format

This command displays information about UDR formats configured in an ACS service.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging udr-format { all | name udr_format_name } [ | { grep  
grep_options | more } ]
```

all

Displays information for all UDR formats.

name udr_format_name

Displays information for the specified UDR format.

udr_format_name must be the name of an existing UDR format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for UDR format(s) in an ACS service.

Example

The following command displays all configured UDR formats in an ACS service.

```
show active-charging udr-format all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging url-blacklisting statistics

This command displays URL Blacklisting statistics.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging url-blacklisting statistics [ rulebase { all | name
rulebase_name } ] [ verbose ] [ | { grep grep_options | more } ]
```

```
rulebase { all | name rulebase_name }
```

Displays URL Blacklisting statistics for all or a specific rulebase.

- **all**: Displays URL Blacklisting statistics for all configured rulebases.
- **name rulebase_name**: Displays URL Blacklisting statistics for the specified rulebase.

rulebase_name must be the name of a rulebase, and must be an alpha and/or numeric string of 1 through 63 characters in length.

verbose

Displays detailed URL Blacklisting statistics.

```
grep grep_options | more
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view URL Blacklisting hits and misses statistics.

Example

The following command displays cumulative URL Blacklisting statistics:

```
show active-charging url-blacklisting statistics
```

The following command displays URL Blacklisting statistics for the rulebase *rulebase_1*:

```
show active-charging url-blacklisting statistics rulebase name rulebase_1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show active-charging xheader-format

This command displays x-header format configurations.

 **Important:** This is a customer-specific command. Please contact your local sales representative for more information.

Product

ACS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show active-charging xheader-format { all | name xheader_format } [ | { grep grep_options | more } ]
```

all

Displays information for all x-header formats configured.

name *xheader_format*

Displays information for the specified x-header format.

xheader_format must be the name of an x-header format, and must be an alpha and/or numeric string of 1 through 63 characters in length.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view details of x-header formats configured in an ACS service.

Example

The following command displays information for the x-header format named *test12*:

```
show active-charging xheader-format test12
```

show administrators

Displays information regarding all CLI users currently connected to the system.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show administrators [ session id ] [ | { grep grep_options | more } ]
```

session id

Indicates the output is to contain additional information about the CLI user session including the assigned session ID.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command displays a list of administrative users that have command line interface sessions active.

Example

```
show administratorsshow administrators session id
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show alarm

Displays alarm information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show alarm { all | audible | central-office | facility | outstanding [ all |
chassis | port slot/port | slot slot ] [ verbose ] | statistics } [ | { grep
grep_options | more } ]
```

all

Displays the state of all alarms in one screen.

audible

Displays the state of the internal audible alarm buzzer on the SMC.

central-office

Displays the state of the CO Alarm relays on the SPIO.

facility

Displays the state of the facility (audible and CO) alarms.

outstanding [all | chassis | port slot/port | slot slot] [verbose]

Displays information on currently outstanding alarms.

- **all**: Displays all alarm information.
- **chassis**: Displays chassis/power/fan alarms.
- **port slot/port**: Shows the alarm information for the specified port.
- **slot slot**: Shows the alarm information for the card in the specified slot.
- **verbose**: Displays more verbose output, including the internal alarm ID

statistics

Displays basic statistics on the alarming subsystem, including the current number of outstanding alarms of different severities and a cumulative total of alarms generated.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command Output* section of the *Command Line Interface Overview* chapter.

■ show alarm

Usage

View alarms to verify system status or to periodically check the general health of the system.

Important: This command is not supported on all platforms.

Example

The following command displays all alarms that are currently outstanding:

```
show alarm outstanding all
```

The following command displays more detailed information on all alarms that are currently outstanding:

```
show alarm outstanding all verbose
```

The following command displays alarm statistics:

```
show alarm statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show alcap counters

This command displays the Access Link Control Application Part (ALCAP) protocol message counters related ALCAP protocol sessions associated with Home-NodeB Gateway (HNB-GW) service instance configured and running on a system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show alcap counters [ alcap-service alcap_svc_name [ aal2-node aal2_node_name [ aal2-path aal2_path_id ] ] ] [ | { grep grep_options | more } ]
```

name *alcap_svc_name*

Specifies the name of the ALCAP service of which ALCAP protocol session counters are to display. *alcap_svc_name* identifies the name of the ALCAP service to display the counters.

aal2-node *aal2_node*

Specifies the name of the ATM Adaptation Layer 2 (AAL2) node to display the ALCAP protocol session counters filtered for specific AAL2 node. *aal2_node_name* is name of the AAL2 node configured in ALCAP service for which session counters are to display.

aal2-path *aal2_path_id*

Specifies the identity number of the AAL2 path on specific ATM Adaptation Layer 2 (AAL2) node to display the ALCAP protocol counters filtered for specific AAL2 path on particular AAL2 node. *aal2_path_id* is the identifier of the AAL2 path on AAL2 node for which protocol counters are to clear.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

This command is used to display the sessions statistics and counters for ALCAP service.

Example

The following command displays the ALCAP protocol session counters for ALCAP service named as *alcap_hnb_svc1*:

```
show alcap counters alcap-service alcap_hnb_svc1
```

■ show alcap counters

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show alcap-service

This command displays the Access Link Control Application Part (ALCAP) session statistics of ALCAP service associated with Home-NodeB Gateway (HNB-GW) service instance configured and running on a system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show alcap-service { all | name alcap_svc_name [ aal2-node aal2_node_name [ aal2-path aal2_path_id [ aal2-channel aal2_channel_num ] ] | endpoint aal2_endpoint_name ] } [ [ | { grep grep_options | more } ] ]
```

name *alcap_svc_name*

Specifies the name of the ALCAP service of which service statistics is to display.
alcap_svc_name identifies the name of the ALCAP service to display the service statistics.

aal2-node *aal2_node*

Specifies the name of the ATM Adaptation Layer 2 (AAL2) node to filter the display of the ALCAP service statistics for specific node.
aal2_node_name is name of the AAL2 node configured in ALCAP service for which statistics is to display.

aal2-path *aal2_path_id*

Specifies the identity number of the AAL2 path on specific ATM Adaptation Layer 2 (AAL2) node to filter the display of the ALCAP service statistics for specific AAL2 path on particular AAL2 node.
aal2_path_id is the identifier of the AAL2 path on AAL2 node for which statistics is to display.

aal2-channel *aal2_channel_num*

Specifies the AAL2 channel number of the AAL2 path on specific ATM Adaptation Layer 2 (AAL2) node to filter the display of the ALCAP service statistics for specific AAL2 path of particular AAL2 node.
aal2_channel_num is the identifier of the AAL2 channel on AAL2 path of AAL2 node for which statistics is to display.

endpoint *atm_endpoint_name*

Specifies the ATM endpoint name to filter the display of the ALCAP service statistics for specific ATM endpoint.
aal2_endpoint_name is the name of the ATM endpoint for which statistics is to display.

Usage

This command is used to clear the sessions statistics and counters for ALCAP service.

■ show alcap-service

Example

The following command displays the service statistics of ALCAP service named as *alcap_hnb_svc1*:

```
show alcap-service name alcap_hnb_svc1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show alcap statistics

This command displays the session statistics related to Access Link Control Application Part (ALCAP) protocol sessions associated with Home-NodeB Gateway (HNB-GW) service instance configured and running on a system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show alcap statistics [ alcap-service alcap_svc_name [ aal2-node aal2_node_name
[ aal2-path aal2_path_id ] ] ] [ verbose ] [ | { grep grep_options | more } ]
```

name *alcap_svc_name*

Specifies the name of the ALCAP service of which statistics counters are to display.
alcap_svc_name identifies the name of the ALCAP service to display the statistics counters.

aal2-node *aal2_node*

Specifies the name of the ATM Adaptation Layer 2 (AAL2) node to display the ALCAP service related statistics counters for specific AAL2 node.
aal2_node_name is name of the AAL2 node configured in ALCAP service for which statistics counters are to display.

aal2-path *aal2_path_id*

Specifies the identity number of the AAL2 path on specific ATM Adaptation Layer 2 (AAL2) node to display the ALCAP service statistics counters for specific AAL2 path on particular AAL2 node.
aal2_path_id is the identifier of the AAL2 path on AAL2 node for which statistics counters are to clear.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

This command is used to display the sessions statistics and counters for ALCAP service.

Example

The following command displays the service session statistics counters for ALCAP service named as *alcap_hnb_svc1*:

```
show alcap counters alcap-service alcap_hnb_svc1
```

■ show alcap statistics

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show apn

Displays configuration information for either a specific or all configured APNs.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show apn { all | name apn_name } [ | { grep grep_options | more } ]
```

all

Displays information on all APNs configured on the system.

name *apn_name*

Displays information for a specific APN.

apn_name is the name of the APN and can be from 1 to 62 alpha and/or numeric characters and is case sensitive.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more** options, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to verify the configuration of one or all APNs for monitoring or troubleshooting purposes. The output is a concise listing of APN parameter settings.

If this command is executed from within the local context with the **all** keyword, information for all APNs configured on the system will be displayed.

Example

The following command displays configuration information for all APNs:

```
show apn all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show apn counter ip-allocation

This command displays the IP allocation method information/statistics counters on per APN basis for all currently active calls.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show apn counter ip-allocation [all | name apn_name ] [ | { grep grep_options | more } ]
```

all

Displays statistics for all APNs.

name apn_name

Displays statistics for a specific APN.

apn_name is the name of the preconfigured APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

{ grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to display the IP allocation counters on per APN basis for all currently active calls. Output of this command gives the user clear idea of how many sessions in each APN are using a particular type of ip-allocation method.

If this command is issued from within the local context, the statistics displayed will be cumulative for all APNs configured on the system regardless of context. If no APN name is specified and the command is executed from a context with multiple APNs configured, the output will be cumulative for all APNs in the context.

Example

The following command displays statistics for all APN on a system:

```
show apn counter ip-allocation all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show apn statistics

Displays APN statistics for either a specific or all configured APNs.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show apn statistics [ all | name apn_name ] [ | { grep grep_options | more } ]
```

all

Displays statistics for all APNs.

name apn_name

Displays statistics for a specific APN.

apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to view statistics for one or all APNs within a context for monitoring or troubleshooting purposes.

If this command is issued from within the local context, the statistics displayed will be cumulative for all APNs configured on the system regardless of context. If no APN name is specified and the command is executed from a context with multiple APNs configured, the output will be cumulative for all APNs in the context.

Example

The following command displays statistics for an APN named *isp2*:

```
show apn statistics name isp2
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asngw-service

This command displays information about selected Access Service Network Gateway (ASN GW) calls/services.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asngw-service { all | name service_name | session | statistics } [ bs-
status [ address ip_address | filter { all | icmp-monitored | no-calls | summary
| up ] ] [ { grep grep_options | more } ]
```

all

Displays information for all configured ASN GW services.

name service_name

Displays information only for the specified ASN GW service.

service_name must be the name of an existing ASN GW service in the current context. The service name must be an alpha and/or numeric string of 1 through 63 characters in length.

session

Displays information about configured ASNGW sessions. See the **show asngw-service session** command

statistics

Total of collected information for specific protocol since last restart or clear command.

```
bs-status { address ip_address | filter { all | icmp-monitored | no-calls
| summary | up } }
```

Displays the ASN BS status based on IP address and various filters.

address *ip_address* specifies the IP address of ASN base station whose status is requested.

ip_address must be an IPv4 or IPv6 IP address of ASN BS.

filter { all | icmp-monitored | no-calls | summary | up }: Filters the requested BS's status on the basis of following criteria:

- **all**: Displays the status of all ASN BS.
- **icmp-monitored**: Displays the status of ASN BS which are monitored through ICMP ping messages.
- **no-calls**: Displays the status of ASN BS which has no active calls.
- **summary**: Displays the summary of status of requested ASN BSs.
- **up**: Displays the of status of ASN BSs which are in active state.

■ show asngw-service

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information for selected configured ASN GW services.

Example

The following command displays available information for all active ASN GW services.

```
show asngw-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asngw-service session

This command displays statistics for specific Access Service Network Gateway sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asngw-service session [ all | anchor-only [ full ] | callid call_id |
counters | full | ip-address ipv4_address | msid msid_number | non-anchor-only [
full ] | peer-address ipv4_address | summary | username user_name ] [ | { grep
grep_options | more } ]
```

all

Displays all related information for all active ASN GW service sessions.

anchor-only

Displays all available information for all active ASN GW service sessions on an anchor ASN GW only.

callid *call_id*

Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

full

Displays all available information for the associated display or filter keyword.

ip-address *ipv4_address*

IP address of the subscriber.
ipv4_address must be an IPv4 address, in dotted decimal notation.

msid *msid_number*

Displays available information for the specific mobile station identification number.
msid_number must be an MSID number.

non-anchor-only

Displays all available information for all active ASN GW service sessions on a non-anchor ASN GW only.

peer-address *ipv4_address*

Address of specific IP peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

summary

Displays summary of available information for associated display or filter keyword (previous keyword).

■ show asngw-service session

username *user_name*

Name of specific user within current context. Displays available information for the specific user name.

user_name must be followed by an user name.

The user name can an alpha and/or numeric string of 1 through 127 characters in length.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for an ASN GW session.

Example

The following command displays all available ASN GW sessions.

```
show asngw-service session all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asngw-service session counters

This command displays statistics for specific Access Service Network Gateway sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asngw-service session counters [ [ function-type { auth-relay | context-
transfer | data-path | handoff | im-operation | ms-state-change | paging | qos }
] | [ anchor-only | callid call_id | ip-address ipv4_address | msid msid_number
| non-anchor-only | peer-address ipv4_address | username user_name ] [ r4-only |
r6-only | verbose ] ] [ | { grep grep_options | more } ]
```

anchor-only

Displays all available information for all active anchor sessions in an ASN GW service.

callid *call_id*

Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

function-type { **auth-relay** | **context-transfer** | **data-path** | **handoff** | **im-operation** | **ms-state-change** | **paging** | **qos** }

Displays the counters for specific type of functions in an ASN GW session.

auth-relay: Displays information about authentication relay messages.

context-transfer: Displays information about context-transfer messages.

data-path: Displays information about data-path registration messages.

handoff: Displays information about hand-off messages.

im-operations: Displays information about idle mode state operation messages.

ms-state-change: Displays information about MS state change messages.

paging: Displays information about paging messages.

qos: Displays information about RR messages.

ip-address *ipv4_address*

IP address of the subscriber.

ipv4_address must be an IPv4 address, in dotted decimal notation.

msid *msid_number*

Displays available information for the specific mobile station identification number.

msid_number must be an MSID number.

non-anchor-only

Displays all available information for all active non-anchor sessions in an ASN GW service.

peer-address *ipv4_address*

Address of specific IP peer.

ipv4_address must be an IPv4 address, in dotted decimal notation.

r6-only

Displays all available counters for R6 interface in an ASN GW session.

r4-only

Displays all available counters for R4 interface in an ASN GW session.

username *user_name*

Displays available session information for the specific WiMAX user in ASN GW service session.

user_name must be followed by an user name.

The user name can an alpha and/or numeric string of 1 through 127 characters in length.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the counters of an ASN GW session.

Example

The following command displays the counters for data path type function.

```
show asngw-service session counters function-type data-path
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asngw-service statistics

Displays statistics for all ASN GW sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asngw-service statistics { [ function-type { auth-relay | context-transfer
| data-path | handoff | im-operations | ms-state-change | paging | qos} [ r4-
only | r6-only ] ] | name service_name | r4-only | r6-only | verbose | peer-
address ipv4_address [ verbose ] } [ | { grep grep_options | more } ]
```

function-type

Displays information about selected function type on R4 or R6 interface.

```
function-type { auth-relay | context-transfer | data-path | handoff | im-
operations | ms-state-change | paging | qos} [ r4-only | r6-only ]
```

Displays the counters for specific type of functions in an ASN GW session.

auth-relay: Displays information about authentication relay messages.

context-transfer: Displays information about context-transfer messages.

data-path: Displays information about data-path registration messages.

handoff: Displays information about hand-off messages.

im-operations: Displays information about idle mode state operation messages.

ms-state-change: Displays information about MS state change messages.

paging: Displays information about paging messages.

qos: Displays information about RR messages.

r4-only: Displays information about selected function on R4 interface.

r6-only: Displays information about selected function on R6 interface.

name *service_name*

Displays specific service.

service_name must be a service name.

The service name can be one to 63 alpha and/or numeric characters long.

r4-only

Displays statistics of R4 interface in ASN GW services.

r6-only

Displays statistics of R6 interface in ASN GW services.

peer-address *ipv4_address*

Address of specific IP Peer.

ipv4_address must be an IPv4 address, in dotted decimal notation.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display ASN GW statistics.

Example

The following command displays information about selected MS-State-Change function.

```
show asngw-service statistics function-type ms-state-change
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service

This command displays information about selected Access Service Network Paging Controller and Location Registry (ASN PC/LR) services.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asnpc-service { all | id | name service_name | session | statistics } [ | {
grep grep_options | more } ]
```

all

Displays information for all configured ASN PC services.

paging-group

Displays all the configured paging-groups and associated paging nodes, and the offset count. For a specific paging group, enter the paging group id number.

name service_name

Displays information only for the specified ASN PC service.

service_name must be the name of an existing ASN PC service in the current context. The service name must be an alpha and/or numeric string of 1 through 63 characters in length.

session

Displays information about configured ASN PC sessions.

statistics

Total of collected information for specific protocol since last restart or clear command.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information for selected configured ASN PC services.

Example

The following command displays available information for all active ASN PC services.

■ show asnpc-service

show asnpc-service all

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service session

This command displays statistics for specific ASN PC service sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asnpc-service session [ all | callid call_id | counters | full | msid  
msid_number | peer-address ipv4_address | summary ] [ | { grep grep_options |  
more } ]
```

all

Displays all related information for all active ASN PC service sessions.

callid *call_id*

Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

full

Displays all available information for the associated display or filter keyword.

msid *msid_number*

Displays available information for the specific mobile station identification number.
msid_number must be an MSID number.

peer-address *ipv4_address*

Address of specific peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

summary

Displays summary of available information for associated display or filter keyword (previous keyword).

| { grep *grep_options* | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for an ASN PC session.

show asnpc-service session

Example

The following command displays all available ASN PC session counters in verbose mode.

```
show asnpc-service session all
```

The following command displays full ASN PC session counters in verbose mode.

```
show asnpc-service session full
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service session counters

This command displays session counters for ASN PC service sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asngw-service session counters [ all | callid call_id | msid msid_number |  
peer-address ipv4_address | verbose ] ] [ { grep grep_options | more } ]
```

all

Displays all available counters for all ASN PC service sessions.

callid *call_id*

Displays available information for the specific call identification number.
call_id must be an eight-digit HEX number.

msid *msid_number*

Displays available information for the specific mobile station identification number.
msid_number must be an MSID number.

peer-address *ipv4_address*

Address of specific IP peer.
ipv4_address must be an IPv4 address, in dotted decimal notation.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { grep *grep_options* | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the counters of an ASN PC session.

Example

The following command displays the counters for ASN PC service sessions in verbose mode.

■ show asnpc-service session counters

show asnpc-service session counters verbose

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service session counters verbose

This command displays session counters for ASN PC service sessions in complete detail.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asngw-service session counters verbose [ function-type { context-transfer |
im-operations | ms-state-change | paging } ] [ all | callid call_id | msid
msid_number | peer-address ipv4_address ] [ [ | { grep grep_options | more } ]
```

all

Displays all available counters for all ASN PC service sessions in verbose mode.

callid *call_id*

Displays available information for the specific call identification number in verbose mode.
call_id must be an eight-digit HEX number.

function-type { context-transfer | im-operations | ms-state-change | paging }

Displays the counters for specific type of functions in an ASN GW session.

context-transfer: Displays information about context-transfer messages.

im-operations: Displays information about idle mode state operation messages.

ms-state-change: Displays information about MS state change messages.

paging: Displays information about paging messages.

msid *msid_number*

Displays available information for the specific mobile station identification number in verbose mode.
msid_number must be an MSID number.

peer-address *ipv4_address*

Address of specific IP peer.

ipv4_address must be an IPv4 address, in dotted decimal notation.

r4-only

Displays statistics of R4 interface in ASN PC services in verbose mode.

r6-only

Displays statistics of R6 interface in ASN PC services in verbose mode.

■ `show asnpc-service session counters verbose`

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the counters of an ASN PC session in verbose mode.

Example

The following command displays the counters for data path type function.

```
show asnpc-service session counters verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service statistics

Displays statistics for all ASN PC service sessions.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asngw-service statistics [ name service_name | peer-address ipv4_address |  
verbose ] [ | { grep grep_options | more } ]
```

name *service_name*

Displays specific service.

service_name must be a service name.

The service name can be one to 63 alpha and/or numeric characters long.

peer-address *ipv4_address*

Address of specific IP Peer.

ipv4_address must be an IPv4 address, in dotted decimal notation.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display ASN PC statistics.

Example

The following command displays information about ASN PC service in verbose mode.

```
show asnpc-service statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show asnpc-service statistics verbose

Displays statistics for all ASN PC service in verbose mode.

Product

ASN GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show asnpc-service statistics verbose [ function-type { context-transfer | im-
operations | ms-state-change | paging } ] | all | r4-only | r6-only ] [ | { grep
grep_options | more } ]
```

```
function-type { context-transfer | ms-state-change | paging }
```

Displays the statistics for specific type of functions in an ASN PC service in verbose mode.

context-transfer: Displays information about context-transfer messages.

im-operations: Displays information about idle mode state operation messages.

ms-state-change: Displays information about MS state change messages.

paging: Displays information about paging messages.

```
all
```

Displays statistics of all ASN PC services in verbose mode.

```
r4-only
```

Displays statistics of R4 interface in ASN PC services.

```
r6-only
```

Displays statistics of R6 interface in ASN PC services.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display ASN PC service statistics in verbose mode.

Example

The following command displays information about selected MS-State-Change function.

```
show asnpc-service statistics verbose function-type ms-state-change
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show banner

Displays the configured banner message for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show banner { all | charging-service | motd | lawful-intercept | pre-login } [ |
{ grep grep_options | more } ]
```

all

Displays all banners configured for a service in a system including enhanced charging service.

charging-service

Displays banner message configured for a enhanced charging service in current context.

motd

Display the banner message that is configured for the current context.

lawful-intercept

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Show the configured banner to verify the message of the day contents for possible change

Example

```
show banner
```

show bcmcs counters

Displays BCMCS-specific counters and statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show bcmcs counters { all | callid call_id | flow-id flow_id }
```

all

Displays BCMCS-specific counters and statistics for all multicast sessions.

callid *call_id*

Displays BCMCS-specific counters and statistics for a specific call ID.

flow_id *flow_id*

Displays BCMCS-specific counters and statistics for a specific BCMCS flow, defined by a flow ID.

Usage

Use this command to view BCMCS-specific statistics. You may narrow the results of the command output by specifying a specific call ID or flow ID.

Example

```
show bcmcs counters all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show bcmcs statistics

Displays BCMCS-specific statistics for the current PDSN-service.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show bcmcs statistics [ pdsn-service service_name ]
```

pdsn-service service_name

Defines a specific PDSN service from which to gather BCMCS-specific statistics.

Usage

Shows several sets of BCMCS-specific statistics, and may be configured to show statistics only for a certain PDSN service.

Example

```
show bcmcs statistics pdsn-service service_name
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show boot

Displays information on the current boot image in use.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show boot [ initial-config | { grep grep_options | more } ]
```

initial-config

Identifies the OS image, configuration file, and boot priority used during the initial start up of the system.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Show the boot information in preparing for maintenance activities by verifying current boot data. The boot image in use may not be the same as the boot image stored on the SMC due to upgrades and pending reboots. **show boot initial-config** displays the actual boot image and configuration file loaded during boot. This may or may not be the highest priority image and makes this command useful when comparing the loaded image to the priority list.

Important: This command is not supported on all platforms.

Example

The following command displays the boot system configuration priority list:

```
show boot
```

The following command displays the initial configuration after a system boot:

```
show boot initial-config
```

show bssap+ statistics

Displays statistics for base station system application part plus in a Gs service sessions.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show bssap+ statistics [ gs-service gs_svc_name ] [ vlr { name vlr_name | isdn-number E164_ISDN_Num } ] [ verbose ] [ | { grep grep_options | more } ]
```

gs-service *gs_svc_name*

Specifies the name of a specific Gs service to filter the BSSAP+ information.

gs_svc_name is the name of a configured Gs service for which BSSAP+ is applied and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

vlr { **name** *vlr_name* | **isdn-number** *E164_ISDN_Num* }

Specifies the name of the VLR or SS7 address in E.164 ISDN format to filter the BSSAP+ information.

name vl_name is name of the VLR must be an alpha and/or numeric string of 1 to 63 characters.

E164_VLR_num is an ISDN number for VLR per E.164 number plan and must be an numerical string of 1 to 15 digits.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the statistics of BSSAP+ application on a system.

Example

The following command displays information about BSSAP+ in a Gs service named *gssvc1*.

```
show bssap+ statistics gs-service gssvc1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show bulkstats

Displays the information on bulk statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show bulkstats [ [ data ] | [ schemas ] | [ variables [ aal2 | alcap | apn |
asngw | asnpc | bcmcs | card | closedrp | common | context | cs-network-ranap |
cs-network-rtp | cscf | cscfintf | dcca | diameter-acct | diameter-auth |
diameter-acct | dpca | ecs | egtpc | fa | fng | gprs | gtpc | gtp | gtpu | ha |
hnbgw-hnbap | hnbgw-ranap | hnbgw-rtp | hnbgw-rua | hnbgw-sctp | hsgw | imsa |
ippool | ipsg | lac | lma | lns | mag | mipv6ha | mme | nat-realm | obsolete |
pcc-af | pcc-policy | pcc-quota | pcc-service | pcc-sp-endpt | pdg | pdif | pgw
| phsgw | phspc | port | ppp | ps-network-ranap | radius | rp | sccp | sgsn |
sgtp | sgw | ss7link | ss7rd | system | vpn ] [ obsolete ] ] [ | { grep
grep_options | more } ] ]
```

data

Displays collected bulk statistical data.

schema

Displays the configuration of the statistics to be collected on a per-schema basis.

```
show bulkstats [ [ data ] | [ schemas ] | [ variables [ aal2 | alcap |
apn | asngw | asnpc | bcmcs | card | closedrp | common | context | cs-
network-ranap | cs-network-rtp | cscf | cscfintf | dcca | diameter-acct |
diameter-auth | diameter-acct | dpca | ecs | egtpc | fa | fng | gprs |
gtpc | gtp | gtpu | ha | hnbgw-hnbap | hnbgw-ranap | hnbgw-rtp | hnbgw-
rua | hnbgw-sctp | hsgw | imsa | ippool | ipsg | lac | lma | lns | mag |
mipv6ha | mme | nat-realm | obsolete | pcc-af | pcc-policy | pcc-quota |
pcc-service | pcc-sp-endpt | pdg | pdif | pgw | phsgw | phspc | port |
ppp | ps-network-ranap | radius | rp | sccp | sgsn | sgtp | sgw | ss7link
| ss7rd | system | vpn ] [ obsolete ] ] [ | { grepgrep_options | more } ]
]
```

Displays all valid bulkstat schema statistics, or only the statistics for the specified schema.

If the **obsolete** keyword is used, obsolete (but still available) schema variables are displayed. An asterisk (*) is displayed next to schema variables that have been obsoleted.

For information on available schemas, refer to the *Bulk Statistics Configuration Mode Commands* chapter.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For information on usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command is used to display information on bulk statistics supported by the system.

The **variable** keyword can be used to list statistics supported by the system either for all schemas, or for an individual schema.

The **schema** keyword can be used to display the configuration of bulkstatistic settings including the schema.

The **data** keyword can be used to display bulkstatistic data collected up to that point.

Example

The following command displays the bulk statistics data:

```
show bulkstats data
```

The following command displays the bulk statistics schema configuration:

```
show bulkstats data schemas
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ca-certificate

Displays information for Certificate Authority (CA) certificates on this system.

Product

All

Privilege

Inspector

Syntax

```
show ca-certificate { all | name name }
```

all

Displays CA certificate information for all CA certificates known to this system.

name name

Displays CA certificate information for a specific CA certificate name. *name* must be an existing CA certificate name and be from 1 to 128 alpha and/or numeric characters.

Usage

View information for CA certificates on this system.

Example

The following command displays information for a CA certificate named *cert-1*:

```
show ca-certificate name cert-1
```

Important: Output descriptions for some commands are available in the *Statistics and Counters Reference*.

show ca-crl

Displays information for Certificate Authority (CA) Certificate Revocation List (CRL) on this system.

Product

All

Privilege

Inspector

Syntax

```
show ca-crl { all | name name }
```

all

Displays CA-CRL information for all CA-CRLs known to this system.

name name

Displays CA-CRL information for a specific CA-CRL name. *name* must be an existing CA-CRL name and be from 1 to 128 alpha and/or numeric characters.

Usage

View information for CA-CRLs on this system.

Example

The following command displays information for a CA-CRL named *crl-5*:

```
show ca-crl name crl-5
```

Important: Output descriptions for some commands are available in the *Statistics and Counters Reference*.

show card

Displays card information based upon the filtering options specified.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show card { diag [ card_num ] | hardware [ card_num ] | info [ card_num ] |
mappings | table [ all ] } [ [ | { grep grep_options | more } ]
```

```
diag [ card_num ] | hardware [ card_num ] | info [ card_num ] | mappings
| table [ all ]
```

Specifies what card information is to be displayed.

diag [*card_num*]: indicates diagnostic information is to be displayed for all cards or the card specified by *card_num*. *card_num* must be a value in the range 1 through 48.

hardware [*card_num*]: indicates information on the installed hardware is to be displayed for all cards or the card specified by *card_num*. *card_num* must be a value in the range 1 through 48.

info [*card_num*]: indicates detailed information is to be displayed for all cards or the card specified by *card_num*. *card_num* must be a value in the range 1 to 48.

mappings: indicates the front installed to rear installed card mapping is to be displayed.

table [**all**]: indicates information for each card in front and RCC slots is to be displayed. The **all** keyword indicates all 48 slots are to be displayed.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the card information to verify card installations for front and rear as well as for checking basic or detailed card information.

Example

The following command displays the diagnostic information for a card in slot 8:

```
show card diag 8
```

The following command displays the detailed information for a card in slot 8:

```
show card info 8
```

The following command displays the card mappings for the chassis:

```
show card mappings
```

The following command displays the card table:

```
show card mappings
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show certificate

Displays information for local node certificates configured on this system.

Product

All

Privilege

Inspector

Syntax

```
show certificate { all | name name }
```

all

Displays certificate information for all node certificates configured on this system.

name *name*

Displays information for a specific certificate name. *name* must be an existing certificate name and be from 1 to 128 alpha and/or numeric characters.

Usage

View information for local node certificates on this system.

Example

The following command displays information for a node certificate named *certificate-3*:

```
show certificate name certificate-3
```

Important: Output descriptions for some commands are available in the *Statistics and Counters Reference*.

show cli

Displays current CLI users and associated session information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show cli { session | history } [ | { grep grep_options | more } ]
```

session

Displays information about the current CLI session.

history

Displays CLI command history for this CLI session.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Show current command line interface sessions when there is some unexpected output from a chassis and a check of current CLI users may reveal other activities in progress.

Example

```
show cli
```

show clock

Displays the current system data and time.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show clock [ universal ] [ | { grep grep_options | more } ]
```

universal

Displays the date and time in universal coordinated time (UTC).

grep *grep_options* more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command Output* section of the *Command Line Interface Overview* chapter.

Usage

Check the current time of a chassis to compare with network wide time or for logging purposes if network accounting and/or event records appear to have inconsistent timestamps.

Important: This command is not supported on all platforms.

Example

The following displays the system time in local time and UTC, respectively.

```
show clock
```

```
show clock universal
```

show configuration

Displays current configuration information for the card, context, port, or target configuration file as specified.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show configuration [ card card_num | context name [ radius group [ all | name
group ] ] | port slot/port | srp ] [ showsecrets ] [ url url ] [ verbose ] [ | {
grep grep_options | more } ]
```

```
card card_num | context name [ radius group [ all | name group ] ] | port
slot/port
```

Specifies the type of configuration information to be displayed.

card *card_num*: specifies a specific card for which configuration information is to be displayed.

card_num must be a value in the range 1 through 48.

context *name*: specifies a specific context for which configuration information is to be displayed.

radius *group* [**all** | **name** *group*]: specifies a specific or all RADIUS server group/s configured in a specific context for which configuration information is to be displayed.

port *slot/port*: specifies a specific port for which configuration information is to be displayed.

srp

Shows the Service Redundancy Protocol configuration.

showsecrets

Show encrypted/unencrypted secret keys saved in the configuration. If this keyword is not specified, secret keys are not displayed.

url *url*

Default: configuration which is currently in use.

This keyword is not available to users with Operator level permissions. Specifies the location of the configuration data to use for information display. The *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

Specifies the source of the copy. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

```
•[file: ]{ /flash | /pcmcial | /hd }[ /directory ]/file_name
•tftp://{ host[ :port# ] }[ /directory ]/file_name
•[ http: | ftp: | sftp: ]//[ username[ :password ]@ ] { host }[
:port# ][ /directory ]/file_name
```

directory is the directory name.

filename is the actual file of interest.

Important: Configuration files should be named with a `.cfg` extension.

`username` is the user to be authenticated.

`password` is the password to use for authentication.

`host` is the IP address or host name of the server.

`port#` is the logical port number that the communication protocol is to use.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the current configuration to review recent changes.

Important: This command is not supported on all platforms.

Example

The following command displays the local in use port configuration information for port `24/1` in verbose mode.

```
show configuration port 24/1 verbose
```

The following command displays the card configuration for card `17` on host `remoteABC` stored in the configuration file in `/pub/config.cfg`.

```
show configuration card 17
```

The following command displays the configuration of all RADIUS server groups configured in context `local`

```
show configuration context local radius group all
```

The following command shows the configuration for a context named PDIF.

```
show configuration context pdif
```

show configuration errors

Displays current configuration errors and warning information for the target configuration file as specified for a service.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show configuration errors [ section { aaa-config | active-charging | apn | apn-
profile | apn-remap-table | asngw-service | asnpc-service | call-control-profile
| camel-service | closed-rp-service | cs-network | cscf-service | diameter |

sgs-service | sgsn-mode | sgsn-service | sgtp-service | sgw-service |
subscriber-config | subscriber-map }
```

Specifies the services and section to display and validate configuration.

aaa-config: Displays configuration errors/warnings for the AAA service(s) configured on the system.

active-charging: Displays configuration errors/warnings for the Enhanced Charging Service(s) and the Personal Stateful Firewall service(s) configured on the system.

apn: Displays configuration errors/warnings for the APN configuration(s) on the system.

apn-profile: Displays configuration errors/warnings for the APN Profile configuration(s) on the system.

apn: Displays configuration errors/warnings for the APN Remap Table configuration(s) on the system.

asngw-service: Displays configuration errors/warnings for the Access Service Network Gateway (ASN-GW) Service configured in a specific context for which configuration errors/warnings is to be displayed.

asnpc-service: Displays configuration errors/warnings for the ASN Paging Controller and Location Registry (ASN PC-LR) Service(s) configured on the system.

call-control-profile: Displays configuration errors/warnings for the Call Control Profile configuration(s) on the system.

camel-service: Displays configuration errors/warnings for the CAMEL Service configuration(s) on the system.

closed-rp-service: Displays configuration errors/warnings for the closed RP service(s) configured on the system.

cs-network: Displays configuration errors/warnings for the CS Network configuration(s) on the system.

cscf-service: Displays configuration errors/warnings for the Call Session Control Function (CSCF) service(s) configured on the system.

diameter: Displays configuration errors/warnings for the Diameter configuration(s) on the system.

Service

dns-client: Displays configuration errors/warnings for the DNS Client configuration(s) on the system.

egtp-service: Displays configuration errors/warnings for the eGTP Service configuration(s) on the system.

fa-service: Displays configuration errors/warnings for the Foreign Agent (FA) service(s) configured on the system.

fng-service: Displays configuration errors/warnings for the FNG configuration(s) on the system.

ggsn-service: Displays configuration errors/warnings for the GGSN service(s) configured on the system.

gprs-service: Displays configuration errors/warnings for the GPRS service(s) configured on the system.

gs-service: Displays configuration errors/warnings for the GS service(s) configured on the system.

ha-service: Displays configuration errors/warnings for the Home Agent (HA) service(s) configured on the system.

hnbgw-service: Displays configuration errors/warnings for the HNB-GW Service configuration(s) on the system.

hsgw-service: Displays configuration errors/warnings for the HSGW service(s) configured on the system.

imei-profile: Displays configuration errors/warnings for the IMEI Profile configuration(s) on the system.

imsa-config: Displays configuration errors/warnings for the IMSA configuration(s) on the system.

imssh-service: Displays configuration errors/warnings for the IMS Sh (IMSSh) service(s) configured on the system.

imsue-service: Displays configuration errors/warnings for the IMS UE service(s) configured on the system.

ipms: Displays configuration errors/warnings for the IPMS service(s) configured on the system.

ipsg-service: Displays configuration errors/warnings for the IP Security Gateway (IPSG) service(s) configured on the system.

iups-service: Displays configuration errors/warnings for the IuPS service(s) configured on the system.

lac-service: Displays configuration errors/warnings for the Layer 2 Tunneling Protocol (L2TP) Access Concentrator (LAC) service(s) configured on the system.

lns-service: Displays configuration errors/warnings for the L2TP Network Server (LNS) service(s) configured on the system.

local-policy: Displays configuration errors/warnings for the Local Policy configuration(s) on the system.

map-service: Displays configuration errors/warnings for the MAP service(s) configured on the system.

mme-service: Specifies the configuration errors for MME service configured in a specific context for which configuration errors/warnings is to be displayed.

operator-policy: Displays configuration errors/warnings for the Operator Policy configuration(s) on the system.

pcc-policy-service: Displays configuration errors/warnings for the PCC Policy Service configuration(s) on the system.

pcc-quote-service: Displays configuration errors/warnings for the PCC Quote Service configuration(s) on the system.

pcc-service: Displays configuration errors/warnings for the PCC Service configuration(s) on the system.

pdg-service: Displays configuration errors/warnings for the PDG Service configuration(s) on the system.

pdif-service: Displays configuration errors/warnings for the PDIF service(s) configured on the system.

pdsn-service: Displays configuration errors/warnings for the PDSN service(s) configured on the system.

pgw-service: Displays configuration errors/warnings for the P-GW Service configuration(s) on the system.

phsgw-service: Displays configuration errors/warnings for the PHS Gateway service(s) configured on the system.

policy-grp-config: Displays configuration errors/warnings for the Policy Group configuration(s) on the system.

ps-network: Displays configuration errors/warnings for the PS Network configuration(s) on the system.

sccp-network: Displays configuration errors/warnings for the SCCP network configuration(s) on the system.

sgs-service: Displays configuration errors/warnings for the SGs Service configuration(s) on the system.

sgsn-mode: Displays configuration errors/warnings for the SGSN Mode configuration(s) on the system.

sgsn-service: Displays configuration errors/warnings for the SGSN service(s) configured on the system.

sgtp-service: Displays configuration errors/warnings for the SGTP service(s) configured on the system.

sgw-service: Displays configuration errors/warnings for the S-GW Service configuration(s) on the system.

subscriber-config: Displays configuration errors/warnings for the Subscriber configuration(s) on the system.

subscriber-map: Displays configuration errors/warnings for the Subscriber Map configuration(s) on the system.

verbose

Indicates the output should provide as much information as possible. If this option is not specified then the output will be the standard level which is the concise mode.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For more information on the usage of **grep** and **more**, refer *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the current configuration errors and warning to review recent changes.

Example

The following command displays configuration errors and warnings for all services configured in a context/system:

```
show configuration errors verbose | more
```

The following command displays configuration errors and warnings for Enhanced Charging service and Personal Stateful Firewall service configured in a context:

```
show configuration errors section active-charging verbose
```

show congestion-control

Displays information pertaining to congestion control functionality on the system

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show congestion-control { configuration | statistics { allmgr | asngwmgr |
asnpcmgr | egtpinmgr | gtpcmgr | hamgr | l2tpmgr } [ all | instance
task_instance ] } [ | { grep grep_options | more } ]
```

configuration

Displays congestion control configuration information including threshold parameters and policy settings for the configured services.

statistics

Displays congestion control statistics for one of the following services:

allmgr: Specifies that statistics are displayed for PDSN services.

asngwmgr: Specifies that statistics are displayed for ASN GW services.

asnpcmgr: Specifies that statistics are displayed for ASN PC-LR services.

egtpinmgr: Specifies that statistics are displayed for EGTP ingress demuxmgr.

gtpcmgr: Specifies that statistics are displayed for GGSN services.

hamgr: Specifies that statistics are displayed for HA services.

l2tpmgr: Specifies that statistics are displayed for L2TP managers.

all: Select this keyword to display statistics based on the current state of all instances of the specified task.

instance task_instance: Specifies that statistics are to be displayed for a specific software task instance. *task_instance* can be configured to any integer value from 1 to 128.

Important: The **inst** column of the **show task table** command output can be used to determine the instance of a particular task.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

This command displays congestion control configuration information or statistics for a particular service type. When the **all** keyword is used, the system compares the current state of all instances of the specified task. The state is based on whether or not any congestion control thresholds have been exceeded. If one or more

instances are experiencing congestion, the state is displayed as “Applied”, and the various thresholds that have been crossed are indicated.

Example

The following command displays congestion control statistics for a PDSN service using an **allmgr** task with an instance of 2:

```
show congestion-control statistics allmgr instance 2
```

The following command displays congestion control statistics for an ASN GW service using an **asnngwmgr** task with an instance of 2:

```
show congestion-control statistics asnngwmgr instance 2
```

The following command displays congestion control statistics for an ASN PC-LR service using an **asnpcmgr** task with an instance of 2:

```
show congestion-control statistics asnpmgr instance 2
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering category database

This command displays details of the specified category based content filtering database for content filtering application configured in a system/service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show content-filtering category database [ active | all | facility srdbmgr { all
| instance instance_value } | url url_string ] [ verbose ] [ | { grep
grep_options | more } ]
```

active

Displays the information about all active databases, for example databases in memory. This is the default setting for category database information.

all

Displays the information about all active databases, for example, databases in memory and all saved databases on a system.

facility

Displays logged events for a specific facility.

srdbmgr { all | instance instance_value }

Displays logged events for all static rating database managers or for all or for a specific instance.

- **all**: Displays the logged events for all SRDB Manager instances.
- **instance instance_value**: Displays events logged for a specific SRDB Manager instance. *instance_value* must be an integer from 1 through 8.

url url_string

Displays the information of the specific database located at the given URL. *url_string* specifies the name/location of category database to retrieve information, and must be an alpha and/or numeric string of 1 through 512 characters in length.

verbose

This option enables the detailed mode for additional information display for specific database.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information of database for category based content filtering application in a service.

Example

The following command displays a detailed information for all active databases in memory.

```
show content-filtering category database active all
```

The following command displays the CF database status of all running SRDB manager.

```
show content-filtering category database facility srdbmgr all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering category policy-id

This command displays Content Filtering category policy definitions.

Important: In StarOS 8.1 and later releases this command is replaced by the [show active-charging content-filtering category policy-id](#) command.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show content-filtering category policy-id { all | id cf_policy_id } [ | { grep
grep_options | more } ]
```

all

Displays definitions of all Content Filtering category policies.

id cf_policy_id

Displays definitions of a specific Content Filtering category policy.

cf_policy_id must be a preconfigured category policy ID, and must be an integer from 1 through 4294967295.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view Content-Filtering Category definitions for a specific/all Policy IDs.

Example

The following command displays Content Filtering category definitions for policy ID 3:

```
show content-filtering category policy-id id 3
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering category statistics

This command displays statistics for the Category-based Content Filtering application configured in a system/service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show content-filtering category statistics [ facility srdbmgr { all | instance
instance_value } ] [ | { grep grep_options | more } ]
```

facility

Displays logged events for a specific facility.

srdbmgr { all | instance instance_value }

Displays logged events for all Static Rating Database (SRDB) Manager instances or for the specified instance.

- **all**: Displays events logged for all SRDB Manager instances.
- **instance instance_value**: Displays events logged for a specific SRDB Manager instance.

instance_value must be an integer from 1 through 8.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view the statistics of Category Based Content Filtering application in a service. This command's output also indicates capability of the system to perform Content Filtering and Dynamic Content Filtering if configured.

Important: Content filtering cannot be performed if less than two PSCs are activated. Dynamic Content Filtering cannot be performed if less than three PSCs are activated.

Example

The following command displays the detailed statistics of configured category based content filtering application:

```
show content-filtering category statistics
```

The following command displays the detailed statistics of configured category based content filtering application based on running SRDB Manager *instance1*.

■ show content-filtering category statistics

```
show content-filtering category statistics facility srdbmgr instance  
instance1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering category url

This command displays the information about the categories of the database at the specific URL configured for category based content filtering application in a system/service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show content-filtering category url url_string [ policy-id cf_policy_id |  
rulebase rulebase_name ] [ verbose ] [ | { grep grep_options | more } ]
```

url *url_string*

Displays the category information of the specific URL.

url_string specifies the URL, and must be an alpha and/or numeric string of 1 through 512 characters in length.

policy-id *cf_policy_id*

Displays the category information of specific URL configured with specified content filtering category policy ID.

cf_policy_id must be a category policy ID configured in the ACS Configuration Mode, and must be an integer from 0 through 65535.

rulebase *rulebase_name*

This option displays the category information of specific URL configured in ACS Configuration Mode for Category-based content filtering in specific rulebase.

rulebase_name must be the name of an existing rulebase, and must be an alpha and/or numeric string of 1 through 15 characters in length.

verbose

This option enables the detailed mode for additional information display for specific database.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information of a database URL for category based content filtering application in a service.

■ show content-filtering category url

Example

The following command displays a detailed information for all active databases in memory.

```
show content-filtering category url verbose /cf_server/cf/optcmd.bin
verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show content-filtering server-group

This command displays information for content Filtering Server Group (CFSG) configured in the service.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show content-filtering server-group [ name cfsg_name | statistics ] | [ | { grep  
grep_options | more } ]
```

name *cfsg_name*

Displays information for the specified CFSG.

cfsg_name must be the name of a CFSG, and must be an alpha and/or numeric string of 1 through 63 characters in length.

statistics

Displays statistical information for all configured CFSGs.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for Content Filtering Server Group configured in a service.

Example

The following command displays a detailed information for all charging actions:

```
show content-filtering server-group statistics
```

The following command displays a details of a specific charging action:

```
show content-filtering server-group name test123
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show context

Displays information on currently configured contexts.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show context [ all | name context_name ] [ | { grep grep_options | more } ]
```

all | **name** *context_name*

all: Display information for all currently configured contexts.

name *context_name*: Display information for the context specified as *context_name* only.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View configured contexts when the context of interest needs to be looked up. This may be useful in verifying configuration or in troubleshooting the system.

Example

The following command displays information for the configured context named *sampleContext*:

```
show context name sampleContext
```

The following command displays information for all contexts:

```
show context all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cpu

Displays information on system CPUs.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show cpu { info [ card card_num [ cpu cpu_num ] ] [ graphs ] [ verbose ] | table
} [ | { grep grep_options | more } ]
```

info [**card** *card_num* [**cpu** *cpu_num*]] [**graphs**] [**verbose**]

Specifies information for an entire card or a specific CPU is to be displayed.

card *card_num*: Specifies the card to display associated information. *card_num* must be a value in the range 1 through 48 and must refer to an installed card.

cpu *cpu_num*: Optionally selects a specific CPU on the card of interest to display specific information. *cpu_num* must be a value in the range 0 through 3 and must refer to an installed CPU.

graphs: In addition to textual CPU information display CPU utilization information in graphs.

verbose: Output is to display all information available.

table

Display, in tabular format, all cards and CPUs.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View CPU statistics to aid in diagnosing service problems for the case of overload conditions.

Important: This command is not supported on all platforms.

Example

The following command displays the CPU information in tabular format for all CPUs on all installed cards:

```
show cpu table
```

The following command displays CPU information for card 8 in verbose mode:

```
show cpu info card 8 verbose
```

■ show cpu

The following command displays information for CPU 0 on card 1:

```
show cpu info card 1 cpu 0
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crash

Displays summary of crashes or information on a specific crash.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crash { list | number crash_num } [ | { grep grep_options | more } ]
```

list | **number** *crash_num*

list: Indicates a list of recent crash data is to be displayed.

number *crash_num*: Indicates the information for the crash specified by *crash_num* is to be displayed. The crash number must be an existing crash which would be displayed using the **list** keyword.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the crash list to determine frequency of crashes or if crashes occur at some specific time of day. This may also be used to view information on a specific crash to aid in troubleshooting.

Example

The following displays the list of recent crashes.

```
show crash list
```

The following command will display the crash information for crash number 11.

```
show crash number 11
```

show credit-control sessions

This command displays credit control sessions information.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show credit-control session [ all | callid | full | mdn | nai | summary ] [ | {
grep grep_options | more } ]
```

```
session [ all | callid | full | mdn | nai | summary ]
```

Displays the credit control session status based on the following keywords:

all: Displays all available information for Credit Control sessions

callid: Displays the Credit Control SessionCall ID

full: Displays All available information for the associated display or the filter keyword

mdn: Displays the Credit Control MDN

nai: Displays the Credit Control NI

summary: Displays the summary of Credit Control session information

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to show active credit control application for service sessions.

Example

The following command shows the configured Credit Control application sessions:

```
show credit-control sessions
```

show credit-control statistics

This command displays credit control statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show credit-control statistics cc-service name
```

cc-service

Specifies the Credit Control Service name.

name must be an existing Credit Control Service, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to show active credit control statistics.

Example

The following command shows the configured credit control statistics for a service named *service1*:

```
show credit-control statistics cc-service service1
```

show crypto group

Displays information pertaining to configured crypto groups.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto group [ name group_name | summary ]
```

name *group_name*

Displays information for a specific crypto group.

group_name is the name of the group for which to display information.

summary

Displays state and statistical information for configured crypto groups in this context.

Usage

Use this command to display information and statistics pertaining to one or all configured crypto groups within the current context.

If the **summary** keyword is not used, detailed information is displayed.

The following command displays detailed information for a crypto group called *group1*:

```
show crypto group name group1
```

show crypto ikev1

Displays pre-shared key information for peer security gateways configured within the context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto ikev1 { keys | policy [ preference ] | security-associations [
summary ] }
```

keys

Specifies the IKE pre-shared key information based on the peer security gateway.

policy [preference]

Specifies the IKE policy priority for which configuration information will be displayed. The priority can be configured to any integer value from 1 to 100. If no preference is specified, information will be displayed for all configured policies.

security-associations [summary]

Specifies that established IPsec SA information should be displayed.

Usage

Use this command to:

- Display pre-shared key information. This information can be used to verify configuration and/or for troubleshooting.
- Verify the configuration of IKE policies within the context.
- Display established IPsec SA information. This information can be used for troubleshooting.

Example

The following command lists the pre-shared keys received from peer security gateways as part of the Diffie-Hellman exchange:

```
show crypto ikev1 keys
```

The following command displays information for an IKE policy with a preference of 1:

```
show crypto ikev1 policy 1
```

The following command displays the currently established SAs:

```
show crypto ikev1 security-associations summary
```

■ show crypto ikev2-ikesa security-associations summary

show crypto ikev2-ikesa security-associations summary

Summary view of ikev2-ikesa SAs

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

```
show crypto ikev2-ikesa security-associations summary
```

Usage

Shows a summary of the of the SAs configured for a crypto template. It shows the total configured SA lifetime in seconds and the number of seconds left on the timer.

Example

Use this command to create the SA summary:

```
show crypto ikev2-ikesa security-associations summary
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto ipsec

Displays IPSec security associations (SAs) configured within or facilitated by the context and can optionally display statistics for them.

Product

PDSN, GGSN, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto ipsec security-associations map-type { ipsec-3gpp-cscf-subscriber |
ipsec-dynamic | ipsec-ikev1 | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip } |
summary [ distribution | ipsecmgr ipsec_mgr_id | map-type map_type ] | tag
map_name
```

```
map-type { ipsec-dynamic | ipsec-ikev1 | ipsec-l2tp | ipsec-manual |
ipsec-mobile-ip }
```

Specifies that information for all crypto maps of a specific type configured within the context will be displayed. The following types can be specified:

- **ipsec-3gpp-cscf-subscriber**: P-CSCF Subscriber IPSec Tunnel
- **ipsec-dynamic**: Dynamic IPSec Tunnel
- **ipsec-ikev1**: IKEv1 IPSec Tunnel
- **ipsec-ikev2-subscriber**: IKEv2 Subscriber Tunnel
- **ipsec-l2tp**: L2TP IPSec Tunnel
- **ipsec-manual**: Manual (Static) IPSec Tunnel
- **ipsec-mobile-ip**: Mobile IP IPSec Tunnel

```
summary [ distribution | ipsecmgr ipsec_mgr_id | map-type map_type |
template-map map_name ]
```

Specifies that only security association summary information should be displayed.

distribution: Show IPSec Manager SA distribution information.

ipsecmgr ipsec_mgr_id: Show summary SA information for the specified IPSec manager instance ID. must be an integer from 1 through 200.

map-type map_type: Show summary SA information for the specified type of crypto map. The following types can be specified:

- **ipsec-3gpp-cscf-subscriber**: P-CSCF Subscriber IPSec Tunnel
- **ipsec-dynamic**: Dynamic IPSec Tunnel
- **ipsec-ikev1**: IKEv1 IPSec Tunnel
- **ipsec-l2tp**: L2TP IPSec Tunnel
- **ipsec-manual**: Manual (Static) IPSec Tunnel
- **ipsec-mobile-ip**: Mobile IP IPSec Tunnel

■ show crypto ipsec

tag *map_name*

Specifies that SAs should be displayed for the specified crypto map.

map_name is the name of the crypto map configured in the context and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to display IPSec SA information and statistics. This information can be used for performance monitoring and/or troubleshooting.

The displayed information categorizes control signal and data statistics. Data statistics are further categorized according to the encapsulation method, either GRE or IP-in-IP.

Example

The following command displays summary SA statistics for all IPSec managers.

```
show crypto ipsec security-associations summary
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto ipsec transform-set

Displays IPsec transform set configuration information.

Product

PDG/TTG

PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto ipsec transform-set [ transform_name ]
```

transform_name

Specifies the name of a particular IPsec transform set for which to display information.

transform_name is the name of the IPsec transform set and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to verify the configuration of IPsec transform sets within the context.

If no keyword is specified, information will be displayed for all IPsec transform sets configured within the context.

Important: This command is used in PDIF Release 8.3 only.

Example

The following command displays information for an IPsec transform set named test1:

```
show crypto ipsec transform-set test1
```

show crypto isakmp keys

Displays pre-shared key information for peer security gateways configured within the context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto isakmp keys
```

Usage

Use this command to display pre-shared key information based on the peer security gateway. This information can be used to verify configuration and/or for troubleshooting.

Example

The following command lists the pre-shared keys received from peer security gateways as part of the Diffie-Hellman exchange:

```
show crypto isakmp keys
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto isakmp policy

Displays ISAKMP policy configuration information.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto isakmp policy [ preference ]
```

preference

Specifies the ISAKMP policy priority for which configuration information will be displayed. The priority can be configured to any integer value from 1 to 100.

Usage

Use this command to verify the configuration of ISAKMP policies within the context. If no *preference* is specified, information will be displayed for all configured policies.

Example

The following command displays information for an ISAKMP policy with a preference of 1:

```
show crypto isakmp policy 1
```

show crypto isakmp security-associations

Displays currently established IKE security associations (SAs) facilitated by the context.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto isakmp security-associations [ cookies ]
```

cookies

Specifies that cookies should be displayed.

Usage

Use this command to display established IPsec SA information. This information can be used for troubleshooting.

Example

The following command displays the currently established SAs:

```
show crypto isakmp security-associations
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto managers

Shows statistics per IPSec Manager.

Product

PDSN, GGSN, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto managers [ context context_id | crypto-map map_name | instance
instance_num | summary [ distribution | ike-stats | ipsec-3gpp-cscf-stats |
ikev2-stats [ demux-stats ] | ipsec-sa-stats | npu-stats ] ]
```

context *context_id*

Show IPSec manager statistics for the context with the specified context identifier number.
must be an integer from 1 through 64.

crypto-map *map_name*

Show IPSec Managers for a specific crypto map.
map_name must be the name of an existing crypto map.

instance *instance_num*

Show statistics for the specified IPSec manager instance.
instance_num must be an integer from 1 through 284.

summary [**distribution** | **ike-stats** | **ipsec-3gpp-cscf-stats** | **ikev2-stats**
[**demux-stats**] | **ipsec-sa-stats** | **npu-stats**]

Shows stats per service IP address for each manager.

distribution: Shows a summary list of IPSec manager distribution.

ike-stats: Shows a summary list of IPSec IKE statistics. for each IPSec manager.

ipsec-3gpp-cscf-stats - Displays CSCF IPSec Statistics on each IPSec Manager.

ikev2-stats: Displays IKEv2 Statistics on each IPSec Manager.

- **demux-stats**: Displays session demux statistics on each IPSec Manager.

ipsec-sa-stats: Shows a summary list of IPsec Security Association statistics for each IPSec Manager.

npu-stats: Displays NPU statistics on each IPSec Manager.

Usage

Use this command to view statistics relating to IPSec managers.

Example

The following command displays summary information for all IPSec managers:

```
show crypto managers summary
```

■ show crypto managers

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto map

Displays crypto map configuration information.

Product

PDIF, PDSN, GGSN, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto map [ map-type [ ipsec-3gpp-cscf-subscriber | ipsec-dynamic | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip ] | tag map_name | summary ]
```

```
map-type [ ipsec-3gpp-cscf-subscriber | ipsec-dynamic | ipsec-ikev1 | ipsec-ikev2-subscriber | ipsec-l2tp | ipsec-manual | ipsec-mobile-ip ]
```

Specifies that information for all crypto maps of a specific type configured within the context will be displayed. The following types can be specified:

- **ipsec-3gpp-cscf-subscriber**: P-CSCF subscriber IPsec Tunnel
- **ipsec-dynamic**: Dynamic IPsec Tunnel
- **ipsec-ikev1**: IKEv1 IPsec Tunnel
- **ipsec-ikev2-subscriber**: IKEv2 Subscriber Tunnel
- **ipsec-l2tp**: L2TP IPsec Tunnel
- **ipsec-manual**: Manual (Static) IPsec Tunnel
- **ipsec-mobile-ip**: Mobile IP IPsec Tunnel

```
tag map_name
```

Specifies the name of a crypto map for which to display configuration information.

map_name is the name of the crypto map configured in the context and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

summary

Displays summary information for all crypto maps configured in the context.

Usage

Use this command to verify the configuration of crypto maps within the context.

If no keyword is specified, information will be displayed for all maps configured within the context regardless of type.

Example

The following command displays configuration information for a dynamic crypto map named *test_map3*:

```
show crypto map tag test_map3
```

■ show crypto map

show crypto statistics

Displays IPsec statistics.

Product

PDSN, GGSN, PDG/TTG, PDIF, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto statistics ikev1 | ikev2 [service-ip-address ip-address ] [ service-name name ] | ipsec-3gpp-cscf [ service-ip-address ip-address ] [ service-name name ]
```

ikev1

Displays global ikev1 statistics for this context.

```
ikev2 [ service-ip-address ip-address ] [ service-name name ]
```

Displays global ikev2 statistics for this context.

service-ip-address *ip-address*: Specified PDIF service ip address.

service-name *name*: Specified PDIF service name.

```
ipsec-3gpp-cscf [ service-ip-address ip-address ] [ service-name name ]
```

Displays global CSCF IPsec SA statistics for this context.

service-ip-address *ip-address*: Specified CSCF service IP address.

service-name *name*: Specified CSCF service name.

Usage

Use this command to display statistics for IPsec tunnels facilitated by the context. This information can be used for performance monitoring and/or troubleshooting

Example

The following command displays cumulative IPsec statistics for the current context:

```
show crypto statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show crypto transform-set

Displays transform set configuration information.

Product

PDIF, PDSN, GGSN, SCM

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show crypto transform-set [ transform_name ]
```

transform_name

Specifies the name of a particular transform set for which to display information.

transform_name is the name of the transform set and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to verify the configuration of transform sets within the context.

If no keyword is specified, information will be displayed for all transform sets configured within the context.

Important: This command is used in PDIF Release 8.1. In PDIF Release 8.3, the syntax of this command is changed to **show crypto ipsec transform-set**.

Example

The following command displays information for a transform set named test1:

```
show crypto transform-set test1
```

show cs-network

Displays statistics for CS-network(s) instance configured on a chassis for HNB-GW service sessions.

Product

HNB-GW

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show cs-network { all | name cs_name } [ status ] [ | { grep grep_options | more } ]
```

all

Displays status counters for all CS networks configured for HNB-GW service sessions on a chassis.

name cs_name

Displays status counters for a specific CS network configured for HNB-GW service sessions on a chassis. *cs_name* specifies the name of a configured CS network instance on a chassis for HNB-GW service sessions and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display the status of any or all CS-network(s) instance configured on a chassis for HNB-GW service sessions..

Example

The following command displays the output for CS network instance status named *cs_1_hnb*:

```
show cs-network name cs_1_hnb status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cs-network counters

This command displays the session counter information for HNB-CS Network associated with Home-NodeB Gateway (HNB-GW) services configured and running on a system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show cs-network counters [ name cs_svc_name [ msc msc_point_code ] ] [ | { grep
grep_options | more } ]
```

name *cs_svc_name*

This keyword is used to filter the counter display based on the HNB-CS Network service name *cs_svc_name* configured and associated with HNB-GW service running on system. *cs_svc_name* must be an existing HNB-CS Network service, and be from 1 to 63 alpha and/or numeric characters in length.

msc *msc_point_code*

This keyword is used to filter the counter display filtered on the basis of MSC address provided in SS7 point code *msc_point_code* which is connected to particular HNB-CS Network service. *msc_point_code* must be the address of an MSC in SS7 point code notation.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session counter information for HNB-CS Network services configured and MSCs connected on a system.

Example

The following command displays the counters for the HNB-CS Network service named *hnb_cs_svc1*:

```
show cs-network counters name hnb_cs_svc1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cs-network statistics

This command displays the session statistics for Home-NodeB Gateway (HNB-GW) services configured and running on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show cs-network statistics [ name cs_svc_name | ranap-only | rtp-only | sccp-
only ] [ | { grep grep_options | more } ]
```

name *cs_svc_name*

This keyword is used to filter the session statistics display based on the HNB-CS Network service name *cs_svc_name* configured and associated with an HNB-GW service running on this system. *cs_svc_name* must be an existing HNB-CS Network service, and be from 1 to 63 alpha and/or numeric characters in length.

ranap-only

This keyword is used to filter the session statistics display limited to Radio Access Network Application Protocol (RANAP) traffic only for selected HNB-CS Network service which is configured and associated with an HNB-GW service running on this system.

rtp-only

This keyword is used to filter the session statistics display limited to Realtime Streaming Protocol (RTP) and Realtime Streaming Control Protocol (RTCP) traffic only for selected HNB-CS Network service which is configured and associated with an HNB-GW service running on this system.

sccp-only

This keyword is used to filter the session statistics display limited to Signaling Connection Control Part (SCCP) traffic only for selected HNB-CS Network service which is configured and associated with an HNB-GW service running on this system.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session statistics for overall session or in selected part of user session for HNB-GW services configured and running on this system.

■ show cs-network statistics

Example

The following command displays the session statistics for RTP and RTCP part of session for the HNB-CS Network service named *hnb_cs1*:

```
show cs-network statistics name hnbcs1 rtp-only
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf nat

Displays the mapping created for each of the media streams present in an established dialog.

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

```
show cscf nat media mapping { all | aor aor } [ | { grep grep_options | more } ]
```

```
media mapping { all | aor aor }
```

all: Displays the UE/Network origins and destinations, including their IP addresses/port numbers and associated contexts.

aor aor: Displays information for a specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display the status of configured Network Address Translation (NAT) support.

Example

The following command displays the status of the mapping created for each of the media streams present on this system:

```
show cscf nat media mapping all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf peer-servers

Displays name, IP address, and status of configured peer servers visible to the system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show cscf peer-servers { all | full | name service_name [ server-name
server_name ] } [ | { grep grep_options | more } ]
```

```
all | full | name service_name [ server-name server_name ]
```

all: Displays the peer server list names and the servers within those lists including their IP addresses/port numbers and domain names.

full: Displays additional details regarding the peer servers within the configured lists on the system.

name service_name [server-name server_name]: Displays the same information as the full keyword output, but for a specific peer server list or specific server.

service_name/server_name must be an existing peer server list or server and be from 1 through 80 alpha and/or numeric characters.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display the status of configured peer servers.

Example

The following command displays the status of a peer server named *icscf3* that is a member of peer server list *cscf-main*:

```
show cscf peer-servers name cscf-main server-name icscf3
```

The following command displays the status of all peer servers in configured peer server groups in this context:

```
show cscf peer-servers full
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf service

Displays configuration and/or statistic information for CSCF services on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show cscf service { all [ counters ] | diameter { location-info statistics
service-name service_name [ vpn-name name ] | policy-control statistics service-
name service_name [ vpn-name name ] } | grey-list name name | li-packet-cable
statistics service-name service_name | performance-counters name service_name |
statistics name service_name [ all | calls | ip-security | message | package-
name { message-summary | presence | reg | winfo } | registrations | sigcomp |
tcp { msrp | sip } ] | subscription name service_name } [ | { grep grep_options |
more } ]
```

all [counters]

Displays configuration information for all CSCF services configured on this system.

counters: Displays statistics with the configuration information for all CSCF services configured on the system.

```
diameter { location-info statistics service-name service_name [ vpn-name
name ] | policy-control statistics service-name service_name [ vpn-name
name ] }
```

location-info: Displays Diameter statistics on the E2 interface with the location information.

policy-control: Displays Diameter (DPECA) statistics on the CSCF Rx interface with the configuration information.

service-name service_name: Specifies the name of a CSCF service for which the statistics will be displayed. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

vpn-name name: Specifies the name of a context in which all statistics for all services will be displayed. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

grey-list name name

Displays the list of run-time grey-listed users and their remaining barred period for the specified CSCF service.

name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

li-packet-cable statistics service-name service_name

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

name service_name [counters]

Displays configuration information for a specific CSCF service configured on this system.

service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters in length.

counters: Displays statistics with the configuration information for the specific CSCF service.

performance-counters *name service_name*

Displays performance counters specified in 3GPP TS 32.409 for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

statistics *name service_name* [**all** | **calls** | **ip-security** | **message** | **package-name** { **message-summary** | **presence** | **reg** | **winfo** } | **registrations** | **sigcomp** | **tcp** { **msrp** | **sip** }]

Displays service statistics for a specific CSCF service configured on this system. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

all: Displays all CSCF service statistics.

calls: Displays session statistics related to CSCF calls.

ip-security: Displays session statistics related to CSCF IPsec.

message: Displays session statistics for the SIP method MESSAGE.

package-name: Displays session statistics for the associated event package.

- **message-summary:** Displays session statistics for the “message-summary” event package.

- **presence:** Displays session statistics for the “presence” event package.

- **reg:** Displays session statistics for the “reg” event package.

- **winfo:** Displays session statistics for the “watcher-info” event package.

registrations: Displays session statistics related to CSCF registrations, re-registrations, and de-registrations.

sigcomp: Displays session statistics related to CSCF sigcomp.

tcp: Displays session statistics related to CSCF TCP.

- **msrp:** Displays statistics related to CSCF TCP MSRP statistics.

- **sip:** Displays statistics related to CSCF TCP SIP statistics.

Important: This keyword must be followed by another statistics-related keyword.

subscription *name service_name*

Displays service level subscription information for a specific service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display configuration information and/or statistics for any or all CSCF services on this system.

Example

The following command displays service statistics for the CSCF service named *cscf1*:

```
show cscf service statistics name cscf1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf sessions

Displays statistics for CSCF sessions on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show cscf sessions { counters { calls { duration | first-response-time | invite-
processing-time | post-answer-delay | post-dial-delay | service service_name |
session-release-delay | session-setup-delay } service service_name |
subscription { duration | service service_name | setup-time } service
service_name } | duration | full [ calleg-id id | from-aor aor | service
service_name | session-id id | to-aor aor ] [ media-type type ] | summary [
from-aor aor | service service_name | session-id id | to-aor aor ] } [ | { grep
grep_options | more } ]
```

```
counters { calls { duration | first-response-time | invite-processing-
time | post-answer-delay | post-dial-delay | service service_name |
session-release-delay | session-setup-delay } service service_name |
subscription { duration | service service_name | setup-time } service
service_name }
```

Displays counters for all CSCF sessions matching the filter criteria.

calls: Counters associated with calls in CSCF service.

- **duration:** Displays the call duration time.
- **first-response-time:** Displays the time interval for the first response received for INVITE.
- **invite-processing-time:** Displays the INVITE message processing time in CSCF.
- **post-answer-delay:** Displays the time interval for post answer delay.
- **post-dial-delay:** Displays the time interval for the ringing or success response for INVITE.
- **service service_name:** Displays specific service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

Important: This keyword may be used alone with the **counters** keyword or following any other counters-specific keyword.

- **session-release-delay:** Displays the time interval for releasing the call.
- **session-setup-delay:** Displays the time interval for session setup.

subscription: Counters associated with subscriptions in CSCF service.

- **duration:** Displays the SIP Subscription duration time.
- **service service_name:** Displays specific service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

 **Important:** This keyword may be used alone with the **subscription** keyword or following any other subscription-specific keyword.

- **setup-time:** Displays the SIP Subscription setup time.

duration

Displays the call duration for all CSCF sessions.

```
full [ calleg-id id | from-aor aor | service service_name | session-id id | to-aor aor ] [ media-type type ]
```

Displays all the session information for the active CSCF sessions matching the filter criteria.

calleg-id *id*: Specifies a call leg from which session statistics are to be displayed. *id* must be an existing call-leg ID and be from 1 to 63 alpha and/or numeric characters.

from-aor *aor*: Specifies that session statistics are to be displayed for sessions originating from this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

service *service_name*: Specifies that session statistics are to be displayed for sessions using this CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

session-id *id*: Specifies that session statistics are to be displayed for sessions with this ID. *id* must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.

to-aor *aor*: Specifies that session statistics are to be displayed for sessions sent to this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

media-type *type*: Displays information about specific media type, if any. *type* must be an existing media type and be from 1 to 9 alpha and/or numeric characters.

```
summary [ from-aor aor | service service_name | session-id id | to-aor aor ]
```

Displays session summary information for sessions matching the filter criteria.

from-aor *aor*: Specifies that session statistics are to be displayed for sessions originating from this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

service *service_name*: Specifies that session statistics are to be displayed for sessions using this CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

session-id *id*: Specifies that session statistics are to be displayed for sessions with this ID. *id* must be an existing session ID and be from 1 to 63 alpha and/or numeric characters.

to-aor *aor*: Specifies that session statistics are to be displayed for sessions sent to this specific AoR. *aor* must be an existing AoR and be from 1 to 79 alpha and/or numeric characters.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display session information for any or all CSCF sessions.

■ show cscf sessions

Example

The following command displays the output for CSCF session duration:

```
show cscf sessions duration
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf sip

Displays SIP statistics for a specific CSCF service configured on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show cscf sip statistics name service_name [ interface { domain { list | name domain_name } | ip { address ip_address | list } } | vpn-name name ] [ | { grep grep_options | more } ]
```

statistics name *service_name*

Specifies the name of the CSCF service. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

```
[ interface { domain { list | name domain_name } | ip { address ip_address | list } }
```

SIP statistics will be displayed for this interface.

domain list: Displays list of interfaces associated with the CSCF service.

domain name *domain_name*: Specifies the domain associated with the CSCF service. *domain_name* must be an existing domain and be from 1 to 80 alpha and/or numeric characters.

ip address *ip_address*: Specifies the destination or source ip address associated with the CSCF service. *ip_address* is expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

ip list: Displays list of interfaces associated with the CSCF service.

vpn-name *name*

Specifies the name of the context in which the service is configured. *name* must be an existing context and be from 1 to 79 alpha and/or numeric characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display SIP statistics for a specific CSCF service.

Important: This command displays counters for SIP statistics for a specified CSCF service. Counters are incremented when SIP messages are sent (Tx) or received (Rx). SIP Request, Response, and Error counters are maintained at various levels in the SIP stack. These values are dependent on the packet flow. For example, if packets are dropped at an initial stage of parsing and error detection, the counters may not increment. All 2xx Response counters for

■ show cscf sip

individual requests are maintain outside the SIP layer and will not track re-transmissions and erroneous packets that are dropped. All other counters do keep track of re-transmissions.

Example

The following command displays SIP statistics for the CSCF service named *cscf1*:

```
show cscf sip statistics name cscf1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show cscf tcp

Displays TCP connection information for a specific CSCF service configured on this system.

Product

SCM

Privilege

Security Administrator, Administrator, Operator

Syntax

```
show cscf tcp connections service service_name [ facility { cscfmgr | sessmgr } ] [ full ] [ remote-ip ip_address ] [ remote-port port_number ] [ | { grep grep_options | more } ]
```

connections service *service_name*

service service_name: Specifies the name of the CSCF service.

service_name must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

facility { **cscfmgr** | **sessmgr** }

Facility type for which connection details have to be retrieved.

cscfmgr: Facility type cscfmgr.

sessmgr: Facility type sessmgr.

full

Displays detailed information related to each connection.

remote-ip *ip_address*

Remote IP address to match the connection. *ip_address* is expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

remote-port *port_number*

Remote port to match the connection. *port_number* is an integer from 1 to 65534.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display TCP connection information for a specific CSCF service.

Important: More than one optional keyword may be used per command.

■ show cscf tcp

Example

The following command displays TCP connections for the CSCF service named *cscf1*:

```
show cscf tcp connections service cscf1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show css delivery-sequence

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

show css server

This is a restricted command. In StarOS 9.0 and later, this command is obsolete.

show css service

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

Chapter 106

Exec Mode Show Commands (D-G)

This section includes the commands **show dhcp** through **show gtpu-service**.

show dhcp

Displays counter information pertaining to DHCP functionality based on specific criteria.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dhcp [ counters | full | summary ] [ all | apn apn_name | callid id |
chaddr mac_address | dhcp-service svc_name | imsi imsi | user-address address |
msid msid | server server_address | username name ]
```

counters

Displays DHCP counter information.

full

Displays all available information pertaining to the criteria specified.

summary

Displays a summary of the DHCP statistics.

all

Displays counter information for each active PDP context.

apn *apn_name*

Displays information based on a specific APN name.

apn_name is the name of the APN and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

callid *id*

Displays information for a specific call identification number.

id must be specified as a 4-byte hexadecimal number.

chaddr *mac_address*

Displays information for a specific mobile node.

mac_address must be MAC address of mobile node.

dhcp-service *svc_name*

Displays information for a specific DHCP service.

svc_name is the name of the DHCP service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

imsi *imsi*

Displays information for a specific International Mobile Subscriber Identity (IMSI).
imsi is an integer value from 1 to 15 characters.

user-address *address*

Displays information for a specific DHCP-assigned user IP address.
address is the IP address expressed in dotted-decimal notation.

msid *msid*

Displays information for a specific Mobile Subscriber Identity (MSID).
msid must be from 1 to 15 digits.

server *server_address*

Displays information for a specific DHCP server.
server_address is the IP address of the server expressed in dotted-decimal notation.

username *name*

Displays information for a specific subscriber.
name can be from 1 to 127 alpha and/or numeric characters (including wildcards ('\$' and '*')) and is case sensitive.

Usage

Counters pertaining to DHCP functionality can be displayed as cumulative values or for specific APNs, PDP contexts, servers, or DHCP services.

Example

The following command displays DHCP counter information for a DHCP service called DHCP-Gi:

```
show dhcp dhcp-service DHCP-Gi
```

The following command displays DHCP counter information for a DHCP Call Id 01ca11a2:

```
show dhcp call-id 01ca11a2
```

The following command displays DHCP information for the specified mobile node:

```
show dhcp chaddr 00:05:47:00:37:44
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show dhcp statistics

Displays DHCP statistics for the specified servers.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dhcp statistics [ dhcp-service svc_name | server ip_address ]
```

dhcp-service *svc_name*

Displays statistics for a specific DHCP service.

svc_name is the name of the desired DHCP service and can be from 1 to 63 alpha and/or numeric characters in length and is case sensitive.

server *ip_address*

Displays statistics for a specific DHCP server.

ip_address is the IP address of the desired server and must be entered in dotted decimal notation.

Usage

Statistics for a single DHCP service or DHCP server can be viewed using the **dhcp-service** or **server** keywords respectively.

Cumulative statistics for all DHCP services and servers within a context can be viewed by executing the command with no keywords from within the context in which they're configured.

If this command is issued from within the local context, the statistics displayed will be cumulative for all dhcp servers configured on the system regardless of context.

Example

The following command allows you to view statistics for all configured DHCP servers within the context:

```
show dhcp statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show dhcp-service

Displays configuration information for either a specific, or for all DHCP servers configured.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dhcp-service { all | name svc_name }
```

all

Displays information for all configured DHCP services.

name *svc_name*

Displays information for a specific DHCP service.

svc_name is the name of the service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

This command is used to verify the configuration of one or all DHCP services for monitoring or troubleshooting purposes. The output is a concise listing of DHCP service parameter settings.

If this command is executed from within the local context with the all keyword, information for all DHCP services configured on the system will be displayed.

Example

The following command displays configuration information for a DHCP service called dhcp1:

```
show dhcp-service name dhcp1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show dhcp status

Displays configuration information for either a specific, or for all DHCP service and servers configured.

Product

GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dhcp status [ dhcp-service svc_name ] [ server ip_addr ]
```

all

Displays information for all configured DHCP services.

dhcp-service *svc_name*

Displays information for a specific DHCP service.

svc_name is the name of the service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

server *ip_address*

Displays status for a specific DHCP server.

ip_address is the IP address of the desired server and must be entered in dotted decimal notation.

Usage

This command is used to show/verify the status or configuration of one or all DHCP services along with count of cumulative leased addresses and addresses leased at that time for monitoring or troubleshooting purposes. The output is a concise listing of DHCP service parameter settings.

If this command is executed from within the local context with the all keyword, information for all DHCP services configured on the system will be displayed.

Example

The following command displays status of a DHCP service called ggsn_dhcp1:

```
show dhcp status dhcp-service ggsn_dhcp1
```

State shown in display is consolidated across session managers, i.e. for each session manager, DHCP server have a timestamp value associated with its state.

For a DHCP server, its timestamp value is compared for each session manager and the state associated with the latest value is shown.

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show diameter aaa-statistics

This command displays Diameter AAA statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter aaa-statistics [ all | group group_name [ server server_name ] |  
server server_name ] [ | { grep grep_options | more } ]
```

all

Displays all available Diameter server statistics.

group group_name [server server_name]

Displays all Diameter server statistics within the specified AAA group.

group_name must be the name of a AAA group, and must be a string of 1 through 64 characters in length.

server_name must be the name of a Diameter server, and must be a string of 1 through 64 characters in length.

server server_name

Displays Diameter server statistics for the specified server.

server_name must be the name of the Diameter server, and must be a string of 1 through 64 characters in length.

| { grep grep_options | more }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view Diameter AAA statistics.

Example

The following command displays all available Diameter server statistics:

```
show diameter aaa-statistics all
```

show diameter accounting servers aaa-group

This command displays Diameter accounting server information for a AAA group.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter accounting servers [ aaa-group group_name ] [ | { grep  
grep_options | more } ]
```

group_name

group_name must be the name of a AAA group, and must be a string of 0 through 64 characters in length.

```
| { grep grep_options | more }
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view Diameter accounting server information for a AAA group.

Example

The following command displays Diameter accounting server information for a AAA group named *group12*:

```
show diameter accounting servers aaa-group group12
```

show diameter authentication servers aaa-group

This command displays Diameter Authentication server information for a specified AAA group.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter authentication servers [ aaa-group group_name ]
```

group_name

group_name must be the name of a AAA group, and must be a string of 0 through 64 characters in length.

Usage

Use this command to view Diameter authentication server information for a AAA group.

Example

The following command displays Diameter authentication server information for a AAA group named *group12*:

```
show diameter authentication servers aaa-group group12
```

show diameter endpoint

This command has been deprecated, and is replaced by the [show diameter endpoints](#) command.

show diameter endpoints

This command displays the status of Diameter client endpoint(s).

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter endpoints { all | endpoint endpoint_name } [ | { grep grep_options  
| more } ]
```

all

Displays status of all Diameter client endpoints.

endpoint endpoint_name

Displays status of the specified Diameter client endpoint.

endpoint_name must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

| { grep grep_options | more }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the status of Diameter client endpoints.

If you are in the local context, then all contexts are searched for the specified endpoint(s). Specify **all** to see all endpoints; otherwise, just the named endpoint will be displayed. If no argument is provided, a summary of all endpoints is displayed.

Default value: N/A

Example

The following command displays status of all Diameter client endpoints.

```
show diameter endpoints all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show diameter message-queue

This command displays Diameter message queue statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter message-queue counters { inbound | outbound } [ endpoint
endpoint_name [ peer-host peer_id [ peer-realm realm_id ] ] | session-id
session_id ] [ | { grep grep_options | more } ]
```

counters { **inbound** | **outbound** }

Specifies the message counters:

inbound: Specifies Diameter inbound messages

outbound: Specifies Diameter outbound messages

endpoint *endpoint_name*

Specifies the Diameter endpoint.

endpoint_name must be a string of 1 through 63 characters in length.

peer-host *peer_id*

Specifies the Diameter peer host.

peer_id must be a string of 1 through 63 characters in length.

peer-realm *realm_id*

Specifies the Diameter peer realm.

realm_id must be a string of 1 through 127 characters in length.

session-id *session_id*

Specifies the session ID.

session_id must be a string of 1 through 127 characters in length.

| { **grep** *grep_options* | **more** }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the count of the messages in the Diameter message queue for specific counter type, session ID, or endpoint, peer host, and peer realm.

Example

The following command displays message queue statistics for outbound messages specific to the Diameter endpoint named *asr5k.testnetwork.com*:

```
show diameter message-queue counters outbound endpoint
asr5k.testnetwork.com
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show diameter peers

This command displays Diameter peer information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter peers [ full | summary ] [ all | [ endpoint endpoint_name ] [
peer-host peer_id ] [ peer-realm realm_id ]+ ] [ | { grep grep_options | more }
]
```

full

Displays full details of all or specified Diameter peers.

summary

Displays summary details of all or specified Diameter peer(s).

all

Displays details of all Diameter peers.

endpoint endpoint_name

Displays details of the specified Diameter endpoint.

endpoint_name must be the origin endpoint value, and must be a string of 1 through 255 characters in length.

peer-host peer_id

Displays details of the specified Diameter peer host.

peer_id must be the peer host value, and must be a string of 1 through to 63 characters in length.

peer-realm realm_id

Displays details of the specified Diameter peer realm.

realm_id must be the Diameter peer realm ID, and must be a string of 1 through 127 characters in length.

| { grep grep_options | more }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the details of Diameter peers.

If you are in the local context, then all contexts are searched for the specified peer(s).

This is similar to the **show subscribers** CLI command and supports multiple filter options specified at the same time.

If filter options are specified (e.g., **all**, **endpoint**, etc.), the default is for one line of output to be displayed per peer. Use **full** to get detailed information per peer, or **summary** to get summarized information about all matching peers.

If no filter options are specified, a summary output for all peers is displayed. Use the **full** option to get detailed information about every peer.

Default value: N/A

Example

The following command details of the Diameter endpoint named *endpoint12*:

```
show diameter peers endpoint endpoint12
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show diameter route status

This command displays Diameter route health status information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter route status [ endpoint endpoint_name | full [ endpoint
endpoint_name ] ] [ host host_name | peer peer_id ] [ | { grep grep_options |
more } ]
```

full

Displays information of which Diameter clients are using which peer/host combinations.

endpoint endpoint_name

Displays detailed information of the specified Diameter client endpoint.

endpoint_name must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

host host_name

Displays information for the specified Diameter host.

host_name must be the name of a Diameter host, and must be a string of 1 through 63 characters in length.

peer peer_id

Displays information for the specified Diameter peer.

peer_id must be the name of a Diameter peer host, and must be a string of 1 through 63 characters in length.

| { grep grep_options | more }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the Diameter route health status.

The route status displays status of peer/host combinations. Refer to the **route-failure** CLI command in Diameter Endpoint Configuration mode. When no options are specified, the display will give one line per peer/host combination, indicating how many Diameter clients are using each combination, and for how many clients the combination is available or failed. Specify **full** to see which Diameter clients are using which peer/host combinations. Specify **host** or **peer** to see just combinations with the named host or peer. Specify **endpoint** to see detailed information about the named Diameter client.

Default value: N/A

Example

The following command displays route health status details of the Diameter client endpoint named *endpoint12*:

```
show diameter route status endpoint endpoint12
```

show diameter route table

This command displays the Diameter routing table.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter route table [ wide ] [ endpoint endpoint_name ] [ | { grep
grep_options | more } ]
```

wide

Displays the route table information in wide-format.

endpoint endpoint_name

Displays the Diameter routing table for the specified endpoint.

endpoint_name must be the name of a Diameter endpoint, and must be a string of 1 through 63 characters in length.

| { grep grep_options | more }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view the status of Diameter client endpoints.

If you are in the local context, then the route information used by Diameter endpoints in all chassis contexts will be used in the display.

The route table displays all static and dynamic routes. Refer to the route-entry CLI command in Diameter Endpoint Configuration Mode.

Default value: N/A

Example

The following command displays status of the Diameter client endpoint named *endpoint12*.

```
show diameter route table endpoint endpoint12
```

show diameter statistics

This command displays Diameter peer statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show diameter statistics [ [ proxy ] endpoint endpoint_name [ peer-host peer_id
[ peer-realm realm_id ] ] ] [ | { grep grep_options | more } ]
```

endpoint *endpoint_name*

Displays statistics for the specified Diameter endpoint.

endpoint_name must be the name of a Diameter endpoint, and must be an alpha and/or numeric string of 1 through 63 characters in length.

peer-host *peer_id*

Displays statistics for the specified Diameter host peer.

peer_id must be an alpha and/or numeric string of 1 through 255 characters in length.

peer-realm *realm_id*

Displays statistics for the specified Diameter peer realm.

realm_id must be an alpha and/or numeric string of 1 through 127 characters in length.

proxy

Displays proxy related statistics.

| { **grep** *grep_options* | **more** }

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view Diameter statistics for the specified endpoint or proxy.

Example

The following command displays Diameter peer statistics for the endpoint named *endpoint12*:

```
show diameter statistics endpoint endpoint12
```

show dns-client

Displays DNS cache and/or statistics for a specified DNS client.

Product

P-CSCF, SIP Proxy, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show dns-client { cache client name [ query-name name | query-type { A | SRV } ]
| statistics client name } [ | { grep grep_options | more } ]
```

```
cache client name [ query-name name | query-type { A | SRV } ]
```

Specifies that the cache for the defined DNS client is to be displayed.

name: Defines the name of the DNS client whose cache is to be displayed. *name* must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

query-name name: Filters DNS results based on the domain name. *name* must be from 1 to 255 characters in length. *name* is the domain name used to perform the DNS query. *name* is different from the actual domain name which is resolved. For example, to resolve the SIP server for *service.com*, the query name is *_sip._udp.service.com* and the query type is *SRV*.

query-type:

- A**: Filters DNS results based on domain IP address records (A records).
- SRV**: Filters DNS results based on service host records (SRV records).

```
statistics client name
```

Specifies that statistics for the defined DNS client are to be cleared.

name: Defines the name of the DNS client whose statistics are to be displayed. *name* must be an existing DNS client and be from 1 to 255 alpha and/or numeric characters in length.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Use this command to display DNS cache and/or statistics for a specified DNS client.

Example

The following command displays statistics for a DNS client named *domain1.com*:

```
show dns-client statistics client domain1.com
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show dynamic-policy statistics

Displays policy control and charging (PCC) statistics from the interface communicating with the PCRF (Gx(x)).

Product

HSGW, PDSN, S-GW

Privilege

Inspector

Syntax

```
show dynamic-policy statistics { hsgw-service name | pdsn-service name | sgw-
service name }
```

hsgw-service *name*

Displays policy control and charging statistics from the Gxa interface communicating with the PCRF. *name* must be an existing HSGW service name and be from 1 to 63 alpha and/or numeric characters.

pdsn-service *name*

Displays policy control and charging statistics from the Gx interface communicating with the PCRF. *name* must be an existing PDSN service name and be from 1 to 63 alpha and/or numeric characters.

sgw-service *name*

Displays policy control and charging statistics from the Gxc interface communicating with the PCRF. *name* must be an existing S-GW service name and be from 1 to 63 alpha and/or numeric characters.

Usage

Use this command to display PCC statistics for the specified service and its Gx interface communicating with the PCRF.

Example

The following command displays PCC statistics for a PDSN service named *cdma4*:

```
show dynamic-policy statistics pdsn-service cdma4
```

show egtpc peers

Displays information about eGTP-C peers.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

```
show egtpc peers [ address ip_address | egtp-service name ] | interface { mme |
pgw-ingress | sgsn | sgw-egress | sgw-ingress } [ address ip_address ] [ wfl ] }
] [ | { grep grep_options | more } ]
```

address *ip_address*

Displays information about a specific eGTP-C peer based on the IP address of the peer. *ip_address* must be an existing eGTP-C peer and be expressed in IPv4 dotted decimal notation or IPv6 colon separated notation.

egtp-service *name* [**address** *ip_address*]

Displays information about eGTP-C peers associated with a specific service. *name* must be an existing egtp-service and be from 1 to 63 alpha and/or numeric characters.

address *ip_address*: Additionally, the results can be filtered based on the IP address associated with the service. *ip_address* must be an existing eGTP-C peer and be expressed in IPv4 dotted decimal notation or IPv6 colon separated notation.

interface { **mme** | **pgw-ingress** | **sgsn** | **sgw-egress** | **sgw-ingress** } [**address** *ip_address*] [**wfl**]

Displays information about eGTP-C peers associated with the service interface configured on this system.

mme: Displays information about eGTP-C MME peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the MME peer.

pgw-ingress: Displays information about eGTP-C P-GW ingress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the P-GW ingress peer.

sgsn: Displays information about eGTP-C SGSN peers associated with the S4 service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the SGSN peer.

sgw-egress: Displays information about eGTP-C S-GW egress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the S-GW egress peer.

sgw-ingress: Displays information about eGTP-C S-GW ingress peers associated with the service interface configured on this system. Additionally, the results can be filtered based on the IP address associated with the S-GW ingress peer.

address *ip_address*: Specifies the IPv4 or IPv6 address of the selected peer. *ip_address* must be an existing peer and be expressed in IPv4 dotted decimal notation or IPv6 colon separated notation.

wfl: Specifies that the output is to be displayed in wide format number 1.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on using the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information about eGTP-C peers associated with the service interface configured on this system. The output contains the following information about the peer:

- Status of the peer
 - Echo status
 - Restart counter status
 - Peer restart counter knowledge
 - Service ID
 - Peer IP address
 - Current sessions
 - Maximum sessions
-

Important: The primary command, **show egtpc peers**, when entered without additional keywords, displays information for all peers associated with the service operating on this system.

Example

The following command returns an output for an eGTP-C S-GW egress peers associated with the service interface configured on this system with an IP address of 1.2.3.4:

```
show egtpc peers interface sgw-egress address 1.2.3.4
```

The following command returns an output for an eGTP-C MME peer associated with the service interface configured on this system with an IP address of 1.2.3.4:

```
show egtpc peers interface mme address 1.2.3.4
```

show egtpc sessions

Displays eGTP-C session information.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

```
show egtpc sessions [ egtp-service name | interface { mme | pgw-ingress | sgsn |
sgw-egress | sgw-ingress } ] [ | { grep grep_options | more } ]
```

egtp-service *name*

Displays information about eGTP-C sessions associated with a specific service. *name* must be an existing egtp-service and be from 1 to 63 alpha and/or numeric characters.

interface { mme | pgw-ingress | sgsn | sgw-egress | sgw-ingress }

Displays information about eGTP-C sessions associated with the service interface configured on this system.
mme: Displays information about eGTP-C sessions associated with the MME interface configured on this system.

pgw-ingress: Displays information about eGTP-C sessions associated with the P-GW ingress interface configured on this system.

sgsn: Displays information about eGTP-C sessions associated with the SGSN eGTP-C S4 interface configured on this system.

sgw-egress: Displays information about eGTP-C sessions associated with the S-GW egress interface configured on this system.

sgw-ingress: Displays information about eGTP-C sessions associated with the S-GW ingress interface configured on this system.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on using the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display session information for a specific eGTP service or for sessions associated with an interface type configured on this system.

Example

The following command displays eGTP-C session information for sessions associated with all P-GW ingress interfaces configured on this system:

```
show egtpc sessions interface pgw-ingress
```

■ show egtpc sessions

The following command displays eGTP-C session information for sessions associated with all MME interfaces configured on this system:

```
show egtpc sessions interface mme
```

show egtpc statistics

Displays evolved GPRS Tunneling Protocol Control (eGTP-C) plane statistics for a specific service name or interface type.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

```
show egtpc statistics [ egtp-service name | interface { mme | pgw-ingress | sgsn
| sgw-egress | sgw-ingress } | mme-address ip_address | pgw-address ip_address |
sgsn-address ip_address | sgw-address ip_address ] [ verbose ] [ | { grep
grep_options | more } ]
```

egtp-service *name*

Displays statistics for a specific eGTP service configured on this system.

service_name must be an existing eGTP service, and be from 1 to 63 alpha and/or numeric characters in length.

interface { mme | pgw-ingress | sgw-egress | sgw-ingress }

mme: Displays eGTP-C statistics for all MME interfaces.

pgw-ingress: Displays eGTP-C statistics for all eGTP P-GW ingress interfaces.

sgsn: Displays eGTP-C statistics for all eGTP S4 SGSN interfaces.

sgw-egress: Displays eGTP-C statistics for all eGTP S-GW egress interfaces.

sgw-ingress: Displays eGTP-C statistics for all eGTP S-GW ingress interfaces.

mme-address *ip_address*

Displays eGTP-C statistics for a specific MME IP address. *ip_address* must be an existing MME IP address and be expressed in IPv4 dotted decimal notation or IPv6 colon-separated notation.

pgw-address *ip_address*

Displays eGTP-C statistics for a specific P-GW IP address. *ip_address* must be an existing P-GW IP address and be expressed in IPv4 dotted decimal notation or IPv6 colon-separated notation.

sgsn-address *ip_address*

Displays eGTP-C statistics for a specific SGSN S4 IP address. *ip_address* must be an existing SGSN S4 IP address and be expressed in IPv4 dotted decimal notation or IPv6 colon-separated notation.

sgw-address *ip_address*

Displays eGTP-C statistics for a specific S-GW IP address. *ip_address* must be an existing S-GW IP address and be expressed in IPv4 dotted decimal notation or IPv6 colon-separated notation.

verbose

Displays the maximum amount of detail available for this commands output. If this option is not specified, the output is truncated to a more concise level.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on using the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display evolved GPRS Tunneling Protocol Control (eGTP-C) plane statistics for a specific service name or interface type.

Example

The following command displays eGTP-C statistics for interfaces configured as S-GW ingress interfaces:

```
show egtpc statistics interface sgw-ingress
```

The following command displays eGTP-C session information for sessions associated with all MME interfaces configured on this system:

```
show egtpc sessions interface mme
```

show egtp-service

Displays configuration information for evolved GPRS Tunneling Protocol (eGTP) services on this system.

Product

MME, P-GW, S-GW

Privilege

Inspector

Syntax

```
show egtp-service { all | name service_name } [ | { grep grep_options | more } ]
```

all

Displays configuration information for all eGTP services configured on this system.

name service_name

Displays configuration information for a specific eGTP service configured on this system.

service_name must be an existing eGTP service, and be from 1 to 63 alpha and/or numeric characters in length.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference Guide*.

Usage

Use this command to view configuration information for eGTP services on this system.

Example

The following command displays service statistics for the eGTP service named *egtp1*:

```
show egtp-service name egtp1
```

show external-inline-servers

This command is obsolete.

show fa-service

Displays information on configured foreign agent services.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show fa-service { all | name fa_name } [ | { grep grep_options | more } ]
```

all | **name** *fa_name*

all: indicates information on all foreign agent services is to be displayed.

name *fa_name*: indicates only the information for the FA service specified as *fa_name* is to be displayed.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Display foreign agent service configuration information.

Example

The following commands display information on the FA service *sampleService* and all services, respectively.

```
show fa-service name sampleService
```

```
show fa-service all
```

 **Important:** Output descriptions for commands are available in the *Statistics and Counters Reference*.

show fans

Displays the current control status, speed, and temperature for the upper and lower fans.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show fans [ | { grep grep_options | more } ]
```

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

View the fan information to verify system hardware status as necessary.

Example

The following command displays information regarding the cooling fans in the system:

```
show fans
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show file

Displays the contents of the file specified. The contents are paginated as if it were normal ASCII output.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show file url url [ | { grep grep_options | more } ]
```

url *url*

Specifies the location of a file to display. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

- ASR 5000:

- [**file:**]{ **/flash** | **/pcmcial** | **/hd** }[**/directory**]/**file_name**
- tftp://**{ *host* [**:port#**] }[**/directory**]/**file_name**
- [**http:** | **ftp:** | **sftp:**]//[*username* [**:password**]@] { *host* }[**:port#**] [**/directory**]/**file_name**

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.

filename is the actual file of interest.

username is the user to be authenticated.

password is the password to use for authentication.

host is the IP address or host name of the server.

port# is the logical port number that the communication protocol is to use.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Display the contents of files to view such information as log data, trace information, etc.

Example

The following will display the contents of the local file */pub/log.txt*.

```
show file //pcmcial/pub/log.txt
```

The following command will display the contents of the file `/pub/log.txt` on remote host `remoteABC`.

```
show file ftp://remoteABC/pub/log.txt
```

show firewall flows

This command is obsolete.

show firewall ruledef

This command is obsolete.

show firewall statistics

This command is obsolete.

show fng-service

This command displays information about specified FNG service configuration, status, and counters, and includes information about the total current sessions maintained by the FNG.

Product

FNG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show fng-service { all [ counters ] | name service_name | session | statistics }
```

all

Displays information for all configured FNG services.

counters

Displays counters associated with the FNG service.

name service_name

Displays information only for the specified FNG service.

service_name must be the name of an existing FNG service in the current context and be from 1 to 63 alpha and/or numeric characters.

session

Displays information about configured FNG sessions.

Important: See `show fng-service session` for detailed options.

statistics service_name

Total of collected information for specific protocol since the last restart or clear command.

Important: See `show fng-service statistics` for detailed options.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the section *Regulating a Command's Output* in the chapter *Command Line Interface Overview* in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Use this command to view information for selected configured FNG services.

Example

The following command displays available information for all active FNG services.

```
show fng-service all
```

Important: Command output descriptions are available in the *Statistics and Counters Reference*.

show fng-service session

This command displays statistics for specific FNG sessions.

Product

FNG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show fng-service session [ all | callid call_id | counters | full [ all | callid
call_id | ip-address ip-address | peer-address ip_address | username name ] |
ip-address ip-address | peer-address ip-address | summary [ all | callid call_id
| ip-address ip-address | peer-address ip-address | username name ] | username
name ]
```

all

Displays all related information for all active FNG sessions.

callid

Displays PPP information for the call.

call_id must be specified as a 4-byte hexadecimal number.

counters

Displays counters for the configured FNG sessions.

full

Displays all available information for the associated display or filter keyword.

ip-address *ipv4_address*

The IPv4 address of the subscriber.

ipv4_address must be entered in standard IPv4 notation.

peer-address *ipv4_address*

The IPv4 address of a specific IP peer.

ipv4_address must be entered in standard IPv4 notation.

summary

Displays summary information for FNG sessions.

username *user_name*

The name of a specific user within the current context. Displays available information for the specific username.

user_name must be followed by a username.

The username can an alpha and/or numeric string of 1 to 127 characters.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the section *Regulating a Command's Output* in the chapter *Command Line Interface Overview* in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Use this command to view configuration information for an FNG session.

Example

The following command displays all available FNG sessions.

```
show fng-service session all
```

Important: Command output descriptions are available in the *Statistics and Counters Reference*.

show fng-service statistics

Displays statistics for the FNG since the last restart or clear command. The output includes the number of each type of protocol message. For example, the output includes the various types of EAP messages.

Product

FNG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show fng-service statistics [ name service_name | peer-address ipv4_address ]
```

name *service_name*

Displays statistics for the specified service.

service_name must be from 1 to 63 alpha and/or numeric characters.

peer-address *ipv4_address*

Displays statistics for a specific IP peer.

ipv4_address must be entered in standard IPv4 dotted decimal notation.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the section *Regulating a Command's Output* in the chapter *Command Line Interface Overview* in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Use this command to display FNG statistics.

Important: You may use more than one keyword per command line.

Example

The following command displays information about the FNG service.

```
show fng-service statistics
```

Important: Command output descriptions are available in the *Statistics and Counters Reference*.

show freeze-ptmsi imsi

Displays the P-TMSI (packet-temporary mobile subscriber identify) corresponding to the IMSI (international mobile subscriber identity) that has entered a frozen state after the purge timeout timer expires.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show freeze-ptmsi imsi imsi_num
```

imsi *imsi_num*

Specifies the IMSI that has been frozen. The first three digits are the MCC (mobile country code). The next two or three digits are the MNC (mobile network code). The remaining digits are the MSIN (mobile station identification number).

imsi_num: Enter a sequence of up to 15 digits.

Usage

This command enables the operator to know whether a frozen IMSI has an associated P-TMSI.

Example

The following command displays the P-TMSI corresponding to a frozen IMSI:

```
show freeze-ptmsi imsi 262090426000194
```

show ggsn-service

Displays configuration information for GGSN services on the system.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ggsn-service { all | name ggsn_svc_name } [ | { grep grep_options | more }]
```

all

Displays information for all GGSN services configured with the given context.

name *ggsn_svc_name*

Specifies the name of a specific GGSN service for which to display information.

ggsn_svc_name is the name of a configured GGSN service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all GGSN services for monitoring or troubleshooting purposes. The output is a concise listing of GGSN service parameter settings.

If this command is executed from within the local context with the all keyword, information for all GGSN services configured on the system will be displayed.

Example

The following command displays configuration information for a GGSN service called *ggsn1*:

```
show ggsn-service name ggsn1
```

show ggsn-service sgsn-table

This new command is the only way to list all SGSNs by IP address and show the current number of subscribers to each SGSN.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ggsn-service sgsn-table
```

Usage

While there are existing commands to show SGSN subscriber information, this new command is the only way to list all SGSNs by IP address and show the current number of subscribers to each SGSN.

Example

The following command will bring up a table showing the current active/inactive status, IP address, reboots/restarts and SGSN users.

```
show ggsn-service sgsn-table
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show global-title-translation

Displays configuration information for the global title translation (GTT).

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show global-title-translation { address-map name | association name }
```

address-map *name*

Displays GTT database. *name* must be a unique identification comprised of 1 to 63 alphanumeric characters.

association *name*

Displays GTT association list.

name: Enter a unique identification comprised of 1 to 63 alphanumeric characters.

Usage

This command displays the configuration for the GTT.

Example

The following command displays the address map called *gtt-ad1*.

```
show global-title-translation address-map gtt-ad1
```

show gmm-sm statistics

This command displays statistics for the GPRS Mobility Management and Session Management (GMM/SM) configuration of the system's SGSN service. GMM/SM supports mobility to allow the SGSN to know the location of a Mobile Station (MS) at any time and to activate, modify and deactivate the PDP sessions required by the MS for user data transfer.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gmm-sm statistics [ gmm-only | sm-only ] [ gprs-service svrc_name [ nsei
nsei_id | routing-area mcc mcc_id mnc mnc_id lac lac_id rac rac_id ] ] | [ sgsn-
service svrc_name [ rnc mcc mcc mcc_id mnc mnc_id rnc-id rnc_id | routing
areamcc mcc_id mnc mnc_id lac lac_id rac rac_id ] ] [ verbose ] [ | { grep
grep_options | more } ]
```

gmm-only

Enter this keyword to display only GPRS mobility management (GMM) information for other specified keyword parameters for the current context.

sm-only

Enter this keyword to display only session management (SM) information for other specified keyword parameters for the current context.

gprs-service *svrc_name*

Enter this keyword to display the statistics for the specified GPRS service. The display request can be narrowed by adding additional keywords.
svrc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

nsei

Enter this keyword to display the GMM/SM session statistics for the identified network service entity (NSEI).

sgsn-service *svrc_name*

Enter this keyword to display the statistics for the specified SGSN service. The display request can be narrowed by adding additional keywords.
svrc_name must be an alphanumeric string of 1 to 63 alphanumeric characters.

rnc

Enter this keyword to fine-tune the display of the GMM/SM session statistics just for the specified (rnc-id) radio network controller (RNC).

rnc-id *rnc_id*

Enter this keyword to identify the specific RNC.

rnc_id must be an integer from 0 through 4095.

routing-area *mcc mcc_id mnc mnc_id lac lac_id rac rac_id*

Enter the **routing-area** keyword to fine-tune the display of the GMM/SM session statistics for a specified routing area (RA) identified by the MCC, MNC, LAC and RAC.

mcc *mcc_id*

Enter this keyword to specify the mobile country code (MCC) as part of the identification of the RNC or RA. *mcc_id* must be an integer from 100 through 999.

mnc *mnc_id*

Enter this keyword to specify the mobile network code (MNC) as part of the identification of the RNC or RA. *mnc_id* must be an integer from 00 through 999.

lac *lac_id*

Enter this keyword to specify the location area code (LAC) as part of the identification of the RNC or RA. *lac_id* must be an integer from 1 through 65535.

rac *rac_id*

Enter this keyword to specify the routing area code (RAC) as part of the identification of the RNC or RA. *rac_id* must be an integer from 1 through 255.

verbose

This keyword displays all possible statistics for specified command or keyword.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

Use this command to display usage statistics for the GMM/SM session configurations for SGSN services, including a BSC's attaches, activations, and throughput.

Example

The following command displays GMM/SM statistics for a specific routing area defined for the GPRS service:

```
show gmm-sm statistics gprs-service gprs1 routing-area mcc 123 mcc 131
lac 24 rac 11
```

The following command displays all possible information for GMM/SM statistics:

```
show gmm-sm statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gprsns statistics

When **statistics** is selected, the system displays the statistics for the 2G GPRS NS layer (link level).

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gprsns statistics { msg-stats { consolidated nse nse_id } | nse nse_id } |
sns-msg-stats } | status { nsvc-status-all nse nse_id | nsvc-status-consolidated
nse nse_id | nsvc-status-per-bvci bvci bvc_id nse nse_id } }
```

statistics

Display statistics for GPRS NS layer.

msg-stats

Display tx and rx message statistics (except for SNS messages) in the statistics output.

consolidated nse nse_id

nse_id: Enter an integer from 0 to 65535.

nse nse_id

Display statistics for a specific NSE.

nse_id: Enter an integer from 0 to 65535.

sns-msg-stats

Display SNS message statistics in the statistics output.

status

nsvc-status-all

Display statistics for all NSVC in the specified NSE.

nsvc-status-consolidated nse nse_id

nsvc-status-per-bvci bvci bvc_id nse nse_id

bvc_id: Enter an integer from 0 to 65535.

nse_id: Enter an integer from 0 to 65535.

grep *stats_type*

stats_type:

- **--ignore-case** - ignore case of letters, unless there is a capital letter
- **--invert-match** - display non matching text
- **--line-number** - display line numbers
- **-i** - ignore case of letters, unless there is a capital letter
- **-n** - display line numbers
- **-v** - display non matching text

Usage

This command is used to display the statistics and status of the NSVC.

If this command is executed from within the context that the NSE and NSVC are configured, then the display
.....???????

Example

Use the following command to display status of all NSVC for NSE 1422:

```
show gprsns status nsvc-status-all nse 1422
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gprs-service

Displays the statistics of GPRS service(s) configured in a given context on the system.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gprs-service { all | name gprs_srvc_name } [ | { grep grep_options | more } ]
```

all

Displays information for all GPRS services configured with the given context.

name *gprs_srvc_name*

Specifies the name of a specific GPRS service for which information is to be displayed.

gprs_srvc_name is the name of a configured GPRS service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all GPRS services for monitoring or troubleshooting purposes. The output is a concise listing of GPRS service parameter settings.

If this command is executed from within the local context with the all keyword, information for all GPRS services configured on the system will be displayed.

Example

The following command displays configuration information for all GPRS services configured in this context:

```
show gprs-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gs-service

Displays configuration information and statistics for Gs service configured on system.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gs-service { all | name svc_name } [ | { grep grep_options | more } ]
```

all

Displays information for all Gs services configured with in the given context.

name *svc_name*

Specifies the name of a specific Gs service for which to display information.

svc_name is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

This command is used to verify the configuration of one or all Gs services for monitoring or troubleshooting purposes.

If this command is executed from within the local context with the all keyword, information for all Gs services configured on the system will be displayed.

Example

The following command displays configuration information for all Gs services configured on a system:

```
show gs-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpc

Displays GTPv0, GTPv1-C, GTPv1-U information with filtering options.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtpc [ full | counters | summary ] { all | apn apn_name | imsi imsi_value [ nsapi nsapi_value ] | callid callid | sgsn-address ip_address | ggsn-service ggsn_name | user-address ip_address | username username }
```

[full | counters | summary]

Specifies the level of information to be displayed. The following levels can be used:

- **full**: Indicates detailed information is to be displayed.
- **counters**: Indicates the output is to include the statistic counters.
- **summary**: Indicates only summary information is to be displayed.

```
{ all | apn apn_name | imsi imsi_value [ nsapi nsapi_value ] | callid callid | sgsn-address ip_address | ggsn-service ggsn_name | user-address ip_address | username username }
```

Specifies the filter criteria used when displaying GTP information. The following filters can be used:

- **all**: Specifies that all available information is to be displayed.
- **apn apn_name**: Specifies that GTP information for a particular APN will be displayed. *apn_name* can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **imsi imsi_value [nsapi nsapi_value]**: Specifies that GTP information will be displayed for a particular International Mobile Subscriber Identity (IMSI). *imsi_value* is an integer value from 1 to 15 characters. Optionally, the IMSI could be further filtered by specifying a particular PDP context using the Network Service Access Point Identifier (NSAPI). *nsapi_value* is an integer value from 5 to 15.
- **callid callid**: Specifies that GTP information will be displayed for a particular call identification number. *callid* must be specified as a 4-byte hexadecimal number.
- **sgsn-address ip_address**: Specifies that GTP information for a particular SGSN will be displayed. *ip_address* is the address of the SGSN in dotted decimal notation.
- **ggsn-service ggsn_name**: Specifies that GTP information for a particular GGSN service will be displayed. *ggsn_name* can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **user-address ip_address**: Specifies that GTP information for a particular user address will be displayed. *ip_address* is the address of the user's PDP context in dotted decimal notation.
- **username username**: Specifies that GTP information for a particular username will be displayed. *username* can be from 1 to 127 alpha and/or numeric characters (including wildcards ('\$' and '*')) and is case sensitive.

Usage

This command displays statistics for every GTP message type based on the filter criteria. This information is useful for system monitoring or troubleshooting.

Example

The following command displays GTPC counters for a GGSN service named *ggsn1*:

```
show gtpc counters ggsn-service ggsn1
```

The following command displays GTPC full information:

```
show gtpc full
```

The following command displays GTPC summary information for a specific call identification number of *05f62f34*:

```
show gtpc summary callid 05f62f34
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpc statistics

Display GTPv0, GTPv1-C, GTPv1-U statistics with filtering options.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtpc statistics [ apn apn_name | ggsn-service svc_name | sgsn-address
IPv4_addr ] [ format1 | verbose ] | [ custom1 | custom2 | gtpcmgr-instance
gtpcmgr_value | smgr-instance smgr_value ] [ apn | format1 | ggsn-service |
sgsn-address | verbose ] | [ verbose ] [ format ] | format1
```

apn *apn_name*

Specifies that GTP statistics for a particular APN will be displayed.

apn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

custom1

Displays the statistics of GTP-C messages for preservation mode and free of charge service.

This keyword is customer-specific license enabled and used for Preservation-Mode and Free-of-Charge Service which are enabled under customer-specific license. For more information on this support, contact your local representative.

custom2

Displays the statistics of GTP-C messages for overcharging protection on loss of radio coverage for a GGSN service.

This keyword is feature-specific license enabled and used for subscriber overcharging protection on loss of radio coverage at the GGSN service. For more information on this support, contact your local representative.

format1

Specifies that more detailed statistics breakup will be displayed.

ggsn-service *svc_name*

Specifies that GTP statistics for a particular GGSN service will be displayed.

ggsn_name can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

gtpcmgr-instance *gtpcmgr_value*

Retrieves information from a particular GTPCMgr Instance.

gtpcmgr_value can be an integer value from 1 to 4294967295.

sgsn-address *address*

Specifies that GTP statistics for a particular SGSN will be displayed.

address is the address of the SGSN in dotted decimal notation.

smgr-instance*smgr_value*

Retrieves information from particular Sessmgr Instance.
smgr_value can be an integer value from 1 to 4294967295.

verbose

Specifies that detailed statistics will be displayed.

Usage

The information displayed by this command consists of session statistics such as the number of currently active sessions categorized by PDP context type, and statistics for every GTP message type. The statistics are cumulative.

If the verbose keyword is used, additional information will be displayed such as statistics for every type of error code.

Example

The following command displays verbose GTP statistics:

```
show gtpc statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtp accounting

Displays information on the GPRS Tunneling Protocol Prime (GTPP).

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtp accounting servers
```

Usage

This command is used to view the status of GTPP accounting servers configured within a context for monitoring or troubleshooting purposes.

If this command is issued from within the local context, a information for all GTPP accounting servers configured on the system is displayed regardless of context.

Example

The following command displays the status of and information on configured GTPP accounting servers:

```
show gtp accounting servers
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtp counters

Displays GTPP counters for configured charging gateway functions (CGFs) within the given context.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtp counters { all | cgf-address cgf_address }
```

all

Displays counters for all CGFs configured within the context.

cgf-address cgf_address

Displays counters for a specific CGF.

cgf_address is the IP address of the CGF expressed in dotted decimal notation.

Usage

Counters for a single CGF can be viewed using the **cgf-address** keyword. Counters for all CGFs in the context can be viewed by entering the command with the **all** keyword.

If this command is issued from within the local context and no CGF-address is specified, the counters displayed will be cumulative for all CGFs configured on the system regardless of context.

Example

The following command displays counters for all CGF:

```
show gtp counters all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtp group

Displays information pertaining to the configured GTP storage server group.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtp group [ name gtp_group_name | all ] ] [ | { grep grep_options | more } ]
```

name *gtp_group_name*

Displays information and CDR statistics of the GTP server group named *gtp_group_name*. *gtp_group_name* is name of the configured/default GTP storage server group.

all

Displays statistics of all configured GTP storage server group including default group.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For more information on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

Use this command to display the CDR statistics on the basis of GTP server groups. It shows the information for all or specific GTP server group configured in the context from which this command is issued.

Example

The following command displays the status of the GTP server group backup server configured in a context called *GTP_Group1*:

```
show gtp group name GTP_Group1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtp statistics

Displays GTPP statistics for configured CGFs within the context.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtp statistics [ cgf-address cgf_address ]
```

cgf-address *cgf_address*

Specifies the IP address of a specific CGF for which to display statistics and is expressed in dotted decimal notation.

Usage

Statistics for a single CGF can be viewed by specifying its IP address. Statistics for all CGFs in the context can be viewed by **not** specifying an IP address.

If this command is issued from within the local context, the statistics displayed will be cumulative for all CGFs configured on the system regardless of context.

Example

The following command displays statistics for a CGF with an IP address of *192.168.1.14*:

```
show gtp statistics cgf-address 192.168.1.14
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtp storage-server

Displays information pertaining to the configured GTPP storage server.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show gtp storage-server [ counters { all | group name name } | group name name
| local file { counters { all | group name name } | statistics [ group name name
] } | status [ verbose ] | streaming { counters { all | group name name } |
statistics [ group name name ] } ] [ | { grep grep_options | more } ]
```

counters

Displays counters for the external GTPP storage server.

group name name

Displays GTPP backup server information for the specified group.

local file

Displays statistics and counters for the local storage-server. This is the hard disk if hard disk support has been enabled with the **gtp storage-server mode** command in the GTPP Group Configuration Mode.

statistics

Displays statistics for the GTPP storage server.

status [verbose]

Displays status of the GTPP storage server. **verbose** enables the detailed view.

streaming

Displays the status of CDRs backup on HDD while 'streaming' mode is enabled.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Executing this command with no keywords displays status information for the GTPP backup server configured in the context from which this command is issued.

Example

The following command displays the GTPP CDR file statistics stored on the local SMC hard disk.

```
show gtp storage-server local file counters all
```

The following command displays the status of the GTPP backup server configured in a context called ggsn1:

```
show gtp storage-server
```

The following command displays statistics for the GTPP backup server configured in a context called ggsn1:

```
show gtp storage-server statistics
```

The following command displays gtp storage server counters:

```
show gtp storage-server counters
```

The following command displays gtp storage server status:

```
show gtp storage-server status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show gtpu statistics

Displays GPRS Tunneling Protocol user plane (GTP-U) statistics and counters on this system.

Product

P-GW, S-GW

Privilege

Inspector

Syntax

```
show gtpu statistics [ gtpumgr-instance number ] [ gtpu-service name | peer-address ip_address ]
```

gtpumgr-instance *number*

Displays configuration information for a specific GTP-U manager instance.
number must be an existing instance and be an integer value from 1 to 4294967295.

gtpu-service *name*

Displays GTP-U statistics and counters for a specific GTP-U service configured on this system.
name must be an existing GTP-U service, and be from 1 to 63 alpha and/or numeric characters in length.

peer-address *ip_address*

Displays GTP-U statistics and counters for a specific peer IP address.
ip_address must be an existing peer IPv4 or IPv6 address and be specified in dotted decimal notation (for IPv4) or colon-separated notation (for IPv6).

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference Guide*.

Usage

Use this command to view statistics and counters for GTP-U traffic on this system.

Example

The following command displays statistics for the GTP-U service named *egtp1*:

```
show egtpu statistics gtpu-service egtp1
```

show gtpu-service

Displays configuration information for GPRS Tunneling Protocol user plane (GTP-U) services on this system.

Product

P-GW, S-GW

Privilege

Inspector

Syntax

```
show gtpu-service { all | name service_name } [ | { grep grep_options | more } ]
```

all

Displays configuration information for all GTP-U services configured on this system.

name service_name

Displays configuration information for a specific GTP-U service configured on this system.

service_name must be an existing GTP-U service, and be from 1 to 63 alpha and/or numeric characters in length.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference Guide*.

Usage

Use this command to view configuration information for GTP-U services on this system.

Example

The following command displays service statistics for the GTP-U service named *egtp1*:

```
show egtp-service name egtp1
```

Chapter 107

Exec Mode Show Commands (H-L)

This section includes the commands **show ha-service** through **show logs**.

show ha-service

Displays information on configured home agent services.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ha-service { all | name ha_name } [ | { grep grep_options | more } ]
```

all | **name** *ha_name*

all: indicates information on all home agent services is to be displayed.

name *ha_name*: indicates only the information for the HA service specified as *ha_name* is to be displayed.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display home agent service configuration information.

Example

The following commands displays information on the HA service *sampleService* and all services, respectively.

```
show ha-service name sampleService
```

```
show ha-service all
```

show hardware

Displays information on the system hardware.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show hardware { card [ card_num ] | inventory | version [ board | diags | fans ]
} [ [ | { grep grep_options | more } ] ]
```

card [*card_num*]

Provide the hardware information for all cards or the card specified by *card_num*. *card_num* must be a value in the range 1 through 48 and must refer to an installed card.

inventory

Display the hardware information for all slots in tabular format.

version [**board** | **diags** | **fans**]

Display the CPU information for all application cards and fan controller version for the upper and lower fan trays.

board: Only include the CPLD and FPGA version information.

diags: Only include the CFE diagnostics version information.

fans: Show the fan controller versions for the upper and lower fan trays.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the hardware information to verify part lists and hardware component versions with reserve stock

Example

The following displays the hardware information for a card installed in slot 1.

```
show hardware card 1
```

The following command displays the hardware inventory for the entire chassis.

```
show hardware inventory
```

■ show hardware

The following command results in the display of the CPU version for all application cards displaying only the CPLD and FPGA information.

```
show hardware version board
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show hd raid

Shows the output of the RAID established on the ASR 5000 SMCs.

Product

All

Privilege

Security Administrator, Administrator, Administrator, Operator

Syntax

```
show hd raid [ verbose ]
```

Example

```
show hd raid verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show hd-storage-policy

Displays ACR counter and statistic information.

Product

HSGW, P-GW, S-GW

Privilege

Inspector

Syntax

```
show hd-storage-policy { all | counters [ all ] [ name name ] [ verbose ] | name
name | statistics [ all ] [ name name ] [ verbose ] }
```

all

Specifies that ACR information for all HD storage policies configured on the system is to be displayed.

counters [**all**] [**name** *name*] [**verbose**]

Specifies that ACR counter information for HD storage policies configured on the system is to be displayed.

name *name*

Specifies that ACR information for an HD storage policy with the specified name is to be displayed.

statistics [**all**] [**name** *name*] [**verbose**]

Specifies that ACR statistic information for HD storage policies configured on the system is to be displayed.

verbose

Displays HD storage statistics based on instance.

Usage

Use this command to display ACR counter and statistic information.

Example

The following command displays ACR statistic information for an HD storage policy named *pgwsgw*:

```
show hd-storage-policy statistics name pgwsgw
```

show hnbgw access-control-db

This command displays the white list IMSI records in Access Control database residing on Home-NodeB Gateway (HNB-GW) service instances to control the HNB and UE access to HNB-GW sessions.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show hnbgw access-control-db { hnbgw-servicehnbgw_svc_name | imsi imsi_value }
```

hnbgw-service *hnbgw_svc_name*

This keyword is used to specify the name of the HNB-GW service of which Access Control database records to be displayed.

hnbgw_svc_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

imsi *imsi_value*

Specifies the International Mobile Subscriber Identification (IMSI) value which is to lookup on Access Control database on HNB-GW service.

imsi_value is an integer of maximum 15 digits. It must be followed by 3 digits of MCC (Mobile Country Code) 2 or 3 digits of MNC (Mobile Network Code) and the rest with MSIN (Mobile Subscriber Identification Number). The total IMSI value should not exceed 15 digits.

Usage

This command displays the white list IMSI records in Access Control database residing on Home-NodeB Gateway (HNB-GW) service instances to control the HNB and UE access to HNB-GW sessions. Access Control database records can be filtered by HNB-GW service or IMSI value.

Example

The following command displays the statistics of registered IMSIs and its status in database on HNB-GW service named *hnbgw1*:

```
show hnbgw access-control-db hnbgw-service hnbgw1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show hnbgw counters

This command displays the session counter information for Home-NodeB Gateway (HNB-GW) services and HNBs connected on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show hnbgw counters [ hnbgw-service hnbgw_svc_name | hnbid hnb_identifier ] [ |
{ grep grep_options | more } ]
```

hnbgw-service *hnbgw_svc_name*

This keyword is used to filter the counter display based on the HNB-GW service name *hnbgw_svc_name* configured and running on this system.

hnbgw_svc_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

hnbid *hnb_identifier*

This keyword is used to filter the counter display based on Home-NodeB *hnb_identifier* which is connected to this system with HNB-GW service and in active or dormant state.

hnb_identifier must be an identifier for HNB from 1 to 255 alpha and/or numeric characters in length.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session counter information for HNB-GW services configured and HNBs connected on this system.

Example

The following command displays the counters for the HNB-GW service named *hnbgw1*:

```
show hnbgw counter hnbgw-service hnbgw1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show hnbgw sessions

This command displays the active/dormant session information about registered HNB(s) on Home-NodeB Gateway (HNB-GW) service instances configured and running on this system based on different filter criterias.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show hnbgw sessions [ full | summary ] [ all ] [ address hnb_ip_address | cell-
id cell_id | hnb-local-id hnb_id | hnbgw-service hnbgw_svc_name | hnbid
hnb_glbl_id | mcc mcc | mnc mnc [ lac lac | rac rac | rnc rnc ] ] [ | { grep
grep_options | more } ]
```

full

This keyword is used to display the full information of specific registered HNB session(s) on an HNB-GW service instance running on system. Display can be filtered based on given filtering criterias.

summary

This keyword is used to display the summarized information of specific registered HNB session(s) on an HNB-GW service instance running on system. Display can be filtered based on given filtering criterias.

all

This keyword is used to display the summarized or full information of all registered HNB sessions on an HNB-GW service instance running on system. Display can be filtered based on given filtering criterias.

address *hnb_ip_address*

This keyword is used to filter the full or summarized session statistics display of HNB session(s) based on the registered HNB IP address *hnb_ip_address* on an HNB-GW service instance.

hnb_ip_address is an IP address expressed in IPv4 notation.

cell-id *cell_id*

This keyword is used to filter the full or summarized session statistics display of HNB session(s) based on the registered cell id as *cell_id* on an HNB-GW service instance.

cell_id is the identification number of the Femto cell where user/subscriber is geographically located and must be an integer between 0 through 268435455.

hnb-local-id *hnb_id*

This keyword is used to filter the full or summarized session statistics display of HNB session(s) based on the registered local id of HNB as *hnb_id* on an HNB-GW service instance.

hnb_id is the local identification of a registered HNB in HNB-GW service instance and must be an integer between 1 through 255.

hnbgw-service *hnbgw_svc_name*

This keyword is used to filter the session statistics display of registered HNB session(s) based on the HNB-GW service name *hnbgw_svc_name* configured and running on this system.

hnbgw_svc_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

hnbid *hnb_global_id*

This keyword is used to display the summarized or full information of HNB session(s) based on the registered global id of HNB as *hnb_global_id* on an HNB-GW service instance.

hnb_global_id is the global identification of a registered HNB in HNB-GW service instance and must be an integer between 1 through 255.

mcc *mcc*

This keyword is used to display the summarized or full information of HNB session(s) based on the registered Mobile Country Code (MCC) identification number of the UE as *mcc* on an HNB-GW service instance.

mcc must be an integer between 101 through 999.

mnc *mnc*

This keyword is used to display the summarized or full information of HNB session(s) based on the registered Mobile Network Code (MNC) identification number of the UE as *mnc* on an HNB-GW service instance.

mnc must be an integer between 00 through 999.

lac *lac*

This keyword is used to display the summarized or full information of HNB session(s) based on the registered Location Area Code (LAC) identification number of the UE as *lac* on an HNB-GW service instance.

lac must be an integer between 1 through 65535.

rac *rac*

This keyword is used to display the summarized or full information of HNB session(s) based on the registered Radio Access Code (RAC) identification number of the UE as *rac* on an HNB-GW service instance.

rac must be an integer between 1 through 255.

rnc *rnc*

This keyword is used to display the summarized or full information of HNB session(s) based on the registered Radio Network Code (RNC) identification number of the HNB as *rnc* on an HNB-GW service instance.

rnc must be an integer between 1 through 65535.

{ **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session statistics of all or specific registered HNB session(s) or in selected part of user session for HNB-GW services configured and running on this system.

Example

The following command displays the summarized session statistics for all registered HNBs on the HNB-GW service named *hnbgw1*:

```
show hnbgw sessions summary hnbgw-service hnbgw1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show hnbgw statistics hnbgw-service

This command displays the session statistics for Home-NodeB Gateway (HNB-GW) services configured and running on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show hnbgw statistics hnbgw-service hnbgw_svc_name [ hnbap-only | ranap-only |
rua-only | sccp-only | sctp-only ] [ verbose ] [ | { grep grep_options | more }
]
```

hnbgw-service *hnbgw_svc_name*

This keyword is used to filter the session statistics display based on the HNB-GW service name *hnbgw_svc_name* configured and running on this system.

hnbgw_svc_name must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

hnbap-only

This keyword is used to filter the session statistics display limited to Home NodeB Application Part (HNBAP) traffic only for selected HNB-GW service which is configured and running on this system.

ranap-only

This keyword is used to filter the session statistics display limited to Radio Access Network Application Protocol (RANAP) traffic only for selected HNB-GW service which is configured and running on this system.

rua-only

This keyword is used to filter the session statistics display limited to RANAP User Adaptation (RUA) traffic only for selected HNB-GW service which is configured and running on this system.

sccp-only

This keyword is used to filter the session statistics display limited to Signaling Connection Control Part (SCCP) traffic only for selected HNB-GW service which is configured and running on this system.

sctp-only

This keyword is used to filter the session statistics display limited to Stream Control Transmission Protocol (SCTP) traffic only for selected HNB-GW service which is configured and running on this system.

verbose

This keyword is used to display the detailed statistics for all sessions on HNB-GW services or for selected filter and named HNB-GW service which is configured and running on this system.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session statistics for overall session or in selected part of user session for HNB-GW services configured and running on this system.

Example

The following command displays the session statistics for HNBAP part of session details for the HNB-GW service named *hnbgw1*:

```
show hnbgw statistics hnbgw-service hnbgw1 hnbap-only
```

The following command displays the session statistics for RANAP part of session with maximum details for the HNB-GW service named *hnbgw1*:

```
show hnbgw statistics hnbgw-service hnbgw1 ranap-only verbose
```

show hnbgw statistics hnbid

This command displays the session statistics for Home-NodeB (HNB) connected to an HNB-GW service on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show hnbgw statistics hnbid hnb_identifier [ hnbap-only | ranap-only | rua -
only] [ verbose] [ | { grep grep_options | more } ]
```

hnbid hnb_identifier

This keyword is used to filter the session statistics display based on Home-NodeB *hnb_identifier* which is connected to this system through an HNB-GW service.

hnb_identifier must be an identifier for HNB from 1 to 255 alpha and/or numeric characters in length.

hnbap-only

This keyword is used to filter the session statistics display limited to Home NodeB Application Part (HNBAP) traffic only for selected HNB which is connected to this system through HNB-GW service.

ranap-only

This keyword is used to filter the session statistics display limited to Radio Access Network Application Protocol (RANAP) traffic only for selected HNB which is connected to this system through HNB-GW service.

rua-only

This keyword is used to filter the session statistics display limited to RANAP User Adaptation (RUA) traffic only for selected HNB which is connected to this system through HNB-GW service.

verbose

This keyword is used to display the detailed statistics for all HNB sessions or for selected filter and HNB which is connected to this system through HNB-GW service.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session statistics for overall session or in selected part of user session for selected HNB which is connected to this system through HNB-GW service..

Example

The following command displays the session statistics for HNBAP part of session details for the HNB having *hnb112234* as identifier on this system:

```
show hnbgw statistics hnbid hnb112234 hnbap-only
```

The following command displays the detailed session statistics for RANAP part of session details for the HNB having *hnb112234* as identifier on this system:

```
show hnbgw statistics hnbid hnb112234 ranap-only verbose
```

show hnbgw-service

This command displays the configuration details for configured HNB-GW service(s) on this system.

Product

HNB-GW

Privilege

Inspector

Syntax

```
show hnbgw-service { all | hnbgw-service hnbgw_svc_name }
```

all

This keyword is used to display the configuration and other default parameters for all HNB-GW service configured on this system.

hnbgw-service *hnbgw_svc_name*

This keyword displays the configuration and default parameters for specific HNB-GW service name *hnbgw_svc_name* which is configured and running on this system. *hnbgw_svc_name* must be an existing HNB-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

Usage

Use this command to view the configuration and service parameters set for all or any specific HNB-GW service(s) on this system.

Example

The following command displays the configured and default parameters for all HNB-GW services configured on this system:

```
show hnbgw-service all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show hsgw-service

Displays configuration information for HRPD Serving Gateway (HSGW) services on this system.

Product

HSGW

Privilege

Inspector

Syntax

```
show hsgw-service { all | name service_name } [ | { grep grep_options | more } ]
```

all

Displays configuration information for all HSGW services configured on this system.

name *service_name*

Displays configuration information for a specific HSGW service configured on this system.

service_name must be an existing HSGW service, and be from 1 to 63 alpha and/or numeric characters in length.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for HSGW services on this system.

Example

The following command displays service statistics for the HSGW service named *hsgw1*:

```
show hsgw-service name hsgw1
```

show hss-peer-service

Displays service, session, and statistics information for HSS peer services configured on this system.

Product

MME

Privilege

Inspector

Syntax

```
show hss-peer-service { service { all | name name } | session { all | callid id
| full | mdn mdn | nai nai | summary } | statistics { all | service name |
summary } } [ | { grep grep_options | more } ]
```

service { all | name name }

Displays HSS peer service statistics for HSS peer services configured on this system.

all: Displays HSS peer service statistics for all configured HSS peer services on this system.

name name: Displays HSS peer service statistics for a specific HSS peer service configured on this system. *name* must be an existing HSS peer service and be from 1 to 63 alpha and/or numeric characters.

session { all | callid id | full | mdn mdn | nai nai | summary }

Displays HSS peer service statistics for sessions on this system.

all: Displays HSS peer service statistics for all sessions on this system.

This keyword is also used to further filter the **full** and **summary** options.

callid id: Displays summarized or detailed statistics of HSS peer service sessions running and filtered on the basis of the call identifier with an MMEHSS service configured on this system. *id* must be an existing call identity in eight character Hex digit format running on an MME service on this system.

This keyword is also used to further filter the **full** and **summary** options.

mdn mdn: Displays summarized or detailed statistics of MME sessions running and filtered on the basis of Mobile Directory Number (MDN) with an HSS peer service configured on this system. *mdn* must be an existing MDN and be an alpha and/or numeric string from 1 to 100 characters.

This keyword is also used to further filter the **full** and **summary** options.

nai nai: Displays summarized or detailed statistics of MME-HSS sessions running and filtered on the basis of Network Access Identifier (NAI) with an MME service configured on this system. *nai* must be an existing NAI and be an alpha and/or numeric string of 1 to 128 characters in length.

This keyword is also used to further filter the **full** and **summary** options.

summary: Displays a summarized output of session information. This keyword can be further filtered by adding the following options:

- **full**
- **callid id**
- **mdn mdn**
- **nai nai**

statistics { all | service name | summary }

Displays statistics for HSS peer services configured on this system.

all: Displays statistics for all HSS peer services configured on this system.

service *name*: Displays statistics for specific HSS peer services configured on this system. *name* must be an existing HSS peer service and be from 1 to 63 alpha and/or numeric characters.

summary: Displays summarized statistics for all HSS peer services configured on this system.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to display service, session, and statistics information for HSS peer services configured on this system.

Example

The following command displays HSS peer service information and statistics for a session with a call ID of *08f11fa4*:

```
show hss-peer-service sessions full callid 08f11fa4
```

show ims-authorization policy-control

Displays information and statistics specific to the policy control in IP Multimedia Subsystem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ims-authorization policy-control statistics [ service ims_auth_svc_name |
server { ip-address ip_address [ port port_value ] | name server_name } ] [ | {
grep grep_options | more } ]
```

statistics

Displays the total collected statistics of all policy control parameters of IMS authorization service sessions since the last system restart or clear command.

service *ims_auth_svc_name*

Displays the total collected statistics of all IMS authorization sessions processed by a specific IMS authorization service since the last system restart or clear command. *ims_auth_svc_name* must be an existing IMS authorization service name.

server { **ip-address** *ip_address* [**port** *port_value*] | **name** *server_name* }

Displays the server-level message statistics and the server IP address.
Specify the PCRF server IP address or server name.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to display information and statistics about policy control configuration in existing IMS authorization services.

Example

The following command displays the existing IMS authorization service name *ims_auth_gx1* on the system:

```
show ims-authorization policy-control statistics service ims_auth_gx1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ims-authorization policy-gate

Displays information of installed Policy Gates for specific subscriber in IP Multimedia Subsystem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ims-authorization policy-gate { { status [ summary | full ] [ { imsi
imsi_value [ nsapi nsapi_value ] } | callid call_id | { ims-auth-service
ims_auth_svc } [ rulename rule_name ] } | { counters [ all | { imsi imsi_value [
nsapi nsapi_value ] } | { rulename rule_name } | { callid call_id } ] } [ | {
grep grep_options | more } ] ]
```

status [summary | full]

This option displays the status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified criteria.

summary: limits the display to a summary on status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based.

full: displays the full information on status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based.

counters all

This option displays the counters/statistics of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified criteria.

all displays the all counters of the installed gates and their flow definitions along with the run-time status in an IMS authorization service based.

imsi imsi_value [nsapi nsapi_value]

This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified International Mobile Subscriber Identity (IMSI) named *imsi_value*.

nsapi nsapi_value specifies Network Service Access Point Identifier (NSAPI) named *nsapi_value* to limit the display to a single PDP context of the subscriber.

callid call_id

This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specified call identifier named *call_id*.

ims-auth-service ims_auth_svc

This option displays status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service named *ims_auth_svc*.

rulename *rule_name*

This option displays all of the counters/status of the installed policy gates and their flow definitions along with the run-time status in an IMS authorization service based on the specific dynamic charging rule named *rule_name*.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display information/statistics/counters about all of the installed policy gates and their flow definitions along with the run-time status with specified criteria and filters in existing IMS authorization services.

Example

The following command displays the full status of the installed policy gates in an existing IMS authorization service on the system:

```
show ims-authorization policy-gate status full
```

The following command displays the all counters of the installed policy gates in an existing IMS authorization service on the system:

```
show ims-authorization policy-gate counters all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ims-authorization servers

Displays information and statistics specific to the authorization servers used for IP Multimedia Subsystem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
show ims-authorization servers [ ims-auth-service ims_auth_svc_name [ | { grep
grep_options | more } ] ]
```

```
server [ ims-auth-service ims_auth_svc_name ]
```

Displays the information and statistics of all authorization servers configured for IMS authorization service in a system.

ims-auth-service *ims_auth_svc_name*: Displays the configured authorization servers for IMS authorization for an IMS authorization service named *ms_auth_svc_name*.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display information and statistics about IMS authorization servers configured on a system or IMS authorization service.

Example

The following command displays the information and statistics of the authorization servers in IMS authorization service named *ims_auth_gx1*:

```
show ims-authorization servers ims-auth-service ims_auth_gx1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ims-authorization service

Displays information, configuration, and statistics of all/specific IP Multimedia Subsystem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
show ims-authorization service { { all [ verbose ] | name ims_auth_svc_name |
summary } } | { statistics [ all | name ims_auth_svc_name ] [ verbose ] } [ | {
grep grep_options | more } ]
```

all [verbose]

Displays information and configuration of all configured IMS authorization services with a single line of information for each IMS authorization service.

verbose: Displays all information and configuration data of every IMS authorization services configured on system.

name *ims_auth_svc_name*]

Displays the information, statistics, and configuration data of an IMS authorization service named *ms_auth_svc_name*.

summary

Displays summarized information and configuration data of all IMS authorization services configured in a system.

statistics [all | name *ims_auth_svc_name*] [verbose]

Displays the IMS Authorization service statistics including following information:

- Initial authorization procedures
- Re-authorization procedures initiated by us
- Re-authorization procedures initiated by servers
- Various failure statistics

If no criteria specified summarized statistics of all IMS Authorization services are displayed

- all:** displays individual statistics for every IMS authorization service configured on system.
- name *ims_auth_svc_name*:** Displays the statistics of the IMS authorization service named *ims_auth_svc_name*
- verbose:** displays the detailed statistics of a configured IMS authorization service.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

show ims-authorization service

Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display the IMS Authorization service status, counters and configuration. The status includes the state of a server table switchover. Statistics option is used for various processes and procedure status.

Example

The following command displays the information and configuration data of the IMS authorization service named *ims_auth_gx1*:

```
show ims-authorization service name ims_auth_gx1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ims-authorization sessions

Displays information, configuration, and statistics of sessions active in IP Multimedia Subsystem (IMS) authorization service.

Product

SCM, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
show ims-authorization session [ full | summary ] | [ all | [ ims-auth-service
ims_auth_svc_name | imsi imsi_value [ nsapi nsapi_value ] | apn apn_name | ip-
address ip_address | callid call_id ] [ | { grep grep_options | more } ]
```

full

Displays complete information and configuration data of all sessions in IMS authorization services configured in a system.

summary

Displays summarized information and configuration data of all sessions in IMS authorization services configured in a system.

all

Displays information and configuration of all sessions running in IMS authorization services with a single line of information for each IMS authorization session.

ims-auth-service *ims_auth_svc_name*]

Displays the information, statistics, and configuration data of sessions in an IMS authorization service named *ms_auth_svc_name*.

imsi *imsi_value* [**nsapi** *nsapi_value*]

This option displays all of the counters/status of the running services in an IMS authorization service based on the specified International Mobile Subscriber Identity (IMSI) named *imsi_value*.

nsapi *nsapi_value* specifies Network Service Access Point Identifier (NSAPI) named *nsapi_value* to limit the display to a single PDP context of the subscriber.

apn *apn_name*

This option displays all of the counters/status of the running services in IMS authorization service based on the access point name (APN) named *apn_name*.

ip-address *ip_address*

This option displays all of the counters/status of the running services in IMS authorization service based on the host IP address having IP address value as *ip_address*.

callid *call_id*

This option displays all of the counters/status of the running services in IMS authorization service based on the specified call identifier named *call_id*.

summary

Displays summarized information and configuration data of all IMS authorization services configured in a system.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display the sessions running under IMS Authorization service on a system with different filter criteria.

Example

The following command displays the information and statistical data of a session in IMS authorization service:

```
show ims-authorization sessions full
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ip

Displays information for the IP-based interfaces' access group and access list information along with address resolve protocol information for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip { access-group [ statistics ] | access-list [ list_name ] | arp [
arp_ip_address ] | [summary ] | statistics ] | localhosts [ host_name ] |
prefix-list [ detail [ list_name ] | name list_name | summary [ list_name ] ] |
rip | route [ route_ip_address [ route_gw_address ] ] | static-route
sroute_ip_address [ sroute_gw_address ] | vrf vrf-name } [ | { grep grep_options
| more } ]
```

access-group [*statistics*]

Displays all configured access groups in the current context along with the priority values.

statistics: Displays all configured access groups along with packet and byte counters for each ACL rule hit for the current context. In addition, it shows the priority values.

access-list [*list_name*]

Indicates the output is to display the information for all access control lists or the list specified as *list_name*.

arp [*arp_ip_address*]

Displays the address resolution protocol table or the ARP information associated with the IP address specified as *arp_ip_address*. *arp_ip_address* must be specified using the standard IPv4 dotted decimal notation.

Important: When the VPN Manager restarts, it removes all interfaces from the kernel and thus the kernel removes all ARP entries. When this happens, the NPU still holds all of the ARP entries so that there is no traffic disruption. When this happens, from a user point of view, **show ip arp** is broken since this command gathers information from the Kernel and not the NPU.

localhosts [*host_name*]

Displays all the local host information or only for the host specified as *host_name*.

prefix-list [**detail** [*list_name*] | **name** *list_name* | **summary** [*list_name*]]

This keyword list information on configured IP prefix lists. With no keyword supplied, a list of all prefix lists and their entries is displayed.

detail [*list_name*]: Lists detailed information for all prefix lists and their entries. If a list name is specified only the details for the specified prefix list are displayed. *list_name* must be a string of from 1 through 79 alpha and/or numeric characters.

name *list_name*: Lists the entries for a specified prefix list. *list_name* must be a string of from 1 through 79 alpha and/or numeric characters.

summary [*list_name*]: Lists summary information for all prefix lists and their entries. If a list name is specified only the summary for the specified prefix list are displayed. *list_name* must be a string of from 1 through 79 alpha and/or numeric characters.

rip

Displays general RIP routing process information. (RIP is not supported at this time.)

route [*route_ip_address* [*route_gw_address*]]

Indicates the route information to the address specified by *route_ip_address* is to be displayed. The route gateway address may be specified as needed to identify the route. *route_ip_address* and *route_gw_address* must be specified using the standard IPv4 dotted decimal notation.

static-route *sroute_ip_address* [*sroute_gw_address*]

Displays the static route information for the address specified by *sroute_ip_address* is to be displayed. The static route gateway address may also be specified to identify the route. *sroute_ip_address* and *sroute_gw_address* must be specified using the standard IPv4 dotted decimal notation.

vrf *vrf_name*

Displays the routing information of the VRF. *vrf_name* is a name used to identify a VRF.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the IP information to verify and/or troubleshooting communication difficulties between to a remote host/node.

Example

The following command displays the ACL for the list named *sampleACL*.

```
show ip access-list sampleACL
```

The following command will output the static route information to remote host *1.2.3.4*.

```
show ip static-route 1.2.3.4
```

show ip as-path-access-list

Displays the contents of a BGP router AS path access list in the current context.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip as-path-access-list list_name
```

list_name

The name of an existing AS path access list configured in the current context. must be an alpha and or numeric string from 1 through 79 characters in length.

Usage

Use this command to display the configured entries for the specified BGP router AS path access list in the current context.

Example

The following command displays the contents of an AS path access list named *ASlist1*:

```
show ip as-path-access-list ASlist1
```

show ip bgp

Disp[lays BGP information for the current context.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip bgp [ ip_address/mask | debugging | filter-list list_name | neighbors [
ip_address ] | route-map map_name | vpnv4 { all [ network | neighbors | summary
] | vrf vrf-name [ network ] | route-distinguisher [ network | neighbors |
summary ] } [ | { grep grep_options | more } ]
```

ip_address/mask

Specify the IP address and netmask bits for the network for which information should be displayed. *ip_address* is an IPv4 address in dotted-decimal notation and *mask* is the number of subnet bits, representing a subnet mask in shorthand. These must be entered in the dotted-decimal notation/subnet bits format (1.1.1.1/24).

debugging

Display debug flags that are enabled.

filter-list *list_name*

Display routes that match the specified filter list.

neighbors [*ip_address*]

Display information for all neighbors or a specified neighbor. *ip_address* is an IPv4 address in dotted-decimal notation

route-map *map_name*

Display routes that match the specified route-map.

```
vpnv4 { all [ network | neighbors | summary ] | vrf vrf-name [ network ]
| route-distinguisher [ network | neighbors | summary ] }
```

Display all VPNv4 routing data, routing data for a VRF, or a route-distinguisher.

- **all**: displays all VPN routing information. If this is specified, the information displayed is gathered from all the VRF's known to BGP and displayed. It could contain the list of neighbors, the list of networks, or a particular network
- **network**: displays the network for which information in the BGP routing table.
- **neighbors**: shows neighbor information for the all the vrfs including the default vrf or for the VRF with a matching RD value.
- **summary**: shows summary information of neighbors for all the vrfs including the default vrf or for the VRF with a matching RD value.

- **vrf vrf name**: name used to identify a VRF. Information is only gathered from the corresponding VRF. If there is no such VRF, an error is reported.
- **network**: displays the network for which information in the BGP routing table.
- **route-distinguisher**: If specified along with the RD value, the information displayed is gathered from the corresponding VRF whose RD value is the same as the specified value. If there is no VRF associated with such an RD, an error is reported.
- **network**: displays the network for which information in the BGP routing table.
- **neighbors**: shows neighbor information for the all the vrfs including the default vrf or for the VRF with a matching RD value.
- **summary**: shows summary information of neighbors for all the vrfs including the default vrf or for the VRF with a matching RD value.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command display to BGP information for the current context.

Example

The following command displays information for all BGP neighbors:

```
show ip bgp neighbors
```

show ip interface

This command displays the statistical and configuration information for the IP-based interfaces including VRF table for specific context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip interface [ vrf vrf-name ] [ name intfc_name [ statistics ] [ tunnel [ gre-keepalive ] ] [ summary ] [ | { grep grep_options | more } ]
```

vrf *vrf_name*

Displays the routing information of the VRF. *vrf_name* is a name used to identify a VRF.

name *intfc_name*

Indicates the name of the interface for which information has to be displayed. If no interface name is specified then information for all IP interfaces is displayed.

ntfc_name is name of the configured IP interface.

tunnel [**gre-keepalive**]

This keyword will filter the IP interface information for tunnel type of interfaces.

It is applicable for GRE/IP-in-IP type of tunnel interfaces only.

gre-keepalive: This optional keyword displays the GRE keepalive information for GRE tunnel configured with this IP interface.

statistics

Displays the session statistics of all ingress and egress packets processed through this IP interface.

summary

Displays summarized information about requested IP interface/s.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display the summarized of detailed configuration and statistical information for configured IP interface. This information can be used to verify and/or troubleshooting communication difficulties between to a remote host/node.

Example

The following command displays the interface information, including statistics, for the IP interface *sampleInterface*.

```
show ip interface sampleInterface statistics
```

The following command displays the GRE keepalive information for an IP interface named *IP_gre1*.

```
show ip interface IP_gre1 tunnel gre-keepalive
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ip ospf

This command displays OSPF routing information.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip ospf [ border-routers | database [ verbose ] [ ls-id ip_addr ] [ adv-
router ip_addr ] [ ls-type { router | network | summary | asbr-summary |
external | nssa | integer } ] | debugging | interface | neighbor [ details ] |
route | virtual-links ]
```

border-routers

Displays all known area border routers (ABRs) and Autonomous System border routers (ASBRs) for OSPF.

```
database [ verbose ] [ ls-id ip_addr ] [ adv-router ip_addr ] [ ls-type {
router | network | summary | asbr-summary | external | nssa | integer } ]
```

Displays a summary of the database information for OSPF.

verbose: Display detailed OSPF database information.

ls-id ip_addr: Display OSPF database information for the LSAs with the specified LSID.

adv-router ip_addr: Display OSPF database information for the advertising router with the specified LSID.

ls-type { router | network | summary | asbr-summary | external | nssa | LSA_Numerical_Type }]: Display OSPF database information for the specified LSA type.

debugging

Lists which debugging parameters are enabled.

interface

Displays interface information for OSPF.

neighbor [details]

Displays summary information about all known OSPF neighbors.

details: Displays detailed information about all known OSPF neighbors.

route [summary]

Displays the OSPF routing table.

summary: Displays the number of intra-area, inter-area, external-1 and external-2 routes.

virtual-links

Displays the OSPF virtual links.

Usage

Use this command to display OSPF information.

Example

To display general OSPF information, enter the following command;

```
show ip ospf
```

show ip policy-forward

Displays information for IP packet redirecting policy for HA.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip policy-forward
```

Usage

Use this command to see all the settings for IP packet redirection configuration from existing HA to new HA during upgrade.

Important: It is a customer specific command.

Example

The following command displays forward policy configuration for an HA:

```
show ip policy-forward
```

show ip pool

This command displays statistics specific to IP pools.

Product

PDSN, GGSN, HA, ASN-GW, A-BG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip pool [ address {pool-name pool_name | group-name group_name } { used |
free | hold | release } [ limit limit ] | group-name group_name | groups | hold-
timer { imsi imsi | msid msid | username username [ imsi imsi | msid msid ] } |
overlap | pool-name pool_name | private | public | resource | static | summary |
verbose | wide ]
```

```
address { pool-name pool_name | group-name group_name } { used | free |
hold | release} [ limit limit ]
```

Displays IP pool addresses for the specified IP pool or pool group that are currently in the specified state.

pool-name *pool_name*: Show IP addresses from the IP pool with the specified name. *pool_name* must be the name of an existing IP pool.

group-name *group_name*: Show IP addresses from the IP pool group with the specified name. *group_name* must be the name of an existing IP pool group.

used: Display the IP addresses that are in a used state.

free: Display the IP addresses that are in a free state.

hold: Display the IP addresses that are in a hold state.

release: Display the IP addresses that are in a release state.

limit *limit*: The maximum number of address to display. *limit* must be an integer from 1 through 524287.

```
group-name group_name
```

Show information about the IP pool group with the specified name. *group_name* must be the name of an existing IP pool group.

```
groups
```

List information about all IP pool groups.

```
hold-timer {imsi imsi | msid msid | username username [imsi imsi | msid
msid]}
```

Displays hold timer address information for the specified IMSI, MSID, or username.

imsi *imsi*: The IMSI for which to display hold-timer information. *imsi* must be a valid IMSI (International Mobile Subscriber Identity) ID which is a 15 character field that identifies the subscriber's home country and carrier.

msid *msid*: The MSID for which to display hold-timer information. *msid* must be a mobile subscriber ID from 7 through 16 digits.

username *username*: The username for which to display hold-timer information. *username* must be an alpha and or numeric string of from 1 through 127 characters.

Important: Active users cannot be displayed. If an active ID or username is entered, the following error message appears: Failure: No address matching the specified information was found! Please confirm that the options used match the network architecture/deployment, i.e. IMSI/MSID only, Username only, or IMSI/MSID plus Username. Please note that this command does not apply for addresses in the used state.

overlap

List information on overlapping IP pools

pool-name *pool_name*

Show information about the specified IP pool. *pool_name* must be the name of an existing IP pool.

private

Show information about IP pools marked private.

public

Show information about IP pools marked public.

resource

Show information about resource IP pools.

static

Show information about static IP pools.

summary

Show a summary of all IP pool information.

verbose

Show detailed information about all IP pools.

wide

Show detailed information formatted to more than 80 columns.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display statistics pertaining to IP Pools in the current context.

Example

The following command displays IP address information for an IP Pool named *pool11*:

```
show ip pool address pool-name pool
```

To display a summary list for all IP pools in the current context, enter the following command:

```
show ip pool summary
```

The following command displays IP pool information for all IP pools configured in the current context:

```
show ip pool verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ip ipsp

Displays the names of IP pools that are enabled for the IP pool sharing protocol (IPSP) and lists the disposition of addresses in the pools.

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ip ipsp [ summary ]
```

summary

Only show the disposition of the addresses in the participating IP pools. Do not show the names of the participating IP pools.

Usage

Use this command to list the names of IP pools that are participating in the IPSP and list the disposition of IP addresses in those pools.

Important: For information on configuring and using IPSP refer to the System Administration and Configuration Guide.

Example

To list information on all IPSP participating pools and address disposition, enter the following command:

```
show ip ipsp
```

show ipms status

Displays the status of IPMS client service with information related to system and call events. It also displays the status of IPMS servers configured.

Product

IPMS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ipms status [ summary | all | server address ip_address ]
```

summary

Displays the summary of all configured IPMS client and IPMS servers.

all

Displays information for all configured IPMS client and IPMS servers.

server address ip_address

Displays status for a specific IPMS server.

ip_address is the IP address of the desired IPMS server and must be entered in IPv4 dotted decimal notation.

Usage

This command is used to show/verify the status or configuration of one or all IPMS server along with system and call event information.

Example

The following command displays status of an IPMS server with IP address 1.2.3.4:

```
show ipms status server address 1.2.3.4
```

show ipsg

Displays information and statistics specific to the IP Services Gateway service.

Product

IPSG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ipsg { service { all [ counters ] | name name } | sessions { all | callid
num | counters { criteria } | full { criteria } | ip-address address | msid num
| peer-address address | summary { criteria } | username name } | statistics [
name name | peer-address address ] } [ | { grep grep_options | more } ]
```

```
service { all [ counters ] | name name }
```

Displays information about the configured IPSG service.

all [counters]: Displays information about all of the configured IPSG services on the system.

name name: Displays information about a specific IPSG service on the system. *name* must be an existing IPSG service name.

```
sessions { all | callid num | counters { criteria } | full { criteria } |
imsi num | ip-address address | msid num | peer-address address | summary
{ criteria } | username name }
```

all: Displays session information including call ID, NAI, and home address for all current IPSG sessions. This is the default behavior for the **sessions** keyword.

callid num: Displays session information for a current IPSG session based on the call ID. *num* must be an existing IPSG service session call ID.

counters { criteria }: Displays session counters for sessions matching the criteria. (See *criteria* below.)

full { criteria }: Displays all available session information for sessions matching the criteria. (See *criteria* below.)

ip-address address:

msid num: Displays session information for a current IPSG session based on the MSID. *num* must be an existing IPSG service session MSID.

peer-address address: Displays session information for a current IPSG session based on the IP address of the device sending the RADIUS accounting messages. *address* must be an existing IPSG service session IP address for the device sending the RADIUS accounting messages.

summary { criteria }: Displays a summary of available session information for sessions matching the criteria. (See *criteria* below.)

username name: Displays session information for a specific IPSG session based on the username of the subscriber. *name* must be an existing IPSG service session subscriber username.

criteria:

all: Displays session information for all existing IPSG service sessions.

callid num: Displays session information for a specific IPSG session based on the call ID. *num* must be an existing IPSG service session call ID.

ip-address address: Displays session information for a specific IPSG session based on the IP address of the subscriber. *address* must be an existing IPSG service session subscriber IP address.

msid *num*: Displays session information for a specific IPSPG session based on the MSID. *num* must be an existing IPSPG service session MSID.

peer-address *address*: Displays session information for a current IPSPG session based on the IP address of the device sending the RADIUS accounting messages. *address* must be an existing IPSPG service session IP address for the device sending the RADIUS accounting messages.

username *name*: Displays session information for a specific IPSPG session based on the username of the subscriber. *name* must be an existing IPSPG service session subscriber username.

statistics [**name** *name* | **peer-address** *address*]

Displays the total collected statistics of all IPSPG sessions since the last system restart or clear command.

name *name*: Displays the total collected statistics of all IPSPG sessions processed by a specific service since the last system restart or clear command. *name* must be an existing IPSPG service name.

peer-address *address*: Displays the total collected statistics of all IPSPG sessions associated with a specific IP address of the device responsible for sending the RADIUS accounting messages. Displayed statistics are from the last system restart or clear command.

grep *grep_options* | **more**

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to display information and statistics about existing IPSPG services.

Example

The following command displays the existing IPSPG services on the system:

```
show ipsg service all
```

The following command displays all the existing IPSPG service sessions on the system:

```
show ipsg session all
```

The following command displays the cumulative IPSPG session statistics on the system:

```
show ipsg statistics
```

The following command displays the cumulative IPSPG session statistics on the system for an IPSPG service named *ipsg1*:

```
show ipsg statistics name ipsg1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ipv6

Displays the statistics for each rule in an IPv6 access control group.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show ipv6 access-group

```
show ipv6 { access-group [ statistics ] | access-list [ list_name ] | interface
[ summary | name interface_name [ statistics ] | neighbors | route
route_ip_address }
```

access-group [*statistics*]

Displays all configured access groups in the current context along with the priority values.

statistics: Displays all configured access groups along with packet and byte counters for each IPv6 ACL rule hit for the current context. In addition, it shows the priority values.

access-list [*list_name*]

Indicates the output is to display the information for all access control lists or the list specified as *list_name*.

interface [**summary** | **name** *interface_name* [**statistics**]

This command displays information about IPv6 interfaces. If no interface name is specified then information for IPv6 interfaces is displayed.

summary: Displays a summary of the interface information.

name *interface_name*: Displays information for the IPv6 interface specified. Must be followed by an *interface_name*.

statistics: Includes the number on inbound and outboud IP packets statistics that were registered by the kernel in the information displayed.

neighbors

Displays the neighbor discovery table for this context.

route *route_ip_address*

Indicates the route information to the address specified by *route_ip_address* is to be displayed. The route gateway address may be specified as needed to identify the route. *route_ip_address* using colon (:) separated notation.

Usage

Show the IPv6 information to verify and/or troubleshoot communication difficulties between to a remote host/node.

Example

The following command displays the ACL for the list named *sampleACL*.

```
show ipv6 access-list samplev6ACL
```

The following command displays the interface information, including statistics, for the IPv6 interface *samplev6Interface*.

```
show ipv6 interface samplev6Interface statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ipv6 pool

Displays information for ipv6 pools.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ipv6 pools [ name ipv6 pool name | group-name name | { grep grep_options |  
more } ]
```

name *ipv6 name*

Displays information for a specified ipv6 pool.

group-name *name*

Displays information for a specified IPv6 pools group.

name is the name of the group of IPv6 pool and must be a string having 1 to 79 alpha and/or numeric characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to see all the ipv6 pools.

Example

The following command displays ipv6 pool information:

```
show ipv6 pools
```

show iups-service

This command displays information for Iu-PS services in the current context.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show iups-service { all | name svrc_name } [ rnc { all | mcc mcc_num mnc mnc_num
| rnc_id } ]
```

all

Show information for all IuPS services.

name *svrc_name*

svrc_name: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing IuPS service.

rnc all

Displays information for all configured RNCs.

rnc mcc *mcc_num* **mnc** *mnc_num*

Displays information for a specific RNC.

- *mcc_num*: The Mobile Country Code (MCC) of the RNC. Must be a 3 digit integer from 200 through 999.
- *mnc_num*: The Mobile Network Code (MNC) of the RNC. Must be a 2 or 3 digit integer from 00 through 999.

rnc *rnc_id*

rnc_id: The identification number of the RNC configuration instance. Must be an integer from 0 to 4095.

Usage

Use this command to display information for a specific Iu-PS service or for all Iu-PS services configured within the context. It is also possible, but not required, to fine-tune the display to only provide information for a specific RNC.

Iu-PS services control the interface between the SGSN and the RNCs in the UMTS Radio Access Network (UTRAN). Iu-PS services include the control plane and the data plane between these nodes.

Example

The following command displays information for a single Iu-PS service named *iups-svc-1*:

```
show iups-service name iups-svc-1
```

■ show iups-service

The next command displays information for all Iu-PS services configured in the current context:

```
show iups-service all
```

This command displays information for a specific RNC for a specific Iu-PS services:

```
show iups-service name iups-svc-1 rnc 123
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show l2tp sessions

Displays information for L2TP tunnels.

Product

LNS, PDSN, GGSN, HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show l2tp sessions [ full | summary | counters ] [ all | callid id | username
name | msid ms_id | lac-service service_name | lns-service service_name peer-
address [ operator ] peer_address ]
```

full

Shows all available information for the specified sessions.

summary

Shows a summary of available information for the specified sessions.

counters

Shows counters for the specified L2TP sessions.

all

Shows all current sessions.

callid *id*

Show session information for the specified call id. The output of the command **show l2tp tunnels** contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.

username *name*

Shows session information for the specified subscriber. *username* has a string length of 1 to 127 characters. Wildcard characters \$ and * are allowed.

msid *ms_id*

Shows session information for the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters \$ and * are allowed.

lac-service *service_name*

Shows all L2TP sessions in the specified LAC service.

lns-service *service_name*

Shows all L2TP sessions in the specified LNS service.

peer-address [*operator*] *peer_address*

Shows all L2TP sessions to the destination (peer LNS) at the specified IP address. The *peer_address* must be specified using the standard IPv4 dotted decimal notation.

In conjunction with **sessions** keyword, indicates a range of peers is to be displayed.

peer-address [*operator*] *peer_address* must be specified using the standard IPv4 dotted decimal notation.

operator implies how to logically specify a range of peer-address and it must be one of the following:

- <: IP address less than to specified *peer_address*
- >: IP address less than to specified *peer_address*
- greater-than**: IP address less than to specified *peer_address*
- less-than**: IP address less than to specified *peer_address*

Usage

Use this command to show information for sessions in the current context.

Important: If this command is executed from within the local context, cumulative session information is displayed for all contexts.

Example

The following command displays cumulative statistics for all sessions processed within the current context:

```
show l2tp sessions
```

The following command displays all information pertaining to the L2TP session of a subscriber named *isp1vpnuser1*:

```
show l2tp session full username isp1vpnuser1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show l2tp statistics

Displays statistics for all L2TP tunnels and sessions.

Product

LNS, PDSN, GGSN, HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show l2tp statistics [ lac-service service_name | lns-service service_name |  
peer-address peer_ip_address ]
```

lac-service *service_name*

Shows L2TP statistics for all tunnels and sessions in the specified LAC service.

lns-service *service_name*

Shows L2TP statistics for all tunnels and sessions in the specified LNS service.

peer-address *peer_address*

Shows L2TP statistics for all tunnels and sessions to the destination (peer LNS) at the specified IP address. The *peer_address* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to display statistics for L2TP services.

Example

The following command displays statistics for a specific LAC service named *vpn1*:

```
show l2tp statistics lac-service vpn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show l2tp tunnels

Displays information for L2TP tunnels.

Product

LNS, PDSN, GGSN, HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show l2tp tunnels [ full | summary | counters ] [ all | callid id | username
name | msid ms_id | lac-service service_name | lns-service service_name | peer-
address [ operator ] peer_address ]
```

full

Shows all available information for the specified tunnels.

summary

Shows a summary of available information for the specified tunnels.

counters

Shows counters for the specified L2TP tunnels.

all

Shows all current tunnels.

callid *id*

Show tunnel information for the specified call id. The output of the command **show l2tp tunnels** contains a field labeled Callid Hint which lists the call id information to use with this command. This is an 8-Byte Hexadecimal number.

username *name*

Shows tunnel information for the specified subscriber. *username* has a string length of 1 to 127 characters. Wildcard characters \$ and * are allowed.

msid *ms_id*

Shows tunnel information for the mobile user identified by *ms_id*. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters \$ and * are allowed.

lac-service *service_name*

Shows all L2TP tunnels in the specified LAC service.

lns-service *service_name*

Shows all L2TP tunnels in the specified LNS service.

peer-address [*operator*] *peer_address*

Shows all L2TP tunnels to the destination (peer LNS) at the specified IP address. The *peer_address* must be specified using the standard IPv4 dotted decimal notation.

In conjunction with **tunnels** keyword, indicates a range of peers is to be displayed.

peer-address [*operator*] *peer_address* must be specified using the standard IPv4 dotted decimal notation.

operator implies how to logically specify a range of peer-address and it must be one of the following:

- <: IP address less than to specified *peer_address*
- >: IP address less than to specified *peer_address*
- greater-than**: IP address less than to specified *peer_address*
- less-than**: IP address less than to specified *peer_address*

Usage

Use this command to show information for tunnels in the current context.

Example

The following command displays all of the tunnels currently being facilitated by LAC services within the current context:

```
show l2tp tunnels all
```

The following command displays information pertaining to the L2TP tunnel(s) established for a LAC-service named vpn1:

```
show l2tp tunnels full lac-service vpn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show lawful-intercept

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a full description of this command.

show lawful-intercept ssdf statistics

Refer to the *Cisco ASR 5000 Lawful Intercept Configuration Guide* for a description of these statistics.

show lac-service

Displays the information for all LAC services or for a particular LAC service.

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show lac-service { all | name service_name } [ | { grep grep_options | more } ]
```

all

Display information for all LAC services.

name *service_name*

Display information only for the LAC service specified by *service_name*.

service_name is up to a 60 character name given to the service when it was originally configured.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to list information for LAC services configured on this system.

Example

The following commands display information for all LAC services and the LAC service named *lac1*, respectively.

```
show lac-service all
show lac-service name lac1
```

show leds

Displays the current status of the LEDs for a specific card or all cards.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show leds { all | card_num } [ | { grep grep_options | more } ]
```

all | *card_num*

all: indicates the LED status for all cards is to be displayed.

card_num: indicates the LED status for the card specified by *card_num* is to be displayed.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display the status of the LEDs as a part of an automated periodic script which checks the LEDs of the chassis.

Important: This command is not supported on all platforms.

Example

The following commands display the LED status for all cards and only card 8, respectively.

```
show leds all
```

Important: Refer to the descriptions for Card LEDs and System LEDs in **show card info** command in the *Counters and Statistics Reference* for information on the LED color codes.

show license information

Displays the installed license information as well as maximum number of sessions.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show license information { key_name | full } | { key } [ | { grep grep_options |
more } ]
```

key_name | **full**

key_name: the output displays the information for the key specified as *key_name*.

full: the output displays the full features and quantities without any hardware limits in place.

key:

indicates the output is to display the installed keys in encrypted format.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the license information to verify the proper keys have been installed. This command is also helpful in troubleshooting user system access due to the maximum number of sessions being reached.

Example

The following displays the encrypted installed key and the information for *sampleKey* respectively.

```
show license information sampleKey
```

show linecard table

Displays information on the rear-installed interface cards.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show linecard table [ | { grep grep_options | more } ]
```

table

Displays information on all linecard slots in tabular format.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the line card information to verify hardware inventories and installed components.

Important: This command is not supported on all platforms.

Example

```
show linecard table
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show lma-service

Displays statistic and counter information for Local Mobility Anchor (LMA) services on this system.

Product

P-GW

Privilege

Inspector

Syntax

```
show lma-service all
```

```
show lma-service name service_name
```

```
show lma-service session [ all | callid id | counters | full | ipv6-address { < address | > address | address | greater-than address [ less-than address ] | less-than address [ greater-than address ] } | summary | username name ]
```

```
show lma-service statistics [ lma-service name ] } [ | { grep grep_options | more } ]
```

all

Displays information about all configured LMA services on this system.

name *service_name*

Displays configuration information for a specific LMA service configured on this system.

service_name must be an existing LMA service, and be from 1 to 63 alpha and/or numeric characters in length.

```
session [ all | callid id | counters | full | ipv6-address { < address | > address | address | greater-than address [ less-than address ] | less-than address [ greater-than address ] } | summary | username name ]
```

Displays session information filtered by the following parameters:

all: Displays all active LMA sessions using LMA services on the system.

callid *id*: Displays available session information for the specific call identification number. *id* must be an eight-digit HEX number.

counters: Displays session counters for active LMA sessions using LMA services on the system. This keyword can also be filtered by the following:

- all
- callid
- ipv6-address
- username

Refer to the keyword descriptions in this command for information regarding these filters.

full: Displays additional session information for active LMA sessions using LMA services on the system. This keyword includes the information in the output of the 'all' keyword plus additional information. This keyword can also be filtered by the following:

- all

- **callid**
- **ipv6-address**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.

ipv6-address:

- **< address** and **less-than address**: Displays summary information for a group of IPv6 addresses that are less than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the **greater-than** option. *address* must be specified in colon separated notation.
- **> address** and **greater-than address**: Displays summary information for a group of IPv6 addresses that are greater than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the **less-than** option. *address* must be specified in colon separated notation.
- **address**: Displays summary information for a specific IPv6 address using an LMA service on this system. *address* must be specified in colon separated notation.

summary: Displays the number of LMA sessions currently active for LMA services configured on the system.

username name: Displays available session information for a specific user in a service session. *name* must be followed by an existing user name and must be from 1 to 127 alpha and/or numeric characters.

statistics [lma-service name]

lma-service name: Displays LMA service statistics for a specific LMA service. *name* must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for LMA services on this system.

Example

The following command displays service statistics for the LMA service named *lma1*:

```
show lma-service name lma1
```

show lns-service

Displays the information for all LNS services or for a particular LNS service.

Product

PDSN, HA, GGSN, LNS

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show lns-service { all | name service_name } [ | { grep grep_options | more } ]
```

all

Display information for all LNS services.

name service_name

Display information only for the LNS service specified by *service_name*.

service_name is up to a 60 character name given to the service when it was originally configured.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to list information for LNS services configured on this system.

Example

The following commands display information for all LNS services and the LNS service named *lns1*, respectively.

```
show lns-service all
```

```
show lns-service name lns1
```

show local-user

Displays information pertaining to local-user accounts.

Product

All

Privilege

Security Administrator

Syntax

```
show local-user [ [ username name ] [ inactive filter ] [ verbose | wide ] |  
statistics [ verbose ] ]
```

username *name*

Specifies the name of a specific local-user administrative account for which to display information. *name* can be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

inactive *filter*

Specifies a filter for displaying inactive local-user accounts. *filter* can be one of the following:

- **< days** : Displays accounts that have been inactive less than the specified number of days.
- **> days** : Displays accounts that have been inactive more than the specified number of days.
- **greater-than days** : Displays accounts that have been inactive more than the specified number of days.
- **less-than days** : Displays accounts that have been inactive less than the specified number of days.

days can be configured to any integer value from 1 to 365.

[**verbose** | **wide**]

Default: **wide**

Specifies how the information is to be displayed as one of the following options:

- **verbose** : The data is displayed in list format. Additional information is provided beyond what is displayed when the **wide** option is used.
- **wide** : The data is displayed in tabular format.

statistics [**verbose**]

Displays local-user statistics.

Using the **verbose** keyword displays additional statistics.

Usage

Use this command to display information and statistics on local-user administrative accounts.

Example

The following command displays detailed information on local-user administrative accounts that have been inactive for more than 10 days:

■ show local-user

```
show local-user inactive greater-than 10 verbose
```

The following command displays detailed information for a local-user account named *Test*:

```
show local-user username Test verbose
```

The following command displays detailed local-user account statistics:

```
show local-user statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show logging

Displays the defined logging filters for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show logging [ active | verbose ] [ | { grep grep_options | more } ]
```

active | **verbose**

Default: all facilities are shown in concise form.

active: indicates only the active CLI logging filter information is to be displayed.

verbose: indicates the output should provide as much information as possible.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View log filters to trouble shoot disk utilization issues.

Example

```
show logging
```

```
show logging active
```

```
show logging verbose
```

```
show logging active verbose
```

show logs

Displays active and inactive logs filtered by the options specified.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show logs [ active ] [ inactive ] [ callid call_id ] [ event-verbosity
evt_verbosity ] [ facility facility ] [ level severity_level ] [ pdu-data
pdu_format ] [ pdu-verbosity pdu_verbosity ] [ proclat facility ] [ since
from_date_time [ until to_date_time ] ] [ | { grep grep_options | more } ]
```

active

Indicates output is to display data from active logs.

inactive

Indicates output is to display data from inactive logs.

callid *call_id*

Specifies a call ID for which log information is to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.

event-verbosity *evt_verbosity*

Specifies the level of verbosity to use in displaying of event data as one of:

- **min** - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- **concise** - displays detailed information about the event, but does not provide the event source within the system.
- **full** - displays detailed information about event, including source information, identifying where within the system the event was generated.

facility *facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **aal2**: AAL2 protocol logging facility

- **acl-log**: Access Control List logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **alcap**: ALCAP protocol logging facility
- **alcapmgr**: ALCAP protocol logging facility
- **all**: All facilities
- **asngwmgr**: ASN Gateway Manager facility
- **asnrmgr**: ASN Paging/Location-Registry Manager facility
- **bfd**: Bidirectional Forwarding Detection (BFD) protocol logging facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bindmux**: IPCF BindMux manager logging facility
- **bssap+**: Base Station Sub-system Application Part+ protocol facility for login interface between the SGSN and the MSC/VLR (2.5G and 3G)
- **bssgp**: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
- **cap**: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
- **chatconf**: Voice Chat/Conference logging facility
- **cli**: CLI logging facility
- **credit-control**: Credit Control facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **cscftmgr**: SIP CSCFTT Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **cx-diameter**: Cx Diameter message logging facility
- **dcardctrl**: IPSEC Daughter card Controller logging facility (not used at this time)
- **dcardmgr**: IPSEC Daughter card Manager logging facility (Not used at this time)
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: DHCP facility (GGSN product only)
- **dhcpxv6**: DHCPV6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase message logging facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting

- **diameter-auth:** Diameter Authentication
- **diameter-dns:** Diameter DNS subsystem logging facility
- **diameter-ecs:** ECS Diameter signaling facility
- **diameter-hdd:** Diameter HDD interface logging facility
- **diameter-svc:** Diameter Service
- **diamproxy:** DiamProxy logging facility
- **dpath:** IPSEC Data Path facility
- **drvctrl:** Driver Controller facility
- **ds3mgr:** DS3 Manager logging facility
- **eap-ipsec:** EAP
- **eap-sta-s6a-s13-s6b-diameter:** Extensible Authentication Protocol (EAP) EAP/STA/S6A/S13/S6B Diameter message logging facility
- **ecs-css:** ACSMGR <-> Session Manager Signalling Interface Logging facility
- **egtpc:** Evolved GPRS Tunneling Protocol (EGTP) control plane logging facility
- **egtpmgr:** EGTP Demux Manager logging facility
- **egtpu:** EGTP user plane logging facility
- **event-notif:** Event Notification Interface logging facility
- **evlog:** Event log facility
- **famgr:** Foreign Agent manager logging facility
- **firewall:** Inline per-subscriber Stateful Firewall facility
- **fng:** FNG logging facility
- **gmm:**
 - For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
 - For 3G: Logs the access application layer (above the RANAP layer)
- **gprs-app:** GPRS Application logging facility
- **gprs-ns:** GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
- **gq-rx-tx-diameter:** Gq/Rx/Tx Diameter messages logging facility
- **gss-gcdr:** GTP Storage Server GCDR facility
- **gtpc:** GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr:** GTP-C protocol Manager logging facility (GGSN product only)
- **gtp:** GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu:** GTP-U protocol logging facility (GGSN product only)
- **gtpumgr:** GTP-U protocol logging facility
- **gx-ty-diameter:** Gx/Ty Diameter messages logging facility
- **gy-diameter:** Gy Diameter messages logging facility
- **hamgr:** Home Agent manager logging facility
- **hat:** High Availability Task (HAT) process facility

- **hdctrl:** HD Controller logging facility
- **hnb-gw:** HNB-GW (3G Femto GW) logging facility
- **hnbmgr:** HNBMgr (3G Femto GW) demux manager logging facility)
- **hss-peer-service:** HSS Peer Service logging facility
- **igmp:** IGMP
- **ikev2:** IKEv2
- **ims-authorization:** IMS Authorization Service facility
- **ims-sh:** HSS SH Service facility
- **imsimgr:** SGSN IMSI manager (the demux for calls coming in, routes the calls to appropriate session manager) logging facility
- **imsue:** IMSUE
- **ip-arp:** IP Address Resolution Protocol facility
- **ip-interface:** IP interface facility
- **ip-route:** IP route facility
- **ipms:** IPMS logging facility
- **ipsec:** IP Security logging facility
- **ipsg:** IP Service Gateway interface logging facility
- **ipsgmgr:** IP Services Gateway facility
- **ipsp:** IP Pool Sharing Protocol logging facility
- **kvstore:** KV Store facility
- **l2tp-control:** L2TP control logging facility
- **l2tp-data:** L2TP data logging facility
- **l2tpdemux:** L2TP Demux Manager logging facility
- **l2tpmgr:** L2TP Manager logging facility
- **ldap:** LDAP messages logging facility
- **li:** Refer to the *Cisco ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.
- **linkmgr:** SGSN/BSS SS7 Link Manager logging facility (2.5G only)
- **llc:** Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
- **local-policy:** Local Policy Service logging facility
- **m3ua:** MTP3 User Adaptation (M3UA) Protocol logging facility
- **magmgr:** Mobile Access Gateway logging facility
- **map:** Mobile Application Part (MAP) Protocol logging facility
- **megadiammgr:** Megadiameter Manager (SLF Service)
- **mpls:** MPLS protocol logging facility
- **mme-app:** MME application logging facility
- **mme-misc:** MME miscellaneous logging facility

- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager logging facility
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 control logging facility
- **mtp2**: MTP2 Service logging facility
- **mtp3**: Message Transfer Part (MTP3) Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit (NPU) Manager facility
- **npumgr-acl**: NPUMGR ACL logging facility
- **npumgr-flow**: NPUMGR Flow logging facility
- **npu-fwd**: NPUMGR FWD logging facility
- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-port**: NPUMGR PORT logging facility
- **npumgr-recovery**: NPUMGR Recovery logging facility
- **ogw-app**: OGW application logging facility
- **ogw-gtpe**: OGW GTPC application logging facility
- **ogw-gtpu**: OGW GTPU application logging facility
- **ogwmgr**: OGW demux manager logging facility
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer detection logging facility
- **pccmgr**: IPCF PCC manager library
- **pdg**: PDG logging facility
- **pdgdmgr**: TCP demux manager logging facility
- **pdif**: PDIF logging facility
- **pgw**: PDN Gateway facility
- **phs-control**: PHS X1/X5 and X2/X6 interface logging facility
- **phs-data**: PHS Data logging facility
- **phs-eapol**: PHS EAPOL logging facility
- **phsgwmgr**: PHS gateway manager facility
- **phspcmgr**: PHS paging controller manager facility
- **pmm-app**: PMM application (for subscriber mobility management) logging facility (3G only)
- **ppp**: PPP link and packet facilities

- **ptt**: Voice push-to-talk logging facility
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Rf Diameter message logging facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **rua**: RUA (3G Femto GW - RUA messages) logging facility
- **s1ap**: S1AP Protocol logging facility
- **sccp**: SCCP Protocol logging connection-oriented messages between RANAP and TCAP layers.
- **sct**: Shared Configuration Task logging facility
- **sctp**: SCTP Protocol logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstr**: Session Trace logging facility
- **sft**: Switch Fabric Task logging facility
- **sgs**: SGS Protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN ‘glue’ interfaces, e.g., between PMM, MAP,. GPRS-FSM, SMS.
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN MBMS Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stach manager to log binding and removing between layers
- **sgsn-system**: SGSNs System Components logging facility; used infrequently
- **sgsn-test**: SGSN Tests logging facility; used infrequently
- **sgtpcmgr**: SGSN GTPC Manager logging information exchange through SGTPC and the GGSN
- **sgw**: Serving Gateway facility
- **sh-diameter**: Sh Diameter message logging facility
- **sitmain**: System Initialization Task main logging facility

- **sm-app**: Session Management (SM) Protocol logging PDPs and associated info
- **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
- **sndcp**: Sub-Network Dependent Convergence (SNDSCP) Protocol logging facility
- **snmp**: SNMP logging facility
- **sprmgr**: IPCF SPR manager library
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **sscfnni**: Service Specific Co-ordination Function for UNNI (SCFNFI) Protocol logging facility
- **sscop**: Service Specific Connection Oriented Protocol (SSCOP) logging facility
- **ssh-ipsec**: SSH IP Security logging facility
- **ssl**: SSL (Secure Socket Layer) message logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **taclep**: Type Allocation Code (TAC) Local Call Processing logging facility
- **tcap**: Transaction Capabilities Application Part (TCAP) Protocol logging facility
- **threshold**: threshold logging facility
- **ttg**: TTG logging facility
- **tucl**: TUCL logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **usertcp-stack**: User TCP stack logging facility
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

level *severity_level*

level *severity_level*: specifies the level of information to be logged, *severity_level*, from the following list which is ordered from highest to lowest:

- **critical** - display critical events
- **error** - display error events and all events with a higher severity level
- **warning** - display warning events and all events with a higher severity level
- **unusual** - display unusual events and all events with a higher severity level
- **info** - display info events and all events with a higher severity level
- **trace** - display trace events and all events with a higher severity level
- **debug** - display all events

pdu-data *pdu_format*

Specifies output format for the display of packet data units as one of:

- **none** - output is in raw format (unformatted).
- **hex** - output being displayed in hexadecimal format.
- **hex-ascii** - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

pdu-verbosity *pdu_verbosity*

Specifies the level of verbosity to use in displaying of packet data units as a value from 1 to 5 where 5 is the most detailed.

proclet *facility*

Shows the logs from a specific proclet facility. The available facilities are the same as those listed earlier.

since *from_date_time* [**until** *to_date_time*]

Default: no limit.

since *from_date_time*: indicates only the log information which has been collected more recently than *from_date_time* is to be displayed.

until *to_date_time*: indicates no log information more recent than *to_date_time* is to be displayed. **until** defaults to current time when omitted.

from_date_time and *to_date_time* must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where YYYY is a 4-digit year, MM is a 2-digit month in the range 01 through 12, DD is a 2-digit day in the range 01 through 31, HH is a 2-digit hour in the range 00 through 23, mm is a 2-digit minute in the range 00 through 59, and ss is a 2 digit second in the range 00 through 59.

to_date_time must be a time which is more recent than *from_date_time*.

The use of the **until** keyword allows for a time range of log information while only using the **since** keyword will display all information up to the current time.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View log files for general maintenance or troubleshooting system issues.

Example

The following commands display log information for the *a11mgr* facility starting with February 20th, 2003 at midnight where both are equivalent.

```
show logs facility a11mgr since 2003:02:20:00:00
```

```
show logs facility a11mgr since 2003:02:20:00:00:00
```

The following command displays the log information for call ID *FE881D32* only in active logs.

```
show logs active callid FE881D32
```

■ show logs

Chapter 108

Exec Mode Show Commands (M-P)

This section includes the commands `show m3ua statistics` through `show profile-id-qci-mapping`.

show mag-service

Displays statistic and counter information for Mobile Access Gateway (MAG) services on this system.

Product

HSGW, S-GW

Privilege

Inspector

Syntax

```
show mag-service { all | name service_name | session [ all | callid id |
counters | full | msid id | summary | username name ] | statistics [ name
service_name ] } [ | { grep grep_options | more } ]
```

all

Displays information for all configured MAG services on this system.

name *service_name*

Displays configuration information for a specific MAG service configured on this system.

service_name must be an existing MAG service, and be from 1 to 63 alpha and/or numeric characters in length.

session [all | callid *id* | counters | full | msid *id* | summary | username *name*]

all: Displays all active MAG sessions using MAG services on the system.

callid *id*: Displays available session information for the specific call identification number. *id* must be an eight-digit HEX number.

counters: Displays counters for all MAG services on the system. This keyword can also be filtered by the following:

- all
- callid
- msid
- username

Refer to the keyword descriptions in this command for information regarding these filters.

full: Displays additional session information for all active MAG sessions using MAG services on the system. This keyword includes the information in the output of the 'all' keyword plus additional information. This keyword can also be filtered by the following:

- all
- callid
- msid
- username

Refer to the keyword descriptions in this command for information regarding these filters.

msid *id*: Displays available information for a specific mobile station identification number or group of numbers based on wildcard entry. *id* must be a valid MSID number and can be a sequence of characters

and/or wildcard characters ('\$' and/or '*'). The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes ('). For example: '\$'.

summary: Displays the number of MAG sessions currently active for MAG services configured on the system.

username name: Displays available session information for a specific user in a service session. *name* must be followed by an existing user name and must be from 1 to 127 alpha and/or numeric characters.

statistics [name service_name]

name *service_name*: Displays MAG service statistics for a specific MAG service. *service_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

| { **grep** *grep_options* | **more** }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for MAG services on this system.

Example

The following command displays service statistics for the MAG service named *mag1*:

```
show mag-service name mag1
```

show map-service

Displays information configured for the Mobile Application Part (MAP) services, including MAP service features and operational configuration. Also includes some related configuration information for the HLR and EIR configuration parameters.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show map-service [ all | name svrc_name ]
```

name *svrc_name*

svrc_name: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing MAP service.

Usage

Use this command to display all MAP service or the statistics for a particular MAP service.

Example

The following command displays configuration information for the MAP service named *map-svc-1*:

```
show map-service name map-svc-1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show map statistics

Displays Mobile Application Part (MAP) statistics.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show map statistics [ name svrc_name ]
```

name *svrc_name*

svrc_name: must be a string of 1 to 63 alphanumeric characters that identifies a specific existing MAP service.

Usage

Use this command to display all MAP statistics or the statistics for a particular MAP service.

Example

The following command displays statistics for the MAP service named *map-svc-1*:

```
show map statistics name map-svc-1
```

The following command displays combined statistics for all MAP services in the current context:

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show maximum-temperatures

Shows the maximum temperature reached by each card since the last temperature timestamp reset.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show maximum-temperatures [ verbose] [ | { grep grep_options | more } ]
```

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

verbose

Indicates that the output is to contain detailed information.

Usage

Verify the maximum temperature reached by components in the chassis since the indicated timestamp.

Important: This command is not supported on all platforms.

Example

```
show maximum-temperatures
```

```
show maximum-temperatures verbose
```

show mbms bearer-service

Displays configuration information for bearer service configured for multimedia broadcast and multicast facility on this system.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show mbms bearer-service [ all | apn apn_name mcast-addr ip_address | service-
type { broadcast | multicast } | full | instance instance_id | summary ] + [ | {
grep grep_options | more } ]
```

all

Displays information on all bearer services configured on the system.

apn *apn_name* mcast-addr *ip_address*

Displays bearer service information of MBMS for a specific APN *apn_name* bind to given BM-SC (Broadcast Multicast - Service Center) server address *ip_address*.

apn_name is the name of the APN and can be from 1 to 62 alpha and/or numeric characters and is case sensitive.

ip_address is the IP address of the BM-SC server in IPv4 dotted decimal notation bind to the APN.

service-type { broadcast | multicast }

Displays information for a specific type of service for MBMS.

broadcast: Specifies the MBMS service type as broadcast only.

multicast: Specifies the MBMS service type as multicast only.

full

Displays full information for specific or all instances of bearer service in MBMS feature on system.

instance *instance_id*

Displays session information filtered for specific instances of bearer service in MBMS feature on system.

instance_id is the indicator for bearer service running for MBMS session and it must be an integer from 1 through 64.

summary

Displays summary information for specific or all instances of bearer service in MBMS feature on system.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more** options, refer to the Regulating a Command's Output section of the Command Line Interface Reference.

Usage

Use this command to verify the configuration of one or all bearer services and active instances of bearer services under MBMS feature. It is also useful for monitoring or troubleshooting purposes. If this command is executed from within the local context with the all keyword, information for all bearer service instances running under MBMS feature configured on the system will be displayed.

Example

The following command displays configuration information for all bearer service instances running on system:

```
show mbms bearer-service full all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipfa

Displays the foreign agent information for the mobile IP calls specified.

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show mipfa { [ [ counters | full | summary ] { all | callid call_id | msid ms_id
| peer-address [ operator ] peer_address | reverse-tunnel { on | off } |
username user_name } | statistics [ fa-service fa_name | peer-address [
peer_address | greater-than peer_address | less-than peer_address | >
peer_address | < peer_address ] } ] | peers fa-service service_name [ current-
sessions { { > | greater-than } sessions [ < sessions ] | { < | less-than }
sessions [ > sessions ] | sessions } ] [ peer-address address ] } [ | { grep
grep_options | more } ]
```

counters | **full** | **summary**

Default: concise output.

counters: indicates the output is to include the statistic counters.

full: indicates detailed information is to be displayed.

summary: indicates only summary information is to be displayed.

These options are not available in conjunction with the **statistics** keyword.

all | **callid** call_id | **msid** ms_id | **peer-address** peer_ip_address |
reverse-tunnel { on | off } | **username** user_name

all: indicates all available information is to be displayed.

callid call_id: indicates the information only for calls with Id call_id are to be displayed.

call_id must be specified as a 4-byte hexadecimal number.

msid ms_id: specifies a mobile subscriber ID only for which information is to be displayed. ms_id must be from 7 to 16 digits specified as an IMSI, MIN, or RMI and /or characters \$ and * for wildcard filter.

show mipfa msid 01234567\$\$

will show any subscriber with a MSID that match the upper 8 digits of MSID supplied, i.e. 01234567 and any 2 digits at remaining 2 places.

peer-address peer_ip_address: specifies the peer IP address for which MIP call information is to be displayed. peer_ip_address must be specified using the standard IPv4 dotted decimal notation.

reverse-tunnel { on | off }: specifies either the on or off reverse IP tunnels information is to be displayed.

username user_name: specifies a user only for which MIP call information is to be displayed where the user is specified as user_name.

user_name must be a sequence of character and /or wildcard characters \$ and * for wildcard matching with a string length of 1 to 127 characters.

```
statistics [ fa-service fa_name | peer-address [ peer_address | greater-
than peer_address | less-than peer_address | > peer_address | <
peer_address ]
```

Indicates the statistics information is to be displayed for foreign agent service specified as *fa_name* or for the peer specified by the address *peer_address*.

fa-service *fa_name* : indicates the statistic information for the peer specified is to be displayed. *fa_name* must be from 1 to 63 alpha and/or numeric characters.

peer-address *peer_address* : indicates the statistic information for the peer specified is to be displayed. *peer_address* must be specified using the standard IPv4 dotted decimal notation.

greater-than *peer_address*: Specifies the range of IPv4 addresses greater than *peer_address*.

less-than *peer_address*: Specifies the range of IPv4 addresses less than *peer_address*.

> *peer_address*: Specifies the range of IPv4 addresses greater than *peer_address*.

< *peer_address*: Specifies the range of IPv4 addresses less than *peer_address*.

```
peer-address [ operator ] peer_address
```

In conjunction with **mipfa** [**summary**] **peer-address** keyword, indicates a range of peers is to be displayed.

peer-address [*operator*] *peer_address* must be specified using the standard IPv4 dotted decimal notation.

operator implies how to logically specify a range of peer-address and it must be one of the following:

- <: IP address less than to specified *peer_address*
- >: IP address less than to specified *peer_address*
- greater-than**: IP address less than to specified *peer_address*
- less-than**: IP address less than to specified *peer_address*

```
peers fa-service service_name [ current-sessions { { > | greater-than }
sessions [ < sessions ] | { < | less-than } sessions [ > sessions ] |
sessions } ] [ peer-address address ]
```

Displays peer servers for the specified FA service.

fa-service *service_name*: Specifies the name of the FA service from which the associated peer servers are to be displayed. *service_name* must be an existing FA service and be from 1 to 63 alpha and/or numeric characters in length.

current-sessions: Displays only peer servers with current sessions meeting the following criteria:

- > | **greater-than** *sessions*: Displays only peer servers currently running sessions higher than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword “**greater-than**” and the “>” symbol are interchangeable in this instance of the command.
- < *sessions*: Displays only peer servers that are currently running sessions higher than the **greater-than** parameter but less than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- < | **less-than** *sessions*: Displays only peer servers currently running sessions lower than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword “**less-than**” and the “<” symbol are interchangeable in this instance of the command.
- > *sessions*: Displays only peer servers that are currently running sessions lower than the **less-than** parameter but more than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- sessions*: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.

`peer-address address`: Displays only peer servers matching the IP address entered in this parameter. `address` must be specified using IPv4 dotted decimal notation and can be followed by the netmask of the address.

`grep grep_options` | `more`

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of `grep` and `more`, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

View MIP foreign agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IP FA calls and statistics for `fa1`, respectively:

```
show mipfa all
```

The following command displays the statistics for the foreign agent service `fa1`:

```
show mipfa statistics fa-service fa1
```

The following commands displays call information for user `user6@aaa` in full detail and in summary:

```
show mipfa full username user6@aaa
```

```
show mipfa summary username user1
```

The following displays MIP FA call information for calls from mobile subscriber `4412345678` and peer address `1.2.3.4`, respectively:

```
show mipfa msid 4412345678
```

```
show mipfa peer-address 1.2.3.4
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipha

Displays the home agent information for the mobile IP calls specified.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show mipha { [ [ counters | full | summary ] { all | callid call_id | imsi
imsi_num | ip-address ip_addr | msid msid_num | peer-address [ operator ]
peer_address | reverse-tunnel { on | off } | username user_name } | statistics [
ha-service ha_name | peer-address peer_address ] } ] | peers ha-service
service_name [ current-sessions { { > | greater-than } sessions [ < sessions ] |
{ < | less-than } sessions [ > sessions ] | sessions } ] [ peer-address address
] } [ | { grep grep_options | more } ]
```

counters | full | summary

Default: concise output.

counters: indicates the output is to include the statistic counters.

full: indicates detailed information is to be displayed.

summary: indicates only summary information is to be displayed.

These options are not available in conjunction with the **statistics** keyword.

msid *msid_num*

Displays the subscriber with supplied MSID on HA.

msid *msid_num*: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits hexadecimal digit specified as an IMSI, MIN, or RMI and /or characters \$ and * for wildcard filter.

In case of **enforce imsi-min equivalence** is enabled on the chasis and MIN or IMSI numbers supplied, this keyword/ filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.

show mipha msid ABCD0123456789 or

show mipha msid 0123456789

will show any subscriber with a MSID that match the lower 10 digits of MSID supplied, i.e. 0123456789.

show mipha msid 01234567\$\$

will show any subscriber with a MSID that match the upper 8 digits of MSID supplied, i.e. 01234567 and any 2 digits at remaining 2 places.

```
all | callid call_id | imsi imsi_num | ip-address ip_addr | msid msid_num
| peer-address [ operator ] peer_address | reverse-tunnel { on | off } |
username user_name
```

all: indicates all available information is to be displayed.

callid *call_id*: indicates the information only for calls with Id *call_id* are to be displayed.

call_id must be specified as a 4-byte hexadecimal number.

imsi *imsi_num*: Specifies an international mobile subscriber ID only for which information is to be displayed. The IMSI (International Mobile Subscriber Identity) ID is a 15 character field which identifies the subscriber's home country and carrier.

ip-address *ip_addr*: Show statistics for a call that has the specified IP address assigned. *ip_addr* must be an IPv4 address specified in decimal notation.

msid *msid_num*: Specifies a mobile subscriber ID only for which information is to be displayed. *msid* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

peer-address *peer_address*: indicates the statistic information for the peer specified is to be displayed. **peer-address** *peer_address* must be specified using the standard IPv4 dotted decimal notation.

reverse-tunnel { **on** | **off** }: specifies either the on or off reverse IP tunnels information is to be displayed.

username *user_name*: specifies a user only for which MIP call information is to be displayed where the user is specified as *user_name*.

user_name must be a sequence of character and /or wildcard characters \$ and * for wildcard matching with a string length of 1 to 127 characters.

peer-address [*operator*] *peer_address*

In conjunction with **mipha** [**summary**] **peer-address** keyword, indicates a range of peers is to be displayed.

peer_address must be specified using the standard IPv4 dotted decimal notation.

operator implies how to logically specify a range of peer-address and it must be one of the following:

- <: IP address less than to specified *peer_address*
- >: IP address less than to specified *peer_address*
- greater-than**: IP address less than to specified *peer_address*
- less-than**: IP address less than to specified *peer_address*

statistics [**ha-service** *ha_name* | **peer-address** *peer_address*]

Indicates the statistics information is to be displayed for home agent service specified as *ha_name* or for the peer specified by the address *peer_address*.

ha-service *ha_name*: indicates the statistic information for the peer specified is to be displayed. *ha_name* must be from 1 to 63 alpha and/or numeric characters.

peer-address *peer_address*: indicates the statistic information for the peer specified is to be displayed. **peer-address** *peer_address* must be specified using the standard IPv4 dotted decimal notation.

peers **ha-service** *service_name* [**current-sessions** { { > | **greater-than** } *sessions* [< *sessions*] | { < | **less-than** } *sessions* [> *sessions*] | *sessions* }] [**peer-address** *address*]

Displays peer servers for the specified HA service.

ha-service *service_name*: Specifies the name of the HA service from which the associated peer servers are to be displayed. *service_name* must be an existing HA service and be from 1 to 63 alpha and/or numeric characters in length.

current-sessions: Displays only peer servers with current sessions meeting the following criteria:

- > | **greater-than** *sessions*: Displays only peer servers currently running sessions higher than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**greater-than**" and the ">" symbol are interchangeable in this instance of the command.

- `< sessions`: Displays only peer servers that are currently running sessions higher than the **greater-than** parameter but less than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.
- `| less-than sessions`: Displays only peer servers currently running sessions lower than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000. **Note:** the keyword “**less-than**” and the “**<**” symbol are interchangeable in this instance of the command.
- `> sessions`: Displays only peer servers that are currently running sessions lower than the **less-than** parameter but more than the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.
- `sessions`: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. `sessions` must be an integer from 1 to 3000000.

peer-address `address`: Displays only peer servers matching the IP address entered in this parameter. `address` must be specified using IPv4 dotted decimal notation and can be followed by the netmask of the address.

`grep grep_options | more`

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command’s Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

View MIP home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IP HA calls and statistics for `ha1`, respectively:

```
show mipha allshow mipha statistics ha-service ha1
```

The following commands displays call information for user `isp1user1` in full detail and in summary:

```
show mipha full username isp1user1show mipha summary username user1
```

The following displays MIP HA call information for calls from mobile subscribers with reverse tunneling `off` and peer address `1.2.3.4`, respectively:

```
show mipha reverse-tunnel off
```

```
show mipha peer-address 1.2.3.4
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipv6ha

Displays MIPv6 Home Agent-based information about selected Mobile IP calls.

Product

PDSN, HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show mipv6ha [ all | callid callid | counters filter | full filter | ipv6-
address ip_addr | statistics mipv6ha-service mipv6ha-service_name | summary
filter | username user_name ]
```

all

Displays all information for mipv6ha calls.

callid *call_id*

Specifies the Call Identification number.

call_id must be an eight-digit HEX number.

counters [all | callid | ipv6-address | username]

Displays the counters associated with the HA-based MIPv6 service. The following filters are available:

- all
- callid:
- ipv6-address
- username

full [all | callid | ipv6-address | username]

Displays all available information for the associated display or filter keyword.

The following filters are available:

- all
- callid:
- ipv6-address
- username

ipv6-address *ip_addr*

Displays information for subscribers connected via the packet control function with a specific or range of IP address *ipv6_addr*. The address must be specified using the IPv6 colon notation.

- <: Filters output so that only information less than the specified IPv6 address value is displayed.
- >: Filters output so that only information greater than the specified IPv6 address value is displayed.
- less-than: Filters output so that only information less than the specified IPv6 address value is displayed.

■ show mipv6ha

- **greater-than**: Filters output so that only information greater than the specified IPv6 address value is displayed.

statistics [**mipv6ha-service** *mipv6ha-service_name*]

Total of collected information for specific protocol since last restart or clear command. This can be filtered according to a specified **mipv6ha-service**.

summary [**all** | **callid** | **ipv6-address** | **username**]

Displays summary information for defined sessions, based on defined parameters. The following filters are available:

- **all**
- **callid**:
- **ipv6-address**
- **username**

username *user_name*

Displays session information for a specific username.

Usage

View MIPv6 home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IP HA calls and statistics for *ha1*, respectively:

```
show mipv6ha all
```

The following command displays call information for user *mipv6hauser1* in full detail and in summary:

```
show mipv6ha full username mipv6hauser1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-policy

Displays information for MME policy configurations on this system including handover restriction lists, subscriber maps, and tracking area identifiers (TAIs).

Product

MME

Privilege

Inspector

Syntax

```
show mme-policy { ho-restriction-list { name name | summary } | subscriber-map {
name name | summary } | tai-mgmt-db { name name | summary } } [ | { grep
grep_options | more } ]
```

```
ho-restriction-list { name name | summary }
```

Displays information about handover restriction lists configured on this system.

name *name*: Displays information about a specific handover restriction list configured on this system.

name must be an existing HO restriction list and be from 1 to 64 alpha and/or numeric characters.

summary: Displays summary information about all handover restriction lists configured on this system.

```
subscriber-map { name name | summary }
```

Displays information about subscriber maps configured on this system.

name *name*: Displays information about a specific subscriber map configured on this system. *name* must be an existing subscriber map and be from 1 to 64 alpha and/or numeric characters.

summary: Displays summary information about all subscriber maps configured on this system.

```
tai-mgmt-db { name name | summary }
```

Displays information about TAI management databases configured on this system.

name *name*: Displays information about a specific TAI management database configured on this system.

name must be an existing TAI management database and be from 1 to 64 alpha and/or numeric characters.

summary: Displays summary information about all TAI management databases configured on this system.

```
| { grep grep_options | more }
```

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to display information for MME policy configurations on this system including handover restriction lists, subscriber maps, and tracking area identifiers (TAIs).

Example

The following command displays information about a subscriber map named *map3*:

■ show mme-policy

`show mme-policy subscriber-map name map3`

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service

Displays configuration information for Mobility Management Entity (MME) services on this system.

Product

MME

Privilege

Inspector

Syntax

```
show mme-service { all | name svc_name } [ verbose ] [ | { grep grep_options | more } ]
```

all

Displays configuration information for all MME services configured on this system.

name *service_name*

Displays configuration information for a specific MME service configured on this system.

service_name must be an existing MME service, and be from 1 to 63 alpha and/or numeric characters in length.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep *grep_options* | more }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view configuration information for MME services on this system.

Example

The following command displays service statistics for the MME service named *mme1*:

```
show mme-service name mme1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service db statistics

This command displays the MME database statistics for MME sessions for all or specific session instances on this system.

Product

MME

Privilege

Inspector

Syntax

```
show mme-service db statistics [ instance smgr_instance ] [ verbose ] [ | { grep
grep_options | more } ]
```

instance *smgr_instance*

This keyword specifies that MME database statistics are to be displayed for a specific instance of session manager running for MME service.

smgr_instance must be specified as an instance ID in the range 0 through 4294967295. If instance is not specified summary statistics are displayed.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { **grep** *grep_options* | **more** }

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*. For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view database statistics for all or a particular instance of session manager for MME services on this system.

Example

The following command displays the summary database statistics for the MME service on a system:

```
show mme-service db statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service db record

This command displays the MME database records of MME sessions grouped in session instances on this system filtered with IMSI or GUTI as criteria.

Product

MME

Privilege

Inspector

Syntax

```
show mme-service db record { all | imsi imsi_identifier | callid call_id | guti
plmn plmn_id group-id mme_grp_id code mme_code m-tmsi mtmsi_value } [ verbose ]
[ | { grep grep_options | more } ]
```

all

This keyword specifies the criteria to display all database records of a session instance used for MME service.

imsi *imsi_identifier*

This keyword specifies the filter criteria as International Mobile Subscriber Identity (IMSI)

imsi_identifier to display the database records of a session instance.

imsi_identifier is a 15 character IMSI field which identifies the subscriber's home country and carrier. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

callid *call_id*

This keyword specifies the filter criteria as call id *call_id* to display the database records of a session instance.

call_id must be specified as an 8-byte hexadecimal number.

guti plmn *plmn_id* group-id *mme_grp_id* code *mme_code* m-tmsi *mtmsi_value*

This set of keyword specifies the filter criteria as Globally Unique Temporary Identifier (GUTI) to display the database records for an MME service.

The GUTI is constructed from the GUMMEI and the M-TMSI where GUMMEI is constructed from PLMN (MMC and MNC) *plmn_id* and MME Identifier is constructed from an MME Group ID (MMEGI) *mme_grp_id* and an MME Code (MMEC) *mme_code*.

Within the MME, the mobile is identified by the M-TMSI *mtmsi_value*.

A GUTI has; 1) unique identity for MME which allocated the GUTI; and 2) the unique identity of the UE within the MME that allocated the GUTI.

Within the MME, the mobile is identified by the M-TMSI. The Globally Unique MME Identifier (GUMMEI) is constructed from public land mobile network id (PLMN) which constructed with MCC and MNC. The MME Identifier (MMEI) is constructed from an MME Group ID (MMEGI) and an MME Code (MMEC). In other words The GUTI is constructed from the GUMMEI and the M-TMSI.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

```
| { grep grep_options | more }
```

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*. For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view database records for all or a particular instance of session manager for MME services on this system with IMSI or GUTI as a filter criteria.

Example

The following command displays the summary database records of a session instance for a subscriber having IMSI as 123455432112345 in the MME service:

```
show mme-service db record imsi 123455432112345
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service enodeb-association

Displays configuration information of associated eNodeB with an MME services on system.

Product

MME

Privilege

Inspector

Syntax

```
show mme-service enodeb-association [ summary | full ] [ all | mme-service-name
mme_svc_name | peer-address peer_ip_address | peer-id peer_identifier ] [
verbose ] [ [ { grep grep_options | more } ] ]
```

summary

This keyword displays the summarized output of this command.

full

This keyword displays detailed output of this command.

all

This keyword displays information of all eNodeBs associated with MME services on this system.

mme-service-name *mme_svc_name*

Displays summarized or detailed configuration information of eNodeBs associated with specific MME service *mme_svc_name* configured on this system.

mme_svc_name must be an existing MME service on system.

peer-address *peer_ip_address*

Displays summarized or detailed configuration information of eNodeBs associated with specific MME peer address *peer_ip_address* configured with an MME service on this system.

peer_ip_address must be a configured peer MME IP address in IPv4/IPv6 notation with an existing MME service on system.

peer-id *peer_identifier*

Displays summarized or detailed configuration information of eNodeBs associated with specific MME peer id *peer_identifier* configured with an MME service on this system.

peer_identifier must be a configured peer MME Id between 1 through 4294967295 with an existing MME service on system.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

■ show mme-service enodeb-association

```
| { grep grep_options | more }
```

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*. For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view configuration information of eNodeBs associated with an MME services on this system.

Example

The following command displays detailed service statistics of associated eNodeBs with MME service named *mme1*:

```
show mme-service enodeb-association full mme-service-name mme1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service session

Displays session information of MME service(s) running on a peer or local system.

Product

MME

Privilege

Inspector

Syntax

```
show mme-service session [ summary | full | counters ] [ all | s1-peer
s1_peer_ip_address | s11-peer s11_peer_ip_address | call-id call_identifier |
pdn-address pdn_ip_address ] [ verbose ] [ | { grep grep_options | more } ]
```

summary

This keyword displays the summarized output of this command.

full

This keyword displays detailed output of this command.

counters

This keyword displays all counters related events and messages for an MME session running on a system.

all

This keyword displays information of all MME sessions running on this system.

s1-peer s1_peer_ip_address

Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of a peer connected through S1 interface with an MME service configured on this system.

s1_peer_ip_address must be a configured IP address of a peer on S1 interface in IPv4/IPv6 notation with an existing MME service on system.

s11-peer s11_peer_ip_address

Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of a peer connected through S11 interface with an MME service configured on this system.

s11_peer_ip_address must be a configured IP address of a peer on S11 interface in IPv4/IPv6 notation with an existing MME service on system.

call-id call_identifier

Displays summarized or detailed configuration information of MME session running and filtered on the basis of the identifier of MME calls with an MME service configured on this system.

call_identifier must be an existing call identity in eight character Hex digit format running on an MME service on system.

pdn-address *pdn_ip_address*

Displays summarized or detailed configuration information of MME session running and filtered on the basis of IP address of connected PDN(s) with an MME service configured on this system.

s11_peer_ip_address must be a configured IP address of a peer on S11 interface in IPv4/IPv6 notation with an existing MME service on system.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { **grep** *grep_options* | **more** }

This argument searches the output of the root command and selects the lines matching one or more patterns/options. The types of patterns are controlled by the options specified with *grep_options*.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

Use this command to view session information of MME session in an MME services on this system.

Example

The following command displays detailed session statistics of an MME service running on a system:

```
show mme-service session full
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays detailed session counters of an MME service running on a system:

```
show mme-service session counters
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service statistics

This command displays the service statistics of an MME service specified by various criteria.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
show mme-service statistics [ sctp [ mme-service mme_svc_name ] | slap [ mme-
service mme_svc_name | peer-id peer_identifier ] | [ emm-only | esm-only ] [
mme-service mme_svc_name | peer-id peer_identifier ] [ verbose ] [ | { grep
grep_options | more } ]
```

emm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to display all EPS mobility management (EMM) related statistics.

esm-only

This keyword sets the filter criteria as MME service name or peer MME identifier to display all EPS session management (ESM) related statistics.

slap

This keyword sets the filter criteria as MME service name of peer MME identifier to display all S1-AP statistics.

sctp

This keyword sets the filter criteria as MME service name of peer MME identifier to display all SCTP statistics.

mme-service mme_svc_name

This keyword sets the filter criteria as MME service name to display all type of statistics of an MME service; i.e. EMM, ESM, SCTP, S1-AP, and SCTP.

peer-id peer_identifier

This keyword sets the filter criteria as identifier of MME peer to display all service statistics of an MME service; i.e. EMM, ESM, SCTP, S1-AP, and SCTP.

verbose

This keyword displays the comprehensive information of specific or set of arguments.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section in CLI Overview chapter of the Command Line Interface Reference.

Usage

This command is used to display the statistical information of an MME service based on various filter criteria as local MME service or peer MME related to EMM, ESM, SCTP, S1-AP, and SCTP.

Example

The following command displays the service session statistics of all MME service on a system related to all; i.e. EMM, ESM, SCTP, S1-AP, and SCTP:

```
show mme-service statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays the service session statistics of all MME services on a system related to S1-AP:

```
show mme-service statistics slap
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays the service session statistics of all MME services on a system related to EMM only:

```
show mme-service statistics emm-only
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mpls ldp

This command displays the MPLS Label Distribution Protocol (LDP) information.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
show mpls ldp { bindings { ldp-id IPv4_addr | local [ ldp-id | local | prefix |
remote ] | prefix IPv4_addr | remote } | discovery | neighbor { detail | ldp-id
} }
```

bindings

This keyword displays the MPLS LDP label bindings.

ldp-id

This keyword displays label values for a specific peer LDP ID.

local

This keyword displays locally assigned label values.

prefix

This keyword displays label values for a specific prefix.

remote

This keyword displays remotely assigned label values.

discovery

This keyword displays the MPLS LDP discovery information.

neighbor

This keyword displays the MPLS LDP peer information.

detail

This keyword displays the MPLS LDP peer information in details. The displayed information includes, Local LDP ID, Peer LDP ID, Transport address, State (e.g. Established), Role (e.g. Active), Uptime, Keepalive negotiated hold time, Proposed Local/Peer, Remaining Keepalive hold time, and Address advertised.

Usage

This command is used to display the statistical information of MPLS Label Distribution Protocol configuration. The information includes Prefix, LDP ID, Label, Nexthop, and Egress_if_index for all MPLS LDP Bindings configurations.

Example

The following command displays the complete MPLS LDP protocol related configurations:

```
show mpls ldp { discovery | { neighbor [ ldp-id 1.2.3.4 ] [ detail ] } |  
{ bindings [ ldp-id 31.32.33.34 ] [ prefix 192.168.102.232 ] [ local ] [  
remote ] }
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays the MPLS LDP discovery information, including, LDP Peer IDs, Hold time (in seconds), Proposed Local/Peer, and Remaining (time in seconds):

```
show mpls ldp discovery
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

The following command displays the remotely assigned label values in the MPLS LDP binding configuration:

```
show mpls ldp bindings remote
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show multicast-sessions

Shows information for multicast sessions defined by the specified keywords. Keywords described under Command Keywords below are base commands that display distinctive different types of data. Keywords described under Filter Keywords are filters that modify or filter the output of the base commands. Not all filter keywords are available for all command keywords commands. Each command keyword lists the filter keywords that it accepts.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show multicast-sessions [ command_keyword ] [ filter_keywords ] [ | { grep
grep_options | more }
```

command_keyword

The following keywords are base commands that each have a distinct display output. Only one Command Keyword can entered on the command line.

debug-info { **callid** *id* | **flowid** *id* }

Displays internal call troubleshooting information for multicast sessions defined by the specified keywords.

callid *id*: Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-byte hexadecimal number.

flowid *id*: Displays information for a specific BCMCS flow, defined by *id*. The flow ID must be a hexadecimal number.

full

Displays all available multicast session information. The following filter keywords are valid for this command:

active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

summary

Only displays a summary of multicast session information. The following commands are valid for this command:

active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

filter_keywords

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.

active

Only display information for multicast sessions that are currently active.

all

If no keywords are specified before **all**, information for all multicast sessions is displayed. If keywords are specified before **all**, all information is displayed with no further options being allowed.

callid *id*

Displays multicast session information for the call specified by *id*. The call must be specified as an 8-byte hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. *card_num* is a slot number from 1 through 7 or 10 through 16.

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

flowid *id*

Displays information for a specific BCMCS flow, defined by *id*. The flow ID must be a hexadecimal number.

flowid-type [**flow** | **program**]

Displays information for multicast sessions according to the type of flow.

flow: Shows all multicast sessions for the flow ID type “flow”.

program: Shows all multicast sessions for the flow ID type “program”.

mcast-address *ipv4_address*

Show multicast sessions for a specific multicast address. Must be followed by the IP address of an interface, using dotted decimal notation.

pcf *ipv4_address*

Displays information for multicast sessions connected via the packet control function, defined by *ipv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

pdsn-service *svc_name*

Displays information for multicast session connected to the packet data service *svc_name*. The packet data service must have been previously configured.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the Regulating a Command’s Output of Command Line Interface Reference for details on the usage of **grep** and **more**.

Usage

Use this command to view information about multicast sessions.

The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant sessions.

Example

The following command displays the all broadcast-multicast sessions active in a context/system:

```
show multicast-sessions all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show network-requested-pdp-context

Displays information for the specified network-requested PDP context.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show network-requested-pdp-context imsi imsi_value
```

imsi *imsi_value*

Specifies that information will be displayed for a particular International Mobile Subscriber Identity (IMSI). *imsi_value* is an integer value from 1 to 15 characters.

Usage

Use this command to display information pertaining to network-requested PDP contexts.

Example

The following command displays network-requested PDP context information for a subscriber with an IMSI of *123456789*:

```
show network-requested-pdp-context imsi 123456789
```

show network-service-entity

Displays information regarding the network service entities (NSEs) in the network.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show network-service-entity { consolidated-status | fr-config [ peer-nsei nsei ]  
| ip-config [ nsvl { all | instance value } }
```

consolidated-status

Displays NSVC status information for all network service entities in the network. This keyword is particularly useful for troubleshooting.

fr-config [peer-nsei nsei]

Displays network service configurations for NSEs using Frame Relay configurations. *peer-nsei nsei* including this optional keyword limits the display to a specific peer NSE identified with an integer of 0 to 65535.

ip-config [nsvl { all | instance value } }

Displays network service configurations for NSEs using IP configurations. Including the **nsvl** keyword limits the display to all or a single (instance 0 to 3) network service virtual link.

Usage

Use this command to display NSE information pertaining to the NSVCs of the NSEs in the networks or NSEs configured for Frame Relay or IP.

Example

The following command displays the status of all the NSVCs for all the NSEs in the network.

```
show network-service-entity consolidated-status
```

show nw-reachability server

Show the configuration for the network reachability servers for the current context.

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show nw-reachability server { all | name server_name }
```

all

Show configuration information for all network reachability servers in the current context.

name server_name

Show configuration information for the network reachability server with the specified name. *server_name* is the name of a previously configured reachability server and must be a string from 1 through 15 characters in length.

Usage

Use this command to display configuration information on network reachability servers configured in the current context.

Example

The following command displays information on all network reachability servers in the current context:

```
show nw-reachability server all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ntp

Displays the network timing protocol associations and status.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ntp { associations | status } [ address ip_address ] [ | { grep
grep_options | more } ]
```

associations

associations: displays the current NTP server associations and related statistics.

status

status: displays the client parameters configured and the synchronization status.

address ip_address

address ip_address: the IP address of a specific NTP server/client in the current context. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

View network timing protocol information to troubleshooting system clock issues by displaying the associations and status of the local NTP client.

Example

The following displays the NTP associations and status, respectively.

```
show ntp associations show ntp status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show orbem

Displays the ORB element manager information and statistics for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show orbem { client { id client_name | table } | event-notif-service filters |
session { id session_name | table } | status } [ | { grep grep_options | more }
]
```

client { id *client_name* | table }

Indicates client information is to be displayed. The keyword **table** is used to output to the display information on all configured clients. The keyword **id** is used to specify a specific client for which information is to be displayed specified as *client_name*.

client_name must refer to an existing client which is found using the **table** keyword option.

event-notif-service filters

Displays information pertaining to filters configured for the ORB Notification Service.

session { id *session_name* | table }

Indicates session information is to be displayed. The keyword **table** is used to output to the display information on all configured clients. The keyword **id** is used to specify a specific session for which information is to be displayed specified as *session_name*.

session_name must refer to an existing session which is found using the **table** keyword option.

status

Indicates the ORB element manage server status information is to be displayed.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Display current sessions when ORBEM system response may appear sluggish. This command is also useful in periodic verification of the server status.

Example

The following commands will display the information for all clients.

```
show orbem client table
```

The following commands display the information for the *clientName* and *sessionID*, respectively:

```
show orbem client id clientName
```

```
show orbem session id sessionId
```

The following command displays the ORBEM server status:

```
show orbem status
```

The following command displays the information for all sessions:

```
show orbem session table
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

■ show patch-progress

show patch-progress

This command displays the status of the on-going software patch installation.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

show patch-progress

Usage

Use this command to show the status of an on-going software patch installation.

Important: Software Patch Upgrades are not supported in this release.

show pdg-service

Displays configuration information about PDIF services configured on the system.

Product

PDG/TTG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show pdg-service { all | name service_name }
```

all

Displays information for all configured PDG services.

name *service_name*

Displays information for the specified PDG service only.

service_name must be the name of an existing PDG service in the current context and from 1 to 63 alpha and/or numeric characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display information for PDG services.

Example

The following command displays available information for all active PDG services:

```
show pdg-service all
```

show pdg-service statistics

Displays statistics for the PDG/TTG since the last restart or clear command. The output includes the number of each type of protocol message. For example, the output includes the various types of EAP messages.

Product

PDG/TTG

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show pdg-service statistics [ name service_name | peer-address ipv4_address ]
```

name *service_name*

Displays statistics for the specified PDG service.

service_name must from 1 to 63 alpha and/or numeric characters.

peer-address *ipv4_address*

Displays statistics for a specific subscriber with the specified WLAN IPv4 address.

ipv4_address must be entered in standard IPv4 dotted decimal notation.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display PDG service statistics.

Example

The following command displays statistics for all active PDG services:

```
show pdg-service statistics
```

show pdif-service

Displays configuration information about PDIF services configured on the system.

Product

PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show pdif service { all [ counters ] | name name [ counters ] | statistics [
name name | peer-address address ] } [ | { grepgrep_options | more } ]
```

all [counters]

Displays configuration information and statistic counters for all PDIF services in the system.

name name [counters]

Displays configuration information and statistic counters for a specified PDIF service in the system. *name* must be from 1 to 63 alpha and/or numeric characters and an existing PDIF service.

statistics [name name | peer-address address]

name name: Displays service statistics for a specific PDIF service. *name* must be from 1 to 63 alpha and/or numeric characters and an existing PDIF service.

peer-address address: Displays service statistics for a specifid peer server. *address* must be specified in IP v4 dotted decimal notation.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display configuration information and statistics about PDIF services on the system.

Example

The following example displays configuration information about a PDIF service named *pdif23*:

```
show pdif service name pdif23
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show pdsn-service

Displays information on configured packet data services for the current context.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show pdsn-service { all | name pdsn_name } [ pcf-status [ address ip_address |
filter [ all | icmp-monitored | no-calls | summary | up ] ] ] [ | { grep
grep_options | more } ]
```

all | **name** *pdsn_name*

all: indicates information is to be displayed for all configured packet data services.

name *pdsn_name*: indicates information only for the PDSN service specified is displayed. *pdsn_name* must be the name of an existing PDSN service in the current context and must be from 1 to 79 alpha and/or numeric characters.

pcf-status [**address** *ip_address* | **filter** [**all** | **icmp-monitored** | **no-calls** | **summary** | **up**]]

pcf-status: This keyword by itself lists summary information for all PCFs.

address *ip_address*: Only list information for the PCF with the specified IP address. *ip_address* must be specified in IP v4 dotted decimal notation.

filter: Filter the output so only the specified information is displayed. If filter is specified with no keywords summary information for all PCFs is displayed.

- **all**: Show information for all the PCFs
- **icmp-monitored**: Show information only for PCFs which are ICMP monitored
- **no-calls**: Show information only for PCFs which have no active sessions
- **summary**: Show only a summary of the status of the PCFs
- **up**: Show information only for PCFs which are alive

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Show the PDSN service information for standard system monitoring or troubleshooting.

Example

The following will display the information for the sampleService and for all configured services, respectively:

```
show pdsn-service all
```

```
show pdsn-service name sampleService
```

show pgw-service

Displays configuration information for PDN Gateway (P-GW) services on this system.

Product

P-GW

Privilege

Inspector

Syntax

```
show pgw-service { all | name service_name | statistics { all | name
service_name } } [ | { grep grep_options | more } ]
```

all

Displays configuration information for all P-GW services configured on this system.

name service_name

Displays configuration information for a specific P-GW service configured on this system.

service_name must be an existing P-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

statistics { all | name service_name }

Displays P-GW service statistics.

all: Displays statistics for all P-GW services on the system.

name *service_name*: Displays statistics for a specific P-GW service. *name* must be an existing P-GW service and be from 1 to 63 alpha and/or numeric characters.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send the output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the Regulating a Command's Output section of Chapter 1 of the Command Line Interface Reference Guide.

Usage

Use this command to view configuration information for P-GW services on this system.

Example

The following command displays service statistics for the P-GW service named *pgw1*:

```
show pgw-service name pgw1
```

show port

Displays information such as statistics and information on configured ports.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show port { datalink counters [ slot/port ] | info { slot/port } [ vlan vlan_id ] | npu counters [ slot/port [ tagged | untagged | vlan tag_id ] ] | table | utilization table } [ | { grep grep_options | more } ]
```

datalink counters *slot/port*

Display the information for all data links or only the one specified by *slot/port*. *slot/port* must refer to a previously configured port.

info { *slot/port* } [**vlan** *vlan_id*]

Display detailed information for all ports within the chassis or only the one specified by *slot/port*. *slot/port* must refer to a previously configured port.

vlan *vlan_id*: Display detailed information about all VLANs in the port/slot. If the optional *vlan_id* is not specified, it will show port information for all VLANs in slot/port.

npu counters [*slot/port* [**tagged** | **untagged** | **vlan** *tag_id*]] | **bound** | **unbound**]

Display the information for network processing unit ports. The information for all ports is output or only the one specified by *slot/port*. *slot/port* must refer to a previously configured port.

tagged: Display stats for all tagged packets.

untagged: Display statistics for all untagged packets.

vlan *tag_id*: Display NPU counters for a specified VLAN. *tag_id* must be the VLAN tag ID of a previously configured VLAN.

bound: Displays individual and cumulative npu port counters for the bound ports within the current context. If the command is invoked the local context all of the bound ports for all contexts and cumulative counter values for all contexts is displayed.

unbound: Displays individual and cumulative npu port counters for all unbound ports within system.

table

Display information on all physical ports on rear-installed interface cards.

utilization table

Show average port utilization in Mbps. The output is a table that lists the current utilization average, a 5 minute average, and a 15 minute average, for all enabled ports.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Display port information for troubleshooting of network communications by viewing statistics and configuration information for physical ports.

Example

The following displays detailed information for port 1 in slot 17:

```
show port info 17/1show port table
```

The following displays information for the data link port 33/1:

```
show port datalink counters 33/1
```

```
show port npu counters 33/1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show power

Displays information about installed cards with power supplied.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show power [ all | chassis | card_num ] [ | { grep grep_options | more } ]
```

```
all | chassis | card_num ]
```

Default: chassis

all: indicates power information for all cards is to be displayed.

chassis: indicates the chassis power source(s) are to be displayed.

card_num: specifies a specific card for which power information is to be displayed. **card_num** must be a value in the range 1 through 48.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

View power source information to quickly check the power for all cards within a chassis.

Important: On some platforms, only **show power** is supported with no other keywords or variables.

Example

The following displays power supply status for the chassis.

```
show power
```

The following command displays the power status for all slots

```
show power all
```

show ppp

Displays the point-to-point protocol information, detailed or summarized, for one or all connections by the use of filtering options.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ppp { [ counters | full | summary ] { all | callid call_id | imsi id | msid
ms_id | username user_name } | statistics [ pcf-address [ pcf_ip_addr | all ] |
pdsn-service pdsn_name ] } [ | { grep grep_options | more } ]
```

counters | full | summary

Provides an optional modifier to the output for the level and type of information.

counters: indicates the point-to-point protocol statistics are to be displayed.

full: indicates all available information is to be displayed.

summary: indicates only a summary of available information is to be displayed.

all | callid *call_id* | imsi *imsi_id* | msid *ms_id* | username *user_name* }]

all: indicates all available information is to be displayed.

callid *call_id*: indicates the PPP information only for the call specified by *call_id* is to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.

imsi *id*: specifies that PPP information only for the subscriber with the specified id be displayed. The IMSI (International Mobile Subscriber Identity) *id* is a 15 character field which identifies the subscriber's home country and carrier.

msid *ms_id*: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

username *user_name*: specifies a user only for which PPP information is to be displayed where the user is specified as *user_name*.

statistics [pcf-address [*pcf_ip_addr* | all] | pdsn-service *pdsn_name*]

Statistics for all packet data services is displayed.

pcf-address [*pcf_ip_addr* | all]: Display statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. *pcf_ip_addr* must be specified using the standard IPv4 dotted decimal notation.

pdsn-service *pdsn_name*: Display statistics only for the service specified by *pdsn_name*. *pdsn_name* must be from 1 to 63 alpha and/or numeric characters.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

View the Point-to-Point Protocol information to support troubleshooting subscriber connections by viewing information for point-to-point connections for a specific subscriber.

Example

The following displays the PPP summary for all connections.

```
show ppp summary all
```

The following outputs the point-to-point detailed information for the user *user1*.

```
show ppp full username user1
```

The following command displays the standard information for the call with ID *FF0E11CD*.

```
show ppp callid ff0e11cd
```

The following command displays the PPP statistics for *pdsn1*.

```
show ppp statistics pdsn-service pdsn1
```

The following command provides summarized information for the PPP statistics.

```
show ppp
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show prepaid 3gpp2

This command displays prepaid accounting information for all services or only the service specified.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show prepaid 3gpp2 statistics { all | { ggsn-service | ha-service | lns-service
| pdsn-service } { all | name service_name } } | per-service-summary } [ | {
grep grep_options | more } ]
```

all

This keyword displays prepaid statistics for all services.

ggsn-service

Display statistics for GGSN service(s).

ha-service

Display statistics for HA service(s).

lns-service

Display statistics for LNS service(s).

pdsn-service

Display statistics for PDSN service(s).

```
{ all | name service_name }
```

all: Display statistics for all services of the specified type.

name service_name: Display statistics for the service named *service_name* of the specified service type.

per-service-summary

Displays prepaid statistics per service summary for all services.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Displays Pre-paid statistics for a particular named service or for all services.

Example

To display statistics for a PDSN service name *PDSN1*, enter the following command:

```
show prepaid 3gpp2 statistics pdsn-service name PDSN1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show prepaid wimax

This command displays prepaid WiMAX accounting information for all services or only the service specified.

Product

ASN GW

Privilege

Inspector

Syntax

```
show prepaid wimax statistics { all | asngw-service { all | name service_name }
| ha-service { all | name service_name } | per-service-summary } [ | { grep
grep_options | more } ]
```

all

This keyword displays prepaid statistics for all services.

asngw-service

Displays prepaid statistics for ASN GW service(s).

ha-service

Displays prepaid accounting statistics for HA service(s).

```
{ all | name service_name }
```

all: Display statistics for all services of the specified type.

name service_name: Display statistics for the service named *service_name* of the specified service type.

per-service-summary

Displays prepaid statistics per service summary for all services.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 500 Series Command Line Interface Reference.

Usage

Use this command to display prepaid WiMAX accounting statistics for named service or for all services.

Example

The following command displays prepaid WiMAX accounting statistics for an ASN GW service name *asn1*:

```
show prepaid wimax statistics asngw-service name asn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show profile-id-qci-mapping

Displays QCI-RAN mapping tables configured on this system.

Product

HSGW

Privilege

Inspector

Syntax

```
show profile-id-qci-mapping table { all | name table_name } [ | { grep
grep_options | more } ]
```

all

Displays information for all QCI-RAN mapping tables configured on this system.

name *table_name*

Displays information for a QCI-RAN mapping tables configured for a specific QCI-RAN table on this system.

table_name must be an existing QCI-RAN table, and be from 1 to 63 alpha and/or numeric characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Cisco ASR 5000 Series Command Line Interface Reference.

Usage

Use this command to display the contents of a specific QCI-RAN mapping table or all mapping tables configured on this system.

Example

The following command displays the contents of a QCI-RAN mapping table named *table1*:

```
show profile-id-qci-mapping table name table1
```

Chapter 109

Exec Mode Show Commands (Q-S)

This section includes the commands `qci-qos-mapping` through `show system uptime`.

show qci-qos-mapping

Displays QCI-QoS mapping tables configured on this system.

Product

HSGW, P-GW, S-GW

Privilege

Inspector

Syntax

```
show qci-qos-mapping table { all | name table_name } [ | { grep grep_options |
more } ]
```

all

Displays information for all QCI-QoS mapping tables configured on this system.

name *table_name*

Displays information for a QCI-QoS mapping tables configured for a specific QCI-QoS table on this system. *table_name* must be an existing QCI-QoS table, and be from 1 to 63 alpha and/or numeric characters in length.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display the contents of a specific QCI-QoS mapping table or all mapping tables configured on this system.

Example

The following command displays the contents of a QCI-QoS mapping table named *table1*:

```
show qci-qos-mapping table name table1
```

show qos npu inter-subscriber traffic

Displays configuration information pertaining to NPU QoS priority queue bandwidth allocation and sharing.

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show inter-subscriber traffic { bandwidth | bandwidth-sharing }
```

bandwidth

Displays NPU QoS priority queue bandwidth allocation configuration information.

bandwidth-sharing

Displays NPU QoS priority queue bandwidth sharing configuration information.

Usage

Use this command to verify configuration information and for troubleshooting.

When the **bandwidth** keyword is used, the output is a table showing the configuration status, the priority queue, and the bandwidth allocation per DSCP.

When the **bandwidth-sharing** keyword is used, the output of is a table displaying the bandwidth sharing configuration per processing card slot/CP number.

For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

show qos npu stats

Displays NPU QoS statistics per priority queue for a particular processing card:

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show qos npu stats inter-subscriber traffic slot slot_num
```

slot *slot_num*

Specifies the chassis slot number in which the processing card for which to display statistics is installed. *slot_num* is an integer from 1 to 48 that represents the slot in which a processing card is installed. Processing cards can be installed in slots 1 through 8, and/or 10 through 16.

Usage

This command displays packet and byte counts per NPU QoS priority queue on a per-processing card basis. For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command displays NPU QoS priority queue statistics for a processing card installed in chassis slot number 4:

```
show qos npu stats inter-subscriber traffic slot 4
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius

Displays and statistic information for accounting and/or authentication.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show radius { accounting servers | authentication servers } [ detail ] [ admin-
status { enabled | disabled } ] [ | { grep grep_options | more } ] [ radius
group group_name [ detail ] [ | { grep grep_options | more } ] ]
```

accounting servers

Lists information for configured accounting servers and their current state.

authentication servers

Lists information for configured authentication servers and their current state.

[detail]

Displays historical state information for configured servers of the specified type

admin-status { enabled | disabled }

Displays information for accounting and/or authentication servers with an administrative status of “enabled” or “disabled”.

radius group group_name

Displays the authentication/authorization RADIUS server group information for server group *group_name* with in current context.

group_name will be a string of size 1 to 63 character and specifies the name of server group configured in specific context for authentication/accounting.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example

The following displays the information on configured accounting servers:

■ show radius

show radius accounting server

The following command displays detailed information for RADIUS accounting servers:

show radius accounting servers detail

The following command displays detailed information for RADIUS server group *star1* used for authentication:

show radius authentication servers radius group *star1* detail

The following command displays detailed information for RADIUS server group *star1* used for accounting:

show radius accounting servers radius group *star1* detail

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius charging servers

This command displays the RADIUS authentication and accounting servers or server group that are configured for use by charging services.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show radius charging servers [ radius group group_name ] [ | { grep grep_options
| more } ]
```

```
radius group group_name all
```

Displays all RADIUS counter information for the specified server group configured for use by charging services.

group_name specifies the name of server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

```
grep grep_options | more
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display information about RADIUS servers or server group configured for use by Charging Services.

Example

The following command displays RADIUS servers configured for Charging Services:

```
show radius charging servers
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius client

Displays information about the RADIUS client configured on the system.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show radius client status [ | { grep grep_options | more } ]
```

status

Displays a status summary for the RADIUS client.

```
| { grep grep_options | more }
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

The configuration of the RADIUS protocol on the system enables RADIUS client functionality. This command is used to view information pertaining to the status of the client.

Example

The following command displays detailed information pertaining to the system's RADIUS client:

```
show radius client status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius counters

Displays RADIUS server and statistic information for accounting and/or authentication.

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show radius counters { all | radius group group_name all | server ip_address [
port number ] | summary [ all-contexts [ verbose ] ] } [ | { grep grep_options |
more } ]
```

```
counters { all | server ip_address [ port number ] }
```

`counters { all | server ip_address [port number] }`: indicates the statistics for either **all** servers or the server specified by *ip_address* is to be displayed. The statistics for a specific port of the server may also be specified as *number*. *ip_address* must be specified using the standard IPv4 dotted decimal notation. *number* must be a value from 0 through 65535.

```
radius group group_name all
```

Displays all RADIUS counter information for the specified server group within current context. *group_name* specifies name of the server group configured in specific context for authentication/accounting, and must be a string of 1 through 63 characters in length.

```
summary [ all-contexts [ verbose ] ]
```

Displays a summary of RADIUS statistics for all the RADIUS servers configured in specific context. **all-contexts**: Specifies that a summary of RADIUS statistics for all RADIUS servers configured in all contexts should be displayed. If **verbose** is also specified the information is displayed in more detail.

```
grep grep_options | more
```

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example

The following command displays detailed information pertaining to the RADIUS server group *star1* with in current context:

```
show radius counters radius group star1 all
```

show radius counters

The following displays the statistics for the server with IP address `1.2.3.4`, then just port `7777`, followed by **all** services.

```
show radius counters server 1.2.3.4
```

```
show radius counters server 1.2.3.4 port 7777
```

```
show radius counters all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show resources

Displays the resource information by CPU or session.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show resources { cpu | session } [ | { grep grep_options | more } ]
```

cpu | **session**

cpu: indicates the resource information is to be displayed by CPU.

session: indicates the resource information is to be displayed by session.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View resource utilization as part of troubleshooting systems which appear sluggish or are having excessive connection timeouts or other connection issues.

Example

The following display the resource information by CPU and session, respectively.

```
show resources cpu
```

```
show resources session
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rohc counters

This command displays ROHC counters for all active calls.

Product

PDSN, HSGW, ASNGW

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rohc counters [ all | callid call_id | imsi imsi_num | ip-address ip_addr | msid msid_num | username user_name ] [ [ | { grep grep_options | more } ]
```

all

indicates all information is to be displayed.

callid *call_id*

call_id indicates the information only for calls with Id *call_id* are to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.

imsi *imsi_num*

imsi_num: Specifies an international mobile subscriber ID only for which information is to be displayed. The IMSI (International Mobile Subscriber Identity) ID is an up to 15-character field which identifies the subscriber's home country and carrier: 3 digits of Mobile Country Code (MCC), 2 or 3 digits of Mobile Network Code (MNC), followed by the Mobile Subscriber Identification Number MSIN. Example: 123-45-678910234. May also be entered as 12345678910234.

ip-address *ip_addr*

ip_addr: Specifies a mobile subscriber IP address only for which information is to be displayed. *ip_addr* must be expressed in dotted decimal notation for IPv4 or colon notation for IPv6.

msid *msid_num*

msid_num specifies a mobile subscriber ID only for which information is to be displayed. *msid_num* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

username *user_name*

user_name: specifies a user only for which R-P information is to be displayed where the user is specified as *user_name*.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display ROHC counters for all active calls.

Example

The following command displays ROHC counters for all active calls:

```
show rohc counters all
```

show rohc statistics

This command displays statistics and counters for ROHC IP header compression.

Product

PDSN, HSGW, and ASNGW.

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rohc statistics [ sessmgr instance < value > / [ pdsn-service < service name > | asngw-service < service name > ] | hsgw-service hsgwsvc_name ] [ | { grep grep_options | more } ]
```

pdsn-service pdsnsvc_name

Display ROHC statistics and counters for the specified PDSN service.

asngw-service asngwsvc_name

Display ROHC statistics and counters for the specified ASNGW service.

hsgw-service hsgwsvc_name

Display ROHC statistics and counters for the specified HSGW service.

grep grep_options | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to display ROHC statistics for all services or for a specific PDSN or HSGW.

Example

The following command displays ROHC statistics for the PDSN service named pdsn1:

```
show rohc statistics pdsn-service pdsn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show route-map

This command displays entries for all route maps for the current context.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show route-map [ name route-map name | | { grep grep_options | more } ]
```

name *route-map name*

Displays information for a specified route-map. The name is a string of 1 to 79 characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to see the rules configured in all route-maps for the current context.

Example

The following command displays the route-map information;

```
show route-map
```

Refer to the match and set command descriptions in Route-map Configuration Mode Commands for explanations of the various entries listed.

show rp

Displays the R-P interface statistics using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rp [ counters | full | summary ] { all | callid call_id | msid ms_id |
peer-address peer_ip_address | username user_name } [ | { grep grep_options |
more } ]
```

counters | full | summary

Provides an optional modifier to the output for the level and type of information.

counters: indicates the R-P protocol statistics are to be displayed.

full: indicates all available information is to be displayed.

summary: indicates only a summary of available information is to be displayed.

These options are not available in conjunction with the keywords **statistics** or **service-option statistics**.

all | callid call_id | msid ms_id | peer-address peer_ip_address | username user_name

all: indicates all R-P information is to be displayed.

callid call_id: indicates the information only for calls with Id *call_id* are to be displayed. *call_id* must be specified as a 4-byte hexadecimal number.

msid ms_id: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

peer-address peer_ip_address: specifies the peer IP address, of the PCF, for which R-P information is to be displayed. *peer_ip_address* must be specified using the standard IPv4 dotted decimal notation.

username user_name: specifies a user only for which R-P information is to be displayed where the user is specified as *user_name*.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the R-P interface statistics for the current context.

Example

The following displays the summary for all connections.

```
show rp summary all
```

The following outputs the R-P interface detailed information for the user *user1*.

```
show rp full username ispluser1
```

The following command displays the standard information for the call with ID *FF0E11CD*.

```
show rp callid ff0e11cd
```

The following displays the statistics summary for the R-P facility.

```
show rp
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rp service-option

Displays the R-P service option statistics using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rp service-option statistics [ number svc_option_num | pdsn-service
pdsn_name ] [ | { grep grep_options | more } ]
```

```
number svc_option_num | pdsn-service pdsn_name
```

Default: display statistics for all service options numbers and associated packet data services.

number *svc_option_num*: specifies the service option number for which collected statistics are to be displayed.

pdsn-service *pdsn_name*: specifies the packet data service for which the collected statistics are to be displayed.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the R-P service option statistics for the current context.

Example

The following displays the statistics for all service options.

```
show rp service-option statistics
```

The following displays the statistics for service option 5.

```
show rp service-option statistics number 5
```

The following command displays the statistics for all service options in collected for the packet data service *sampleService*.

```
show rp service-option statistics pdsn-service sampleService
```

show rp statistics

Displays the R-P protocol statistics using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rp statistics [ pdsn-service pdsn_name | peer-address [ peer_address | all ] ] [ | { grep grep_options | more } ] [ verbose ]
```

```
pdsn-service pdsn_name | peer-address peer_address
```

Default: all R-P protocol statistics are to be displayed.

pdsn-service *pdsn_name* : indicates the statistic information for the service specified is to be displayed. *pdsn_name* must be from 1 to 63 alpha and/or numeric characters.

peer-address [*peer_address* | **all**] : indicates the statistic information for the peer specified or all peers is to be displayed. *peer_address* must be specified using the standard IPv4 dotted decimal notation.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

```
verbose
```

Displays more detailed statistics.

Usage

View the R-P statistics for the current context.

Example

The following displays all collected R-P statistics.

```
show rp statistics
```

The following displays the R-P statistics associated with the peer address 1.2.3.4.

```
show rp statistics peer-address 1.2.3.4
```

The following command displays the R-P statistics for the packet data service *PCFnet*.

```
show rp statistics pdsn-service PCFnet
```

■ show rp statistics

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rsvp counters

Displays the rsvp counters using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rsvp counters [ all | callid call_id | msid ms_id | username user_name ]
```

```
all | callid call_id | msid ms_id | username user_name
```

all: indicates all rsvp information is to be displayed.

callid *call_id*: indicates the information only for calls with Id *call_id* are to be displayed.

call_id must be specified as a 4-byte hexadecimal number.

msid *ms_id*: specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.

username *user_name*: specifies a user only for which rsvp information is to be displayed where the user is specified as *user_name*.

Usage

View the rsvp counters for the current context.

Example

The following displays all collected rsvp counters.

```
show rsvp counters all
```

show rsvp statistics

Displays the rsvp statistics using the filtering options specified.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show rsvp counters [ pdsn-service service | sessmgr instance instance ]
```

```
pdsn-service service | sessmgr instance instance
```

pdsn-service *service*: indicates the statistic information for the service specified is to be displayed.

pdsn_name must be from 1 to 63 alpha and/or numeric characters.

sessmgr instance *instance*: indicates the session manager instances.

Usage

View the rsvp statistics for the current context.

Example

The following displays collected rsvp statistics for a *sampleService*.

```
show rsvp statistics pdsn-service sampleService
```

show sccp-network

This command displays SS7 Signaling Connection Control Part (SCCP) network configuration and status information.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show sccp-network { ntwk_index | all } [ status [ all | dpc ] ]
```

ntwk_index

Display configuration and status information for the SCCP network configuration with the specified network index.

ntwk_index must be an integer from 1 through 12.

all

Display all available configuration and status information for all SCCP networks.

status all

Display all status information for specified SCCP networks.

status dpc

Display status information for the device in the SCCP network identified by the destination point-code.

Usage

Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or network.

Example

The following command displays global SCCP statistics:

```
show sccp-network all
```

The following command displays information for an SCCP network configuration with the network index of 1:

```
show sccp-network 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sccp statistics

This command displays SS7 Signaling Connection Control Part (SCCP) statistics for services that use the SCCP protocol.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show sccp statistics [ iups-service iups_srvc_name | map-service map_srvc_name | sccp-network ntwk_index ]
```

iups-service *iups_srvc_name*

Display SCCP protocol statistics for the specified IU-PS service in the current context. *iups_name* must be the name of a configured Iu-PS service and must be an alphanumeric string of from 1 through 63 characters.

map-service *map_srvc_name*

Display SCCP protocol statistics for the specified MAP service in the current context. must be the name of a configured MAP service and must be an alphanumeric string of from 1 through 63 characters.

sccp-network *ntwk_index*

Display SCCP protocol statistics for the SCCP network configuration with the specified network index. *ntwk_index* must be an integer from 1 through 12.

Usage

Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or network.

Example

The following command displays global SCCP statistics:

```
show sccp statistics
```

The following command displays SCCP statistics for the IuPS service named *iups-serv1*:

```
show sccp statistics iups-service iups-serv1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session counters historical

Displays historical information for session-related counters based on data collected in bulk statistics.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show session counters historical { all | arrived | callops | connected |  
disconnected | failed | handoff | rejected | renewal } [ all-intervals | recent-  
intervals ] [ cumulative | incremental ] [ graph | table ]
```

all

Displays data for all counters either as a single, wide table or as multiple graphs.

arrived

Displays only data for “total calls arrived” counters. This is based on the “sess-tlarrived” statistic in the system schema.

callops

Displays data for all call operations. This is a calculated value based on the following formula:
(arrived + rejected + disconnected + failed + handoffs + renewals)

connected

Displays only data for “total calls connected” counters. This is based on the “sess-tlconnected” statistic in the system schema.

disconnected

Displays only data for “total calls disconnected” counters. This is based on the “sess-tldisconn” statistic in the system schema.

failed

Displays only data for “total calls failed” counters. This is based on the “sess-tlfailed” statistic in the system schema.

handoff

Displays only data for “total handoffs” counters. This is based on the “sess-tlhandoff” statistic in the system schema.

rejected

Displays only data for “total calls rejected” counters. This is based on the “sess-tlrejected” statistic in the system schema.

renewal

Displays only data for “total renewal” counters. This is based on the “sess-ttlrenewal” statistic in the system schema.

all-intervals

Displays all available historical information from all samples. This filter is used by default.

recent-intervals

Displays historical information for only recent samples.

cumulative

Displays total data for all samples up to and including the last one. In this view, values increase over time.

incremental

Displays data changes for each specific sample. The data for each sample is the amount of change since the previous sample. This filter is used by default.

graph

Displays data in graphical form.

table

Displays data in tabular form. This is the default view.

Usage

This command provides the ability to track key session-related statistic information over time. This information can be used as part of system performance monitoring and capacity planning.

Important: The information provided in the output of this command requires that bulk statistics functionality be enabled on the system. Refer to the System Administration and Configuration Guide for more information on configuring/enabling bulk statistics support.

The output of this command displays historical data collected at various sample intervals. The interval length is 15 minutes and is not user-configurable. Up to 192 samples (2 days worth of data) are maintained.

Important: Data collection is “best-effort” over these intervals. Data is preserved on system management card switchovers. As with all counters, certain session failures can cause inaccuracies with counters, including counters which appear to go backwards.

Each sample is identified by a timestamp that displays the approximate time the data was gathered. It is in the format YYYY:MM:DD:HH:MM:SS.

Data acquired during the sample may be marked with an “S” appended to the end of the timestamp or to the counter value. The “S” indicates that the data is suspect (potentially bad). Occurrences of this result from events like changes to the real time clock, which can cause an interval to be an atypical length. Instances of suspect data should be rare. Additionally, there may be occasions in which a sample may be marked as

“invalid”. “invalid” identifies bad data, a situation that could result from the polling hasn't run long enough, or because of an unexpected error retrieving data. Since baseline values must be obtained prior to collecting interval samples, the first interval of data will not be available until up to 2x the interval period.

Example

The following command displays cumulative total calls arrived information for the most recent intervals and displays the output in graphical format:

```
show session counters historical arrived recent-intervals cumulative
graph
```

The following command displays historical data for all counters for all intervals and displays the output in tabular format:

```
show session counters historical all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session counters pcf-summary

Displays the PCF summary which include the number of calls, call types, and Tx/Rx packets/octets statistics.

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show session counters pcf-summary [ call-types | data | wf1 [ pcf pcf_address |
[ | { grep grep_options | more } ] ] ]
```

call-types

Displays the number of calls and the types of calls.

data

Displays the number of successful calls and Tx/Rx packets/octets statistics.

pcf pcf_address

Displays the given PCF summary for a particular address.

wf1

Displays the PCF summary in a single very wide line.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference* for details on the usage of **grep** and **more**.

Usage

Use this command to display a summary of all PCFs.

Example

```
show session counters pcf-summary
```

show session disconnect-reasons

Displays a list of the reasons for call disconnects and the number of calls disconnected for each reason.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show session disconnect-reasons [ gprs-only | sgsn-only | mme-only | verbose ] [
| { grep grep_options | more } ] ]
```

gprs-only

Only supported on the SGSN.

This keyword limits the display to session disconnect reasons for the SGSN's 2G MM and PDP context disconnects.

sgsn-only

Only supported on the SGSN.

This keyword limits the display to session disconnect reasons for the SGSN's 3G MM and PDP context disconnects.

mme-only

This keyword filters to the list of the session disconnect reasons for MME call disconnects.

verbose

List all disconnect reasons even if the values are zero (0).

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference* .

Usage

Use this command to display a list of the reasons why calls were disconnected.

Example

To view session disconnect statistics, enter the following command:

```
show session disconnect-reasons
```

To view a list of the disconnect reasons with verbose output, enter the following command:

■ show session disconnect-reasons

show session disconnect-reasons verbose

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session duration

Displays session duration information for the current context filtered by the options specified.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show session duration [ session_filter ] [ | { grep grep_options | more } ]
```

session_filter

Indicates name of the sessions/services/AGWs whose session duration information is to be filtered and displayed. This consist of following:

- **asn-peer-address** *ip_address*: Indicates that only the session information for the ASN GW peer whose IP address is specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **asn-gw-service** *service_name*: Indicates that only the session information for the ASN GW service whose name is specified by *service_name* is to be displayed.
- **asn-pc-peer-address** *ip_address*: Indicates that only the session information for the ASN PC peer whose IP address is specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **asn-pc-service** *service_name*: Indicates that only the session information for the ASN PC service whose name is specified by *service_name* is to be displayed.
- **apn** *apn_name*: Indicates that only session information for the specified APN will be displayed. *apn_name* specifies the name of a configured APN that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **cscf-service** *service_name*: Indicates that only session information for the specified CSCF service will be displayed. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

Important: CSCF SIP calls under progress only. Registrations will not be considered a call.

- **dhcp-server** *dhcp_address*: Indicates that only session information for the specified DHCP server will be displayed. *dhcp_address* is the name of the DHCP server and must be expressed in dotted decimal notation.
- **fa** *fa_address*: Indicates only the session information for the foreign agent whose IP address is specified by *fa_address* is to be displayed. *fa_address* must be specified using the standard IPv4 dotted decimal notation.
- **fa-service** *fa_name*: Indicates only the session information for the foreign agent service specified by *fa_name* is to have information displayed.
- **ggsn-service** *ggsn_name*: Indicates that only session information for the specified GGSN service will be displayed. *ggsn_name* specifies the name of a configured GGSN service that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

- **gprs-only**: Limits the display to the session information for the SGSN's 2G MM and PDP contexts.
- **ha** *ha_address*: Indicates only the session information for the home agent whose IP address is specified by *ha_address* is to be displayed. *ha_address* must be specified using the standard IPv4 dotted decimal notation.
- **ha-service** *ha_name*: Indicates only the session information for the home agent service specified by *ha_name* is to be displayed.
- **hnbgw-only**: Indicates only the session information for the HNB-GW service related sessions instances; i.e. HNB, IuPS, IuCS to be displayed.
- **hsgw-service** *service_name*: Indicates only the session information for the HSGW service specified by the *service_name* is to be displayed. *service_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.
- **lma-service** *service_name*: Indicates only the session information for the LMA service specified by the *service_name* is to be displayed. *service_name* must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.
- **mme-service** *service_name*: Indicates only the session information for the MME service specified by the *service_name* is to be displayed. *service_name* must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.
- **mag-service** *service_name*: Indicates only the session information for the MAG service specified by the *service_name* is to be displayed. *service_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.
- **pcf** *pcf_address*: Indicates only the session information for the packet control function with IP address *pcf_address* is to be displayed. *pcf_address* must be specified using the standard IPv4 dotted decimal notation.
- **pdsn-service** *pdsn_name*: Indicates only the session information for the packet data service specified by *pdsn_name* is to have information displayed.

Important: If no PCF address or PDSN service is specified the session information for all sessions is displayed.

- **sgsn-address** *sgsn_address*: Indicates that only session information for the specified SGSN will be displayed. *sgsn_address* is the IP address of the SGSN and must be expressed in dotted decimal notation.
- **sgsn-only**: Limits the display to the session information for the SGSN's 3G MM and PDP contexts.
- **sgw-service** *service_name*: Indicates only the session information for the S-GW service specified by the *service_name* is to be displayed. *service_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

Example

The following commands display the duration information for the session connected to the packet control function with address *1.2.3.4*, packet data service *sampleService*, and for all sessions, respectively.

```
show session duration pcf 1.2.3.4
```

```
show session duration pdsn-service sampleService
```

```
show session duration
```

show session progress

Displays session progress information for the current context filtered by the options specified.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show session progress [ asn-peer-address ip_address | asngw-service service_name
| asnpc-service service_name | asnpc-peer-address ip_address | apn apn_name |
cscf-service service_name | dhcp-server dhcp_address | fa fa_address | fa-
service fa_name | ggsn-service ggsn_name | ha ha_adress | ha-service ha_name |
hsgw-servie service_name | lma-service service_name | mag-service service_name |
mme-address mme_address | pcf { pcf_address | all } | pdsn-service pdsn_name |
pdsnclosedrp-service | pgw-address ip_address | sgsn-address sgsn_address |
sgw-service service_name ] [ | { grep grep_options | more } ]
```

```
progress [ asn-peer-address ip_address | asngw-service service_name |
asnpc-service service_name | asnpc-peer-address ip_address | apn apn_name
| cscf-service service_name | dhcp-server dhcp_address | fa fa_address |
fa-service fa_name | ggsn-service ggsn_name | ha ha_adress | ha-service
ha_name | hsgw-servie service_name | lma-service service_name | mag-
service service_name | mme-address mme_address | pcf { pcf_address | all
} | pdsn-service pdsn_name | pdsnclosedrp-service | pgw-address
ip_address | sgsn-address sgsn_address | sgw-service service_name ]
```

progress: indicates session progress information is to be displayed.

- **asn-peer-address** *ip_address*: Indicates that only the session information for the ASN GW peer whose IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **asngw-service** *service_name*: Indicates that only the session information for the ASN GW service whose name is specified by *service_name* is to be displayed.
- **asnpc-service** *service_name*: Indicates that only the session information for the ASN PC service whose name is specified by *service_name* is to be displayed.
- **asnpc-peer-address** *ip_address*: Indicates that only the session information for the ASN PC peer whose IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **apn** *apn_name*: Indicates that only session information for the specified APN will be displayed. *apn_name* specifies the name of a configured APN that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **cscf-service** *service_name*: Indicates that only session information for the specified CSCF service will be displayed. *service_name* must be an existing CSCF service and be from 1 to 63 alpha and/or numeric characters.

Important: CSCF SIP calls under progress only. Registrations will not be considered a call.

- **dhcp-server** *dhcp_address*: Indicates that only session information for the specified DHCP server will be displayed. *dhcp_address* is the name of the DHCP server and must be expressed in dotted decimal notation.
- **fa** *fa_address*: indicates only the session information for the foreign agent whose IP address is specified by *fa_address* is to be displayed. *fa_address* must be specified using the standard IPv4 dotted decimal notation.
- **fa-service** *fa_name*: indicates only the session information for the foreign agent service specified by *fa_name* is to have information displayed.
- **ggsn-service** *ggsn_name*: Indicates that only session information for the specified GGSN service will be displayed. *ggsn_name* specifies the name of a configured GGSN service that can be from 1 to 63 alpha and/or numeric characters and is case sensitive.
- **ha** *ha_address*: indicates only the session information for the home agent whose IP address is specified by *ha_address* is to be displayed. *ha_address* must be specified using the standard IPv4 dotted decimal notation.
- **ha-service** *ha_name*: indicates only the session information for the home agent service specified by *ha_name* is to have information displayed.
- **hsgw-service** *service_name*: Indicates only the session progress information for the HSGW service specified by the *service_name* is to be displayed. *service_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.
- **lma-service** *service_name*: Indicates only the session progress information for the LMA service specified by the *service_name* is to be displayed. *service_name* must be an existing {MA service and be from 1 to 63 alpha and/or numeric characters.
- **mag-service** *service_name*: Indicates only the session progress information for the MAG service specified by the *service_name* is to be displayed. *service_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.
- **mme-address** *mme_address*: indicates only the session information for the foreign agent whose IP address is specified by *mme_address* is to be displayed. *mme_address* must be specified using the standard IPv4 dotted decimal notation.
- **pcf** *pcf_address*: Indicates only the session information for the packet control function with IP address *pcf_address* is to be displayed. *pcf_address* must be specified using the standard IPv4 dotted decimal notation.
- **pcf all**: indicates the session information for the packet control function for all pcf addresses.
- **pdsn-service** *pdsn_name*: indicates only the session information for the packet data service specified by *pdsn_name* is to have information displayed.

Important: If no PCF address or PDSN service is specified the session information for all sessions is displayed.

- **pgw-address** *ip_address*: Indicates only session progress information for the P-GW with an IP address specified by *ip_address* is to be displayed. *ip_address* must be specified using the standard IPv4 dotted decimal notation.
- **sgsn-address** *sgsn_address*: Indicates that only session information for the specified SGSN will be displayed. *sgsn_address* is the IP address of the SGSN and must be expressed in dotted decimal notation.

■ show session progress

- **sgw-service** *service_name*: Indicates only the session progress information for the S-GW service specified by the *service_name* is to be displayed. *service_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

Example

The following commands display the status information for the session connected to the packet control function with address *1.2.3.4*, packet data service *sampleService*, and for all sessions, respectively.

```
show session progress pcf 1.2.3.4
```

```
show session progress pdsn-service sampleService
```

```
show session progress
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session recovery status

Displays session recovery status information for the current context filtered by the options specified.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show session recovery status [verbose] [ | { grep grep_options | more } ]
```

recovery status

Displays the current status of the system's ability to recover from a hardware or software fault that requires the recovery of home agent-based Mobile IP session(s).

verbose

Includes per-CPU Session Recovery status.

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the session information for troubleshooting subscriber problems and for general monitoring for orphaned sessions.

Example

To display the session recovery status information, enter the following command:

```
show session recovery status
```

Adding the optional verbose keyword to this command provides more details.

```
show session recovery status verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session setuptime

Displays session setup time information for all sessions or sessions associated with the specified AGW/node.

Product

All

Privilege

Operator

Syntax

```
show session setuptime [ hnbgw-only | mme-only | pcf pcf_address | gprs-only |
sgsn-address sgsn_address | sgsn-only ] [ | { grep grep_options | more } ]
```

```
[ hnbgw-only | mme-only | pcf pcf_address | gprs-only | sgsn-address
sgsn_address | sgsn-only ]
```

Displays the call setup times aggregated into basic ranges of time.

- **hnbgw-only**: Filters and displays the call setup information for HNB-GW calls only.
- **mme-only**: Filters and displays the call setup information for MME calls only.
- **pcf pcf_address**: displays call setup data for the packet control function whose IP address is specified as *pcf_address*. *pcf_address* must be specified using the standard IPv4 dotted decimal notation. The call setup times for all PCFs is displayed when no specified PCF is specified.
- **gprs-only**: Displays 2G call setup data for the for the SGSN for the MM and PDP contexts.
- **sgsn-address sgsn_address**: Displays call setup times for the specified SGSN. *sgsn_address* is the IP address of the SGSN and must be expressed in dotted decimal notation. This keyword is used by the GGSN.
- **sgsn-only**: Displays 3G call setup data for the for the SGSN for the MM and PDP contexts.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

When no keywords are specified, the information shown is cumulative for all sessions that have been facilitated by the system.

Example

The following command shows setup time statistics for all sessions from the PCF at IP address 192.168.10.3:

```
show session setuptime pcf 192.168.10.3
```

show session subsystem

Displays session information for system subsystems. If no keywords are specified, information for all subsystems is displayed.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show session subsystem [ full | facility facility [ all | instance id ] ] [
verbose ] [ | { grep grep_options | more }]
```

```
[ full | facility facility [ all | instance id ] ]
```

- **full**: Indicates that a full statistics summary of all subsystems is to be displayed.
- **facility *facility***: Specifies the facility for which subsystem statistics is to be displayed where *facility* is specified as one of:
 - **allmgr**: All Manager
 - **aaamgr**: Accounting and Authentication Manager
 - **aaaproxy**: AAA Proxy Manager
 - **asngwmgr**: ASN Gateway Manager
 - **asnpcmgr**: ASN Paging/Location-Registry Manager
 - **cscfmgr**: SIP CSCF Manager
 - **dgmbmgr**: Diameter Gmb Application Manager
 - **diamproxy**: Diameter Proxy Application Manager
 - **egtpegmgr**: EGTP Egress Demux Manager
 - **egtpinmgr**: EGTP Ingress Demux Manager
 - **famgr**: Foreign Agent Manager
 - **gtpumgr**: GTPUMGR Demux Manager
 - **gtpcmgr**: GTPC Manager
 - **hamgr**: Home Agent Manager
 - **hnbmgr**: HNBGW HNB Manager
 - **imsimgr**: SGSN IMSI Manager
 - **ipsgmgr**: IP Services Gateway Manager
 - **l2tpdemux**: L2TP Demux Manager
 - **l2tpmgr**: L2TP Manager
 - **linkmgr**: SGSN/SS7 Master Manager
 - **magmgr**: Mobile Access Gateway Manager

- **megadiammgr**: Mega Diameter Manager
 - **mmedemux**: MME Demux Manager logging facility
 - **mmemgr**: MME Manager logging facility
 - **mmgr**: SGSN/SS7 Master Manager
 - **phsgwmgr**: PHS Gateway Manager
 - **phspcmgr**: PHS Paging Controller Manager
 - **sessmgr**: Session Manager
 - **sgtpcmgr**: SGSN GTPC Manager
- **all** | **instance** *id*: the keyword **all** indicates all instances of the specified facility are to be displayed whereas the keyword **instance** specifies a specific instance for which information is to be displayed where *id* must be specified as an instance ID in the range 0 through 4294967295. If all or instance is not specified summary statistics are displayed.

verbose

Displays everything the show session subsystem command output displays with the exception that the Setup Time statistics are reported in 100 ms increments from <100 ms up to 9600 ms.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the Regulating the Command Output section in the Command Line Interface Reference for details on the usage of **grep** and **more**.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

If this command is entered with no keywords, the information displayed is cumulative for all sessions facilitated by the system.

Example

The following commands display the statistics information summarized for all sessions, then for the *famgr* facility (all sessions), and finally only for the session with ID *127589* for the *hamgr* subsystem.

```
show session subsystem full
show session subsystem facility allmgr all
show session subsystem facility aaamgr all
show session subsystem facility asngwmgr all
show session subsystem facility famgr all
show session subsystem facility hamgr all
show session subsystem facility sessmgr all
```

■ show session subsystem

```
show session subsystem facility aaaproxy all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session trace

Displays status and statistics for the session trace application.

Product

GGSN, MME, P-GW, S-GW

Privilege

Inspector

Syntax

```
show session trace { statistics | subscriber network-element { ggsn | mme | pgw
| sgw } trace-ref value | tce-address ip_address tce-index num | tce-summary |
trace-summary } [ | { grep grep_options | more } ]
```

statistics

Displays summary statistics of the session trace subsystem.

```
subscriber network-element { ggsn | mme | pgw | sgw } trace-ref value
```

Displays status and statistics of a specified session trace using the network element type; GGSN, MME, P-GW, and S-GW, and the trace reference. *value* must be a valid trace reference of 12 characters in length.

```
tce-address ip_address tce-index num
```

Displays status and statistics of a specified Trace Collection Entity (TCE) connection. *ip_address* must be a valid existing collection entity IPv4 address and is specified in dotted decimal notation.

tce-summary

Displays a summary of all active TCE connections.

trace-summary

Displays a summary of all active session traces.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

Please refer to the Regulating the Command Output section in this reference for details on the usage of **grep** and **more**.

Usage

Use this command to display status and statistics for the session trace application.

Example

The following command displays status and statistics for a subscriber session trace on a P-GW with a trace reference of 32223398765:

■ show session trace

```
show session trace subscriber network-element pgw trace-ref 32223398765
```

The following command displays status and statistics for a subscriber session trace on an MME with a trace reference of 32221234567:

```
show session trace subscriber network-element mme trace-ref 32223398765
```

The following command displays status and statistics for a subscriber session trace on an GGSN with a trace reference of 1203398765:

```
show session trace subscriber network-element ggsn trace-ref 1203398765
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgs-service

Displays information and statistics about SGs services configured on this system.

Product

MME

Privilege

Inspector

Syntax

```
show sgs-service { all | name name | statistics { all | name name } | vlr-  
status [ service-name name ] [ vlr-name name ] [ full ]
```

all

Displays information about all SGs services configured on this system.

name *name*

Displays information about a specific SGs service configured on this system. *name* must be an existing SGs service and be from 1 to 63 alpha and/or numeric characters.

statistics { **all** | **name** *name* }

Displays statistics for SGs services configured on this system.

all: Displays statistics for all SGs services configured on this system.

name *name*: Displays statistics for a specific SGs service configured on this system. *name* must be an existing SGs service and be from 1 to 63 alpha and/or numeric characters.

vlr-status [**service-name** *name*] [**vlr-name** *name*] [**full**]

Displays status information about Visitor Location Registers (VLRs) configured in SGs services on this system.

service-name *name*: Displays names and states of Visitor Location Registers (VLRs) configured in a specific SGs service on this system. *name* must be an existing SGs service and be from 1 to 63 alpha and/or numeric characters.

vlr-name *name*: Displays the name and state of a specific Visitor Location Register (VLR) configured in SGs services on this system. *name* must be an existing VLR name and be from 1 to 63 alpha and/or numeric characters.

full: Displays additional information about VLRs configured in SGs services on this system. Additional information includes ports, addresses and peer IDs.

Usage

Use this command to display information and statistics about SGs services configured on this system.

Example

The following command displays statistics for an SGs service named *sgs3*:

```
show sgs-service name sgs3
```

The following command displays VLR status information for a configured VLR named *vlr-main*:

```
show sgs-service vlr-status vlr-name vlr-main
```

show sgsn-operator-policy

Displays configuration information for the SGSN features bundled into the SGSN Operator Policy and includes operational configuration for features such as GPRS Attach, GPRS RAU Inter, and PTMSI-Realloc Service Request (Signalling).

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show sgsn-operator-policy ( all | full | name op-pol-name ) +
```

all

Displays information for all configured SGSN operator policies.

full

Display all details of the configuration for the specified SGSN Operator Policy.

name *op-pol-name*

Identifies a specific operator policy. *op-pol-name* must be a combination of 1 to 64 alphanumeric characters.

Usage

This command can be used to display all of the operator policies that have been configured or all of the configuration information for a specific operator policy.

Example

The following command displays information for all configured SGSN operator policies:

```
show sgsn-operator-policy all
```

show sgsn-service

This command displays information about the configured SGSN services in the current context.

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show sgsn-service { all | name svrc_name }
```

all

Displays information for all SGSN services in the current context.

name *svrc_name*

Displays information for the specified SGSN service in the current context. *svrc_name* must be the name of a configured SGSN service and must be an alphanumeric string from 1 to 63 characters in length.

Usage

Use this command to display information for SGSN services.

Example

The following command displays information for all SGSN services in the current context:

```
show sgsn-service all
```

The following command displays information for an SGSN service in the current context that is named sgsn1:

```
show sgsn-service name sgsn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgsn sessmgr

This command displays session manager (SessMGR) statistics specific to the SGSN service.

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show sgsn sessmgr { all | instance smgr_inst }
```

all

Displays all SessMGR statistics specific to the system's SGSN services.

instance *smgr_inst*

Displays the statistics for a specific session manager instance of the SGSN service. *smgr_inst* must be an integer between 1 and 10000000.

Usage

Use this command to display information for SGSN services.

Example

The following command displays SGSN SessMGR statistics for all SGSN services on the system:

```
show sgsn sessmgr all
```

show sgtp-service

This command displays information about the configured SGTP services in the current context, including GTP-C and GTP-U operational configuration.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show sgtp-service { all | ggsn-table | sgsn-table | name svrc_name }
```

all

Displays configuration information for all of the SGTP services defined for the current context.

ggsn-table

Displays GGSN information configured for the SGTP service in the current context.

sgsn-table

Displays SGSN information configured for the SGTP service in the current context.

name *svrc_name*

Displays information for the specified SGTP service in the current context. *svrc_name* must be the name of a configured SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

Usage

Use this command to display information for SGSN services.

Example

The following command displays information for all SGTP services in the current context:

```
show sgtp-service all
```

The following command displays the GGSN information in SGTP services in the current context:

```
show sgtp-service ggsn-table
```

The following command displays the SGSN information in SGTP services in the current context:

```
show sgtp-service sgsn-table
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

■ show sgtp-service

show sgtpc statistics

This command displays all statistics, for SGTPC interface parameters, collected since the last restart or last use of a clear command.

Product

SGSN
PDG/TTG

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show sgtpc statistics [ all | gsn-address ipv4_address | sgtp-service
sgtp_srvc_name ] [ verbose ]
```

all

Displays configuration information for all of the SGTP services defined for the current context.

gsn-address ipv4_address

ipv4_address Displays statistics for a specific SGSN identified by the SGSN's IPv4 address. specified in dotted decimal notation.

Note this must be an existing and active interface.

sgtp-service sgtp_srvc_name

Displays statistics for the specified SGTP service in the current context.

sgtp_srvc_name must be the name of a previously configured and active SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

verbose

Causes the system to display more detailed level of statistics.

Usage

Use this command to display information for SGSN services.

Example

The following command displays statistics for the SGTP service named *sgtp1*:

```
show sgtpc statistics sgtp-service sgtp1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtpu statistics

This command displays all transmission and reception statistics, for pre-defined and active GTP-U interfaces, collected since the last restart or last use of a clear command.

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show sgtpu statistics [ ggsn-address ipv4_address | iups-service iups_srvc_name
| rnc-address ipv4_address | sgtp-service sgtp_srvc_name | gprs-service
gprs_srvc_name nsei nse_id ]
```

ggsn-address *ipv4_address*

ipv4_address Displays statistics for a specific GGSN identified by the GGSN's IPv4 address. specified in dotted decimal notation.

iups-service *iups_srvc_name*

Displays statistics for the specified IuPS service in the current context.

iups_srvc_name must be the name of a previously configured and active IuPS service and must be an alphanumeric string from 1 to 63 characters in length.

rnc-address *ipv4_address*

ipv4_address Displays statistics for a specific RNC identified by the RNC's IPv4 address. specified in dotted decimal notation.

sgtp-service *sgtp_srvc_name*

Displays statistics for the specified SGTP service in the current context.

sgtp_srvc_name must be the name of a previously configured and active SGTP service and must be an alphanumeric string from 1 to 63 characters in length.

gprs-service *gprs_srvc_name* **nsei** *nse_id*

Displays the statistics for a specific NSEI-based GTPU statistics associated with the specified GPRS service in the current context.

gprs_srvc_name must be the name of a previously configured and active GPRS service and must be an alphanumeric string from 1 to 63 characters in length.

nse_id must be an integer from 0 to 65535.

Usage

Use this command to display information for SGSN services.

Example

The following command displays GTP-U statistics for the traffic between an SGSN and a connected RNC.

```
show sgtpu statistics rnc-address 123.1.2.3
```

show sgw-service

Displays configuration information and/or service statistics for Serving Gateway (S-GW) services on this system.

Product

S-GW

Privilege

Inspector

Syntax

```
show sgw-service { all | name service_name | statistics { all | name
service_name } } [ | { grep grep_options | more } ]
```

all

Displays configuration information for all S-GW services configured on this system.

name service_name

Displays configuration information for a specific S-GW service configured on this system.

service_name must be an existing S-GW service, and be from 1 to 63 alpha and/or numeric characters in length.

statistics { all | name service_name }

Displays statistics for all S-GW services on this system or for a specified service. *service_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numerics characters.

| { grep grep_options | more }

Indicates the output of the command is to be piped (sent) to the command specified.

A command to send output to must be specified.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view configuration information and/or service statistics for S-GW services on this system.

Example

The following command displays service statistics for the S-GW service named *sgw1*:

```
show sgw-service statistics name sgw1
```

show snmp

Displays information on the Simple Network Management Protocol servers and interfaces.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show snmp { accesses | communities | contexts | notifies | server | transports |
trap [ history | statistics { verbose } { wide } ] | views } [ | { grep
grep_options | more } ]
```

accesses

Displays SNMP server usage statistics.

communities

Displays SNMP community strings.

contexts

Displays SNMP information per context.

notifies

Displays SNMP event trap and notification statistics.

server

Displays SNMP server configuration information.

transports

Displays trap destination configuration information.

```
trap [ history | statistics { verbose } { wide } ]
```

history: displays SNMP event trap history. **trap history** shows up to 5000 time-stamped trap records stored in a buffer. The buffer may be cleared by entering the **clear snmp history** command.

statistics: displays SNMP event trap and notification statistics.

verbose: displays rows for every defined trap, even if never generated.

wide: shows trap statistics data in excess of 80 columns.

views

Displays SNMP views.

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

■ show snmp

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display SNMP information as part of system verification and troubleshooting.

Example

The following commands display the usage statistics, community string information, event trap and notification data, server information, and trap destination configuration, respectively.

```
show snmp communities
```

```
show snmp transport
```

```
show snmp server
```

```
show snmp accesses
```

```
show snmp notifies
```

```
show snmp trap history
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show srp

Displays the Service Redundancy Protocol information.

Product

HA, PDSN GGSN PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show srp { call-loss statistics | checkpoint statistics [ verbose ] | info |
statistics } | [ grep grep_options | more ]
```

call-loss statistics

Displays history of lost calls during switchover.

checkpoint statistics [verbose]

Displays check pointing statistics on session redundancy data (session managers, current call recovery records, etc.).

verbose: Displays cumulative information for all session managers in tabular output.

info

Displays Service Redundancy Protocol information (context, chassis state, peer, connection state, etc.).

statistics

Displays Service Redundancy Protocol statistics (hello messages sent, configuration validation, resource messages, switchovers, etc.).

grep grep_options | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the Interchassis Session Recovery chapter of the Administration and Configuration Guide and the Service Redundancy Protocol Configuration Mode chapter of the Command Line Reference.

Example

The following command shows Service Redundancy Protocol information:
show srp call-loss statistics

■ show srp

show srp info

show srp checkpoint statistics

show srp statistics

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show srp monitor

Displays the Service Redundancy Protocol monitor information.

Product

HA, GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show srp monitor [ all | authentication-probe | bgp | [ grep grep_options | more ] ]
```

all

Displays monitor information for all types (authentication-probe and bgp).

authentication-probe

Displays authentication probe monitor information.

bgp

Displays BGP monitor statistics.

grep *grep_options* | more

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the Interchassis Session Recovery chapter of the Administration and Configuration Guide and the Service Redundancy Protocol Configuration Mode chapter of the Command Line Reference.

Example

The following command shows Service Redundancy Protocol monitor information:

```
show srp monitor
```

show ss7-routing-domain

This command displays the configuration information for the defined SS7 routing domains. As SS7 routing domains conglomerate a large number of operational parameters, this command enables you to narrow your displays to specific protocol parameters on a specific link.

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show ss7-routing-domain { all | ss7rd_id { m3ua | mtp2 | mtp3 | qsaal | routes [
adjacent ] | sctp asp { all | instance asp_id } | sscf } }
```

```
show ss7-routing-domain ss7rd_id m3ua { statistics { gen | peer-server { all |
id peer_server_id peer-server-process { all | instance psp_instance } } } |
status { address-translation-table | destination-point-code { all | ss7_dpc } |
gen | peer-server peer_server_id [ peer-server-process instance psp_id | verbose
1 ] }
```

```
show ss7-routing-domain 1 sscf { statistics linkset { all | id linkset_id link {
all | id link_id } } | status linkset { all | id linkset_id link { all | id
link_id [ verbose 1 ] } } }
```

ss7-routing-domain { all | ss7rd_id }

Specifies whether the display will output information for all SS7 routing domains or only for a specifically identified SS7 routing domain.

ss7rd_id must be an integer value from 1 through 12.

m3ua

Provides access to statistics or status information for the SS7 MTP3 User Adaptation Layer (M3UA) the specified SS7 routing domain.

mtp2

Provides access to statistics or status information the SS7 Message Transfer Part-2 (MTP2) for the specified SS7 routing domain.

mtp3

Provides access to statistics or status information the SS7 Message Transfer Part-3 (MTP3) for the specified SS7 routing domain.

qsaal

Provides access to statistics or status information for the Service Specific Connection-Oriented Protocol (SSCOP) sub-layer of the Quasi Signaling Application Adaptation Layer (QSAAL) for the specified SS7 routing domain.

routes [adjacent]

Displays the destination point code (DPC) routing table.

adjacent - If this keyword is used with the routes keyword, then it provides access to the statistics and status information for configured adjacent point codes.

sctp asp { all | instance *asp_id* }

Provides access to the status or statistics of Stream Control Transmission Protocol (SCTP) application server processes (ASP) in the specified SS7 routing domain for all or a specified SCTP ASP instance.

- **all**: This keyword displays the information for all SCTP application server process instances for specific SS7 routing domain.
- **instance *asp_id***: Specified the specific SCTP application server process instance where *instance_id* must be an integer value from 1 through 4.

sscf

Provides access to the statistics or status information for the Service Specific Coordination Function (SSCF (q.2140)) for the specified SS7 routing domain.

peer-server [all | id *peer-server_id*]

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific peer server id.

- **all**: This keyword displays the information for all peer servers for specific protocol.
- **id *peer-server_id***: Specified the specific linkset identifier where *peer-server_id* must be an integer value from 1 through 49.

peer-server-process [all | instance *instance_id*]

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific instance of peer-server process.

- **all**: This keyword displays the information for all peer server process instances for specific protocol.
- **instance *instance_id***: Specified the specific peer server process instance where *instance_id* must be an integer value from 1 through 4.

destination-point-code [all | *dest_point_code*]

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific destination point code.

- **all**: This keyword displays the information for all destination point codes in SS7 routing domain.
- ***dest_point_code***: Specified the specific destination point code in SS7 routing domain.

gen

This keyword displays the general information for the specific protocol for the specified SS7 routing domain.

verbose

This keyword enables the display of maximum information for a protocol statistics/status.

```
linkset [ all | id linkset_id ]
```

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific link set.

- **all**: This keyword displays the information for all linksets for specific protocol.
- **id** *linkset_id*: Specified the specific linkset identifier where *linkset_id* must be an integer value from 1 through 49.

```
link [ all | id link_id ]
```

This keyword filters the information for the specific protocol in SS7 routing domain for all or specific link set.

- **all**: This keyword displays the information for all links for specific protocol.
- **id** *link_id*: Specified the specific linkset identifier where *link_id* must be an integer value from 1 through 16.

Usage

Use this command to display the SS7 routing domain and different layer protocol information for SGSN service.

Example

Following command displays the information/statistics of all SCTP application server processes of peer server id 17 and peer server process instance 1 in SS7 routing domain 12:

```
show ss7-routing-domain 12 sctp asp all status peer-server id 17 peer-server-process instance 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ssh key

Displays the secure shell public key information.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show ssh key [ type { v1-rsa | v2-rsa | v2-dsa } ] [ | { grep grep_options |
more } ]
```

```
[ type { v1-rsa | v2-rsa | v2-dsa } ]
```

Specifies the type of SSH key information to display. If type is not specified, information for all types is displayed.

v1-rsa: SSH v1 RSA host key only

v2-rsa: SSH v2 DSA host key only

v2-dsa: SSH v2 RSA host key only

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Show the secure shell key information for all types to verify installed keys.

Example

The following command shows information for all SSH V1 and SSH V2 keys:

```
show ssh key
```

The following command shows information for only SSH V2 RSA host keys:

```
show ssh key type v2-rsa
```

show subscribers

Shows information for subscriber sessions defined by the specified keywords. Keywords described under Command Keywords below are base commands that display distinctive type of data. Keywords described under Filter Keywords are filters that modify or filter the output of the base commands. Not all filter keywords are available for all command keywords commands. Each command keyword lists the filter keywords that it accepts.

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Syntax

```
show subscribers [ command_keyword ] [ filter_keywords ] [ | { grep grep_options
| more } ]
```

Command Keywords

The following keywords are base commands that each have a distinct display output. Only one Command Keyword can be entered on the command line.

aaa-configuration

Shows AAA configuration information for subscriber sessions defined by the specified filter keywords. The following filter keywords are valid with this command:

active, **all**, **apn**, **callid**, **card-num**, **configured-idle-timeout**, **connected-time**, **dhcp-server**, **dormant**, **fa**, **fa-service**, **ggsn-service**, **ha**, **ha-service**, **idle-time**, **imsi**, **ip-address**, **ip-pool**, **lac**, **lac-service**, **lms**, **lms-service**, **long-duration-time-left**, **msid**, **network-requested**, **network-type**, **pcf**, **pdsn-service**, **plmn-type**, **rx-data**, **session-time-left**, **sgsn-address**, **sgsn-service**, **tx-data**, **username**, **verbose**, **grep**, **more**

access-flows { **accounting** | **dynamic** | **pre-provisioned** | **static** }

Shows the ip-flows for the subscribers defined by the specified filter keywords.

accounting: Use this keyword to display the accounting type of access flows for a subscriber.

dynamic: Use this keyword to display the dynamic type of access flows for a subscriber.

pre-provisioned: Use this keyword to display the pre-provisioned type of access flows for a WiMAX subscriber.

static: Use this keyword to display the static type of access flows for a subscriber.

The following filter keywords are valid with this command:

active, **active-charging-service**, **all**, **asngw-service**, **asnpc-service**, **asn-peer-address**, **apn**, **callid**, **card-num**, **coa-only**, **configured-idle-timeout**, **connected-time**, **dhcp-server**, **dormant**, **fa**, **fa-service**, **flow-type**, **ggsn-service**, **gsm-traffic-class**, **hnbgw-only**, **ha**, **ha-ipsec-only**, **ha-service**, **idle-time**, **imsi**, **ip-address**, **ip-pool**, **ipv6-address**, **ipv6-prefix**, **l3-tunnel-local-address**, **l3-tunnel-remote-address**, **lac**, **lac-service**, **lms**, **lms-service**, **long-duration-time-left**, **mip-udp-tunnel-only**, **msid**, **msiddn**, **network-requested**, **network-type**, **pcf**, **pdsn-service**, **plmn-type**, **rulebase**,

rx-data, session-time-left, sgsn-address, sgsn-service, tpo, tx-data, username, verbose, grep, more

activity

Display subscribers link activity percentage. When no Filter Keywords are specified, the output is a summary of all subscriber activity. When Filter Keywords are specified, the link activity percentage is displayed as graphs in which one is displayed using a high sampling rate, a 10 second interval between samples, and a low sampling rate, a 15 minute interval between samples

The following filter keywords are valid with this command:

active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tpo, tx-data, username, grep, more

asn-peer-address *ip_address*

Displays information for subscribers on an ASN GW trusted peer.

ip_address is the IPv4 address of the ASN GW peer server in dotted decimal notation.

The following filter keywords are valid with this command:

all, counters all, asngw-service, full, summary, grep, more

asngw-service *service_name*

Displays counters for subscribers accessing the ASN GW service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

The following filter keywords are valid with this command:

all, counters all, full, summary, grep, more

asnpc-service *service_name*

Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service.

service_name must be an existing ASN PC service and be from 1 to 63 alpha and/or numeric characters in length.

The following filter keywords are valid with this command:

all, counters all, full, summary, grep, more

bearer-establishment { direct-tunnel | normal | pending }

Selects Bearer Establishment type defined by the specified filter keywords.

direct-tunnel: Select subscribers having direct tunnel established with the RNC.

normal: Select subscribers having bearer established with SGSN.

pending: Select subscribers for whom bearer is not fully established.

configuration

Display current configuration for all subscribers or a specified subscriber. The following filter keywords are valid with this command:

all, username, grep, more

counters

Show the counters associated with the subscriber. The following filter keywords are valid with this command: active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tpo, tx-data, username, grep, more

cscf-only

Displays information for CSCF subscribers only.

The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, dormant, fa, full, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, policy, rx-data, session-time-left, smgr-instance, subscription, summary, tft, tx-data, username, wfl

cscf-service *service_name*

Displays information for subscribers accessing the specified CSCF service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

The following filter keywords are valid with this command:

bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, cscf-service, fa, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, rx-data, session-time-left, smgr-instance, subscription, tx-data, username

css-delivery-sequence

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsolete.

css-service *csssvc_name*

Important: This is a restricted keyword. In StarOS 9.0 and later releases, this keyword is obsolete.

data-rate [summary | full] [verbose | graph { high | low }] [high | low]

Indicates how to display subscriber throughput data.

Important: This keyword is best used for individual subscriber output.

summary: Combine statistics for the matching subscriber and show a summary in text form.

full: Display a separate output for each matching subscriber separately in tabular form.

verbose: Display cumulative information for all matching subscribers in tabular output.

graph { high | low }: Display the throughput data as a graph using either a high sampling rate of every 30 seconds or a low sampling rate of every 15 minutes. The graph contains data points over the last 24 hours, if available. The command displays a graph each for the transmit and receive peak, average, and sustained throughput for a total of six graphs.

high: Display the raw data collected for the throughput analysis using a high sampling rate (smaller interval). The data displayed uses a sampling interval of 30 seconds and includes the data collected over the last 24 hours, if available.

low: Display the raw data collected for the throughput analysis using a low sampling rate (larger interval). The data displayed uses a sampling interval of 15 minutes and includes the data collected over the last 24 hours, if available.

The following filter keywords are valid with this command:

```
active, all, asngw-service, asnpc-service, asn-peer-address, apn,
callid, card-num, configured-idle-timeout, connected-time, dhcp-
server, dormant, fa, fa-service, ggsn-service, ha, ha-service,
hnbgw-service, hsgw-only, hsgw-service, idle-time, imsi, ip-
address, ip-pool, lac, lac-service, lma-service, lns, lns-service,
long-duration-time-left, mag-service, mme-address, mme-service,
msid, network-requested, pcf, pdsn-service, plmn-type, rx-data,
session-time-left, sgsn-address, sgsn-service, tpo, tx-data,
username, grep, more
```

```
debug-info { callid id | msid id | username name }
```

Displays internal call troubleshooting information for subscriber sessions defined by the specified keywords.

callid *id*: Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-byte hexadecimal number.

msid *id*: Displays information for the mobile user identified by *id*. *id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

username *name*: Displays information for connections for the subscriber identified by *name*. The user must have been previously configured. *name* must be a sequence of characters and/or wildcard characters ('\$ and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes ('). For example; '\$'.

fng-only

Displays FNG context information for the session.

```
fng-service service_name
```

Displays information for subscribers accessing the specified FNG service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

full

Shows all available subscriber information. The following filter keywords are valid with this command: active, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi, ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested, network-type, pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, sgsn-service, tpo, tx-data, username, grep, more

ggsn-only

Displays only GGSN-specific subscriber context information.

gprs-only

Displays only 2G SGSN subscribers/contexts. The following filter keywords are valid with this command: aaa-configuration, active, active-charging-service, activity, all, apn, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, partial, plmn-type, rx-data, session-time-left, summary, tx-data, grep, and more.

gtp-version { 0 | 1 }

Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1). The following filter keywords are valid with this command: active-charging-service, apn, bearer-establishment, callid, dhcp-server, fa, fa-service, ggsn-service, gprs-service, gsm-traffic-class, msid, msisdn, plmn-type, sgsn-address, sgsn-service, smgr-instance, tx-data, username, grep, more.

hnbgw-only

Displays HNB-GW subscriber session information.
The following filters/keywords are valid with this command:

all, full, summary

hnbgw-service *svc_name*: Displays subscriber information based on the HNB-GW service name. *svc_name* must be an existing HNB-GW service and be from 1 to 63 alpha and/or numeric characters.

hsgw-only

Displays HSGW subscriber session information.
The following filters/keywords are valid with this command:

all, full, summary

hsgw-service *svc_name*: Displays subscriber information based on the HSGW service name. *svc_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

hsgw-service *svc_name*

Displays subscriber information based on the HSGW service name. *svc_name* must be an existing HSGW service and be from 1 to 63 alpha and/or numeric characters.

```
ip-alloc-method {aaa-assigned | dhcp [ relay-agent | proxy-client ] |
dynamic-pool | l2tp-lns-assigned | mip-ha-assigned | ms-provided-static |
not-ms-provided-static | static pool }
```

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

aaa-assigned: Selects subscribers whose IP Addresses were assigned by AAA.

dhcp: Selects subscribers whose IP Addresses were assigned by DHCP.

- **relay-agent:** Selects subscribers whose IP Addresses were assigned by the DHCP Relay Agent

- **proxy-client:** Selects subscribers whose IP Addresses were assigned by the DHCP Proxy Client

dynamic-pool: Selects subscribers whose IP Addresses were assigned from a dynamic IP address pool.

l2tp-lns-assigned: Selects subscribers whose IP Addresses were assigned by the Layer 2 Tunneling Protocol Network Server.

mip-ha-assigned: Selects subscribers whose IP Addresses were assigned by the Mobile IP Home Agent.

ms-provided-static: Selects subscribers whose IP Addresses were provided by the Mobile Station.

not-ms-provided-static: Selects subscribers whose IP Addresses were not provided by the Mobile Station.

static-pool: Selects subscribers whose IP Addresses were assigned from a static IP address pool.

ipsg-only

Displays IPSG subscriber session information.

```
lma-service svc_name
```

Displays subscriber information based on the LMA service name. *svc_name* must be an existing LMA service and be from 1 to 63 alpha and/or numeric characters.

mag-only

Displays MAG subscriber session information.

The following filters/keywords are valid with this command:

```
all, full, summary
```

mag-service *svc_name*: Displays subscriber information based on the MAG service name. *svc_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

```
mag-service svc_name
```

Displays subscriber information based on the MAG service name. *svc_name* must be an existing MAG service and be from 1 to 63 alpha and/or numeric characters.

mme-address

Displays subscriber information based on the MME IP address. *ip_address* must be an existing MME IP address and be entered in IPv4 dotted decimal notation.

mme-only

Displays MME subscriber session information.

The following filter keywords are valid with this command:

```
all, full, summary
```

mme-service *svc_name*: Displays subscriber information based on the MME service name. *svc_name* must be an existing MME service and be from 1 to 63 alpha and/or numeric characters.
mme-address *ip_address*: Displays subscriber information based on the MME IP address. *ip_address* must be an existing MME IP address and be entered in IPv4 dotted decimal notation.

pdg-only

Displays a summary of PDG subscriber statistics.

pdg-service *name*

Displays statistics for users associated with a specific PDG service name.

pdif-only

Displays a summary of PDIF subscriber statistics.

pdif-service *name*

Displays connection statistics for users associated with a specific pdif-service name.

pgw-only

Displays P-GW subscriber session information.
 The following filters/keywords are valid with this command:

all, full, summary

pgw-service *svc_name*: Displays subscriber information based on the P-GW service name. *svc_name* must be an existing P-GW service and be from 1 to 63 alpha and/or numeric characters.
sgw-address *ip_address*: Displays subscriber information based on the S-GW IP address. *ip_address* must be an existing S-GW IP address and be entered in IPv4 dotted decimal notation.

qci *number*

Displays subscriber session information based on the QCI value assigned to the subscriber. *number* must be an integer value from 0 to 9.

s1u-state { active | idle | idle-active }

Displays session information based on the subscriber's S1-U state. The S1-U interface is the interface from the eNodeB to the S-GW.

active: Displays session information for subscribers with an S1-U state set to active.

idle: Displays session information for subscribers with an S1-U state set to idle.

idle-active: Displays session information for subscribers with an S1-U state set to idle-active.

s5-proto { gtp | pmip }

Displays subscriber session information based on the S5 interface protocol used. Choose either GPRS Tunneling Protocol (GTP) or Proxy Mobile IP (PMIP).

sgsn-only

Displays only 3G SGSN-specific subscriber context information. The following filters are valid with this command:

aaa-configuration, active, active-charging-service, activity, all, apn, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, ggsn-address, gsm-traffic-class, idle-time, imsi, msid, msisdn, partial qos [requested | netogitated] , plmn-type, rnc, rx-data, session-time-left, summary, tx-data, grep, and more.

sgw-only

Displays S-GW subscriber session information.

The following filters/keywords are valid with this command:

all, full, summary

sgw-service *svc_name*: Displays subscriber information based on the S-GW service name. *svc_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

pgw-address *ip_address*: Displays subscriber information based on the P-GW IP address. *ip_address* must be an existing P-GW IP address and be entered in IPv4 dotted decimal notation.

sgw-service *svc_name*

Displays subscriber information based on the S-GW service name. *svc_name* must be an existing S-GW service and be from 1 to 63 alpha and/or numeric characters.

subscription { **aor** *address* | **callid** *id* | **full** }

Displays subscription information for defined subscribers, based on defined parameters.

aor *address*: Clear session(s) by Address of Record.

callid *id*: Specific Call Identification Number.

full: Displays all available information.

summary

Only display a summary of the subscriber information. The following filter keywords are valid with this command:

active, activity, all, asngw-service, asnpc-service, asn-peer-address, apn, callid, card-num, configured-idle-timeout, connected-time, dhcp-server, dormant, enodeb-address, fa, fa-service, ggsn-service, ha, ha-service, idle-time, imsi ip-address, ip-pool, lac, lac-service, lns, lns-service, long-duration-time-left, msid, network-requested pcf, pdsn-service, plmn-type, rx-data, session-time-left, sgsn-address, tx-data, username, grep, more

tft

Displays the current Traffic Flow Template (TFT) associated with the subscriber session.

tx-data

Bytes transmitted by the subscriber.

wf1

Displays subscriber information in wide format number 1. Wide format number 1 includes the following information for each listed subscriber session:

- Access Type
- Access Technology
- Call State

- Link Status
- Network Type
- Call ID
- MSID
- Username
- IP Address
- Time-Idle
- Access Peer Address
- Service Address
- Network Peer Address
- Connect Time

filter_keywords

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.

For example; if you enter the following command:

```
show subscribers counters ip-pool pool1 card-num 1
```

Counters for all subscriber sessions that were assigned an IP address from the IP pool named pool1 and also are being processed by the processing card in slot 1 is displayed. Information for all other subscribers is not displayed.

active

Only display information for those subscribers who currently have active sessions.

active-charging-service *acs_service*

Displays information for subscribers under active charging service processing.

acs_service must be a string of 1 through 15 characters in length.

all

If no keywords are specified before **all**, information for all subscribers is displayed. If keywords are specified before **all**, all information is displayed with no further options being allowed.

apn *name*

Displays subscribers currently facilitated by the Access Point Name (APN) template called *name* configured on the system. This command is for GGSN only.

asngw-only

Displays counters for subscribers accessing the ASN GW service only.

asnpc-only

Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service only.

hnbgw-only

Displays counters for subscribers accessing the HNB-GW service only.

callid *id*

Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-byte hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. *pac_num* is a slot number from 1 through 7 or 10 through 16.

coa-only

Displays the subscribers that registered a MIP colocated COA directly with the HA. This option is only valid when MIPHA session license is enabled.

configured-idle-timeout [< | > | **greater-than** | **less-than**] *value*

Shows the idle timeout that is configured for the specified subscriber. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.

<: Filters output so that only information less than the specified value is displayed.

>: Filters output so that only information greater than the specified value is displayed.

greater-than: Filters output so that only information greater than the specified value is displayed.

less-than: Filters output so that only information less than the specified value is displayed.

value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

connected-time [< | > | **greater-than** | **less-than**] *value*

Shows how long the subscriber has been connected. <: Filters output so that only information less than the specified value is displayed.

<: Filters output so that only information less than the specified value is displayed.

>: Filters output so that only information greater than the specified value is displayed.

greater-than: Filters output so that only information greater than the specified value is displayed.

less-than: Filters output so that only information less than the specified value is displayed.

value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

cscf-only

Displays information for CSCF subscribers only.

cscf-service *service_name*

Displays information for subscribers accessing the specified CSCF service.

service_name must be an existing service and be from 1 to 63 alpha and/or numeric characters in length.

dhcp-server *address*

Displays subscribers currently accessing the system that have been provided an IP address by the DHCP server specified by *address*. This command is for GGSN only.

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

enodeb-address *IPv4_address*

Displays information for EPS subscribers connected to the eNodeB specified by *IPv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

fa *address*

Displays information for subscribers connected to the foreign agent specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

fa-only

Only display FA-specific context information.

fa-service *name*

Displays information for subscribers connected to the foreign agent service specified by *name*. The foreign agent service name must have been previously defined.

firewall { **not-required** | **required** }

Displays information for the specified subscribers:

not-required: Subscribers for whom firewall processing is not required.

required: Subscribers for whom firewall processing is required.

firewall-policy *fw_policy_name*

This keyword is obsolete.

fw-and-nat policy *fw_nat_policy*

Important: This option is customer-specific and is only available in StarOS 8.1.

Displays information for subscribers using the specified Firewall-and-NAT policy.

fw_nat_policy specifies the Firewall-and-NAT policy name, and must be an alpha and/or numeric string of 1 through 15 characters in length.

ggsn-address *ip_address*

Displays information for subscribers connected to the GGSN with specific IP address specified by *ip_address*. The GGSN IP address *ip_address* must have been previously defined.

ip_address: must use dotted decimal notation.

This keyword is for SGSN only.

ggsn-preservation-mode

Displays information for subscribers connected to the GGSN service with preservation mode enabled. This filter keyword is for GGSN only.

ggsn-service *name*

Displays information for subscribers connected to the GGSN service specified by *name*. The GGSN service *name* must have been previously defined. This keyword is for GGSN only.

gsm-traffic-class { **background** | **conversational** | **interactive** | **streaming** }

Displays information for subscriber traffic that matches the specified 3GPP traffic class.

- **background**: 3GPP QoS background class.
- **conversational**: 3GPP QoS conversational class.
- **interactive**: 3GPP QoS interactive class. Must be followed by a traffic priority.
- **streaming**: 3GPP QoS streaming class.

ha *address*

Displays information for subscribers connected to the home agent specified by *address*. The address must be specified using the standard IPv4 dotted decimal notation.

ha-ipsec-only

Only display information for subscriber sessions that are using IP-Security.

ha-only

Only display HA-specific context information.

ha-service *name*

Displays information for subscribers connected to the home agent service specified by *name*. The home agent service *name* must have been previously defined.

idle-time [< | > | **greater-than** | **less-than**] *value*

Displays how long the subscriber session has been idle or display subscriber sessions that meet the idle time criteria specified.

<: Filters output so that only information less than the specified value is displayed.

>: Filters output so that only information greater than the specified value is displayed.

greater-than: Filters output so that only information greater than the specified value is displayed.

less-than: Filters output so that only information less than the specified value is displayed.

value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

ims-auth-service *service_name*

Displays information for subscribers with specified IMS Authorization Service. *service_name* must have been previously defined.

imsi *id*

Shows the subscriber with the specified id. The IMSI (International Mobile Subscriber Identity) ID is a 15 character field which identifies the subscriber's home country and carrier. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do

not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

ip-address [< | > | **greater-than** | **less-than**] *address*

Displays information for subscribers connected to the specified *address*.

<: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.

>: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.

greater-than: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.

less-than: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.

address: The address must be specified using the standard IPv4 dotted decimal notation. Used in conjunction with <, >, greater-than, less-than. If the ip address is specified without a qualifier then only subscribers with the specified IP address have their information displayed.

ip-pool *name*

Displays information for subscribers assigned addresses from the IP address pool *name*. *name* must be the name of an existing IP pool or IP pool group.

IP pool *name* will be either ipv4 or ipv6 according to call line setup for specified pool *name*.

ipv6-address *address*

Displays information for subscribers connected to the specified *address*.

ipv6-prefix *prefix*

Displays information for subscribers connected to the specified address and *prefix*.

lac *address*

Displays information for calls to the peer LAC (L2TP access concentrator) specified by *address*.

lac-only

Show L2TP LAC specific information only.

lac-service *name* [**local-tunnel-id** *id* | **remote-tunnel-id** *id*]

Displays information for calls associated with the LAC service named *name*. This is a string of 1 to 63 characters.

local-tunnel-id *id*: Specifies a specific local tunnel from which to clear calls. *id* must be in the range of 1 to 65535.

remote-tunnel-id *id*: Specifies a specific remote tunnel from which to clear calls. *id* must be in the range of 1 to 65535.

l3-tunnel-local-addr *ip_address*

Specific layer 3 tunneling interface specified by *ip_address*. The address must be specified using the standard IPv4 dotted decimal notation.

l3-tunnel-remote-addr *ip_address*

Specific layer 3 tunneling peer specified by *ip_address*. The address must be specified using the standard IPv4 dotted decimal notation.

lns *address*

Displays information for calls to the peer LNS (L2TP network server) specified by *address*.

lns-only

Show L2TP LNS specific information only.

lns-service *name* [**local-tunnel-id** *id* | **remote-tunnel-id** *id*]

Displays information for calls associated with the LNS service named *name*. This is a string of 1 to 63 characters.

local-tunnel-id *id* : Specifies a specific local tunnel from which to clear calls. *id* must be in the range of 1 to 65535.

remote-tunnel-id *id* : Specifies a specific remote tunnel from which to clear calls. *id* must be in the range of 1 to 65535.

long-duration-time-left [< | > | **greater-than** | **less-than**] *value*

Shows how much time is left for the maximum duration of a specified subscriber session.

<: Filters output so that only information less than the specified value is displayed.

>: Filters output so that only information greater than the specified value is displayed.

greater-than: Filters output so that only information greater than the specified value is displayed.

less-than: Filters output so that only information less than the specified value is displayed.

value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

mip-udp-tunnel-only

Displays the subscribers that negotiated MIP-UDP tunneling with the HA. This option is only valid when MIP NAT Traversal license is enabled.

mipv6ha-only

Shows MIPV6HA-specific context information for the session.

mipv6ha-service *service_name*

Displays specific configured MIPV6 Home Agent service. *service_name* must have been previously defined.

msid *id*

Displays information for the mobile user identified by *id*. *id* must be from 7 to 16 hexadecimal digits specified as an IMSI, MIN, or RMI. Wildcard characters \$ and * are allowed. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example: '\$'.

In case of **enforce imsi-min equivalence** is enabled on the chassis and MIN or IMSI numbers supplied, this filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.

```
show subscribers msid ABCD0123456789 or
show subscribers msid 0123456789
```

will show any subscriber with a MSID that match the lower 10 digits of MSID suplid, i.e. 0123456789.

```
msisdn msisdn
```

Displays information for the mobile user identified by the Mobile Subscriber ISDN Number (MSISDN). *msisdn* must be 7 to 16 digits; specified as an IMSI, MIN, or RMI.

```
nat { not-required | required [ nat-ip nat_ip_address | nat-realm
nat_realm ] }
```

Displays information for the specified subscribers.

not-required: Subscribers for whom Network Address Translation (NAT) processing is not required.

required: Subscribers for whom NAT processing is required.

Important: The **nat-ip** keyword is only available in StarOS 8.3 and later releases.

nat-ip *nat_ip_address*: Subscribers for whom NAT processing is enabled and are using the specified NAT IP address. *nat_ip_address* specifies the NAT IP address and must be a standard IPv4 address.

nat-realm *nat_realm*: Subscribers for whom NAT processing is enabled and are using the specified NAT realm. *nat_realm* specifies the NAT realm name and must be a string from 1 through 63 characters in length.

```
network-requested
```

Display information for currently active subscribers whose sessions were initiated by the GGSN network requested create PDP context procedure.

```
network-type { gre | ipip | ipsec | ipv4 | ipv6 | l2tp | mobile-ip |
proxy-mobile-ip }
```

Displays network type information for the subscriber session. The following network types can be selected:

- **gre** : Generic Routing Encapsulation (GRE) per RFC 2784
- **ipip** : IP-in-IP encapsulation per RFC 2003
- **ipsec** : IPSec
- **ipv4**: Internet Protocol version 4 (IPv4)
- **ipv6**: Internet Protocol version 6 (IPv6)
- **l2tp**: Layer 2 Tunneling Protocol encryption per RFC 2661
- **mobile-ip** : Mobile IP
- **proxy-mobile-ip** : Proxy Mobile IP

```
nsapi nsap_id
```

Displays session information for the mobile user identified by network service access point identifier (NSAPI) between MS and SGSN. NSAPI is also used as part of the Tunnel Identifier between GPRS Support Nodes (GSNs). The user identity IMSI and the application identifier (NSAPI) are integrated into the Tunnel Identifier (GTPv0) (TID) or Tunnel Endpoint Identifier (GTPv1) (TEID) that uniquely identifies the subscriber's sublink between the GSNs (SGSN and GGSN). The NSAPI is an integer value within the PDP context header.

nsap_id must be an integer value from 5 through 15.

partial qos { negotiated | requested }

This filter is specific to the SGSN.

It limits the display of information to requested or negotiated QoS information for the subscriber.

This filter can be used in combination with further defining filters: active, active-charging-service, all, apn, callid, card-num, configured-idle-timeout, connected-time, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisd, negotiated, plmn-type, requested, rx-data, session-time-left, tx-data

pcf [< | > | less-than | greater-than] ipv4_address [[< | > | less-than | greater-than] ipv4_address]

Displays information for subscribers connected via the packet control function with a specific or range of IP address *ipv4_address*. The address must be specified using the standard IPv4 dotted decimal notation.

- <: Filters output so that only information less than the specified IPv4 address value is displayed.
- >: Filters output so that only information greater than the specified IPv4 address value is displayed.
- less-than: Filters output so that only information less than the specified IPv4 address value is displayed.
- greater-than: Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

pdsn-only

Show PDSN specific information only.

pdsn-service name

Displays information for subscribers connected to the packet data service *name*. The packet data service must have been previously configured.

plmn-type

Displays subscriber type (HOME, VISITING, or ROAMING).

This keyword is for the GGSN or the SGSN only.

policy

Displays the current policies associated with the subscriber session.

rnc id rnc_id mcc mcc_num mnc mnc_num

Displays information for subscribers connected to the SGSN via a specific RNC (radio network controller) identified by the RNC ID, the MCC (mobile country code), and the MNC (mobile network code).

This keyword is for SGSN only.

rx-data [< | > | greater-than | less-than] value

The number of bytes received by the specified subscriber.

<: Filters output so that only information less than the specified value is displayed.

>: Filters output so that only information greater than the specified value is displayed.

greater-than: Filters output so that only information greater than the specified value is displayed.

less-than: Filters output so that only information less than the specified value is displayed.

value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

session-time-left [< | > | greater-than | less-than] *value*

How much session time is left for the specified subscriber.

<: Filters output so that only information less than the specified value is displayed.

>: Filters output so that only information greater than the specified value is displayed.

greater-than: Filters output so that only information greater than the specified value is displayed.

less-than: Filters output so that only information less than the specified value is displayed.

value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

smgr-instance *number*

Specific sessmgr instance. *number* must be in the range of 1 to 4294967295.

sgsn-address *address*

Shows information for subscribers whose PDP contexts are currently being facilitated by the SGSN specified by address. This command is for GGSN only.

sgsn-service *svrc_name*

Shows subscriber information for a specified 3G SGSN service.

svrc_name must be a string of 1 to 63 alphanumeric characters that identifies a configured SGSN service. This command is for SGSN only.

tpo { not-required | required }

Displays information for specified subscribers.

- **not-required**: Subscribers for whom Traffic Performance Optimizer (TPO) processing is not enabled.
- **required**: Subscribers for whom TPO processing is enabled.

tx-data [< | > | greater-than | less-than] *value*

The number of bytes transmitted by the specified subscriber.

<: Filters output so that only information less than the specified value is displayed.

>: Filters output so that only information greater than the specified value is displayed.

greater-than: Filters output so that only information greater than the specified value is displayed.

less-than: Filters output so that only information less than the specified value is displayed.

value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

username *name*

Displays information for connections for the subscriber identified by *name*. The user must have been previously configured. *name* must be a sequence of characters and/or wildcard characters ('\$' and '*') from 1 to 127 characters in length. The * wildcard matches multiple characters and the \$ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes ('). For example; '\$'.

verbose

Display detailed information.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Use this command to view information about subscriber sessions.

The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant subscribers.

The Command Keywords may be used standalone to display detailed information or you may use one or more of the various Filter Keywords to reduce the amount of information displayed.

Caution: Executing this command may negatively impact performance if multiple instances are executed while the system is under heavy load and simultaneously facilitating multiple CLI sessions.

Example

The following command displays information for all subscriber sessions:

```
show subscribers all
```

The following command displays information for all ggsn-only subscriber sessions:

```
show subscribers ggsn-only all
```

The following command displays information for all subscriber sessions in wide format 1:

```
show subscribers wfl all
```

```
show subscribers aaa-configuration
```

```
show subscribers counters username ispluser1
```

The following command displays information for subscriber in GGSN service:

```
show subscribers ggsn-only allshow subscribers ggsn-only full
```

The following command displays information for all subscriber with SGSN session having partial QoS requests:

```
show subscribers sgsn-only partial qos requested
```

The following command displays information for all subscriber with MME session connected to MME service having IP address as 1.1.1.1:

```
show subscribers mme-only mme-address 1.1.1.1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

■ show subscribers

show super-charger

Lists subscribers with valid super charger configuration.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show super-charger { imsi imsi | all }
```

imsi

Defines a specific subscriber's international mobile subscriber identity (IMSI) number.

imsi - up to 15 digits This number includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number),

all

Instructs the SGSN to display super charger subscription information for all subscribers.

Usage

Use this command to determine if a single subscriber, identified by the IMSI, has a super charger configuration. Also, this command can display the list of all subscribers with a super charger configuration. If a subscriber has super charger as part of the configuration, then subscriber data is backed up (using the IMSI Manager) after the subscriber detaches and the purge timer expires.

Example

The following command displays the super charger configuration information for the subscriber identified by the IMSI 90121882144672.

```
show super-charger imsi 90121882144672
```

show support details

This command outputs a comprehensive list of system information that is useful for troubleshooting purposes. In most cases, the output of this command is requested by the technical support team.

Product

All

Privilege

All

Syntax

```
show support details [ to file url [ compress ] ]
```

to file urlurl

Specifies the location where a tar file with the support detail information should be created. *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

•ASR 5000:

- [**file:**] { /flash | /pcmcial | /hd } [/directory] /file_name
[**compress**]
- tftp://** { host [:port#] } [/directory] /file_name
- [**ftp:** | **sftp:**] // [username[:password] @] { host } [:port#] [/directory] /file_name

directory is the directory name.

filename is the actual file of interest.

username is the user to be authenticated.

password is the password to use for authentication.

host is the IP address or host name of the server.

port# is the logical port number that the communication protocol is to use.

If the filename is not specified with a .tar extension, it is automatically appended to the filename when the file is created and a message is generated.

The content of the tar file is:

- support_summary** - An ASCII text file that contains the support detail information.
- information.minicores.tar** - A tar file that contains any minicores files found on the system. Minicores files contain memory core dumps that are captured during some events. These core dumps provide specific memory locations and other information about the event. This information is useful to the technical support team in identifying specifically where an event occurred and its probable cause.

compress

Including the **compress** keyword instructs the system to generate a compressed .tar.gz file for the output of the command.

Usage

Use this command to obtain extensive system information for use in troubleshooting. This command does the work of over 30 separate commands, which saves time and ensures that all of the information needed is collected and displayed in the same order every time.

In addition to the information provided, the show support details command includes information that is not otherwise accessible to users but that is helpful in the swift resolution of issues.

Example

The following command displays the system information on your console.

```
show support details
```

The following command displays the information on your console and also writes it to the local device (pcmcia1 in this case) and includes the mini core dumps, using the filename *r-p_problem.tar*:

```
show support details to file /pcmcia1/r-p_problem.tar
```

The following command displays the information on your console and also writes it to an FTP server (named host), placing the file in the dir directory and includes the mini core dumps, using the filename *re_problem.tar*:

```
show support details to file ftp://host/dir/re_problem.tar
```

show system uptime

Shows the system the amount of time the system has been operational since the down time (maintenance or otherwise).

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show system uptime [ | { grep grep_options | more } ]
```

uptime

Indicates only the system up time is to be displayed.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Display the system up time to check for the possibility of anomalous behavior related to longer up times.

Example

The following commands display the system basic information and up time only, respectively.

```
show system uptime
```

Chapter 110

Exec Mode Show Commands (T-Z)

This section includes the commands **show task** through **show version**.

show task

Displays information about system tasks.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show task { info | resources | table } [ card card_num ] [ facility facility {
all | instance id } ] [ process process_name all ] [ max ] [ | { grep
grep_options | more } ]
```

```
{ info | resources | table }
```

Specifies type of information to be displayed and scope of tasks to include in output.

info: Display detailed task information.

resources: Display resource allocation and usage information for all tasks.

table: Display identification information in tabular format for all tasks.

```
card card_num
```

Default: all powered on cards.

Specifies a single card for which task information is to be displayed where *card_num* must be from 1 to 48.

```
facility facility { all | instance id }
```

Default: all facilities.

Specifies the list of facilities for which task information may be displayed. A specific instance of the facility may be displayed as specified by id or all instances may be displayed. The value of id must be in the range of 0 through 100000. *facility* must be one of:

- **allmgr:** All Interface Manager facility
- **aaamgr:** AAA Manager Facility
- **aaaproxy:** AAA Proxy manager Facility
- **acsctrl:** Active Charging Service (ACS) Controller Facility
- **acsmgr:** Active Charging Service (ACS) Manager Facility
- **asn gw mgr:** ASN Gateway Manager
- **asn permgr:** ASN Paging/Location-Registry (ASN-PC) Manager
- **bgp:** Border Gateway Protocol (BGP) Facility
- **bulkstat:** Bulk Statistics Manager Facility
- **cdrmod:** Charging Detail Record Module
- **cli:** Command Line Interface Facility
- **cscfmgr:** SIP CSCF Manager
- **cspectrl:** Card Slot Port controller Facility

- **cssctrl**: Content Service Steering Controller
- **dcardctrl**: IPSEC Daughtercard Controller Logging Facility
- **dcardmgr**: IPSEC Daughtercard Manager Logging Facility
- **dhmgr**: Distributed Host Manager
- **drvctrl**: Driver Controller Facility
- **egtpegmgr**: EGTP Egress Demux Manager
- **egtpinmgr**: EGTP Ingress Demux Manager
- **evlogd**: Event Log Daemon Facility
- **famgr**: Foreign Agent Manager Facility
- **gtpcmr**: GTP-C Protocol Logging facility (GGSN product only)
- **h248prt**: H.248 Protocol Task
- **hamgr**: Home Agent Manager Facility
- **hatcpu**: High Availability Task CPU Facility
- **hatsystem**: High Availability Task Facility
- **ipsectrl**: IP Security Controller Facility
- **ipsecmgr**: IP Security Manager Facility
- **ipsgmgr**: IP Services Gateway Facility
- **l2tpdemux**: L2TP Demultiplexor (LNS) Facility
- **l2tpmgr**: L2TP Manager Facility
- **magmgr**: Mobile Access Gateway Manager
- **megadiammgr**: MegaDiameter Manager
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager logging facility
- **mmgr**: SGSN/SS7 Master Manager
- **mpctest**: Migration Performance Test on Packet Accelerator Card
- **netwstrg**: Network Storage Manager
- **npuctrl**: Network Processor Unit control Facility
- **npumgr**: Network Processor Unit Manager Facility
- **nputst**: Network Processor Unit Tester
- **nsctrl**: Charging Service Controller
- **nsmgr**: Charging Service Process Manager
- **orbns**: Object Request Broker Notification Server Facility
- **orbs**: Object Request Broker System Facility
- **ospf**: Open Shortest Path First Facility
- **rct**: Recovery Control Task Facility
- **rdt**: Redirect Task Facility
- **rip**: Routing Information Protocol Facility

- **rmctrl**: Resource Manager Controller Facility
- **rmmgr**: Resource Manager Facility
- **sct**: Shared Configuration Task Facility
- **sessctrl**: Session Controller Facility
- **sessmgr**: Session Manager Facility
- **sft**: Switch Fabric Monitoring Task
- **sipcdprt**: Sip Call Distributor Task
- **sitmain**: System Initialization Task Main Facility
- **sitparent**: Card based system initialization facility that applies to Packet Accelerator Cards and Switch Processor Cards

Important: **sitparent** replaces the facilities **sitpac**, **sitspc** and **sittac**.

- **snmp**: SNMP Protocol Facility
- **srdb**: Static Rating Database
- **threshold**: Threshold Server Facility
- **vpnctrl**: Virtual Private Network Controller Facility
- **vpnmgr**: VPN Manager Facility
- **zebos**: ZEBOS™ OSPF Message Facility

all: Display information for all instances of the specified facility.

instance id: Display information for the specified instance of the specified facility only. id must be an integer from 0 through 10000000.

process process_name all

Display information for all instances of the specified process. must be one of the following process names:

- **ftpd**: File Transfer Protocol Daemon
- **inetd**: Internet Super-server Daemon
- **nsproc**: NetSpira Packet Processor
- **ntpd**: Network Time Protocol Daemon
- **orbnsd**: Object Request Broker Notification Server
- **ping**: Ping
- **pvmd-wrapper**: NetSpira Messenger Daemon
- **pvmsg**: NetSpira Messenger Daemon
- **rlogin**: Remote Login
- **sftp-server**: Secure File Transfer Protocol Server
- **sitreap**: System Initialization Task Cleanup Process
- **sn_resolve**: DNS Resolver Process
- **ssh**: Secure Shell
- **sshd**: Secure Shell Daemon

- **telnet:** Telnet
- **telnetd:** Telnet Daemon
- **tftpd:** Trivial File Transfer Protocol Daemon
- **traceroute:** Traceroute

max

Default: current usage levels are displayed.
Displayed the maximum usage levels for tasks as opposed to the current usage levels.
The keyword **max** is valid only in conjunction with the **resources** keyword.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Display task information as part of system troubleshooting unexpected behavior.

Important: This command is not supported on all platforms.

Example

The following commands provide some examples of the combinations of options that may be used to display task information.

```
show task info facility hatspc all
show task info facility hatspc instance 456
show task resources facility zebos all
show task table facility ospf
show task table card 8 facility cli all
show task resources facility rip all max
```

show temperature

Displays the current temperature on all installed application and line cards. Also displays the temperature of upper and lower fan trays. Temperature readings are acquired from sensors located on these components.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show temperature [ verbose] [ | { grep grep_options | more } ]
```

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

verbose

Indicates that the output is to contain detailed information.

Usage

Verify current temperature of components in chassis.

Example

```
show temperature
```

```
show temperature verbose
```

show terminal

Displays the current terminal settings for number of lines in length and number of characters in width.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show terminal [ | { grep grep_options | more } ]
```

```
grep grep_options | more
```

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Verify current terminal settings in case the output displayed appears to have line breaks/wraps in unexpected places.

Example

```
show terminal
```

show threshold

Displays thresholding information for the system.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show threshold [ default ]
```

```
[ default ]
```

Used to display the system's thresholding default values.

Usage

Use this command to display information on threshold value configuration and activity.

Example

The following command displays configuration information pertaining to threshold values configured on the system:

```
show threshold
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show timing

Displays the information configured to define a transmit timing source other than the system clock. The display includes related information (such as port status, timing source priority, timing alarms, etc.) for all of the ports configured for either BITS or line timing.

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show timing
```

Usage

Use this command to determine which line cards are recovering receive timing clocks.

Important: This command is not supported on all platforms.

Example

The following command displays timing configuration and status information for the timing-configured ports.

```
show timing
```

show upgrade

Displays the status of an on-going on-line software upgrade.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show upgrade
```

Usage

Use this command to show the status of an on-going on-line software upgrade.

Important: This command is not supported on all platforms.

show url-blacklisting database

This command displays URL Blacklisting static database configurations.

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show url-blacklisting database [ all | url url | facility acsmgr { all |
instance instance } ] [ [ | { grep grep_options | more } ]
```

all

Displays configurations of all URL Blacklisting databases present in the default or override directory.

facility acsmgr { all | instance instance }

Displays configurations of URL Blacklisting database configuration per facility/ACSMgr instance.

all: Displays URL Blacklisting database configuration of all ACSMgrs.

instance instance: Displays URL Blacklisting database configuration of the specified instance.

instance must be instance number of the database, and must be an integer from 1 through 10000000.

url url

Displays configurations of the URL Blacklisting database specified in the URL.

url must be the database's URL, and must be a string of 1 through 512 characters in length.

grep grep_options | more

Specifies that output of this command is to be piped (sent) to the command specified. A command to send the output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the Command Line Interface Reference.

Usage

Use this command to view configurations associated with in-memory and on-flash Blacklisting database. The **show url-blacklisting database** command displays the active database that is loaded, and is the one set by either the default or override CLI commands.

Example

The following command displays configurations of all the databases present in default or override directory, indicating one as ACTIVE and rest as NOT LOADED:

```
show url-blacklisting database all
```

The following command displays configurations of the */flash/bl/optblk.bin* database:

■ show url-blacklisting database

```
show url-blacklisting database url /flash/bl/optblk.bin
```

The following command displays database configuration for the ACSMgr instance 1:

```
show url-blacklisting database facility acsmgr instance 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show version

Displays the version information for the current system image or for a remote image.

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Syntax

```
show version [ url ] [ all | verbose ] [ | { grep grep_options | more } ]
```

url

Specifies the location of a configuration file to display version information for. The *url* may refer to a local or a remote file. *url* must be entered using one of the following formats:

•ASR 5000:

- [**file:**] { **/flash** | **/pcmcial** | **/hd** } [**/directory**] **/file_name**
- tftp://** { *host* [**:port#**] } [**/directory**] **/file_name**
- [**http:** | **ftp:** | **sftp:**] // [*username* [**:password**] @] { *host* } [**:port#**] [**/directory**] **/file_name**

directory is the directory name.

filename is the actual file of interest.

username is the user to be authenticated.

password is the password to use for authentication.

host is the IP address or host name of the server.

port# is the logical port number that the communication protocol is to use.

all | **verbose**

all: indicates all image information is to be displayed.

verbose: indicates the output is to contain detailed information.

The **verbose** keyword may not be used in conjunction with a URL specification.

grep *grep_options* | **more**

Indicates the output of the command is to be piped (sent) to the command specified. A command to send output to must be specified.

For details on the usage of **grep** and **more**, refer to the Regulating a Command's Output section of the Command Line Interface Overview chapter in the *Cisco ASR 5000 Series Command Line Interface Reference*.

Usage

Display the version information to verify the image versions loaded in preparation for maintenance, upgrades, etc.

Important: This command is not supported on all platforms.

■ show version

Example

The following commands display the version information with the basic level of output and the detailed level, respectively.

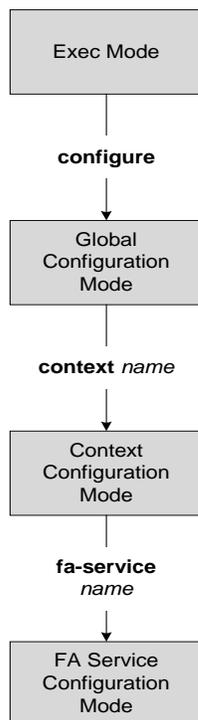

```
show version
```

```
show version verbose
```

Chapter 111

FA Service Configuration Mode Commands

The Foreign Agent Service Configuration Mode is used to create and manage the Foreign Agent (FA) services associated with the current context.

advertise

Configures agent advertisement parameters within the FA service.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
advertise { adv-delay seconds / adv-lifetime time | adv-interval { seconds | msec num } | num-adv-sent number | prefix-length-extn | reg-lifetime reg_time }
```

```
no advertise { prefix-length-extn | reg-lifetime }
```

```
[default] advertise adv-delay
```

```
no advertise prefix-length-extn
```

Disables prefix-length-extn

```
no advertise reg-lifetime
```

Specifies that there is no limit to the registration lifetime that the FA service will allow in any Registration Request message from the mobile node.

```
default advertise adv-delay
```

Sets the initial delay for the unsolicited advertisement to default value of 1000 ms.

```
advertise adv-delay seconds
```

Default: 1000

This command sets the initial delay for the unsolicited advertisement.

seconds is the advertisement delay in milliseconds and must be an integer from 10 through 5000.

Important: This command is available for WiMAX CMIP calls only.

```
adv-lifetime time
```

Default: 9000

Specifies the FA agent advertisement lifetime.

The agent advertisement lifetime is the amount of time that an FA agent advertisement remains valid in the absence of further advertisements.

time is measured in seconds and can be configured to any integer value between 1 and 65535.

```
adv-interval { seconds | msec num }
```

Default: 5 seconds

Specifies the amount of time between agent advertisements.

seconds is the time in seconds and can be any integer value from 1 through 1800.

msec num: Configures agent advertisement Interval in milliseconds. can be any integer from 100 through 180000.

num-adv-sent number

Default: 5

Specifies the number of unanswered agent advertisements that the FA service sends upon PPP establishment before it will reject the session.

number can be any integer value between 1 and 65535.

prefix-length-extn

Default: Disabled

When this is enabled, the FA includes the FA-service address in the Router Address field of the Agent Advertisement and appends a Prefix Length Extension in Agent Advertisements with a prefix length of 32.

reg-lifetime reg_time

Default: 600

Specifies the longest registration lifetime that the FA service will allow in any Registration Request message from the mobile node.

reg_time is measured in seconds and can be configured to any integer value between 1 and 65534.

Usage

Use to tailor FA advertisements to meet your network needs and/or conditions.

Example

The following command configures the FA advertisement interval at 10 seconds, the advertise lifetime to 20000 seconds, and the maximum number of unanswered advertisements that will be sent to 3.

```
advertise adv-interval 10 adv-lifetime 20000 num-adv-sent 3
```

authentication aaa

This configuration enables/disables the authentication parameters for the FA service to override dynamic keys from AAA with static keys to support MIP registration with HA which do not support dynamic keys.

Product

FA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] authentication aaa-distributed-mip-keys override
```

no

Disable the override of dynamic keys from AAA.

default

By default the override behavior is disabled and system uses dynamic keys from AAA after successful EAP authentication. When no EAP authentication happens system uses static keys by default.

Usage

Specify how the system will perform authentication of registration request messages. By default dynamic MN-HA and FA-HA keys from AAA after successful EAP authentication used by PMIP client in WiMAX calls for MIP registration with HA. This configuration in FA service overrides the dynamic keys from AAA with static keys to support MIP registration with HA which do not support dynamic keys.

Example

The following command configures the FA service to override use of AAA MIP keys and force the use of statically configured FA-HA SPI/key for WiMAX calls.

```
authentication aaa-distributed-mip-keys override
```

authentication mn-aaa

Specifies how the system handles authentication for mobile node re-registrations.

Product

PDSN, ASN GW, GGS

Privilege

Security Administrator, Administrator

Syntax

```
authentication mn-aaa { always | ignore-after-handoff | init-reg | init-reg-  
except-handoff | renew-and-dereg-noauth | renew-reg-noauth } [ optimize-retries  
]
```

always

Specifies that the FA service performs authentication each time a mobile node registers. This is the default setting.

ignore-after-handoff

MN-AAA authentication is not done at the FA, for a handoff Access Gateway (AGW).

init-reg

MN-AAA and MN-FAC extensions are required only in initialization RRQ.

init-reg-except-handoff

MN-AAA and MN-FAC extensions are not required in initialization RRQ after inter-Access Gateway (AGW) handoff.

renew-and-dereg-noauth

Specifies that the FA service does not perform authentication for mobile node re-registration or deregistration authorization requests. Initial registration is handled normally.

renew-reg-noauth

Specifies that the FA service does not perform authentication for mobile node re-registrations. Initial registration and de-registration are handled normally.

optimize-retries

Optimizes the number of Authentication retries sent to the AAA server.

When an authentication request is pending for a MIP call at the AGW, if a retry RRQ is received from the mobile node, the AGW discards the old RRQ and keeps the most recent RRQ. Subsequently when the authentication succeeds, the AGW forwards the most recent RRQ to the HA. If the authentication fails, the AGW replies to the MN using the most recent RRQ.

Usage

Use this command to determine how the FA service handles mobile node re-registrations. The system is shipped from the factory with the mobile AAA authentication set to always.

Example

The following command configures the FA service to perform mobile node authentication for every re-registration:

```
authentication mn-aaa always
```

The following command specifies that the FA service does not perform authentication for mobile node re-registrations:

```
authentication mn-aaa renew-reg-noauth
```

authentication mn-ha

Configures whether the FA service looks for MN-HA auth extension in the RRP.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
authentication mn-ha { allow-noauth | always }
```

allow-noauth

Allows a reply that does not contain the auth extension.

always

A reply should always contain the auth extension to be accepted.
This is the default setting.

Usage

Use this command to determine whether or not the the FA service requires the MN-HA auth extension in the RRP.

The system is shipped from the factory with this set to always.

Example

The following command configures the FA service to require a reply to contain the authentication extension to be accepted.:

```
authentication mn-ha always
```

bind

Binds the FA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
bind address address [ max-subscribers count ]
```

```
no bind address
```

address

Specifies the IP address (address) of the interface configured as the Pi interface. address is specified in dotted decimal notation.

max-subscribers *max#*

Default: 500000

Specifies the maximum number of subscribers that can access this service on this interface. *count* can be configured to any integer value between 0 and 500000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PACs/PSCs installed in the system. A fully loaded system with 13 active PACs/PSCs can support 500,000 total subscribers. Refer to the license key command for additional information.

Usage

Associate or tie the FA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.

When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces you will configure for use as Pi interfaces
- The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Use the **no bind address** command to delete a previously configured binding.

Example

The following command would bind the logical IP interface with the address of 192.168.3.1 to the FA service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

challenge-window

Defines the number of recently sent challenge values that are considered valid by the FA.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
challenge-window number
```

number

Default: 2

The number of recently sent challenge values that are considered valid. *number* must be an integer from 1 through 5.

Usage

Use this command to set the number of recently sent challenge values that are considered valid by the FA.

Example

Set the challenge window to 3:

```
challenge-window 3
```

default subscriber

Specifies the name of a subscriber profile configured within the same context as the FA service from which to base the handling of all other subscriber sessions handled by the FA service.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
default subscriber profile_name
```

```
no default subscriber profile_name
```

profile_name

Specifies the name of the configured subscriber profile. *profile_name* can be between 1 and 63 alpha and/or number characters and is case sensitive.

Usage

Each subscriber profile specifies “rules” such as permissions, PPP settings, and timeout values.

By default, the FA service will use the information configured for the subscriber named default within the same context. This command allows for multiple FA services within the same context to apply different “rules” to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.

Use the **no default subscriber** *profile_name* command to delete the configured default subscriber.

Example

To configure the FA service to apply the rules configured for a subscriber named user1 to every other subscriber session it processes, enter the following command:

```
default subscriber user1
```

dynamic-ha-assignment

This command configures various dynamic HA assignment parameters.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] dynamic-ha-assignment [ aaa-override mn-supplied-ha-addr |  
allow-failover ]
```

default

Feature is disabled by default.

no

Removes the feature and returns it to the default setting of disabled.

aaa-override mn-supplied-ha-addr

Enables the system to override the mobile node supplied HA IP address with the AAA provided HA address.

allow-failover

Enables/disables a failover retry for dynamic HA assignment from the AAA server.

Usage

Use this command to override the mobile node supplied HA IP address with the AAA supplied HA address. Use this command to enable or disable the failover feature that allows the system to receive and use a newer HA address from the AAA server in cases where the original HA address is not responding. A AAA server may assign different HA addresses each time a retransmitted MIP RRQ is authenticated during the MIP session setup. When this configuration is enabled, if the FA gets a new HA address from AAA during setup, it discards the previous HA address and start using the new address. This allows the FA session to connect to an available HA during setup.

Example

The following command enables the failover feature that allows the system to receive and use a newer HA address from the AAA server:

```
dynamic-ha-assignment allow-failover
```

dynamic-mip-key-update

When enabled, the FA service processes MIP_Key_Update_Request from the AAA server and allows dynamic MIP key updates (DMUs).

Default: Disabled

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
dynamic-mip-key-update
```

```
no dynamic-mip-key-update
```

no

The FA service rejects MIP_Key_Update_Request from the AAA server, not allowing dynamic MIP key updating to occur and terminates the call.

Usage

Use this command to enable or disable the DMU feature in the FA service.

Example

To enable DMU and allow dynamic updates of MIP keys, enter the following command:

```
dynamic-mip-key-update
```

encapsulation allow gre

Enables or disables the use of generic routing encapsulation (GRE) when establishing a MIP session. When enabled, if requested by a Mobile Node (MN), the FA requests the HA to use GRE encapsulation when establishing the MIP session. When disabled, the FA does not set the GRE bit in Agent Advertisements to the MN.

Default: GRE is enabled.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
encapsulation allow gre
```

```
no encapsulation allow gre
```

Usage

Use to disable or re-enable the use of GRE encapsulation for MIP sessions.

Example

To disable GRE encapsulation for MIP sessions, enter the following command;

```
no encapsulation allow gre
```

To re-enable GRE encapsulation for MIP sessions, enter the following command;

```
encapsulation allow gre
```

end

Exits the FA service configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the FA service configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

fa-ha-spi

Configures the security parameter index (SPI) between the FA service and the HA.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
fa-ha-spi remote-address { ha_ip_address | ip_addr_mask_combo } spi-number
number { encrypted secret enc_secret | secret } [ description string | hash-
algorithm { hmac-md5 | md5 | rfc2002-md5 } | monitor-ha | replay-protection {
timestamp | nonce } | timestamp-tolerance tolerance ]
```

```
no fa-ha-spi remote-address { ha_ip_address | ip_addr_mask_combo } spi-number
number
```

```
remote-address { ha_ip_address | ip_addr_mask_combo }
```

ha_ip_address: Specifies the IP address of the HA in IP v4 dotted decimal notation.

ip_addr_mask_combo: Specifies the IP address of the HA and specifies the IP address network mask bits. *ip_addr_mask_combo* must be specified using the form 'IP Address/Mask Bits' where the IP address is specified using the standard IPv4 dotted decimal notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

```
spi-number number
```

Specifies the SPI (number) which indicates a security context between the FA and the HA in accordance with RFC 2002.

number can be configured to any integer value between 256 and 4294967295.

```
encrypted secret enc_secret | secret secret
```

Configures the shared-secret between the FA service and the HA. The secret can be either encrypted or non-encrypted.

- **encrypted secret** *enc_secret* : Specifies the encrypted shared key (*enc_secret*) between the FA service and the HA. *enc_secret* must be between 1 and 254 alpha and/or numeric characters and is case sensitive.

Important: The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

- **secret** *secret* : Specifies the shared key (*secret*) between the FA service and the HA. *secret* must be between 1 and 127 alpha and/or numeric characters and is case sensitive.

description *string*

This is a description for the SPI. *string* must be an alpha and or numeric string of from 1 through 31 characters.

hash-algorithm { **hmac-md5** | **md5** | **rfc2002-md5** }

Default: hmac-md5

Specifies the hash-algorithm used between the FA service and the HA.

- **hmac-md5** : Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
- **md5** : Configures the hash-algorithm to implement MD5 per RFC 1321.
- **rfc2002-md5** : Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

monitor-ha

Default: disabled

Enables the HA monitor feature for this HA address.

To set the behavior of the HA monitor feature, refer to the **ha-monitor** command in this chapter. To disable this command (if enabled) for this HA address, re-enter the entire **fa-ha-spi** command without the **monitor-ha** keyword.

replay-protection { **timestamp** | **nonce** }

Default: timestamp

Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.

- **nonce**: Configures replay protection to be implemented using NONCE per RFC 2002.
- **timestamp**: Configures replay protection to be implemented using timestamps per RFC 2002.

Important: This keyword should only be used in conjunction with Proxy Mobile IP support.

timestamp-tolerance *tolerance*

Default: 60

Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.

tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

Important: This keyword should only be used in conjunction with Proxy Mobile IP support.

+

More than one of the above keywords can be entered within a single command.

Usage

An SPI is a security mechanism configured and shared by the FA service and the HA. Please refer to RFC 2002 for additional information.

Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a “default” SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.

Important: The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2048 SPIs can be configured per FA service.
Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the FA service to use an SPI of 512 when communicating with an HA with the IP address 192.168.0.2. The key that would be shared between the HA and the FA service is q397F65. When communicating with this HA, the FA service will also be configured to use the rfc2002-md5 hash-algorithm.

```
fa-ha-spi remote-address 192.168.0.2 spi-number 512 secret q397F65 hash-  
algorithm rfc2002-md5
```

The following command deletes the configured SPI of 400 for an HA with an IP address of 172.100.3.200:

```
no fa-ha-spi remote-address 172.100.3.200 spi-number 400
```

gre

Configures Generic Routing Encapsulation (GRE) parameters.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gre { checksum | checksum-verify | reorder-timeout timeout | sequence-mode {
none | reorder } | sequence-numbers }
```

```
no gre { checksum | checksum-verify | sequence-numbers }
```

no

Disables the specified functionality.

checksum

Default: disabled

Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled

Enables verification of the GRE checksum (if present) in incoming GRE packets.

reorder-timeout *timeout*

Default: 100

Configures maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *timeout* must be an integer from 0 through 5000.

sequence-mode { none | reorder }

Default: none

Configures how incoming out-of-sequence GRE packets should be handled.

none: Disables reordering of incoming out-of-sequence GRE packets.

reorder: Enables reordering of incoming out-of-sequence GRE packets.

sequence-numbers

Default: Disabled.

Enables insertion or removal of GRE sequence numbers in GRE packets.

Usage

Use this command to configure how the FA service handles GRE packets.

Example

To set maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to 500 milliseconds, enter the following command:

```
gre reorder-timeout 500
```

To enable the reordering of incoming out of sequence GRE packets, enter the following command:

```
gre sequence-mode reorder
```

ha-monitor

Configures the behavior of the HA monitor feature.

Product

PDSN, ASN GW, FA, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] ha-monitor [ interval sec | max-inactivity-time sec | num-retry num ]
[ no ] ha-monitor
```

default

Restores the system default setting(s) for the command/keyword(s). This command is disabled by default.

no

Disables the HA monitoring feature for this FA service.

interval *sec*

Default: 30

Configures the time interval before the next monitoring request message is sent to the HA.

sec must be a numeric value between 1 and 36000.

max-inactivity-time *sec*

Default: 60

Specifies the maximum amount of time the system will wait without receiving MIP control traffic from a HA before the HA monitoring mechanism is triggered.

sec must be a numeric value between 30 and 600.

num-retry *num*

Default: 5

Configures the number of time the system will attempt to send HA monitor requests before determining the HA is down and a trap is initiated.

num must be a numeric value between 0 and 10.

Usage

Use this command to set parameters for the HA monitor feature. This feature allows the AGW/FA to monitor HAs with which it has MIP sessions. The monitoring feature is triggered when the AGW/FA does not receive any MIP traffic from a HA for a configured amount of time (**max-inactivity-time**). The AGW/FA starts sending special MIP RRQ monitor messages and waits for RRP monitor message responses from the HA. The RRQ monitor messages are addressed to the HA service address. The source address of the monitor-request messages is the FA service's IP address.

The actions taken during monitoring are comprised of the following:

- If no monitor response is received during the interval time (**interval**), the AGW retransmits the monitor message a configured number of times (**num-retry**).
- If no response is received after retransmitting for the number configured in **num-retry**, the HA is considered down. The AGW/FA sends a trap (HAUnreachable) to the management station. Monitoring of this HA is stopped until a MIP control message is received from the particular HA and when the AGW/FA sends a trap (HAreachable) to the management station and starts monitoring the HA again.
- When an HA receives the RRQ from an FA, it verifies the message and identifies it as a monitor message based on a special reserved NAI (in the message) and a Monitor HA CVSE in the RRQ. The HA responds with an RRP with Reply code 0x00 (accepted) and includes the Monitor HA CVSE. When the FA receives the RRP from the HA, it updates the activity for the peer HA to maintain the “up” state.

Important: This command only sets the behavior of the HA monitor feature. To enable the HA monitor feature for each HA address, refer to the **fa-ha-spi** command in this chapter. Up to 256 HAs can be monitored per system.

Example

The following commands set the HA monitor message interval to 45 seconds, the HA inactivity time to 60 seconds, and the number of HA monitor retries to 6:

```
ha-monitor interval 45ha-monitor max-inactivity-time 60
ha-monitor num-retry 6
```

idle-timeout-mode

Controls whether Mobile IP data and control packets or only Mobile IP data resets the session idle timer.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
idle-timeout-mode {aggressive | normal}
```

aggressive

Only Mobile IP data resets the session idle timer.

normal

Both Mobile IP data and control packets reset the session idle timer.

Usage

Use this command to control how the session idle timer is reset.

Example

The following command specifies that only Mobile IP data can reset the session idle timer:

```
idle-timeout-mode aggressive
```

ignore-mip-key-data

When this is enabled, if DMU is not enabled and the MN sends a MIP_Key_Data CVSE, the FA ignores the MIP_Key_Data extension and the call is continued like a regular MIP call.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ignore-mip-key-data
```

```
no ignore-mip-key-data
```

no

Disable ignoring of MIP key data.

Usage

When DMU is not enabled, use this command to ignore MIP key data sent by the MN and allow the call to continue normally.

Example

To enable the FA to ignore MIP key data sent by the MN, enter the following command:

```
ignore-mip-key-data
```

ignore-stale-challenge

Enables the system to accept RRQs with previously used challenges. This feature is disabled by default.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ignore-stale-challenge
```

```
no ignore-stale-challenge
```

no

Disable this feature. If an RRQ is received with a previously used challenge and there are RRQs pending on the same session, accept the RRQ if it has a new Identification in the retransmitted RRQ. All other RRQs received with previously used challenge are rejected with the Stale Challenge (106) error code.

Usage

Use this command to allow the FA to accept stale challenges regardless of the ID field or if other RRQs are pending.

Example

To enable this functionality in the FA service, enter the following command;

```
ignore-stale-challenge
```

To disable this functionality, enter the following command;

```
no ignore-stale-challenge
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interfaces' IP socket on which to listen for Mobile IP Registration messages.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip local-port port#
```

port#

Specifies the UDP port number.

port# can be any integer value between 1 and 65535.

Usage

Specify the UDP port that should be used for communications between the FA service and the HA.
The system is shipped from the factory with the local port set to 434.

Example

The following command specifies a UDP port of 3950 for the FA service to use to communicate with the HA on the Pi interface:

```
ip local-port 3950
```

isakmp

Configures support for IPSec within the FA-service.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
isakmp {peer-ha ha_address {crypto map map_name [ [ encrypted ] secret secret ] }
| default { crypto map map_name [ [ encrypted ] secretsecret ]}}
```

```
no isakmp { peer-ha peer_ip_address | default }
```

no

Deletes the reference to the crypto map for the specified HA or deletes the reference for the default crypto map.

```
peer-ha ha_address { crypto map map_name [ [ encrypted ] secret
preshared_secret ] }
```

Configures a crypto map for a peer HA.

- **ha_address** : The IP address of the HA with which the FA service will establish an IPSec SA. The address must be expressed in dotted decimal format.
- **crypto map map_name** : The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map and can be from 1 to 127 alpha and/or numeric characters.
- **encrypted** : This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret secret** : The pre-shared secret that will be used during the IKE negotiation. *preshared_secret* is the secret and can be from 1 to 127 alpha and/or numeric characters.

```
default { crypto map map_name [ [ encrypted ] secret secret ] }
```

Specifies the default crypto map to use when there is no matching crypto map configured for an HA address.

- **crypto map map_name** : The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map and can be from 1 to 127 alpha and/or numeric characters.
- **encrypted** : This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret secret** : The pre-shared secret that will be used during the IKE negotiation. *preshared_secret* is the secret and can be from 1 to 127 alpha and/or numeric characters.

Usage

Use this command to configure the FA-service's per-HA IPSec parameters. These dictate how the FA service is to establish an IPSec SA with the specified HA.

Important: For maximum security, it is recommended that the above command be executed for every possible HA that the FA service communicates with.

A default crypto map can also be configured using the default keyword. The default crypto map is used in the event that the AAA server returns an HA address that is not configured as an isakmp peer-ha.

Important: For maximum security, the default crypto map should be configured in addition to peer-ha crypto maps instead of being used to provide IPSec SAs to all HAs.

Note that once an IPSec tunnel is established between the FA and HA for a particular subscriber, all new Mobile IP sessions using the same FA and HA are passed over the tunnel regardless of whether or not IPSec is supported for the new subscriber sessions. Data for existing Mobile IP sessions is unaffected.

Example

The following command creates a reference for an HA with the IP address 1.2.3.4 to a crypto map named map1:

```
isakmp peer-ha 1.2.3.4 crypto map map1
```

The following command deletes the crypto map reference for the HA with the IP address 1.2.3.4.

```
no isakmp peer-ha 1.2.3.4
```

limit-reg-lifetime

Enable the current default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts. When disabled, this command allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] limit-reg-lifetime
```

no

Allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

default

Enable the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Usage

Use the **no** keyword with this command to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

Use the base command or the keyword to reset the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Example

Configure the FA service to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts by entering the following command:

```
no limit-reg-lifetime
```

Configure the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts by entering either of the following commands:

```
default limit-reg-lifetime  
limit-reg-lifetime
```

max-challenge-len

For mobile subscribers, the FA generates a random number and sends it to the mobile node as part of the mobile authentication extension (Mobile-Foreign Authentication extension) as described in RFC 3012. This command sets the maximum length of the FA challenge in bytes.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
max-challenge-len length
```

length

Default: 16

The maximum length, in bytes, of the FA challenge. This value must be an integer in from 4 to 32.

Usage

Change the maximum allowed length of the randomly generated FA challenge its default of 16.

Example

Use the following command to change the maximum length of the FA challenge to 18 bytes:

```
max-challenge-len 18
```

mn-aaa-removal-indication

Enables the FA to remove the MN-FAC and MN-AAA extensions from RRQs. This is disabled by default.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
mn-aaa-removal-indication
```

```
no mn-aaa-removal-indication
```

no

Disable the removal of the MN-FAC and MN-AAA extensions from RRQs.

Usage

Enable this feature if there is no need to authenticate the subscriber at HA using MN-AAA extension.

Example

The following command enables the FA service to remove MN-FAC and MN-AAA extensions from RRQs:

```
mn-aaa-removal-indication
```

multiple-reg

Specifies the number of simultaneous Mobile IP sessions that will be supported for over a single PPP session.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
multiple-reg number
```

number

number can be configured to any integer value between 1 and 3.

Usage

Use to support multiple registrations per subscriber.

The system is shipped from the factory with the multiple simultaneous MIP sessions set to 1.

Important: The system will only support multiple Mobile IP sessions per subscriber if the subscriber's mobile node has a static IP address. The system will only allow a single Mobile IP session for mobile nodes that receive a dynamically assigned IP address. In addition, because only a single Mobile IP or proxy-Mobile IP session is supported for IP PDP contexts, this parameter must remain at its default configuration.

Example

The following command configures the number of supported simultaneous registrations for subscribers using this FA service to 3.

```
multiple-reg 3
```

optimize tunnel-reassembly

Configures FA to HA optimization for tunnel reassembly.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
optimize tunnel-reassembly
```

```
no optimize tunnel-reassembly
```

Usage

Enabling this functionality fragments large packets prior to encapsulation for easier processing. Tunnel reassembly optimization is disabled by default.

Important: Cisco Systems strongly recommends that you do not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

Important: This functionality works best when the FA service is communicating with an HA service running in a system. However, an FA service running in the system communicating with an HA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the no version of this command to disable tunnel optimization if it was previously enabled.

Example

The following command enables tunnel reassembly optimization:

```
optimize tunnel-reassembly
```

private-address allow-no-reverse-tunnel

This command enables the FA to allow calls with private addresses and no reverse tunneling.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
private-address allow-no-reverse-tunnel  
no private-address allow-no-reverse-tunnel
```

no

Disables the functionality. This is the default setting.

Usage

Use this command to let the FA allow sessions with private addresses that do not have the reverse tunnel bit set.

Example

To enable sessions with private addresses and no reverse tunneling, enter the following command:

```
private-address allow-no-reverse-tunnel
```

proxy-mip

Configures parameters pertaining to Proxy Mobile IP support.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
proxy-mip { allow | ha-failover [ max-attempts max_attempts | num-attempts-
before-switching num_attempts | timeout seconds ] | max-retransmissions number |
renew-percent-time renew-time | retransmission-timeout time }
```

```
no proxy-mip {allow | ha-failover }
```

```
default proxy-mip {allow | ha-failover | max-retransmissions | renew-percent-
time | retransmission-timeout}
```

no

Disables FA service support for Proxy Mobile IP or HA failover for Proxy Mobile IP.

default

Restores the specified option to the default setting as described below.

allow

Default: Disabled

Enables FA service support for Proxy Mobile IP.

```
ha-failover [max-attempts max_attempts | num-attempts-before-switching
num_attempts | timeout seconds ]
```

Default: Disabled

Enables HA failover for the Proxy Mobile IP feature.

- **max-attempts** *max_attempts* - Configures the maximum number of retransmissions of Proxy MIP control messages. *max_attempts* must be an integer from 1 through 10. Default is 4
- **num-attempts-before-switching** *num_attempts* - Configures the total number of RRQ attempts (including retransmissions) before failing over to the alternate HA. *num_attempts* must be an integer from 1 through 5. Default is 2.
- **timeout** *seconds* - Configures the retransmission timeout, in seconds, of Proxy MIP control messages when failover happens. *seconds* must be an integer from 1 through 50. Default is 2

```
max-retransmissions number
```

Default: 5

Configures the maximum number re-try attempts that the FA service is allowed to make when sending Proxy Mobile IP Registration Requests to the HA.

number is the maximum number of retries and can be configured to any integer value from 1 to 4294967295.

renew-percent-time *renew-time*

Default: 75

Configures the amount of time that must pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request.

renew-time is entered as a percentage of the advertisement registration lifetime configured for the FA service. (Refer to the **advertise** command in this chapter). The time can be configured to any integer value from 1 to 100.

The following equation can be used to calculate *renew-time*:

$$\text{renew-time} = (\text{duration} / \text{lifetime}) * 100$$

duration = The desired amount of time that can pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request

lifetime = The advertisement registration lifetime configured for the FA service.

duration £ lifetime

retransmission-timeout *time*

Default: 3

Configure the maximum amount of time allowed by the FA for a response from the HA before re-sending a Proxy Mobile IP Registration Request message.

time is measured in seconds and can be configured to any integer value from 1 to 100.

Usage

The proxy-mip command and its keywords configure the FA services support for Proxy Mobile Mobile IP. When enabled through the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP. In addition to the parameters configured via this command, the HA-FA SPI(s) must also be modified to support Proxy Mobile IP. Refer to the fa-ha-spi command for more information.

Example

The following command configures the FA service to wait up to 5 seconds for an HA to respond prior to re-sending an a Mobile IP Registration Request message:

```
proxy-mip retransmission-timeout 5
```

If the advertisement registration lifetime configured for the FA service is 900 seconds and you want the system to send a Proxy Mobile IP Registration Renewal Request message after 500 seconds, then the following command must be executed:

```
proxy-mip renew-percent-time 50
```

Note that 50 = (450 / 900) 100.

reg-timeout

Configures the FA registration reply timeout.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
reg-timeout time
```

time

Default: 45

time is measured in seconds and can be configured to any integer between 1 and 65535.

Usage

Configure the amount of time that the FA service will wait for a Registration Reply from an HA before the call is rejected with a reply code of 78H (registration Timeout).

Example

The following command configures a registration timeout of 10.

```
reg-timeout 10
```

reverse-tunnel

Enables the use of reverse tunneling for a Mobile IP sessions when requested by the mobile node.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
reverse-tunnel
```

```
no reverse-tunnel
```

no

Indicates the reverse tunnel option is to be disabled. When omitted, the reverse tunnel option is enabled.

Usage

Reverse tunneling involves tunneling datagrams originated by the mobile node to the HA via the FA service. When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.

The advantages of using reverse-tunneling:

- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA that the mobile node is registered to and tunnel all datagrams from the mobile node to its HA

Use the **no** option of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, then triangular routing is used.

The system is shipped from the factory with the reverse tunnel enabled.

Important: If reverse tunneling is disabled on the system and a mobile node requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

Example

The following command disables reverse-tunneling support for the FA service:

```
no reverse-tunnel
```

revocation

Enables the MIP revocation feature and configures revocation parameters.

Product

PDSN, ASN GW, GGSN PDIF

Privilege

Security Administrator, Administrator

Syntax

```
revocation { enable | max-retransmission number | negotiate-i-bit |
retransmission-timeout secs | trigger internal-failure }
```

```
no revocation enable | trigger internal-failure | negotiate-i-bit
```

```
no revocation { enable | negotiate-i-bit | trigger internal-failure }
```

Completely disables registration revocation on the FA.

Disables sending revocation messages to the HA when a session is affected by an internal task failure.

enable

Enables the MIP registration revocation feature on the FA. When enabled, if revocation is negotiated with an HA, and a MIP binding is terminated, the FA can send a Revocation message to the HA. This feature is disabled by default.

max-retransmission *number*

Default: 3

The maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer from 0 through 10.

negotiate-i-bit

Default: disabled

Enables the FA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

retransmission-timeout *secs*

Default: 3

The number of seconds to wait for a Revocation Acknowledgement from the HA before retransmitting the Revocation message. *secs* must be an integer from 1 through 10.

trigger internal-failure

Default: disabled

Enable sending a revocation message to the HA for all sessions that are affected by an internal task failure.

Usage

Use this command to enable or disable the MIP revocation feature on the FA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

Example

The following command enables Registration Revocation on the FA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to 6:

```
revocation max-retransmission 6
```

The following command sets the timeout between retransmissions to 10:

```
revocation retransmission-timeout 10
```

threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per FA service.

Product

PDSN, ASN GW, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
threshold reg-reply-error high_thresh [ clear low_thresh ]
```

```
no threshold reg-reply-error
```

no

Deletes the alert or alarm.

high_thresh

Default: 0

The high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

 **Important:** You must enter a value between 1 and 100000 to trigger an alert/alarm.

clear *low_thresh*

Default:0

The low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

 **Important:** You must enter a value between 1 and 100000 to trigger an alert/alarm.

Usage

Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second.

Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- **Enter condition:** Actual number of registration reply errors > High Threshold
- **Clear condition:** Actual number of registration reply errors £ Low Threshold

Example

The following command configures a registration reply error threshold of 1000 and a low threshold of 500 for a system using the Alarm thresholding model:

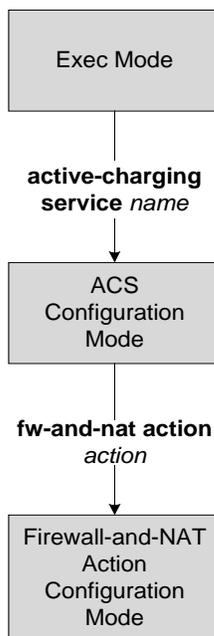

```
threshold reg-reply-error 1000 clear 500
```

Chapter 112

Firewall-and-NAT Action Configuration Mode Commands

The Firewall-and-NAT Action Configuration Mode enables configuring Firewall-and-NAT actions.

 **Important:** This configuration mode is only available in release 11.0 and later releases. This configuration mode must be used to configure Action-based Stateful Firewall and NAT features.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

■ end

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

flow check-point

This command checkpoints all the flows matching the Firewall-and NAT action.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
flow check-point [ data-usage data_usage [ and | or ] | time-duration duration [ and | or ] ]
```

```
{ default | no } flow check-point
```

default

Configures the default Firewall action.

no

Deletes the Firewall action configuration.

data-usage *data_usage*

Specifies the data usage in bytes.

data_usage must be an integer ranging from 1 through 4294967295.

The maximum limit for data-usage is 4 GB.

time-duration *duration*

Specifies the time duration in seconds.

duration must be an integer ranging from 1 through 86400.

The maximum limit for time-duration is 24 hours.

and | **or**

This option allows to configure only **data-usage** or **time-duration**, or a combination of **data-usage** and **time-duration**.

Usage

Use this command to enable/disable the check-pointing of NATed flows and control the type of flows need to be check pointed based on specified criteria. Check pointing is done only for TCP and UDP flows.

Example

The following command configures Stateful Firewall to drop packets with data-usage 5000:

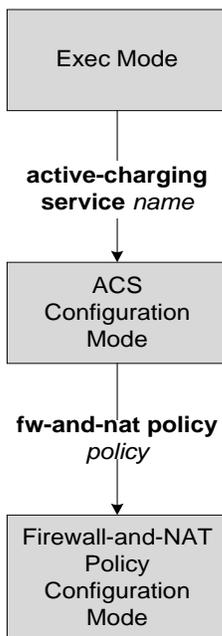

```
flow check-point data-usage 5000
```

Chapter 113

Firewall-and-NAT Policy Configuration Mode Commands

The Firewall-and-NAT Policy Configuration Mode enables configuring Firewall-and-NAT policies.

 **Important:** This configuration mode is only available in StarOS 8.1, StarOS 9.0 and later releases. This configuration mode must be used to configure Policy-based Stateful Firewall and NAT features.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-rule

This command creates and configures an access rule.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
access-rule { no-ruledef-matches { downlink | uplink } action { deny [ charging-
action charging_action ] | permit [ bypass-nat | nat-realm nat_realm [ fw-and-
nat-action name ] ] } | priority priority { [ dynamic-only | static-and-dynamic
] access-ruledef ruledef_name { deny [ charging-action charging_action ] |
permit [ [ bypass-nat | nat-realm nat_realm [ fw-and-nat-action name ] ] trigger
open-port { port_number | range start_port to end_port } direction { both |
reverse | same } ] } } }
```

```
default access-rule no-ruledef-matches { downlink | uplink } action
```

```
no access-rule priority priority
```

default

Configures the default setting.

Default: Uplink direction: **permit**; Downlink direction: **deny**

no

Removes the access rule specified by the priority.

no-ruledef-matches

Configures action on packets with no ruledef match.

downlink

Specifies to act on downlink packets with no ruledef match.

uplink

Specifies to act on uplink packets with no ruledef match.

action

Specifies action to take on downlink/uplink packets with no ruledef match.

deny

Specifies to deny packets.

permit

Specifies to permit packets and allow the creation of data flows.

charging-action *charging_action*

Specifies the charging action. Optionally, for deny action a charging action can be configured. If a packet matches the deny rule, action is taken as configured in the charging action. If a charging action is specified, the content-ID and billing-action configured in the charging action are used. Also, the flow may be terminated (instead of just discarding the packet), if so configured in the specified charging action. *charging_action* must be an alpha and/or numeric string of 1 through 63 characters in length.

bypass-nat

Important: In StarOS 9.0 and later, this keyword is NAT license dependent.

Specifies to bypass NAT.

nat-realm *nat_realm*

Important: In StarOS 9.0 and later, this keyword is NAT license dependent.

Specifies the NAT realm to be used to perform NAT on subscriber packets matching the access ruledef. If the NAT realm is not specified, NAT will be bypassed. That is, NAT will not be performed on subscriber packets that are matching a ruledef with no NAT realm name configured in it.

nat_realm must be an alpha and/or numeric string of 1 through 31 characters in length.

priority *priority*

Specifies priority of an access ruledef in the Firewall-and-NAT policy.

priority must be an integer from 1 through 65535, and must be unique for each access ruledef in the Firewall-and-NAT policy.

[dynamic-only | static-and-dynamic] access-ruledef *ruledef_name*

Specifies the access ruledef name. Optionally, the ruledef type can also be specified.

- **dynamic-only:** Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
- **static-and-dynamic:** Static and Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is enabled by default.
- **access-ruledef** *ruledef_name*: Specifies the access ruledef name. *ruledef_name* must be an alpha and/or numeric string of 1 through 63 characters in length.

trigger open-port { *port_number* | **range** *start_port* **to** *end_port* }
direction { **both** | **reverse** | **same** }

Important: In StarOS 9.0 and later, this keyword is Stateful Firewall license dependent.

Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.

- *port_number*: Specifies the auxiliary port number to open for traffic, and must be an integer from 1 through 65535.
- **range start_port to end_port**: Specifies the range of port numbers to open for subscriber traffic.
 - *start_port* must be an integer from 1 through 65535.
 - *end_port* must be an integer from 1 through 65535, and must be greater than *start_port*.
- **direction { both | reverse | same }**: Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.
 - *both*: Provides the trigger to open port for traffic in either direction of the control connection.
 - *reverse*: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).
 - *same*: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add access ruledefs to the Firewall-and-NAT policy and configure the priority and actions for rule matching.

The policy specifies the rules to be applied on calls. The ruledefs in the policy have priorities, based on which priority matching is done.

For Stateful Firewall, the port trigger configuration is optional, and can be configured only if a rule action is permit. When a rule is matched and the rule action is permit, if the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association that matches the rule. Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic. When a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, EDR is generated.
- If the content ID is configured, UDR information is updated.
- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Important: For Stateful Firewall, only the terminate-flow action is applicable if configured in the specified charging action.

Allowing/dropping of packets is determined in the following sequence:

- Check is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Access ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the **access-rule priority** configuration.

- If no access ruledef matches, the packet is allowed or dropped as per the **access-rule no-ruledef-matches** configuration.

For a packet dropped due to access ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.

For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command in the ACS Rulebase Configuration Mode.

The GGSN can dynamically activate/deactivate dynamic ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the policy is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

Example

For Stateful Firewall, the following command assigns a priority of *10* to the access ruledef *test_rule*, adds it to the policy, and permits port trigger to be used for the rule to open ports in the range of *1000* to *2000* in either direction of the control connection:

```
access-rule priority 1 access-ruledef test_rule permit trigger open-port  
range 1000 to 2000 direction both
```

■ end

end

This command returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec mode.

exit

This command exits the current configuration mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

firewall dos-protection

This command configures Stateful Firewall protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | mime-flood | port-scan | source-router | tcp-window-containment | teardrop | winnuke }
```

default firewall dos-protection

no

Disables Stateful Firewall protection for subscribers against the specified DoS attack(s).

default

Disables Stateful Firewall protection for subscribers against all DoS attacks.

all

Enables Stateful Firewall protection for subscribers against all DoS attacks supported by the Stateful Firewall service.

flooding { icmp | tcp-syn | udp }

Enables protection against the specified flooding attack:

- **icmp**: Enables protection against ICMP Flood attack
- **tcp-syn**: Enables protection against TCP Syn Flood attack
- **udp**: Enables protection against UDP Flood attack

ftp-bounce

Enables protection against FTP Bounce attacks.

ip-unaligned-timestamp

Enables protection against IP Unaligned Timestamp attacks.

mime-flood

Enables protection against HTTP Multiple Internet Mail Extension (MIME) header flooding attacks.

port-scan

Enables protection against Port Scan attacks.

tcp-window-containment

Enables protection against TCP sequence number out-of-range attacks.

source-router

Enables protection against IP Source Route IP Option attacks.

teardrop

Enables protection against Teardrop attacks.

winnuke

Enables protection against WIN-NUKE attacks.

Usage

Use this command to enable Stateful Firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Important: DoS attacks are detected only in the downlink direction.

Example

The following command enables protection from all supported DoS attacks:

```
firewall dos-protection all
```

firewall flooding

This command configures Stateful Firewall protection from Packet Flooding attacks.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flooding { protocol { icmp | tcp-syn | udp } packet limit packets } |
sampling-interval interval }
```

```
default firewall flooding { protocol { icmp | tcp-syn | udp } packet limit } |
sampling-interval }
```

default

Configures the default setting for the specified configuration.

```
protocol { icmp | tcp-syn | udp }
```

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

```
packet limit packets
```

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.

packets must be an integer from 1 through 4294967295.

Default: 1000 packets per sampling interval for all protocols.

```
sampling-interval interval
```

Specifies the flooding sampling interval, in seconds.

interval must be an integer from 1 through 60.

Default: 1 second

The maximum sampling-interval configurable is 60 seconds.

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more than 1000 ICMP packets per sampling interval:

```
firewall flooding protocol icmp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to 1000 packets per sampling interval. This way only “suspected” malicious packets are limited and not “legitimate” packets.

```
firewall flooding protocol udp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 TCP-Syn packets per sampling interval:

```
firewall flooding protocol tcp-syn packet limit 1000
```

The following command specifies a flooding sampling interval of 1 second:

```
firewall flooding sampling-interval 1
```

firewall icmp-checksum-error

This command configures Stateful Firewall action on packets with ICMP Checksum errors.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall icmp-checksum-error { drop | permit }
```

```
default firewall icmp-checksum-error
```

default

Configures the default setting.

Default: **drop**

drop

Specifies to drop packets with ICMP Checksum errors.

permit

Specifies to permit packets with ICMP Checksum errors.

Usage

Use this command to configure Stateful Firewall action on packets with ICMP Checksum errors. This CLI also applies to ICMP packets with Inner IP Checksum error.

For NAT-only calls, packets with ICMP errors are dropped, and other packets are allowed.

Example

The following command configures Stateful Firewall to drop packets with ICMP Checksum errors:

```
firewall icmp-checksum-error drop
```

firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall icmp-destination-unreachable-message-threshold messages then-block-server
```

```
{ default | no } firewall icmp-destination-unreachable-message-threshold
```

default

Configures the default setting.

Default: No limit

no

Removes the previous configuration.

messages

Specifies the threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.

Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of 10 ICMP error messages:

```
firewall icmp-destination-unreachable-message-threshold 10 then-block-server
```

■ firewall icmp-destination-unreachable-message-threshold

firewall icmp-echo-id-zero

This command configures Stateful Firewall action on echo packets with ICMP ID zero.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall icmp-echo-id-zero { drop | permit }  
default firewall icmp-echo-id-zero
```

default

Configures the default setting.
Default: **permit**

drop

Specifies to drop packets with ICMP ID zero.

permit

Specifies to permit packets with ICMP ID zero.

Usage

Use this command to configure Stateful Firewall action on echo packets with ICMP ID zero.

Example

The following command configures Stateful Firewall to drop packets with ICMP ID zero:

```
firewall icmp-echo-id-zero drop
```

firewall icmp-fsm

This command enables/disables Stateful Firewall's ICMP Finite State Machine (FSM).

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] firewall icmp-fsm
```

default

Configures the default setting.

Default: Enabled. Same as **firewall icmp-fsm**.

no

Disables Stateful Firewall ICMP FSM checks.

Usage

Use this command to enable/disable Stateful Firewall ICMP FSM checks. When Stateful Firewall and ICMP FSM are enabled, ICMP reply messages for which there is no saved ICMP request message are discarded. ICMP error messages (i.e., messages containing an embedded message) for which there is no saved flow for the embedded message are discarded.

Example

The following command disables Stateful Firewall's ICMP FSM checks:

```
no firewall icmp-fsm
```

firewall ip-reassembly-failure

This command configures Stateful Firewall action on packets involved in IP Reassembly Failure scenarios.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall ip-reassembly-failure { drop | permit }  
default firewall ip-reassembly-failure
```

default

Configures the default setting.
Default: **permit**

drop

Specifies to drop packets involved in IP reassembly failure scenarios.

permit

Specifies to permit packets involved in IP reassembly failure scenarios.

Usage

Use this command to configure Stateful Firewall action on packets involved in IP reassembly failure scenarios such as missing fragments, overlapping offset, etc.
For NAT-only calls, packets involved in IP reassembly failure scenarios are dropped.

Example

The following command specifies to drop packets involved in IP reassembly failure scenarios:

```
firewall ip-reassembly-failure drop
```

firewall malformed-packets

This command configures Stateful Firewall action on malformed packets.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall malformed-packets { drop | permit }
```

```
default firewall malformed-packets
```

default

Configures the default setting.

Default: **permit**

drop

Specifies to drop malformed packets.

permit

Specifies to permit malformed packets.

Usage

Use this command to configure Stateful Firewall action on malformed packets.

For NAT-only calls, malformed packets are always permitted.

Example

The following command specifies Stateful Firewall to drop malformed packets:

```
firewall malformed-packets drop
```

firewall max-ip-packet-size

This command configures the maximum IP packet size (after IP reassembly) allowed over Stateful Firewall.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall max-ip-packet-size packet_size protocol { icmp | non-icmp }
```

```
default firewall max-ip-packet-size protocol { icmp | non-icmp }
```

default

Configures the default setting.

Default: 65535 bytes (for both ICMP and non-ICMP)

packet_size

Specifies the maximum packet size allowed.

packet_size must be an integer from 30000 through 65535.

protocol { icmp | non-icmp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **non-icmp**: Configuration for protocols other than ICMP.

Usage

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt” and “Ping-Of-Death” attacks.

Example

The following command allows a maximum packet size of 60000 for ICMP protocol:

```
firewall max-ip-packet-size 60000 protocol icmp
```

firewall mime-flood

This command configures Stateful Firewall protection from MIME Flood attacks.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall mime-flood { http-headers-limit max_limit | max-http-header-field-size
max_size }
```

```
default firewall mime-flood { http-headers-limit | max-http-header-field-size }
```

default

Configures the default setting for the specified parameter.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.

max_limit must be an integer from 1 through 256.

Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.

max_size must be an integer from 1 through 8192.

Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks.

This command is only effective if Stateful Firewall DoS protection for MIME flood attacks has been enabled using the **firewall dos-protection mime-flood** command, and the **route** command has been configured to send HTTP packets to the HTTP analyzer.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:

```
firewall mime-flood http-headers-limit 100
```

The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:

```
firewall mime-flood max-http-header-field-size 1000
```

firewall policy

This command enables/disables Stateful Firewall support in a Firewall-and-NAT policy.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall policy firewall-required

no firewall policy

no

Disables Stateful Firewall support in the Firewall-and-NAT policy.

firewall-required

Enables Stateful Firewall support in the Firewall-and-NAT policy.

Usage

Use this command to enable/disable Stateful Firewall support for all subscribers using a Firewall-and-NAT policy.

Example

The following command enables Stateful Firewall support in a Firewall-and-NAT policy:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support in a Firewall-and-NAT policy:

```
no firewall policy
```

firewall tcp-checksum-error

This command configures Stateful Firewall action on packets with TCP Checksum error.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-checksum-error { drop | permit }  
default firewall tcp-checksum-error
```

default

Configures the default setting.
Default: **drop**

drop

Specifies to drop packets with TCP Checksum errors.

permit

Specifies to permit packets with TCP Checksum errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Checksum error.
For NAT-only calls, packets with TCP Checksum errors are permitted.

Example

The following command specifies Stateful Firewall to drop packets with TCP Checksum errors:

```
firewall tcp-checksum-error drop
```

firewall tcp-first-packet-non-syn

This command configures Stateful Firewall action on TCP flows starting with a non-SYN packet.

 **Important:** In StarOS 9.0, this command is deprecated. This configuration is available as the `firewall tcp-fsm [first-packet-non-syn { drop | permit | send-reset }]` command.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-first-packet-non-syn { drop | reset }
```

```
default firewall tcp-first-packet-non-syn
```

default

Configures the default setting.
Default: **drop**

drop

Specifies to drop the non-SYN packet.

reset

Specifies to send reset.

Usage

Use this command to configure Stateful Firewall action on TCP flows starting with a non-SYN packet.

Example

For flows starting with a non-SYN packet, the following command specifies Stateful Firewall to drop the non-SYN packet:

```
firewall tcp-first-packet-non-syn drop
```

firewall tcp-fsm

This command enables/disables Stateful Firewall's TCP Finite State Machine (FSM).

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-fsm [ first-packet-non-syn { drop | permit | send-reset } ]  
{ default | no } firewall tcp-fsm
```

default

Configures the default setting.

Default: **firewall tcp-fsm first-packet-non-syn drop**

no

Disables Stateful Firewall's TCP FSM.

first-packet-non-syn { drop | permit | send-reset }

Specifies Stateful Firewall action on TCP flows starting with a non-SYN packet:

- **drop**: Specifies to drop the packet.
- **permit**: Specifies to permit the packet.
- **send-reset**: Specifies to drop the packet and send TCP RST.

Default: **drop**

Usage

Use this command to enable/disable Stateful Firewall's TCP FSM checks. When Stateful Firewall and TCP FSM are enabled, state of the TCP session is checked to decide whether to forward TCP packets.

Example

The following command enables TCP FSM, and configures action to take on TCP flows starting with a non-SYN packet to drop the packet:

```
firewall tcp-fsm first-packet-non-syn drop
```

firewall tcp-idle-timeout-action

This command configures action on TCP idle timeout expiry.

Important: In StarOS 9.0 and later this command is also available to NAT.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-idle-timeout-action { drop | reset }
{ default | no } firewall tcp-idle-timeout-action
```

default

Configures the default setting.

Default: **reset**

no

Configures the TCP idle timeout expiry action to reset.

drop | reset

Specifies the action to take on TCP idle timeout expiry.

drop: Drops the session.

reset: Sends TCP RST. When configured to reset, the session is dropped, and the system can avoid packets arriving for the idle flow from getting dropped.

Usage

Use this command to configure action to take on TCP idle timeout expiry.

Example

The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```

firewall tcp-options-error

This command configures Stateful Firewall action on packets with TCP Option errors.

Product

FW

Privileges

Security Administrator, Administrator

Syntax

```
firewall tcp-options-error { drop | permit }  
default firewall tcp-options-error
```

default

Configures the default setting.
Default: **permit**

drop

Specifies to drop packets with TCP Option errors.

permit

Specifies to permit packets with TCP Option errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Option errors.

Example

The following command configures Stateful Firewall to drop packets with TCP Option errors:

```
firewall tcp-options-error drop
```

firewall tcp-partial-connection-timeout

This command configures action on idle timeout for partially open TCP connections.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-partial-connection-timeout timeout  
  
{ default | no } firewall tcp-partial-connection-timeout
```

default

Configures the default setting for the specified configuration.

no

Disables the idle timeout for partially open TCP connections.

timeout

Specifies the timeout in seconds.

timeout must be an integer from 0 to 86400.

Default: 30 seconds

Usage

Use this command to configure idle timeout for TCP connections that are yet to be established (partially open) in the case of Firewall enabled calls.

Example

The following command sets the idle timeout setting to 30 seconds:

```
firewall tcp-partial-connection-timeout 30
```

firewall tcp-reset-message-threshold

This command configures a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-reset-message-threshold messages then-block-server
```

```
{ default | no } firewall tcp-reset-message-threshold
```

default

Configures the default setting.

Default: Disabled

no

Disables the configuration.

messages

Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of TCP reset messages (TCP RST+ACK) sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

Example

The following command sets the threshold on the number of TCP reset messages to 10:

```
firewall tcp-reset-message-threshold 10 then-block-server
```

firewall tcp-syn-flood-intercept

This command configures TCP SYN intercept parameters for protection against TCP SYN flooding attacks.

Important: In StarOS 8.0, this configuration is available in the ACS Configuration Mode. In StarOS 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-syn-flood-intercept { mode { none | watch [ aggressive ] } | watch-
timeout intercept_watch_timeout }
```

```
default firewall tcp-syn-flood-intercept { mode | watch-timeout }
```

default

Configures the default settings for SYN Flood DoS protection.

```
mode { none | watch [ aggressive ] }
```

Specifies the TCP SYN flood intercept mode:

- **none:** Disables the TCP SYN Flood Intercept feature.
- **watch:** Configures TCP SYN flood intercept feature in watch mode. The Stateful Firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the Stateful Firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive:** Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

```
watch-timeout intercept_watch_timeout
```

Specifies the TCP intercept watch timeout, in seconds.

intercept_watch_timeout must be an integer from 5 through 30.

Default: 30

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks. This command enables and configures TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command

The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the intercept watch timeout setting to *15* seconds:

```
firewall tcp-syn-flood-intercept watch-timeout 15
```

firewall tcp-syn-with-ecn-cwr

This command configures Stateful Firewall action on TCP SYN packets with either ECN or CWR flag set.

Product

FW

Privileges

Security Administrator, Administrator

Syntax

```
firewall tcp-syn-with-ecn-cwr { drop | permit }
```

```
default firewall tcp-syn-with-ecn-cwr
```

default

Configures the default setting.

Default: **permit**

drop

Specifies to drop TCP SYN packets with either ECN or CWR flag set.

permit

Specifies to permit TCP SYN packets with either ECN or CWR flag set.

Usage

Use this command to configure Stateful Firewall action on receiving a TCP SYN packet with either ECN or CWR flag set.

Example

The following command configures Stateful Firewall to drop TCP SYN packets with ECN / CWR flag set:

```
firewall tcp-syn-with-ecn-cwr drop
```

firewall udp-checksum-error

This command configures Stateful Firewall action on packets with UDP Checksum error.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall udp-checksum-error { drop | permit }  
default firewall udp-checksum-error
```

default

Configures the default setting.
Default: **drop**

drop

Specifies to drop packets with UDP Checksum error.

permit

Specifies to permit packets with UDP Checksum error.

Usage

Use this command to configure Stateful Firewall action on packets with UDP Checksum error.
For NAT-only calls, packets with UDP Checksum error are permitted.

Example

The following command specifies to drop packets with UDP Checksum error:

```
firewall udp-checksum-error drop
```

firewall validate-ip-options

This command enables / disables the Stateful Firewall validation of IP options for errors.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] firewall validate-ip-options
```

default

Configures the default setting.

Default: Disabled. Same as **no firewall validate-ip-options**

no

Disables validation of IP options.

Usage

Use this command to enable / disable Stateful Firewall validation of IP options. When enabled, Stateful Firewall will drop packets with IP option errors.
For NAT calls, validation of IP Options is disabled.

Example

The following command enables validation of IP options:

```
firewall validate-ip-options
```

nat binding-record

This command configures the generation of NAT Binding Records.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat binding-record edr-format edr_format [ port-chunk-allocation ] [ port-chunk-release ]
```

```
{ default | no } nat binding-record
```

default

Configures the default setting.

Default: **port-chunk-release**

no

Disables generating NAT Binding Records.

edr-format *edr_format*

Specifies the EDR format name.

edr_format must be an alpha and/or numeric string of 1 through 63 characters in length.

port-chunk-allocation

Specifies generating NAT Binding Records when a port-chunk is allocated.

port-chunk-release

Specifies generating NAT Binding Record when a port-chunk is released.

Usage

Use this command to configure the generation of NAT Binding Records.

Example

The following command configures an EDR format named *test123* and specifies generating NAT Binding Records when a port chunk is allocated:

```
nat binding-record edr-format test123 port-chunk-allocation
```

nat policy

This command enables/disables Network Address Translation (NAT) support in a Firewall-and-NAT policy.

Important: In StarOS 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat policy nat-required [ default-nat-realm nat_realm_name ]
```

```
no nat policy
```

no

Disables NAT support in the Firewall-and-NAT policy.

nat-required

Enables NAT support in the Firewall-and-NAT policy.

default-nat-realm *nat_realm_name*

Specifies the default NAT realm for the Firewall-and-NAT policy.

nat_realm_name must be the name of an existing NAT realm, and must be an alpha and/or numeric string of 1 through 31 characters in length.

Usage

Use this command to enable/disable NAT support for all subscribers using a Firewall-and-NAT policy.

In StarOS 8.1, to enable NAT support for a subscriber, Stateful Firewall must also be enabled for that subscriber. See the **firewall policy** CLI command.

Once NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms specified in the rules. See the **access-rule** CLI command.

You can enable/disable NAT at any time, however the changed NAT status will not be applied to active calls.

The new NAT status will only be applied to new calls.

Example

The following command enables NAT support in a Firewall-and-NAT policy:

```
nat policy nat-required
```

The following command disables NAT support in a Firewall-and-NAT policy:

```
no nat policy
```

nat private-ip-flow-timeout

This command configures the Private IP NPU flow timeout setting.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat private-ip-flow-timeout timeout
{ default | no } nat private-ip-flow-timeout
```

default

Configures the default setting.
Default: 180 seconds

no

Disables the Private IP NPU flow timeout configuration.
When disabled, the flow is installed at call setup and will be removed only when the subscriber disconnects.

timeout

Specifies the Private IP NPU flow timeout period in seconds.
timeout must be an integer from 180 through 86400.

Usage

Use this command to configure the Private IP NPU flow timeout setting.
For NAT-enabled calls, by default, the downlink private IP NPU flow will not be installed at call setup for a subscriber session. The flow will only be installed on demand. When there is no traffic on the private flow, the private IP flow will be removed after the configurable timeout period.

Example

The following command configures the Private IP NPU flow timeout setting to *36000* seconds:

```
nat private-ip-flow-timeout 36000
```

nat suppress-aaa-update

This command suppresses sending NAT Bind Update (NBU) to the AAA server when PPP disconnect happens.

 **Important:** This command is customer-specific. For more information please contact your local service representative.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat suppress-aaa-update call-termination
```

```
default nat suppress-aaa-update
```

default

Configures the default setting.

Default: No suppression of AAA updates.

Usage

Use this command to suppress sending of NBU to the AAA server when PPP disconnect happens, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NBU are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

Example

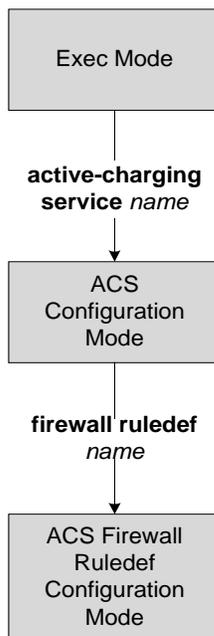

The following command suppresses the sending of NBU to the AAA server:

```
nat suppress-aaa-update call-termination
```

Chapter 114

Firewall Ruledef Configuration Mode Commands

The Firewall Ruledef Configuration Mode is used to configure and manage Access/Stateful Firewall rule definitions.

bearer 3gpp apn

This command configures an access/firewall ruledef to analyze user traffic based on APN bearer.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bearer 3gpp apn [ case-sensitive ] operator value
```

no

Removes previously configured bearer ruledef.

case-sensitive

This keyword makes the rule case sensitive.

By default, ruledefs are not case sensitive.

Default: Disabled

operator

Specifies how to logically match the APN name.

operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

The APN name to match in bearer flow.

value must be an alpha and/or numeric string of 1 through 62 characters in length, and can include punctuation characters.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on APN name.

Example

The following command creates an access/firewall ruledef for analyzing user traffic for an APN named *apn12*:

```
bearer 3gpp apn = apn12
```

bearer 3gpp imsi

This command configures an access/firewall ruledef to analyze user traffic based on International Mobile Station Identification (IMSI) number in bearer flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bearer 3gpp imsi { operator msid | { !range | range } imsi-pool imsi_pool }
}
```

no

Removes previously configured bearer ruledef.

operator

Specifies how to logically match the MSID.

operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

msid

Specifies the Mobile Station Identifier.

```
{ !range | range } imsi-pool imsi_pool
```

```
{ !range | range }:
```

 Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

imsi-pool *imsi_pool*: Specifies the IMSI pool name. *imsi_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on IMSI number of mobile station.

Example

The following command creates an access/firewall ruledef to analyze user traffic for the IMSI number 9198838330912:

```
bearer 3gpp imsi = 9198838330912
```

bearer username

This command configures an access/firewall ruledef to analyze user traffic based on user name of the bearer flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bearer username [ case-sensitive ] operator value
```

no

Removes previously configured bearer ruledef.

case-sensitive

This keyword makes the rule case sensitive.
By default, ruledefs are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the MSID.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

Specifies the user name.
value must be an alpha and/or numeric string of 1 through 127 characters in length.

Usage

Use this command to specify a access/firewall ruledef to analyze user traffic based on user name of the bearer flow.

Example

The following command creates an access/firewall ruledef for analyzing user traffic for the user name *user12*:

■ bearer username

```
bearer username = user12
```

create-log-record

This command enables/disables Firewall ruledef logging.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] create-log-record
```

no

Disables Firewall ruledef logging.

Usage

Use this command to enable/disable Firewall ruledef logging.

Example

The following command enables Firewall ruledef logging:

```
create-log-record
```

The following command disables Firewall ruledef logging:

```
no create-log-record
```

■ end

end

This command exits the current configuration mode, and returns to the Executive mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Executive mode.

exit

This command exits the current configuration mode, and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to returns to the parent configuration mode.

icmp any-match

This command configures an access/firewall ruledef to match any ICMP traffic for the user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] icmp any-match operator condition
```

no

Removes previously configured ICMP any-match ruledef.

operator

Specifies how to logically match the analyzed state.

operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.

condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any ICMP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any non-ICMP traffic of the user:

```
icmp any-match = FALSE
```

icmp code

This command configures an access/firewall ruledef to analyze user traffic based on ICMP code.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] icmp code operator code
```

no

Removes previously configured ICMP code ruledef.

operator

Specifies how to logically match the ICMP code.

operator must be one of the following:

- **!=**: does not equal
- **<=**: less than or equals
- **=**: equals
- **>=**: greater than or equals

code

Specifies the ICMP code.

code must be an integer from 0 through 255.

Usage

Use this command to define an access/firewall ruledef to analyze user traffic based on the ICMP code.

Example

The following command creates an access/firewall ruledef for analyzing user traffic using the ICMP code as 23:

```
icmp code = 23
```

icmp type

This command configures an access/firewall ruledef to analyze user traffic based on ICMP type.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] icmp type operator type
```

no

Removes previously configured ICMP type ruledef.

operator

Specifies how to logically match the ICMP type.

operator must be one of the following:

- !=: Does not equal
- <=: Less than or equals
- =: Equals
- >=: Greater than or equals

type

Specifies the ICMP type.

type must be an integer from 0 through 255.

For example, 0 for ECHO Reply, 3 for Dest. Unreachable, and 5 for Redirect.

Usage

Use this command to define an access/firewall ruledef to analyze user traffic based on the ICMP type.

Example

The following command creates an access/firewall ruledef for analyzing user traffic using an ICMP type as 123:

```
icmp type = 123
```

ip any-match

This command configures an access/firewall ruledef to match any IP traffic for the user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip any-match operator condition
```

no

Removes previously configured IP any-match ruledef.

operator

Specifies how to logically match the analyzed state.

operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.

condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any IP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any non-IP traffic of the user:

```
ip any-match = FALSE
```

ip downlink

This command configures an access/firewall ruledef to analyze user traffic based on IP packet flow in downlink direction (to subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip downlink operator condition
```

no

Removes previously configured IP ruledef.

operator

Specifies how to logically match the packet flow direction.

operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.

condition must be one of the following:

- **TRUE**: Analyzed
- **FALSE**: Not analyzed

Usage

Use this command to define an access/firewall ruledef to analyze user traffic based on the IP packet flow direction as downlink.

Example

The following command creates firewall ruledef for analyzing user traffic using an IP packet direction to downlink (to subscriber):

```
ip downlink = TRUE
```

ip dst-address

This command configures an access/firewall ruledef to analyze user traffic based on IP destination address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip dst-address { operator { ip_address | ip_address/mask } | { !range | range } host-pool host_pool }
```

no

Removes previously configured IP destination address ruledef.

```
operator { ip_address | ip_address/mask }
```

operator specifies how to logically match the IP destination address.

operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the IP address of destination node for outgoing traffic in IPv4 or IPv6 standard notation. *ip_address* must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6.

ip_address/mask: Specifies the IP address of destination node for outgoing traffic in IPv4 or IPv6 standard notation with subnet mask bit. *ip_address/mask* must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6 with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

```
{ !range | range } host-pool host_pool }
```

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool host_pool: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP destination address.

Example

■ ip dst-address

The following command creates IP ruledef for analyzing user traffic using an IP destination address of `1.1.1.1`:

```
ip dst-address = 1.1.1.1
```

ip protocol

This command configures an access/firewall ruledef to analyze user traffic based on the protocol being transported by IP packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip protocol { { operator { protocol | protocol_assignment } } | {
operator protocol_assignment } }
```

no

Removes previously configured IP protocol address ruledef.

```
operator { protocol | protocol_assignment }
```

operator: Specifies how to logically match the IP protocol.

operator must be one of the following:

- !=: Does not equal
- =: Equals

protocol: Specifies the protocol by name.

protocol must be one of the following:

- ah
- esp
- gre
- icmp
- tcp
- udp

protocol_assignment: Specifies the protocol by assignment number. *protocol_assignment* must be an integer from 0 through 255 (e.g., 1 for ICMP, 6 for TCP, and 17 for UDP).

```
operator protocol_assignment
```

operator: Specifies how to logically match the IP protocol.

operator must be one of the following:

- <=: Less than or equals
- >=: Greater than or equals

protocol_assignment: Specifies the protocol by assignment number.

protocol_assignment must be an integer from 0 through 255 (e.g., 1 for ICMP, 6 for TCP, and 17 for UDP).

ip protocol

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP protocol.

Example

The following command creates IP ruledef for analyzing user traffic using a protocol assignment of *1*:

```
ip protocol = 1
```

ip src-address

This command configures an access/firewall ruledef to analyze user traffic based on IP source address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip src-address { operator { ip_address | ip_address/mask } | { !range | range } host-pool host_pool }
```

no

Removes previously configured IP destination address ruledef.

```
operator { ip_address | ip_address/mask }
```

operator: Specifies how to logically match the IP source address.

operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the IP address of source node for incoming traffic in IPv4 or IPv6 standard notation. *ip_address* must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6.

ip_address/mask: Specifies the IP address of source node for incoming traffic in IPv4 or IPv6 standard notation with subnet mask bit. *ip_address/mask* must be the IP address in dotted decimal notation for IPv4, or in colon notation for IPv6 with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

```
{ !range | range } host-pool host_pool
```

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool host_pool: Specifies the host pool name. *host_pool* must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on the IP source address.

Example

The following command creates IP ruledef for analyzing user traffic using an IP source address of 1.1.1.1:

■ ip src-address

```
ip src-address = 1.1.1.1
```

ip uplink

This command configures an access/firewall ruledef to analyze user traffic based on IP packet flow in uplink direction (from subscriber).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip uplink operator condition
```

no

Removes previously configured IP uplink match ruledef.

operator

Specifies how to logically match the IP packet flow direction.

operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.

condition must be one of the following:

- **TRUE**: Not analyzed
- **FALSE**: Analyzed

Usage

Use this command to define an access/firewall ruledef to analyze user traffic based on the IP packet flow direction as uplink.

Example

The following command creates firewall ruledef for analyzing user traffic using an IP packet direction to uplink (from subscriber):

```
ip uplink = TRUE
```

tcp any-match

This command configures an access/firewall ruledef to match any TCP traffic for the user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp any-match operator condition
```

no

Removes previously configured TCP any-match ruledef.

operator

Specifies how to logically match the analyzed state.

operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.

condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any TCP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any non-TCP traffic of the user:

```
tcp any-match = FALSE
```

tcp dst-port

This command configures an access/firewall ruledef to analyze user traffic based on destination TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp dst-port { operator port_number | { !range | range } { start_range to
end_range | port-map port_map } }
```

no

Removes the previously configured destination TCP port ruledef.

operator

Specifies how to logically match the port number.

operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.

port_number must be an integer from 1 to 65535.

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

start_range to end_range

Specifies the starting and ending port numbers for the range of destination TCP ports.

start_range must be an integer from 1 through 65535.

end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map port_map

Specifies name of the port-map for the port range.

port_map must be a string of 1 through 63 characters in length.

Usage

■ tcp dst-port

Use this command to specify an access/firewall ruledef to analyze user traffic based on destination TCP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching destination port for TCP as *10*:

```
tcp dst-port = 10
```

tcp either-port

This command configures an access/firewall ruledef to analyze user traffic based on either (destination or source) TCP ports.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp either-port { operator port_number | { !range | range } { start_range
to end_range | port-map port_map } }
```

no

Removes previously configured TCP either-port (destination or source) ruledef.

operator

Specifies how to logically match the port number.

operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.

port_number must be an integer from 1 through 65535.

range | **!range**

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.

start_range must be an integer from 1 through 65535.

end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.

port_map must be a string of 1 through 63 characters in length.

■ tcp either-port

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on either TCP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching destination or source port for TCP as *10*:

```
tcp either-port = 10
```

tcp src-port

This command configures an access/firewall ruledef to analyze user traffic based on source TCP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp src-port { operator port_number | { !range | range } { start_range to end_range | port-map port_map } }
```

no

Removes previously configured source TCP port ruledef.

operator

Specifies how to logically match the port number.

operator must be one of the following:

- **!=**: Does not equal
 - **<=**: Less than or equals
 - **=**: Equals
 - **>=**: Greater than or equals
-

port_number

Specifies the port number to match.

port_number must be an integer from 1 to 65535.

range | !range

Specifies the range criteria:

- **!range**: Not in the range
 - **range**: In the range
-

start_range to end_range

Specifies the starting and ending port numbers for the port range.

start_range must be an integer from 1 through 65535.

end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map port_map

Specifies name of the port-map for the port range.

port_map must be a string of 1 through 63 characters in length.

Usage

■ tcp src-port

Use this command to specify an access/firewall ruledef to analyze user traffic based on source TCP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching source port for TCP as 10:

```
tcp src-port = 10
```

udp any-match

This command configures an access/firewall ruledef to match any UDP traffic for the user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] udp any-match operator condition
```

no

Removes previously configured UDP any-match ruledef.

operator

Specifies how to logically match the analyzed state.

operator must be one of the following:

- **!=**: does not equal
- **=**: equals

condition

Specifies the condition to be matched for the user traffic.

condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access/firewall ruledef to match any UDP traffic of the user.

Example

The following command creates an access/firewall ruledef to match any UDP traffic of the user:

```
udp any-match = TRUE
```

udp dst-port

This command configures an access/firewall ruledef to analyze user traffic based on destination UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] udp dst-port { operator port_number | { !range | range } { start_range to
end_range | port-map port_map } }
```

no

Removes previously configured destination UDP ports ruledef.

operator

Specifies how to logically match the port number.

operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.

port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range to end_range

Specifies the starting and ending port numbers for the port range.

start_range must be an integer from 1 through 65535.

end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map port_map

Specifies name of the port-map for the port range.

port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on destination UDP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching destination port for UDP as *10*:

```
udp dst-port = 10
```

udp either-port

This command configures an access/firewall ruledef to analyze user traffic based on either (destination or source) UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] udp either-port { operator port_number | { !range | range } { start_range
to end_range | port-map port_map } }
```

no

Removes previously configured either-port (destination or source) UDP ruledef.

operator

Specifies how to logically match the port number.

operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.

port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range to end_range

Specifies the starting and ending port numbers for the port range.

start_range must be an integer from 1 through 65535.

end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map port_map

Specifies name of the port-map for the port range.

port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on either UDP port.

Example

The following command creates an access/firewall ruledef for analyzing user traffic matching destination or source port for UDP as *10*:

```
udp either-port = 10
```

udp src-port

This command configures an access/firewall ruledef to analyze user traffic based on source UDP port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] udp src-port { operator port_number | { !range | range } { start_range to
end_range | port-map port_map } }
```

no

Removes previously configured source UDP port ruledef.

operator

Specifies how to logically match the port number.

operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the port number to match.

port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

start_range to end_range

Specifies the starting and ending port numbers for the port range.

start_range must be an integer from 1 through 65535.

end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

port-map port_map

Specifies name of the port-map for the port range.

port_map must be a string of 1 through 63 characters in length.

Usage

Use this command to specify an access/firewall ruledef to analyze user traffic based on source UDP port.

Example

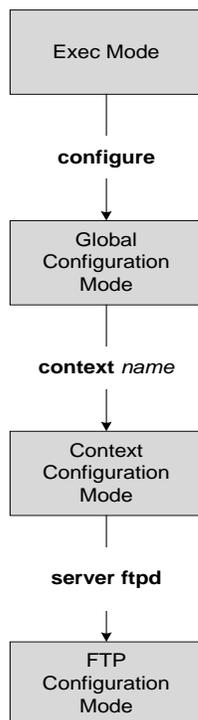

The following command creates an access/firewall ruledef for analyzing user traffic matching source port for UDP as 10:

```
udp src-port = 10
```

Chapter 115

FTP Configuration Mode Commands

The FTP Configuration Mode is used to manage the FTP server options for the current context.

■ end

end

Exits the FTP server configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the FTP server configuration mode and returns to the context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the context configuration mode.

max servers

Configures the maximum number of FTP servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
max servers count
```

count

Default: 40

Specifies the maximum number of servers that can be spawned in any 60 second interval. *count* must be a value in the range from 1 to 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.

The converse would be true as well in that a system can benefit by reducing the number of servers such that FTP services do not cause excessive system impact to other services.

Example

```
max servers 50
```

timeout

Configures the client idle timeout before an FTP session is automatically closed.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
timeout seconds
```

seconds

Default: 900

Specifies the number of seconds of inactivity before an FTP session is automatically closed. *seconds* must be in the range from 10 through 86400.

Usage

Adjust the session timeout to fine tune the system. FTP session resources can be released sooner to support additional requests by adjusting the timeout to a smaller value.

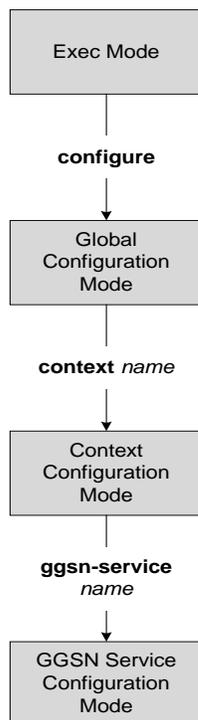

Example

```
timeout 300
```

Chapter 116

GGSN Service Configuration Mode Commands

The Gateway GPRS Support Node (GGSN) Configuration Mode is used to create and manage GGSN services within for the current context.

 **Important:** The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

Configures the name of the context configured on the system that processes accounting for PDP contexts handled by this GGSN service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
accounting context context_name
```

```
[ no ] accounting context
```

no

Removes a previously configured accounting context.

context_name

Specifies the name of the context to be used for accounting. The name must be between 1 and 79 alpha and/or numeric characters and is case sensitive.

Usage

By default, the system attempts to use the same context as the one in which the GGSN service is configured for accounting purposes. This command can be used to either change the system's default behavior, or allow GPRS Tunneling Protocol Prime (GTPP) accounting to a charging gateway (CG).

By default when GTPP accounting is used, accounting records will be sent to the accounting servers configured in whichever context the GGSN service is configured. This command may be used to override that default.

Example

The following command configures the GGSN service's accounting context to be `plmn1`:

```
accounting context plmn1
```

associate gtpu-service

This command associates a previously configured GTP-U service to bind the GGSN service with a peer. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
associate gtpu-service svc_name
```

```
[ no ] associate gtpu-service
```

no

Removes the associated GTP-U service from this GGSN service configuration.

svc_name

Identifies the name of the GTP-U service preconfigured in Context configuration mode to associate with a GGSN service.

The *svc_name* must be an alphanumeric string from 1 through 63 characters.

Usage

Use this command to configure GTP-U data plan between GGSN service and peer node. The service defined for GTP-U can be configured in Context configuration mode.

Example

Following command associates GTP-U service named *gtpu-hnb1* with specific GGSN service.

```
associate gtpu-service gtpu-hnb1
```

associate pgw-service

This command enables a previously configured P-GW service to which handover will be done by the GGSN service. The P-GW service must be configured in Context Configuration mode before using this configuration.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

associate pgw-service *svc_name*

[**no**] **associate pgw-service**

no

Removes the associated P-GW service from this GGSN service configuration.

svc_name

Identifies the name of the P-GW service preconfigured in Context configuration mode to which handover will be done.

The *svc_name* must be an alphanumeric string from 1 through 63 characters.

Usage

Use this command to allow enabling/disabling bearer handover from GGSN to a P-GW service. The service defined for P-GW can be configured in Context configuration mode.

The P-GW's eGTP service should have the same bind address as GGSN service and P-GW and GGSN should share same GTP-U, otherwise handover will fail.

Example

Following command enables P-GW service named *pgw-test* handover with specific GGSN service.

```
associate pgw-service pgw-test
```

authorize-with-hss

This command enables/disables subscriber session authorization with HSS over S6b Diameter interface. This feature is required to support the interworking of GGSN with P-GW and HA.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] authorize-with-hss
```

Usage

Use this command to enable/disable the authorization support for subscriber over S6b interface which is used between GGSN and the 3GPP AAA to exchange the information related to charging, P-CSCF discovery, etc. By use of this feature allows the GGSN service to interact with HSS over S6b interface through Diameter configuration which is already configured on the system.

Important: Diameter configuration must be available before enabling this command. For more information of Diameter interface configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter..

Important: This command is a license-enabled feature.

Example

The following command enables the subscriber authorization with HSS over S6b Diameter interface to provide session interoperability between GGSN and PGW and HA in this GGSN service:

```
authorize-with-hss
```

bind

Binds the GGSN service to a logical IP interface serving as the Gn interface. Specifies the maximum number of subscribers that can access this service over the interface.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
bind address address [ max-total-pdp-contexts max_total | max-ppp-pdp-contexts max_ppp ]
```

```
no bind address address
```

no

Removes a previously configured binding for the GGSN service.

address

Specifies the IP address (address) of the interface configured as the Gn interface. address is specified in dotted decimal notation.

max-total-pdp-contexts max_total

Default: 1,500,000

Specifies the maximum number of PDP contexts (both IP and PPP) that can access this service on this interface.

count can be configured to any integer value between 4,000,000 on ASR 5000.

 **Important:** The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active PACs/PSCs installed in the system. A fully loaded ASR 5000 with 13 active PSCs can support 4,000,000 total IP and PPP PDP contexts. Note that each PPP PDP context is treated as two IP PDP contexts. Refer to the **license key** command for additional information.

max-ppp-pdp-contexts max_ppp

Default: 750,000

Specifies the maximum number of PPP PDP contexts that can access this service on this interface.

count can be configured to any integer value between 0 and 2,500,000 on ASR 5000.

 **Important:** The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active PACs installed in the system. A fully loaded ST16 system with 13 active PACs can support 1,500,000 PPP PDP contexts. Refer to the **license key** command for additional information.

 **Important:** The maximum number of subscriber contexts supported is dependant on the session capacity license installed and the number of active processing cards installed in the system. A fully loaded ASR 5000 with 13 active

processing cards can support 2,500,000 total PPP PDP contexts. Refer to the **license key** command for additional information.

Usage

Used to associate or tie the GGSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of a Gn interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a “soft” limit as to the number of simultaneous subscriber contexts that can be facilitated by the service/interface at any given time. Soft limits are based on measurements gathered at regular short intervals (several times per minute) as opposed to measurements taken in real-time. Therefore the sampled measurement may not match the actual number of PDP contexts currently being processed.

Every PDP context request received is compared against the result of the last sample. If the sample is less than the soft limit configured, the request will be processed. If it is more, the request will be rejected.

When configuring the **max-total-pdp-contexts** or **max-ppp-pdp-contexts** options, be sure to consider the following:

- Each PPP PDP context is treated as two IP PDP contexts due to the additional CPU and memory resources required
- The total number of interfaces that you configure for use as Gn interfaces
- The maximum number of subscriber PDP contexts that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the PDP contexts
- The type of physical port (10/100Base-T or 1000Base-Tx) to which these interfaces are bound

Taking these factors into account and distributing your subscriber contexts across all available interfaces allows you to configure your interfaces to optimally handle PDP contexts without degraded performance.

Example

The following command would bind the logical IP interface with the address of 192.168.3.1 to the GGSN service and specifies that a maximum of 600 simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

cc behavior

Configures the 3GPP behavior bits associated with the GGSN's charging characteristics (CC).

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
cc behavior { accounting-server as_value | deny-connect dc_value | no-records nr_value }
```

no-records *nr_value*

Default: 0 (disabled)

Specifies the behavior bit upon which the GGSN ceases sending accounting records to a server.

nr_value can be configured to any integer value between 1 and 12 corresponding to the 12 behavior bits B1 through B12.

Usage

3GPP standards after 3GPP R98 included 12 behavior bits as part of GGSN charging characteristics. Like the charging characteristics profile index, the behavior bits are sent by the SGSN to the GGSN in the Create PDP Context request message.

This command configures the behavior bits for each of the conditions described.

Example

The following command configures a behavior bit of 10 for no-records:

```
cc behavior no-records 10
```

cc profile

Configures the charging characteristic (CC) profile index properties.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
cc profile index [ buckets number | interval time [ downlink down_octets uplink
up_octets | total total_octets ] | prepaid { prohibited | use-rulebase-
configuration } | server address context | sgsns num_changes | tariff time1
mins hours [ time2 mins hours [ time3 mins hours [ time4 mins hours [ time5 mins
hours [ time6 mins hours ] ] ] ] | volume { downlink vol_down_octets uplink
vol_up_octets | total total_octets } ]

[ no ] cc profile index { buckets | interval | prepaid | server address | sgsns
| tariff | volume }

[ default ] cc profile index [ buckets | interval | prepaid | server address |
sgsns | tariff | volume ]
```

no

Removes a previously configured profile index.

default

Returns the specified cc profile to the original default system settings.

index

Configures a profile index for the parameter to be specified. index can be configured to any integer value from 0 to 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

buckets number

Default: 4

Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.

number can be configured to any integer value from 1 through 4.

```
interval time [downlink down_octets uplink up_octets | total total_octets ]
```

Specifies the normal time duration that must elapse before closing an accounting record provided that any or all of the following conditions occur:

- Downlink traffic volume is reached within the time interval
- Uplink traffic volume is reached within the time interval
- Total traffic volume (up and downlink) is reached within the time interval

time is measured in seconds and can be configured to any integer value from 60 to 40,000,000.

down_octets is the downlink traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.

up_octets is the uplink traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.

total_octets is the total traffic volume measured in octets and can be configured to any integer value from 0 to 1,000,000.

```
prepaid {prohibited | use-rulebase-configuration }
```

This command enables or disables prepaid for the specified profile index.

Default: N/A

prohibited: Disable prepaid for the specified profile index.

use-rulebase-configuration: Use the prepaid configuration in the rulebase.

```
sgsns num_changes
```

Default: 4

Specifies the number of SGSN changes (i.e., inter-SGSN switchovers) resulting in a new RAI (Routing Area Identity) that can occur before closing an accounting record.

num_changes can be configured to any integer value from 1 to 15.

```
tariff time1 mins hours time2 mins hours time3 mins hours time4 mins hours time5 mins hours time6 mins hours
```

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: The minutes of the hour, an integer value from 0 to 59.
- *hours*: The hour of the day, an integer value from 0 to 23.

```
volume {downlink vol_down_octets uplink vol_up_octets | total total_octets }
```

Specifies the downlink, uplink, and total volumes that must be met before closing an accounting record.

vol_down_octets is measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.

vol_up_octets is measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.

total_octets is the total traffic volume (up and downlink) measured in octets and can be configured to any integer value from 100,000 to 4,000,000,000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the GGSN's charging characteristics. The GGSN supports up to 16 profile indexes. This command works in conjunction with the `cc-sgsn` command located in the APN configuration mode that dictates which CCs should be used for subscriber PDP contexts.

Example

The following command configures a profile index of 10 for tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
```

default

Sets/restores the default value assigned for the specified parameter.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] { cc { behavior | profile index } | echo-interval | gtpu echo-
interval | gtpu reorder { context | sequence-numbers | timeout } | guard-
interval | ip { local-port gtpc-v1 | qos-dscp } | max-retransmissions | plmn {
unlisted-sgsn } | setup-timeout | timeout }
```

```
cc { behavior | profile index }
```

Restores the GGSN's charging characteristics parameters to the following default settings:

- **behavior:** Restores all behavior parameters to their default values of 0 (disabled).
- **profile:** For the specified index, the following defaults are applied:
 - buckets: 4
 - interval: Disabled
 - volume: Disabled
 - sgsns: 4
 - tariff-time: Disabled

echo-interval

Restores the GTP echo-interval parameter to its default setting of 60.

gtpu echo-interval

Restores the GTPU echo-interval parameter to its default setting of 60.

```
gtpu reorder { context | sequence-numbers | timeout }
```

Restores the gtpu reordering parameters to the following default settings:

- gtpu reorder context: Disabled
- gtpu reorder sequence-numbers: Disabled
- gtpu reorder timeout: 100 milliseconds

gtpu udp-checksum insert

Restores the GGSN gtpu udp-checksum parameter to its default setting of enabled.

guard-interval

Restores the GGSN guard-interval parameter to its default setting of 100.

```
ip {local-port gtpc-v1 | qos-dscp }
```

Restores the GGSN ip parameters to the following default setting:

- **local-port gtpc-v1**: 2123
- **qos-dscp**: conversational ef streaming af11 interactive af21 background be

```
max-retransmissions
```

Restores the GGSN max-retransmissions parameter to its default setting of 4.

```
plmn {unlisted-sgsn }
```

Restores the GGSN plmn unlisted-ggsn parameter to its default setting of reject.

```
setup-timeout
```

Restores the GGSN setup-timeout parameter to its default setting of 60.

```
timeout
```

Restores the GGSN timeout parameter to its default setting of 5.

Usage

After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the GGSN service's guard interval parameter to its default setting:

```
default guard-interval
```

dns-client

This command defines the context name where a DNS client is configured. This command will associate an existing DNS client configuration with GGSN to perform DNS query for P-CSCF, if P-CSCF query request in AAA message is received from Diameter node.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
dns-client context dns_ctxt_name
```

```
[no] dns-client context
```

no

Removes the association of DNS context which was configured to perform DNS query in this GGSN service.

dns_ctxt_name

Specifies the name of the context in which a DNS client configuration is present. Typically this should be the same where this GGSN service is configured.

dns_ctxt_name is a context name and must be alpha and/or numeric string of 1 through 79 characters.

Usage

Use this command to associate a DNS client configuration to perform DNS query used for the resolution of P-CSCF query received in AAA message from Diameter peer, on the basis of DNS client parameters configured in a context.

A DNS client configuration must be present in the same context as GGSN service before enabling this command to perform DNS query for P-CSCF.

Important: This command is a license-enabled feature.

Example

The following command associates a DNS client configuration to perform DNS query for P-CSCF with this GGSN service which is configured in same context as GGSN service:

```
default dns-client context
```

echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-C Echo packets are sent from the GGSN service to the SGSN.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
echo-interval time_interval
```

```
no echo-interval
```

no

Disables the sending of GTPv1-C Echo packets.

time_interval

Default: 60

Specifies the frequency at which the GGSN service sends GTPv1-C Echo packets to the SGSN(s) it is configured to communicate with.

time_interval is measured in seconds and can be configured to any integer value between 60 and 3600.

Usage

Use this command to adjust the rate at which the GGSN sends these packets. GTPv1-C Echo packets are used to detect whether SGSNs that the GGSN service is communicating with, has become unresponsive or has rebooted.

The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new SGSN on the system using the **sgsn address** command as described in this chapter
- Upon the execution of the path failure detection policy as described in **path-failure** command of this chapter

The echo-interval command is used in conjunction with the **max-retransmissions** and **retransmission-timeout** commands as described in this chapter.

In addition to receiving an echo response for this echo protocol, if GGSN receives a Node Alive Request message or a Echo Request message from a presumed dead SGSN, it will immediately assume the SGSN is active again.

If the GGSN discovers that an SGSN has become unresponsive, it will terminate all PDP contexts that had been established with the SGSN.

Example

The following command configures the GGSN service to send GTP Echo packets every 120 seconds:

■ echo-interval

```
echo-interval 120
```

end

Exits the GGSN service configuration mode and returns to the Administrator-Exec mode prompt.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Administrator-Exec mode.

■ exit

exit

Exits the GGSN service configuration mode and returns to the context configuration mode.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the context configuration mode.

fqdn

This command defines Fully Qualified Domain Name (FQDN) which would be used for authorization over S6b interface between GGSN and 3GPP AAA/HSS.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] fqdn host host_name realm realm_id
```

no

Removes configured FQDN host name and realm id from GGSN service.

default

Sets the system to default mode for this command and configure the host and realm id value to NULL.

host *host_name*

Specifies the name of the host to be used for authorization over S6b interface with 3GPP AAA server/HSS from GGSN service.

host_name is a unique name that need to be configured for the authorization over S6b interface from this GGSN service.

host_name must be an alpha and/or numeric string of from 1 through 127 characters. *host_name* allows punctuation marks.

realm *realm_id*

Specifies the realm as FQDN to be used for authorization over S6b interface with 3GPP AAA server/HSS from GGSN service. The realm may typically be a company or service name.

realm_id is a unique identifier that need to be configured for the authorization over S6b interface from this GGSN service and must be an alpha and/or numeric string of from 1 through 127 characters. It allows punctuation marks.

host_name

Usage

Use this command to define host and realm as FQDN for 3GPP AAA server/HSS which would be used for authorization over S6b interface with GGSN. The realm specified as FQDN may typically be a company or service name.

By default the FQDN host and realm will be NULL

Important: This command is a license-enabled feature.

Example

■ fqdn

The following configures the *hss1* as host name and *xyz.com* as realm for FQDN to support authorization over S6b from this GGSN service:

```
fqdn host hss1 realm xyz.com
```

gtpc nsapi-in-create-pdp-response

This command configures the exclusion/inclusion of optional information element (IE) Network Service Access Point Identifier (NSAPI) in “Create PDP Context Response” messages in GTP-C.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] gtpc nsapi-in-create-pdp-response
```

default

Sets the default mode for GTP-C messages; i.e. to not to include NSAPI IE in “Create PDP Context Response” messages.

no

Removes the preconfigured mode for GTP-C messages; in other words sets the mode for GTP-C message to not to include NSAPI IE in “Create PDP Context Response” messages. By default it is disabled.

Usage

Use this command to configure the mode for the GTP-C messages to exclude or include the NSAPI IE in “Create PDP Context Response” message received from SGSN.

Example

The following command configures the GGSN service to include the optional IE of NSAPI in “Create PDP Context Response” message:

```
gtpc nsapi-in-create-pdp-response
```

gtpc private-extension

This command configures the customer specific private extension in GTP-C messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpc private-extension { { { focs | odb } access-list acl_name in disconnect-on-violation } | ggsn-preservation-mode | insk | loss-of-radio-coverage | none }
```

```
default gtpc private-extension
```

```
[ no ] gtpc private-extension [ focs | insk | preservation-mode | loss-of-radio-coverage ]
```

default

Sets the default mode for GTP-C messages. By default it is disabled.

no

Disables the configured private extensions for GTP-C messages.

```
{focs | odb} access-list acl_name in disconnect-on-violation
```

These keywords configures the Free-Of-Charge-Service and Operator Determined Barring fo all packet oriented services as defined by operators.

focs: This keyword enables/disables Free of Charging Services for the subscriber who has no credit, and also takes the access-list *acl_name* to be applied for FOCS.

odb: This keyword enables/disables “all packet oriented service barred” for the subscriber, and also takes the access-list *acl_name* to be applied for ODB.

acl_name is the name of configured access control list for this service.

Important: These are the customer-specific keywords and need customer-specific license to use them.

insk

This keyword is for the Intelligent-Network-Service-Key defined by vendors. This private extension can be present in Create PDP Context request messages.

A radius dictionary can be configured to send that value in accounting messages.

Important: This is a customer specific-keyword and needs customer-specific license to use this feature.

ggsn-preservation-mode

This keyword is the customer specific option and used to indicate the presence of such a private extension in Update PDP Context requests. It indicates whether the subscriber is active or has become idle, and RAN resources might have been released. It also indicates the "type" of desired preservation mode behavior. System support two different types of behavior. When **ggsn-preservation-mode** is configured, different generation of accounting records occur based on the "type" of mode. To enable the different generation of accounting records, the trigger for preservation mode must be configured for RADIUS or GTPC command for that accounting protocol. If that trigger is not configured, there will be no change in the generation of accounting records.

 **Important:** This is a customer-specific keyword and needs customer-specific license to use this feature.

loss-of-radio-coverage

These keywords enables the protection for overcharging to a subscriber due to loss of radio coverage (LORC) in a GGSN service. It also enables the system to understand the private extension in GTP-C message for LORC in Update PDP Context message from SGSN.

 **Important:** This is a license enabled keyword and need feature-specific license to use it.

none

Removes the private extensions from record which are from GTP-C messages received from the SGSN.

Usage

Use this command to configure the private extensions to record from the GTP-C messages received from SGSN. It also configures the customer specific features; i.e. preservation mode for GGSN service. Overcharging protection for LORC is a solution which provides the ability to configure mobile carriers to maximize their network solutions and balancing the requirements to accurately bill their customer. Consider scenario where a mobile is streaming or downloading very large files from external sources and the mobile goes out of radio coverage. If this download is happening on Background/Interactive traffic class then the GGSN is unaware of such loss of connectivity as SGSN does not perform the Update PDP Context procedure to set QoS to 0kbps (this is done when traffic class is either Streaming or Conversational only). The GGSN continues to forward the downlink packets to SGSN. In the loss of radio coverage, the SGSN will do paging request and find out that the mobile is not responding; SGSN will then drops the packets. In such cases, the G-CDR will have increased counts but S-CDR will not. This means that when operators charge the subscribers based on G-CDR the subscribers may be overcharged. This feature is implemented to avoid the overcharging in such cases. This implementation is based on Cisco-specific private extension to GTP messages and/or any co-relation of G-CDRs and S-CDRs. It also does not modify any RANAP messages.

 **Important:** This is a license enabled command and needs feature-specific license/s to use this command.

 **Important:** Some of the keywords a customer-specific feature and need customer-specific license/s to use them.

Example

■ `gtpc private-extension`

The following command configures the GGSN service to record the private extension for intelligent network service key as defined by operator:

```
gtpc private-extension insk
```

gtpc ran-procedure-ready-delay

This command configures the GGSN to enable the RAN Procedure Ready feature for the particular GGSN service and specify the timeout period for RAN procedure timer in GGSN which is started on arrival of every secondary Create PDP Context request.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpc ran-procedure-ready-delay [ timeout dur ]
```

```
[default | no] gtpc ran-procedure-ready-delay
```

default

Sets the default mode of RAN Procedure Ready feature for the particular GGSN service. By default it is disabled.

no

This keyword is used to disable RAN Procedure Ready feature for the particular GGSN service. By default it is disabled.

timeout *dur*

Default: 10

Specifies the timeout duration in seconds for RAN procedure timer in GGSN which is started on arrival of every secondary “Create PDP Context Request” message.

This is an optional keyword. If no timeout period is specified then default value of 10 seconds will be assigned to timeout period.

dur must be an integer between 1 through 40.

Usage

Use this command to enable the RAN Procedure Ready feature for the particular GGSN service and to specify the timeout period for RAN procedure timer in GGSN which is started on arrival of every secondary “Create PDP Context Request” message.

Once a “Create PDP Context Request” is received by GGSN from SGSN, a timer will be started at GGSN and GGSN will wait till the Radio Access Bearer setup is completed and “Update PDP Context Request” is sent by SGSN. If any downlink data is received before arrival of “Update PDP Context Request” or before timer expire, that downlink packets will be queued or buffered. Currently buffer limit of sub-system is 1024 packets.

To support this feature each sub-session uses a common flag ‘ran procedure ready state’, whenever a “Create PDP Context Request” is received for secondary PDP context and sub-session is allocated, this flag will be set to TRUE by default. This common flag is checked while sending downlink traffic, if this flag is FALSE then GGSN permit flow of downlink data but, if it is TRUE, GGSN will queue the downlink packets.

In case if the buffer becomes full (total buffer limit is of 1024 packets) then, all the newly coming packets will be dropped.

If “Update PDP Context Request” is received by GGSN with RAN Procedure flag set or if timer expires the ‘ran-procedure ready state’ flag in sub-session will be reset and hence GGSN will start sending queued packets in ‘first-in first-out’ manner and buffering will be disabled for further downlink traffic.

This feature supports following scenarios when RAB setup timer starts at the GGSN:

- If GGSN receives the “Update PDP Context Request” before timer expires, with RAN Procedure Ready bit TRUE (1), then GGSN will stop the timer, send all the queued/buffered packets in ‘first-in first-out’ manner and change the ‘ran procedure ready state’ to FALSE and disables buffering of further downlink data.
- If GGSN receives the “Update PDP Context Request” before timer expires, with RAN Procedure Ready bit FALSE (0), then GGSN will process the “Update PDP Context Request” as usual, but will not disable the buffering of downlink data and wait for other “Update PDP Context Request” to come with RAN procedure ready flag set or wait for timer to expire.
- If GGSN do not receive the “Update PDP Context Request” with RAN Procedure Ready bit TRUE (1) before timer expire, the timer will be fired and GGSN starts sending all the queued packet and will change the ‘ran procedure ready state’ to FALSE and disables buffering of further downlink data (assuming that the corresponding SGSN does not support this feature).
- If timer has expired and GGSN received an “Update PDP Context Request” for secondary PDP context with or without RAN Procedure Ready bit set , the UPC will be processed as usual without making any changes for buffering the packets.

Important: This feature make no effect on Enhanced Charging Service or DPI as the buffering of downlink data is done before sending it to ACSMgr.

Important: During SGSN handoff scenario all packets will be processed in a normal way and the downlink packets buffered till the timer expires.

Example

The following command configures the GGSN service to enable the RAN Procedure Ready feature and specify the timeout period as 20 seconds for RAN procedure timer in GGSN:

```
gtpc ran-procedure-ready-delay timeout 20
```

gtpu echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-U Echo packets are sent from the GGSN service to the SGSN.

This command is obsolete, however, it is supported with older configuration for backward compatibility.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpu echo-interval time_interval
```

```
no gtpu echo-interval
```

no

Disables the sending of GTPv1-U Echo packets.

time_interval

Default: 60

Specifies the frequency at which the GGSN service sends GTPv1-C Echo packets to the SGSN(s) it is configured to communicate with.

time_interval is measured in seconds and can be configured to any integer value between 60 and 3600.

Usage

GTPv1-C Echo packets are used to detect whether SGSNs that the GGSN service is communicating with, has become unresponsive or has rebooted. Use this command to adjust the rate at which the GGSN sends these packets.

If the GGSN discovers that an SGSN has become unresponsive, it will terminate all PDP contexts that had been established with the SGSN.

Example

The following command configures the GGSN service to send GTPv1-U Echo packets every 120 seconds:

```
gtpu echo-interval 120
```

gtpu reorder

Configures packet data reordering for the GGSN service.

This command is obsolete, however, it is supported with older configuration for backward compatibility.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpu reorder { context { ppp } | sequence-numbers { ipv4 | ppp | ipv4-ppp | ppp-
ipv4 } | timeout time }
```

```
[ no ] gtpu reorder { context | sequence-numbers { ipv4 | ppp | ipv4-ppp | ppp-
ipv4 } }
```

no

Disables the re-ordering of GTPU packets.

context { ppp }

Default: Disabled

Enables the GGSN service to re-order PPP data packets based on the sequence numbers inserted by the SGSN.

sequence-numbers { ipv4 | ppp | ipv4-ppp | ppp-ipv4 }

Default: Disabled

Enables the GGSN service to insert sequence numbers into the data packets that it sends to the SGSN.

The insertion of sequence numbers can be controlled for specific PDP context types. The following PDP context types can be specified:

- **ipv4** : Enables re-ordering for IP PDP context types
- **ppp** : Enables re-ordering for PPP PDP context types
- **ipv4-ppp** : Enables re-ordering for both IP and PDP context types
- **ppp-ipv4**: The same as ipv4-ppp, enables re-ordering for both IP and PDP context types

Important: If packet re-ordering is enabled using the **gtpu reorder context** command, sequence numbers are automatically be added regardless of this command.

timeout time

Default: 100 milliseconds

If re-ordering is enabled, this option specifies the amount of time that the GGSN should wait prior to sending re-sequenced data packets stored in queue.

time is measured in milliseconds and can be configured to any integer value between 0 and 5000. A timeout of "0" indicates that only packets arriving in sequence are processed and the accepted sequence number is

updated for each in-sequence packet. Packets are not queued. Packets arriving with seq number less than the accepted sequence number are discarded.

Usage

Use this command to control data packet re-ordering between the GGSN and SGSN.

If re-ordering is enabled for the GGSN service, the GGSN informs the SGSN to also reorder the data packets from the GGSN. The GGSN informs the SGSN in the create PDP context response. The GGSN and SGSN optionally insert sequence numbers into the data packets that they send.

Example

The following command specifies that the GGSN service re-sequences data packets received from the SGSN for PPP PDP context types:

```
gtpu reorder context ppp
```

The following command specifies that the GGSN service inserts sequence numbers for both IP and PPP PDP context types into data packets it is sending to the SGSN for PPP PDP context types:

```
gtpu reorder sequence-numbers ppp-ipv4
```

gtpu udp-checksum insert

This command enables/disables the insertion of UDP checksum in outgoing UDP data packets. By default checksum insertion is enabled.

This command is obsolete, however, it is supported with older configuration for backward compatibility.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] gtpu udp-checksum insert
```

no

Disables insertion of UDP checksum in outgoing UDP data packets.

default

Enables the insertion of UDP checksum in outgoing UDP data packets.

Usage

Use this command to enable or disable the system to insert UDP checksum in outgoing UDP data packets.

Example

The following command specifies that the GGSN service will insert the UDP checksum into outgoing UDP data packets:

```
gtpu udp-checksum insert
```

guard-interval

Configures the time period after which a redundant PDP context request received from an SGSN is treated as a new request rather than a re-send of a previous request.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
guard-interval guard_time
```

```
no guard-interval
```

no

Disables the guard-interval function for the GGSN service.

guard_time

Default: 100

Specifies the amount of time that must pass before a GGSN service treats a redundant PDP context request as a new request instead of a re-send of a previous request.

guard_time is measured in seconds and can be configured to any integer value between 10 and 3600.

Usage

The guard interval is used to protect against replay attacks. Without a guard interval configured, information from a valid PDP context request could be used to gain un-authorized network access.

If the GGSN service receives a PDP context request in which the International Mobile Subscriber Identity (IMSI), the Network Service Access Point Identifier (NSAPI), the end user IP address, and the GTP sequence number are identical to those received in a previous request, the GGSN treats the new request as a re-send of the original. Therefore, information from a valid PDP context request could be collected and re-sent at a later time by an un-authorized user to gain network access.

Configuring a guard interval limits the amount of time that the information contained within a PDP context request remains valid.

Example

The following command configures the GGSN service with a guard interval of 60 seconds:

```
guard-interval 60
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Gn interfaces' GTPC socket for GTPv1.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip local-port gtpc-v1 port#
```

```
gtpc-v1 port#
```

Default: 2123

Specifies the UDP port number for GTPv1 GTPC sockets.

port# can be configured to any integer value between 1 and 65535.

Usage

By default, the GGSN service attempts to use GTPv1 when communicating with SGSNs. This parameter configures the UDP port over which the GTP control (GTPC) sockets are sent.

If an SGSN only supports GTPv0, the GGSN service automatically switches to GTPv0 when communicating with this SGSN. In the scenario, the GGSN service communicates with the SGSN on UDP port 3386 and does not have a GTPC socket.

Important: The UDP port setting on the SGSN must match the local-port setting for the GGSN service on the system in order for the two devices to communicate.

Example

The following command configures the GGSN service to use UDP port 2500 for exchanging GTPC sockets with SGSNs when using GTPv1:

```
ip local port 2500
```

ip qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Gn interface.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip qos-dscp { qci { 1 { dscp } | 2 { dscp } | 3 { dscp } | 4 { dscp } | 5 { dscp
| allocation-retention-priority } | 6 { dscp | allocation-retention-priority } |
7 { dscp | allocation-retention-priority } | 8 { dscp | allocation-retention-
priority } | 9 { dscp } } | gtpc } +
```

```
no ip qos-dscp { qci { 1 | 2 | 3 | 4 | 5 { allocation-retention-priority | dscp
} | 6 { allocation-retention-priority | dscp } | 7 { allocation-retention-
priority | dscp } | 8 { allocation-retention-priority | dscp } | 9 } | gtpc } +
```

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QoS profile.

allocation-retention-priority can be the integers 1, 2, or 3.

DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QoS profile.

The following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 19. Default DSCP Value Matrix

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	ef	ef	ef
3	af21	af21	af21
	af21	af21	af21

qci

Configures the qci attribute of QoS. Here the *qci_val* is the QCI for which the negotiate limit is being set, it ranges from 1 to 9.

dscp

Default QCI:

- 1: ef
- 2: ef
- 3: af11
- 4: af11
- 5: ef
- 6: ef
- 7: af21
- 8: af21
- 9: be

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• af11: Assured Forwarding 11 per-hop-behavior (PHB)	• af32: Assured Forwarding 32 PHB
• af12: Assured Forwarding 12 PHB	• af33: Assured Forwarding 33 PHB
• af13: Assured Forwarding 13 PHB	• af41: Assured Forwarding 41 PHB
• af21: Assured Forwarding 21 PHB	• af42: Assured Forwarding 42 PHB
• af22: Assured Forwarding 22 PHB	• af43: Assured Forwarding 43 PHB
• af23: Assured Forwarding 23 PHB	• be: Best effort forwarding PHB
• af31: Assured Forwarding 31 PHB	• ef: Expedited forwarding PHB

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the outer IP header of every GTP data packet. The diffserv marking of the inner IP header is not modified.

The traffic patterns are defined by QCI (1 to 9). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables :

Table 20. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
High	af13	af23	af33	af43

Table 21. DSCP Precedence

Precedence (low to high)	DSCP
0	Best Effort (be)
1	Class 1
2	Class 2
3	Class 3
4	Class 4
5	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command. The no ip qos command can be issued to remove a QOS setting and return it to its default setting.

Example

The following command configures the DSCP level for QCI to be Expedited Forwarding, **ef**:

```
ip qos-dscp qci 1 ef
```

max-retransmissions

Configures the maximum number of times that GTP control packets are retransmitted to an SGSN before it marks it unreachable.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
max-retransmissions max_number
```

max_number

Default: 4

Indicates the maximum number of times that GTP control packets are retransmitted.

max_number can be configured to any integer value between 0 and 15.

Usage

This command is used in conjunction with the **timeout** command to control the retransmission of GTP control packets when no response is received from an SGSN. It is equivalent to the N3-REQUESTS parameter discussed in 3GPP TS 29.060.

If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of this command.

If the max-retransmissions value is exceeded, the GGSN records a "Path Failure" for that SGSN and releases all PDP contexts associated with it.

Example

The following command configures the maximum number of retransmissions to 8:

```
max-retransmissions 8
```

mbms policy

This command enables/disables the MBMS user service support for Multicast and/or Broadcast mode. It also specifies the policy for MBMS user service mode.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
mbms policy { multicst broadcast | none }
```

```
[ no | default ] mbms policy
```

no

Removes/disables the configured MBMS support for Multicast and/or Broadcast mode in this GGSN service.

default

Restores the default mode of MBMS support in this GGSN service.

multicst broadcast

Enables the MBMS support and configures the policy for multicast and broadcast of user service.

Usage

Use this command to enable/disable the MBMS user service support for Multicast and/or Broadcast mode. It also specifies the policy for MBMS user service mode.

Example

The following command enables the MBMS support in this GGSN service:

```
mbms policy multicast broadcast
```

newcall

This command enables/disables the new call related behavior of GGSN service when duplicate sessions with same IP address request is received. This feature is required to support the interworking with P-GW and HA.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] newcall duplicate-subscriber-requested-address { accept | reject }
```

default

Restores the default mode for new call session with same address request received in this GGSN service. It sets the new call related behavior to reject call with duplicate address request.

accept

Sets the system to “accept” the another session using same IP address for new call. New session will be accepted and old session will be torn down.

Default: Disabled

reject

Reject new call with duplicate address request. This is the default behavior.

Default: Enabled

Usage

Use this command to enable/disable to support the new connection where UE is not able to gracefully disconnect from the Enterprise PDN before it attempts to reconnect via another access method. The Enterprise xGW (GGSN) shall be able to tear down the old session in order to accept the new connection with the same IP address assignment.

By use of this feature GGSN will allow accepting request for static subscriber address, even if address is already used by another session. If this feature is not enabled, then new request with same IP address for another session will be rejected.

Important: This command is a license-enabled feature.

Example

The following command allows the GGSN to accept the duplicate call session request with same IP address:

```
newcall duplicate-subscriber-requested-address accept
```

path-failure

Determines the GTP path-failure behavior on echo/non-echo messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
path-failure detection-policy gtp { echo [ non-echo ] | non-echo [ echo ] }
[no | default] path-failure detection-policy
```

no

No defined detection policy means path-failures are not detected.

default

Use the default command to set the path-failure detection-policy to gtp in echo mode.

```
detection-policy gtp {echo [non-echo] | non-echo [echo] }
```

Detection-policy is the policy to be used when path-failure is in the default active state. GTP messages are either gtp(u) (user) or gtp(c) (control) type, and the gtp keyword takes either echo or non-echo as message type.

echo: gtp(u) or gtp(c) message.

non-echo: a message type other than gtp(u) or gtp(c).

Usage

Under current circumstances, a GGSN shuts down the GTP tunnel if the associated SGSN does not respond to multiple retries of an echo or non-echo message from the GGSN. In this way, a single call failure could be responsible for the loss of all active calls in the tunnel.

This is also an issue when echo is disabled, or when there is very little traffic on the SGSN and the GGSN is configured with large echo intervals.

This behavior adversely impacts the user experience because the customer has to reconnect every time this happens with their SGSN.

Example

The following example detects path failures when the SGSN fails to respond to multiple echo message retries:

```
path-failure detection-policy gtp echo
```

The following example turns off path-failure detection. On timeout of gtp(c) message retries, the particular context will be purged:

```
no path-failure detection-policy
```

■ path-failure

plmn id

Configures the GGSN's public land mobile network (PLMN) identifiers. Up to five PLMN IDs can be configured for each GGSN service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_number* **mnc** *mnc_number* [**primary**]

no plmn id mcc *mcc_number* **mnc** *mnc_number*

no

Removes a previously configured PLMN identifier for the GGSN service.

mcc *mcc_number*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.

mcc_number is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_number*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.

mnc_number is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

primary

When multiple PLMN IDs are configured the **primary** keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute (3GPP-GGSN-MCC-MNC).

Usage

The PLMN identifier is used to aid the GGSN service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple GGSN services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each GGSN Service.

Example

The following command configures the PLMN identifier with an MCC of 462 and MNC of 2:

```
plmn id mcc 462 mnc 02
```

plmn unlisted-sgsn

Configures the GGSN's policy for handling communications from SGSNs that it is not configured to communicate with.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] plmn unlisted-sgsn { foreign [ disable-gtpc-echo ] [ reject-foreign-subscriber ] | home [ disable-gtpc-echo ] | reject }
```

default

Resets configured parameters to their default settings.

foreign

Default: Disabled

Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the sgsn command.

This keyword also dictates that unlisted SGSNs are treated as if they belong to a foreign PLMN. Therefore PDP contexts originating from them are treated as visiting or roaming.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.

When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

reject-foreign-subscriber

Default: Disabled

Specifies that incoming calls from foreign subscribers are rejected.

home

Default: Disabled

Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the sgsn command.

This keyword also dictates that unlisted SGSNs are treated as if they belong to the GGSN service's home PLMN.

reject

Default: Enabled

Specifies that the GGSN service rejects messages from SGSNs that are not configured within the service using the sgsn command.

When the GGSN service rejects the message(s), it returns a cause code of No Resources 199 (C7H, No resources available).

Usage

This command works in conjunction with the **sgsn** command that configures the GGSN service to communicate with specific SGSNs. Any messages received from SGSNs not configured in that list are subject to the rules dictated by the **unlisted-sgsn** policy.

Example

The following command configures the GGSN service to accept messages from unlisted SGSNs and treat the SGSN as if it is on the GGSN's home network:

```
plmn unlisted-sgsn accept home
```

policy

Specifies the reject code to be used in the "Create PDP Context" response message when a RADIUS server timeouts.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
policy { accounting-server-timeout use-reject-code { system-failure | no-
resources } | authentication-server-timeout use-reject-code { system-failure |
user-authentication-failure } }
```

```
[ default ] policy { authentication-server-timeout | accounting-server-timeout }
```

default

Restores the specified parameter to its default setting.

```
accounting-server-timeout use-reject-code { system-failure | no-resources
}
```

Default: **no-resources**

Specifies the reject code used by the GGSN if communication with an accounting server times out. The possible reject codes are:

- system-failure (204 (CCH))
- no-resources (199 (C7H))

```
authentication-server-timeout use-reject-code {system-failure | user-
authentication-failure }
```

Default: **user-authentication-failure**

Specifies the reject code used by the GGSN if communication with an authentication server times out. The possible reject codes are:

- system-failure (204 (CCH))
- user-authentication-failure (209 (D1H))

Usage

This command is used to configure the cause code used by the GGSN if communication with either a RADIUS authentication or accounting server times out.

When this parameter is used in conjunction with Radius accounting servers, the response is only set if a flag is configured in the APN Delay GTP Response, only after getting a response to the Accounting Start.

Example

The following command configures the GGSN response to a RADIUS authentication server timeout to be system-failure:

```
policy authentication-server-timeout use-reject-code system-failure
```

retransmission-timeout

Configures the timeout period in between retransmissions of GTP control packets. This timeout configuration is not applicable on Echo Request retransmission.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
retransmission-timeout retransmit_time
```

retransmit_time

Default: 5

Specifies the amount of time that must pass without an SGSN response before the GGSN service retransmits GTP control packets.

retransmit_time is measured in seconds and can be configured to any integer value between 1 and 20.

Usage

This command is used in conjunction with the **max-retransmissions** command to control the retransmission of GTP control packets when no response is received from an SGSN.

If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of the **max-retransmissions** command.

If the **max-retransmissions** value is exceeded within the **retransmission-timeout** period, the GGSN records a "Path Failure" for that SGSN and releases all PDP contexts associated with it.

Important: This retransmission timeout configuration is not applicable for Echo Requests message retransmission. Echo are sent/retransmitted every echo interval, which can be configured separately.

Example

The following command configures a timeout value of 20 seconds:

```
retransmission-timeout 20
```

setup-timeout

Configures the maximum amount of time the GGSN service allows for the setting up of PDP contexts.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
setup-timeout setup_time
```

setup_time

Default: 60

Specifies the maximum amount of time the GGSN service allows for the setting up of PDP contexts.

setup_time is measured in seconds and can be configured to any integer value between 1 and 6000.

Usage

Use this command to limit the amount of time allowed for setting up PDP contexts. If the PDP context is not setup within the configured time frame, the GGSN service rejects the PDP context with a cause code of 199 (C7H, No resources available).

Example

The following command allows a maximum of 120 seconds for the setting up of PDP contexts:

```
setup-timeout 120
```

sgsn address

Configures the SGSNs that this GGSN service is allowed to communicate with.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn address { { ip_address [ subnetmask netmask ] } | ip_address/netmask } [
plmn-foreign [ reject-foreign-subscriber ] | mcc mcc_code mnc mnc_code [ reject-
foreign-subscriber ] ] [ rat-type { GAN | GERAN | HSPA | UTRAN | WLAN } ] [
description description ] [ disable-gtpc-echo ]

[ no ] sgsn { address ip_address [ subnetmask netmask ] }
```

no

Removes a specific SGSN from the list or all configured SGSNs.

address

Configures the IP address of the SGSN.

ip_address must be expressed in dotted decimal notation.

subnetmask

Configures the subnet mask of the SGSN.

netmask must be expressed in dotted decimal notation.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.

When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign

Indicates whether or not the SGSN belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber

Default: Disabled

Specifies that incoming calls from foreign subscribers are rejected.

mcc *mcc_code*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.

mcc_code is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_code*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.

mnc_code is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

rat-type { **GAN** | **GERAN** | **HSPA** | **UTRAN** | **WLAN** }

This keyword configures the type of radio access technology.

GAN: Specifies the Generic Access Network type of RAT.

GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.

HSPA: Specifies the High Speed Packet Access type of RAT.

UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.

WLAN: Specifies the Wireless Local Access Network type of RAT.

description *description*

Add description field to the SGSN entry in GGSN service.

description is a string of 1 to 63 alpha and/or numeric characters.

Usage

Use this command to configure a list of SGSNs that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSNs.

Important: The GGSN only communicates with the SGSNs configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the **plmn-unlisted-sgsn** command.

Example

The following command configures the GGSN to communicate with an SGSN on a foreign PLMN with an IP address of 192.168.1.100 and subnet mask of 255.255.255.0:

```
sgsn address 192.168.1.100 subnetmask 255.255.255.0 plmn-foreign
```

sgsn define-multiple-address-group

This keyword defines an SGSN Multiple Address Group and enters SGSN Multiple Address Group Configuration mode. Whenever there is a change in the control address in a GTPC UPC message, it is treated as an inter-SGSN handoff because an SGSN is usually identified uniquely by a single IP-address. This command supports a multiple address group feature which allows you to specify a set of addresses that specify a single SGSN. When a UPC handoff is received from any address in the group, it is treated as an intra-SGSN handoff.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] sgsn define-multiple-address-group grp_name
```

no

Removes a specific SGSN Multiple Address Group from the list GGSN service configuration.

grp_name

Specifies the name of an SGSN multiple address group to create or configure.
must be an alphanumeric string from 1 through 63 characters in length.

Usage

Use this command to create or configure an SGSN Multiple Address Group that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSN Multiple Address Groups.

Example

The following command creates an SGSN Multiple Address Group named sgsngrp1 enters *SGSN Multiple Address Group Configuration* mode:

```
sgsn define-multiple-address-group sgsngrp1
```

sgsn multiple-address-group

Configures the SGSN multiple address groups that this GGSN service is allowed to communicate with.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn multiple-address-group grp_name [ disable-gtpc-echo ] [ mcc mcc_code mnc
mnc_code [ reject-foreign-subscriber ] ] [ plmn-foreign [ reject-foreign-
subscriber ] [ rat-type { GAN | GERAN | HSPA | UTRAN | WLAN } ] [ description
description ]
```

```
no sgsn multiple-address-group grp_name
```

no

Removes a specific SGSN multiple address group from the list of configured SGSN multiple address groups.

grp_name

Specifies the name of a configured SGSN multiple address group to use.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.

When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign

Indicates whether or not the SGSN multiple address group belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber

Default: Disabled

Specifies that incoming calls from foreign subscribers are rejected.

mcc *mcc_code*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.

mcc_code is the PLMN MCC identifier and can be configured to any integer value between 100 and 999.

mnc *mnc_code*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.

mnc_code is the PLMN MNC identifier and can be configured to any 2 or 3 digit integer value between 00 and 999.

```
rat-type { GAN | GERAN | HSPA | UTRAN | WLAN }
```

This keyword configures the type of radio access technology.

GAN: Specifies the Generic Access Network type of RAT.

GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.

HSPA: Specifies the High Speed Packet Access type of RAT.

UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.

WLAN: Specifies the Wireless Local Access Network type of RAT.

description *description*

Add a description field to the SGSN multiple address group entry in the GGSN service configuration. *description* must be a string of 1 through 63 alphanumeric characters.

Usage

Use this command to configure a list of SGSN multiple address groups that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSN multiple address groups.

Important: The GGSN only communicates with the SGSN multiple address groups configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the **plmn unlisted-sgsn** command.

Example

The following command configures the GGSN to communicate with an SGSN with multiple address that is defined by an SGSN multiple address group named sgsngrp1 that is on a foreign PLMN:

```
sgsn multiple-address-group sgsngrp1 plmn-foreign
```

trace-collection-entity

This command configures the trace collection entity IP address. Trace collection entity is the destination node in Network management where trace files are transferred to and stored.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
trace-collection-entity IPv4_addr
```

```
[no] trace-collection-entity
```

no

Removes the configured IPv4 address for trace collection in this GGSN service.

IPv4_addr

Specifies the IP address in dotted decimal notation.

Usage

Use this command to configure the trace collection entity IP address. This configuration is required because during signaling session trace activation, CPC REQ and UPC REQ do not provide the IP address of trace collection entity.

Example

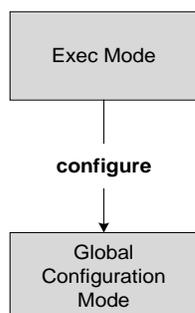

The following command configures the trace collection entity IP address with this GGSN service:

```
trace-collection-entity 192.36.56.56
```

Chapter 117

Global Configuration Mode Commands

The Global Configuration Mode is used to configure basic system-wide parameters.

aaa accounting-overload-protection

This command configures Overload Protection Policy for accounting requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting-overload-protection prioritize-gtpp  
{ default | no } aaa accounting-overload-protection
```

default

Configures the default setting.
Default: no priority assigned

no

Disables the Overload Protection configuration.

prioritize-gtpp

Specifies to give higher priority to GTPP requests among the other outstanding requests. So while purging the lower priority requests will be selected first.

Usage

Use this command to configure Overload Protection Policy for accounting requests.

Example

The following command prioritizes GTPP requests among the other outstanding requests:

```
aaa accounting-overload-protection prioritize-gtpp
```

aaa default-domain

Configure global accounting and authentication default domain for subscriber and context-level administrative user sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa default-domain { administrator | subscriber } domain_name  
no aaa default-domain { administrator | subscriber } [ domain_name ]
```

no

Removes all or only the specified configured domain.

administrator | subscriber

administrator: Configures the default domain for context-level administrative users.

subscriber: Configures the default domain for subscribers.

domain_name

Specifies the context which is to be set as the default. *domain_name* must be from 1 to 79 alpha and/or numeric characters with no spaces.

Usage

This command configures the default domain which is used when accounting and authentication services are required for context-level administrative user and subscriber sessions whose user name does not include a domain.

Example

The following commands configure the default domains for context-level administrative users and subscribers, respectively:

```
aaa default-domain administrator sampleAdministratorDomain
```

```
aaa default-domain subscriber sampleSubscriberDomain
```

The following command removes the *sampleSubscriberDomain* domain:

```
no aaa default-domain subscriber sampleSubscriberDomain
```

aaa domain-matching ignore-case

This command disables case sensitivity when performing domain matching. When this command is enabled, the system disregard case when matching domains.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa domain-matching ignore-case
```

```
default aaa domain-matching
```

default

Configures ignore-case as the domain matching method.

no

Specifies that the system consider case when domain matching.

Usage

Use this command to configure the system to ignore case when matching domains.

Example

The following command configures the system to ignore case when matching domains:

```
aaa domain-matching ignore-case
```

aaa domain-matching imsi-prefix

This command enables domain lookup for session based on the IMSI prefix length. Default: Disabled

Important: This command is only available in Release 8.3 and later.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa domain-matching imsi-prefix prefix-length prefix_length
```

```
no aaa domain-matching imsi-prefix
```

no

Specifies the system must not consider imsi-prefix domain matching method.

prefix_length

Specifies the IMSI length to be matched with the domain.

prefix_length must be an integer from 1 through 15.

Usage

Use this command to configure the IMSI-prefix method of domain matching. This command enables domain lookup for the session based on the IMSI prefix length. If there is a domain configured with the matching IMSI prefix, the associated configuration is used.

This feature does not support partial matches.

Example

The following command configures the IMSI prefix method for domain matching setting the prefix length to 10.

```
aaa domain-matching imsi-prefix prefix-length 10
```

aaa large-configuration

This command enables/disables the system to accept a large number of RADIUS configurations to be defined and stored.

Important: For this command to take affect, after entering the command the configuration must be saved and reloaded.

When aaa large-configuration is disabled, the following restrictions are in place:

- Only one (1) NAS IP address can be defined per context with the **radius attribute** command.
- The RADIUS attribute **nas-ip-address** can only be configured if the RADIUS group is **default**.
- Only 320 RADIUS servers can be configured system-wide.
- Only 64 RADIUS groups can be configured system-wide.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa large-configuration
```

```
no aaa large-configuration
```

```
no
```

Disables AAA large configuration support.

Usage

When aaa large-configuration is enabled, the system provides the ability to configure multiple NAS IP addresses in a single context to used with different radius groups. As well, the command allows support for up to 1600 RADIUS server configurations and for a PDSN a maximum of 400 or for a GGSN a maximum of 800 RADIUS server group configurations system-wide.

Example

To enable the definition of a large number of RADIUS configurations, enter the following commands in the following order:

In APN Configuration mode, enter:

```
default aaa group
```

In Global Configuration mode, enter:

```
aaa large-configuration
```

In Exec mode, use the **save configuration** command and then the **reload** command.

aaa last-resort

Configure global accounting and authentication last resort domain for subscriber and context-level administrative user sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa last-resort context { administrator | subscriber } context_name
```

```
no aaa last-resort context { administrator | subscriber } [ context_name ]
```

no

Removes all or only the specified previously configured authentication last resort domain name.

administrator | subscriber

administrator: Configures the last resort domain for context-level administrative.

subscriber: Configures the last resort domain for the subscribers.

context_name

Specifies the context which is to be set as the last resort. *context_name* must be from 1 to 79 alpha and/or numeric characters with no spaces.

Usage

Set the last resort context which is used when there is no applicable default domain (context) and there is no domain provided with the subscriber's or context-level administrative user's name for use in the AAA functions.

Example

The following commands configure the last resort domains for context-level administrative user and subscribers, respectively:

```
aaa last-resort administrator sampleAdministratorDomain
```

```
aaa last-resort subscriber sampleSubscriberDomain
```

The following command removes the previously configured domain called *sampleAdministratorDomain*:

```
no aaa last-resort administrator sampleAdministratorDomain
```

aaa username-format

Configure global accounting and authentication user name formats for AAA functions. Up to six formats may be configured.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa username-format { domain | username } separator
```

```
no aaa username-format { domain | username } separator
```

no

Removes the specified user name format from the configuration.

domain | username

Default: username @

domain: indicates the left side of the string from the separator character is a domain name and the right side is the user name.

username: indicates the left side of the string from the separator character is a user name and the right side is the domain name.

Important: The user name string is always searched from right to left for the first occurrence of the separator character.

separator

Specifies the character to use for delimiting the domain from the user name for global AAA functions as one of: @, %, -, \, #, or /. Note: to specify a slash (/) as the separator it is necessary to enter a double slash (//) on the command line.

Usage

Define the formats for user name delimiting if certain domains or groups of users are to be authenticated based upon their user name versus domain name.

Example

```
aaa username-format domain @  
  
aaa username-format username %  
  
no aaa username-format username %
```

■ aaa username-format

active-charging service

This command creates/selects an Active Charging Service.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
active-charging service acs_service_name [ -noconfirm ]
```

```
no active-charging service acs_service_name
```

no

Removes the specified Active Charging Service.

acs_service_name

Creates/selects the specified ACS Service, and changes to the ACS Configuration Mode wherein the ACS service can be configured.

acs_service_name must be the name of an ACS service, and must be an alpha and/or numeric string of 1 through 15 characters in length.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/select an ACS service in the system.

Use this command after enabling ACS using the **require active-charging** command. This command allows administrative users to configure the ACS functionality.

Example

The following command creates an ACS service named *test*:

```
active-charging service test
```

alarm

Enables/disables alarming options for the switch processor card internal alarms and the central-office external alarms. To verify the state of the alarms, refer to the **show alarm** command.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
alarm { audible | central-office }
```

```
no alarm { audible | central-office }
```

no

Disables the option specified.

audible | central-office

audible: indicates the internal audible alarm on the switch processor cards are to be enabled.

central-office: indicates the central office alarms are to be enabled.

Usage

Disable CO and audible alarms when an existing device provides such capability.

Example

The following commands enable the SMC internal alarm and disable the central office alarms, respectively.

```
alarm audible
```

```
no alarm central-office
```

apn-profile

Creates an instance of an APN profile.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] apn-profile apn_profile_name
```

no

Deletes the APN profile instance from the configuration.

apn_profile_name

Specifies the name of the APN profile. Enter a string of 1 to 64 alphanumeric characters.

Usage

Use this command to create an instance of an APN profile and to enter the APN profile configuration mode. An APN profile is a template which groups a set of APN-specific commands that may be applicable to one or more APNs. See the *APN Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: An APN profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what APN profiles have already been created, return to the Exec mode and enter the **show apn-profile all** command.

Example

The following command creates a configuration instance of an APN profile:

```
apn-profile apnprof27
```

apn-remap-table

Creates an instance of an APN remap table.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] apn-remap-table apn_remap_table_name
```

no

Deletes the APN remap table instance from the configuration.

apn_remap_table_name

Specifies the name of the APN remap table. Enter a string of 1 to 65 alphanumeric characters.

Usage

Use this command to create an instance of an APN remap table and to enter the APN remap table configuration mode. An APN remap table includes entries that define how an incoming APN, or the lack on one, will be handled. See the *APN Remap Table Configuration Mode Commands* chapter for information regarding the definition of the entries contained within the table and the use of the table.

Important: An APN remap table is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what APN remap tables have already been created, return to the Exec mode and enter the **show apn-remap-table all** command.

Example

The following command creates a configuration instance of an APN remap table:

```
apn-remap-table apnremap-USorigins-table1
```

arp

Configures a system-wide time interval for performing Address Resolution Protocol (ARP) refresh.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
arp base-reachable-time time
```

```
default arp base-reachable-time
```

default

Restores the parameter to its default setting.

time

Default: 30

Specifies the ARP refresh interval (in seconds). The range is 30 to 86400 seconds.

Usage

Use this command to configure a system-wide ARP refresh interval. Once a neighbor is found, the entry is considered valid for at least a random value between the $time/2$ and the $time*1.5$.

Example

The following command configures an ARP refresh interval of 1 hour:

```
arp base-reachable-time 3600
```

autoconfirm

This command disables or enables confirmation for certain commands. This command affects all future CLI sessions.

Important: To change the behavior for the current CLI session only, use the **autoconfirm** command in the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator, Operator

Syntax

autoconfirm

no autoconfirm

Usage

When autoconfirm is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When autoconfirm is disabled the confirmation questions never appear. Disabling autoconfirm disables command confirmation for all future CLI sessions.

By default **autoconfirm** is enabled.

Example

The following command enables command confirmation for all future CLI sessions;

```
autoconfirm
```

The following command disables command confirmation for all future CLI sessions;

```
no autoconfirm
```

autoless

This command is obsolete. It is included in the CLI for backward compatibility with older configuration files. When executed, this command issues a warning and performs no function.

Product

All

Privilege

Security Administrator, Administrator

Syntax`autoless``no autoless`

banner

Configures the CLI banner which is displayed upon the initialization of a CLI session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
banner { charging-service | lawful-intercept | motd | pre-login } string
```

```
no banner { charging-service | lawful-intercept | motd | pre-login }
```

no

Removes the banner message by setting it to be string of zero length.

charging-service

Specifies the Active Charging Service banner message. That banner is displayed upon the initialization of an SSH CLI session with ACS-admin privileges (whenever anyone with the CLI privilege bit for ACS logs in.

lawful-intercept

Refer to the *Cisco ASR 5000 Lawful Intercept Configuration Guide* for a description of this parameter.

motd

Configures the CLI banner message of the day which is displayed upon the initialization of any CLI session.

pre-login

Configures the CLI banner displayed before a CLI user logs in.

Important: This banner is displayed only for serial port and telnet log ins. It is not supported in ssh and, therefore, will not be displayed before ssh log ins.

string

Specifies the banner or message to be displayed at session initialization. *string* may be from 0 to 2048 characters and must be enclosed in double quotation marks if the banner or message is to include spaces.

Usage

Set the message of the day banner when an important system wide message is needed. For example, in preparation for removing a chassis from service, set the banner 1 or more days in advance to notify administrative users of the pending maintenance.

Example

```
banner motd "Have a nice day."
```

```
banner motd No_News_Today
```

```
no banner motd
```

boot delay

Configures the delay period, in seconds, before attempting to boot the system from a software image file residing on an external network server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
boot delay time
```

```
no boot delay
```

no

Deletes the setting for the boot delay. The boot process executes immediately.

time

Specifies the amount of time (in seconds) to delay prior to requesting the software image from the external network server. The range is 1 to 300 seconds.

Usage

Useful when booting from the network when connection delays may cause timeouts. Such as when the Spanning Tree Protocol is used on network equipment.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following sets the boot delay to 10 seconds:

```
boot delay 10
```

boot interface

Configures the Switch Processor I/O card network interfaces for obtaining a system software image during the system boot process.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
boot interface { spio-eth1 | spio-eth2 } [ medium { auto | speed medium_speed duplex medium_duplex } [ media medium_media ] ]
```

```
no boot interface
```

no

Removes the boot interface configuration from the boot.sys file. Only files from the local file system can be loaded.

spio-eth1 | **spio-eth2**

Specifies the network interface to be configured where **spio-eth1** is the primary interface on the SPIO (slot 24 interface 1 or slot 25 interface 1) and **spio-eth2** is the secondary interface on the SPIO (slot 24 interface 2 or slot 25 interface 2). The interfaces refer to either the RJ-45 interfaces for speeds of 10, 100, or 1000 megabit per second (Mbps) or the SFP interface for the optical gigabit (1000 Mbps) interface.

medium { **auto** | **speed** *medium_speed* **duplex** *medium_duplex* }

Default: auto

auto: configures the interface to auto-negotiate the interface speed, and duplex.

speed *medium_speed* **duplex** *medium_duplex*: specifies the speed to use at all times where *medium_speed* must be one of:

- 10
- 100
- 1000

The keyword **duplex** is used to set the communication mode of the interface where *medium_duplex* must be one of:

- full
- half

media *medium_media*

Default: rj45

Optionally sets the physical interface where *medium_media* must be either rj45 or sfp.

Usage

boot interface

Modify the boot interface settings to ensure the system is able to obtain a software image from an external network server.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following configures the primary interface to auto-negotiate the speed.

```
boot interface spio-eth1 medium auto
```

The following command configures the secondary interface to a fixed gigabit speed at full duplex using RJ45 connectors for the physical interface.

```
boot interface spio-eth2 medium speed 1000 duplex full media rj45
```

The following restores the defaults for the boot interface.

```
no boot interface
```

boot nameserver

Configures the IP address of the DNS (Domain Name Service) server to use when looking up hostnames in URLs for network booting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
boot nameserver ip_address
```

```
no boot nameserver
```

ip_address

IPv4 address of the DNS server the system uses to lookup hostnames in URLs for a software image from the network during the system boot process.

no

Removes the network boot nameserver information from the boot.sys file.

Usage

Use this command to identify the DNS server to use to lookup hostnames in a software image URL.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following configures the system to communicate with a DNS nameserver with the IP address of 1.2.3.4:

```
boot nameserver 1.2.3.4
```

boot networkconfig

Configures the networking parameters for the Switch Processor I/O card network interfaces to use when obtaining a software image from an external network server during the system boot process.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
boot networkconfig { dhcp | { { dhcp-static-fallback | static } ip address
spio24 ip_address [ spio25 ip_address ] netmask ip_mask [ gateway gw_address ]
}
```

```
no boot networkconfig
```

no

Removes the network configuration information from the boot.sys file.

dhcp

Indicates that a Dynamic Host Control Protocol (DHCP) server is used for communicating with the external network server.

dhcp-static-fallback | static

dhcp-static-fallback: provides static IP address fallback network option when a DHCP server is unavailable.

static: specifies a fixed network IP address for the external network server that hosts the software image.

```
spio24 ip_address [ spio25 ip_address ] netmask ip_mask [ gateway
gw_address ]
```

spio24 ip_address [spio25 ip_address]: the IP address to use for the SPIO in slot 24 and optionally the SPIO in slot 25 for network booting. *ip_address* must be specified using the standard IPv4 dotted-decimal notation.

netmask ip_mask: the network mask to use in conjunction with the IP address(es) specified for network booting. *ip_mask* must be specified using the standard IPv4 dotted-decimal notation.

gateway gw_address: the IP address of a network gateway to use in conjunction with the IP address(es) specified for network booting. *gw_address* must be specified using the standard IPv4 dotted-decimal notation.

Important: If *gw_address* is not specified, then the network server must be on the same LAN as the system. Since both SPIOs must be in the same network, the netmask and gateway settings are shared.

Usage

Configure the network parameters for the ports on the SPIO cards to use to communicate with an external network server that hosts software images.

 **Important:** The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

 **Important:** When configuring static addresses both SPIOs must have different IP addresses. Neither address can be the same as the local context IP address.

Example

The following configures the system to communicate with the external network server via DHCP with a fallback to IP address 1.2.3.4, respectively.

```
boot networkconfig dhcp-static-fallback ip address spio24 192.168.100.10
netmask 255.255.255.0
```

The following command configures the system to communicate with an external network server using the fixed (static) IP address 1.2.3.4 with a network mask of 255.255.255.0.

```
boot networkconfig static ip address spio24 192.168.100.10 netmask
255.255.255.0
```

The following restores the system default for the network boot configuration options.

```
no boot networkconfig
```

boot system priority

Specifies the priority of a boot stack entry to use when the system first initializes or restarts. Up to 10 boot system priorities (entries in the boot.sys file located on the /flash device in the SMC) can be configured.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
boot system priority number image image_url config config_path
```

```
no boot system priority number
```

no

Remove a boot stack entry at the priority specified from the boot stack when it is no longer used.

priority *number*

Specifies the priority for the file group (consisting of an image (.bin) and its corresponding configuration (.cfg) file) specified in the boot stack. The value must be in the range from 1 through 100 where a priority of 1 is the highest. Up to 10 boot system priorities (boot stack entries) can be configured.

 **Important:** When performing a software upgrade it is important that the new file group have the highest priority (lowest value) configured.

 **Important:** It is suggested that an “N-1” priority numbering methodology, where “N” is the first priority in the current boot stack be employed to ensure that higher priority numbers remain open.

image *image_url*

Specifies the location of a image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted according to one of the following formats:

- ASR 5000:
- **[file:]** { /flash | /pcmcial | /hd } [/directory] /filename
- **[http: | tftp:]** //host [:port] [/directory] /filename

 **Important:** Use of the SMC hard drive is not supported in this release.

directory is the directory name.

filename is the actual file of interest.

host is the IP address or host name of the server.

port# is the logical port number that the communication protocol is to use.

Important: A file intended for use on an ASR 5000 uses the convention `xxxxx.asr5000.bin`, where `xxxxx` is the software build information.

Important: When using the TFTP, it is advisable to use a server that supports large blocks, per RFC 2348. This can be implemented by using the “block size option” to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

config *config_path*

Specifies the location of a configuration file to use for system startup. This must be formatted according to the following format:

- [**file:**] { /**flash** | /**pcmcia1** | /**pcmcia2** } [/*path*] /*filename*
- ASR 5000:
- [**file:**] { /**flash** | /**pcmcia1** | /**hd** } [/*path*] /*filename*

Important: Use of the SMC hard drive is not supported in this release.

Where *path* is the directory structure to the file of interest, and *filename* is the name of the configuration file. This file typically has a `.cfg` extension.

Usage

This command is useful in prioritizing boot stack entries in the `boot.sys` file, typically located on the `/flash` device of the Active SMC, for automatic recovery in case of a failure of a primary boot file group.

Important: The configuration file must reside on the SMC’s local filesystem, stored on one of its local devices (`/flash`, `/pcmcia1`, `/pcmcia2`, `/hd`). Attempts to load the configuration file from an external network server will result in a failure to load that image and configuration file group, causing the system to load the image and configuration file group with the next highest priority in the boot stack.

Important: Configuration changes do not take effect until the system is reloaded.

Important: The settings for this command are stored immediately in the `boot.sys` file. No changes are made to the system configuration file.

Example

The following commands set up two locations to obtain a boot file group from.

```
boot system priority 1 image tftp://remoteABC/pub/2003jan.bin config
/flash/pub/data/2003feb.cfg

boot system priority 2 image /flash/pub/data/2002jun.bin config
/pcmcia1/pub/data/2003feb.cfg
```

The following removes the current priority 1 boot entry from the `boot.sys` file.

■ boot system priority

```
no boot system priority 1
```

bulkstats

Enables the collection of bulk statistics by the system and/or enters the bulk statistic configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
bulkstats { collection | historical | mode }
```

```
no bulkstats collection
```

no

Disables the collection of bulk statistics.

collection

Enables the statistics collection process. Collects a period snapshot of data, i.e. “here is what the value is right now”.

historical collection

Enables the system to collect historical bulk statistics.

If enabled, the system keeps track of some things which require the storing of more data, such as “the highest value that’s been seen over the last 24 hours”.

mode

Enters the bulk statistics configuration mode. The resulting command-line prompt will look similar to:

```
[<context-name>]asr5000(config-bulkstats)#
```

Usage

The Bulk Statistics Configuration Code consists of commands for configuring bulk statistic properties, such as the period of collection. Bulk Statistics configuration mode commands are defined in the “Bulk Statistics Configuration Mode Commands” chapter.

The system can be configured to collect bulk statistics and send them to a collection server (called a receiver). Bulk statistics are statistics that are collected in a group or schema, for example, system stats, port stats, radius stats.

Once bulk statistics receiver, schema, and collection properties are configured, this **bulkstats** command is used to enable or disable the collection of the data.

To collect a sample that will provide an average, for example, an average of CPU counters, the “historical” features must be enabled with the **bulkstats historical collection** command.

Since bulk statistics are collected at regular, user-defined intervals, the **bulkstats force** command in the Exec Mode can be used to manually initiate the collection of statistics at any time.

■ bulkstats

Example

```
bulkstats collection
bulkstats mode
no bulkstats collection
```

ca-certificate

Configures and selects an X.509 CA root certificate to enable a security gateway to perform certificate-based peer (client) authentication. The system supports a maximum of 16 certificates and 16 CA root certificates. A maximum of four CA root certificates can be bound to a crypto template.

Product

FNG

Privilege

Administrator, Security Administrator, Operator

Syntax

```
[ no ] ca-certificate name name pem { data pemdata | url url }
```

no

Removes the named CA certificate.

name

Names the CA certificate.

pem data *pemdata* | *url*

The PEM-formatted data can be specified (**data pemdata**) or the information can be read from a file via url **url**). When read via a file, note that **show configuration** will not contain the url reference, but will instead output the data via **data pemdata**, such that the configuration file is self-contained.

Usage

In addition to the X.509 certificate-based gateway authentication method and the PSK (Pre-Shared Key) and EAP-AKA (Extensible Authentication Protocol - Authentication and Key Agreement) peer (client) authentication methods, the FNG supports X.509 certificate-based peer authentication.

The FNG checks the network policy on whether a FAP is authorized to provide service. If the network policy states that all FAPs that pass device authentication are authorized to provide service, no further authorization check may be required. If the network policy requires that each FAP be individually authorized for service (in the case where the FEID is associated with a valid subscription), the FNG sends a RADIUS Access-Request message to the AAA server. If the AAA server sends a RADIUS Access-Accept message, the FNG proceeds with device authentication. Otherwise, the FNG terminates the IPsec tunnel setup by sending an IKEv2 Notification message indicating authentication failure.

The operator/administrator is responsible for configuring the certificates through the CLI. The FNG will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named *fap1*:

```
no ca-certificate data fap1
```

ca-crl

Configures the name and URL path of a Certificate Authority-Certificate Revocation List (CA-CRL).

Product

S-GW
 PDG/TTG
 PDIF
 FNG
 HNB-GW

Privilege

Operator

Syntax

```
ca-crl name name { der | pem } { url url }
```

```
no ca-crl name name
```

no

Removes the named CA-CRL.

name

Provides a name of the CA-CRL. *name* must be from 1 to 128 alpha and/or numeric characters.

der

Specifies that the Distinguished Encoding Rules (DER) format is to be used for the source format.

pem

Specifies that the Privacy-enhanced Electronic Mail (PEM) format is to be used for the source format.

url *url*

Specifies the URL where the CA-CRL is to be fetched. *url* must be an existing URL and be in one of the following formats:

- [file:]{/flash | /pcmcial | /hd-raid}/{/directory}/<filename
- tftp://<host>[:<port>][/<directory>]/<filename
- ftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename
- sftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename
- http://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename

Usage

Use this command to name and fetch a CA-CRL from a specified location.

Without additional information from the CA, an issued certificate remains valid to any verifier until it expires. To revoke certificates, the CA publishes a CRL periodically to provide an updated list of certificates revoked, but not yet expired. Like a certificate, a CRL is a digital document signed by the CA. In addition to a list of serial numbers of revoked certificates, the CRL includes attributes such as issuer name (same as the issuer name in the certificate), signature (signed by the issuer using the same key that signs certificates), last update (the time this CRL was issued), and next update (the time next CRL will be available).

Example

The following command fetches a CA-CRL named *list1.pem* from a *host.com/CRLs* location and names the list *CRL5*:

```
ca-crl name CRL5 pem url http://host.com/CRLs/list1.pem
```

card

Enters the card configuration mode for the card specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card *number*

number

Specifies the number of the card for which the card configuration mode is to be entered. *number* must be a value in the range 1 through 48.

Usage

Enter the configuration mode for a specific card when changes are required.

Important: This command is not supported on all platforms.

Example

card 8

card-standby-priority

Configures the redundancy priorities for the Packet Services Cards (PSC or PSC2) by specifying the slot number search order for a standby card when needed. Not available for the XT2 platform.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
card-standby-priority slot_num [ slot_num ] [ slot_num ] ...
```

slot_num

Specifies the slot of the card for the order of the standby cards. *slot_num* must be in the range from 1 through 16 excluding slots 8 and 9. *slot_num* may be repeated as many times as necessary to indicate the complete search order.

Usage

Set the standby order of the redundant cards when multiple standby cards are available. Questionable hardware should be placed lower in the priority list.

Important: This command replaces the **pac-standby-priority** command.

Important: This command is not supported on all platforms.

Example

The following command configures the redundancy priority to use the standby cards in slots 16, 14, and 12 in that order:

```
card-standby-priority 16 14 12
```

call-control-profile

Creates an instance of a call-control profile.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] call-control-profile cc_profile_name
```

no

Deletes the Call-Controll Profile instance from the configuration.

cc_profile_name

Specifies the name of the call-control profile. Enter a string of 1 to 64 alphanumeric characters.

Usage

Use this command to create an instance of a call-control profile and to enter the call-control profile configuration mode. A call-control profile is a template which groups a set of call-handling instructions that may be applicable to one or more incoming calls. See the *Call-Control Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: A call-control profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what call-control profiles have already been created, return to the Exec mode and enter the **show call-control-profile all** command.

Example

The following command creates a configuration instance of an call-control profile:

```
call-control-profile ccprof1
```

cdr-multi-mode

This command enables multiple instances of CDRMOD.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] cdr-multi-mode
```

default

Configures the default setting.

Usage

Use this command to enable multiple instances of CDRMOD.

certificate

Configures and selects an X.509 Trusted Author certificate.

Product

ECS

FNG

PDG/TTG

PDIF

Privilege

Administrator, Security Administrator, Operator

Syntax

```
[ no ] certificate name name pem { data pemdata | url url }
```

no

Removes the named certificate.

name

Names the certificate.

pem data *pemdata* | *url*

The PEM-formatted data can be specified (**data pemdata**) or the information can be read from a file via url **url**). When read via a file, note that **show configuration** will not contain the URL reference, but will instead output the data via **data pemdata**, such that the configuration file is self-contained.

Usage

A certificate authority or certification authority (CA) is an entity which issues digital certificates for use by other parties. It is an example of a trusted third party. CAs are characteristic of many public key infrastructure (PKI) schemes.

If CERT information is configured, PDIF will include the CERT payload in the first IKE_AUTH Response during the first authentication. PDIF stores its own certificate for use in the first AUTH calculation. MS will not have its own certificate from CA. Still it will be capable of accepting a certificate from PDIF and verify AUTH.

The operator/administrator is responsible for configuring the certificates through the CLI. PDIF will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named *box1*:

```
no certificate data box1
```

cli

Configures global CLI parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cli { access { monitor-protocol | monitor-subscriber | show-configuration } {
administrator | operator } } | login-failure-delay number | max-sessions number
| operator clear-subscriber-one-only | trap config-mode }
```

```
no cli { max-sessions | login-failure-delay number | operator clear-subscriber-
one-only | trap config-mode }
```

```
default cli { access { monitor-protocol | monitor-subscriber | show-
configuration } | max-sessions | login-failure-delay number | operator clear-
subscriber-one-only | trap config-mode }
```

no

Removes the limit on the number of allowed simultaneous CLI sessions on the system, or removes the limit of how many subscribers an Operator can clear.

default

Resets the keywords to their default values.

```
access { monitor-protocol | monitor-subscriber | show-configuration } { operator |
administrator }
```

Sets access privileges on the **monitor protocol** and **monitor subscriber** commands:

monitor-protocol: Selects privileges for the **monitor protocol** command.

monitor-subscriber: Selects privileges for the **monitor subscriber** command.

show-configuration: Selects privileges for the **show-configuration** command. However the default access level for this command is the user with operator privileges.

operator: Sets the privileges for the selected command to allow use by users with operator privileges.

administrator: Restricts use of the selected command to administrators only.

login-failure-delay *number*

This is the time to wait before a login failure is returned and another login may be attempted. Default is five seconds.

max-sessions *number*

Sets the number of allowed simultaneous CLI sessions on the system. If this value is set to a number below the current number of open CLI sessions, the open sessions will continue until closed. *number* must be from 2 through 100.

Caution: Use caution when setting this command. Limiting simultaneous CLI sessions prevents authorized users from accessing the system if the maximum number allowed has been reached. The system already limits CLI sessions based on available resources. Additional limitation could have adverse effects.

operator clear-subscriber-one-only

Restricts Operator to clearing only one subscriber session at a time.

trap config-mode

Enables sending an SNMP notification (trap) when a CLI user enters the configuration mode.

Usage

Control the number of simultaneous CLI sessions on the system at any given time.

Important: The maximum number of multiple CLI session support is based on the amount of available memory. The Resource Manager, however, reserves enough resources so that a minimum of 15 CLI sessions are assured for ASR 5000s. One of the CLI sessions is reserved for use exclusively by a CLI session on an SPIO console interface. Additional CLI sessions beyond the pre-reserved set are permitted if sufficient SMC resources are available. If the Resource Manager is unable to reserve resources for a CLI session beyond those that are pre-reserved, administrative users are prompted as to whether or not the system should attempt to create the new CLI session even without reserved resources.

Example

The following command sets the number of allowed simultaneous CLI sessions to 5.

```
cli max-sessions 5
```

The following command sets the command **monitor protocol** to administrator-only

```
cli access monitor-protocol administrator
```

clock

Configures system clock timezone and what local time zone to use.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
clock timezone tz [ local ]
```

```
no clock timezone
```

no

Resets the system timezone to the system default UTC.

tz

Specifies the system time zone to use as one of:

- america-buenos-aires (GMT-3:00; Buenos Aires)
- america-caracas (GMT-4:00) Caracas
- america-guatemala (GMT-6:00; Guatemala, Guatemala)
- america-la_paz (GMT-4:00; La Paz)
- america-lima (GMT-5:00; Lima, Peru)
- america-puerto-rico (GMT-4:00; Puerto Rico)
- america-sao-paulo (GMT -3:00; Brazil)
- america-tijuana (GMT-8:00; Tijuana)
- asia-baghdad (GMT+3:00; Baghdad, Russia Zone 2, Kuwait, Nairobi, Riyadh, Moscow, Tehran)
- asia-bangkok (GMT+7:00; Bangkok)
- asia-calcutta (GMT+5:30; Calcutta, Mumbai, New Delhi)
- asia-dhaka (GMT+6:00; Dhaka)
- asia-hong-kong (GMT+8:00; Hong_Kong)
- asia-irkutsk (GMT+9:30; Irkutsk)
- asia-kabul (GMT+4:30; Kabul)
- asia-karachi (GMT+5:00; Karachi)
- asia-katmandu (GMT+5:45; Kathmandu)
- asia-magadan (GMT+11:00; Magadan)
- asia-muscat (GMT+4:00; Abu Dhabi, UAE, Muscat, Tblisi, Volgograd, Kabul)
- asia-rangoon (GMT+6:30; Rangoon)
- asia-seoul (GMT+9:00) Seoul

- asia-tehran (GMT+3:30; Tehran)
- asia-tokyo (GMT+9:00; Tokyo, Russia Zone 8)

- pacific-samoa (GMT-11:00; Samoa)
- us-alaska (GMT-9:00; Alaska)
- us-arizona (GMT-7:00; Arizona)
- us-central (GMT-6:00; Chicago, Mexico City, Saint Louis)
- us-eastern (GMT-5:00; Bogota, Lima, New York City)
- us-hawaii (GMT-10:00; Hawaii)
- us-indiana (GMT-6:00; Indiana)
- us-mountain (GMT-7:00; Cheyenne, Denver, Las Vegas)
- us-pacific (GMT-8:00) San Francisco, LA, Seattle
- utc (GMT; Universal Time Coordinated: London, Dublin, Edinburgh, Lisbon, Reykjavik, Casablanca)

local

Indicates the timezone specified by *tz* is to be considered the local time zone for local time display and conversion.

Usage

Clock and timezone management is necessary for proper accounting records. The chassis may be set to display a different local time than that of the system clock which allows accounting records to use the system time but to display the proper local time for users.

Example

```
clock timezone utc
clock timezone us-indiana local
no clock timezone
```

congestion-control

Enables/disables congestion control support on the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

congestion-control policy

default congestion-control

no congestion-control

default

Sets the congestion control to its default value.

no

Disables congestion-control functionality. This is the default setting.

Usage

Congestion control on the system is used to monitor the system for conditions that could potentially degrade performance when the system is under heavy load. Typically, these conditions are temporary (i.e high CPU or memory utilization) and are quickly resolved. However, continuous or large numbers of these conditions within a specific time interval may impact the system's ability to service subscriber sessions. The purpose of congestion control is to aid in the identification of such conditions and invoke policies for addressing the situation.

Congestion control operation is based on the configuration of the following:

- **Congestion condition thresholds:** Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.

A threshold tolerance is configured to dictate the percentage under the configured threshold that must be reached in order for the condition to be considered "cleared". An SNMP trap (starCongestionClear) is then triggered.

- **Service congestion policies:** Congestion policies are configurable for each service (PDSN, GGSN, or HA). These policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Because congestion control functionality on the system is disabled by default, this command should be executed once congestion-control thresholds and policies have been configured. (Refer to the **congestion-control policy** and **congestion-control threshold** commands for more information.)

congestion-control overload-disconnect

This command enables and disables the policy for disconnecting passive calls (chassis-wide) during an overload situation. It also configures and fine-tunes the overload-disconnect congestion control policy for an entire chassis.

To verify the congestion-control configuration use **show congestion-control configuration** from the Exec mode.

To set overload-disconnect policies for individual subscribers., see **overload-disconnect** in Subscriber Configuration Mode Commands.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
congestion-control overload-disconnect [ iterations-per-stage integer | percent
percentage_value | threshold { license-utilization percentage_value | max-
sessions-per-service-utilization percentage_value | tolerance number } ]
```

```
default congestion-control overload-disconnect [ iterations-per-stage | percent
| threshold { license-utilization | max-sessions-per-service-utilization |
tolerance } ]
```

```
no congestion-control overload-disconnect
```

iterations-per-stage *integer*

An integer between 2 and 8. This value defines the number of calls to be disconnected during the defined number of seconds. The default value for this keyword is 8.

percent *percentage_value*

An integer between 1 and 100 specifies the percentage of calls to be disconnected, in stages, during an overload situation. The default value is 5.

threshold

license-utilization: An integer value between 1 and 100 that specifies the license-utilization percentage threshold for overload situations. If candidates are available, passive calls are disconnected when this threshold is exceeded. The default value is 80.

max-sessions-per-service-utilization: An integer value between 1 and 100 that specifies a percentage of the maximum sessions per service. If candidates are available, passive calls are disconnected when this threshold is exceeded. The default value is 80.

tolerance: An integer between 1 and 25 that specifies the percentage of calls the system disconnects below the values set for the other two thresholds. In either case, a Clear Traps message is sent after the number of calls goes below the corresponding threshold value. The tolerance default value is 10.

default

When 'default' and one of the keywords is added to the command, then the policy remains in its current state and the value for the specified keyword is reset to its default value.

When 'default' and the command are entered without keywords, then the overload-disconnect policy for congestion control is disabled.

```
no congestion-control overload-disconnect
```

Disables the overload-disconnect policy for congestion control.

Usage

Use this command to set the policy for call disconnects when the chassis experiences call overload.

Example

The following command sets an overload-disconnect policy for the chassis in which 5 calls would be disconnected every 5 seconds during an overload situation.

```
congestion-control overload-disconnect interations-per-stage 5
```

Both of the following commands disable the overload-disconnect policy without changing the policy configuration.

```
default congestion-control overload-disconnect
```

or

```
no congestion-control overload-disconnect
```

To instruct the system to stop call disconnects when the number of calls goes down 85% of the total allowed calls for that service, enter both of the following commands to set the max-sessions-per-service-utilization value to 90% and the tolerance value to 5%:

```
congestion-control overload-disconnect threshold max-sessions-per-  
service-utilization 90
```

```
congestion-control overload-disconnect threshold tolerance 5
```

congestion-control policy

Configures congestion control policies.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
congestion-control policy { asngw-service | asnpc-service | cscf-service | fng-
service | ggsn-service | ha-service | hnbgw-service | hsgw-service | lma-service
| lns-service | mipv6ha-service | mme-service | pcc-af-service | pcc-policy-
service | pcc-quota-service | pdg-service | pdif-service | pdsn-service |
pdsnclosedrp-service | pgw-service | phsgw-service | phspc-service | sgsn-
service | sgw-service } action { drop | none | redirect | reject }
```

```
default congestion-control policy {asngw-service | asnpc-service | cscf-service
| fng-service | ggsn-service | ha-service | hnbgw-service | hsgw-service | lma-
service | lns-service | mipv6ha-service | mme-service | pcc-af-service | pcc-
policy-service | pcc-quota-service | pdg-service | pdif-service | pdsn-service |
pdsnclosedrp-service | pgw-service | phsgw-service | phspc-service | sgsn-
service | sgw-service}
```

default congestion-control policy *service*

Sets the congestion policy action for the selected service to its default value.

asngw-service

Sets the congestion policy action for the ASN GW service.

asnpc-service

Sets the congestion policy action for the ASN PC-LR service.

cscf-service

Sets the congestion policy action for the CSCF service.

fng-service

Sets the congestion policy action for the FNG service.

ggsn-service

Sets the congestion policy action for the GGSN service.

ha-service

Sets the congestion policy action for the HA service.

hnbgw-service

Sets the congestion policy action for the HNB-GW service.

Supported policy actions are:

- **drop**: Specifies that the system is to drop incoming packets containing new session requests.
- **none**: Specifies that the system is take no action.
- **reject**: Specifies that the system processes new session request messages and responds with a reject message.

lma-service

Sets the congestion control policy action for the LMA service

lns-service

Sets the congestion policy action for the LNS service.

mipv6ha-service

Sets the congestion policy action for the MIPv6-HA service.

mme-service

Sets the congestion control policy for action to take when subscriber sessions exceeds the defined threshold limit.

For MME type of session/calls **redirect** action is not supported.

pdg-service

Sets the congestion policy action for the PDG service.

pdif-service

Sets the congestion policy action for the PDIF service.

pdsn-service

Sets the congestion policy action for the PDSN service.

sgsn-service

Sets the congestion policy action for the SGSN service.

action { drop | none | redirect | reject }

Defines what policy action is taken:

- **drop**: Specifies that the system is to drop incoming packets containing new session requests. (PDSN, GGSN, ASN GW, LMA, MME, and ASN PC and HA only)
- **none**: Specifies that the system is take no action. This is the default for PDIF-service.
- **redirect**: Specifies that the system is to redirect new session requests to an alternate device. (PDSN and HA only)

Important: If this option is used, the IP address of the alternate device must be configured using the **policy overload redirect** command that is part of the

service configuration. Note that this option can not be used in conjunction with GGSN and MME services.

- **reject**: Specifies that the system processes new session request messages and responds with a reject message. (For PDSN and HA, the reply code is 130, “insufficient resources”. For the GGSN, the reply code is 199, “no resources available”.)

Usage

Congestion policies can be configured for each service. When congestion control functionality is enabled, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures a congestion control policy of reject for PDSN services:

```
congestion-control policy pdsn-service action reject
```

The following command configures a congestion control policy of reject for MME services:

```
congestion-control policy mme-service action reject
```

congestion-control threshold

Configures the congestion control threshold values that are to be monitored.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
congestion-control threshold { license-utilization percent | max-sessions-per-
service-utilization percent | message-queue-utilization percent | message-queue-
wait-time time | port-rx-utilization percent | port-specific {slot/port | all }
[ tx-utilization percent ] [ rx-utilization percent ] | port-tx-utilization
percent | service-control-cpu-utilization percent | system-cpu-utilization
percent | system-memory-utilization percent | tolerance percent }
```

```
default congestion-control threshold { license-utilization | max-sessions-per-
service-utilization | message-queue-utilization | message-queue-wait-time |
port-rx-utilization | port-specific | tx-utilization | rx-utilization | port-tx-
utilization | service-control-cpu-utilization | system-cpu-utilization | system-
memory-utilization | tolerance }
```

```
no congestion-control threshold port-specific { slot/port | all }
```

```
no congestion-control threshold port-specific { slot/port | all } [ rx-
utilization percent ] [ tx-utilization percent ]
```

```
no congestion-control threshold { message-queue-utilization | message-queue-
wait-time | port-rx-utilization percent | port-tx-utilization percent | service-
control-cpu-utilization | system-cpu-utilization | system-memory-utilization }
```

```
default congestion-control threshold keyword
```

Sets the threshold keyword to its default value.

```
no congestion-control threshold port-specific { slot/port | all }
```

This command disables port specific threshold monitoring on the specified port or on all ports.

slot/port: Specifies the port for which port specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.

all: Set port specific threshold monitoring for all ports on all cards.

```
license-utilization percent
```

Default: 100

The percent utilization of licensed session capacity as measured in 10 second intervals.

percent can be configured to any integer value from 0 to 100.

```
max-sessions-per-service-utilization percent
```

Default: 80

The percent utilization of the maximum sessions allowed per service as measured in real-time. This threshold is based on the maximum number of sessions or PDP contexts configured for the a particular service. (Refer to the bind command for the PDSN, GGSN, SGSN, or HA services.) percent can be configured to any integer value from 0 to 100.

message-queue-utilization *percent*

Default: 80

The percent utilization of the Demux Manager software task's message queue as measured in 10 second intervals. The queue is capable of storing a maximum of 10000 messages. percent can be configured to any integer value from 0 to 100.

message-queue-wait-time *time*

Default: 5

The maximum time (in seconds) messages can be held in queue as measured by packet time stamps. time is measured in seconds and can be configured to any integer value from 1 to 30.

Important: In the event that this threshold is crossed, an SNMP trap is not triggered. In addition, the service congestion policy invocation resulting from the crossing of this threshold is enforced only for the packet that triggered the action.

[no] port-rx-utilization *percent*

Default: 80

The average percent utilization of port resources for all ports by received data as measured in 5 minute intervals. percent can be configured to any integer value from 0 to 100.

[no] port-specific {*slot/port* | **all**} [**rx-utilization** *percent*] [**tx-utilization** *percent*]

Default: Disabled

Sets port-specific thresholds. If you set port-specific thresholds, when any individual port-specific threshold is reached, congestion control is applied system-wide.

slot/port: Specifies the port for which port-specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.

all: Set port specific threshold monitoring for all ports on all cards.

rx-utilization *percent*: Default 80%. The average percent utilization of port resources for the specified port by received data as measured in 5 minute intervals. percent must an integer from 0 through 100.

tx-utilization *percent*: Default 80%. The average percent utilization of port resources for the specified port by transmitted data as measured in 5 minute intervals. percent must be an integer from 0 through 100.

[no] port-tx-utilization *percent*

Default: 80

The average percent utilization of port resources for all ports by transmitted data as measured in 5 minute intervals. percent can be configured to any integer value from 0 to 100.

service-control-cpu-utilization *percent*

Default: 80

The average percent utilization of CPUs on which a Demux Manager software task instance is running as measured in 10 second intervals.

percent can be configured to any integer value from 0 to 100.

system-cpu-utilization *percent*

Default: 80

The average percent utilization for all PSC/PSC2 CPUs available to the system as measured in 10 second intervals.

percent can be configured to any integer value from 0 to 100.

This threshold setting can be disabled with **no congestion-control threshold system-cpu-utilization** command. In case later you want to enable the same threshold setting **congestion-control threshold system-cpu-utilization** command will enable the CPU utilization threshold to preconfigured level.

system-memory-utilization *percent*

Default: 80

The average percent utilization of all CPU memory available to the system as measured in 10 second intervals.

percent can be configured to any integer value from 0 to 100.

tolerance *percent*

Default: 10

The percentage under a configured threshold that dictates the point at which the condition is cleared.

percent is an integer value from 0 to 100.

Usage

Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.

The tolerance parameter establishes the threshold at which the condition is cleared. An SNMP trap (starCongestionClear) is generated for the clear condition, as well.

Example

The following command configures a system CPU utilization threshold of 75%.

```
congestion-control threshold system-cpu-utilization 75
```

This setting will remain in configuration unless you specify another threshold value in place of 75. This threshold setting can be disabled with **no congestion-control threshold system-cpu-utilization** command but can not be removed from configuration. Later if you want to enable the previously configured threshold value of 75 percent you only need to enter **congestion-control threshold system-cpu-utilization** command without specifying any threshold value and it will enable the CPU utilization threshold to preconfigured level of 75 percent.

■ congestion-control threshold

For example, **no congestion-control threshold system-cpu-utilization** will disable the configured threshold setting and **congestion-control threshold system-cpu-utilization** will again enable the threshold setting of 75%.

The following command configures a threshold tolerance of 5%:

```
congestion-control threshold tolerance 5
```

In the above examples, the starCongestion trap gets triggered if the system CPU utilization goes above 75% and the starCongestionClear trap gets triggered if it reaches or goes below 70%.

content-filtering category database directory

This command configures the base directory to be used for storing all content-rating databases that are required for Category-based Content Filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering category database directory path directory_path
```

```
default content-filtering category database directory path
```

default

Specifies the default base directory and directory path for Category-based Content Filtering application.

directory_path

Default: /pcmcial/cf

Specifies the base directory and its path to store all of the full or incremental content rating databases for the Category-based Content Filtering application.

directory_path must be an alpha and/or numeric string of 1 through 255 characters in length.

Usage

Use this command to specify the directory and its path to download all full or incremental category-rating databases to be used for the Category-based Content Filtering application.

Merging of incremental database can be done as part of the database upgrade process performed with **upgrade content-filtering category database** command in the Executive Mode.

Example

The following command configures the */flash/cf_temp/DB* as base directory to download all full and incremental content-rating databases for content filtering application.

```
content-filtering category database directory path /flash/cf_temp/DB
```

content-filtering category database max-versions

This command configures the number of full content-rating databases to maintain/archive in the base directory for category-based content filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering category database max-versions num_archive
```

```
default content-filtering category database max-versions
```

default

Sets the default number of full databases for specified directory path/location.

num_archive

Default: 2

Specifies the maximum number of database to be archived or maintained in the specific location.

num_archive must be an integer between 1 and 3.

Usage

Use this command to set the number of full content-rating database to be maintained in the specified directory path with the base file name specified using the **content-filtering database override file** command. Note that the specified directory path is the location specified using the **content-filtering category database directory path** command.

Example

The following command configures the system to maintain 3 full content-rating databases for category-based content filtering application.

```
content-filtering category database max-versions 3
```

content-filtering category database override

This command specifies the name of a file to be used by the category-rating database load process for category-based content filtering application.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering category database override file file_name.extension
```

```
default content-filtering category database override file
```

default

Sets the default content rating database file name; i.e. optcmd.bin.

file *file_name.extension*

Specifies the header of the file in the database directory path location to determine the newest full database. *file_name* must be an alpha and/or numeric string of up to 10 characters with an extension of 3 character after a period (.) as *extension*.

Usage

Use this command to configure the category-rating database file name to determine the newest version of full database. A process called “**LOAD_DATABASE**” invokes during the system startup or the database upgrade process by **upgrade content-filtering category database** command in Executive Mode. This process examines the header of each of the files in the database folder specified by **content-filtering category directory path** command in this mode. Note that by default system examines the header of those files only which begins with the string “OPTCMDB” and having extension “.bin”.

Example

The following command configures the system to examine the header of files that begins with *CF_sta.DB* only for content filtering application.

```
content-filtering category database override file CF_sta.DB
```

context

Enters the context configuration mode or is used to add or remove a specified context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
context name [ -noconfirm ]
```

```
no context name
```

no

Removes the specified context from the configuration.

name

Specifies the name of a context to enter, add, or remove. When creating a new context, the context name must be unique, it may not be the same as any existing context or any domain specified within any context.

Important: *When creating a new context, the context name specified must not conflict with the name of any existing context or domain names.*

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Configure contexts or remove obsolete contexts.

Important: A maximum of 64 contexts may be created.

Example

```
context sampleContext  
no context sampleContext
```

crash enable

Enables/disables the copying of crash data to a specified location.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
crash enable [ encrypted ] url crash_url [ filename-pattern pattern ] [ restrict
mbyte ]
```

```
no crash enable
```

no

Removes the specified context from the configuration.

Important: System crash information is generated and stored in the crash list even when the **no** keyword is specified. The information maintained in the crash lists is minimal crash information when the **no** keyword has been specified.

encrypted

The URL specified is in an encrypted format for security reasons.

filename-pattern *pattern*

The **filename-pattern** is a string containing any or all of the following variables:

- **%hostname%** - The system hostname.
- **%ip%** - A SPIO IP address
- **%cpu%** - CPU number
- **%card%** - Card number
- **%time%** - POSIX timestamp in hexadecimal notation
- **%filename%** - Alias for *crash-%card%-%cpu%-%time-core%*
- **%** - A single % sign

If no pattern is specified the result is the same as the pattern *filename*.

Use '/' characters in the filename pattern part to store crashes in per-system subdirectories.

url *crash_url*

Specifies the location to store crash files. *crash_url* may refer to a local or a remote file. *crash_url* must be entered using one of the following formats:

- **[file:]**{/flash|/pcmcia1|/pcmcia2}{/directory}/
- **tftp://**{host[:port#]}{/directory}/
- **[ftp|sftp:]**://{username[:password]@} {host}[:port#]{/directory}/

- ASR 5000:
- `[file:]{/flash|pcmcia1|hd}[/directory]/`
- `tftp://{host[:port#]}[/directory]/`
- `[ftp:|sftp:]{/[username[:password]@] {host}[:port#]}[/directory]/`

Important: Use of the SMC hard drive is not supported in this release.

directory is the directory name.

filename is the actual file of interest.

username is the user to be authenticated.

password is the password to use for authentication.

host is the IP address or host name of the server.

port# is the logical port number that the communication protocol is to use.

restrict *mbyte*

Default: 128

Specifies a maximum amount of memory to use for storing crash files where *mbyte* is in megabytes and must be in the range from 1 through 128 megabytes.

The **restrict** keyword is only applicable to local URLs.

Usage

Enable crashes if there are systems that are not stable and the crash information will be useful for trouble shooting. The remote storage of the crash file reduces the memory utilized on the chassis.

Example

```
crash enable ftp://remoteABC/pub/crash.dmp
```

```
crash enable /flash/pub/data/crash.dmp restrict 64
```

```
no crash enable
```

cs-network

This command creates/removes an HNB-CS network configuration instance for Femto UMTS access over Iu-CS/Iu-Flex interface between Home NodeB Gateway (HNB-GW) service and CS networks elements; i.e. MSC/VLR. This command also configures an existing HNB-CS network instance and enters the HNB-CS Network Configuration mode on a system.

Product

HNB-GW

Privilege

Administrator

Syntax

```
cs-network cs_instance [ -noconfirm ]
```

```
no cs-network cs_instance
```

no

Removes the specified HNB-CS network instance from the system.

 **Caution:** Removing the HNB-CS network instance is a disruptive operation and it will affect all UEs accessing MSC(s) configured in specific CS core network through the HNB-GW service.

 **Caution:** If any HNB-CS Network instance is removed from system all parameters configured in that mode will be deleted and Iu-CS/Iu-Flex interface will be disabled.

cs_instance

Specifies the name of the Circuit Switched Core Networks instance which needs to be associated with HNB Radio Network PLMN in HNB RN-PLMN configuration mode. If *cs_instance* does not refer to an existing HNB-PS network instance, the new HNB-CS network instance is created. *cs_instance* must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to enter the HNB-CS Network Configuration mode for an existing CS network instance or for a newly defined HNB-CS network instance. This command is also used to remove an existing HNB-CS network instance.

This configuration enables/disables the Iu-CS/Iu-Flex interface on HNB-GW service with CS core network elements; i.e. MSC/VLR.

A maximum of 25 HNB-CS network instance can be configured per HNB-GW service instance which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

Caution: This is a critical configuration. The HNBs can not access MSC(s) in CS core network without this configuration. Any change to this configuration would lead to disruption in HNB access to CS core network.

Entering this command results in the following prompt:

```
[ context_name ] hostname ( config-cs-network ) #
```

The various parameters available for configuration of an HNB-CS network instance are defined in the *HNB-CS Network Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Example

The following command enters the existing HNB-CS Network configuration mode (or creates it if it doesn't already exist) for the instance named *hnb-cs1*:

```
cs-network hnb-cs1
```

The following command will remove HNB-CS network instance *hnb-cs1* from the system without any warning to operator:

```
no cs-network hnb-cs1
```

css acsmgr-selection-attempts

This is a restricted command. In Release 9.0 and later, this command is obsolete.

css delivery-sequence

This is a restricted command. In Release 9.0 and later, this command is obsoleted.

css service

This is a restricted command. In Release 9.0 and later, this command is obsolete.

default

Restores the system default values for the specified parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { aaa { domain-matching | username-format } | autoconfirm | banner [
lawful-intercept | motd | pre-login ] | boot [ delay | interface | nameserver |
networkconfig ] | card-standby-priority | cli max-sessions | congestion-control
| logging { display | filter runtime } | operational-mode | pac-standby-priority
| qos npu inter-subscriber traffic { bandwidth | priority [ assigned-to dscp {
af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 |
af43 | be | ef } ] } | require session recovery | snmp { engine-id | notif-
threshold } | system hostname | task { facility sessmgr start | resource cpu-
memory-low } | threshold { value } | timestamps | upgrade limit [ time ] [
usage] }
```

aaa { domain-matching | username-format }

domain-matching - Resets the system to consider case when matching domains.

username-format - Resets the username format to the default of username @

autoconfirm

Restores the autoconfirm behavior to its default of disabled.

banner

lawful-intercept - Restores the system default message of the day for SSH CLI sessions.

motd - Restores the system default message of the day banner.

pre-login - Restores the CLI log in banner to the system default.

boot [delay | interface | nameserver | networkconfig]

interface | **networkconfig** - Restores the default boot interface and network configuration options. The keywords **interface** and **networkconfig** are used to restore the default option settings for the interface and network configuration options, respectively.

Defaulting the network configuration boot option removes the network boot option from the boot.sys file. It does not remove the network config options from the configuration file which is managed separately from the boot.sys file.

delay - Removes the boot delay setting (if any). The default for boot delay is “no boot delay”.

nameserver - Removes the nameserver IP address.

card-standby-priority

Resets the standby priority of the Packet Services Cards.

cli max-sessions

Restores the default value of this command to **no cli max-sessions** which removes the limit on the number of allowed simultaneous CLI sessions on the system.

congestion-control

Restores the system's congestion-control functionality to its default setting of disabled.

logging {display | filter runtime}

display: sets the default level of detail to display for trace log information to the system default.

filter runtime: resets the filtering of logged information to log in real time.

operational-mode

Sets the operational mode of the chassis to the system default.

pac-standby-priority

This parameter has been replaced by the **card-standby-priority** keyword.

qos npu inter-subscriber traffic {bandwidth | priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }] }

Restores the following NPU QoS parameters to their default values:

- **bandwidth** :
- **gold** : 10%
- **silver** : 20%
- **bronze**: 30%
- **best-effort**: 40%
- **priority** : All DSCP values are mapped to the best-effort priority queue but are not configured.

require session recovery

Resets the session recovery feature to its default setting of disabled.

snmp { engine-id | notif-threshold | system hostname | timestamps }

engine-id: restores the SNMP engine ID to the system default.

notif-threshold: restores the SNMP notification threshold to the system default.

task { facility sessmgr start | resource cpu-memory-low }

facility sessmgr start: Restores the default session manager start policy.

resource cpu-memory-low: Resets the system so that when a CPU runs very low on memory (below 12MB) the most over limit task is killed.

system hostname

Sets the system host name for SNMP use to the system default value.

threshold { *value* }

Restores thresholding values to their default setting. The possible values are:

- **10sec-cpu-utilization**: CPU utilization using a 10 sec average.
- **aaa-acct-failure**: AAA accounting failure threshold settings
- **aaa-acct-failure-rate**: AAA accounting failure rate threshold settings
- **aaa-auth-failure**: AAA authentication failure threshold settings
- **aaa-auth-failure-rate**: AAA authentication failure rate threshold settings
- **aaa-retry-rate**: AAA retry rate threshold settings
- **call-reject-no-resource**: Calls rejected due to no resources threshold settings
- **call-setup**: Calls setup threshold settings
- **call-setup-failure**: Call setup failure threshold settings
- **cpu-available-memory**: CPU available memory threshold settings
- **cpu-load**: PSC/PSC2 CPU load using a 5 minute average measurement
- **cpu-memory-usage**: Percentage of total CPU memory usage
- **cpu-session-throughput**: CPU session throughput threshold settings
- **cpu-utilization**: CPU utilization threshold settings
- **license**: Session license threshold settings
- **model**: Thresholding model settings
- **monitoring**: Threshold monitoring configuration settings
- **packets-filtered-dropped**: Filtered/dropped packet threshold settings
- **packets-forwarded-to-cpu**: Forwarded packet threshold settings
- **pdif-current-sessions**: Threshold monitoring for all current PDIF sessions.
- **pdif-current-active-sessions**: Threshold monitoring for only the currently-active PDIF sessions.
- **per-service-ggsn-sessions**: The number of GGSN sessions per GGSN service
- **per-service-gprs-sessions**: The number of GPRS sessions per GPRS service
- **per-service-gprs-pdp-sessions**: The number of PDP contexts per GPRS service
- **per-service-ha-sessions**: The number of HA sessions per HA service
- **per-service-lns-sessions**: The number of LNS sessions per LNS service
- **per-service-pdsn-sessions**: The number of PDSN sessions per PDSN service
- **per-service-sgsn-sessions**: The number of SGSN sessions per SGSN service
- **per-service-sgsn-pdp-sessions**: The number of PDP contexts per SGSN service
- **poll**: Threshold polling interval configuration settings
- **total**: Total subscriber threshold settings
- **total-ggsn-sessions**: Total GGSN sessions for all GGSN services in the system
- **total-gprs-sessions**: Total GPRS sessions per for all GPRS services in the system
- **total-gprs-pdp-sessions**: Total PDP contexts for all GPRS services in the system
- **total-ha-sessions**: Total HA sessions for all HA services in the system

- **total-lns-sessions**: Total LNS sessions for all LNS services in the system
- **total-pdsn-sessions**: Total PDSN sessions for all PDSN services in the system
- **total-sgsn-sessions**: Total SGSN sessions per for all SGSN services in the system
- **total-sgsn-pdp-sessions**: Total PDP contexts for all SGSN services in the system

timestamps

Resets the inclusion of timestamps in command.

upgrade limit [time] [usage]

Sets upgrade limit values to the defaults. If the optional keywords are not specified all values are reset to their defaults.

time: Resets the maximum time a session may exist during a software upgrade to the default of 120.

usage: Resets the minimum number of sessions before closing the sessions during a software upgrade to the system default of 100.

Usage

Restore system defaults to aid in trouble shooting or just prior to modifying additional configuration options.

Example

```
default banner motd
default boot
default logging display
default system hostname
default upgrade limit time
```

diameter-proxy ram-disk-limit

This command configures the amount of extra RAM disk space in MB to be allocated to Diamproxy task when local storage (hard disk) is enabled.

Product

SGW, PGW, HSGW

Privilege

Security Administrator, Administrator

Syntax

```
diameter-proxy ram-disk-limit mb space_mb
```

```
default diameter-proxy ram-disk-limit mb
```

default

Configures the default setting.

Default: 32 MB

mb space_mb

Specifies the storage space in MB.

space_mb must be an integer from 10 through 256.

Usage

Specifies the additional storage space to be allocated to Diamproxy for file write, in MB. The specified memory in MB is added to the existing memory allocated to Diamproxy only if HDD storage is enabled. By default, 32 MB is additionally allocated.

Example

The following command specifies that 100 MB of additional storage space be allocated to the Diamproxy task:

```
diameter-proxy ram-disk-limit mb 100
```

end

Exits the Global Configuration Mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to change to the Exec Mode.

enforce imsi-min equivalence

Enables the PDSN/HA to treat IMSI and MIN as the same for identifying the PDSN/HA session.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
enforce imsi-min equivalence
```

```
[ no | default ] enforce imsi-min equivalence
```

```
[ no | default ]
```

Disables the PDSN/HA from treating IMSI and MIN as the same for identifying the PDSN/HA session.
Default: Disabled.

Usage

Generally on an HA, the IMSI and MIN are treated as different and hence the RRQs with 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session if the NAI and HoA also match. If the NAI and/or HoA do not match, then the duplicate IMSI session detect and terminate feature is applicable.

Generally on a PDSN, the IMSI and MIN are treated as different and hence RP messages from 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching PDSN sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session.

Example

To monitor or clear subscriber session information filtered by on IMSI/MIN refer to the **show subscribers msid** command.

Important: This command must be executed at startup only and will not take effect when reconfigured without rebooting.

Example

The following command enables the treatment of the IMSI and MIN as the same for identifying the session:

```
enforce imsi-min equivalence
```

Either of the following commands disables the treatment of the IMSI and MIN as the same for identifying sessions:

```
no enforce imsi-min equivalence
```

```
default enforce imsi-min equivalence
```

exit

Exits the Global Configuration Mode, and returns the CLI session to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to change to the parent configuration mode. This command has the same effect as the **end** command as the Global Configuration Mode's parent mode is the Exec Mode.

gtpc compression-process

This command configures the maximum number of child compression processes that AAA proxy can have. This command is only applicable to the ASR 5000 platform.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpc compression-process max_number
```

```
default gtpc compression-process
```

default

Restores the system to the default settings for the number of child compression processes allowed.

max_number

Specifies the maximum number of child processes. The default is 1
max_number: Must be an integer from 1 to 4.

Usage

This command configures the maximum number of child compression processes that AAA proxy can have only if hard disk storage is enabled.

Example

```
gtpc compression-process 3
```

gtpm ram-disk-limit

This command configures additional storage space to be allocated for writing files. This command is only applicable to the ASR 5000 platform.

Product

GGSN, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtpm ram-disk-limit mb mega_bytes
```

```
default gtpm ram-disk-limit
```

default

Restores the system to the default settings of 32 MB of storage.

mb *mega_bytes*

Specifies the number of megabytes of storage allocated for files.

mega_bytes: Must be an integer from 10 to 256. The default is 32 MB.

Usage

The memory specified with this command would be added to the existing memory allocated to the AAA proxy only if hard disk storage is enabled.

Example

```
gtpm ram-disk-limit mb 256
```

gtp single-source

Configures the system to reserve a CPU for performing a proxy function for accounting.

Product

GGSN, SGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
gtp single-source [ centralized-lrsn-creation | private-extensions ]  
no gtp single-source
```

centralized-lrsn-creation

Defines the LRSN generation at proxy. The AAA proxy will generate the LRSN for all CDR types generated by either the GGSN or the SGSN.

Default: disabled

private-extensions

It is an optional keyword, enables the proprietary use of customer-specific GTPP extensions.

If **private-extensions** is not configured, all customer specific private extensions related to GTPP message transfer with CGF and recovery through GSS are disabled.

 **Important:** In order for the customer-specific extensions to work properly, the **gtp max-pdu-size** command in the Context Configuration Mode should be set to 65400 and the **gtp server** command's **max** value should be set to "1".

no

Disables GTPP single-sourcing. This is the default setting.

 **Caution:** Entering this command while PDP contexts are in process could cause the loss of pending CDRs. The configuration must be saved and the chassis reloaded for this option to take effect.

Usage

When GTPP single-sourcing is enabled, the system's AAA proxy function generates requests to the accounting server using a single UDP source port number, instead of having each AAA Manager generate independent requests with unique UDP source port numbers. This is accomplished by the AAA Managers forwarding their GTPP PDUs to the AAA Proxy function that runs on a reserved PSC/PSC2 CPU. Since a PSC/PSC2 CPU is being reserved, fewer Session Managers and AAA Managers will be started on that PSC.

 **Caution:** This command must be entered prior to the configuration of other services. Specifying it later may return an error due to a lack of CPU availability.

■ gtp single-source

Example

The following command enables GTPP single-sourcing with the use of private GTPP extensions:

```
gtp single-source private-extensions
```

The following command disables GTPP single-sourcing:

```
no gtp single-source
```

global-title-translation address-map

Creates an instance of a Global Title Translation (GTT) address-map, a database, for global titles (ISDN-type address) used for SCCP routing. Upon creating the instance, the system enters global title translation address-map configuration mode. For the commands to configuration the database, go to the Global Title Translation Address-Map Configuration Mode chapter in this guide.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
global-title-translation address-map name
```

```
no global-title-translation address-map name
```

no

Removes the specified GTT address-map database from the SCCP portion of the configuration.

name

This value uniquely identifies a specific instance of a GTT address-map.
name : must be a string of 1 to 63 alphanumeric characters.

Usage

Create a GTT address-map with a unique identifier and enter the GTT address-map configuration mode.

Example

```
global-title-translation address-map gtt-map1
```

global-title-translation association

Creates an instance of a Global Title Translation (GTT) association which defines the rules for handling global title translation. Upon creating the instance, the system enters global title translation association configuration mode. For the commands to configure the rules, go to the Global Title Translation Association Configuration Mode chapter in this guide.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
global-title-translation association name
```

```
no global-title-translation association name
```

no

Removes the specified instance of a GTT association from the SCCP portion of the configuration.

name

This value uniquely identifies a specific instance of a GTT association.

name : must be a string of 1 to 63 alphanumeric characters.

Usage

Create a GTT association with a unique identifier and enter the GTT association configuration mode.

Example

```
global-title-translation association gtt-assoc1
```

hd raid

Provides access to a local RIAD hard drive configuration mode in order to manage parameters supporting local storage of records.

Product

All

Privilege

Security Administrator, Administrator

Syntax

hd raid

raid

Provides access to the HD RAID configuration mode in order to manage the RAID on the ASR 5000 SMC hard drive.

Usage

Enters the HD RAID configuration mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-hd-raid)#
```

HD RAID Configuration Mode commands are defined in the HD RAID Configuration Mode Commands chapter.

Example

The following command opens the hd-raid mode:

```
hd raid
```

hd storage-policy

Provides access to the local hard drive configuration mode in order to manage parameters supporting local storage of records.

Product

GGSN, SGSN, HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
hd storage-policy name
```

```
no hd storage-policy name
```

no

Removes a configured HD storage policy from the system.

storage-policy *name*

Specifies a name for an HD storage policy and enters the HD Storage Policy Configuration Mode. *name* must be from 1 to 63 alpha and/or numeric characters.

Usage

Creates a new policy or specifies an existing policy and enters the HD Storage Policy Configuration Mode.

Entering this command results in the following prompt:

```
[context_name]hostname(config-hd-storage-policy)#
```

HD Storage Policy Configuration Mode commands are defined in the HD Storage Policy Configuration Mode Commands chapter.

Example

The following command creates an HD storage policy named *policy3* and enters the HD Storage Policy Configuration Mode:

```
hd storage-policy policy3
```

high-availability

Configures PSC/PSC2 task failure detection speed.

Product

PDSN, GGSN, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
high-availability fault-detection speed { aggressive | normal }  
default high-availability fault-detection speed
```

```
{ aggressive | normal }
```

Default: **normal**

- **aggressive**: Initiates PSC failover without performing additional checks.
- **normal**: Initiates PSC failover after additional checks are performed.

Usage

Use this command to increase the fault detection speed for faster switchovers after a PSC/PSC2 task failure. Setting fault detection speed to aggressive will trigger PSC/PSC2 failover as soon as possible if a potential failure is detected. Aggressive mode will reduce the duration of subscriber outages caused by a failed PSC/PSC2 if session recovery is enabled.

Aggressive mode also bypasses most information gathering steps and logs that can be used to determine the root cause of the failure.

In normal mode, additional checks are performed before triggering a PSC/PSC2 failover to ensure the card has actually failed. In aggressive mode these checks are bypassed so that session recovery can start as soon as possible. These additional checks reduce the likelihood of a false positive failure.

Example

The following command sets the fault detection speed for PSC/PSC2/tasks to **aggressive**:

```
high-availability fault-detection speed aggressive
```

imei-profile

Creates an instance of an IMEI profile.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] imei-profile imei_profile_name
```

no

Deletes the IMEI profile instance from the configuration.

imei_profile_name

Specifies the name of the IMEI profile. Enter a string of 1 to 64 alphanumeric characters.

Usage

Use this command to create an instance of an IMEI (International Mobile Equipment Identity) profile and to enter the IMEI profile configuration mode. An IMEI profile is a template which groups a set of device instructions, such as blacklisting, that may be applicable to one or more calling devices. See the *IMEI Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: An IMEI profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what IMEI profiles have already been created, return to the Exec mode and enter the **show imei-profile all** command.

Example

The following command creates a configuration instance of an IMEI profile:

```
imei-profile imeiprofl
```

license

Configures the session license key.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
license key key_value [ -force ] session-limit
```

```
no license key key_value [ -force ] session-limit
```

no

Removes the license key(s) installed.

key *key_value*

Installs the license key specified by *key_value*. *key_value* is provided by Cisco Systems operations staff.

session-limit

Use this keyword to suppress fail-over calls from being rejected if the licensed threshold is crossed.

Important: This is a customer-specific command that is available for HA, PDSN, EHA, and PDIF. Please contact your local sales representative for more information.

-force

Sets the license key even if resources are not available. The system supports the dynamic resizing of demultiplexor software tasks based on the licensed session capacity and feature type. When installing a license, the system automatically attempts to resize currently functioning tasks. Warning messages are displayed if there is an issue. Though its use is not recommended, the -force keyword can be used to suppress these warning messages.

Caution: Use of this option is not recommended.

Usage

Install or update system session keys when necessary due to expiration and/or capacity needs.

Example

```
license key sampleKeyValue
```

■ license

`no license key`

line

Enters the terminal display line configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

line

Usage

Change the terminal display configuration based upon the users own terminal characteristics.

local-policy-service

This feature is not supported in this release.

local-user allow-aaa-authentication

Enables/disables the use of administrative accounts other than local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
local-user allow-aaa-authentication
no local-user allow-aaa-authentication
default local-user allow-aaa-authentication
```

no

Disables administrative user accounts other than local-user accounts.

default

Returns this parameter to its default setting of enabled.

Usage

Local-user administrative accounts are separate from other administrative user accounts configured at the context level (Security Administrator, Administrator, Operator, and Inspector).

Context-level administrative users rely on the system's AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server.

Since the T1.276-2003 password security mechanisms are supported only for local-user administrative accounts and not for the AAA-based administrative accounts, this command provides a mechanism for disabling AAA-based administrative accounts.

By default, AAA-based administrative accounts are allowed.

Example

The following command forces the system to authenticate local-user accounts based only on the information in the security account file on its CompactFlash:

```
no local-user allow-aaa-authentication
```

local-user lockout-time

Configures the lockout period for local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
local-user lockout-time time
```

```
default local-user lockout-time
```

default

Restores the parameter to its default setting.

time

Default: 60

The amount of time that must elapse before a previously locked-out local-user account can attempt to login again. *time* is measured in minutes and can be configured to any integer value between 1 and 10080.

Usage

Local-user administrative accounts can become locked for reasons such as exceeding the configured maximum number of login failures.

Once an account is locked, this parameter specifies the lockout duration. Once the amount of time configured by this parameter has elapsed, the local-user can once again attempt to login.

Example

The following command configures a lockout time of 120 minutes (2 hours):

```
local-user lockout-time 120
```

local-user max-failed-logins

Configures the maximum number of failed login attempts a local-user can have before their account is locked out.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
local-user max-failed-logins number
```

```
no local-user max-failed-logins
```

```
default local-user max-failed-logins
```

no

Disables this functionality.

default

Restores this parameter to its default setting.

number

Default: 5

Specifies the maximum number of times a local-user could experience a login failure before their account is locked out. *number* can be configured to any integer value between 2 and 100.

Usage

This command configures the maximum number of failed login attempts a local-user can have before their account is locked out. For example if, this parameter is configured to “3” then after the third failed login attempt, the account would be locked.

Important: Local-user accounts can be configured to either enforce or reject a lockout due to the maximum number of failed login being reached. Refer to the **local-user username** command for more information.

Refer to the **local-user lockout-time** command for more information.

Example

The following command configures a maximum of three login attempts:

```
local-user max-failed-logins 3
```

local-user password

Configures local-user administrative account password properties.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
local-user password { [ complexity { ansi-t1.276-2003 | none } ] [ history
length number [ duration days ] ] [ max-age days ] [ min-change-char number ] [
min-change-interval days ] [ min-length number ] }
```

```
no local-user password { [ history ] [ max-age ] [ min-change-interval ] }
```

```
default local-user password { [ complexity ] [ history ] [ max-age ] [ min-
change-char ] [ min-change-interval ] [ min-length ] }
```

no

Disables the specified parameter.

default

Restores the specified parameter to its default setting.

```
[ complexity { ansi-t1.276-2003 | none } ]
```

Default: ansi-t1.276-2003

Specifies the password strength as one of the following:

- **ansi-t1.276-2003:** If this option is selected, then the following rules are enforced:
 - Passwords may not contain the username or the reverse of the username
 - Passwords may contain no more than 3 of the same characters used consecutively
 - Passwords must contain at least three of the following:
 - upper case alpha character
 - lower case alpha character
 - numeric character
 - special character
 - **none:** No additional password checks are performed.

```
[ history length number [ duration days ] ]
```

Default: length is 5

Specifies the number of previous password entries kept in the history list maintained by the system. A password can not be reused if it is one of the entries kept in the history list unless the time it was last used was more than the number of days specified by the **duration** keyword.

If the duration keyword is not used, the only check performed by the system is that it is not in the history list.

number is the number of entries for each account stored in the history list and can be configured to any integer value from 1 to 100. *days* is the number of days during which a password can not be reused and can be configured to any integer value between 1 and 365.

[**max-age** *days*]

Default: 90

Specifies the maximum age for a password. Users logging in with a password older than the specified limit are locked out. Once the lockout period expires, at their next login attempt, they are prompted to change their password before accessing the CLI.

Important: Local-user accounts can be configured to either enforce or reject a lockout due to a password's maximum age being reached. Refer to the **local-user username** command for more information.

days is the number of days that passwords remain valid and can be configured to any integer value from 1 to 365.

[**min-change-char** *number*]

Default: 2

Specifies the minimum number of characters that must be changed (in comparison to the current password) when a user changes their password.

Important: Changes in password length are counted as “character” changes. For example: changing a password from “password” to “passwo” is a 2-character change, changing a password from “password” to “password2” is a 1-character change, and changing a password from “password” to “apassword” is a 9-character change.

number is the number of characters and can be configured to any integer value between 0 and 16.

[**min-change-interval** *days*]

Default: 1

Specifies the frequency that passwords can be changed (other than first login).

days is the minimum number of days that must pass before a user can change their password. It can be configured to any integer value from 1 to 365.

Important: If the **no local-user password min-change-interval** command is used, users may change their password as often as desired which could allow them to circumvent the password history function.

[**min-length** *number*]

Default: 8

Specifies the minimum length allowed for user-defined password.

number is the minimum number of alpha and/or numeric characters that the password must contain and can be configured to any integer value between 3 and 32.

Usage

This command is used to set the property requirements for user-defined passwords and system behavior in relation to those passwords.

Information pertaining to user passwords, login failures, and password history are stored on the SMC's CompactFlash and in the software's Shared Configuration Task (SCT).

The system uses the information in SCT for runtime operations such as determining password ages and determining if new passwords meet the criteria specified by this command.

Example

The following command configures a minimum password length requirement of 6 characters:

```
local-user password min-length 6
```

The following command configures the system to store the 4 most recently used passwords per user-account in the history list:

```
local-user password history length 4
```

local-user username

Adds/removes local-user administrative accounts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
local-user username name [ authorization-level { administrator | inspector |
operator | security-admin } ] [ ecs | noecs ] [ ftp | noftp ] [ timeout-min-
absolute time ] [ timeoute-min-idle time ] [ no-lockout-login-failure ] [ no-
lockout-password-aging ] password password
```

```
no local-user username name
```

no

Removes a previously configured user.

name

Specifies the name of the user. The name must be from 3 to 16 alpha and/or numeric characters in length and is case sensitive.

```
[ authorization-level { administrator | inspector | operator | security-
admin } ]
```

Default: Operator

Configures the authorization level for the user as one of the following:

- **administrator:** Administrator users have read-write privileges and can execute any command throughout the CLI except for a few security functions allowed only in the administrator mode. Administrators can configure or modify the system and are able to execute all system commands, including those available to the operator and inspector user. This level corresponds to the both the System Administrator and Application Administrator levels in the T1.276-2003.
- **inspector:** Inspector users are limited to a small number of read-only Exec Mode commands. The bulk of these are “show” commands giving the inspector the ability to view a variety of statistics and conditions. The Inspector cannot execute show configuration commands and do not have the privilege to enter the Config Mode.
- **operator:** Operator users have read-only privileges to a larger subset of the Exec Mode commands as depicted in the following figure. Operator users can execute all commands that are part of the inspector mode, plus some system monitoring, statistic, and fault management functions. Operators do not have the ability to enter the Config Mode.
- **security-admin:** Security Administrator users have read-write privileges and can execute any command throughout the CLI. Security Administrators can execute all system commands, including those available to the administrator, operator, and inspector users. This level corresponds to both the System Security Administrator and Application Security Administrator levels in T1.276-2003.

[**ecs** | **noecs**]

Default: ecs

Specifies whether or not the user has access to configuration parameters pertaining to the Active Charging Service.

- ecs**: The user has access.
- noecs**: The user does not have access.

[**ftp** | **noftp**]

Default: ftp

Specifies whether or not the user is allowed to access the system via the File Transfer Protocol (FTP) and/or the Secure File Transfer Protocol (SFTP).

- ftp**: The user has access.
- noftp**: The user does not have access.

[**timeout-min-absolute** *time*]

Default: 0

Specifies the maximum session time for this user. *time* is measured in minutes and can be configured to any integer value between 0 and 525600. A value of "0" indicates no limit.

Important: This limit applies only to the user's CLI sessions.

[**timeout-min-idle** *time*]

Default: 0

Specifies the maximum idle time for this user. *time* is measured in minutes and can be configured to any integer value between 0 and 525600. A value of "0" indicates no limit.

Important: This limit applies only to the user's CLI sessions.

[**no-lockout-login-failure**]

Default: Disabled

Specifies that this user will never be locked out due to login attempt failures.

[**no-lockout-password-aging**]

Default: Disabled

Specifies that this user will never be locked out due to the age of their password.

password *password*

Specifies the initial password for this user. *password* must from 6 to 32 alpha and or numeric characters in length in length and is case sensitive.

Important: The user is requested to change their password upon their first login.

Usage

The ability to configure administrative local-users is provided in support of the login security mechanisms specified in ANSI T1.276-2003.

Like administrative users configured at the context level, local-users can be assigned one of 4 security levels:

Local-User Level User	Context Level User
Security Administrator	Administrator
Administrator	Config-Administrator
Operator	Operator
Inspector	Inspector

Local-user configuration support is handled differently from that provided for administrative users configured at the context level.

Context-level administrative users rely on the system's AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Passwords for these user types are assigned once and are accessible in the configuration file.

Local-user account information (passwords, password history, lockout states, etc.) is maintained in non-volatile memory on the CompactFlash module and in the software's Shared Configuration Task (SCT). This information is maintained in a separate file--not in configuration files used by the system. As such, the configured local-user accounts are not visible with the rest of the system configuration.

Local-user and context-level administrative accounts can be used in parallel.

Example

The following command configures a security-administrator level local-user administrative account for a user named *User672* that has FTP privileges, a temporary password of *abc123*, and that does not lockout due to either login attempt failures or password aging:

```
local-user username User672 authorization-level security-admin ftp no-lockout-login-failure no-lockout-password-aging password abc123
```

The following command deletes a previously configured local-user administrative account called *admin32*:

```
no local-user username admin32
```

logging console

Enables the output of logged events to be displayed on the console terminal.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging console
```

```
no logging console
```

```
no
```

Disables the output of events to the console port.

Usage

Log console output to allow for offline review during system monitoring and/or trouble shooting.

logging disable

Enables/disables the logging of the specified event ID or range of IDs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging disable eventid id [ to to_id ]
```

```
no logging disable eventid id [ to to_id ]
```

no

Indicates the event IDs specified are to be enabled for logging.

eventid *id*

Specifies the event for which no logging is to occur. *id* must be a value in the range 1 through 100000.

to *to_id*

Specifies the end ID of the events when a range of event ID is to be disabled from being logged. *to_id* must be a value in the range 1 through 100000. The *to_id* must be equal to or larger than the *id* specified.

Usage

Disable common events which may occur with a normal frequency are not of interest in monitoring the system for troubles.

Example

The following commands disables the logging of event ID 4580 and the range of events from 4500 through 4599, respectively.

```
logging disable eventid 4580
```

```
logging disable eventid 4500 to 4599
```

The following enables the subset of disabled event IDs:

```
no logging disable eventid 4500 to 4549
```

logging display

Configures the level of detail for information to be logged.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging display event-verbosity evt_level ] [ pdu-data format ] [ pdu-verbosity pdu_level ]
```

```
event-verbosity evt_level
```

Specifies the level of verbosity to use in logging of events as one of:

- min
- concise
- full

```
pdu-data format
```

Specifies output format for packet data units when logged as one of:

- none
- hex
- hex-ascii

Where none results in the output in raw format, hex results in the output being displayed in hexadecimal format, and hex-ascii results in the output being displayed in hexadecimal and ASCII similar to a main-frame dump.

```
pdu-verbosity pdu_level
```

Specifies the level of verbosity to use in logging of packet data units as a value from 1 to 5 where 5 is the most detailed.

Usage

Tune the level of information to be logged so as to avoid flooding a log file with information which is not useful or critical.

Example

The following sets the logging display for events to the maximum.

```
logging display event-verbosity full
```

The following command sets the logging display level of detail for packet data units to level 3 and sets the output format to the main-frame style hex-ascii:

```
logging display pdu-data hex-ascii pdu-verbosity 3
```

logging filter

Configures the logging of events to be done in real time for the specified facility.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging filter runtime facility facility level report_level [ critical-info |
no-critical-info ]
```

facility *facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **MPLS**: MPLS protocol logging facility
- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: AAA client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **aal2**: AAL2 protocol logging facility
- **acl-log**: Access Control List logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: Active Charging Service (ACS) Manager facility
- **alarmctrl**: Alarm Controller facility
- **alcap**: ALCAP protocol logging facility
- **alcapmgr**: ALCAP protocol logging facility
- **all**: All facilities
- **asn gw mgr**: ASN Gateway Manager facility
- **asn lrmgr**: ASN Paging/Location-Registry Manager facility
- **bfd**: Bidirectional Forwarding Detection (BFD) protocol logging facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bindmux**: IPCF BindMux manager logging facility
- **bssap+**: Base Station Sub-system Application Part+ protocol facility for login interface between the SGSN and the MSC/VLR (2.5G and 3G)
- **bssgp**: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)

- **cap**: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
- **chatconf**: Voice Chat/Conference logging facility
- **cli**: CLI logging facility
- **credit-control**: Credit Control facility
- **cscf**: IMS/MMD CSCF
- **cscfmgr**: SIP CSCF Manager facility
- **cscftmgr**: SIP CSCFTT Manager facility
- **csp**: Card Slot Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: Content Service Selection (CSS) RADIUS Signaling facility
- **cx-diameter**: Cx Diameter message logging facility
- **dcardctrl**: IPSEC Daughter card Controller logging facility (not used at this time)
- **dcardmgr**: IPSEC Daughter card Manager logging facility (Not used at this time)
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: DHCP facility (GGSN product only)
- **dhcpv6**: DHCPV6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase message logging facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-dns**: Diameter DNS subsystem logging facility
- **diameter-ecs**: ECS Diameter signaling facility
- **diameter-hdd**: Diameter HDD interface logging facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSEC Data Path facility
- **drvctrl**: Driver Controller facility
- **ds3mgr**: DS3 Manager logging facility
- **eap-diameter**: Extensible Authentication Protocol (EAP) Diameter message logging facility
- **eap-ipsec**: EAP
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface Logging facility
- **egtpc**: Evolved GPRS Tunneling Protocol (EGTP) control plane logging facility
- **egtpmgr**: EGTP Demux Manager logging facility
- **egtpu**: EGTP user plane logging facility

- **event-notif**: Event Notification Interface logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Inline per-subscriber Stateful Firewall facility
- **fng**: FNG logging facility
- **gmm**:
 - For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
 - For 3G: Logs the access application layer (above the RANAP layer)
- **gprs-app**: GPRS Application logging facility
- **gprs-ns**: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages logging facility
- **gss-gcdr**: GTP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility (GGSN product only)
- **gtpcmgr**: GTP-C protocol Manager logging facility (GGSN product only)
- **gtp**: GTP-PRIME protocol logging facility (GGSN product only)
- **gtpu**: GTP-U protocol logging facility (GGSN product only)
- **gtpumgr**: GTP-U protocol logging facility
- **gx-ty-diameter**: Gx/Ty Diameter messages logging facility
- **gy-diameter**: Gy Diameter messages logging facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **hdctrl**: HD Controller logging facility
- **hnb-gw**: HNB-GW (3G Femto GW) logging facility
- **hnbmgr**: HNBMgr (3G Femto GW) demux manager logging facility
- **hss-peer-service**: HSS Peer Service logging facility
- **igmp**: IGMP
- **ikev2**: IKEv2
- **ims-authorization**: IMS Authorization Service facility
- **ims-sh**: HSS SH Service facility
- **imsimgr**: SGSN IMSI manager (the demux for calls coming in, routes the calls to appropriate session manager) logging facility
- **imsue**: IMSUE
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipms**: IPMS logging facility
- **ipsec**: IP Security logging facility

- **ipsg**: IP Service Gateway interface logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility
- **kvstore**: KV Store facility
- **l2tp-control**: L2TP control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **ldap**: LDAP messages logging facility
- **li**: Refer to the *Cisco ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.
- **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
- **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
- **local-policy**: Local Policy Service logging facility
- **m3ua**: MTP3 User Adaptation (M3UA) Protocol logging facility
- **magmgr**: Mobile Access Gateway logging facility
- **map**: Mobile Application Part (MAP) Protocol logging facility
- **megadiammgr**: Megadiameter Manager (SLF Service)
- **mme-app**: MME application logging facility
- **mme-misc**: MME miscellaneous logging facility
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager logging facility
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 control logging facility
- **mtp2**: MTP2 Service logging facility
- **mtp3**: Message Transfer Part (MTP3) Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit (NPU) Manager facility
- **npumgr-acl**: NPUMGR ACL logging facility
- **npumgr-flow**: NPUMGR Flow logging facility
- **npu-fwd**: NPUMGR FWD logging facility
- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-port**: NPUMGR PORT logging facility

- **npumgr-recovery**: NPUMGR Recovery logging facility
- **ogw-app**: OGW application logging facility
- **ogw-gtpc**: OGW GTPC application logging facility
- **ogw-gtpu**: OGW GTPU application logging facility
- **ogwmgr**: OGW demux manager logging facility
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer detection logging facility
- **pccmgr**: IPCF PCC manager library
- **pdg**: PDG logging facility
- **pdgdmgr**: TCP demux manager logging facility
- **pdif**: PDIF logging facility
- **pgw**: PDN Gateway facility
- **phs-control**: PHS X1/X5 and X2/X6 interface logging facility
- **phs-data**: PHS Data logging facility
- **phs-eapol**: PHS EAPOL logging facility
- **phsgwmgr**: PHS gateway manager facility
- **phspcmgr**: PHS paging controller manager facility
- **pmm-app**: PMM application (for subscriber mobility management) logging facility (3G only)
- **ppp**: PPP link and packet facilities
- **ptt**: Voice push-to-talk logging facility
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Rf Diameter message logging facility
- **rip**: RIP logging facility (RIP is not supported at this time.)
- **rohc**: RObust Header Compression facility
- **rsvp**: Reservation Protocol logging facility
- **rua**: RUA (3G Femto GW - RUA messages) logging facility
- **s1ap**: S1AP Protocol logging facility

- **sccp**: SCCP Protocol logging connection-oriented messages between RANAP and TCAP layers.
- **set**: Shared Configuration Task logging facility
- **sctp**: SCTP Protocol logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstr**: Session Trace logging facility
- **sft**: Switch Fabric Task logging facility
- **sgs**: SGS Protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN 'glue' interfaces, e.g., between PMM, MAP, GPRS-FSM, SMS.
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN MBMS Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stach manager to log binding and removing between layers
- **sgsn-system**: SGSNs System Components logging facility; used infrequently
- **sgsn-test**: SGSN Tests logging facility; used infrequently
- **sgtpcmgr**: SGSN GTPC Manager logging information exchange through SGTPC and the GGSN
- **sgw**: Serving Gateway facility
- **sh-diameter**: Sh Diameter message logging facility
- **sitmain**: System Initialization Task main logging facility
- **sm-app**: Session Management (SM) Protocol logging PDPs and associated info
- **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
- **sndcp**: Sub-Network Dependent Convergence (SNDCCP) Protocol logging facility
- **snmp**: SNMP logging facility
- **sprmgr**: IPCF SPR manager library
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **sscfnni**: Service Specific Co-ordination Function for UNNI (SCFNNI) Protocol logging facility
- **sscop**: Service Specific Connection Oriented Protocol (SSCOP) logging facility
- **ssh-ipsec**: SSH IP Security logging facility
- **ssl**: SSL (Secure Socket Layer) message logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **taclep**: Type Allocation Code (TAC) Local Call Processing logging facility
- **tcap**: Transaction Capabilities Application Part (TCAP) Protocol logging facility

- **threshold**: threshold logging facility
- **ttg**: TTG logging facility
- **tucl**: TUCL logging facility
- **udr**: User detail record facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User layer-3 tunnel logging facility
- **usertcp-stack**: User TCP stack logging facility
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

```
level report_level [ critical-info | no-critical-info ]
```

level report_level: specifies the level of information to be logged, *report_level*, as one of:

- critical
- debug
- error
- info
- trace
- unusual
- warning.

critical-info | no-critical-info: indicates if critical information is to be displayed or not. The keyword **critical-info** specifies that events with a category attribute of critical information are to be displayed. Examples of these types of events can be seen at bootup when system processes and tasks are being initiated. The **no-critical-info** keyword specifies that events with a category attribute of critical information are not to be displayed.

Usage

This command is useful when it is necessary to get real time output of events. Event output may be cached otherwise which may make it difficult to trouble shoot problems which do not allow the last cache of events to be output prior to system problems.

Caution: Issuing this command could negatively impact system performance depending on system loading, the log level, and/or the type of facility(ies) being logged.

Example

Set real time output for the point-to-point protocol facility and all facilities, respectively, to avoid logging of excessive information.

```
logging filter runtime facility ppp
```

```
logging filter runtime facility all level warning
```

logging monitor

Enables/disables the monitoring of a specified user.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging monitor { ipaddr ip_address | msid ms_id | username user_name }
```

```
no logging monitor { ipaddr ip_address | msid ms_id | username user_name }
```

no

Disables the monitoring of the user specified by the options given.

ipaddr ip_address

Specifies the IP address of the user for which the monitoring filter is to be set. *ip_address* must be an IP v4 address in dotted decimal notation.

msid ms_id

msid *ms_id*: specifies the mobile subscriber ID for which the monitoring filter is to be set. *ms_id* must be from 7 to 16 digits.

This keyword/option can be used to specify the Mobile Subscriber ISDN (MSISDN) for GGSN calls which enables logging based on MSISDN.

username user_name

username *user_name*: specifies a user for which the monitoring filter is to be set. *user_name* must refer to a previously configured user.

Usage

Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers for which monitoring is performed and/or the amount amount of data they're passing.

Example

The following command enables the monitoring of user *user1* and mobile subscriber ID 4441235555, respectively.

```
logging monitor username user1
```

```
logging monitor msid 4441235555
```

The following disables the monitoring of user *user1*.

```
no logging monitor username user1
```

logging runtime

Enables events to be filtered and logged in real time.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
logging runtime buffer store { all-events | filtered-events-only }
```

```
buffer store { all-events | filtered-events-only }
```

Determines which logs are stored in internal logging daemon runtime buffer.

- **all-events**: Logging daemon runtime buffer stores all logs that come to it.
- **filtered-events-only**: Logging daemon runtime buffer stores only logs that pass the runtime filter.

Usage

Sets the filtering of logged information to log in real time.

Example

The following command enables storage of logs that pass the runtime filter:

```
logging runtime buffer store filtered-events-only
```

mediation-device

This command is obsolete. Even though the CLI accepts the command no function is performed.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
mediation-device mode { tcs }
```

```
no mediation-device mode { tcs }
```

mme-policy

This command enters the MME Policy Configuration Mode where MME policy parameters can be configured.

Product

MME

Privilege

Administrator

Syntax

mme-policy

Usage

Enters the MME Policy Configuration Mode.

Entering this command results in the following prompt:

```
[context_name]hostname(mme-policy)#
```

MME Policy Configuration Mode commands are defined in the MME Policy Configuration Mode Commands chapter.

network-overload-protection

This command configures an attach rate throttle mechanism to control the number of new connections (attaches or inter-SGSN RAUs), through the SGSN, on a per second basis.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-overload-protection sgsn-new-connections-per-second #_new_connections  
action { drop | reject with cause { congestion | network failure } }  
  
default network-overload-protection sgsn-new-connections-per-second
```

default

Using **default** in the command, disables this attach rate throttle feature.

#_new_connections

Define the number of new connections to be accepted per second.

#_new_connections: Must be an integer from 50 to 5000.

action

Specifies the action to be taken by the SGSN when the attach rate exceeds the configured limit on the number of attaches. Select one of the following actions:

- **drop**: Drop the new connection request.
- **reject-with-cause**: Reject the new connection request. Include one of the following as the cause in the reject message:
 - **congestion**
 - **network failure**

Usage

Use this command to configure the rate at which the SGSN must process new connection requests. The rate is the number of new connections to be accepted per second.

In some cases, the incoming new connection rate is higher than this configured rate. When this occurs, all of the new connection requests cannot be processed. This command can also be used to configure the action to be taken when the rate limit is exceeded. The new connection requests, which cannot be processed, can be either dropped or rejected with a specific reject cause.

Counters for this feature are available in the **show gmm-sm statistics** command display in the Network Overload Protection portion of the table.

Example

Configure the throttle rate or limit to 2500 attaches per second and to drop all requests if the limit is exceeded.

■ network-overload-protection

```
network-overload-protection sgsn-new-connections-per-second 2500 action  
drop
```

network-service-entity

This command creates a new instance of an SGSN network service entity for either the IP environment or the Frame Relay environment.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] network-service-entity ( ip-local | peer-nsei peer_nsei_number frame-relay )
```

no

Deletes the network service entity definition from the system configuration.

ip-local

Configures the local endpoint for NS/IP and enters the NSE-IP configuration mode. The prompt will change to [local]<hostname>(nse-ip-local)#

peer-nsei *peer_nsei_number* frame-relay

Configures a peer NSE and configures that peer with frame relay connectivity. This set of keywords also provides access to the NSE-FR configuration mode. The prompt will change to [local]<hostname>(nse-fr-peer-nsei-<*peer_nsei_number*>)#

Usage

Use this command to access the configuration modes for either the IP or Frame Relay network service entities.

Example

Enter the NSE for a Frame Relay configuration instance identified as 4554:

```
network-service-entity peer-nsei 4554 frame-relay
```

network-service-entity ip

This command has been deprecated. See the replacement command [network-service-entity](#) .

ntp

Enters the network timing protocol configuration mode or disables the use of NTP on the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ntp
```

```
no ntp
```

no

Disables the use of NTP for clock synchronization. When omitted, the NTP client support is enabled on the chassis.

Important: If the use of NTP is disabled the system clock may drift over a period of time. This may require manual updates to the system clock to synchronize the clock with other network elements.

Usage

Used when it is necessary to configure NTP settings.

Example

The following command enters the NTP configuration mode:

```
ntp
```

The following disables the use of the network timing protocol for system clock synchronization.

```
no ntp
```

operational-mode

Configures the systems operational mode for general use or only as a home agent.

Important: This command is only required for code versions prior to 4.5.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
operational-mode { general | ggsn-only | ha-only }
```

general

Sets the system operational mode to general use allowing for FA, HA, PSDN, and/or GGSN services to be co-located.

ggsn-only

Configures the system to only allow Gateway GPRS Support Node (GGSN) services.

Important: Executing this keyword increases the maximum number of PDP contexts supported per Session Manager from 2000 to 4000.

ha-only

This command keyword has been deprecated and no longer performs any function.

Usage

Set the operational mode to segregating services across multiple systems.

Caution: In order for this command to function properly, this command must be executed prior to configuring services on the system.

Example

The following sets the operational mode to general and home agent, respectively.

```
operational-mode general
```

operator-policy

This command creates an operator policy and enters the operator policy configuration mode. Commands for configuration of the policies are available in the *Operator Policy Configuration Mode* chapter elsewhere in this *Command Line Interface Reference*.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
operator-policy ( default | name policy_name } [ -noconfirm ]
no operator-policy ( default | name policy_name }
```

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no

Removes the specified operator policy from the system configuration.

default

default, in this case, is the *name* of a specific operator policy. This default policy is used when no other defined operator policy matches the incoming IMSI.

Important: We recommend that you configure this default operator policy so that it is available to handle IMSIs that are not matched with other defined policies.

name *policy_name*

This keyword specifies the unique name of an operator policy.

Usage

Use this command to create an operator policy and to enter the operator policy configuration mode to define or modify policies.

An operator policy associates APNs, APN profiles, IMEI ranges, IMEI profiles, an APN remap table and a call-control profile to ranges of IMSIs. These profiles and tables are created and defined within their own configuration modes to generate sets of rules and instructions that can be reused and assigned to multiple policies. In this manner, an operator policy manages the application of rules governing the services, facilities and privileges available to subscribers. These policies can override standard behaviors and provide mechanisms for an operator to get around the limitations of other infrastructure elements such as DNS servers and HLRs.

The system supports up to 1000 operator policies, including the *default* operator policy.

Important: An operator policy is **the** key element of the Operator Policy feature. Once the instance of an operator policy is defined, to use the policy it is necessary to go into the SGSN Global Configuration Mode (from the Global Configuration mode) to define the IMSI range(s) - this requirement does not hold if you are using a *default* operator policy.

To see what operator policies have already been created, return to the Exec mode and enter the **show operator-policy all** command.

Example

The following command accesses the default SGSN operator policy and enters the SGSN operator policy configuration mode to view or modify the specified policy:

```
sgsn-operator-policy default
```

orbem

Enters the object request broker element manager configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

orbem

Usage

Set the configuration mode to allow modification of the ORB element manager configuration data.

pac-standby-priority

This command has been renamed to **card-standby-priority**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

port atm

Identifies a physical port on a line card that supports ATM signaling and then enters the configuration mode for the specific interface-type. For the commands to configure the port interface, see the CLI chapter ATM Port Configuration Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
port atm slot/port
```

atm

Indicates the port identified is an ATM interface port.

slot/port

To determine valid ATM slot and port numbers, use the Exec mode's command **show port table**

slot: Identifies the chassis slot holding the line card that supplies ATM ports. The slot ID number can be any valid integer between 17 and 48.

port: Identifies the physical port that is to be configured to support ATM signaling. The ID number can be any valid integer between 1 and 4.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Important: This command is not supported on all platforms.

Example

The following enters the ATM port configuration mode for ATM port 1 on the card in slot 19:

```
port atm 19/1
```

port bits

Enters the BITS port configuration mode by identifying the BITS port on the active or standby SPIO.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
port bits slot/port
```

bits

Identifies the BITS port.

slot/port

slot: Identifies the chassis slot holding the SPIO. The slot ID can be either 24 (active SPIO) or 25 (standby SPIO).

port: Identifies the BITS port on the SPIO. The port ID number must be 4.

Usage

Change the current configuration mode to BITS port configuration mode.

Important: This command is not supported on all platforms.

Example

The following enters the BITS port configuration mode for the active SPIO:

```
port bits 24/4
```

port channelized

Identifies a physical port on a channelized line card that supports Frame Relay signaling and creates a Frame Relay interface. As well, this command enters the configuration mode for the commands to configure the Frame Relay interface and the channelized port interface, see the CLI chapter Channelized Port Configuration Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
port channelized slot/port
```

channelized

Selects the channelized frame relay interface for the selected line card and port.

slot/port

To determine valid slots and port numbers, use the Exec mode's command **show port table** to find the channelized line card.

slot: Identifies the chassis slot holding the Channelized line card that supplies Frame Relay ports. The slot ID number can be any valid integer between 17 and 48.

port: Identifies the physical port that is to be configured to support Frame Relay signaling. The ID number can only be 1.

Usage

Change the current configuration mode to Channelized Port configuration mode.

Example

The following enters the Channelized port configuration mode for port 1 on the card in slot 20:

```
port channelized 20/1
```

port ethernet

Enters the Ethernet Port Configuration mode for the identified port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
port ethernet slot/port
```

ethernet

Indicates the port identified is an Ethernet interface port.

slot/port

Specifies the port for which Ethernet Port Configuration mode is being entered. The slot and port must refer to an installed card and port.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Example

The following enters the Ethernet Port Configuration mode for ethernet port 1 in slot 17:

```
port ethernet 17/1
```

port mac-address virtual-base-address

This command defines a block of 256 consecutive MAC addresses and enables virtual MAC addressing for Ethernet line card ports. Not available for the XT2 platform.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
port mac-address virtual-base-address MAC_Address
```

```
no port mac-address virtual-base-address
```

no

Disables virtual MAC addressing for Ethernet line card ports. The block of virtual MAC addresses is not saved.

MAC_Address

The beginning address of a block of 256 MAC addresses that are used for virtual MAC addressing.

Usage

Use this command to disregard the MAC addresses assigned and stored in the IDEEPROM on Ethernet Line Cards and assign MAC addresses for all ports on all Ethernet Line Cards from the specified block of virtual MAC addresses. This command does not affect the MAC addresses on SPIO cards.

There are 65536 MAC addresses (00:05:47:FF:00:00 - 00:05:47:FF:FF:FF) reserved for use by customers. This range allows for the creation of 256 address blocks each containing 256 MAC addresses (e.g. 00:05:47:FF:00:00, 00:05:47:FF:01:00, 00:05:47:FF:02:00, 00:05:47:FF:03:00, 00:05:47:FF:04:00, etc.).

 **Caution:** This configuration requires the configuration of a valid block of unique MAC addresses that are not used anywhere else. Use of non-unique MAC addresses can degrade and impair the operation of your network.

 **Important:** This command is not supported on all platforms.

Example

To enable virtual MAC addressing for Ethernet ports on all Ethernet line cards in the system using a block of MAC addresses starting at 00:05:47:FF:00:00, enter the following command:

```
port mac-address virtual-base-address 00:05:47:FF:00:00
```

port rs232

Enters the RS-232 Port Configuration mode for the RS-232 port on the specified SPIO card. Not available on the XT2 platform.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
port rs232 slot 3
```

rs232

Indicates the port identified is an RS-232 port on a SPIO card.

slot

Specifies the slot of the SPIO for which RS-232 Port Configuration mode is being entered. The slot must refer to an installed SPIO card. The specified port must always be 3 for an RS-232 port. The value for *slot* must be either 24 or 25.

Usage

Change the current configuration mode to RS-232 Port Configuration mode.

Example

The following command enters the RS-232 Port Configuration mode for the SPIO in slot 24;

```
port rs232 24 3
```

profile-id-qci-mapping

Creates a QCI - RAN ID mapping table or specifies an existing table and enters the QCI - RAN ID mapping configuration mode for the system.

Product

HSGW

Privilege

Administrator

Syntax

```
[ no ] profile-id-qci-mapping name [ -noconfirm ]
```

no

Removes the specified mapping table from the system

name

Creates a new or enters an existing mapping table configuration. *name* must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enters the QCI - RAN ID mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.

Entering this command results in the following prompt:

```
[ context_name ]hostname (config-hsgw-association-table)#
```

QCI Mapping Configuration Mode commands are defined in the QCI Mapping Configuration Mode Commands chapter.

Use this command when configuring the following eHRPD component: HSGW.

Important: This command creates a mapping table available to any HSGW context configured on the system.

Example

The following command enters the existing QCI mapping configuration mode (or creates it if it doesn't already exist) for a mapping table named *qci_table1*:

```
profile-id-qci-mapping qci_table1
```

The following command will remove *qci_table1* from the system:

```
no profile-id-qci-mapping qci_table1
```

■ profile-id-qci-mapping

ps-network

This command creates/removes an HNB-PS network configuration instance for Femto UMTS access over Iu-PS/Iu-Flex interface between Home NodeB Gateway (HNB-GW) service and PS networks elements; i.e. SGSN. This command also configures an existing HNB-CS network instance and enters the HNB-CS Network Configuration mode on a system.

Product

HNB-GW

Privilege

Administrator

Syntax

```
[ no ] ps-network ps_instance [ -noconfirm ]
```

```
no ps-network ps_instance
```

no

Removes the specified HNB-PS network instance from the system.

 **Caution:** Removing the HNB-PS network instance is a disruptive operation and it will affect all UEs accessing SGSN(s) in specific PS core network through the HNB-GW service.

 **WARNING:** If any HNB-PS Network instance is removed from system all parameters configured in that mode will be deleted and Iu-PS/Iu-Flex interface will be disabled.

ps_instance

Specifies the name of the Packet Switched Core Networks instance which needs to be associated with HNB Radio Network PLMN in HNB RN-PLMN configuration mode. If *ps_instance* does not refer to an existing HNB-PS instance, the new HNB-PS network instance is created.

ps_instance must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to enter the HNB-PS Network Configuration mode for an existing PS network instance or for a newly defined HNB-PS network instance. This command is also used to remove an existing HNB-PS network instance.

This configuration enables the Iu-PS/Iu-Flex interface on HNB-GW service with CS core network elements; i.e. MSC/VLR.

A maximum of 25 HNB-PS networks instance can be configured per HNB-GW service instance which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

 **Caution:** This is a critical configuration. The HNBs can not access SGSNs in PS core network without this configuration. Any change to this configuration would lead to disruption in HNB access to PS core network.

Entering this command results in the following prompt:

```
[ context_name ]hostname ( config-ps-network )#
```

The various parameters available for configuration of an HNB-PS network instance are defined in the *HNB-PS Network Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Example

The following command enters the existing HNB-PS Network configuration mode (or creates it if it doesn't already exist) for the instance named *hnb-ps1*:

```
ps-network hnb-ps1
```

The following command will remove HNB-PS network instance *hnb-ps1* from the system without any prompt to user:

```
no ps-network hnb-ps1
```

qci-qos-mapping

Global QCI-QoS mapping tables are used to map QCI values to appropriate QoS parameters.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
qci-qos-mapping name [ -noconfirm ]
```

no

Removes the specified mapping configuration from the system

name

Creates a new or enters an existing mapping configuration. *name* must be from 1 to 63 alpha and/or numeric characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enter the QCI-QoS mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.

Entering this command results in the following prompt:

```
[context_name]hostname(config-qci-qos-mapping)#
```

QCI - QoS Mapping Configuration Mode commands are defined in the QCI - QoS Mapping Configuration Mode Commands chapter.

Use this command when configuring the following eHRPD component: HSGW, P-GW, S-GW.

Important: This command creates a mapping configuration available to any HSGW, P-GW, S-GW context configured on the system.

Example

The following command enters the existing QCI - QoS mapping configuration mode (or creates it if it doesn't already exist) for a mapping configuration named *qci-qos3*:

```
qci-qos-mapping qci-qos3
```

qos npu inter-subscriber traffic bandwidth

Configures NPU QoS bandwidth allocations for the system.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
qos npu inter-subscriber traffic bandwidth gold percent silver percent bronze
percent best-effort percent
```

```
no qos npu inter-subscriber traffic bandwidth
```

no

Removes a previous bandwidth allocation.

gold *percent*

Default: 10%

Specifies the maximum percentage of bandwidth to be allocated to the gold queue priority.

percent can be configured to any integer value from 0 to 100.

silver *percent*

Default: 20%

Specifies the maximum percentage of bandwidth to be allocated to the silver queue priority.

percent can be configured to any integer value from 0 to 100.

bronze *percent*

Default: 30%

Specifies the maximum percentage of bandwidth to be allocated to the bronze queue priority.

percent can be configured to any integer value from 0 to 100.

best-effort *percent*

Default: 40%

Specifies the maximum percentage of bandwidth to be allocated to the best-effort queue priority.

percent can be configured to any integer value from 0 to 100.

Usage

The bandwidth of a subscriber queue is maintained by rate limiting functions which implement packet-rate limiting at the first level and bit-rate limiting at the next level.

The packet-rate limit of a queue is defined by the number of packets-per-second (PPS) permitted for queuing. Before queuing a packet on a subscriber queue, the NPU ensures that the packet falls within the limit. If the packet to be queued exceeds the packet rate limit, it is dropped.

Each subscriber queue is configured with a bit rate limit, measured in megabits-per-second (Mbps), referred to as CP-BPS (bit-per-second to CP). The CP-BPS is available as the total bandwidth for the subscriber traffic

that a CP can sustain. Each subscriber queue receives an allocation of a certain percentage of the CP-BPS. The following maximum CP-BPS values are supported:

- Lead CP (CP0) = 128 Mbps
- Remaining CPs (CP1, CP2, CP3) = 256 Mbps

For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command configures bandwidth allocations of 20, 30, 40, and 50% for the gold, silver, bronze, and best-effort queues respectively:

```
qos npu inter-subscriber traffic bandwidth gold 20 silver 30 bronze 40
best-effort 50
```

Upon executing this command, the priority queues will have the following PSC/PSC2 CP bandwidth allocations based on the maximum CP bandwidth specifications:

Priority	Lead CP (CP 0) Bandwidth (Mbps)	CP 1 through CP 3 Bandwidth (Mbps)
Gold	25.6	51.2
Silver	38.4	76.8
Bronze	51.2	102.4
Best-effort	64	128

qos npu inter-subscriber traffic bandwidth-sharing

Configures NPU QoS bandwidth sharing properties for the system.

Product

PDSN, GGSN

Privilege

Administrator

Syntax

```
qos npu inter-subscriber traffic bandwidth-sharing { { enable | disable } { all
| slot slot_num cpu cpu_num } }
```

enable

Enables bandwidth sharing for the specified criteria.

disable

Disables bandwidth sharing for the specified criteria.

all

Specifies that the bandwidth action is to be applied to all PSC/PSC2s and every CPU on each PSC/PSC2.

slot slot_num

Specifies that the bandwidth action is to be applied to a PSC/PSC2 in a specific chassis slot number. *slot_num* is an integer from 1 to 48 that represents the slot in which a PSC/PSC2 is installed. These cards can be installed in slots 1 through 8, and/or 10 through 16.

cpu cpu_num

Specifies a specific PSC/PSC2 CP for which to perform the bandwidth action. *cpu_num* is an integer value from 0 to 3. 0 represents the lead CP.

Usage

The available bandwidth of a subscriber queue can be shared equally among the other subscriber queues. Any unutilized bandwidth of a queue can be shared with the other queues equally. For example, if only one DSCP is configured and it is mapped to best-effort, that DSCP would get the bandwidth allocated to the best-effort in addition to the rest of the bandwidth allocated to the gold, silver, and bronze.

By default, the system enables sharing for all PSCs or PSC2s and their CPs.

For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command disables bandwidth sharing for the fourth CP (CP 3) on a PSC/PSC2 installed in chassis slot 4:

```
qos npu inter-subscriber traffic bandwidth-sharing disable slot 4 cpu 3
```

qos npu inter-subscriber traffic priority

Configures the DSCP-to-Priority assignments for the system.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
qos npu inter-subscriber traffic priority { best-effort | bronze | gold | silver
} assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 |
af33 | af41 | af42 | af43 | be | ef | dscp_num } }
```

```
no qos npu inter-subscriber traffic priority [ assigned-to dscp { af11 | af12 |
af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }
]
```

best-effort

Specifies the best-effort queue priority.

bronze

Specifies the bronze queue priority.

gold

Specifies the gold queue priority.

silver

Specifies the silver queue priority.

afXX

Assigns the Assured Forwarding *XX* PHB DSCP.

Each Assured Forwarding PHB has a corresponding DSCP value as follows:

- af11 through af13: DSCP values 5 through 7 respectively
- af21 through af23: DSCP values 9 through 11 respectively
- af31 through af33: DSCP values 13 through 15 respectively
- af41 through af43: DSCP values 17 through 19 respectively

be

Assigns the Best Effort forwarding PHB which has a corresponding DSCP value of 0.

ef

Assigns the Expedited Forwarding PHB which has a corresponding DSCP value of 23.

dscp_num

Specifies a specific DSCP value. The value must be expressed as an integer value from 0 through 31.

Usage

The differentiated services (DS) field of a packet contains six bits (0-5) that represent the differentiated service code point (DSCP) value.

Five of the bits (1-5) represent the DSCP. Therefore, up to 32 (25) DSCPs can be assigned to the various priorities. By default, they're all assigned to the lowest priority (best-effort).

For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command maps the ef DSCP to the gold priority queue:

```
qos npu inter-subscriber traffic priority gold assigned-to dscp ef
```

ran-peer-map

Creates a RAN Peer Map and enters the RAN Peer Map Configuration Mode.

Product

ASN GW, PHS

Privilege

Administrator

Syntax

```
[ no ] ran-peer-map name [ -noconfirm ]
```

no

Removes the RAN Peer Map from the system.

name

Specifies the name of the RAN Peer Map. *name* must be from 1 to 31 alpha and/or numeric characters.

Usage

Use this command to create a new RAN Peer Map or edit an existing one. RAN peer maps reconcile base station MAC addresses received in R6 protocol messages to the base station's IP address.

Entering this command results in the following prompt:

```
[context_name]hostname(config-ran-peer-map)#
```

RAN Peer Map Configuration Mode commands are defined in the ASN RAN Peer Map Configuration Mode Commands chapter in this guide.

Example

The following command creates a RAN peer map named *ran12*:

```
ran-peer-map ran12
```

require active-charging

This command enables/disables Active Charging Service (ACS) with or without Category-based Content Filtering application.

Product

ACS, CF

Privilege

Security Administrator, Administrator

Syntax

```
require active-charging [ isolated-mode ] [ content-filtering category [ static-and-dynamic ] ] [ optimized-mode ]
```

```
no require active-charging
```

no

Disables ACS on the system.

isolated-mode

Enables ACS, and separates ACS-related resources from other sub-system resource sharing.

 **Important:** In Release 8.1 and later, this keyword is not supported.

optimized-mode

Enables ACS in Optimized mode, wherein ACS functionality is managed by SessMgrs.

 **Important:** In Release 8.0 and earlier and in Release 9.0 and later, this keyword is not supported.

 **Important:** In Release 8.1, ACS must be configured in the Optimized mode.

 **Important:** In Release 8.1, if the active-charging mode is changed from the default (non-optimized) mode to the Optimized mode, or vice-versa, the system must be rebooted for the change to take effect.

 **Important:** In Release 8.3, this keyword is obsolete. With or without this keyword ACS is always enabled in the Optimized mode.

Use the **require active-charging** command to enable ACS in the non-optimized mode. Wherein, ACS Managers will spawn to support ACS.

Use the **require active-charging optimized-mode** command to enable ACS in the Optimized mode. Wherein, ACS is enabled as part of Session Managers.

■ require active-charging

content-filtering category [static-and-dynamic]

Enables the Category-based Content Filtering application with ACS support and creates the necessary Static Rating Database (SRDB) tasks to utilize the internal database of static/dynamic URLs.

For Dynamic Content Filtering support, the **static-and-dynamic** keyword must be configured to specify that the Dynamic Rater Package (model and feature files) must be distributed to rating modules on startup, recovery, etc. If not configured, by default, the static-only mode is enabled.

Usage

Use this command to enable/disable ACS with or without Category-based Content Filtering application on a system.

In Release 8.0 and 8.1, this command must be configured before configuring any services. This is to ensure that the resource subsystem can appropriately reserve adequate memory for ACS Manager tasks. If this command is configured after all the Session Manager tasks are already active, the ACS Manager tasks will not be started even if additional cards are added to the chassis—instead, the chassis must be rebooted.

Example

In Release 8.0, the following command enables resource subsystem to configure ACS in isolated mode:

```
require active-charging isoated-mode
```

In Release 8.1, the following command enables ACS in Optimized mode:

```
require active-charging optimized-mode
```

In Release 8.3, the following command enables ACS in Optimized mode:

```
require active-charging
```

require demux card

This command enables/disables the demux capabilities.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] require demux card
```

default

Disables the demux capabilities on the card.

no

Disables the demux capabilities on the card.

Usage

Use this command configure the system to allow session recovery task placement scheme when session recovery is off.

Important: This command is not supported on all platforms.

Example

The following command enables demux capabilities:

```
require demux card
```

■ require detailed-rohc-stats

require detailed-rohc-stats

Enables or disables context-specific Robust Header Compression (RoHC) statistics.

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ no ] require detailed-rohc-stats
```

no

Disables require detailed-rohc-stats. This is the default condition.

Usage

Enables context-specific statistics for RoHC calls.

Example

Enter the following command to enable context specific stats for RoHC calls:

```
require detailed-rohc-stats
```

require diameter-proxy

This command enables/disables Diameter Proxy mode.

Default: no require diameter-proxy

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
require diameter-proxy { multiple | single }
```

```
no require diameter-proxy
```

no

To disable Diameter Proxy mode.

multiple

To configure one Diameter proxy for each active PSC/PSC2.

single

To configure one Diameter proxy for the entire chassis.

Usage

When the Diameter Proxy mode is enabled, each proxy process is a Diameter host, instead of requiring every Diameter application user (i.e., every ACSMgr and/or every SessMgr, depending on the application) to be a host.

Example

To configure a Diameter proxy for each active PSC/PSC2, enter the following command:

```
require diameter-proxy multiple
```

To configure a single Diameter proxy for the entire chassis, enter the following command:

```
require diameter-proxy single
```

require session recovery

Enables session recovery when hardware or software fault occurs within system.

Product

PDSN, GGSN, SGSN, HA, LNS, ASN GW, PDIF, PDG/TTG, MME

Privilege

Security Administrator, Administrator

Syntax

require session recovery

no require session recovery

no

Disables session recovery feature after configuration file is saved and system is restarted.

Usage

When this feature is enabled, the system attempts to recover any home agent-based Mobile IP sessions that would normally be lost due to a hardware or software fault within the system.

This functionality is available for the following call types:

- ASN GW services supporting simple IP, Mobile IP, and Proxy Mobile IP
- PDSN services supporting simple IP, Mobile IP, and Proxy Mobile IP
- HA services supporting Mobile IP and/or Proxy Mobile IP session types with or without per-user Layer 3 tunnels
- GGSN services for IPv4 and PPP PDP contexts
- SGSN services for all attached and/or activated subscribers
- LNS session types
- PDIF services supporting Simple-IP, Mobile-IP and Proxy Mobile-P
- MME services

The default setting for this command is disabled.

The no option of this command disables this feature.

It is important to note that this command only works when the Session Recovery feature is enabled through a valid Session and Feature Use License Key.

Important: Upon entering this command, the system must be restarted before the command takes effect. Remember to save the configuration file before issuing the reload command.

reveal disabled commands

Enables the input of commands for features that do not have license keys installed. The output of the command **show cli** indicates when this is enabled. This command effects all future CLI sessions. This is disabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
reveal disabled commands
```

```
no reveal disabled commands
```

no

Do not show disabled commands.

Usage

When this is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command. When this is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

Example

Set the CLI to accept disabled commands and display the required feature for all future CLI sessions with the following command:

```
reveal disabled commands
```

Set the CLI to reject disabled commands and return an error message for all future CLI sessions:

```
no reveal disabled commands
```

rohc-profile

This command allows you to create an RoHC (Robust Header Compression) profile and enter the RoHC Profile Configuration Mode. This mode is used to configure RoHC Compressor and Decompressor parameters. RoHC profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured.

Product

HSGW, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
rohc-profile profile-name name [ -noconfirm ] [ common-options | compression-  
options | decompression-options ]
```

```
no rohc-profile profile-name name
```

common-options

Configures common parameters for compressor and decompressor.

compression-options

Configures ROHC compression options.

decompression-options

Configures ROHC decompression options.

no

Remove the specified RoHC profile.

name

The name of the RoHC profile to create or remove. *name* must be an alphanumeric string of from 1 through 63 characters in length.

-noconfirm

Do not prompt for additional verification when executing this command.

Usage

Use this command to enter the RoHC Profile Configuration mode.
Entering this command results in the following prompt:

```
[context_name]host(config-rohcprofile-<profile_name>)#
```

RoHC Profile Configuration Mode commands are defined in the RoHC Profile Configuration Mode Commands chapter.

Example

Enter the following command to create an RoHC profile named *HomeUsers* and enter the RoHC Configuration mode without prompting for verification:

```
rohc-profile profile-name HomeUsers
```

The following command removes the RoHC profile named *HomeUsers*:

```
no rohc-profile profile-name HomeUsers
```

sccp-network

This command creates or removes a Signaling Connection Control Part (SCCP) network instance which is used to define the SS7 end-to-end routing in a UMTS network. As well, this command enters the SCCP network configuration mode. The SGSN supports up to 12 SCCP network instances at one time.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
sccp-network sccp_net_id [ -noconfirm ]
```

```
no sccp-network sccp_net_id
```

no

Remove the SCCP network configuration with the specified index number from the system configuration.

sccp_net_id

This number identifies a specific SCCP network configuration.

sccp_net_id: must be an integer from 1 through 12.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create or modify an SCCP network and enter the SCCP network configuration mode. The SCCP network is not a standard SS7 or UMTS concept - this concept is specific to this platform. For details about the commands and parameters needed to create and edit the SCCP Network configuration, check the *SCCP Network Configuration Mode* chapter.

Example

The following command creates an SCCP network with the index number of 1:

```
sccp-network 1
```

The following command creates an SCCP network with the index number of 2 to associate with HNB-GW service for HNB access network users without any prompt.:

```
sccp-network 2 -noconfirm
```

session trace

This command configures the type of network elements, file transfer protocol, and Trace collection entity mode to be used for the transportation of trace files collected for the subscriber session tracing on the UMTS/EPC network element(s) along with network connection parameters and timers.

Product

GGSN, MME, P-GW, S-GW

Privilege

Administrator

Syntax

```
session trace network-element { all | mme | pgw | sgw | ggsn } [ collection-
timer sec ] [ tce-mode { none | push transport sftp path string username name {
encrypted password enc_pw | password password } } ]
```

```
no session trace network-element { all | mme | pgw | sgw | ggsn }
```

no

Removes the entire session trace configuration from the system or a specific network element trace configuration.

```
network-element { all | mme | pgw | sgw | ggsn }
```

Identifies the type of service to the session trace application in order to determine the applicable interfaces. **all**: Specifies that all network elements and their associated interfaces are to be made available to the session trace application.

ggsn: Specifies that the GGSN as network element and its associated interfaces is to be made available to the session trace application.

mme: Specifies that the MME as network element and its associated interfaces is to be made available to the session trace application.

pgw: Specifies that the P-GW as network element and its associated interfaces is to be made available to the session trace application.

sgw: Specifies that the S-GW as network element and its associated interfaces is to be made available to the session trace application.

```
collection-timer sec
```

Specifies the amount of time, in seconds, to wait from initial activation/data collection before data is reported to the Trace Collection Entity (TCE). *sec* must be an integer value from 0 to 255.

```
tce-mode none
```

Specifies that session trace files are to be stored locally and must be pulled by the TCE.

```
tce-mode push transport sftp path string username name { encrypted
password enc_pw | password password }
```

Specifies that session trace files are to be pushed to the Trace Collection Entity (TCE).

sftp: Specifies that Secure FTP is used to push session trace files to the TCE.

path *string*: Specifies the directory path on the TCE where files will be placed.

username *name*: Specifies the username to be used when pushing files to the TCE.

encrypted password *enc_pw*: Specifies the encrypted password to be used when pushing files to the TCE.

password *password*: Specifies the password to be used when pushing files to the TCE.

Usage

Use this command to configure the file transfer methods and modes for subscriber session trace functionality and to how and where session trace files are sent after collection.

This configuration contains collection timer, UMTS/EPC network element, type of file transfer, and user credentials setting to send the collected trace files to the TCE.

Example

The following command configures the collection time for session traces to 30 seconds, identifies the network element as all elements (GGSN, MME, S-GW, and P-GW), and pushes session trace files to a TCE via SFTP into a directory named */trace/agw* using a username *admin* and a password of *pw123*:

```
session trace network-element all collection-timer 30 tce-mode push
transport sftp path /trace/agw username admin password pw123
```

The following command configures the collection time for session traces to 30 seconds, identifies the network element as an MME, and pushes session trace files to a TCE via SFTP into a directory named */trace/sgw* using a username *admin* and a password of *pw123*:

```
session trace network-element mme collection-timer 30 tce-mode push
transport sftp path /trace/mme username admin password pw123
```

The following command configures the collection time for session traces to 30 seconds, identifies the network element as GGSN, and pushes session trace files to a TCE via SFTP into a directory named */trace/ggsn* using a username *admin* and a password of *pw123*:

```
session trace network-element ggsn collection-timer 30 tce-mode push
transport sftp path /trace/ggsn username admin password pw123
```

sgsn-global

This command gives access to the SGSN Global configuration mode to set parameters relevant to the SGSN as a whole.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn-global
```

Usage

Using this command moves into SGSN Global configuration mode. In this mode, you can set SGSN-wide parameters to perform tasks, such as

- monitoring and managing TLLIs in the BSSGP layer.
- defining IMSI ranges used as filters in the operator policy selection process.

Example

Enter the SGSN Global configuration mode with the following:

```
sgsn-global
```

snmp authentication-failure-trap

Enables/disables the SNMP traps for authentication failures.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp authentication-failure-trap
```

```
no snmp authentication-failure-trap
```

no

Disables SNMP traps for authentication failures. When omitted, SNMP traps for authentication failures will be generated.

Usage

Disables authentication failure traps if they are not of interest. At this time the option may be changed to support trouble shooting.

The chassis is shipped from the factory with the SNMP authentication failure traps disabled.

snmp community

Configures the SNMP v1 and v2 community strings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp community string [ context ctx_name ] [ view view_name ] [ read-only | read-write ]
```

```
no snmp community string
```

no

The specified community string is removed from the configuration.

string

Specifies a community string whose options are to be modified. *string* must be a from 1 to 31 alpha and/or numeric characters.

context *ctx_name*

Default: community string applies to all contexts.

Specifies a the context to which the community string shall be applied. *ctx_name* must be from 1 to 1023 alpha and/or numeric characters.

view *view_name*

Default: community string applies to all views.

Specifies the view to which the community string shall be applied. *view_name* must from 1 to 1023 alpha and/or numeric characters.

read-only | **read-write**

Default: read-only

Specifies if access rights for the community string.

read-only: the configuration may only be viewed.

read-write: the configuration may be viewed and edited.

Usage

The community strings define the privileges of SNMP users. It may be desirable to give read-only access to front line operators.

Example

■ snmp community

```
snmp community sampleString
```

```
snmp community sampleString context sampleContext
```

```
snmp community sampleString context sampleContext view sampleView
```

```
snmp community sampleString view sampleView read-write
```

```
no snmp community sampleString
```

snmp engine-id

Configures the SNMP engine to use for SNMP requests when SNMPv3 agents are utilized.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp engine-id local id
```

id

Specifies the SNMPv3 engine to employ. *id* must be from 1 to 31 alpha and/or numeric characters.

Usage

When SNMPv3 is used for SNMP access to the chassis the engine ID can be used to quickly change which schema is used for SNMP access.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

```
snmp engine-id local id
```

snmp heartbeat

Enables the sending of periodic “heartbeat” notifications (traps).

Product

All

Privilege

Administrator

Syntax

```
snmp heartbeat { interval [ minutes ] | second-interval [ seconds ] }
```

```
default snmp heartbeat
```

```
no snmp heartbeat
```

default

Returns the command to its default setting of disabled.

no

Disables the feature.

interval [*minutes*]

Default: 60

Specifies the interval time, in minutes, between notifications. *minutes* must be an integer value between 1 and 1440.

second-interval [*seconds*]

Default: 30

Specifies the secondary interval time, in seconds, between notifications. *seconds* must be an integer value between 10 and 50.

Usage

Use this command to enable the sending of a heartbeat notification periodically to confirm a system is up and communicating.

Example

The following command sets the snmp heartbeat notification interval to 2 hours, 15 minutes and 30 seconds:

```
snmp heartbeat interval 135 second-interval 30
```

snmp history heartbeat

Enables the recording of heartbeat notifications in SNMP history.

Product

All

Privilege

Administrator

Syntax

```
[ default | no ] snmp history heartbeat
```

default

Returns the command to the default setting of enabled.

no

Disables the history recording feature.

Usage

Use this command to enable the recording of SNMP heartbeat notifications in SNMP history files.

snmp notif-threshold

Configures the number of SNMP notification that need to be generated for a given event before it is propagated to the SNMP users.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp notif-threshold count [ low low_count ] [ period seconds ]
```

```
no snmp notif-threshold
```

no

Removes all SNMP notification thresholds. All notifications will be broadcast to SNMP users.

count

Default: 100

Specifies the number of notifications that must be generated before the next notification is broadcast to SNMP users. *count* must be a value in the range from 1 to 10000.

low *low_count*

Default: 20

Specifies the number of notifications within the monitoring period before which any subsequent notification for each specific event. *low_count* must be a value in the range from 1 through 10000.

period *seconds*

Default: 300

Specifies the number of seconds of the monitoring window size used to determine when any subsequent notification may be broadcast to users. *seconds* must be a value in the range from 10 through 3600.

Usage

Set the notification threshold to avoid a flood of events which may be the result of a single failure or maintenance activity.

Example

```
snmp notif-threshold 100
```

```
snmp notif-threshold 100 period30
```

snmp server

Enables the SNMP server as well the configuration of the SNMP server port.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp server [ port number ]
```

```
no snmp server
```

no

Restores the default SNMP port assignment.

port *number*

Default: 161

Specifies the port number to use for SNMP communications. *number* must be a value in the range from 1 to 65535.

Usage

Set the SNMP port for communications when SNMP is enabled.

Important: This will result in restarting the SNMP agent when the **no** keyword is omitted. SNMP queries as well as notifications/traps will be blocked until the agent has restarted.

Example

```
snmp server port 100
```

```
no snmp server
```

snmp target

Configures remote receivers of SNMP notifications.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp target name ip_address [ port number ] [ non-default ] [ security-name
string ] [ version { 1 | 2c | 3 | view } [ security-level { noauth | { auth |
priv-auth privacy [ encrypted ] des privpassword } authentication [ encrypted ]
{ md5 | sha } authpassword } } ] [ informs | traps ]
```

```
no snmp target name
```

no

Removes the specified target as a receiver of unsolicited SNMP messages.

authentication { **md5** | **sha** } *authpassword*

Reads the authentication type and password if the security level of the SNMP messages is set to **auth** or **priv-auth**. Authentication types are:

md5: Configures the hash-algorithm to implement MD5 per RFC 1321.

sha: Specifies that the hash protocol is Secure Hash Algorithm.

security-level { **noauth** | { **auth** | **priv-auth privacy [encrypted] des privpassword** }

Sets the security level of the SNMPv3 messages, as follows:

noauth: No authentication and encryption is used.

auth: Only authentication will be used.

priv-auth: Both authentication and encryption will be used.

privacy des privpassword: Reads the privacy type and password.

name

Specifies a logical name to use to refer to the remote receiver. *name* must be from 1 to 31 alpha and/or numeric characters.

ip_address

Specifies the IP address of the receiver. *ip_address* must be specified using the standard IPv4 dotted decimal notation.

non-default

Specifies that this destination is only used for SNMP traps which have been specifically identified.

port *number*

Default: 162

Specifies the port which is to be used in communicating with the remote receivers. *number* must be a value in the range from 0 through 65535.

security-name *string*

Default: no community string included

Specifies the community string to use in the unsolicited messages. *string* must be from 1 to 31 alpha and/or numeric characters.

version { **1** | **2c** | **3** } | **view**

Default: 1

Specifies the SNMP version the target supports and consequently the version of the SNMP protocol to use for communications.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must configure this command to use version 1 or version 2c.

informs | **traps**

Default: traps

Specifies the type of SNMP event to use to send notifications to SNPM targets. **traps** are unacknowledged (fire and forget) whereas **informs** require a response from the SNMP target.

If the notification type is set to **informs**, the notification is resent if no response is received within 5 seconds. The notification is resent at most two times.

Usage

The target manages the list of remote receivers to which unsolicited messages are sent, e.g., this is necessary if a new monitoring system is added to a network or removed.

Example

```
snmp target sampleReceiver 1.2.3.4 security-name sampleComm
snmp target sampleReceiver 1.2.5.6 port 100
snmp target sampleReceiver 1.2.7.8 version 2c traps
no snmp target sampleReceiver
```

snmp trap

This command enables/disables generation of specific or all SNMP traps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp trap { enable | suppress } [ trap_name1 trap_name2 ... trap_nameN | all ]
```

enable

Enables or allows the generation of one or more SNMP traps by the system.

suppress

Disables the generation of one or more SNMP traps by the system.

```
trap_name1 trap_name2 ... trap_nameN
```

The name of the specific SNMP trap to enable or disable. Multiple traps can be listed for a single instance of this command.

Important: The system disregards character case when entering trap names.

all

Default: Enable All

Specifies that all SNMP traps will be affected by the specified operation (enable or suppress).

Usage

SNMP traps are used by the system to indicate that certain events have occurred. A complete listing of the traps supported by the system and their descriptions can be found in the *SNMP MIB Reference*. Additionally, a trap listing can be viewed using the following command:

```
snmp trap { enable | suppress } ?
```

By default, the system enables the generation of all traps. However, individual traps can be disabled allowing only traps of a certain type or alarm level to be generated. This command can be used to disable un-desired traps and/or re-enable previously suppressed traps.

Example

The following command suppresses the LogMessage trap:

```
snmp trap suppress logmessage
```

The following command suppresses the *CLISessEnd* and *CLISessStart*:

```
snmp trap suppress clisessend clisesstart
```

snmp trap-timestamps

Adds an additional system-time varbind to generated traps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap-timestamps
```

no

Disables the adding of timestamps to generated traps.

Usage

The timestamp added to the generated trap reflects the current system time. The timestamp is proprietary. This functionality is disabled by default.

Important: If the Web Element Manager application is used as your alarm server, the application relies on the timestamp provided by enabling this command to identify duplicate traps. As a result, it is recommended that this parameter be enabled for this case.

Example

The following command enables the inclusion of a timestamp with each generated trap:

```
snmp trap-timestamps
```

snmp user

Configures an SNMPv3 user for SNMP access.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp user user_name [ [ encrypted ] password password | engine id | group
grp_name | security-model model auth [ [ encrypted ] password password ] ]
```

```
no snmp user user_name
```

no

Removes the specified user from the list of valid SNMPv3 users.

user_name

Specifies the user which is to use SNMPv3 interfaces to the system. *user_name* must be from 1 to 31 alpha and/or numeric characters.

engine *id*

The SNMP engine ID. *id* must be a string of alpha and/or numeric characters from 1 to 31 characters in length.

group *grp_name*

Default: undefined (not a member of any group)

Specifies the user SNMPv3 group the into which user will be added. *grp_name* must be from 1 to 1023 alpha and/or numeric characters.

security-model *model* **auth**

Default: USM

Specifies the security model used to authenticate the user. *model* must be configured to the following:

- **usm** : User Security Model

[**encrypted**] **password** *password*

Default: undefined

Specifies the password for authenticating the user when the security model is set to USM.

The **encrypted** keyword indicates the password will be received in an encrypted form. *password* must be from 8 to 31 alpha and/or numeric characters.

The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Add and remove SNMPv3 users as operations staff or automated systems are updated. The security model will be user dependant based upon the support the users system provides.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

```
snmp user user1

snmp user user1 security-model 2c auth

snmp user user1 group sampleGroup security-model usm auth

no snmp user user1
```

ss7-routing-domain

This command creates an SS7 routing domain instance and enters the SS7 routing domain configuration mode.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
ss7-routing-domain rd_id variant v_type [ -noconfirm ]
```

```
no ss7-routing-domain rd_id
```

no

Removes the specified SS7 routing domain from the system configuration.

rd_id

This number identifies a specific SS7 routing domain. Once it has been created, it can be accessed for further configuration and modification by entering the *rd_id* without entering the variant. *rd_id* must be an integer from 1 to 12.

variant *v_type*

Identifies the national standard to be used for call setup, routing and control, signaling. Select one of the following:

- **ansi**: American National Standards Institute (U.S.A.)
- **bici**: Broadband Intercarrier Interface standard
- **china**: Chinese standard
- **itu**: International Telecommunication Union (ITU-T) Telecommunication Standardization Sector
- **ntt**: Japanese standard
- **ttc**: Japanese standard

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create an SS7 routing domain configuration instance or to enter the SS7 routing domain configuration mode to edit the configuration.

A routing domain groups configuration items to facilitate the management of the SS7 connection resources for an SGSN service. An Access Gateway supports up to 12 configured SS7 routing domains at one time. After entering this command, the prompt appears as:

```
[context_name]<hostname>(config-ss7-routing-domain-routing_domain_id)#
```

For details about the commands and parameters used to define or edit an SS7 routing domain, refer *SS7 Routing Domain Configuration Mode* chapter.

Example

The following creates an SS7 routing domain with an index of 1 and the variant selection of Broadcast Inter-carrier Interface (bici):

```
ss7-routing-domain 1 variant bici
```

The following command creates an SS7 routing domain instance with an index of 2 and the variant selection of Broadcast Inter-carrier Interface (bici) to be associated with HNB RN-PLMN in an HNB access network:

```
ss7-routing-domain 1 variant bici
```

suspend local-user

Suspends a local-user administrative account.

Product

All

Privilege

Administrator

Syntax

```
suspend local-user name
```

```
no suspend local-user name
```

no

Removes the suspended status for the specified local-user account.

name

The name of the local-user account. It can be from 3 to 16 alpha and/or numeric characters and is case sensitive.

Usage

This command allows a security administrator to suspend local-user administrative accounts. A “suspended” user can not login to the system. The user’s account information (passwords, password history, etc.), however, is preserved.

Example

The following command suspends a local-user account called Inspector1:

```
suspend local-user Inspector1
```

The following command removes the suspension from a local-user account called Admin300:

```
no suspend local-user Admin300
```

system

Configures system information which is accessible via SNMP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
system { carrier-id mcc mcc_id mnc mnc_id | contact who | hostname host_name |
location text }
```

```
default system { contact | location }
```

default

This keyword removes the configured **system contact** and **system location** on system.

```
carrier-id mcc mcc_id mnc mnc_id
```

Important: This carrier ID is not used by the GGSN

This keyword specifies a carrier-id that is a unique identifier for the carrier that has installed the system. When the carrier ID values are set, the carrier-id and `gmt_offset` attributes are included in access-request and accounting packets when using the following RADIUS dictionaries:

- 3gpp2
- 3gpp2-835
- starent
- starent-835
- starent-vs1
- starent-vs1-835
- custom9

mcc *mcc_id*: The mobile country code. This must be specified as a string of integers from 001 through 999. Values must be expressed as three integers.

mnc *mnc_id*: The mobile network code. This must be specified as a string of integers from 01 through 999. Values must be expressed as a minimum of two integers and a maximum of three integers.

contact *who*

Default: No contact specified.

contact *who*: specifies the contact information for the chassis. *who* must be a string of 0 to 255 characters. The string specified must be embedded in double quotes (") if spaces and special punctuation is to be used.

hostname *host_name*

hostname *host_name*: configures the chassis host name where *host_name* must be from 1 to 63 characters.

Important: Please note that changing the chassis host name results in the command prompt changing as well to reflect the new name. This may affect any scripted interfaces from OSS or maintenance facility.

location *text*

Default: No location specified.

location *text*: specifies the location text to use which may be a string of 0 to 255 characters. The text specified must be embedded in double quotes (“) if spaces are to be used.

Usage

Specify system basic information which is useful back at a network operations center which uses the SNMP interfaces for management.

Example

The following commands configure the contact information, system host name, and location text, or remove configured location and system respectively.

```
system contact user1@company.com
```

```
system hostname system16
```

```
system location "Clark Street Closet\nBasement Rack 4"
```

The following commands remove the configured contact and location from system respectively

```
default system contact
```

```
default system location
```

task facility ipsecmgr

Configures IPsec manager settings.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
task facility ipsecmgr { max-crypto-maps-each-ipsecmgr max_num | max-ipsecmgr-tasks max_num | start-at-a-time num | task-count { increased | normal } }
```

```
default task facility ipsecmgr { max-crypto-maps-each-ipsecmgr | max-ipsecmgr-tasks | start-at-a-time | task-count }
```

max-crypto-maps-each-ipsecmgr *max_num*

Default: 2

The maximum number of crypto maps per IPSEC manager.

max_num must be an integer from 1 through 150.

max-ipsecmgr-tasks *max_num*

Default: 200

The maximum number of IPSEC manager tasks that can be started for all services.

max_num must be an integer from 1 through 200.

start-at-a-time *num*

Default: 1

The number of IPSEC manager tasks created at once when they are required.

num must be an integer from 1 to 128.

task-count { **increased** | **normal** }

Default: **normal**

Adjusts the IPsec manager task count to support EHA.

increased: Increases the number of IPsec manager tasks operating on the PSCs/PSC2s while reducing the number of session manager tasks.

normal: Uses the standard algorithm for allocationg memory for IPsec manager tasks.

Caution: If **task-count** is set to **normal** and session-recovery is enabled, IPsecMgr tasks are not allowed to start on most PSCs/PSC2s.

Usage

Set the IPsec manager parameters for all IPsec managers in the system.

Example

Use the following command to set the maximum number of crypto maps per IPsec manager to 25:

```
task facility ipsecmgr max-crypto-maps-each-ipsecmgr 25
```

task facility sessmgr

Configures system information which is accessible via SNMP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
task { facility sessmgr start { aggressive | normal } | resource cpu-memory-low
{ kill | warn } }
```

```
facility sessmgr start { aggressive | normal }
```

Default: Normal

Specifies the facility options for the session manager.

aggressive: specifies the maximum number of session manager processes are started immediately.

 **Caution:** The `task facility sessmgr start aggressive` command should only be used if the system will reach capacity (for the existing configuration) during the first few minutes of service.

 **Caution:** This command must only be executed last during configuration (or appended to the end of the configuration file) to ensure the availability of memory resources to contexts and services.

normal: indicates the session manager processes are started as needed.

```
resource cpu-memory-low { kill | warn }
```

Default: kill

Sets the action for the Resource Manager to take when the amount of free memory on a CPU falls below 12MB. An SNMP TRAP and CORBA notification are generated and the event is logged.

Once the free memory threshold is crossed, The Resource Manager examines all tasks on that cpu and finds the most over limit task and kills it. If there are no over limit tasks nothing happens. Resource Manager takes preference on killing a non-sessmgr task over a sessmgr task.

kill: The task most over memory limit (if any) is killed and recovered.

warn: The event is logged and no tasks are killed.

Usage

Set the session manager start policy to aggressive on heavily utilized systems to avoid undue delays in processing subscriber sessions.

Set the CPU memory low action to only log CPU low memory events.

Example

```
task facility sessmgr start aggressive
```

```
task facility sessmgr start normal
task resource cpu-memory-low warn
```

task facility acsmgr

This command configures the ACSMgr tasks setting.

Product

ECS

Privilege

Security Administrator, Administrator

Syntax

```
task facility acsmgr start [ aggressive | normal ]
```

```
no task facility acsmgr start
```

no

Disables the configured ACSMgr setting.

aggressive

Specifies to start the maximum possible ACSMgr tasks.

normal

Configures the resource subsystem to start/stop ACSMgr tasks on as needed basis.

Usage

This command provides option for the resource subsystem to start maximum possible ACSMgr tasks based on the license configured and the available system configuration.

Example

The following command starts the maximum possible ACSMgr tasks:

```
task facility acsmgr start aggressive
```

terminal

Configures the console port on the SPIO.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
terminal [ carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol {  
hardware { off | on } | none } | parity { even | none | odd } | speed { 115200 |  
19200 | 38400 | 57600 | 9600 } | stopbits { 1 | 2 } ]
```

```
carrierdetect { off | on }
```

Specifies whether or not the console port is to use Data Carrier Detect (DCD) when connecting to a terminal.

Default: **off**

off: Do not use DCD

on: Use DCD

```
databits { 7 | 8 }
```

Specifies the number of data bits used to transmit and receive characters.

Default: **8**

7: Use 7 databits to transmit and receive characters.

8: Use 8 databits to transmit and receive characters.

```
flowcontrol { hardware { off | on } | none }
```

Specifies how the flow of data is controlled between the SPIO and a terminal.

Default: **none**

hardware: Enable or disable the use of hardware-based flow control

off: Disable the use of Ready to Send (RTS) and Clear to Send (CTS).

on: Enable the use of Ready to Send (RTS) and Clear to Send (CTS).

none: Disable the use of DCD, RTS and CTS.

```
parity { even | none | odd }
```

Specifies the type of error checking used on the port.

Default: **none**

even - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.

none - Disables error checking.

odd - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

```
speed { 115200 | 19200 | 38400 | 57600 | 9600 }
```

Specifies the flow of data in bits per second between the console port and terminal.

Default: **9600**

stopbits { 1 | 2 }

Specifies the number of stop bits between each transmitted character.

Default: **1**

1: Use one stop bit between each transmitted character.

2: Use two stop bits between each transmitted character.

Usage

Sets the SPIO's console port parameters for communication with the terminal device.

Example

The following command sets the SPIO's console port. The terminal must support these values.

```
terminal carrierdetect off databits 7 flowcontrol hardware on parity even  
speed 115200 stopbits 1
```

threshold 10sec-cpu-utilization

Configures a threshold that measures a 10 second average of cpu utilization. Its polling interval can be set down to 30 seconds.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold 10sec-cpu-utilization percent [ clear percent ]
```

percent

Default: 0

Configures the high threshold for 10 second average cpu-utilization. If the monitored CPU utilization is greater than or equal to the specified percentage an alert is sent. Regardless of the length of the polling interval, only one sample at the end of the polling interval is tested.

clear *percent*

Default: 0:

This is a low watermark value that sets the alarm clearing threshold value. If not specified it is taken from the first value.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set a threshold that sends an alert when CPU utilization over a 10 second average exceeds the limit set.

Alerts or alarms are triggered for 10-second sample of CPU utilization based on the following rules:

- **Enter condition:** 10-second average percentage of CPU utilization \geq High Threshold
- **Clear condition:** 10-second average percentage of CPU utilization $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

Send an alert when the 10 second average CPU utilization reaches 45 percent by entering the following command;

■ threshold 10sec-cpu-utilization

```
threshold 10sec-cpu-utilization 45
```

threshold aaa-acct-archive-size

This command configures accounting message archive size threshold.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold aaa-acct-archive-size high_thresh [ clear low_thresh ]
```

high_thresh

Default: 1

The high threshold number of archived accounting messages that must be met or exceeded within the polling interval to generate an alert or alarm.

The number can be configured to any integer value between 0 and 1044000.

clear *low_thresh*

Default: 1

The low threshold number of archived accounting messages that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.

The number can be configured to any integer value between 0 and 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system cannot communicate with configured AAA accounting servers (RADIUS or CGFs), either due to the server being busy or loss of network connectivity, the system buffers, or archives, the accounting messages.

Accounting message archive size thresholds generate alerts or alarms based on the number of AAA accounting messages buffered in the archive during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.

Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of archived messages \geq High Threshold
- **Clear condition:** Actual number of archived messages $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

■ threshold aaa-acct-archive-size

The following command configures a high threshold count of 250 AAA accounting archived messages and low threshold of 100 for an system using the Alarm thresholding model:

```
threshold aaa-acct-archive-size 250 clear 100
```

threshold aaa-acct-failure

Configures accounting failure thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold aaa-acct-failure high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold number of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm.

The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of accounting failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.

The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Accounting failure thresholds generate alerts or alarms based on the number of failed AAA accounting message requests that occur during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.

Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of failures \geq High Threshold
- **Clear condition:** Actual number of failures $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 100 AAA accounting failures and low threshold of 25 for an system using the Alarm thresholding model:

■ threshold aaa-acct-failure

```
threshold aaa-acct-failure 100 clear 25
```

threshold aaa-acct-failure-rate

Configures accounting failure rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold aaa-acct-failure-rate high_thresh [ clear low_thresh ]
```

high_thresh

Default: 1

The high threshold percent of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 1

The low threshold percent of accounting failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Accounting failure rate thresholds generate alerts or alarms based on the percentage of AAA accounting message requests that failed during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.

Alerts or alarms are triggered for accounting failure rates based on the following rules:

- **Enter condition:** Actual failure percentage \geq High Threshold
- **Clear condition:** Actual failure percentage $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA accounting failure rate high threshold percentage of 30 and a low threshold percentage of 10 for an system using the Alarm thresholding model:

■ threshold aaa-acct-failure-rate

```
threshold aaa-acct-failure-rate 30 clear 10
```

threshold aaa-auth-failure

Configures authentication failure thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold aaa-auth-failure high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.

The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.

The number can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Authentication failure thresholds generate alerts or alarms based on the number of failed AAA authentication message requests that occur during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with.

Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures \geq High Threshold
- **Clear condition:** Actual number of failures $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

■ threshold aaa-auth-failure

The following command configures a high threshold count of 100 AAA authentication failures for an system using the Alert thresholding model:

```
threshold aaa-auth-failure 100
```

threshold aaa-auth-failure-rate

Configures authentication failure rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold aaa-auth-failure-rate high_thresh [ clear low_thresh ]
```

high_thresh

Default: 5

The high threshold percent of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 5

The low threshold percent of authentication failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Authentication failure rate thresholds generate alerts or alarms based on the percentage of AAA authentication message requests that failed during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with.

Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual failure percentage \geq High Threshold
- **Clear condition:** Actual failure percentage $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

■ `threshold aaa-auth-failure-rate`

Example

The following command configures a AAA authentication failure rate high threshold percentage of 30 for an system using the Alert thresholding model:

```
threshold aaa-auth-failure-rate 30
```

threshold aaa-retry-rate

Configures AAA retry rate thresholds for the system.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold aaa-retry-rate high_thresh [ clear low_thresh ]
```

high_thresh

Default: 5

The high threshold percent of AAA request message retries that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 5

The low threshold percent of AAA request message retries that maintains a previously generated alarm condition. If the percentage of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

AAA request message retry rate thresholds generate alerts or alarms based on the percentage of request messages (both authentication and accounting) that were retried during the specified polling interval. The percentage is based on a message count taken for all AAA authentication and accounting servers that the system is configured to communicate with.

Alerts or alarms are triggered for request message retries based on the following rules:

- **Enter condition:** Actual retry percentage \geq High Threshold
- **Clear condition:** Actual retry percentage $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA message retry rate high threshold percentage of 25 and a low threshold percentage of 10 for an system using the Alarm thresholding model:

■ threshold aaa-retry-rate

```
threshold aaa-retry-rate 25 clear 10
```

threshold aaamgr-request-queue

This command configures the AAA Manager internal request queue threshold.

Product

PDSN, GGSN, HA, ASN GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold aaamgr-request-queue high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold number of AAA Manager Requests that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 1 and 100.

clear

Allows the configuration of the low threshold.

low_thresh

Default: 5

The low threshold number of AAA Manager Requests that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm is generated.

low_thresh can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

AAA Manager Request thresholds generate alerts or alarms based on the number of AAA Manager Requests for an AAA manager process during the specified polling interval.

Alerts or alarms are triggered for AAA Manager Requests based on the following rules:

- **Enter condition:** Actual number of AAA Manager Requests per AAA manager ³ High Threshold
- **Clear condition:** Actual number of AAA Manager Requests per AAA manager process < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm is not generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

■ `threshold aaamgr-request-queue`

Example

The following command configures a AAA authentication failure rate high threshold percentage of 30 for an system using the Alert thresholding model:

```
threshold aaamgr-request-queue 30
```

threshold asngw-auth-failure

Configures authentication failure thresholds for the ASN-GW system.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold asngw-auth-failure high_thresh [ clear low_thresh ]
```

```
default threshold asngw-auth-failure
```

high_thresh

Default: 0

The high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to configure threshold limits to generate alerts or alarms based on the number of failed ASN-GW authentication message requests that occur during the specified polling interval. Authentication requests are counted for all ASN Gateway authentication servers that the system is configured to communicate with.

Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures \geq High Threshold
- **Clear condition:** Actual number of failures $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

■ `threshold asngw-auth-failure`

Example

The following command configures a high threshold count of *100* authentication failures for an ASN-GW using the Alert thresholding model:

```
threshold asngw-auth-failure 100
```

threshold asngw-handoff-denial

Configures thresholds for hand-off denial for the ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold asngw-handoff-denial high_thresh [ clear low_thresh ]
```

```
default threshold asngw-handoff-denial
```

high_thresh

Default: 0

The high threshold number of hand-off denials that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of hand-off denials that maintains a previously generated alarm condition. If the number of hand-off denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of denied hand-off that occurred during the specified polling interval. Hand-off denial messages are counted for all ASN Gateways that the system is configured to communicate with.

Alerts or alarms are triggered for hand-off denials based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

■ `threshold asngw-handoff-denial`

Example

The following command configures a high threshold count of *100* hand-off denials using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```

threshold asngw-max-eap-retry

Configures thresholds for maximum retries for Extensible Authentication Protocol (EAP) authentication on an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold asngw-max-eap-retry high_thresh [ clear low_thresh ]
```

```
default threshold asngw-max-eap-retry
```

high_thresh

Default: 0

The high threshold number of retries for EAP authentication that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of retries for EAP authentication that maintains a previously generated alarm condition. If the number of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of retries for EAP authentication that occur during the specified polling interval.

Alerts or alarms are triggered for maximum number of retries for EAP authentication based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

■ `threshold asngw-max-eap-retry`

Example

The following command configures a high threshold count of *100* alerts or alarms generated on maximum number of retries for EAP authentication for an ASN Gateway using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```

threshold asngw-network-entry-denial

Configures thresholds for denial of network entry to an MS with in the ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold asngw-network-entry-denial high_thresh [ clear low_thresh ]
```

```
default threshold asngw-network-entry-denial
```

high_thresh

Default: 0

The high threshold number of denial of network entry to an MS that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of denial of network entry to an MS that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of network entry denials that occurred during the specified polling interval. Network denial messages are counted for an MS that the system is configured to communicate with.

Alerts or alarms are triggered for network entry denials based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

■ threshold asngw-network-entry-denial

Example

The following command configures a high threshold count of *100* network entry denials for an MS using the Alert thresholding model:

```
threshold asngw-network-entry-denial 100
```

threshold asngw-r6-invalid-nai

Configures thresholds to generate alert/alarm for invalid Network Access Identifier (NAI) in R6 message.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold asngw-r6-invalid-nai high_thresh [ clear low_thresh ]
```

```
default threshold asngw-r6-invalid-nai
```

high_thresh

Default: 0

The high threshold number of invalid NAIs in R6 messages that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of invalid NAIs in R6 messages that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of invalid NAIs in R6 messages that occurred during the specified polling interval. Invalid NAIs are counted for an MS that the system is configured to communicate with or per system for all R6 messages.

Alerts or alarms are triggered for invalid NAIs based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

■ `threshold asngw-r6-invalid-nai`

Example

The following command configures a high threshold count of *100* invalid NAIs in R6 messages using the Alert thresholding model:

```
threshold asngw-r6-invalid-nai 100
```

threshold asngw-session-setup-timeout

Configures thresholds to generate alert/alarm for session setup timeouts in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold asngw-session-setup-timeout high_thresh [ clear low_thresh ]
```

```
default threshold asngw-session-setup-timeout
```

high_thresh

Default: 0

The high threshold number of timeouts during session setup that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of timeouts during session setup that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during session setup that occurred during the specified polling interval.

Alerts or alarms are triggered for session setup timeouts based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

■ threshold asngw-session-setup-timeout

The following command configures a high threshold count of *100* timeouts during session setup using the Alert thresholding model:

```
threshold asngw-session-setup-timeout 100
```

threshold asngw-session-timeout

Configures thresholds to generate alert/alarm for session timeouts in an ASN-GW service.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
threshold asngw-session-timeout high_thresh [ clear low_thresh ]
```

```
default threshold asngw-session-timeout
```

high_thresh

Default: 0

The high threshold number of timeouts during session that must be met or exceeded within the polling interval to generate an alert or alarm.

high_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of timeouts during session that maintains a previously generated alarm condition. If the number of session timeouts falls beneath the low threshold within the polling interval, a clear alarm will be generated.

low_thresh can be configured to any integer value between 0 and 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during a session that occurred during the specified polling interval.

Alerts or alarms are triggered for session timeouts based on the following rules:

- **Enter condition:** Actual number of failures ³ High Threshold
- **Clear condition:** Actual number of failures < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

■ threshold asngw-session-timeout

The following command configures a high threshold count of *100* timeouts during a session using the Alert thresholding model:

```
threshold asngw-session-timeout 100
```

threshold call-reject-no-resource

Configures thresholds on the system for calls rejected due to insufficient resources.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold call-reject-no-resource high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold number of no-resource call rejects issued by the system that must be met or exceeded within the polling interval to generate an alert or alarm.

The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of no-resource call rejects issued by the system that maintains a previously generated alarm condition. If the number of rejections falls beneath the low threshold within the polling interval, a clear alarm will be generated.

The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

No resource call reject thresholds generate alerts or alarms based on the total number of calls that were rejected by the system due to insufficient or no resources (memory and/or session licenses) during the specified polling interval.

Alerts or alarms are triggered for no-resource-rejected calls based on the following rules:

- **Enter condition:** Actual number of calls rejected due to no resources ³ High Threshold
- **Clear condition:** Actual number of calls rejected due to no resources < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

■ `threshold call-reject-no-resource`

The following command configures a high threshold count for the number of calls rejected by the system due to insufficient or no resources to 100 and allow threshold of 40 for an system using the Alarm thresholding model:

```
threshold call-reject-no-resource 100 clear 40
```

threshold call-setup

Configures call setup thresholds for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold call-setup high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold number of calls setup by the system that must be met or exceeded within the polling interval to generate an alert or alarm.

The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of calls setup by the system that maintains a previously generated alarm condition. If the number of setups falls beneath the low threshold within the polling interval, a clear alarm will be generated.

The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Call setup thresholds generate alerts or alarms based on the total number of calls setup by the system during the specified polling interval.

Alerts or alarms are triggered for call setups based on the following rules:

- **Enter condition:** Actual number of call setups \geq High Threshold
- **Clear condition:** Actual number of call setups $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 100 calls setup for an system using the Alert thresholding model:

■ threshold call-setup

```
threshold call-setup 100
```

threshold call-setup-failure

Configures call setup failure thresholds for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold call-setup-failure high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold number of call setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.

The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold number of call setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.

The number can be configured to any integer value between 0 and 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Call setup failure thresholds generate alerts or alarms based on the total number of call setup failures experienced by the system during the specified polling interval.

Alerts or alarms are triggered for call setup failures based on the following rules:

- **Enter condition:** Actual number of call setup failures \geq High Threshold
- **Clear condition:** Actual number of call setup failures $<$ Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of 100 call setup failures and a low threshold of 80 for an system using the Alarm thresholding model:

■ threshold call-setup-failure

```
threshold call-setup-failure 100 clear 80
```

threshold cpu-available-memory

Configures thresholds for available CPU memory for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold cpu-available-memory low_thresh [ clear high_thresh ]
```

low_thresh

Default: 32

The low threshold amount of CPU memory that must be met or exceeded at the polling time to generate an alert or alarm.

low_thresh is measured in mega bytes (MB) and can be configured to any integer value between 0 and 2048.

clear *high_thresh*

Default: 32

The high threshold amount of CPU memory that maintains a previously generated alarm condition. If the memory amount rises above the high threshold within the polling interval, a clear alarm will be generated.

high_thresh is measured in mega bytes (MB) and can be configured to any integer value between 0 and 2048.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CPU available memory thresholds generate alerts or alarms based on the amount of available memory for each PSC/PSC2 CPU at the polling time. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.

Alerts or alarms are triggered for available CPU memory based on the following rules:

- **Enter condition:** Average measured amount of memory/CPU for last 5 minutes \leq Low Threshold
- **Clear condition:** Average measured amount of memory/CPU for last 5 minutes $>$ High Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

 **Important:** This command is not supported on all platforms.

■ threshold cpu-available-memory

Example

The following command configures a low threshold count of 50 MB CPU memory available and a high threshold of 112 MB for an system using the Alarm thresholding model:

```
threshold cpu-available-memory 50 clear 112
```

threshold cpu-load

Configures the threshold for monitoring PSC/PSC2 CPU loads using a 5 minute average measurement. The threshold is enabled by enabling CPU resource monitoring.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold cpu-load high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

If the monitored CPU load is greater than or equal to the specified number an alert is sent. *high_thresh* must be an integer from 0 through 15.

clear *low_thresh*

Default: 0

This is a low watermark value that sets the alarm clearing threshold value. If not present it is taken from the first value. *low_thresh* must be an integer from 0 through 15.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

Use this command to set an alert when the card's CPU load is equal to or greater than the number specified. Alerts or alarms are triggered for CPU load based on the following rules:

- **Enter condition:** Actual CPU load \geq High Threshold
- **Clear condition:** Actual CPU load < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

 **Important:** This command is not supported on all platforms.

Example

To set an alert when the PSC/PSC2 CPU load is over 10 and set an alert clear when the CPU load drops down equal or less than 7, enter the following command;

```
threshold cpu-load 10 clear 7
```

■ threshold cpu-load

threshold cpu-memory-usage

Configures the threshold for monitoring the percentage of total CPU memory used during the polling interval.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold cpu-memory-usage high_thresh [ clear low_thresh ]
```

high_thresh

Default: 0

The high threshold for percentage of total memory used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.

high_thresh is measured in percentage of total CPU memory used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0

The low threshold for percentage of total CPU memory used that maintains a previously generated alarm condition. If the memory usage falls below the low threshold within the polling interval, a clear alarm is generated.

low_thresh is measured in percentage of total CPU memory used and can be configured to any integer value between 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CPU memory usage generate alerts or alarms based on the percentage of total CPU memory used during the polling interval.

Alerts or alarms are triggered for CPU memory usage session based on the following rules:

- **Enter condition:** Actual percentage of CPU memory usage ³ specified percentage of total CPU memory.
- **Clear condition:** Actual CPU memory usage < specified clear percentage of total CPU memory usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

■ threshold cpu-memory-usage

The following command configures a threshold of 65 percent of total PSC/PSC2 CPU memory usage and a clear threshold of 35 percent:

```
threshold cpu-memory-usage 65 clear 35
```

threshold cpu-orbs-crit

Configures threshold for generating critical-level alerts or alarms based on the percentage of CPU utilization by the ORBS software task

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
threshold cpu-orbs-crit high_thresh [ clear low_thresh ]
[ default ] threshold cpu-orbs-crit
```

default

Restores this parameter to its default setting.

high_thresh

Default: 60

The high threshold percent of CPU utilization by the ORB software task that must be exceeded as measured at the time of polling to generate a critical-level alert or alarm.

high_thresh is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

clear low_thresh

Default: 60

The low threshold percent of CPU utilization by the ORB software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to the low threshold at the time of polling, a clear alarm will be generated.

low_thresh is measured in percentage of total CPU utilization and can be configured to any integer value 0 through 100. A value of 0 disables the threshold.

 **Important:** This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage
